- **An IAM role with appropriate permissions**. The following steps require your environment to have `iam:CreateRole`, `iam:CreatePolicy`, `iam:AttachRolePolicy`, and `iam:ListPolicies` permissions. These permissions are needed on the role that is being used to run the steps in this user guide. The instructions in this guide create an IAM role that is used as the execution role of the MLflow Tracking Server so that it can access data in your Amazon S3 buckets. Additionally, a policy is created to give the IAM role of the user that is interacting with the Tracking Server via the MLflow SDK permission to call MLflow APIs. For more information, see Modifying a role permissions policy (console) .

  If using a SageMaker Studio Notebook, update the service role for your Studio user profile with these IAM permissions. To update the service role, navigate to the SageMaker AI console and select the domain you are using. Then, under the domain, select the user profile you are using. You will see the service role listed there. Navigate to the IAM console, search for the service role under **Roles**, and update your role with a policy that allows the `iam:CreateRole`, `iam:CreatePolicy`, `iam:AttachRolePolicy`, and `iam:ListPolicies` actions.

Set up Amazon CLI model

Follow these command line steps within a terminal to set up the Amazon CLI for Amazon SageMaker AI with MLflow.

1. Install an updated version of the Amazon CLI. For more information, see Install or update to the latest version of the Amazon CLI in the *Amazon CLI User Guide*.
2. Verify that the Amazon CLI is installed using the following command:

   ```
   aws sagemaker help
   ```

   Press q to exit the prompt.

   For troubleshooting help, see Troubleshoot common setup issues.

Set up MLflow infrastructure

The following section shows you how to set up an MLflow Tracking Server along with the Amazon S3 bucket and IAM role needed for the tracking server.

Create an S3 bucket

Within your terminal, use the following commands to create a general purpose Amazon S3 bucket:

> **Important**
>
> When you provide the Amazon S3 URI for your artifact store, ensure the Amazon S3 bucket is in the same Amazon Web Services Region as your tracking server. **Cross-region artifact storage is not supported**.

```
bucket_name=bucket-name
region=valid-region

aws s3api create-bucket \
  --bucket $bucket_name \
  --region $region \
  --create-bucket-configuration LocationConstraint=$region
```

The output should look similar to the following:

```
{
    "Location": "/bucket-name"
}
```

Set up IAM trust policies

Use the following steps to create an IAM trust policy. For more information about roles and trust policies, see Roles terms and concepts in the *Amazon Identity and Access Management User Guide*.

1. Within your terminal, use the following command to create a file called `mlflow-trust-policy.json`.

   ```
   cat <<EOF > /tmp/mlflow-trust-policy.json
   {
        "Version": "2012-10-17",
   ```

```
     "Statement": [
         {
             "Effect": "Allow",
             "Principal": {
                 "Service": [
                      "sagemaker.amazonaws.com"
                 ]
             },
             "Action": "sts:AssumeRole"
         }
     ]
 }
EOF
```

2. Within your terminal, use the following command to create a file called `custom-policy.json`.

```
cat <<EOF > /tmp/custom-policy.json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:Get*",
                "s3:Put*",
                "sagemaker:AddTags",
                "sagemaker:CreateModelPackageGroup",
                "sagemaker:CreateModelPackage",
                "sagemaker:DescribeModelPackageGroup",
                "sagemaker:UpdateModelPackage",
                "s3:List*"
            ],
            "Resource": "*"
        }
    ]
}
EOF
```

3. Use the trust policy file to create a role. Then, attach IAM role policies that allow MLflow to access Amazon S3 and SageMaker Model Registry within your account. MLflow must have access to Amazon S3 for your tracking server's artifact store and SageMaker Model Registry for automatic model registration.

> **Note**
>
> If you are updating an existing role, use the following command instead: `aws iam update-assume-role-policy --role-name $role_name --policy-document file:///tmp/mlflow-trust-policy.json`.

```
role_name=role-name

aws iam  create-role \
  --role-name $role_name \
  --assume-role-policy-document file:///tmp/mlflow-trust-policy.json

aws iam put-role-policy \
  --role-name $role_name \
  --policy-name custom-policy \
  --policy-document file:///tmp/custom-policy.json

role_arn=$(aws iam get-role --role-name  $role_name --query 'Role.Arn' --output
 text)
```

Create MLflow tracking server

Within your terminal, use the `create-mlflow-tracking-server` API to create a tracking server in the Amazon Web Services Region of your choice. This step can take up to 25 minutes.

You can optionally specify the size of your tracking server with the parameter `--tracking-server-config`. Choose between `"Small"`, `"Medium"`, and `"Large"`. The default MLflow Tracking Server configuration size is `"Small"`. You can choose a size depending on the projected use of the tracking server such as the volume of data logged, number of users, and frequency of use. For more information, see MLflow Tracking Server sizes.

The following command creates a new tracking server with automatic model registration enabled. To deactivate automatic model registration, specify `--no-automatic-model-registration`.

After creating your tracking server, you can launch the MLflow UI. For more information, see Launch the MLflow UI using a presigned URL.

> **Note**
>
> It may take up to 25 minutes to complete tracking server creation. If the tracking server takes over 25 minutes to create, check that you have the necessary IAM permissions. For more information on IAM permissions, see Set up IAM permissions for MLflow. When you successfully create a tracking server, it automatically starts.

When you create a tracking server, we recommend specifying the latest version. For information about the available versions, see Tracking server versions.

By default, the tracking server that's created is the latest version. However, we recommend always specifying the latest version explicitly because the underlying MLflow APIs can change.

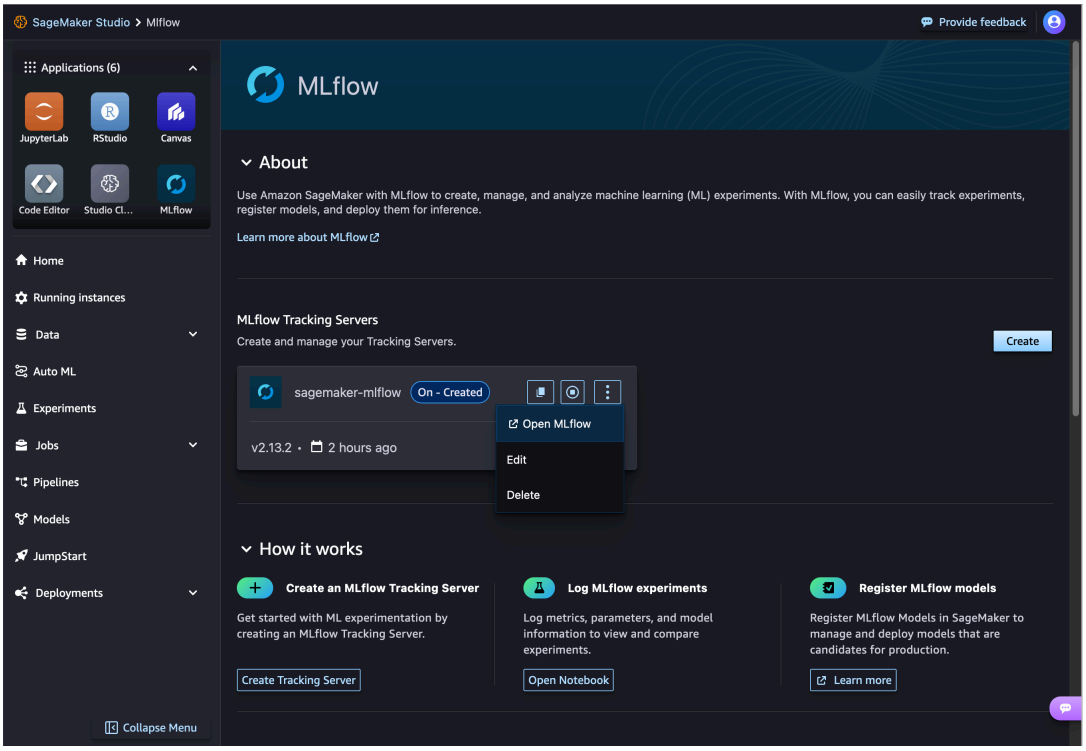
```
ts_name=tracking-server-name
region=valid-region
version=valid-version

aws sagemaker create-mlflow-tracking-server \
 --tracking-server-name $ts_name \
 --artifact-store-uri s3://$bucket_name \
 --role-arn $role_arn \
 --automatic-model-registration \
 --region $region \
 --mlflow-version $version
```

The output should be similar to the following:

```
{
    "TrackingServerArn": "arn:aws:sagemaker:region:123456789012:mlflow-tracking-
server/tracking-server-name"
}
```

> **Important**
>
> **Take note of the tracking server ARN for later use.** You will also need the `$bucket_name` for clean up steps.



Launch the MLflow UI using a presigned URL

You can access the MLflow UI to view your experiments using a presigned URL. You can launch the MLflow UI either through Studio or using the Amazon CLI in a terminal of your choice.

Launch the MLflow UI using Studio

After creating your tracking server, you can launch the MLflow UI directly from Studio.

1. Navigate to Studio from the SageMaker AI console. Be sure that you are using the new Studio experience and have updated from Studio Classic. For more information, see Migration from Amazon SageMaker Studio Classic.
2. Choose **MLflow** in the **Applications** pane of the Studio UI.
3. **(Optional)** If have not already created a tracking server or if you need to create a new one, you can choose **Create**. Then provide a unique tracking server name and S3 URI for artifact storage and create a tracking server. You can optionally choose **Configure** for more granular tracking server customization.
4. Find the tracking server of your choice in the **MLflow Tracking Servers** pane. If the tracking server is **Off**, start the tracking server.
5. Choose the vertical menu icon in the right corner of the tracking server pane. Then, choose **Open MLflow**. This launches a presigned URL in a new tab in your current browser.

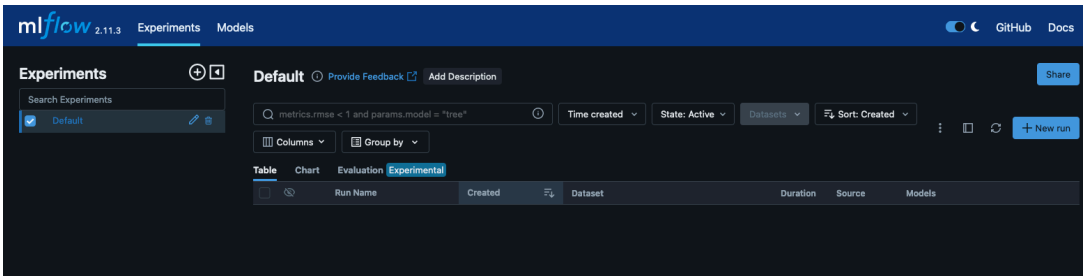
Launch the MLflow UI using the Amazon CLI

You can access the MLflow UI to view your experiments using a presigned URL.

Within your terminal, use the `create-presigned-mlflow-tracking-server-url` API to generate a presigned URL.

```
aws sagemaker create-presigned-mlflow-tracking-server-url \
  --tracking-server-name $ts_name \
  --session-expiration-duration-in-seconds 1800 \
  --expires-in-seconds 300 \
  --region $region
```

The output should look similar to the following:



```
{
    "AuthorizedUrl": "https://unique-key.us-west-2.experiments.sagemaker.aws.a2z.com/
auth?authToken=example_token"
}
```

Copy the entire presigned URL into the browser of your choice. You can use a new tab or a new private window. Press q to exit the prompt.

The `--session-expiration-duration-in-seconds` parameter determines the length of time that your MLflow UI session remains valid. The session duration time is the amount of time that the MLflow UI can be loaded in the browser before a new presigned URL must be created. The minimum session duration is 30 minutes (1800 seconds) and the maximum session duration is 12 hours (43200 seconds). The default session duration is 12 hours if no other duration is specified.

The `--expires-in-seconds parameter` determines the length of time that your presigned URL remains valid. The minimum URL expiration length is 5 seconds and the maximum URL expiration length is 5 minutes (300 seconds). The default URL expiration length is 300 seconds. The presigned URL can be used only once.

The window should look similar to the following.

Use Amazon KMS permissions for MLflow Apps

You can protect your data at rest using encryption for MLflow Apps. By default, MLflow Apps use server-side encryption with an Amazon owned key. SageMaker also supports an option for server-side encryption with a customer managed KMS key.

> **Note**
>
> The customer managed key encrypts the data that SageMaker manages for the MLflow App. It does not encrypt the artifacts you store in your own Amazon S3 artifact store. That Amazon S3 bucket is created and owned by you, not managed by Amazon, so you are responsible for configuring its encryption. To encrypt your artifacts with a customer managed key, set the default encryption on your Amazon S3 bucket. For more information, see Setting default server-side encryption behavior for Amazon S3 buckets in the *Amazon Simple Storage Service User Guide*.

Server-side encryption with Amazon owned keys

By default, MLflow Apps encrypt your data at rest using an Amazon owned key.

Server-side encryption with customer managed KMS keys

As an option, you can use a symmetric customer managed key that you create, own, and manage to replace the existing Amazon owned encryption. Because you have full control of this layer of encryption, you can perform such tasks as:

- Establishing and maintaining key policies
- Establishing and maintaining IAM policies and grants
- Enabling and disabling key policies
- Rotating key cryptographic material
- Adding tags
- Creating key aliases
- Scheduling keys for deletion

For more information, see Customer managed keys in the *Amazon Key Management Service Developer Guide*.

How MLflow Apps use grants in Amazon KMS

To use your customer managed key, your MLflow App requires a grant. When you create an MLflow App encrypted with a customer managed key, SageMaker creates a grant on your behalf by sending a `CreateGrant` request to Amazon KMS. Amazon KMS grants give MLflow Apps access to your customer managed key. When you delete an MLflow App, SageMaker retires the grant.

You can revoke the grant, or remove the service's access to your customer managed key, at any time. Revoking access does not immediately interrupt a running MLflow App. The underlying storage layer continues to use the access granted when the app was created. After you revoke access, SageMaker can no longer use your key for subsequent operations that require it, such as scheduled maintenance. If your key becomes permanently unavailable — for example, if you disable it or schedule it for deletion — your data at rest can no longer be decrypted, and the MLflow App becomes unrecoverable.

Configuring a customer managed KMS key for an MLflow App

You can create a symmetric customer managed key by using the Amazon Web Services Management Console or the Amazon KMS APIs.

You can specify the customer managed key for an MLflow App only at creation time. You cannot change it for the lifetime of the app. MLflow Apps do not support switching an existing app between an Amazon owned key and a customer managed key, or replacing one customer managed key with another. If you want to use a different key, delete the MLflow App and create a new one with the desired encryption configuration.

Creating a symmetric customer managed key

Follow the steps for Creating symmetric encryption KMS keys in the *Amazon Key Management Service Developer Guide*.

Key policy

Key policies control access to your customer managed key. Every customer managed key must have exactly one key policy, which contains statements that determine who can use the key and how they can use it. When you create your customer managed key, you can specify a key policy. For more information, see Determining access to Amazon KMS keys in the *Amazon Key Management Service Developer Guide*.

To use your customer managed key with your MLflow App, your key policy must permit the following API operations. The principal for these operations depends on whether the role is used to create or use the application.

- Creating the application:
  - kms:CreateGrant
  - kms:DescribeKey
- Using the application:
  - No Amazon KMS permissions are required.

The following are policy statement examples you can add for MLflow Apps based on whether the persona is an administrator or a user. For more information about specifying permissions in a policy, see Amazon KMS permissions in the *Amazon Key Management Service Developer Guide*. For more information about troubleshooting, see Troubleshooting key access in the *Amazon Key Management Service Developer Guide*.

Administrator key policy

The following policy can be used for the administrator who is creating MLflow Apps.

```
{
    "Sid": "AllowMLflowAppAdministratorAccess",
    "Effect": "Allow",
    "Principal": {
        "AWS": "arn:aws:iam::111122223333:role/mlflow-app-admin-role"
    },
    "Action": [
        "kms:CreateGrant",
        "kms:DescribeKey"
    ],
    "Resource": "*",
    "Condition": {
        "StringEquals": {
            "kms:ViaService": "sagemaker.region.amazonaws.com"
        },
        "ForAllValues:StringEquals": {
            "kms:GrantOperations": [
                "CreateGrant",
                "Decrypt",
                "DescribeKey",
                "Encrypt",
                "GenerateDataKey",
                "GenerateDataKeyWithoutPlaintext",
                "ReEncryptFrom",
                "ReEncryptTo",
                "RetireGrant"
            ]
        }
    }
}
```

The following list describes the condition keys and encryption context in the preceding policy:

- `kms:ViaService` — Restricts use of the key to requests that originate from SageMaker in a specific Region. With `"kms:ViaService": "sagemaker.region.amazonaws.com"`, the `kms:CreateGrant` and `kms:DescribeKey` permissions can be exercised only when the request is made through SageMaker on your behalf — not directly by any other principal or service. This ensures your key is used only for your MLflow App.
- `kms:GrantOperations` — Constrains the operations that the grant SageMaker creates is allowed to contain. When you create an MLflow App, SageMaker calls `CreateGrant` to allow its data plane to encrypt and decrypt your data at rest. Adding `kms:GrantOperations` to the

`kms:CreateGrant` statement ensures SageMaker can only create a grant containing exactly the operations required for that purpose — `CreateGrant`, `Decrypt`, `DescribeKey`, `Encrypt`, `GenerateDataKey`, `GenerateDataKeyWithoutPlaintext`, `ReEncryptFrom`, `ReEncryptTo`, and `RetireGrant`.

- Encryption context — Not applicable. MLflow Apps do not set a custom encryption context on the grant, so you cannot use the `kms:EncryptionContext` condition key to further scope down access.

User key policy

Accessing an MLflow App — through the MLflow APIs or a presigned URL — does not involve Amazon KMS. SageMaker encrypts and decrypts your data at rest for you, and no Amazon KMS request is made when you access the app. As a result, if you access an MLflow App, you do not need any Amazon KMS permissions. You do not need to account for Amazon KMS access when you define security policies for your users.

Creating a new MLflow App with a customer managed KMS key

To encrypt your MLflow App with a customer managed key, specify the key when you create the app by using the `--kms-key-id` parameter of the `create-mlflow-app` Amazon CLI command. If you omit this parameter, SageMaker uses an Amazon owned key. The role that calls `create-mlflow-app` must have `kms:CreateGrant` and `kms:DescribeKey` permissions on the customer managed key.

```
aws sagemaker create-mlflow-app \
  --name app-name \
  --artifact-store-uri s3://bucket-name \
  --role-arn role-arn \
  --kms-key-id your-kms-key-id \
  --region your-region
```

For more information about creating an MLflow App, see the section called “Create MLflow App”.

Monitoring MLflow Apps interaction with Amazon KMS

You can use CloudTrail to track the requests that are made to Amazon KMS on your behalf when your MLflow App uses a customer managed key. For more information about finding and interpreting Amazon KMS events in CloudTrail, see Logging Amazon KMS API calls with CloudTrail in the *Amazon Key Management Service Developer Guide*.

The following Amazon KMS CloudTrail events are recorded for an MLflow App encrypted with a customer managed key:

- `DescribeKey` and `CreateGrant` — Recorded when you create an MLflow App. SageMaker validates your key and creates the grant that allows your data at rest to be encrypted and decrypted on your behalf.
- `GenerateDataKeyWithoutPlaintext`, `Encrypt`, and `Decrypt` — Recorded while the MLflow App is being provisioned and while it operates. The SageMaker underlying storage layer uses your customer managed key to encrypt and decrypt your data at rest. These requests are made by Amazon services acting on your behalf through the grant, so the CloudTrail `userIdentity` element shows an Amazon service as the caller rather than an IAM principal from your account.
- `RetireGrant` — Recorded when you delete an MLflow App. The grants created for the app are retired so that your customer managed key can no longer be used for it.

Integrate MLflow with your environment

The following page describes how to get started with the MLflow SDK and the Amazon MLflow plugin within your development environment. This can include local IDEs or a Jupyter Notebook environment within Studio or Studio Classic.

Amazon SageMaker AI uses an MLflow plugin to customize the behavior of the MLflow Python client and integrate Amazon tooling. The Amazon MLflow plugin authenticates API calls made with MLflow using Amazon Signature Version 4. The Amazon MLflow plugin allows you to connect to your MLflow tracking server using the tracking server ARN. For more information about plugins, see Amazon MLflow plugin and MLflow plugins.

> **Important**
>
> Your user IAM permissions within your development environment must have access to any relevant MLflow API actions to successfully run provided examples. For more information, see Set up IAM permissions for MLflow.

For more information about using the MLflow SDK, see Python API in the MLflow documentation.

Install MLflow and the Amazon MLflow plugin

Within your development environment, install both MLflow and the Amazon MLflow plugin.

```
pip install sagemaker-mlflow
```

To ensure compatibility between your MLflow client and tracking server, use the corresponding MLflow version based on your tracking server version:

- For tracking server 2.13.x, use `mlflow==2.13.2`
- For tracking server 2.16.x, use `mlflow==2.16.2`
- For tracking server 3.0.x, use `mlflow==3.0.0`

To see which versions of MLflow are available to use with SageMaker AI, see Tracking server versions.

Connect to your MLflow Tracking Server

Use `mlflow.set_tracking_uri` to connect to a your tracking server from your development environment using its ARN:

```
import mlflow

arn = "YOUR-TRACKING-SERVER-ARN"

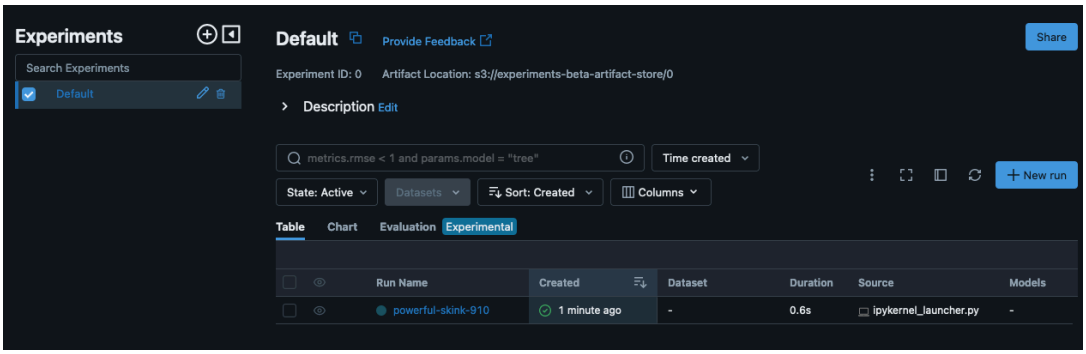
mlflow.set_tracking_uri(arn)
```

Log metrics, parameters, and MLflow models during training

After connecting to your MLflow Tracking Server, you can use the MLflow SDK to log metrics, parameters, and MLflow models.

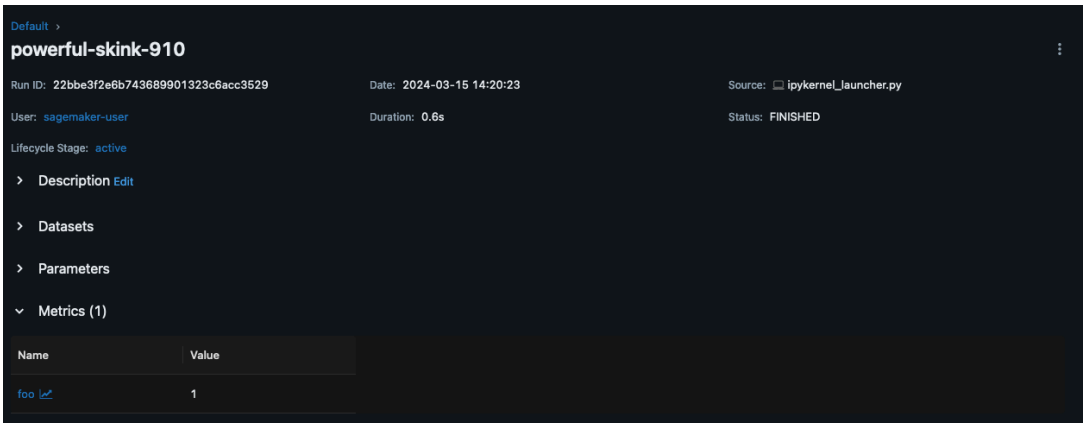
Log training metrics

Use `mlflow.log_metric` within an MLflow training run to track metrics. For more information about logging metrics using MLflow, see `mlflow.log_metric`.



```
with mlflow.start_run():
    mlflow.log_metric("foo", 1)

print(mlflow.search_runs())
```



This script should create an experiment run and print out an output similar to the following:

```
run_id experiment_id status artifact_uri ... tags.mlflow.source.name tags.mlflow.user
 tags.mlflow.source.type tags.mlflow.runName
0 607eb5c558c148dea176d8929bd44869 0 FINISHED s3://
dddd/0/607eb5c558c148dea176d8929bd44869/a... ... file.py user-id LOCAL experiment-code-
name
```

Within the MLflow UI, this example should look similar to the following:

Choose **Run Name** to see more run details.

Log parameters and models

> **Note**
>
> The following example requires your environment to have `s3:PutObject` permissions. This permission should be associated with the IAM Role that the MLflow SDK user assumes when they log into or federate into their Amazon account. For more information, see User and role policy examples.

The following example takes you through a basic model training workflow using SKLearn and shows you how to track that model in an MLflow experiment run. This example logs parameters, metrics, and model artifacts.

```
import mlflow

from mlflow.models import infer_signature

import pandas as pd
from sklearn import datasets
from sklearn.model_selection import train_test_split
from sklearn.linear_model import LogisticRegression
from sklearn.metrics import accuracy_score, precision_score, recall_score, f1_score

# This is the ARN of the MLflow Tracking Server you created
mlflow.set_tracking_uri(your-tracking-server-arn)
mlflow.set_experiment("some-experiment")

# Load the Iris dataset
X, y = datasets.load_iris(return_X_y=True)

# Split the data into training and test sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2,
 random_state=42)

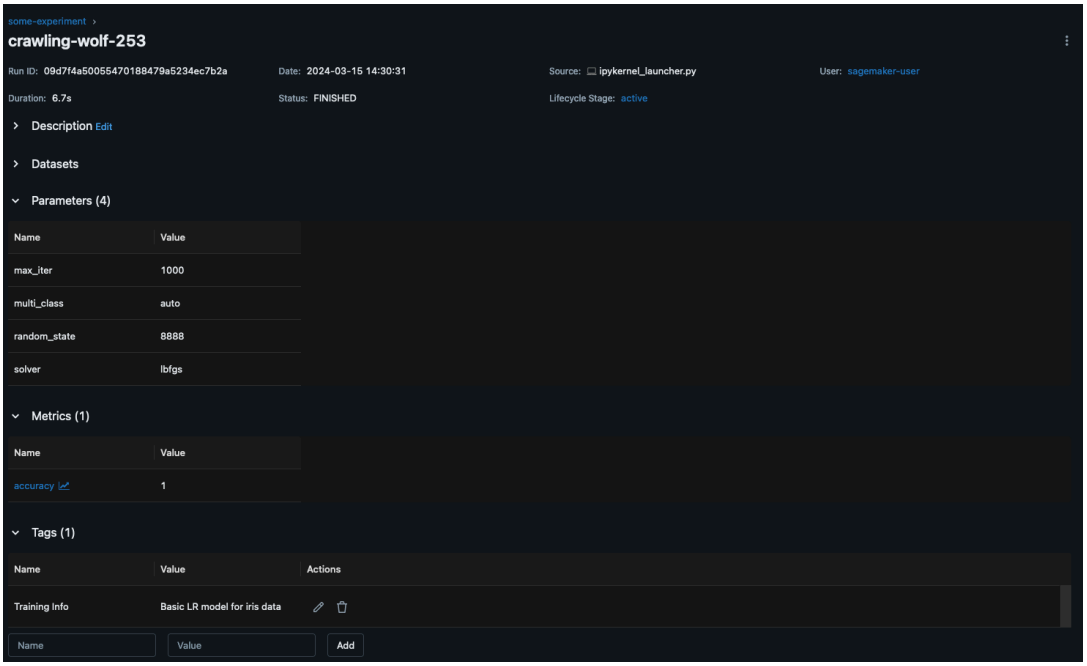
# Define the model hyperparameters
params = {"solver": "lbfgs", "max_iter": 1000, "multi_class": "auto", "random_state":
 8888}

# Train the model
lr = LogisticRegression(**params)
lr.fit(X_train, y_train)

# Predict on the test set
y_pred = lr.predict(X_test)

# Calculate accuracy as a target loss metric
accuracy = accuracy_score(y_test, y_pred)

# Start an MLflow run and log parameters, metrics, and model artifacts
with mlflow.start_run():
    # Log the hyperparameters
    mlflow.log_params(params)
```



```
    # Log the loss metric
    mlflow.log_metric("accuracy", accuracy)

    # Set a tag that we can use to remind ourselves what this run was for
    mlflow.set_tag("Training Info", "Basic LR model for iris data")

    # Infer the model signature
    signature = infer_signature(X_train, lr.predict(X_train))

    # Log the model
    model_info = mlflow.sklearn.log_model(
        sk_model=lr,
        name="iris_model", # Changed from artifact_path to name for MLflow 3.0
        signature=signature,
        input_example=X_train,
        registered_model_name="tracking-quickstart",
    )
```

Within the MLflow UI, choose the experiment name in the left navigation pane to explore all associated runs. Choose the **Run Name** to see more information about each run. For this example, your experiment run page for this run should look similar to the following.

This example logs the logistic regression model. Within the MLflow UI, you should also see the logged model artifacts.

Automatically register SageMaker AI models with SageMaker Model Registry

When you register an MLflow model, SageMaker AI automatically creates a corresponding Model Package Group and Model Package version in the SageMaker Model Registry. This enables you to:

- Register models from the MLflow SDK or the MLflow UI.
- Attach an inference specification to enable direct deployment to SageMaker AI endpoints.
- Log evaluation metrics that are included as a model card in the Model Package.
- Manage model lifecycle stages (staging, production) and statuses (pending, active) through MLflow aliases.
- Control lifecycle transitions and registration with IAM condition keys and resource tag-based policies.

> **Note**
>
> Model Registry sync is an opt-in feature. To enable it, call the UpdateMlflowTrackingServer or UpdateMlflowApp API with Model Registry sync enabled.

Warning

When automatic model registration is enabled, MLflow registered models are synced into a SageMaker Model Package Group with the following name: *`mlflow-registered-model-name-suffix`*, where *`suffix`* is the first six characters of the SHA-256 hash of the last segment of the tracking server or MLflow App ARN (the tracking server name or the MLflow App ID).
A pre-existing group with the same name might have been created by a different authorized IAM principal for that account, and the data synced into that group is accessible to that IAM principal. To avoid accidentally syncing registered model data to a pre-existing group, you can verify that a SageMaker Model Package Group with such a name does not already exist by calling the DescribeModelPackageGroup API and checking the `CreatedBy` field.

Log and register models

This section covers how to prepare a model for registration, register it with the SageMaker Model Registry, and view it in Studio.

Required IAM permissions

The MLflow tracking server or MLflow App IAM service role must have the following permissions to register models:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateModelPackageGroup",
                "sagemaker:DescribeModelPackageGroup",
                "sagemaker:CreateModelPackage",
                "sagemaker:UpdateModelPackage",
                "sagemaker:AddTags",
                "sagemaker:CreateAction",
                "sagemaker:AddAssociation"
            ],
            "Resource": "*"
        },
```

```
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:PutObject",
                "s3:ListBucket"
            ],
            "Resource": "*"
        }
    ]
}
```

For more information about setting up IAM roles for MLflow Apps, see Set up IAM permissions for MLflow Apps.

Prepare a model for registration

Before registering a model, you log it during a training run. You can optionally attach an inference specification and evaluation metrics, which are carried forward to the SageMaker AI Model Package upon registration.

Log a model

Use the MLflow SDK to log a model during a training run:

```
import mlflow
from sklearn.datasets import make_regression
from sklearn.ensemble import RandomForestRegressor
from mlflow.models import infer_signature

mlflow.set_tracking_uri(arn)
mlflow.set_experiment("my-experiment")

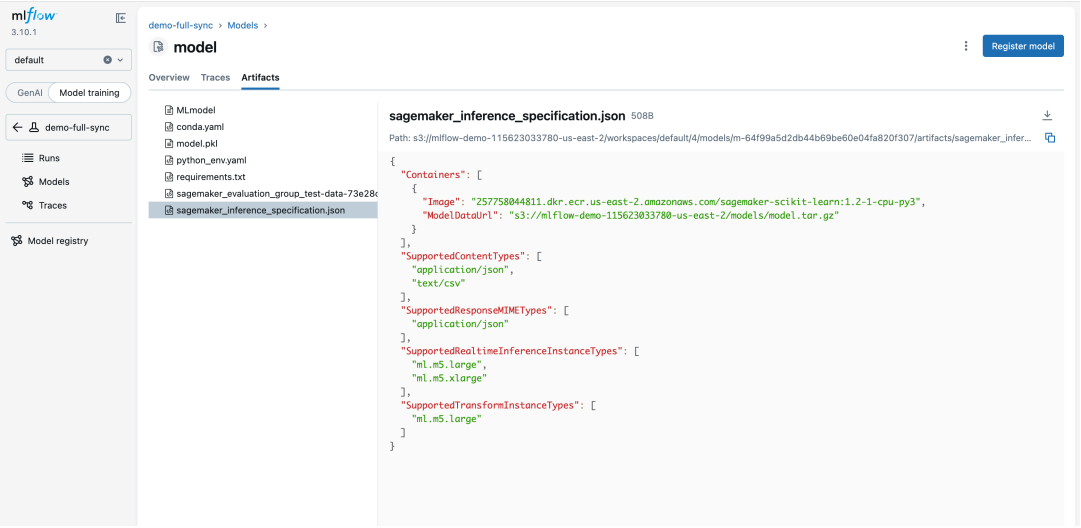
params = {"n_estimators": 3, "random_state": 42}
X, y = make_regression(n_features=4, n_informative=2, random_state=0, shuffle=False)

with mlflow.start_run() as run:
    model = RandomForestRegressor(**params).fit(X, y)
    signature = infer_signature(X, model.predict(X))
    mlflow.log_params(params)
    model_info = mlflow.sklearn.log_model(
        model, name="sklearn-model", signature=signature, input_example=X[:3]
    )
```

Log an inference specification (optional)

An inference specification defines the container image and instance types required to deploy your model. When attached to a logged model before registration, the inference specification is automatically included in the SageMaker AI Model Package. This enables direct deployment to a SageMaker AI endpoint from the Model Registry without additional configuration.

Use `sagemaker_mlflow.log_inference_specification()` to attach an inference specification:



```
import sagemaker_mlflow

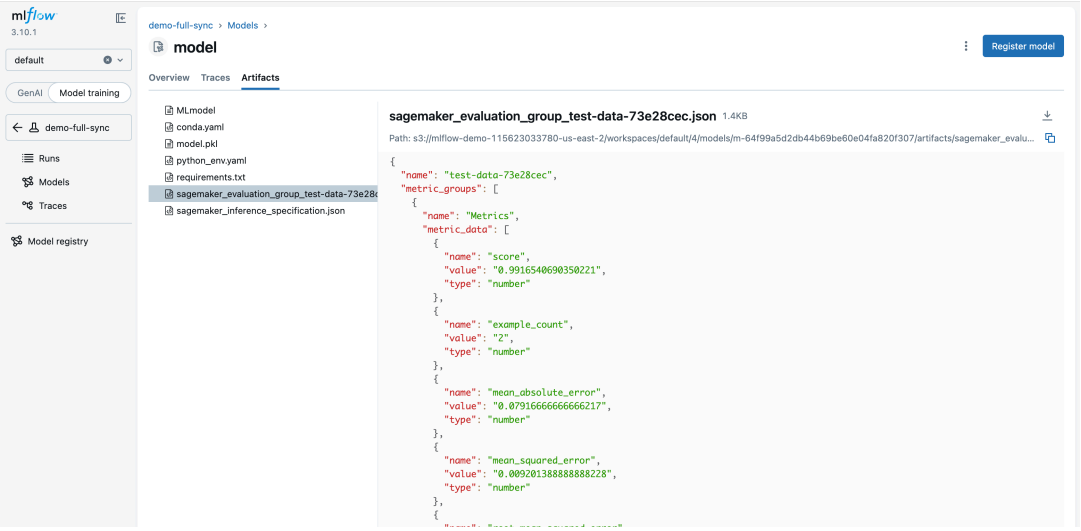
# Get the logged model's artifact location
logged_model = mlflow.MlflowClient().get_logged_model(model_info.model_id)

inference_spec = {
    "Containers": [{
        "Image": "763104351884.dkr.ecr.us-west-2.amazonaws.com/pytorch-inference:2.0.0-cpu-py310",
        "ModelDataSource": {
            "S3DataSource": {
                "S3Uri": logged_model.artifact_location + "/",
                "S3DataType": "S3Prefix",
                "CompressionType": "None",
            }
        },
    }],
    "SupportedRealtimeInferenceInstanceTypes": ["ml.m5.xlarge"],
}
sagemaker_mlflow.log_inference_specification(
    model_info.model_id,
    inference_specification=inference_spec
)
```

> **Note**
>
> The inference specification must follow the same schema as the `InferenceSpecification` parameter of the SageMaker AI `CreateModelPackage` API. For more information, see InferenceSpecification in the SageMaker AI API Reference.

After logging, the inference specification is stored as a `sagemaker_inference_specification.json` artifact alongside your model:

Log evaluation metrics (optional)



Evaluation metrics provide a standardized summary of your model's performance. When logged before registration, evaluation results are included in the SageMaker AI Model Package as a model card, making metrics visible in the SageMaker AI Model Registry and Studio. For more information about model cards, see Model card schema.

Use `sagemaker_mlflow.evaluate()` to log evaluation metrics:

```
import sagemaker_mlflow
import pandas as pd

eval_df = pd.DataFrame(X, columns=["f1", "f2", "f3"])
eval_df["target"] = y
dataset = mlflow.data.from_pandas(
    eval_df, source="s3://my-bucket/eval.csv", name="eval_set", targets="target"
)
sagemaker_mlflow.evaluate(model_info, data=dataset, model_type="regressor")
```

After logging, the evaluation group is stored as an artifact alongside your model:

Register models using the SDK

Use `mlflow.register_model()` to register a model with the SageMaker Model Registry. This automatically creates a Model Package Group (if one does not exist) and a Model Package version in SageMaker AI.

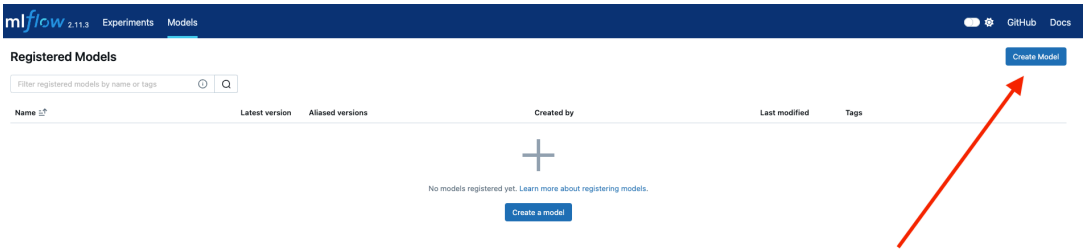
```
model_uri = f"runs:/{run.info.run_id}/sklearn-model"
mv = mlflow.register_model(model_uri, "MyRegisteredModel")

print(f"Name: {mv.name}")
print(f"Version: {mv.version}")
```

You can also use `create_registered_model` to create the Model Package Group before registering versions:

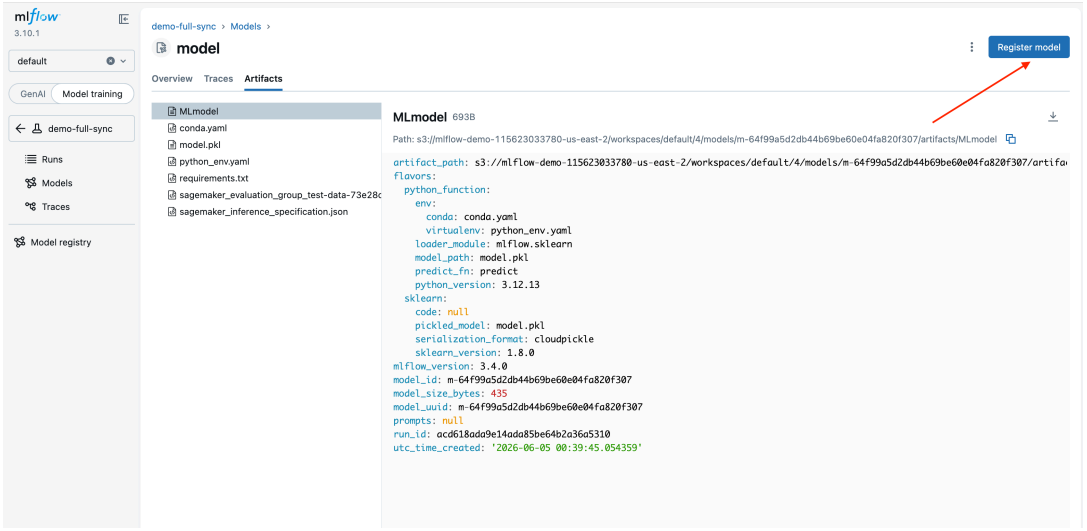
```
from mlflow import MlflowClient

client = MlflowClient()
client.create_registered_model("MyRegisteredModel", tags={"team": "ml-platform"})
```



After registration, the model version is tagged with the SageMaker AI Model Package ARN. You can retrieve it as follows:

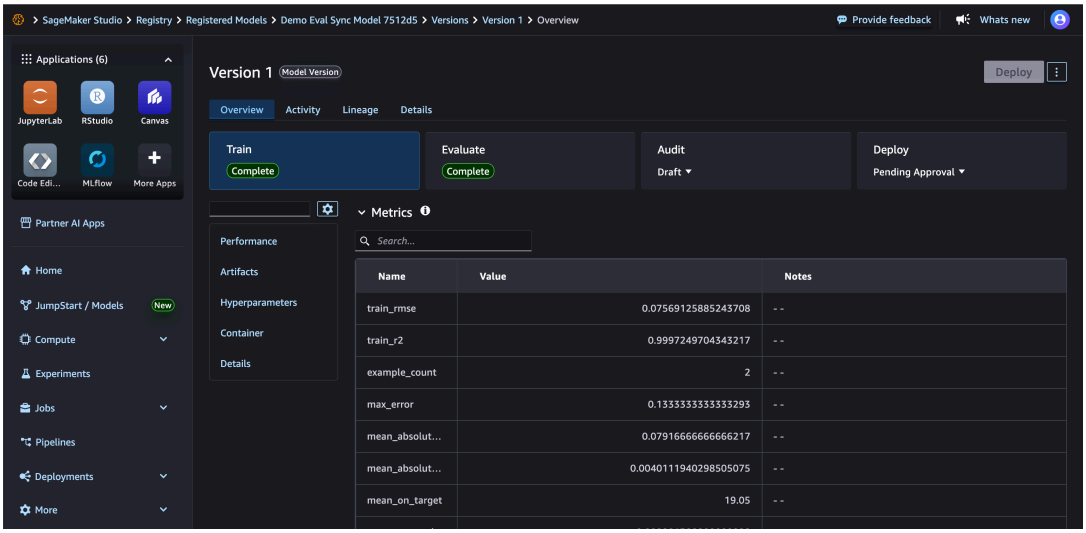
```
mv = client.get_model_version("MyRegisteredModel", mv.version)
sm_arn = mv.tags["sagemaker.model_package_arn"]
print(f"SageMaker Model Package ARN: {sm_arn}")
```



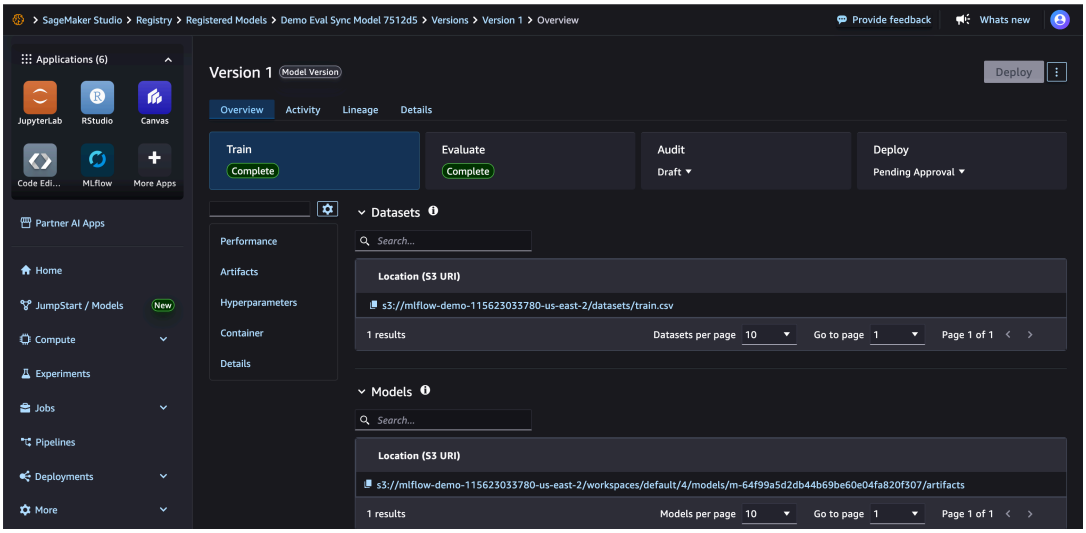
> **Note**
>
> Do not use spaces in a model name. While MLflow supports model names with spaces, SageMaker AI Model Package does not. The registration process fails if you use spaces in your model name.

Register models using the MLflow UI

You can register a model with the SageMaker Model Registry directly in the MLflow UI. Within the **Models** menu, choose **Create Model**. Models created this way are automatically added to the SageMaker Model Registry.

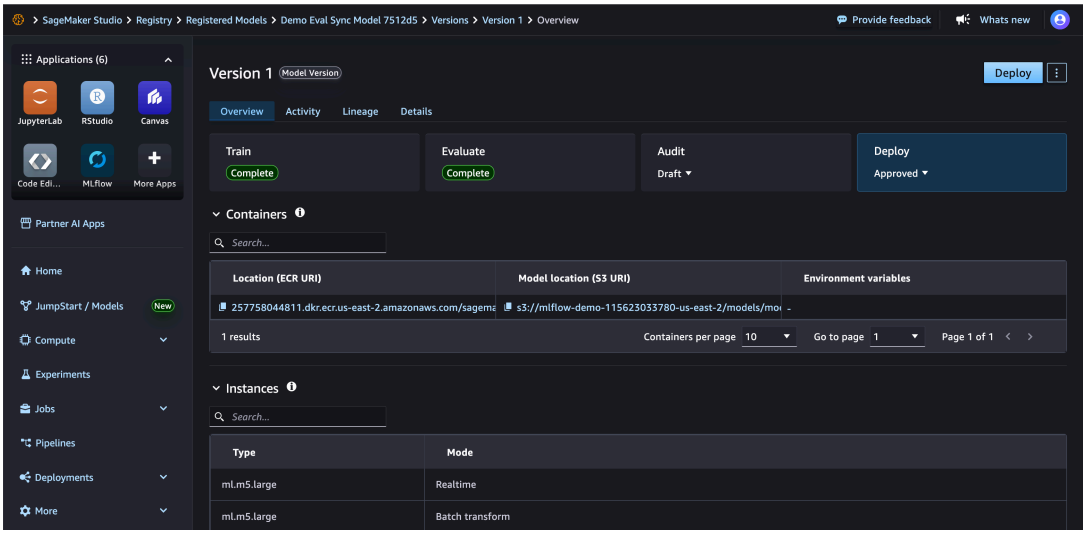


After logging a model during experiment tracking, navigate to the run page in the MLflow UI. Choose the **Artifacts** pane and choose **Register model** to register the model version in both MLflow and SageMaker Model Registry.

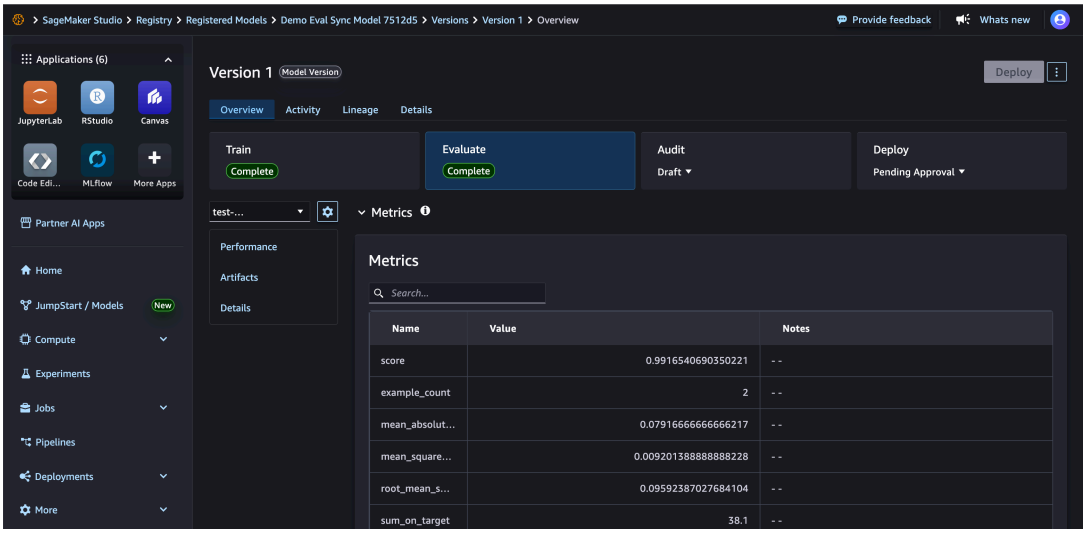


View registered models in Studio

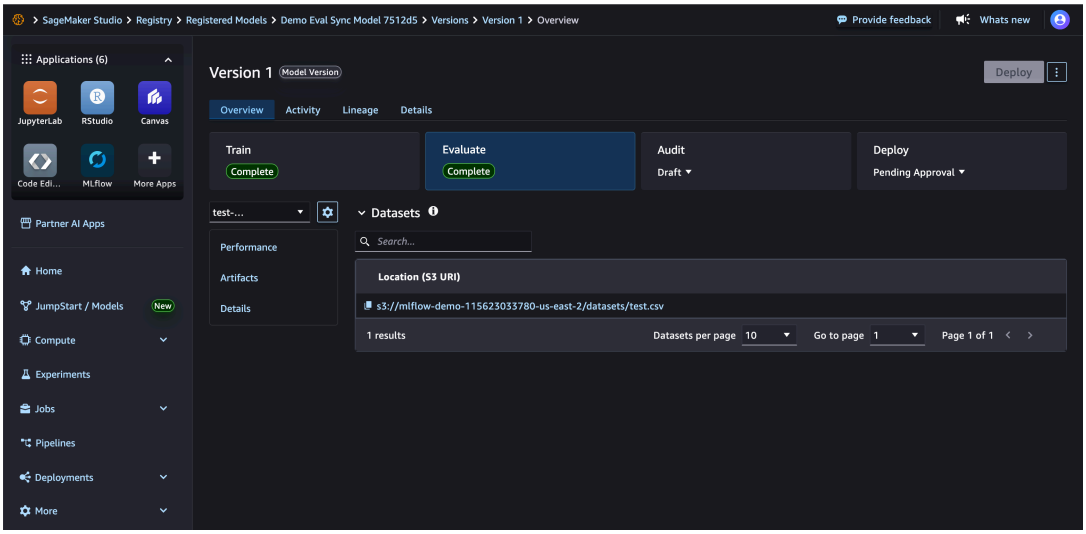
Within Studio, choose **Models** on the left navigation pane to view your registered models. For more information on getting started with Studio, see Launch Amazon SageMaker Studio.



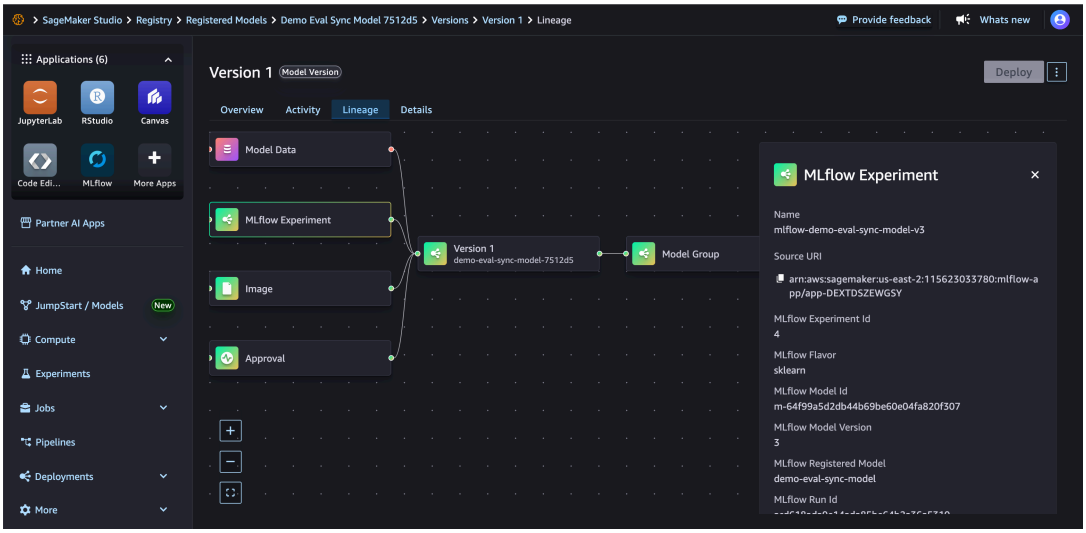
The Model Package version page in Studio displays training metrics and datasets that were synced from MLflow:



The **Train** tab also shows the training dataset location and model artifact path:



If you logged an inference specification, the **Container** section shows the container image, model data location, and supported instance types. The **Deploy** stage shows **Approved**, indicating the model is ready for deployment:



If you logged evaluation metrics, the **Evaluate** tab displays performance metrics such as score, mean absolute error, and root mean squared error:

The **Evaluate** tab also shows the evaluation dataset location:

The **Lineage** tab shows the relationship between the MLflow experiment, model version, container image, and the Model Package Group:

Limitations

- Do not use spaces in model names. SageMaker AI Model Package does not support spaces, and the registration fails.
- If the role is missing `s3:GetObject` permission on the artifact paths, inference specification and evaluation artifacts are silently skipped. The Model Package is still created but without inference or evaluation data.
- If the role is missing `sagemaker:CreateAction` or `sagemaker:AddAssociation`, lineage associations between the MLflow model and the SageMaker AI Model Package are silently skipped. This does not affect registration or lifecycle management.

- Setting a lifecycle stage and status does not enable the **Deploy** button in Studio. To enable one-click deployment from the UI, you must separately set the Model Package approval status to `Approved` using the SageMaker AI API.
- Changes to the MLflow App IAM service role permissions can take up to 15 minutes to take effect.

Manage model lifecycle stages

After registering a model, you can manage its lifecycle stage and status in the SageMaker AI Model Registry by setting MLflow model version aliases. When you set an alias using the lifecycle naming convention, the corresponding SageMaker AI Model Package lifecycle is automatically updated. For more information about model lifecycle stages, see Stage models in the Model Registry.

IAM permissions for lifecycle management

The MLflow tracking server or MLflow App IAM service role requires `sagemaker:UpdateModelPackage` permission to manage lifecycle stages. This action is already included in the base registration permissions described above.

Restrict lifecycle transitions

You can use IAM condition keys to control which lifecycle transitions a role is allowed to perform:

- `sagemaker:ModelLifeCycle:stage` — The lifecycle stage being set. Values: `staging`, `production`.
- `sagemaker:ModelLifeCycle:stageStatus` — The lifecycle status being set. Values: `pending`, `active`.

Example: Deny production promotions

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "sagemaker:UpdateModelPackage",
            "Resource": "*",
            "Condition": {
                "StringEquals": {
```

```
                    "sagemaker:ModelLifeCycle:stage": "production"
                }
            }
        }
    ]
}
```

Example: Allow only staging/pending transitions

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "sagemaker:UpdateModelPackage",
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "sagemaker:ModelLifeCycle:stage": "staging",
                    "sagemaker:ModelLifeCycle:stageStatus": "pending"
                }
            }
        }
    ]
}
```

When a lifecycle transition is denied by IAM policy, the MLflow alias operation fails and returns an error to the caller.

For more information about model lifecycle in SageMaker AI Model Registry, see Deploy a Model from the Registry.

Set lifecycle stages using the SDK

Use the following alias format to set the lifecycle stage and status:

```
sagemakerlifecycle-stage-status
```

Supported stages: `staging`, `production`

Supported statuses: `pending`, `active`

> **Note**
>
> Stage and status values must be lowercase. MLflow aliases only support lowercase characters, so values such as `Production` or `Active` are not valid.

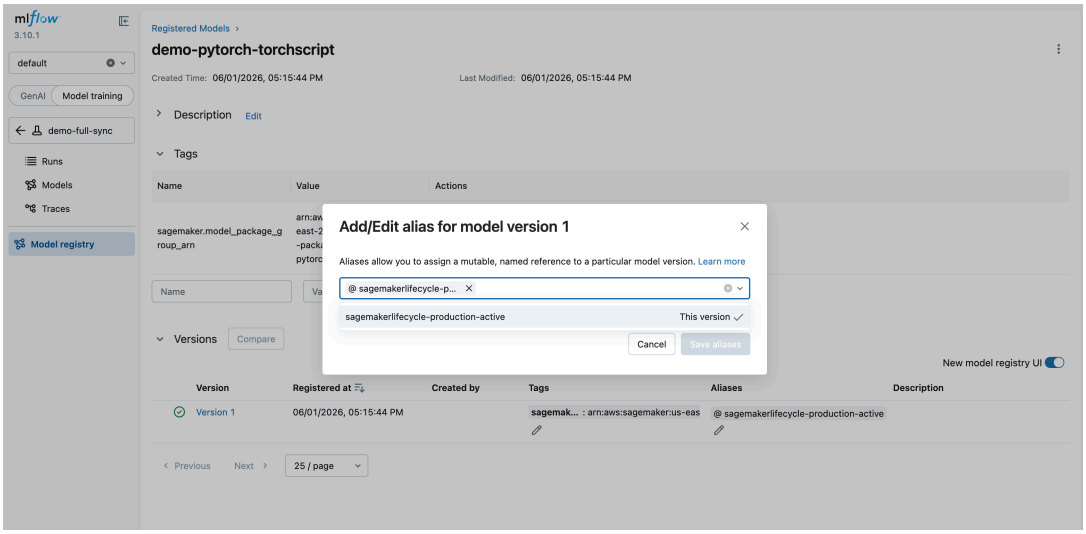
```
import mlflow

mlflow.set_tracking_uri(arn)
client = mlflow.MlflowClient()

# Set lifecycle to staging/pending
client.set_registered_model_alias("MyRegisteredModel", "sagemakerlifecycle-staging-
pending", version)

# Promote to production/active
client.set_registered_model_alias("MyRegisteredModel", "sagemakerlifecycle-production-
active", version)
```

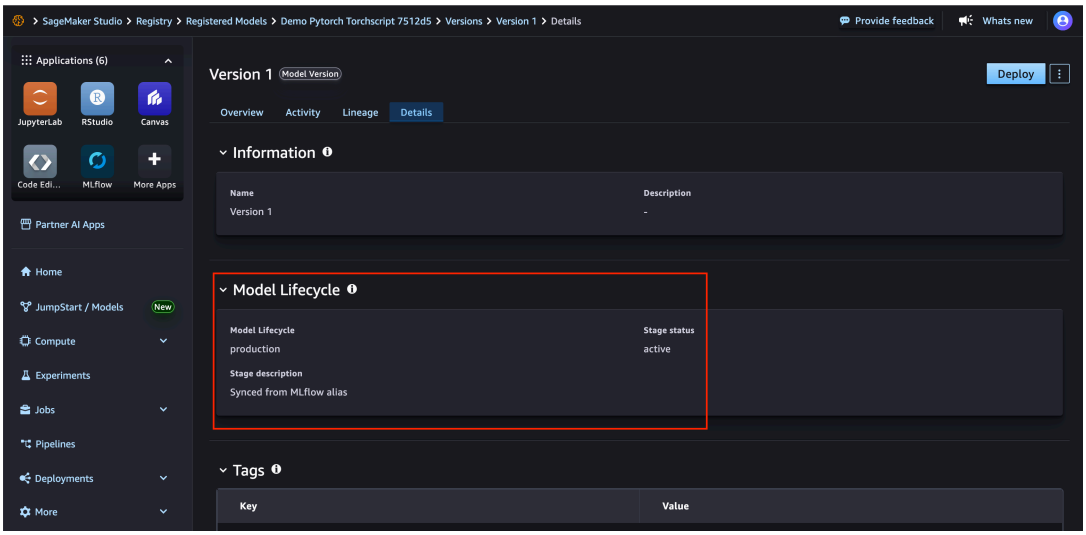
You can verify the lifecycle state by describing the SageMaker AI Model Package:



```
import boto3

sm = boto3.client("sagemaker")
mv = client.get_model_version("MyRegisteredModel", version)
sm_arn = mv.tags["sagemaker.model_package_arn"]

desc = sm.describe_model_package(ModelPackageName=sm_arn)
print(desc["ModelLifeCycle"]["Stage"])       # "staging"
print(desc["ModelLifeCycle"]["StageStatus"]) # "pending"
```



Set lifecycle stages using the MLflow UI

In the MLflow UI, navigate to the model version page. Under **Aliases**, add an alias using the `sagemakerlifecycle-`*`stage`*`-`*`status`* format. The SageMaker AI Model Package lifecycle is automatically updated when the alias is saved.

View lifecycle stages in Studio

In Studio, navigate to **Models** and select a Model Package version. The lifecycle stage and status are displayed on the **Details** tab under **Model Lifecycle**.

Prevent updates to registered models using resource tags

You can use IAM resource tag-based conditions to prevent the MLflow tracking server or MLflow App role from modifying specific Model Package Groups or Model Package versions. This allows you to lock individual models from being updated through MLflow after they reach a certain state.

For example, the following policy denies `UpdateModelPackage` on any Model Package that has the tag `locked=true`:

```
{
```

```
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "sagemaker:UpdateModelPackage",
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/locked": "true"
                }
            }
        }
    ]
}
```

When this policy is attached to the tracking server or MLflow App role, any attempt to update the lifecycle of a tagged Model Package from MLflow fails with an access denied error.

You can similarly restrict `CreateModelPackage` on a Model Package Group to prevent new versions from being registered:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "sagemaker:CreateModelPackage",
            "Resource": "arn:aws:sagemaker:region:account:model-package-group/group-name/*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceTag/frozen": "true"
                }
            }
        }
    ]
}
```

Note

Resource tag-based conditions rely on tags that are applied to the SageMaker AI Model Package Group or Model Package resource (not the MLflow model). You can apply these

tags through the SageMaker AI console, CLI, or SDK. Tag-based conditions may take up to 15 minutes to propagate after a tag is applied.

Deploy MLflow models with `ModelBuilder`

You can deploy MLflow models to a SageMaker AI endpoint using Amazon SageMaker AI Model Builder. For more information about Amazon SageMaker AI Model Builder, see Create a model in Amazon SageMaker AI with ModelBuilder.

`ModelBuilder` is a Python class that takes a framework model or a user-specified inference specification and converts it to a deployable model. For more details about the `ModelBuilder` class, see ModelBuilder.

To deploy your MLflow model using `ModelBuilder`, provide a path to your MLflow artifacts in the `model_metadata["MLFLOW_MODEL_PATH"]` attribute. Read on for more information about valid model path input formats:

Note

If you provide your model artifact path in the form of an MLflow run ID or MLflow model registry path, then you must also specify your tracking server ARN through the `model_metadata["MLFLOW_TRACKING_ARN"]` attribute.

- Model paths that require an ARN in the `model_metadata`
- Model paths that do not require an ARN in the `model_metadata`

Model paths that require an ARN in the `model_metadata`

The following model paths do require that you specify an ARN in the `model_metadata` for deployment:

- MLflow run ID: *`runs:/aloy-run-id/run-relative/path/to/model`*
- MLflow model registry path: *`models:/model-name/model-version`*

Model paths that do not require an ARN in the `model_metadata`

The following model paths do not require that you specify an ARN in the `model_metadata` for deployment:

- Local model path: */Users/me/path/to/local/model*
- Amazon S3 model path: *s3://amzn-s3-demo-bucket/path/to/model*
- Model package ARN: *arn:aws:sagemaker:region:account-id:mlflow-tracking-server/tracking-server-name*

For more information on how MLflow model deployment works with Amazon SageMaker AI, see Deploy MLflow Model to Amazon SageMaker AI in the MLflow documentation.

If using an Amazon S3 path, you can find the path of your registered model with the following commands:

```
registered_model = client.get_registered_model(name='AutoRegisteredModel')
source_path = registered_model.latest_versions[0].source
```

The following sample is an overview of how to deploy your MLflow model using `ModelBuilder` and an MLflow model registry path. Because this sample provides the model artifact path in the form of an MLflow model registry path, the call to `ModelBuilder` must also specify a tracking server ARN through the `model_metadata["MLFLOW_TRACKING_ARN"]` attribute.

Important

You must use version 2.224.0 or later of the SageMaker Python SDK to use `ModelBuilder`.

Note

Use the following code example for reference. For end-to-end examples that show you how to deploy registered MLflow models, see MLflow tutorials using example Jupyter notebooks.

```
from sagemaker.serve import ModelBuilder
from sagemaker.serve.mode.function_pointers import Mode
```

```
from sagemaker.serve import SchemaBuilder

my_schema = SchemaBuilder(
    sample_input=sample_input,
    sample_output=sample_output
)

model_builder = ModelBuilder(
    mode=Mode.SAGEMAKER_ENDPOINT,
    schema_builder=my_schema,
    role_arn="Your-service-role-ARN",
    model_metadata={
        # both model path and tracking server ARN are required if you use an mlflow run
 ID or mlflow model registry path as input
        "MLFLOW_MODEL_PATH": "models:/sklearn-model/1"
        "MLFLOW_TRACKING_ARN": "arn:aws:sagemaker:region:account-id:mlflow-tracking-
server/tracking-server-name"
    }
)
model = model_builder.build()
endpoint = model_builder.deploy(endpoint_name="my-endpoint",
 instance_type="ml.c6i.xlarge")
```

To maintain lineage tracking for MLflow models deployed using `ModelBuilder`, you must have the following IAM permissions:

- `sagemaker:CreateArtifact`
- `sagemaker:ListArtifacts`
- `sagemaker:AddAssociation`
- `sagemaker:DescribeMLflowTrackingServer`

> **Important**
>
> Lineage tracking is optional. Deployment succeeds without the permissions related to lineage tracking. If you do not have the permissions configured, you will see a lineage tracking permissions error when calling `model.deploy()`. However, the endpoint deployment still succeeds and you can directly interact with your model endpoint. If the permissions above are configured, lineage tracking information is automatically created and stored.

For more information and end-to-end examples, see MLflow tutorials using example Jupyter notebooks.

MLflow tutorials using example Jupyter notebooks

The following tutorials demonstrate how to integrate MLflow experiments into your training workflows. To clean up resources created by a notebook tutorial, see Clean up MLflow resources.

You can run SageMaker AI example notebooks using JupyterLab in Studio. For more information on JupyterLab, see JupyterLab user guide.

Explore the following example notebooks:

- SageMaker Training with MLflow — Train and register a Scikit-Learn model using SageMaker AI in script mode. Learn how to integrate MLflow experiments into your training script. For more information on model training, see Train a Model with Amazon SageMaker AI.
- SageMaker AI HPO with MLflow — Learn how to track your ML experiment in MLflow with Amazon SageMaker AI automatic model tuning (AMT) and the SageMaker AI Python SDK. Each training iteration is logged as a run within the same experiment. For more information about hyperparameter optimization (HPO), see Perform Automatic Model Tuning with Amazon SageMaker AI.
- SageMaker Pipelines with MLflow — Use Amazon SageMaker Pipelines and MLflow to train, evaluate and register a model. This notebook uses the `@step` decorator to build a SageMaker AI Pipeline. For more information on pipelines and the `@step` decorator, see Create a pipeline with `@step`-decorated functions.
- Deploy an MLflow Model to SageMaker AI — Train a decision tree model using SciKit-Learn. Then, use Amazon SageMaker AI `ModelBuilder` to deploy the model to a SageMaker AI endpoint and run inference using the deployed model. For more information about `ModelBuilder`, see Deploy MLflow models with `ModelBuilder`.

Troubleshoot common setup issues

Explore common troubleshooting issues.

Could not find executable named 'groff'

When using the Amazon CLI, you might encounter the following error: `Could not find executable named 'groff'`.

If using a Mac, you can resolve this issue with the following command:

```
brew install groff
```

On a Linux machine, use the following commands:

```
sudo apt-get update -y
sudo apt-get install groff -y
```

Command not found: jq

When creating your AuthZ permission policy JSON file, you might encounter the following error: `jq: command not found`.

If using a Mac, you can resolve this issue with the following command:

```
brew install jq
```

On a Linux machine, use the following commands:

```
sudo apt-get update -y
sudo apt-get install jq -y
```

Amazon MLflow plugin installation speeds

Installing the Amazon MLflow plugin can take several minutes when using a Mac Python environment.

UnsupportedModelRegistryStoreURIException

If you see the `UnsupportedModelRegistryStoreURIException`, do the following:

1. Restart your Jupyter notebook Kernel.
2. Reinstall the Amazon MLflow plugin:

   ```
   !pip install --force-reinstall sagemaker-mlflow
   ```

Unsupported MLflow features

Some features available in open source MLflow are not supported in Amazon SageMaker AI managed MLflow.

The following features are currently not supported:

- **MLflow AI Gateway** – The MLflow AI Gateway for managing connections to LLM providers is not available.
- **LLM Judges and Scorers** – Built-in judges and custom judges are not supported. Code-based scorers continue to work as expected.
- **Prompt Optimization** – Automatic prompt optimization is not available.
- **OpenTelemetry Integration** – The OTEL-compatible traces ingestion endpoint is not available.

If you attempt to use these features, you may encounter missing UI elements or unexpected errors. This is expected behavior in the Amazon SageMaker AI managed environment.

Clean up MLflow resources

We recommend deleting any resources when you no longer need them. You can delete tracking servers through Amazon SageMaker Studio or using the Amazon CLI. You can delete additional resources such as Amazon S3 buckets, IAM roles, and IAM policies using the Amazon CLI or directly in the Amazon console.

> **Important**
>
> Don't delete the IAM role that you've used to create until you've deleted the tracking server itself. Otherwise, you'll lose access to the tracking server.

Stop tracking servers

We recommend stopping your tracking server when it is no longer in use. You can stop a tracking server in Studio or using the Amazon CLI.

Stop a tracking server using Studio

To stop a tracking server in Studio:

1. Navigate to Studio.
2. Choose **MLflow** in the **Applications** pane of the Studio UI.
3. Find the tracking server of your choice in the **MLflow Tracking Servers** pane. Choose the **Stop** icon in the right corner of the tracking server pane.

> **Note**
>
> If your tracking server is **Off**, you see the **Start** icon. If the tracking server is **On**, you see the **Stop** icon.

Stop a tracking server using the Amazon CLI

To stop the tracking server using the Amazon CLI, use the following command:

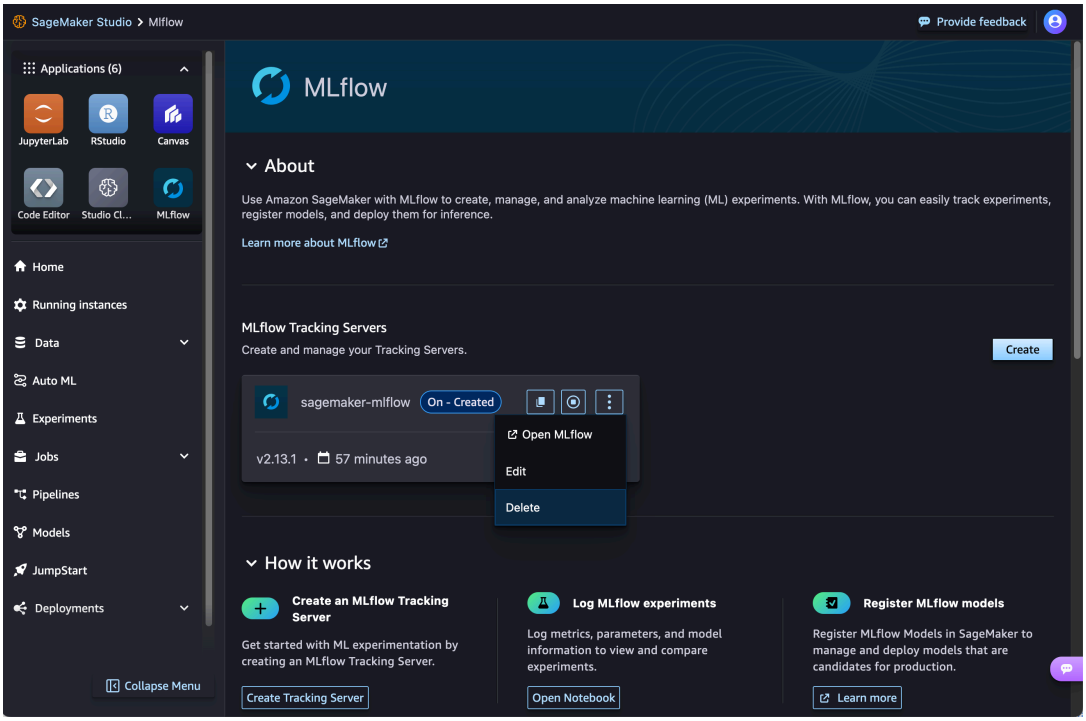
```
aws sagemaker stop-mlflow-tracking-server \
  --tracking-server-name $ts_name \
  --region $region
```

To start the tracking server using the Amazon CLI, use the following command:

> **Note**
>
> It may take up to 25 minutes to start your tracking server.

```
aws sagemaker start-mlflow-tracking-server \
  --tracking-server-name $ts_name \
  --region $region
```

Delete tracking servers



You can fully delete a tracking server in Studio or using the Amazon CLI.

Delete a tracking server using Studio

To delete a tracking server in Studio:

1. Navigate to Studio.

2. Choose **MLflow** in the **Applications** pane of the Studio UI.
3. Find the tracking server of your choice in the **MLflow Tracking Servers** pane. Choose the vertical menu icon in the right corner of the tracking server pane. Then, choose **Delete**.
4. Choose **Delete** to confirm deletion.

Delete a tracking server using the Amazon CLI

Use the `DeleteMLflowTrackingServer` API to delete any tracking servers that you created. This may take some time.

```
aws sagemaker delete-mlflow-tracking-server \
  --tracking-server-name $ts_name \
  --region $region
```

To view the status of your tracking server, use the `DescribeMLflowTrackingServer` API and check the `TrackingServerStatus`.

```
aws sagemaker describe-mlflow-tracking-server \
  --tracking-server-name $ts_name \
  --region $region
```

Delete Amazon S3 buckets

Delete any Amazon S3 bucket used as an artifact store for your tracking server using the following commands:

```
aws s3 rm s3://$bucket_name --recursive
aws s3 rb s3://$bucket_name
```

You can alternatively delete an Amazon S3 bucket associated with your tracking server directly in the Amazon console. For more information, see Deleting a bucket in the *Amazon S3 User Guide*.

Delete registered models

You can delete any model groups and model versions created with MLflow directly in Studio. For more information, see Delete a Model Group and Delete a Model Version.

Delete experiments or runs

You can use the MLflow SDK to delete experiments or runs.

- mlflow.delete_experiment
- mlflow.delete_run

Amazon SageMaker Experiments in Studio Classic

Important

Experiment tracking using the SageMaker Experiments Python SDK is only available in Studio Classic. We recommend using the new Studio experience and creating experiments using the latest SageMaker AI integrations with MLflow. There is no MLflow UI integration with Studio Classic. If you want to use MLflow with Studio, you must launch the MLflow UI using the Amazon CLI. For more information, see Launch the MLflow UI using the Amazon CLI.

Amazon SageMaker Experiments Classic is a capability of Amazon SageMaker AI that lets you create, manage, analyze, and compare your machine learning experiments in Studio Classic. Use SageMaker Experiments to view, manage, analyze, and compare both custom experiments that you programmatically create and experiments automatically created from SageMaker AI jobs.

Experiments Classic automatically tracks the inputs, parameters, configurations, and results of your iterations as *runs*. You can assign, group, and organize these runs into *experiments*. SageMaker Experiments is integrated with Amazon SageMaker Studio Classic, providing a visual interface to browse your active and past experiments, compare runs on key performance metrics, and identify the best performing models. SageMaker Experiments tracks all of the steps and artifacts that went into creating a model, and you can quickly revisit the origins of a model when you are troubleshooting issues in production, or auditing your models for compliance verifications.

Migrate from Experiments Classic to Amazon SageMaker AI with MLflow

Past experiments created using Experiments Classic are still available to view in Studio Classic. If you want to maintain and use past experiment code with MLflow, you must update your training code to use the MLflow SDK and run the training experiments again. For more information on getting started with the MLflow SDK and the Amazon MLflow plugin, see Integrate MLflow with your environment.

Example notebooks for Experiments Classic

The following example notebooks demonstrate how to track runs for various model training experiments. You can view the resulting experiments in Studio Classic after running the notebooks. For a tutorial that showcases additional features of Studio Classic, see Amazon SageMaker Studio Classic Tour.

Track experiments in a notebook environment

To learn more about tracking experiments in a notebook environment, see the following example notebooks:

- Track an experiment while training a Keras model locally
- Track an experiment while training a Pytorch model locally or in your notebook

Track bias and explainability for your experiments with SageMaker Clarify

For a step-by-step guide on tracking bias and explainability for your experiments, see the following example notebook:

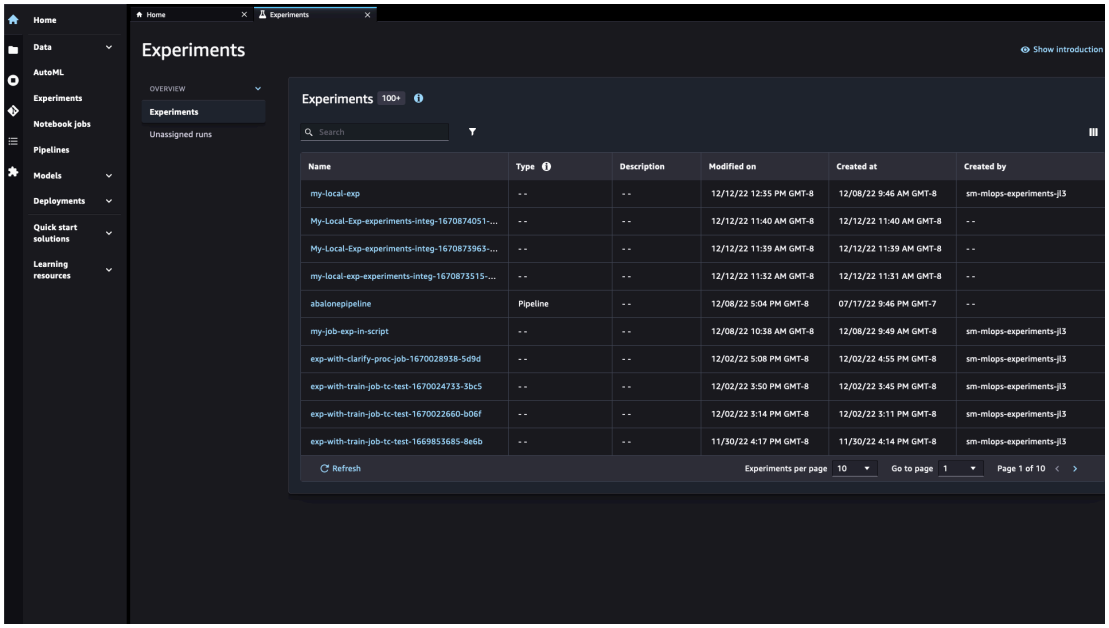
- Fairness and Explainability with SageMaker Clarify

Track experiments for SageMaker training jobs using script mode

For more information about tracking experiments for SageMaker training jobs, see the following example notebooks:

- Run a SageMaker AI Experiment with Pytorch Distributed Data Parallel - MNIST Handwritten Digits Classification
- Track an experiment while training a Pytorch model with a SageMaker Training Job
- Train a TensorFlow model with a SageMaker training job and track it using SageMaker Experiments

View experiments and runs



Amazon SageMaker Studio Classic provides an experiments browser that you can use to view lists of experiments and runs. You can choose one of these entities to view detailed information about the entity or choose multiple entities for comparison. You can filter the list of experiments by entity name, type, and tags.

To view experiments and runs

1. To view the experiment in Studio Classic, in the left sidebar, choose **Experiments**.

   Select the name of the experiment to view all associated runs. You can search experiments by typing directly into the **Search** bar or filtering for experiment type. You can also choose which columns to display in your experiment or run list.

   It might take a moment for the list to refresh and display a new experiment or experiment run. You can click **Refresh** to update the page. Your experiment list should look similar to the following:

2. In the experiments list, double-click an experiment to display a list of the runs in the experiment.

> **Note**
>
> Experiment runs that are automatically created by SageMaker AI jobs and containers are visible in the Experiments Studio Classic UI by default. To hide runs created by SageMaker AI jobs for a given experiment, choose the settings icon ( ) and toggle **Show jobs**.

3. Double-click a run to display information about a specific run.

   In the **Overview** pane, choose any of the following headings to see available information about each run:

   - **Metrics** – Metrics that are logged during a run.
   - **Charts** – Build your own charts to compare runs.
   - **Output artifacts** – Any resulting artifacts of the experiment run and the artifact locations in Amazon S3.
   - **Bias reports** – Pre-training or post-training bias reports generated using Clarify.
   - **Explainability**– Explainability reports generated using Clarify.
   - **Debugs** – A list of debugger rules and any issues found.

Automatic model tuning with SageMaker AI

Amazon SageMaker AI automatic model tuning (AMT) finds the best version of a model by running many training jobs on your dataset. Amazon SageMaker AI automatic model tuning (AMT) is also known as hyperparameter tuning. To do this, AMT uses the algorithm and ranges of

hyperparameters that you specify. It then chooses the hyperparameter values that creates a model that performs the best, as measured by a metric that you choose.

For example, running a *binary classification* problem on a marketing dataset. Your goal is to maximize the *area under the curve (AUC)* metric of the algorithm by training an XGBoost algorithm with Amazon SageMaker AI model. You want to find which values for the `eta`, `alpha`, `min_child_weight`, and `max_depth` hyperparameters that will train the best model. Specify a range of values for these hyperparameters. Then, SageMaker AI hyperparameter tuning searches within the ranges to find a combination that creates a training job that creates a model with the highest AUC. To conserve resources or meet a specific model quality expectation, set up completion criteria to stop tuning after the criteria have been met.

You can use SageMaker AI AMT with built-in algorithms, custom algorithms, or SageMaker AI pre-built containers for machine learning frameworks.

SageMaker AI AMT can use an Amazon EC2 Spot instance to optimize costs when running training jobs. For more information, see Managed Spot Training in Amazon SageMaker AI.

Before you start using hyperparameter tuning, you should have a well-defined machine learning problem, including the following:

- A dataset
- An understanding of the type of algorithm that you need to train
- A clear understanding of how you measure success

Prepare your dataset and algorithm so that they work in SageMaker AI and successfully run a training job at least once. For information about setting up and running a training job, see Guide to getting set up with Amazon SageMaker AI.

Topics

- Understand the hyperparameter tuning strategies available in Amazon SageMaker AI
- Define metrics and environment variables
- Define Hyperparameter Ranges
- Track and set completion criteria for your tuning job
- Tune Multiple Algorithms with Hyperparameter Optimization to Find the Best Model
- Example: Hyperparameter Tuning Job

- Stop Training Jobs Early

- Resource Limits for Automatic Model Tuning
- Best Practices for Hyperparameter Tuning

Understand the hyperparameter tuning strategies available in Amazon SageMaker AI

When you build complex machine learning systems like deep learning neural networks, exploring all of the possible combinations is impractical. Hyperparameter tuning can accelerate your productivity by trying many variations of a model. It looks for the best model automatically by focusing on the most promising combinations of hyperparameter values within the ranges that you specify. To get good results, you must choose the right ranges to explore. This page provides a brief explanation of the different hyperparameter tuning strategies that you can use with Amazon SageMaker AI.

Use the API reference guide to understand how to interact with hyperparameter tuning. You can use the tuning strategies described on this page with the HyperParameterTuningJobConfig and HyperbandStrategyConfig APIs.

> **Note**
>
> Because the algorithm itself is stochastic, the hyperparameter tuning model may fail to converge on the best answer. This can occur even if the best possible combination of values is within the ranges that you choose.

Grid search

When using grid search, hyperparameter tuning chooses combinations of values from the range of categorical values that you specify when you create the job. Only categorical parameters are supported when using the grid search strategy. You do not need to specify the `MaxNumberOfTrainingJobs`. The number of training jobs created by the tuning job is automatically calculated to be the total number of distinct categorical combinations possible. If specified, the value of `MaxNumberOfTrainingJobs` should equal the total number of distinct categorical combinations possible.

Random search

When using random search, hyperparameter tuning chooses a random combination of hyperparameter values in the ranges that you specify for each training job it launches. The choice of hyperparameter values doesn't depend on the results of previous training jobs. As a result, you can run the maximum number of concurrent training jobs without changing the performance of the tuning.

For an example notebook that uses random search, see the Random search and hyperparameter scaling with SageMaker XGBoost and Automatic Model Tuning notebook.

Bayesian optimization

Bayesian optimization treats hyperparameter tuning like a *regression* problem. Given a set of input features (the hyperparameters), hyperparameter tuning optimizes a model for the metric that you choose. To solve a regression problem, hyperparameter tuning makes guesses about which hyperparameter combinations are likely to get the best results. It then runs training jobs to test these values. After testing a set of hyperparameter values, hyperparameter tuning uses regression to choose the next set of hyperparameter values to test.

Hyperparameter tuning uses an Amazon SageMaker AI implementation of Bayesian optimization.

When choosing the best hyperparameters for the next training job, hyperparameter tuning considers everything that it knows about this problem so far. Sometimes it chooses a combination of hyperparameter values close to the combination that resulted in the best previous training job to incrementally improve performance. This allows hyperparameter tuning to use the best known results. Other times, it chooses a set of hyperparameter values far removed from those it has tried. This allows it to explore the range of hyperparameter values to try to find new areas that are not yet well understood. The explore/exploit trade-off is common in many machine learning problems.

Hyperband

Hyperband is a multi-fidelity based tuning strategy that dynamically reallocates resources. Hyperband uses both intermediate and final results of training jobs to re-allocate epochs to well-utilized hyperparameter configurations and automatically stops those that underperform. It also seamlessly scales to using many parallel training jobs. These features can significantly speed up hyperparameter tuning over random search and Bayesian optimization strategies.

Hyperband should only be used to tune iterative algorithms that publish results at different resource levels. For example, Hyperband can be used to tune a neural network for image classification which publishes accuracy metrics after every epoch.

Hyperband with early stopping

Training jobs can be stopped early when they are unlikely to improve the objective metric of the hyperparameter tuning job. This can help reduce compute time and avoid overfitting your model. Hyperband uses an advanced internal mechanism to apply early stopping. The parameter `TrainingJobEarlyStoppingType` in the `HyperParameterTuningJobConfig` API must be set to `OFF` when using the Hyperband internal early stopping feature.

> **Note**
>
> Hyperparameter tuning might not improve your model. It is an advanced tool for building machine solutions. As such, it should be considered part of the scientific development process.

Define metrics and environment variables

A tuning job optimizes hyperparameters for training jobs that it launches by using a metric to evaluate performance. This guide shows how to define metrics so that you can use a custom algorithm for training, or use a built-in algorithm from Amazon SageMaker AI. This guide also shows how to specify environment variables during an Automatic model tuning (AMT) job.

Define metrics

Amazon SageMaker AI hyperparameter tuning parses your machine learning algorithm's `stdout` and `stderr` streams to find metrics, such as loss or validation-accuracy. The metrics show how well the model is performing on the dataset.

The following sections describe how to use two types of algorithms for training: built-in and custom.

Use a built-in algorithm for training

If you use one of the SageMaker AI built-in algorithms, metrics are already defined for you. In addition, built-in algorithms automatically send metrics to hyperparameter tuning for optimization. These metrics are also written to Amazon CloudWatch logs. For more information, see Log Amazon SageMaker AI Events with Amazon CloudWatch.

For the objective metric for the tuning job, choose one of the metrics that the built-in algorithm emits. For a list of available metrics, see the model tuning section for the appropriate algorithm in Use Amazon SageMaker AI Built-in Algorithms or Pre-trained Models.

You can choose up to 40 metrics to monitor in your tuning job. Select one of those metrics to be the objective metric. The hyperparameter tuning job returns the training job that performed the best against the objective metric.

> **Note**
>
> Hyperparameter tuning automatically sends an additional hyperparameter `_tuning_objective_metric` to pass your objective metric to the tuning job for use during training.

Use a custom algorithm for training

This section shows how to define your own metrics to use your own custom algorithm for training. When doing so, make sure that your algorithm writes at least one metric to `stderr` or `stdout`. Hyperparameter tuning parses these streams to find algorithm metrics that show how well the model is performing on the dataset.

You can define custom metrics by specifying a name and regular expression for each metric that your tuning job monitors. Then, pass these metric definitions to the `CreateHyperParameterTuningJob` API in the `TrainingJobDefinition` parameter in the `MetricDefinitions` field of `AlgorithmSpecification`.

The following shows sample output from a log written to `stderr` or `stdout` by a training algorithm.

```
GAN_loss=0.138318;  Scaled_reg=2.654134; disc:[-0.017371,0.102429] real 93.3% gen 0.0%
 disc-combined=0.000000; disc_train_loss=1.374587;  Loss = 16.020744;  Iteration 0 took
 0.704s;  Elapsed=0s
```

The following code example shows how to use regular expressions in Python (regex). This is used to search the sample log output and capture the numeric values of four different metrics.

```
[
    {
```

```
        "Name": "ganloss",
        "Regex": "GAN_loss=(.*?);",
    },
    {
        "Name": "disc-combined",
        "Regex": "disc-combined=(.*?);",
    },
    {
        "Name": "discloss",
        "Regex": "disc_train_loss=(.*?);",
    },
    {
        "Name": "loss",
        "Regex": "Loss = (.*?);",
    },
]
```

In regular expressions, parenthesis `()` are used to group parts of the regular expression together.

- For the `loss` metric that is defined in the code example, the expression `(.*?);` captures any character between the exact text `"Loss="` and the first semicolon `(;)` character.
- The character `.` instructs the regular expression to match any character.
- The character `*` means to match zero or more characters.
- The character `?` means capture only until the first instance of the `;` character.

The loss metric defined in the code sample will capture `Loss = 16.020744` from the sample output.

Choose one of the metrics that you define as the objective metric for the tuning job. If you are using the SageMaker API, specify the value of the `name` key in the `HyperParameterTuningJobObjective` field of the `HyperParameterTuningJobConfig` parameter that you send to the `CreateHyperParameterTuningJob` operation.

Specify environment variables

SageMaker AI AMT optimizes hyperparameters within a tuning job to find the best parameters for model performance. You can use environment variables to configure your tuning job to change its behavior. You can also use environment variables that you used during training inside your tuning job.

If you want to use an environment variable from your tuning job or specify a new environment variable, input a string value for `Environment` within the SageMaker AI HyperParameterTrainingJobDefinition API. Pass this training job definition to the CreateHyperParameterTuningJob API.

For example, the environment variable `SM_LOG_LEVEL` can be set to the following values to tailor the output from a Python container.

```
NOTSET=0
DEBUG=10
INFO=20
WARN=30
ERROR=40
CRITICAL=50
```

As an example, to set the log level to `10` to debug your container logs, set the environment variable inside the HyperParameterTrainingJobDefinition, as follows.

```
{
   "HyperParameterTuningJobConfig": {
   ...,
   }
   "TrainingJobDefinition": {
      ...,
      "Environment" : [
          {
            "SM_LOG_LEVEL": 10
          }
      ],
      ...,
   },
   ...,
}
```

Define Hyperparameter Ranges

This guide shows how to use SageMaker APIs to define hyperparameter ranges. It also provides a list of hyperparameter scaling types that you can use.

Choosing hyperparameters and ranges significantly affects the performance of your tuning job. Hyperparameter tuning finds the best hyperparameter values for your model by searching over a

range of values that you specify for each tunable hyperparameter. You can also specify up to 100 static hyperparameters that do not change over the course of the tuning job. You can use up to 100 hyperparameters in total (static + tunable). For guidance on choosing hyperparameters and ranges, see Best Practices for Hyperparameter Tuning. You can also use autotune to find optimal tuning job settings. For more information, see the following **Autotune** section.

> **Note**
>
> SageMaker AI Automatic Model Tuning (AMT) may add additional hyperparameters(s) that contribute to the limit of 100 total hyperparameters. Currently, to pass your objective metric to the tuning job for use during training, SageMaker AI adds `_tuning_objective_metric` automatically.

Static hyperparameters

Use static hyperparameters for the following cases: For example, you can use AMT to tune your model using `param1` (a tunable parameter) and `param2` (a static parameter). If you do, then use a search space for `param1` that lies between two values, and pass `param2` as a static hyperparameter, as follows.

```
param1: ["range_min","range_max"]
param2: "static_value"
```

Static hyperparameters have the following structure:

```
"StaticHyperParameters": {
    "objective" : "reg:squarederror",
    "dropout_rate": "0.3"
}
```

You can use the Amazon SageMaker API to specify key value pairs in the StaticHyperParameters field of the `HyperParameterTrainingJobDefinition` parameter that you pass to the CreateHyperParameterTuningJob operation.

Dynamic hyperparameters

You can use the SageMaker API to define hyperparameter ranges. Specify the names of hyperparameters and ranges of values in the `ParameterRanges` field

of the `HyperParameterTuningJobConfig` parameter that you pass to the [CreateHyperParameterTuningJob](#) operation.

The `ParameterRanges` field has three subfields: categorical, integer, and continuous. You can define up to 30 total (categorical + integer + continuous) tunable hyperparameters to search over.

> **Note**
>
> Each categorical hyperparameter can have at most 30 different values.

Dynamic hyperparameters have the following structure:

```
"ParameterRanges": {
    "CategoricalParameterRanges": [
        {
            "Name": "tree_method",
            "Values": ["auto", "exact", "approx", "hist"]
        }
    ],
    "ContinuousParameterRanges": [
        {
            "Name": "eta",
            "MaxValue" : "0.5",
            "MinValue": "0",
            "ScalingType": "Auto"
        }
    ],
    "IntegerParameterRanges": [
        {
            "Name": "max_depth",
            "MaxValue": "10",
            "MinValue": "1",
            "ScalingType": "Auto"
        }
    ]
}
```

If you create a tuning job with a `Grid` strategy, you can only specify categorical values. You don't need to provide the `MaxNumberofTrainingJobs`. This value is inferred from the total number of configurations that can be produced from your categorical parameters. If specified, the value

of `MaxNumberOfTrainingJobs` should be equal to the total number of distinct categorical combinations possible.

Autotune

To save time and resources searching for hyperparameter ranges, resources or objective metrics, autotune can automatically guess optimal values for some hyperparameter fields. Use autotune to find optimal values for the following fields:

- **ParameterRanges** – The names and ranges of hyperparameters that a tuning job can optimize.
- **ResourceLimits** – The maximum resources to be used in a tuning job. These resources can include the maximum number of training jobs, maximum runtime of a tuning job, and the maximum number of training jobs that can be run at the same time.
- **TrainingJobEarlyStoppingType** – A flag that stops a training job if a job is not significantly improving against an objective metric. Defaults to enabled. For more information, see Stop Training Jobs Early.
- **RetryStrategy** – The number of times to retry a training job. Non-zero values for `RetryStrategy` can increase the likelihood that your job will complete successfully.
- **Strategy** – Specifies how hyperparameter tuning chooses the combinations of hyperparameter values to use for the training job that it launches.
- **ConvergenceDetected** – A flag to indicate that Automatic Model Tuning (AMT) has detected model convergence.

To use autotune, do the following:

1. Specify the hyperparameter and an example value in the `AutoParameters` field of the ParameterRanges API.
2. Enable autotune.

AMT will determine if your hyperparameters and example values are eligible for autotune. Hyperparameters that can be used in autotune are automatically assigned to the appropriate parameter range type. Then, AMT uses `ValueHint` to select an optimal range for you. You can use the `DescribeHyperParameterTrainingJob` API to view these ranges.

The following example shows you how to configure a tuning job that uses autotune. In the configuration example, the hyperparameter `max_depth` has `ValueHint` containing an example value of 4.

```
config = {
    'Autotune': {'Mode': 'Enabled'},
    'HyperParameterTuningJobName':'my-autotune-job',
    'HyperParameterTuningJobConfig': {
        'HyperParameterTuningJobObjective': {'Type': 'Minimize', 'MetricName':
 'validation:rmse'},
        'ResourceLimits': {'MaxNumberOfTrainingJobs': 5, 'MaxParallelTrainingJobs': 1},
        'ParameterRanges': {
            'AutoParameters': [
                {'Name': 'max_depth', 'ValueHint': '4'}
            ]
        }
    },
    'TrainingJobDefinition': {
    .... }
```

Continuing the previous example, a tuning job is created after the previous configuration is included in a call to the `CreateHyperParameterTuningJob` API. Then, autotune converts the max_depth hyperparameter in AutoParameters to the hyperparameter `IntegerParameterRanges`. The following response from a `DescribeHyperParameterTrainingJob` API shows that the optimal `IntegerParameterRanges` for `max_depth` are between 2 and 8.

```
{
    'HyperParameterTuningJobName':'my_job',
    'HyperParameterTuningJobConfig': {
        'ParameterRanges': {
            'IntegerParameterRanges': [
                {'Name': 'max_depth', 'MinValue': '2', 'MaxValue': '8'},
            ],
        }
    },
    'TrainingJobDefinition': {
        ...
    },
    'Autotune': {'Mode': 'Enabled'}
```

```
}
```

Hyperparameter scaling types

For integer and continuous hyperparameter ranges, you can choose the scale that you want hyperparameter tuning to use. For example, to search the range of values, you can specify a value for the `ScalingType` field of the hyperparameter range. You can choose from the following hyperparameter scaling types:

Auto

SageMaker AI hyperparameter tuning chooses the best scale for the hyperparameter.

Linear

Hyperparameter tuning searches the values in the hyperparameter range by using a linear scale. Typically, you choose this if the range of all values from the lowest to the highest is relatively small (within one order of magnitude). Uniformly searching values from the range provides a reasonable exploration of the entire range.

Logarithmic

Hyperparameter tuning searches the values in the hyperparameter range by using a logarithmic scale.

Logarithmic scaling works only for ranges that have values greater than 0.

Choose logarithmic scaling when you're searching a range that spans several orders of magnitude.

For example, if you're tuning a Tune a linear learner model model, and you specify a range of values between .0001 and 1.0 for the `learning_rate` hyperparameter, consider the following: Searching uniformly on a logarithmic scale gives you a better sample of the entire range than searching on a linear scale would. This is because searching on a linear scale would, on average, devote 90 percent of your training budget to only the values between .1 and 1.0. As a result, that leaves only 10 percent of your training budget for the values between .0001 and .1.

`ReverseLogarithmic`

Hyperparameter tuning searches the values in the hyperparameter range by using a reverse logarithmic scale. Reverse logarithmic scaling is supported only for continuous hyperparameter ranges. It is not supported for integer hyperparameter ranges.

Choose reverse logarithmic scaling when you are searching a range that is highly sensitive to small changes that are very close to 1.

Reverse logarithmic scaling works only for ranges that are entirely within the range 0<=x<1.0.

For an example notebook that uses hyperparameter scaling, see these Amazon SageMaker AI hyperparameter examples on GitHub.

Track and set completion criteria for your tuning job

You can use completion criteria to instruct Automatic model tuning (AMT) to stop your tuning job if certain conditions are met. With these conditions, you can set a minimum model performance or maximum number of training jobs that don't improve when evaluated against the objective metric. You can also track the progress of your tuning job and decide to let it continue or to stop it manually. This guide shows you how to set completion criteria, check the progress of and stop your tuning job manually.

Set completion criteria for your tuning job

During hyperparameter optimization, a tuning job will launch several training jobs inside a loop. The tuning job will do the following.

- Check your training jobs for completion and update statistics accordingly
- Decide what combination of hyperparameters to evaluate next.

AMT will continuously check the training jobs that were launched from your tuning job to update statistics. These statistics include tuning job runtime and best training job. Then, AMT determines whether it should stop the job according to your completion criteria. You can also check these statistics and stop your job manually. For more information about stopping a job manually, see the Stopping your tuning job manually section.

As an example, if your tuning job meets your objective, you can stop tuning early to conserve resources or ensure model quality. AMT checks your job performance against your completion criteria and stops the tuning job if any have been met.

You can specify the following kinds of completion criteria:

- `MaxNumberOfTrainingJobs` – The maximum number of training jobs to be run before tuning is stopped.

- `MaxNumberOfTrainingJobsNotImproving` – The maximum number of training jobs that do not improve performance against the objective metric from the current best training job. As an example, if the best training job returned an objective metric that had an accuracy of `90%`, and `MaxNumberOfTrainingJobsNotImproving` is set to `10`. In this example, tuning will stop after `10` training jobs fail to return an accuracy higher than `90%`.
- `MaxRuntimeInSeconds` – The upper limit of wall clock time in seconds of how long a tuning job can run.
- `TargetObjectiveMetricValue` – The value of the objective metric against which the tuning job is evaluated. Once this value is met, AMT stops the tuning job.
- `CompleteOnConvergence` – A flag to stop tuning after an internal algorithm determines that the tuning job is unlikely to improve more than 1% over the objective metric from the best training job.

Selecting completion criteria

You can choose one or multiple completion criteria to stop your hyperparameter tuning job after a condition has been meet. The following instructions show you how to select completion criteria and how to decide which is the most appropriate for your use case.

- Use `MaxNumberOfTrainingJobs` in the ResourceLimits API to set an upper limit for the number of training jobs that can be run before your tuning job is stopped. Start with a large number and adjust it based on model performance against your tuning job objective. Most users input values of around `50` or more training jobs to find an optimal hyperparameter configuration. Users looking for higher levels of model performance will use `200` or more training jobs.
- Use `MaxNumberOfTrainingJobsNotImproving` in the BestObjectiveNotImproving API field to stop training if model performance fails to improve after a specified number of jobs. Model performance is evaluated against an objective function. After the `MaxNumberOfTrainingJobsNotImproving` is met, AMT will stop the tuning job. Tuning jobs tend to make the most progress in the beginning of the job. Improving model performance against an objective function will require a larger number of training jobs towards the end of tuning. Select a value for `MaxNumberOfTrainingJobsNotImproving` by checking the performance of similar training jobs against your objective metric.
- Use `MaxRuntimeInSeconds` in the ResourceLimits API to set an upper limit for the amount of wall clock time that the tuning job may take. Use this field to meet a deadline by which the tuning job must complete or to limit compute resources.

To get an estimated total compute time in seconds for a tuning job, use the following formula:

Estimated max compute time in seconds= `MaxRuntimeInSeconds` * `MaxParallelTrainingJobs` * `MaxInstancesPerTrainingJob`

> **Note**
>
> The actual duration of a tuning job may deviate slightly from the value specified in this field.

- Use `TargetObjectiveMetricValue` in the TuningJobCompletionCriteria API to stop your tuning job. You stop the tuning job after any training job that is launched by the tuning job reaches this objective metric value. Use this field if your use case depends on reaching a specific performance level, rather than spending compute resources to find the best possible model.
- Use `CompleteOnConvergence` in the TuningJobCompletionCriteria API to stop a tuning job after AMT has detected that the tuning job has converged, and is unlikely to make further significant progress. Use this field when it is not clear what values for any of the other completion criteria should be used. AMT determines convergence based on an algorithm developed and tested on a wide range of diverse benchmarks. A tuning job is defined to have converged when none of the training jobs return significant improvement (1% or less). Improvement is measured against the objective metric returned by the highest performing job, so far.

Combining different completion criteria

You can also combine any of the different completion criteria in the same tuning job. AMT will stop the tuning job when any one of the completion criteria is met. For example, if you want to tune your model until it meets an objective metric, but don't want to keep tuning if your job has converged, use the following guidance.

- Specify `TargetObjectiveMetricValue` in the TuningJobCompletionCriteria API to set a target objective metrics value to reach.
- Set CompleteOnConvergence to `Enabled` to stop a tuning job if AMT has determined that model performance is unlikely to improve.

Track tuning job progress

You can use the `DescribeHyperParameterTuningJob` API to track the progress of your tuning job at any time while it is running. You don't have to specify completion criteria to obtain tracking information for your tuning job. Use the following fields to obtain statistics about your tuning job.

- BestTrainingJob – An object that describes the best training job obtained so far, evaluated against your objective metric. Use this field to check your current model performance and the value of the objective metric of this best training job.
- ObjectiveStatusCounters – An object that specifies the total number of training jobs completed in a tuning job. To estimate average duration of a tuning job, use `ObjectiveStatusCounters` and the total runtime of a tuning job. You can use the average duration to estimate how much longer your tuning job will run.
- `ConsumedResources` – The total resources, such as `RunTimeInSeconds`, consumed by your tuning job. Compare `ConsumedResources`, found in the DescribeHyperParameterTuningJob API, against `BestTrainingJob` in the same API. You can also compare `ConsumedResources` against the response from the ListTrainingJobsForHyperParameterTuningJob API to assess if your tuning job is making satisfactory progress given the resources being consumed.
- TuningJobCompletionDetails – Tuning job completion information that includes the following:
  - The timestamp of when convergence is detected if the job has converged.
  - The number of training jobs that have not improved model performance. Model performance is evaluated against the objective metric from the best training job.

  Use the tuning job completion criteria to assess how likely your tuning job is to improve your model performance. Model performance is evaluated against the best objective metric if it ran to completion.

Stopping your tuning job manually

You can determine if you should let the tuning job run until it completes or if you should stop the tuning job manually. To determine this, use the information returned by the parameters in the `DescribeHyperParameterTuningJob` API, as shown in the previous **Tracking tuning job progress** section. As an example, if your model performance does not improve after several training jobs complete, you may choose to stop the tuning job. Model performance is evaluated against the best objective metric.

To stop the tuning job manually, use the StopHyperParameterTuningJob API and provide the name of the tuning job to be stopped.

Tune Multiple Algorithms with Hyperparameter Optimization to Find the Best Model

To create a new hyperparameter optimization (HPO) job with Amazon SageMaker AI that tunes multiple algorithms, you must provide job settings that apply to all of the algorithms to be tested and a training definition for each of these algorithms. You must also specify the resources you want to use for the tuning job.

- The **job settings** to configure include warm starting, early stopping, and the tuning strategy. Warm starting and early stopping are available only when tuning a single algorithm.
- The **training job definition** to specify the name, algorithm source, objective metric, and the range of values, when required, to configure the set of hyperparameter values for each training job. It configures the channels for data inputs, data output locations, and any checkpoint storage locations for each training job. The definition also configures the resources to deploy for each training job, including instance types and counts, managed spot training, and stopping conditions.
- The **tuning job resources**: to deploy, including the maximum number of concurrent training jobs that a hyperparameter tuning job can run concurrently and the maximum number of training jobs that the hyperparameter tuning job can run.

Get Started

You can create a new hyperparameter tuning job, clone a job, add, or edit tags to a job from the console. You can also use the search feature to find jobs by their name, creation time, or status. Alternatively, you can also hyperparameter tuning jobs with the SageMaker AI API.

- **In the console**: To create a new job, open the Amazon SageMaker AI console at https://console.amazonaws.cn/sagemaker/, choose **Hyperparameter tuning jobs** from the **Training**, menu, and then choose **Create hyperparameter tuning job**. Then following the configuration steps to create a training job for each algorithm that you want to use. These steps are documented in the Create a Hyperparameter Optimization Tuning Job for One or More Algorithms (Console) topic.

> **Note**
>
> When you start the configuration steps, note that the warm start and early stopping features are not available to use with multi-algorithm HPO. If you want to use these features, you can only tune a single algorithm at a time.

- **With the API**: For instructions on using the SageMaker API to create a hyperparameter tuning job, see Example: Hyperparameter Tuning Job. When you call `CreateHyperParameterTuningJob` to tune multiple algorithms, you must provide a list of training definitions using `TrainingJobDefinitions` instead of specifying a single TrainingJobDefinition. You must provide job settings that apply to all of the algorithms to be tested and a training definition for each of these algorithms. You must also specify the resources that you want to use for the tuning job. Choose only one of these definition types depending on the number of algorithms that are being tuned.

- Manage Hyperparameter Tuning and Training Jobs

Create a Hyperparameter Optimization Tuning Job for One or More Algorithms (Console)

This guide shows you how to create a new hyperparameter optimization (HPO) tuning job for one or more algorithms. To create an HPO job, define the settings for the tuning job, and create training job definitions for each algorithm being tuned. Next, configure the resources for and create the tuning job. The following sections provide details about how to complete each step. We provide an example of how to tune multiple algorithms using the SageMaker AI SDK for Python client at the end of this guide.

Components of a tuning job

An HPO tuning job contains the following three components:

- Tuning job settings
- Training job definitions
- Tuning job configuration

The way that these components are included in your HPO tuning job depends on whether your tuning job contains one or multiple training algorithms. The following guide describes each of the components and gives an example of both types of tuning jobs.

Tuning job settings

Your tuning job settings are applied across all of the algorithms in the HPO tuning job. Warm start and early stopping are available only when you're tuning a single algorithm. After you define the job settings, you can create individual training definitions for each algorithm or variation that you want to tune.

Warm start

If you cloned this job, you can use the results from a previous tuning job to improve the performance of this new tuning job. This is the warm start feature, and it's only available when tuning a single algorithm. With the warm start option, you can choose up to five previous hyperparameter tuning jobs to use. Alternatively, you can use transfer learning to add additional data to the parent tuning job. When you select this option, you choose one previous tuning job as the parent.

> **Note**
>
> Warm start is compatible only with tuning jobs that were created after October 1, 2018. For more information, see Run a warm start job.

Early stopping

To reduce compute time and avoid overfitting your model, you can stop training jobs early. Early stopping is helpful when the training job is unlikely to improve the current best objective metric of the hyperparameter tuning job. Like warm start, this feature is only available when tuning a single algorithm. This is an automatic feature without configuration options, and it's disabled by default. For more information about how early stopping works, the algorithms that support it, and how to use it with your own algorithms, see Stop Training Jobs Early.

Tuning strategy

Tuning strategy can be either random, Bayesian, or Hyperband. These selections specify how automatic tuning algorithms search specified hyperparameter ranges that are selected in a later step. Random search chooses random combinations of values from the specified ranges and

can be run sequentially or in parallel. Bayesian optimization chooses values based on what is likely to get the best result according to the known history of previous selections. Hyperband uses a multi-fidelity strategy that dynamically allocates resources toward well-utilized jobs and automatically stops those that underperform. The new configuration that starts after stopping other configurations is chosen randomly.

Hyperband can only be used with iterative algorithms, or algorithms that run steps in iterations, such as XGBoost or Random Cut Forest. Hyperband can't be used with non-iterative algorithms, such as decision trees or k-Nearest Neighbors. For more information about search strategies, see How Hyperparameter Tuning Works.

> **Note**
>
> Hyperband uses an advanced internal mechanism to apply early stopping. Therefore, when you use the Hyperband internal early stopping feature, the parameter `TrainingJobEarlyStoppingType` in the `HyperParameterTuningJobConfig` API must be set to `OFF`.

Tags

To help you manage tuning jobs, you can enter tags as key-value pairs to assign metadata to tuning jobs. Values in the key-value pair are not required. You can use the key without values. To see the keys associated with a job, choose the **Tags** tab on the details page for tuning job. For more information about using tags for tuning jobs, see Manage Hyperparameter Tuning and Training Jobs.

Training job definitions

To create a training job definition, you must configure the algorithm and parameters, define the data input and output, and configure resources. Provide at least one `TrainingJobDefinition` for each HPO tuning job. Each training definition specifies the configuration for an algorithm.

To create several definitions for your training job, you can clone a job definition. Cloning a job can save time because it copies all of the job settings, including data channels and Amazon S3 storage locations for output artifacts. You can edit a cloned job to change what you need for your use case.

Topics

- Configure algorithm and parameters

- Define data input and output
- Configure training job resources
- Add or clone a training job

Configure algorithm and parameters

The following list describes what you need to configure the set of hyperparameter values for each training job.

- A name for your tuning job
- Permission to access services
- Parameters for any algorithm options
- An objective metric
- The range of hyperparameter values, when required

Name

Provide a unique name for the training definition.

Permissions

Amazon SageMaker AI requires permissions to call other services on your behalf. Choose an Amazon Identity and Access Management (IAM) role, or let Amazon create a role with the `AmazonSageMakerFullAccess` IAM policy attached.

Optional security settings

The network isolation setting prevents the container from making any outbound network calls. This is required for Amazon Web Services Marketplace machine learning offerings.

You can also choose to use a virtual private cloud (VPC).

> **Note**
>
> Inter-container encryption is only available when you create a job definition from the API.

Algorithm options

You can choose built-in algorithms, your own algorithm, your own container with an algorithm, or you can subscribe to an algorithm from Amazon Web Services Marketplace.

- If you choose a built-in algorithm, it has the Amazon Elastic Container Registry (Amazon ECR) image information pre-populated.
- If you choose your own container, you must specify the (Amazon ECR) image information. You can select the input mode for the algorithm as file or pipe.
- If you plan to supply your data using a CSV file from Amazon S3, you should select the file.

Metrics

When you choose a built-in algorithm, metrics are provided for you. If you choose your own algorithm, you must define your metrics. You can define up to 20 metrics for your tuning job to monitor. You must choose one metric as the objective metric. For more information about how to define a metric for a tuning job, see Define metrics.

Objective metric

To find the best training job, set an objective metric and whether to maximize or minimize it. After the training job is complete, you can view the tuning job detail page. The detail page provides a summary of the best training job that is found using this objective metric.

Hyperparameter configuration

When you choose a built-in algorithm, the default values for its hyperparameters are set for you, using ranges that are optimized for the algorithm that's being tuned. You can change these values as you see fit. For example, instead of a range, you can set a fixed value for a hyperparameter by setting the parameter's type to **static**. Each algorithm has different required and optional parameters. For more information, see Best Practices for Hyperparameter Tuning and Define Hyperparameter Ranges.

Define data input and output

Each training job definition for a tuning job must configure the channels for data inputs, data output locations, and optionally, any checkpoint storage locations for each training job.

Input data configuration

Input data is defined by channels. Each channel its own source location (Amazon S3 or Amazon Elastic File System), compression, and format options. You can define up to 20 channels of input

sources. If the algorithm that you choose supports multiple input channels, you can specify those, too. For example, when you use the XGBoost churn prediction notebook, you can add two channels: train and validation.

Checkpoint configuration

Checkpoints are periodically generated during training. For the checkpoints to be saved, you must choose an Amazon S3 location. Checkpoints are used in metrics reporting, and are also used to resume managed spot training jobs. For more information, see Checkpoints in Amazon SageMaker AI.

Output data configuration

Define an Amazon S3 location for the artifacts of the training job to be stored. You have the option of adding encryption to the output using an Amazon Key Management Service (Amazon KMS) key.

Configure training job resources

Each training job definition for a tuning job must configure the resources to deploy, including instance types and counts, managed spot training, and stopping conditions.

Resource configuration

Each training definition can have a different resource configuration. You choose the instance type and number of nodes.

Managed spot training

You can save computer costs for jobs if you have flexibility in start and end times by allowing SageMaker AI to use spare capacity to run jobs. For more information, see Managed Spot Training in Amazon SageMaker AI.

Stopping condition

The stopping condition specifies the maximum duration that's allowed for each training job.

Add or clone a training job

After you create a training job definition for a tuning job, you will return to the **Training Job Definition(s)** panel. This panel is where you can create additional training job definitions to train additional algorithms. You can select the **Add training job definition** and work through the steps to define a training job again.

Alternatively, to replicate an existing training job definition and edit it for the new algorithm, choose **Clone** from the **Action** menu. The clone option can save time because it copies all of the job's settings, including the data channels and Amazon S3 storage locations. For more information about cloning, see Manage Hyperparameter Tuning and Training Jobs.

Tuning job configuration

Resource Limits

You can specify the maximum number of concurrent training jobs that a hyperparameter tuning job can run concurrently (10 at most). You can also specify the maximum number of training jobs that the hyperparameter tuning job can run (500 at most). The number of parallel jobs should not exceed the number of nodes that you have requested across all of your training definitions. The total number of jobs can't exceed the number of jobs that your definitions are expected to run.

Review the job settings, the training job definitions, and the resource limits. Then select **Create hyperparameter tuning job**.

HPO tuning job example

To run a hyperparameter optimization (HPO) training job, first create a training job definition for each algorithm that's being tuned. Next, define the tuning job settings and configure the resources for the tuning job. Finally, run the tuning job.

If your HPO tuning job contains a single training algorithm, the SageMaker AI tuning function will call the `HyperparameterTuner` API directly and pass in your parameters. If your HPO tuning job contains multiple training algorithms, your tuning function will call the `create` function of the `HyperparameterTuner` API. The `create` function tells the API to expect a dictionary containing one or more ModelTrainers.

In the following section, code examples show how to tune a job containing either a single training algorithm or multiple algorithms using the SageMaker AI Python SDK.

Create training job definitions

When you create a tuning job that includes multiple training algorithms, your tuning job configuration will include the ModelTrainers and metrics and other parameters for your training jobs. Therefore, you need to create the training job definition first, and then configure your tuning job.

The following code example shows how to retrieve two SageMaker AI containers containing the built-in algorithms XGBoost and Linear Learner. If your tuning job contains only one training algorithm, omit one of the containers and one of the ModelTrainers.

```
import sagemaker
from sagemaker.core import image_uris
from sagemaker.core.helper.session_helper import Session, get_execution_role

from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Compute

sess = Session()
region = sess.boto_region_name
role = get_execution_role()

bucket = sess.default_bucket()
prefix = "sagemaker/multi-algo-hpo"

# Define the training containers and initialize the ModelTrainers
xgb_container = image_uris.retrieve("xgboost", region, "latest")
ll_container = image_uris.retrieve("linear-learner", region, "latest")

xgb_model_trainer = ModelTrainer(
    xgb_container,
    role=role,
    compute=Compute(
        instance_count=1,
        instance_type="ml.m4.xlarge",
    ),
    output_path='s3://{}/{}/xgb_output'.format(bucket, prefix),
    hyperparameters={
        "eval_metric": "auc",
        "objective": "binary:logistic",
        "num_round": "100",
        "rate_drop": "0.3",
        "tweedie_variance_power": "1.4",
    },
)

ll_model_trainer = ModelTrainer(
    ll_container,
    role=role,
    compute=Compute(
```

```
        instance_count=1,
        instance_type="ml.c4.xlarge",
    ),
    output_path="s3://{}/{}/ll_output".format(bucket, prefix),
    hyperparameters={
        "predictor_type": "binary_classifier",
    },
)
```

Next, define your input data by specifying the training, validation, and testing datasets, as shown in the following code example. This example shows how to tune multiple training algorithms.

```
from sagemaker.train.configs import InputData

training_data = InputData(
    channel_name="train", data_source="s3://{}/{}/train".format(bucket, prefix)
)
validation_data = InputData(
    channel_name="validation", data_source="s3://{}/{}/validate".format(bucket, prefix)
)
test_data = InputData(
    channel_name="test", data_source="s3://{}/{}/test".format(bucket, prefix)
)

train_inputs = {
    "model-trainer-1": {
        "train": training_data,
        "validation": validation_data,
        "test": test_data,
    },
    "model-trainer-2": {
        "train": training_data,
        "validation": validation_data,
        "test": test_data,
    },
}
```

If your tuning algorithm contains only one training algorithm, your `train_inputs` should contain only one entry.

You must upload the inputs for the training, validation, and training datasets to your Amazon S3 bucket before you use those in an HPO tuning job.

Define resources and settings for your tuning job

This section shows how to initialize a tuner, define resources, and specify job settings for your tuning job. If your tuning job contains multiple training algorithms, these settings are applied to all of the algorithms that are contained inside your tuning job. This section provides two code examples to define a tuner. The code examples show you how to optimize a single training algorithm followed by an example of how to tune multiple training algorithms.

Tune a single training algorithm

The following code example shows how to initialize a tuner and set hyperparameter ranges for one SageMaker AI built-in algorithm, XGBoost.

```
from sagemaker.train import HyperparameterTuner
from sagemaker.parameter import ContinuousParameter, IntegerParameter

hyperparameter_ranges = {
    "max_depth": IntegerParameter(1, 10),
    "eta": ContinuousParameter(0.1, 0.3),
}

objective_metric_name = "validation:accuracy"

tuner = HyperparameterTuner(
    xgb_model_trainer,
    objective_metric_name,
    hyperparameter_ranges,
    objective_type="Maximize",
    max_jobs=5,
    max_parallel_jobs=2,
)
```

Tune multiple training algorithms

Each training job requires different configurations, and these are specified using a dictionary. The following code example shows how to initialize a tuner with configurations for two SageMaker AI built-in algorithms, XGBoost and Linear Learner. The code example also shows how to set a tuning strategy and other job settings, such as the compute resources for the tuning job. The following code example uses `metric_definitions_dict`, which is optional.

```
from sagemaker.train import HyperparameterTuner
from sagemaker.parameter import ContinuousParameter, IntegerParameter
```

```
# Initialize your tuner
tuner = HyperparameterTuner.create(
    model_trainer_dict={
        "model-trainer-1": xgb_model_trainer,
        "model-trainer-2": ll_model_trainer,
    },
    objective_metric_name_dict={
        "model-trainer-1": "validation:auc",
        "model-trainer-2": "test:binary_classification_accuracy",
    },
    hyperparameter_ranges_dict={
        "model-trainer-1": {"eta": ContinuousParameter(0.1, 0.3)},
        "model-trainer-2": {"learning_rate": ContinuousParameter(0.1, 0.3)},
    },
    metric_definitions_dict={
        "model-trainer-1": [
            {"Name": "validation:auc", "Regex": "Overall test accuracy: (.*?);"}
        ],
        "model-trainer-2": [
            {
                "Name": "test:binary_classification_accuracy",
                "Regex": "Overall test accuracy: (.*?);",
            }
        ],
    },
    strategy="Bayesian",
    max_jobs=10,
    max_parallel_jobs=3,
)
```

Run your HPO tuning job

Now you can run your tuning job by passing your training inputs to the tuner. The following code example shows how to pass the `train_inputs` parameter, that is defined in a previous code example, to your tuner.

```
tuner.tune(inputs=train_inputs, model_trainer_kwargs={})
```

Manage Hyperparameter Tuning and Training Jobs

A tuning job can contain many training jobs and creating and managing these jobs and their definitions can become a complex and onerous task. SageMaker AI provides tools to help facilitate

the management of these jobs. Tuning jobs you have run can be accessed from the Amazon SageMaker AI console at https://console.amazonaws.cn/sagemaker/. Select **Hyperparameter tuning job** from the **Training** menu to see the list. This page is also where you start the procedure to create a new tuning job by selecting **Create hyperparameter tuning job**.

To see the training jobs run a part of a tuning job, select one of the hyperparameter tuning jobs from the list. The tabs on the tuning job page allow you to inspect the training jobs, their definitions, the tags and configuration used for the tuning job, and the best training job found during tuning. You can select the best training job or any of the other training jobs that belong to the tuning job to see all of their settings. From here you can create a model that uses the hyperparameter values found by a training job by selecting **Create Model** or you can clone the training job by selecting **Clone**.

Cloning

You can save time by cloning a training job that belongs to a hyperparameter tuning job. Cloning copies all of the job's settings, including data channels, S3 storage locations for output artifacts. You can do this for training jobs you have already run from the tuning job page, as just described, or when you are creating additional training job definitions while creating a hyperparameter tuning job, as described in Add or clone a training job step of that procedure.

Tagging

Automatic Model Tuning launches multiple training jobs within a single parent tuning job to discover the ideal weighting of model hyperparameters. Tags can be added to the parent tuning job as described in the Components of a tuning job section and these tags are then propagated to the individual training jobs underneath. Customers can use these tags for purposes, such as cost allocation or access control. To add tags using the SageMaker SDK, use `AddTags` API. For more information about using tagging for Amazon resources, see Tagging Amazon resources.

Example: Hyperparameter Tuning Job

This example shows how to create a new notebook for configuring and launching a hyperparameter tuning job. The tuning job uses the XGBoost algorithm with Amazon SageMaker AI to train a model to predict whether a customer will enroll for a term deposit at a bank after being contacted by phone.

You use the low-level SDK for Python (Boto3) to configure and launch the hyperparameter tuning job, and the Amazon Web Services Management Console to monitor the status of hyperparameter tuning jobs. You can also use the Amazon SageMaker AI high-level Amazon SageMaker Python SDK

to configure, run, monitor, and analyze hyperparameter tuning jobs. For more information, see https://github.com/aws/sagemaker-python-sdk.

Prerequisites

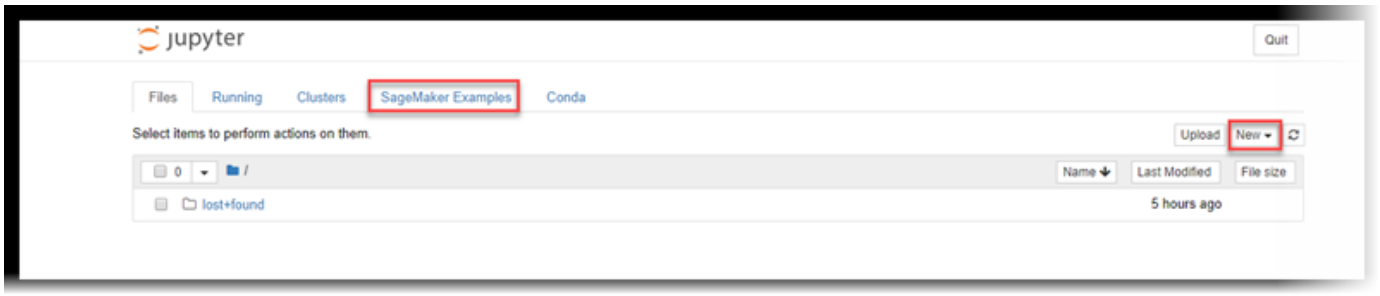
To run the code in this example, you need

- An Amazon account and an administrator user
- An Amazon S3 bucket for storing your training dataset and the model artifacts created during training
- A running SageMaker AI notebook instance

Topics

- Create a Notebook Instance
- Get the Amazon SageMaker AI Boto 3 Client
- Get the SageMaker AI Execution Role
- Use an Amazon S3 bucket for input and output
- Download, Prepare, and Upload Training Data
- Configure and Launch a Hyperparameter Tuning Job
- Clean up

Create a Notebook Instance



Important

Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see Provide permissions for tagging SageMaker AI resources.
Amazon managed policies for Amazon SageMaker AI that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

Create a Jupyter notebook that contains a pre-installed environment with the default Anaconda installation and Python3.

To create a Jupyter notebook

1. Open the Amazon SageMaker AI console at https://console.amazonaws.cn/sagemaker/.
2. Open a running notebook instance, by choosing **Open** next to its name. The Jupyter notebook server page appears:

3. To create a notebook, choose **Files**, **New**, and **conda_python3**. .
4. Name the notebook.

Next Step

Get the Amazon SageMaker AI Boto 3 Client

Get the Amazon SageMaker AI Boto 3 Client

Import Amazon SageMaker Python SDK, Amazon SDK for Python (Boto3), and other Python libraries. In a new Jupyter notebook, paste the following code to the first cell:

```
import sagemaker
import boto3

import numpy as np                                # For performing matrix operations
 and numerical processing
import pandas as pd                               # For manipulating tabular data
from time import gmtime, strftime
import os

region = boto3.Session().region_name
smclient = boto3.Session().client('sagemaker')
```

The preceding code cell defines `region` and `smclient` objects that you will use to call the built-in XGBoost algorithm and set the SageMaker AI hyperparameter tuning job.

Next Step

Get the SageMaker AI Execution Role

Get the SageMaker AI Execution Role

Get the execution role for the notebook instance. This is the IAM role that you created for your notebook instance.

To find the ARN of the IAM execution role attached to a notebook instance:

1. Open the IAM console at https://console.amazonaws.cn/iam/.
2. On the left navigation pane, choose **Notebook** then **Notebook instances**.
3. From the list of notebooks, select the notebook that you want to view.
4. The ARN is in the **Permissions and encryption** section.

Alternatively, Amazon SageMaker Python SDK users can retrieve the ARN of the execution role attached to their user profile or a notebook instance by running the following code:

```
from sagemaker import get_execution_role

role = get_execution_role()
print(role)
```

For more information about using `get_execution_role` in the Amazon SageMaker Python SDK, see Session. For more information about roles, see How to use SageMaker AI execution roles.

Next Step

Use an Amazon S3 bucket for input and output

Use an Amazon S3 bucket for input and output

Set up a S3 bucket to upload training datasets and save training output data for your hyperparameter tuning job.

To use a default S3 bucket

Use the following code to specify the default S3 bucket allocated for your SageMaker AI session. `prefix` is the path within the bucket where SageMaker AI stores the data for the current training job.

```
sess = sagemaker.Session()
bucket = sess.default_bucket() # Set a default S3 bucket
prefix = 'DEMO-automatic-model-tuning-xgboost-dm'
```

To use a specific S3 bucket (Optional)

If you want to use a specific S3 bucket, use the following code and replace the strings to the exact name of the S3 bucket. The name of the bucket must contain **`sagemaker`**, and be globally unique. The bucket must be in the same Amazon Region as the notebook instance that you use for this example.

```
bucket = "sagemaker-your-preferred-s3-bucket"

sess = sagemaker.Session(
    default_bucket = bucket
)
```

> **Note**
>
> The name of the bucket doesn't need to contain **`sagemaker`** if the IAM role that you use to run the hyperparameter tuning job has a policy that gives the `S3FullAccess` permission.

Next Step

Download, Prepare, and Upload Training Data

Download, Prepare, and Upload Training Data

For this example, you use a training dataset of information about bank customers that includes the customer's job, marital status, and how they were contacted during the bank's direct marketing campaign. To use a dataset for a hyperparameter tuning job, you download it, transform the data, and then upload it to an Amazon S3 bucket.

For more information about the dataset and the data transformation that the example performs, see the *hpo_xgboost_direct_marketing_sagemaker_APIs* notebook in the **Hyperparameter Tuning** section of the **SageMaker AI Examples** tab in your notebook instance.

Download and Explore the Training Dataset

To download and explore the dataset, run the following code in your notebook:

```
!wget -N https://archive.ics.uci.edu/ml/machine-learning-databases/00222/bank-
additional.zip
!unzip -o bank-additional.zip
data = pd.read_csv('./bank-additional/bank-additional-full.csv', sep=';')
pd.set_option('display.max_columns', 500)     # Make sure we can see all of the columns
pd.set_option('display.max_rows', 5)         # Keep the output on one page
data
```

Prepare and Upload Data

Before creating the hyperparameter tuning job, prepare the data and upload it to an S3 bucket where the hyperparameter tuning job can access it.

Run the following code in your notebook:

```
data['no_previous_contact'] = np.where(data['pdays'] == 999, 1, 0)
            # Indicator variable to capture when pdays takes a value of 999
data['not_working'] = np.where(np.in1d(data['job'], ['student', 'retired',
 'unemployed']), 1, 0)   # Indicator for individuals not actively employed
model_data = pd.get_dummies(data)
            # Convert categorical variables to sets of indicators
model_data
model_data = model_data.drop(['duration', 'emp.var.rate', 'cons.price.idx',
 'cons.conf.idx', 'euribor3m', 'nr.employed'], axis=1)

train_data, validation_data, test_data = np.split(model_data.sample(frac=1,
 random_state=1729), [int(0.7 * len(model_data)), int(0.9*len(model_data))])

pd.concat([train_data['y_yes'], train_data.drop(['y_no', 'y_yes'], axis=1)],
 axis=1).to_csv('train.csv', index=False, header=False)
pd.concat([validation_data['y_yes'], validation_data.drop(['y_no', 'y_yes'], axis=1)],
 axis=1).to_csv('validation.csv', index=False, header=False)
pd.concat([test_data['y_yes'], test_data.drop(['y_no', 'y_yes'], axis=1)],
 axis=1).to_csv('test.csv', index=False, header=False)
```

```
boto3.Session().resource('s3').Bucket(bucket).Object(os.path.join(prefix, 'train/
train.csv')).upload_file('train.csv')
boto3.Session().resource('s3').Bucket(bucket).Object(os.path.join(prefix, 'validation/
validation.csv')).upload_file('validation.csv')
```

Next Step

Configure and Launch a Hyperparameter Tuning Job

Configure and Launch a Hyperparameter Tuning Job

> **Important**
>
> Custom IAM policies that allow Amazon SageMaker Studio or Amazon SageMaker Studio Classic to create Amazon SageMaker resources must also grant permissions to add tags to those resources. The permission to add tags to resources is required because Studio and Studio Classic automatically tag any resources they create. If an IAM policy allows Studio and Studio Classic to create resources but does not allow tagging, "AccessDenied" errors can occur when trying to create resources. For more information, see Provide permissions for tagging SageMaker AI resources.
> Amazon managed policies for Amazon SageMaker AI that give permissions to create SageMaker resources already include permissions to add tags while creating those resources.

A hyperparameter is a high-level parameter that influences the learning process during model training. To get the best model predictions, you can optimize a hyperparameter configuration or set hyperparameter values. The process of finding an optimal configuration is called hyperparameter tuning. To configure and launch a hyperparameter tuning job, complete the steps in these guides.

Topics

- Settings for the hyperparameter tuning job
- Configure the training jobs
- Name and launch the hyperparameter tuning job
- Monitor the Progress of a Hyperparameter Tuning Job

- View the Status of the Training Jobs
- View the Best Training Job

Settings for the hyperparameter tuning job

To specify settings for the hyperparameter tuning job, define a JSON object when you create the tuning job. Pass this JSON object as the value of the `HyperParameterTuningJobConfig` parameter to the `CreateHyperParameterTuningJob` API.

In this JSON object, specify the following:

In this JSON object, you specify:

- `HyperParameterTuningJobObjective` – The objective metric used to evaluate the performance of the training job launched by the hyperparameter tuning job.
- `ParameterRanges` – The range of values that a tunable hyperparameter can use during optimization. For more information, see Define Hyperparameter Ranges
- `RandomSeed` – A value used to initialize a pseudo-random number generator. Setting a random seed will allow the hyperparameter tuning search strategies to produce more consistent configurations for the same tuning job (optional).
- `ResourceLimits` – The maximum number of training and parallel training jobs that the hyperparameter tuning job can use.

> **Note**
>
> If you use your own algorithm for hyperparameter tuning, rather than a SageMaker AI built-in algorithm, you must define metrics for your algorithm. For more information, see Define metrics.

The following code example shows how to configure a hyperparameter tuning job using the built-in XGBoost algorithm. The code example shows how to define ranges for the `eta`, `alpha`, `min_child_weight`, and `max_depth` hyperparameters. For more information about these and other hyperparameters see XGBoost Parameters.

In this code example, the objective metric for the hyperparameter tuning job finds the hyperparameter configuration that maximizes `validation:auc`. SageMaker AI built-in algorithms

automatically write the objective metric to CloudWatch Logs. The following code example also shows how to set a RandomSeed.

```
tuning_job_config = {
    "ParameterRanges": {
      "CategoricalParameterRanges": [],
      "ContinuousParameterRanges": [
        {
          "MaxValue": "1",
          "MinValue": "0",
          "Name": "eta"
        },
        {
          "MaxValue": "2",
          "MinValue": "0",
          "Name": "alpha"
        },
        {
          "MaxValue": "10",
          "MinValue": "1",
          "Name": "min_child_weight"
        }
      ],
      "IntegerParameterRanges": [
        {
          "MaxValue": "10",
          "MinValue": "1",
          "Name": "max_depth"
        }
      ]
    },
    "ResourceLimits": {
      "MaxNumberOfTrainingJobs": 20,
      "MaxParallelTrainingJobs": 3
    },
    "Strategy": "Bayesian",
    "HyperParameterTuningJobObjective": {
      "MetricName": "validation:auc",
      "Type": "Maximize"
    },
    "RandomSeed" : 123
  }
```

Configure the training jobs

The hyperparameter tuning job will launch training jobs to find an optimal configuration of hyperparameters. These training jobs should be configured using the SageMaker AI `CreateHyperParameterTuningJob` API.

To configure the training jobs, define a JSON object and pass it as the value of the `TrainingJobDefinition` parameter inside `CreateHyperParameterTuningJob`.

In this JSON object, you can specify the following:

- `AlgorithmSpecification` – The registry path of the Docker image containing the training algorithm and related metadata. To specify an algorithm, you can use your own custom built algorithm inside a Docker container or a SageMaker AI built-in algorithm (required).
- `InputDataConfig` – The input configuration, including the `ChannelName`, `ContentType`, and data source for your training and test data (required).
- `InputDataConfig` – The input configuration, including the `ChannelName`, `ContentType`, and data source for your training and test data (required).
- The storage location for the algorithm's output. Specify the S3 bucket where you want to store the output of the training jobs.
- `RoleArn` – The Amazon Resource Name (ARN) of an Amazon Identity and Access Management (IAM) role that SageMaker AI uses to perform tasks. Tasks include reading input data, downloading a Docker image, writing model artifacts to an S3 bucket, writing logs to Amazon CloudWatch Logs, and writing metrics to Amazon CloudWatch (required).
- `StoppingCondition` – The maximum runtime in seconds that a training job can run before being stopped. This value should be greater than the time needed to train your model (required).
- `MetricDefinitions` – The name and regular expression that defines any metrics that the training jobs emit. Define metrics only when you use a custom training algorithm. The example in the following code uses a built-in algorithm, which already has metrics defined. For information about defining metrics (optional), see Define metrics.
- `TrainingImage` – The Dockercontainer image that specifies the training algorithm (optional).
- `StaticHyperParameters` – The name and values of hyperparameters that are not tuned in the tuning job (optional).

The following code example sets static values for the `eval_metric`, `num_round`, `objective`, `rate_drop`, and `tweedie_variance_power` parameters of the XGBoost algorithm with Amazon SageMaker AI built-in algorithm.

SageMaker Python SDK v1

```
from sagemaker.amazon.amazon_estimator import get_image_uri
training_image = get_image_uri(region, 'xgboost', repo_version='1.0-1')

```

Name and launch the hyperparameter tuning job

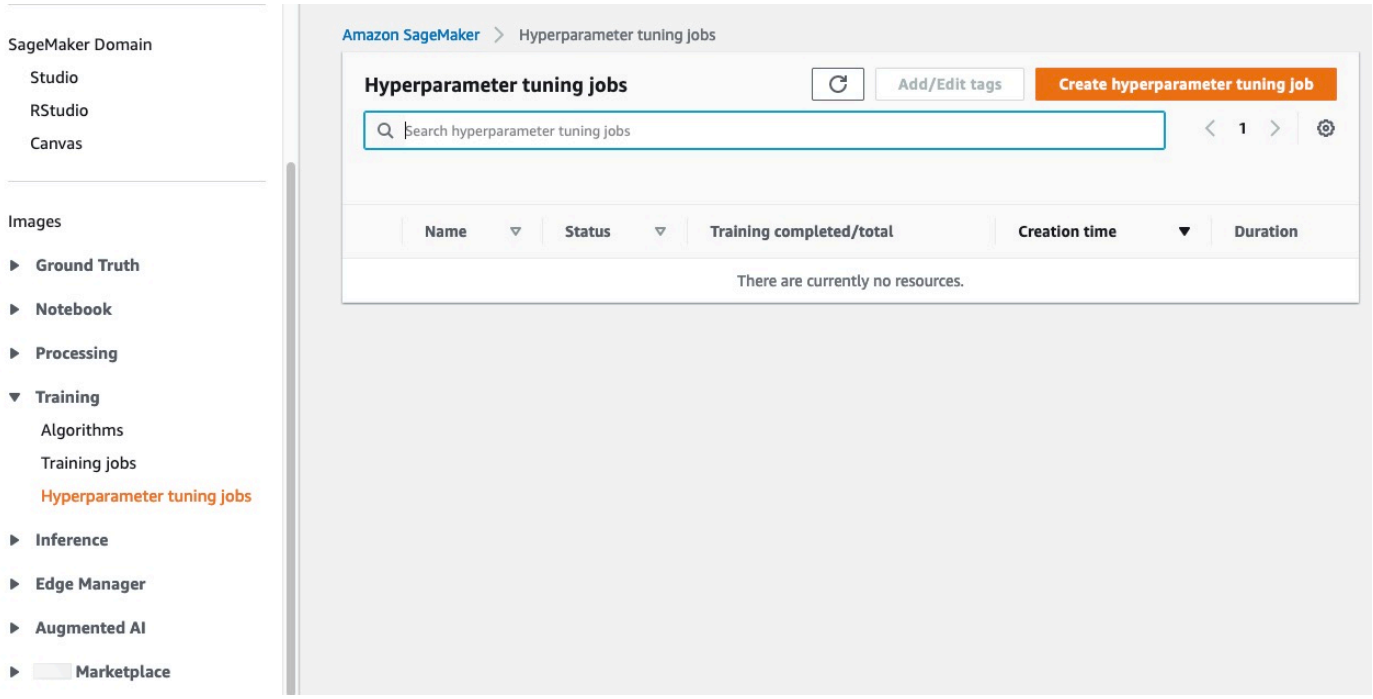
After you configure the hyperparameter tuning job, you can launch it by calling the `CreateHyperParameterTuningJob` API. The following code example uses

`tuning_job_config` and `training_job_definition`. These were defined in the previous two code examples to create a hyperparameter tuning job.

```
tuning_job_name = "MyTuningJob"
smclient.create_hyper_parameter_tuning_job(HyperParameterTuningJobName =
 tuning_job_name,
                                            HyperParameterTuningJobConfig =
 tuning_job_config,
                                            TrainingJobDefinition =
 training_job_definition)
```

Monitor the Progress of a Hyperparameter Tuning Job

To monitor the progress of a hyperparameter tuning job and the training jobs that it launches, use the Amazon SageMaker AI console.



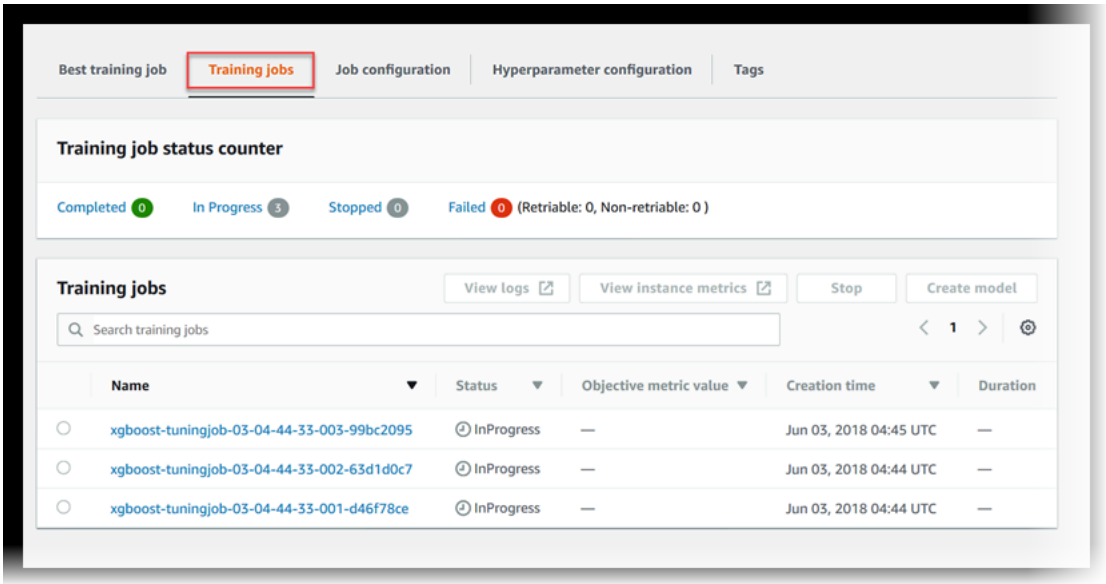
Topics

- View the Status of the Hyperparameter Tuning Job

View the Status of the Hyperparameter Tuning Job

To view the status of the hyperparameter tuning job

1. Open the Amazon SageMaker AI console at https://console.amazonaws.cn/sagemaker/.
2. Choose **Hyperparameter tuning jobs**.



3. In the list of hyperparameter tuning jobs, check the status of the hyperparameter tuning job you launched. A tuning job can be:

   - `Completed`—The hyperparameter tuning job successfully completed.
   - `InProgress`—The hyperparameter tuning job is in progress. One or more training jobs are still running.
   - `Failed`—The hyperparameter tuning job failed.
   - `Stopped`—The hyperparameter tuning job was manually stopped before it completed. All training jobs that the hyperparameter tuning job launched are stopped.
   - `Stopping`—The hyperparameter tuning job is in the process of stopping.

View the Status of the Training Jobs

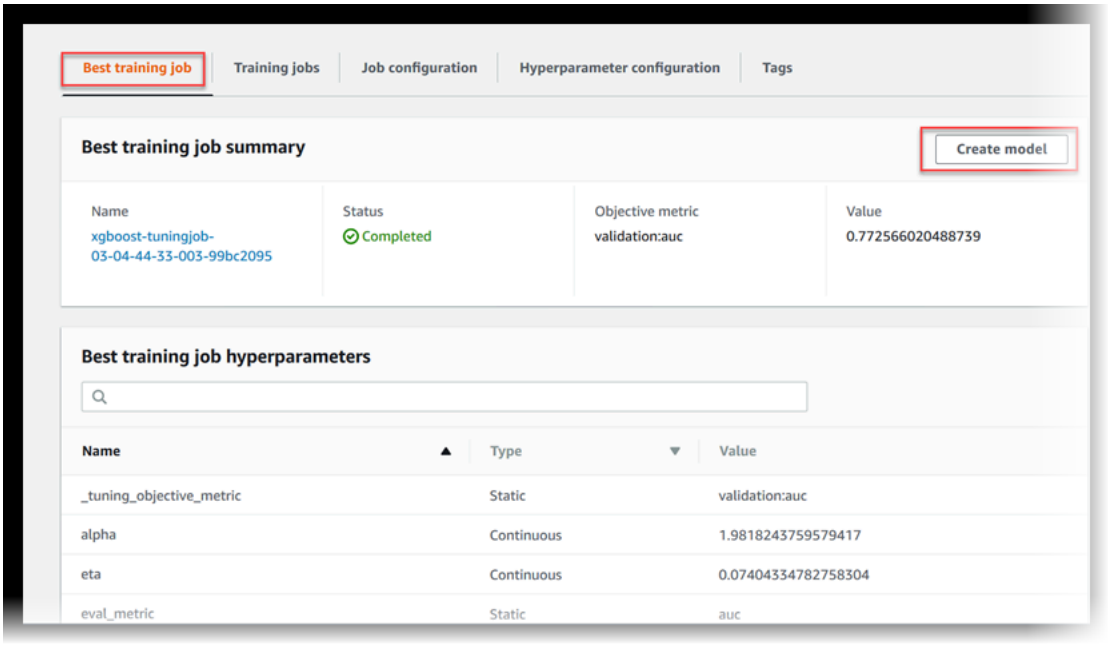
To view the status of the training jobs that the hyperparameter tuning job launched

1. In the list of hyperparameter tuning jobs, choose the job that you launched.
2. Choose **Training jobs**.

3. View the status of each training job. To see more details about a job, choose it in the list of training jobs. To view a summary of the status of all of the training jobs that the hyperparameter tuning job launched, see **Training job status counter**.

   A training job can be:

   - `Completed`—The training job successfully completed.
   - `InProgress`—The training job is in progress.
   - `Stopped`—The training job was manually stopped before it completed.
   - `Failed (Retryable)`—The training job failed, but can be retried. A failed training job can be retried only if it failed because an internal service error occurred.
   - `Failed (Non-retryable)`—The training job failed and can't be retried. A failed training job can't be retried when a client error occurs.



> **Note**
>
> Hyperparameter tuning jobs can be stopped and the underlying resources deleted, but the jobs themselves cannot be deleted.

View the Best Training Job

A hyperparameter tuning job uses the objective metric that each training job returns to evaluate training jobs. While the hyperparameter tuning job is in progress, the best training job is the one

that has returned the best objective metric so far. After the hyperparameter tuning job is complete, the best training job is the one that returned the best objective metric.

To view the best training job, choose **Best training job**.

To deploy the best training job as a model that you can host at a SageMaker AI endpoint, choose **Create model**.

Next Step

Clean up

Clean up

To avoid incurring unnecessary charges, when you are done with the example, use the Amazon Web Services Management Console to delete the resources that you created for it.

> **Note**
>
> If you plan to explore other examples, you might want to keep some of these resources, such as your notebook instance, S3 bucket, and IAM role.

1. Open the SageMaker AI console at https://console.amazonaws.cn/sagemaker/ and delete the notebook instance. Stop the instance before deleting it.

2. Open the Amazon S3 console at https://console.amazonaws.cn/s3/ and delete the bucket that you created to store model artifacts and the training dataset.
3. Open the IAM console at https://console.amazonaws.cn/iam/ and delete the IAM role. If you created permission policies, you can delete them, too.
4. Open the Amazon CloudWatch console at https://console.amazonaws.cn/cloudwatch/ and delete all of the log groups that have names starting with `/aws/sagemaker/`.

Stop Training Jobs Early

Stop the training jobs that a hyperparameter tuning job launches early when they are not improving significantly as measured by the objective metric. Stopping training jobs early can help reduce compute time and helps you avoid overfitting your model. To configure a hyperparameter tuning job to stop training jobs early, do one of the following:

- If you are using the Amazon SDK for Python (Boto3), set the `TrainingJobEarlyStoppingType` field of the `HyperParameterTuningJobConfig` object that you use to configure the tuning job to `AUTO`.
- If you are using the Amazon SageMaker Python SDK, set the `early_stopping_type` parameter of the HyperParameterTuner object to `Auto`.
- In the Amazon SageMaker AI console, in the **Create hyperparameter tuning job** workflow, under **Early stopping**, choose **Auto**.

For a sample notebook that demonstrates how to use early stopping, see https://github.com/awslabs/amazon-sagemaker-examples/blob/master/hyperparameter_tuning/image_classification_early_stopping/hpo_image_classification_early_stopping.ipynb or open the `hpo_image_classification_early_stopping.ipynb` notebook in the **Hyperparameter Tuning** section of the **SageMaker AI Examples** in a notebook instance.

How Early Stopping Works

When you enable early stopping for a hyperparameter tuning job, SageMaker AI evaluates each training job the hyperparameter tuning job launches as follows:

- After each epoch of training, get the value of the objective metric.
- Compute the running average of the objective metric for all previous training jobs up to the same epoch, and then compute the median of all of the running averages.

- If the value of the objective metric for the current training job is worse (higher when minimizing or lower when maximizing the objective metric) than the median value of running averages of the objective metric for previous training jobs up to the same epoch, SageMaker AI stops the current training job.

Algorithms That Support Early Stopping

To support early stopping, an algorithm must emit objective metrics for each epoch. The following built-in SageMaker AI algorithms support early stopping:

- LightGBM
- CatBoost
- AutoGluon-Tabular
- TabTransformer
- Linear Learner Algorithm—Supported only if you use `objective_loss` as the objective metric.
- XGBoost algorithm with Amazon SageMaker AI
- Image Classification - MXNet
- Object Detection - MXNet
- Sequence-to-Sequence Algorithm
- IP Insights

> **Note**
>
> This list of built-in algorithms that support early stopping is current as of December 13, 2018. Other built-in algorithms might support early stopping in the future. If an algorithm emits a metric that can be used as an objective metric for a hyperparameter tuning job (preferably a validation metric), then it supports early stopping.

To use early stopping with your own algorithm, you must write your algorithms such that it emits the value of the objective metric after each epoch. The following list shows how you can do that in different frameworks:

TensorFlow

Use the `tf.keras.callbacks.ProgbarLogger` class. For information, see the tf.keras.callbacks.ProgbarLogger API.

MXNet

Use the `mxnet.callback.LogValidationMetricsCallback`. For information, see the mxnet.callback APIs.

Chainer

Extend chainer by using the `extensions.Evaluator` class. For information, see the chainer.training.extensions.Evaluator API.

PyTorch and Spark

There is no high-level support. You must explicitly write your training code so that it computes objective metrics and writes them to logs after each epoch.

Run a Warm Start Hyperparameter Tuning Job

Use warm start to start a hyperparameter tuning job using one or more previous tuning jobs as a starting point. The results of previous tuning jobs are used to inform which combinations of hyperparameters to search over in the new tuning job. Hyperparameter tuning uses either Bayesian or random search to choose combinations of hyperparameter values from ranges that you specify. For more information, see Understand the hyperparameter tuning strategies available in Amazon SageMaker AI. Using information from previous hyperparameter tuning jobs can help increase the performance of the new hyperparameter tuning job by making the search for the best combination of hyperparameters more efficient.

> **Note**
>
> Warm start tuning jobs typically take longer to start than standard hyperparameter tuning jobs, because the results from the parent jobs have to be loaded before the job can start. The increased time depends on the total number of training jobs launched by the parent jobs.

Reasons to consider warm start include the following:

- To gradually increase the number of training jobs over several tuning jobs based on results after each iteration.
- To tune a model using new data that you received.
- To change hyperparameter ranges that you used in a previous tuning job, change static hyperparameters to tunable, or change tunable hyperparameters to static values.
- You stopped a previous hyperparameter job early or it stopped unexpectedly.

Topics

- Types of Warm Start Tuning Jobs
- Warm Start Tuning Restrictions
- Warm Start Tuning Sample Notebook
- Create a Warm Start Tuning Job

Types of Warm Start Tuning Jobs

There are two different types of warm start tuning jobs:

`IDENTICAL_DATA_AND_ALGORITHM`

The new hyperparameter tuning job uses the same input data and training image as the parent tuning jobs. You can change the hyperparameter ranges to search and the maximum number of training jobs that the hyperparameter tuning job launches. You can also change hyperparameters from tunable to static, and from static to tunable, but the total number of static plus tunable hyperparameters must remain the same as it is in all parent jobs. You cannot use a new version of the training algorithm, unless the changes in the new version do not affect the algorithm itself. For example, changes that improve logging or adding support for a different data format are allowed.

Use identical data and algorithm when you use the same training data as you used in a previous hyperparameter tuning job, but you want to increase the total number of training jobs or change ranges or values of hyperparameters.

When you run an warm start tuning job of type `IDENTICAL_DATA_AND_ALGORITHM`, there is an additional field in the response to `DescribeHyperParameterTuningJob` named `OverallBestTrainingJob`. The value of this field is the TrainingJobSummary for the training

job with the best objective metric value of all training jobs launched by this tuning job and all parent jobs specified for the warm start tuning job.

`TRANSFER_LEARNING`

The new hyperparameter tuning job can include input data, hyperparameter ranges, maximum number of concurrent training jobs, and maximum number of training jobs that are different than those of its parent hyperparameter tuning jobs. You can also change hyperparameters from tunable to static, and from static to tunable, but the total number of static plus tunable hyperparameters must remain the same as it is in all parent jobs. The training algorithm image can also be a different version from the version used in the parent hyperparameter tuning job. When you use transfer learning, changes in the dataset or the algorithm that significantly affect the value of the objective metric might reduce the usefulness of using warm start tuning.

Warm Start Tuning Restrictions

The following restrictions apply to all warm start tuning jobs:

- A tuning job can have a maximum of 5 parent jobs, and all parent jobs must be in a terminal state (`Completed`, `Stopped`, or `Failed`) before you start the new tuning job.
- The objective metric used in the new tuning job must be the same as the objective metric used in the parent jobs.
- The total number of static plus tunable hyperparameters must remain the same between parent jobs and the new tuning job. Because of this, if you think you might want to use a hyperparameter as tunable in a future warm start tuning job, you should add it as a static hyperparameter when you create a tuning job.
- The type of each hyperparameter (continuous, integer, categorical) must not change between parent jobs and the new tuning job.
- The number of total changes from tunable hyperparameters in the parent jobs to static hyperparameters in the new tuning job, plus the number of changes in the values of static hyperparameters cannot be more than 10. For example, if the parent job has a tunable categorical hyperparameter with the possible values `red` and `blue`, you change that hyperparameter to static in the new tuning job, that counts as 2 changes against the allowed total of 10. If the same hyperparameter had a static value of `red` in the parent job, and you change the static value to `blue` in the new tuning job, it also counts as 2 changes.
- Warm start tuning is not recursive. For example, if you create `MyTuningJob3` as a warm start tuning job with `MyTuningJob2` as a parent job, and `MyTuningJob2` is itself an warm start

tuning job with a parent job `MyTuningJob1`, the information that was learned when running `MyTuningJob1` is not used for `MyTuningJob3`. If you want to use the information from `MyTuningJob1`, you must explicitly add it as a parent for `MyTuningJob3`.

- The training jobs launched by every parent job in a warm start tuning job count against the 500 maximum training jobs for a tuning job.
- Hyperparameter tuning jobs created before October 1, 2018 cannot be used as parent jobs for warm start tuning jobs.

Warm Start Tuning Sample Notebook

For a sample notebook that shows how to use warm start tuning, see https://github.com/awslabs/amazon-sagemaker-examples/blob/master/hyperparameter_tuning/image_classification_warmstart/hpo_image_classification_warmstart.ipynb.

Create a Warm Start Tuning Job

You can use either the low-level Amazon SDK for Python (Boto 3) or the high-level SageMaker AI Python SDK to create a warm start tuning job.

Topics

- Create a Warm Start Tuning Job (Low-level SageMaker AI API for Python (Boto 3))
- Create a Warm Start Tuning Job (SageMaker AI Python SDK)

Create a Warm Start Tuning Job (Low-level SageMaker AI API for Python (Boto 3))

To use warm start tuning, you specify the values of a `HyperParameterTuningJobWarmStartConfig` object, and pass that as the `WarmStartConfig` field in a call to `CreateHyperParameterTuningJob`.

The following code shows how to create a `HyperParameterTuningJobWarmStartConfig` object and pass it to `CreateHyperParameterTuningJob` job by using the low-level SageMaker AI API for Python (Boto 3).

Create the `HyperParameterTuningJobWarmStartConfig` object:

```
warm_start_config = {
          "ParentHyperParameterTuningJobs" : [
```

```
            {"HyperParameterTuningJobName" : 'MyParentTuningJob'}
            ],
            "WarmStartType" : "IdenticalDataAndAlgorithm"
}
```

Create the warm start tuning job:

```
smclient = boto3.Session().client('sagemaker')
smclient.create_hyper_parameter_tuning_job(HyperParameterTuningJobName =
 'MyWarmStartTuningJob',
   HyperParameterTuningJobConfig = tuning_job_config, # See notebook for tuning
 configuration
   TrainingJobDefinition = training_job_definition, # See notebook for job definition
   WarmStartConfig = warm_start_config)
```

Create a Warm Start Tuning Job (SageMaker AI Python SDK)

To use the Amazon SageMaker Python SDK to run a warm start tuning job, you:

- Specify the parent jobs and the warm start type by using a `WarmStartConfig` object.
- Pass the `WarmStartConfig` object as the value of the `warm_start_config` argument of a HyperparameterTuner object.
- Call the `tune` method of the `HyperparameterTuner` object.

For more information about using the Amazon SageMaker Python SDK for hyperparameter tuning, see https://github.com/aws/sagemaker-python-sdk#sagemaker-automatic-model-tuning.

This example uses an estimator that uses the Image Classification - MXNet algorithm for training. The following code sets the hyperparameter ranges that the warm start tuning job searches within to find the best combination of values. For information about setting hyperparameter ranges, see Define Hyperparameter Ranges.

```
hyperparameter_ranges = {'learning_rate': ContinuousParameter(0.0, 0.1),
                         'momentum': ContinuousParameter(0.0, 0.99)}
```

The following code configures the warm start tuning job by creating a `WarmStartConfig` object.

```
from sagemaker.train.tuner import WarmStartTypes
from sagemaker.core.shapes import HyperParameterTuningJobWarmStartConfig
```

```
parent_tuning_job_name = "MyParentTuningJob"
warm_start_config =
 HyperParameterTuningJobWarmStartConfig(warm_start_type=WarmStartTypes.IDENTICAL_DATA_AND_ALGOR
 parents=[parent_tuning_job_name])
```

Now set the values for static hyperparameters, which are hyperparameters that keep the same value for every training job that the warm start tuning job launches. In the following code, `imageclassification` is a ModelTrainer that was created previously.

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Compute

imageclassification = ModelTrainer(
    training_image=training_image,
    role=role,
    hyperparameters={
        'num_layers': '18',
        'image_shape': '3,224,224',
        'num_classes': '257',
        'num_training_samples': '15420',
        'mini_batch_size': '128',
        'epochs': '30',
        'optimizer': 'sgd',
        'top_k': '2',
        'precision_dtype': 'float32',
        'augmentation_type': 'crop',
    },
    compute=Compute(instance_type='ml.p3.8xlarge', instance_count=1),
)
```

Now create the `HyperparameterTuner` object and pass the `WarmStartConfig` object that you previously created as the `warm_start_config` argument.

```
tuner_warm_start = HyperparameterTuner(model_trainer=imageclassification,
                            objective_metric_name='validation:accuracy',
                            hyperparameter_ranges=hyperparameter_ranges,
                            objective_type='Maximize',
                            max_jobs=10,
                            max_parallel_jobs=2,
                            base_tuning_job_name='warmstart',
                            warm_start_config=warm_start_config)
```

Finally, call the `tune` or `fit` method of the `HyperparameterTuner` object to launch the warm start tuning job.

```
tuner_warm_start.tune(
        {'train': s3_input_train, 'validation': s3_input_validation})
```

Resource Limits for Automatic Model Tuning

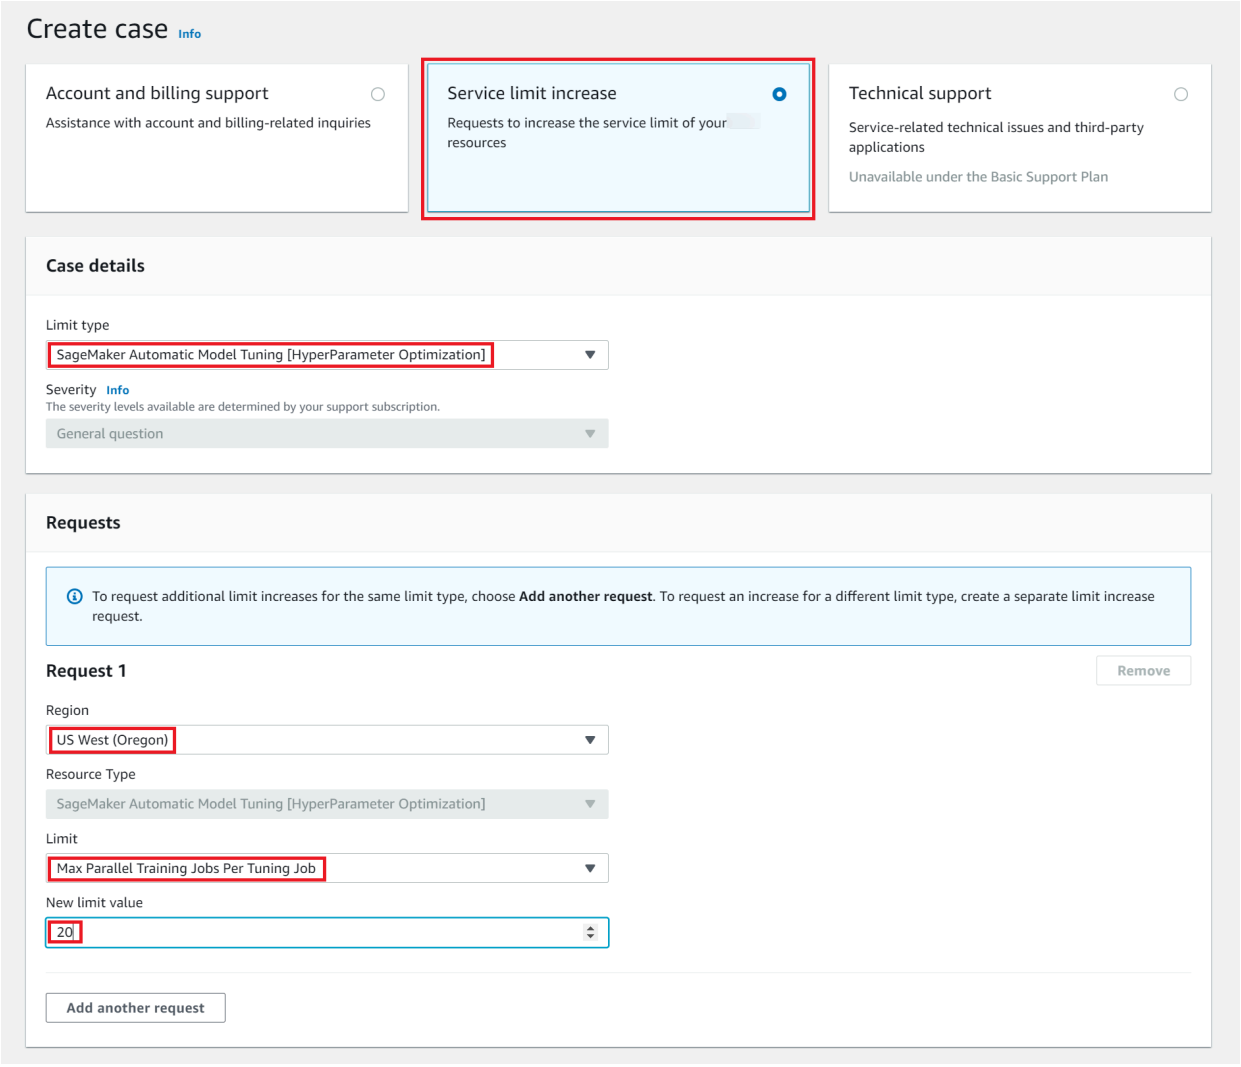
SageMaker AI sets the following default limits for resources used by automatic model tuning:

Resource	Regions	Default limits	Can be increased to
Number of parallel (concurrent) hyperparameter tuning jobs	All	100	N/A
Number of hyperparameters that can be searched *	All	30	N/A
Number of metrics defined per hyperparameter tuning job	All	20	N/A
Number of parallel training jobs per hyperparameter tuning job	All	10	100
[Bayesian optimization] Number of training jobs per hyperparameter tuning job	All	750	N/A
[Random search] Number of training	All	750	10000

Resource	Regions	Default limits	Can be increased to
jobs per hyperparameter tuning job			
[Hyperband] Number of training jobs per hyperparameter tuning job	All	750	N/A
[Grid] Number of training jobs per hyperparameter tuning job, either specified explicitly or inferred from the search space	All	750	N/A
Maximum run time for a hyperparameter tuning job	All	30 days	N/A

* Each categorical hyperparameter can have at most 30 different values.

Resource limit example



When you plan hyperparameter tuning jobs, you also have to take into account the limits on training resources. For information about the default resource limits for SageMaker AI training jobs, see SageMaker AI Limits. Every concurrent training instance on which all of your hyperparameter tuning jobs run counts against the total number of training instances allowed. For example, if you run 10 concurrent hyperparameter tuning jobs, each of those hyperparameter tuning jobs runs 100 total training jobs and 20 concurrent training jobs. Each of those training jobs runs on one **ml.m4.xlarge** instance. The following limits apply:

- Number of concurrent hyperparameter tuning jobs: You don't need to increase the limit, because 10 tuning jobs is below the limit of 100.
- Number of training jobs per hyperparameter tuning job: You don't need to increase the limit, because 100 training jobs is below the limit of 750.

- Number of concurrent training jobs per hyperparameter tuning job: You need to request a limit increase to 20, because the default limit is 10.
- SageMaker AI training **ml.m4.xlarge** instances: You need to request a limit increase to 200, because you have 10 hyperparameter tuning jobs, each of which is running 20 concurrent training jobs. The default limit is 20 instances.
- SageMaker AI training total instance count: You need to request a limit increase to 200, because you have 10 hyperparameter tuning jobs, each of which is running 20 concurrent training jobs. The default limit is 20 instances.

To request a quota increase:

1. Open the Amazon Support Center page, sign in if necessary, and then choose **Create case**.
2. On the **Create case** page, choose **Service limit increase**.
3. On the **Case details** panel, select **SageMaker AI Automatic Model Tuning [Hyperparameter Optimization]** for the **Limit type**
4. On the **Requests** panel for **Request 1**, select the **Region**, the resource **Limit** to increase and the **New Limit value** you are requesting. Select **Add another request** if you have additional requests for quota increases.

5. In the **Case description** panel, provide a description of your use case .
6. In the **Contact options** panel, select your preferred **Contact methods** (**Web**, **Chat** or **Phone**) and then choose **Submit**.

Best Practices for Hyperparameter Tuning

Hyperparameter optimization (HPO) is not a fully-automated process. To improve optimization, follow these best practices for hyperparameter tuning.

Topics

- Choosing a tuning strategy
- Choosing the number of hyperparameters
- Choosing hyperparameter ranges

- Using the correct scales for hyperparameters
- Choosing the best number of parallel training jobs
- Running training jobs on multiple instances
- Using a random seed to reproduce hyperparameter configurations

Choosing a tuning strategy

For large jobs, using the Hyperband tuning strategy can reduce computation time. Hyperband has an early stopping mechanism to stop under-performing jobs. Hyperband can also reallocate resources towards well-utilized hyperparameter configurations and run parallel jobs. For smaller training jobs using less runtime, use either random search or Bayesian optimization.

Use Bayesian optimization to make increasingly informed decisions about improving hyperparameter configurations in the next run. Bayesian optimization uses information gathered from prior runs to improve subsequent runs. Because of its sequential nature, Bayesian optimization cannot massively scale.

Use random search to run a large number of parallel jobs. In random search, subsequent jobs do not depend on the results from prior jobs and can be run independently. Compared to other strategies, random search is able to run the largest number of parallel jobs.

Use grid search to reproduce results of a tuning job, or if simplicity and transparency of the optimization algorithm are important. You can also use grid search to explore the entire hyperparameter search space evenly. Grid search methodically searches through every hyperparameter combination to find optimal hyperparameter values. Unlike grid search, Bayesian optimization, random search and Hyperband all draw hyperparameters randomly from the search space. Because grid search analyzes every combination of hyperparameters, optimal hyperparameter values will be identical between tuning jobs that use the same hyperparameters.

Choosing the number of hyperparameters

During optimization, the computational complexity of a hyperparameter tuning job depends on the following:

- The number of hyperparameters
- The range of values that Amazon SageMaker AI has to search

Although you can simultaneously specify up to 30 hyperparameters, limiting your search to a smaller number can reduce computation time. Reducing computation time allows SageMaker AI to converge more quickly to an optimal hyperparameter configuration.

Choosing hyperparameter ranges

The range of values that you choose to search can adversely affect hyperparameter optimization. For example, a range that covers every possible hyperparameter value can lead to large compute times and a model that doesn't generalize well to unseen data. If you know that using a subset of the largest possible range is appropriate for your use case, consider limiting the range to that subset.

Using the correct scales for hyperparameters

During hyperparameter tuning, SageMaker AI attempts to infer if your hyperparameters are log-scaled or linear-scaled. Initially, SageMaker AI assumes linear scaling for hyperparameters. If hyperparameters are log-scaled, choosing the correct scale will make your search more efficient. You can also select `Auto` for `ScalingType` in the CreateHyperParameterTuningJob API if you want SageMaker AI to detect the scale for you.

Choosing the best number of parallel training jobs

You can use the results of previous trials to improve the performance of subsequent trials. Choose the largest number of parallel jobs that would provide a meaningful incremental result that is also within your region and account compute constraints. Use the `MaxParallelTrainingJobs` field to limit the number of training jobs that a hyperparameter tuning job can launch in parallel. For more information, see Running multiple HPO jobs in parallel on Amazon SageMaker AI.

Running training jobs on multiple instances

When a training job runs on multiple machines in distributed mode, each machine emits an objective metric. HPO can only use one of these emitted objective metrics to evaluate model performance, In distributed mode, HPO uses the objective metric that was reported by the last running job across all instances.

Using a random seed to reproduce hyperparameter configurations

You can specify an integer as a random seed for hyperparameter tuning and use that seed during hyperparameter generation. Later, you can use the same seed to reproduce hyperparameter

configurations that are consistent with your previous results. For random search and Hyperband strategies, using the same random seed can provide up to 100% reproducibility of the previous hyperparameter configuration for the same tuning job. For Bayesian strategy, using the same random seed will improve reproducibility for the same tuning job.

Data refining during training with Amazon SageMaker smart sifting

SageMaker smart sifting is a capability of SageMaker Training that helps improve the efficiency of your training datasets and reduce total training time and cost.

Modern deep learning models such as large language models (LLMs) or vision transformer models often require massive datasets to achieve acceptable accuracy. For example, LLMs often require trillions of tokens or petabytes of data to converge. The growing size of training datasets, along with the size of state-of-the-art models, can increase the compute time and cost of model training.

Invariably, samples in a dataset do not contribute equally to the learning process during model training. A significant proportion of computational resources provisioned during training might be spent on processing easy samples that do not contribute substantially to the overall accuracy of a model. Ideally, training datasets would only include samples that are actually improving the model convergence. Filtering out less helpful data can reduce training time and compute cost. However, identifying less helpful data can be challenging and risky. It is practically difficult to identify which samples are less informative before training, and model accuracy can be impacted if the wrong samples or too many samples are excluded.

Smart sifting of data with Amazon SageMaker AI can help reduce training time and cost by improving data efficiency. The SageMaker smart sifting algorithm evaluates the loss value of each data during the data loading stage of a training job and excludes samples which are less informative to the model. By using refined data for training, the total time and cost of training your model is reduced by eliminating unnecessary forward and backward passes on non-improving data. Therefore, there is minimal or no impact on the accuracy of the model.

SageMaker smart sifting is available through SageMaker Training Deep Learning Containers (DLCs) and supports PyTorch workloads via the PyTorch `DataLoader`. Just a few lines of code change are needed to implement SageMaker smart sifting and you do not need to change your existing training or data processing workflows.

How SageMaker smart sifting works

The goal of SageMaker smart sifting is to sift through your training data during the training process and only feed more informative samples to the model. During typical training with PyTorch, data is iteratively sent in batches to the training loop and to accelerator devices (such as GPUs or Trainium chips) by the PyTorch `DataLoader`. SageMaker smart sifting is implemented at this data loading stage and is thus independent of any upstream data pre-processing in your training pipeline. SageMaker smart sifting uses your model and its user-specified loss function to do an evaluative forward pass of each data sample as it is loaded. Samples that return *low-loss* values have less of an impact on the model's learning and are thus excluded from training, because it is already *easy* for the model to make the right prediction about them with high confidence. Meanwhile, those relatively high-loss samples are what the model still needs to learn, so these are kept for training. A key input you can set for SageMaker smart sifting is the proportion of data to exclude. For example, by setting the proportion to 25%, samples distributed in the lowest quartile of the distribution of loss (taken from a user-specified number of previous samples) are excluded from training. High-loss samples are accumulated in a refined data batch. The refined data batch is sent to the training loop (forward and backward pass), and the model learns and trains on the refined data batch.

The following diagram shows an overview of how the SageMaker smart sifting algorithm is designed.

In short, SageMaker smart sifting operates during training as data is loaded. The SageMaker smart sifting algorithm runs loss calculation over the batches, and sifts non-improving data out before the forward and backward pass of each iteration. The refined data batch is then used for the forward and backward pass.

> **Note**
>
> Smart sifting of data on SageMaker AI uses additional forward passes to analyze and filter your training data. In turn, there are fewer backward passes as less impactful data

is excluded from your training job. Because of this, models which have long or expensive backward passes see the greatest efficiency gains when using smart sifting. Meanwhile, if your model's forward pass takes longer than its backward pass, overhead could increase total training time. To measure the time spent by each pass, you can run a pilot training job and collect logs that record the time on the processes. Also consider using SageMaker Profiler that provides profiling tools and UI application. To learn more, see Amazon SageMaker Profiler.

SageMaker smart sifting works for PyTorch-based training jobs with classic distributed data parallelism, which makes model replicas on each GPU worker and performs `AllReduce`. It works with PyTorch DDP and the SageMaker AI distributed data parallel library.

Supported frameworks and Amazon Regions

Before using SageMaker smart sifting data loader, check if your framework of choice is supported, that the instance types are available in your Amazon account, and that your Amazon account is in one of the supported Amazon Regions.

Note

SageMaker smart sifting supports PyTorch model training with traditional data parallelism and distributed data parallelism, which makes model replicas in all GPU workers and uses the `AllReduce` operation. It doesn't work with model parallelism techniques, including sharded data parallelism. Because SageMaker smart sifting works for data parallelism jobs, make sure that the model you train fits in each GPU memory.

Supported Frameworks

SageMaker smart sifting supports the following deep learning frameworks and is available through Amazon Deep Learning Containers.

Topics

- PyTorch

PyTorch

Framework	Framework version	Deep Learning Container URI	
PyTorch	2.1.0	*763104351884* .dkr.ecr.*region*.amazonaws.com/pytorch-training:2.1.0-gpu-py310-cu121-ubuntu20.04-sagemaker	

For more information about the pre-built containers, see SageMaker AI Framework Containers in the *Amazon Deep Learning Containers GitHub repository*.

Amazon Web Services Regions

The containers packaged with the SageMaker smart sifting library are available in the Amazon Web Services Regions where Amazon Deep Learning Containers are in service.

Instance types

You can use SageMaker smart sifting for any PyTorch training jobs on any instance types. We recommend that you use P4d, P4de, or P5 instances.

SageMaker smart sifting within your training script

The SageMaker smart sifting library is packaged in the SageMaker AI framework DLCs as a complementary library. It provides a filtering logic against training samples that have relatively lower impact on model training, and your model can reach the desired model accuracy with fewer training samples when compared to the model training with full data samples.

To learn how to implement the smart sifting tool into your training script, choose one of the following based on the framework you use.

Topics

- Apply SageMaker smart sifting to your PyTorch script

- Apply SageMaker smart sifting to your Hugging Face Transformers script

Apply SageMaker smart sifting to your PyTorch script

These instructions demonstrate how to enable SageMaker smart sifting with your training script.

1. Configure the SageMaker smart sifting interface.

   The SageMaker smart sifting library implements a relative-threshold loss-based sampling technique that helps filter out samples with lower impact on reducing the loss value. The SageMaker smart sifting algorithm calculates the loss value of every input data sample using a forward pass, and calculates its relative percentile against the loss values of preceding data.

   The following two parameters are what you need to specify to the `RelativeProbabilisticSiftConfig` class for creating a sifting configuration object.

   - Specify the proportion of data that should be used for training to the `beta_value` parameter.
   - Specify the number of samples used in the comparison with the `loss_history_length` parameter.

   The following code example demonstrates setting up an object of the `RelativeProbabilisticSiftConfig` class.

```
from smart_sifting.sift_config.sift_configs import (
    RelativeProbabilisticSiftConfig
    LossConfig
    SiftingBaseConfig
)

sift_config=RelativeProbabilisticSiftConfig(
    beta_value=0.5,
    loss_history_length=500,
    loss_based_sift_config=LossConfig(
         sift_config=SiftingBaseConfig(sift_delay=0)
    )
)
```

For more information about the `loss_based_sift_config` parameter and related classes, see the section called "SageMaker smart sifting configuration modules" in the SageMaker smart sifting Python SDK reference section.

The `sift_config` object in the preceding code example is used in step 4 for setting up the `SiftingDataloader` class.

2. (Optional) Configure a SageMaker smart sifting batch transform class.

   Different training use cases require different training data formats. Given the variety of data formats, the SageMaker smart sifting algorithm needs to identify how to perform sifting on a particular batch. To address this, SageMaker smart sifting provides a batch transform module that helps convert batches into standardized formats that it can efficiently sift.

   a. SageMaker smart sifting handles batch transform of training data in the following formats: Python lists, dictionaries, tuples, and tensors. For these data formats, SageMaker smart sifting automatically handles the batch data format conversion, and you can skip the rest of this step. If you skip this step, in step 4 for configuring `SiftingDataloader`, leave the `batch_transforms` parameter of `SiftingDataloader` to its default value, which is `None`.

   b. If your dataset is not in these format, you should proceed to the rest of this step to create a custom batch transform using `SiftingBatchTransform`.

      In cases in which your dataset isn't in one of the supported formats by SageMaker smart sifting, you might run into errors. Such data format errors can be resolved by adding the `batch_format_index` or `batch_transforms` parameter to the `SiftingDataloader` class, which you set up in step 4. The following shows example errors due to an incompatible data format and resolutions for them.

Error Message	Resolution
Batches of type *`{type(batch)}`* are not supported by default.	This error indicates the batch format is not supported by default. You should implement a custom batch transform class, and use this by specifying it to the `batch_transforms` parameter of the `SiftingDataloader` class.

Error Message	Resolution
Unable to index the batch of type *{type(batch)}*	This error indicates the batch object cannot be indexed normally. User must implement a custom batch transform and pass this using the `batch_transforms` parameter.
Batch size *{batch_size}* does not match dimension 0 or dimension 1 sizes	This error occurs when the provided batch size does not match the 0th or 1st dimensions of the batch. User must implement a custom batch transform and pass this using the `batch_transforms` parameter.
Both dimension 0 and dimension 1 match batch size	This error indicates that since multiple dimensions match the provided batch size, more information is required to sift the batch. The user can provide the `batch_format_index` parameter to indicate if the batch is indexable by sample or feature. Users may also implement a custom batch transform, but this is more work than required.

To resolve the aforementioned issues, you need to create a custom batch transform class using the `SiftingBatchTransform` module. A batch transform class should consist of a pair of transform and reverse-transform functions. The function pair converts your data format to a format that SageMaker smart sifting algorithm can process. After you create a batch transform class, the class returns a `SiftingBatch` object that you'll pass to the `SiftingDataloader` class in step 4.

The following are examples of custom batch transform classes of the `SiftingBatchTransform` module.

- An example of a custom list batch transform implementation with SageMaker smart sifting for cases where the dataloader chunk has inputs, masks, and labels.

```
from typing import Any

import torch

from smart_sifting.data_model.data_model_interface import
 SiftingBatchTransform
from smart_sifting.data_model.list_batch import ListBatch

class ListBatchTransform(SiftingBatchTransform):
    def transform(self, batch: Any):
        inputs = batch[0].tolist()
        labels = batch[-1].tolist()  # assume the last one is the list of
 labels
        return ListBatch(inputs, labels)

    def reverse_transform(self, list_batch: ListBatch):
        a_batch = [torch.tensor(list_batch.inputs),
 torch.tensor(list_batch.labels)]
        return a_batch
```

- An example of a custom list batch transform implementation with SageMaker smart sifting for cases where no labels are needed for reverse transformation.

```
class ListBatchTransformNoLabels(SiftingBatchTransform):
    def transform(self, batch: Any):
        return ListBatch(batch[0].tolist())

    def reverse_transform(self, list_batch: ListBatch):
        a_batch = [torch.tensor(list_batch.inputs)]
        return a_batch
```

- An example of a custom tensor batch implementation with SageMaker smart sifting for cases where the data loader chunk has inputs, masks, and labels.

```
from typing import Any

from smart_sifting.data_model.data_model_interface import
 SiftingBatchTransform
from smart_sifting.data_model.tensor_batch import TensorBatch

class TensorBatchTransform(SiftingBatchTransform):
    def transform(self, batch: Any):
```

```
        a_tensor_batch = TensorBatch(
            batch[0], batch[-1]
        )  # assume the last one is the list of labels
        return a_tensor_batch

    def reverse_transform(self, tensor_batch: TensorBatch):
        a_batch = [tensor_batch.inputs, tensor_batch.labels]
        return a_batch
```

After you create a `SiftingBatchTransform`-implemted batch transform class, you use this class in step 4 for setting up the `SiftingDataloader` class. The rest of this guide assumes that a `ListBatchTransform` class is created. In step 4, this class is passed to the `batch_transforms`.

3. Create a class for implementing the SageMaker smart sifting `Loss` interface. This tutorial assumes that the class is named `SiftingImplementedLoss`. While setting up this class, we recommend that you use the same loss function in the model training loop. Go through the following substeps for creating a SageMaker smart sifting `Loss` implemented class.

   a. SageMaker smart sifting calculates a loss value for each training data sample, as opposed to calculating a single loss value for a batch. To ensure that SageMaker smart sifting uses the same loss calculation logic, create a smart-sifting-implemented loss function using the SageMaker smart sifting `Loss` module that uses your loss function and calculates loss per training sample.

   > **Tip**
   >
   > SageMaker smart sifting algorithm runs on every data sample, not on the entire batch, so you should add an initialization function to set the PyTorch loss function without any reduction strategy.
   >
   > ```
   > class SiftingImplementedLoss(Loss):
   >     def __init__(self):
   >         self.loss = torch.nn.CrossEntropyLoss(reduction='none')
   > ```
   >
   > This is also shown in the following code example.

   b. Define a loss function that accepts the `original_batch` (or `transformed_batch` if you have set up a batch transform in step 2) and the PyTorch model. Using the specified loss

function with no reduction, SageMaker smart sifting runs a forward pass for each data sample to evaluate its loss value.

The following code is an example of a smart-sifting-implemented `Loss` interface named `SiftingImplementedLoss`.

```
from typing import Any

import torch
import torch.nn as nn
from torch import Tensor

from smart_sifting.data_model.data_model_interface import SiftingBatch
from smart_sifting.loss.abstract_sift_loss_module import Loss

model=... # a PyTorch model based on torch.nn.Module

class SiftingImplementedLoss(Loss):
    # You should add the following initializaztion function
    # to calculate loss per sample, not per batch.
    def __init__(self):
        self.loss_no_reduction = torch.nn.CrossEntropyLoss(reduction='none')

    def loss(
        self,
        model: torch.nn.Module,
        transformed_batch: SiftingBatch,
        original_batch: Any = None,
    ) -> torch.Tensor:
        device = next(model.parameters()).device
        batch = [t.to(device) for t in original_batch] # use this if you use
 original batch and skipped step 2
        # batch = [t.to(device) for t in transformed_batch] # use this if you
 transformed batches in step 2

        # compute loss
        outputs = model(batch)
        return self.loss_no_reduction(outputs.logits, batch[2])
```

Before the training loop hits the actual forward pass, this sifting loss calculation is done during the data loading phase of fetching a batch in each iteration. The individual loss value is then

compared to previous loss values, and its relative percentile is estimated per the object of `RelativeProbabilisticSiftConfig` you have set up in step 1.

4. Wrap the PyTroch data loader by the SageMaker AI `SiftingDataloader` class.

   Finally, use all the SageMaker smart sifting implemented classes you configured in the previous steps to the SageMaker AI `SiftingDataloder` configuration class. This class is a wrapper for PyTorch `DataLoader`. By wrapping PyTorch `DataLoader`, SageMaker smart sifting is registered to run as part of data loading in each iteration of a PyTorch training job. The following code example demonstrates implementing SageMaker AI data sifting to a PyTorch `DataLoader`.

```
from smart_sifting.dataloader.sift_dataloader import SiftingDataloader
from torch.utils.data import DataLoader

train_dataloader = DataLoader(...) # PyTorch data loader

# Wrap the PyTorch data loader by SiftingDataloder
train_dataloader = SiftingDataloader(
    sift_config=sift_config, # config object of RelativeProbabilisticSiftConfig
    orig_dataloader=train_dataloader,
    batch_transforms=ListBatchTransform(), # Optional, this is the custom class
 from step 2
    loss_impl=SiftingImplementedLoss(), # PyTorch loss function wrapped by the
 Sifting Loss interface
    model=model,
    log_batch_data=False
)
```

Apply SageMaker smart sifting to your Hugging Face Transformers script

There are two ways to implement the SageMaker smart sifting into the Transformers `Trainer` class.

> **Note**
>
> If you use one of the DLCs for PyTorch with the SageMaker smart sifting package installed, note that you need to install the `transformers` library. You can install additional packages by extending the DLCs or passing `requirements.txt` to the training job

launcher class for PyTorch (sagemaker.pytorch.PyTorch) in the SageMaker AI Python SDK.

Simple setup

The simplest way to implement SageMaker smart sifting into the Transformers `Trainer` class is to use the `enable_sifting` function. This function accepts an existing `Trainer` object, and wraps the existing `DataLoader` object with `SiftingDataloader`. You can continue using the same training object. See the following example usage.

```
from smart_sifting.integrations.trainer import enable_sifting
from smart_sifting.loss.abstract_sift_loss_module import Loss
from smart_sifting.sift_config.sift_configs import (
    RelativeProbabilisticSiftConfig
    LossConfig
    SiftingBaseConfig
)

class SiftingImplementedLoss(Loss):
   def loss(self, model, transformed_batch, original_batch):
        loss_fct = MSELoss(reduction="none") # make sure to set reduction to "none"
        logits = model.bert(**original_batch)
        return loss_fct(logits, original_batch.get("labels"))

sift_config = RelativeProbabilisticSiftConfig(
    beta_value=0.5,
    loss_history_length=500,
    loss_based_sift_config=LossConfig(
         sift_config=SiftingBaseConfig(sift_delay=0)
    )
)

trainer = Trainer(...)
enable_sifting(trainer, sift_config, loss=SiftingImplementedLoss()) # updates the
 trainer with Sifting Loss and config
trainer.train()
```

The `SiftingDataloader` class is an iterable data loader. The exact size of the resulting dataset is not known beforehand due to the random sampling during sifting. As a result, the Hugging Face `Trainer` expects the max_steps training argument. Note that this argument overrides the epoch

configuration parameter num_train_epochs. If your original data loader was also iterable, or your training uses max_steps and a single epoch, then the SiftingDataloader performs the same as the existing dataloader. If the original dataloader was not iterable or max_steps was not provided, the Hugging Face Trainer might throw an error message similar to the following.

```
args.max_steps must be set to a positive value if dataloader does not have a length,
was -1
```

To address this, the enable_sifting function provides an optional set_epochs parameter. This enables training with epochs, using the number of epochs provided by num_train_epochs argument of the Trainer class, and sets max_steps to the maximum system integer, allowing training to progress until the specified epochs have completed.

Custom setup

For a custom integration of the SageMaker smart sifting dataloader, you can utilize a custom Hugging Face Trainer class. Within any subclass of Trainer, the get_train_dataloader() function can be overridden to return an object of the SiftingDataloader class instead. For cases with existing custom trainers, this approach might be less intrusive but requires code changes than the simple setup option. The following is an example implementation of SageMaker smart sifting into a custom Hugging Face Trainer class.

```
from smart_sifting.sift_config.sift_configs import (
    RelativeProbabilisticSiftConfig
    LossConfig
    SiftingBaseConfig
)
from smart_sifting.dataloader.sift_dataloader import SiftingDataloader
from smart_sifting.loss.abstract_sift_loss_module import Loss
from smart_sifting.data_model.data_model_interface import SiftingBatch,
 SiftingBatchTransform
from smart_sifting.data_model.list_batch import ListBatch

class SiftingListBatchTransform(SiftingBatchTransform):
    def transform(self, batch: Any):
        inputs = batch[0].tolist()
        labels = batch[-1].tolist()  # assume the last one is the list of labels
        return ListBatch(inputs, labels)

    def reverse_transform(self, list_batch: ListBatch):
        a_batch = [torch.tensor(list_batch.inputs), torch.tensor(list_batch.labels)]
```

```
        return a_batch

class SiftingImplementedLoss():
    # You should add the following initializaztion function
    # to calculate loss per sample, not per batch.
    def __init__(self):
        self.celoss = torch.nn.CrossEntropyLoss(reduction='none')

    def loss(
        self,
        model: torch.nn.Module,
        transformed_batch: SiftingBatch,
        original_batch: Any = None,
    ) -> torch.Tensor:
        device = next(model.parameters()).device
        batch = [t.to(device) for t in original_batch]

        # compute loss
        outputs = model(batch)
        return self.celoss(outputs.logits, batch[2])

class SiftingImplementedTrainer(Trainer):
    def get_train_dataloader(self):
        dl = super().get_train_dataloader()

        sift_config = RelativeProbabilisticSiftConfig(
            beta_value=0.5,
            loss_history_length=500,
            loss_based_sift_config=LossConfig(
                sift_config=SiftingBaseConfig(sift_delay=0)
            )
        )

        return SiftingDataloader(
                sift_config=sift_config,
                orig_dataloader=dl,
                batch_transforms=SiftingListBatchTransform(),
                loss_impl=SiftingImplementedLoss(),
                model=self.model
        )
```

Using the wrapped `Trainer` class, create an object of it as follows.

```
trainer = SiftingImplementedTrainer(
    model=model,
    args=training_args,
    train_dataset=small_train_dataset,
    eval_dataset=small_eval_dataset
)

trainer.train()
```

Troubleshooting

If you run into an error, use the following list to try to troubleshoot the issue. If you need further support, reach out to the SageMaker AI team at <sm-smart-sifting-feedback@amazon.com>.

Exceptions from the SageMaker smart sifting library

Use the following reference of exceptions raised by the SageMaker smart sifting library to troubleshoot errors and identify causes.

Exception Name	Description
SiftConfigValidationException	Thrown from the SageMaker smart sifting library in case of any missing Config key or unsupported value type for Sift Key
UnsupportedDataFormatException	Thrown from the SageMaker smart sifting library in case of any unsupported DataFormat for Sifting logic
LossImplementationNotProvidedException	Thrown in case of missing or not implement ing Loss interface

Security in SageMaker smart sifting

Because the SageMaker smart sifting library runs processes of removing less valuable training samples, it requires full access to training datasets as they are produced by the data loader. This access is not different than the access already provided to PyTorch in normal training scenario.

SageMaker smart sifting has built-in logging with security implications. By default, SageMaker smart sifting logs are only application-level logs containing metrics, latencies, and user errors or warnings. Users can, however, choose to enable verbose logs, which log full batch data to show which samples were removed from a given batch. These logs are emitted using Python loggers and are not uploaded or stored anywhere by the library. In the case of automatic log uploading to CloudWatch or similar services, please note that using verbose logs may result in sensitive training data being uploaded off of the training instance.

Beyond the aforementioned logging, SageMaker smart sifting does not have any network functionality nor does it interact with the local file system. User data is stored as in-memory objects for the entirety of the time it is used by the library.

SageMaker smart sifting Python SDK reference

This page provides a reference of Python modules you need for applying SageMaker smart sifting to your training script.

SageMaker smart sifting configuration modules

class smart_sifting.sift_config.sift_configs.RelativeProbabilisticSiftConfig()

The SageMaker smart sifting configuration class.

Parameters

- `beta_value` (float) – A beta (constant) value. It is used to calculate the probability of selecting a sample for training based on the percentile of the loss in the loss values history. Lowering the beta value results in a lower percentage of data sifted, and raising it results in a higher percentage of data sifted. There's no minimum or maximum value for the beta value, other than it must be a positive value. The following reference table gives information for sifting rates with respect to `beta_value`.

beta_value	Proportion of data kept (%)	Proportion of data sifted out (%)
0.1	90.91	9.01
0.25	80	20

beta_value	Proportion of data kept (%)	Proportion of data sifted out (%)
0.5	66.67	33.33
1	50	50
2	33.33	66.67
3	25	75
10	9.09	90.92
100	0.99	99.01

- `loss_history_length` (int) – The number of previous training losses to store for the relative threshold loss based sampling.
- `loss_based_sift_config` (dict or a `LossConfig` object) – Specify a `LossConfig` object that returns the SageMaker smart sifting Loss interface configuration.

class smart_sifting.sift_config.sift_configs.LossConfig()

The configuration class for the `loss_based_sift_config` parameter of the `RelativeProbabilisticSiftConfig` class.

Parameters

- `sift_config` (dict or a `SiftingBaseConfig` object) – Specify a `SiftingBaseConfig` object that returns a sifting base configuration dictionary.

class smart_sifting.sift_config.sift_configs.SiftingBaseConfig()

The configuration class for the `sift_config` parameter of `LossConfig`.

Parameters

- `sift_delay` (int) – The number of training steps to wait for before starting sifting. We recommend that you start sifting after all the layers in the model have enough view of the training data. The default value is `1000`.

- `repeat_delay_per_epoch` (bool) – Specify whether to delay sifting every epoch. The default value is `False`.

SageMaker smart sifting data batch transform modules

class `smart_sifting.data_model.data_model_interface.SiftingBatchTransform`

A SageMaker smart sifting Python module for defining how to perform batch transform. Using this, you can set up a batch transform class that converts the data format of your training data to `SiftingBatch` format. SageMaker smart sifting can sift and accumulate data in this format into a sifted batch.

class `smart_sifting.data_model.data_model_interface.SiftingBatch`

An interface to define a batch data type that can be sifted and accumulated.

class `smart_sifting.data_model.list_batch.ListBatch`

A module for keeping track of a list batch for sifting.

class `smart_sifting.data_model.tensor_batch.TensorBatch`

A module for keeping track of a tensor batch for sifting.

SageMaker smart sifting loss implementation module

class `smart_sifting.loss.abstract_sift_loss_module.Loss`

A wrapper module for registering the SageMaker smart sifting interface to the loss function of a PyTorch-based model.

SageMaker smart sifting data loader wrapper module

class `smart_sifting.dataloader.sift_dataloader.SiftingDataloader`

A wrapper module for registering the SageMaker smart sifting interface to the data loader of a PyTorch-based model.

The Main Sifting Dataloader iterator sifts out training samples from a dataloader based on a sift configuration.

Parameters

- `sift_config` (dict or a `RelativeProbabilisticSiftConfig` object) – A `RelativeProbabilisticSiftConfig` object.
- `orig_dataloader` (a PyTorch DataLoader object) – Specify the PyTorch Dataloader object to be wrapped.
- `batch_transforms` (a `SiftingBatchTransform` object) – (Optional) If your data format is not supported by the SageMaker smart sifting library's default transform, you must create a batch transform class using the `SiftingBatchTransform` module. This parameter is used to pass the batch transform class. This class is used for `SiftingDataloader` to convert the data into a format that the SageMaker smart sifting algorithm can accept.
- `model` (a PyTorch model object) – The original PyTorch model
- `loss_impl` (a sifting loss function of `smart_sifting.loss.abstract_sift_loss_module.Loss`) – A sifting loss function that is configured with the `Loss` module and wraps the PyTorch loss function.
- `log_batch_data` (bool) – Specify whether to log batch data. If set to `True`, SageMaker smart sifting logs the details of the batches that are kept or sifted. We recommend that you turn it on only for a pilot training job. When logging is on, the samples are loaded to GPU and transferred to CPU, which introduces overhead. The default value is `False`.

SageMaker smart sifting release notes

See the following release notes to track the latest updates for the SageMaker smart sifting capability.

SageMaker smart sifting release notes: November 29, 2023

New Features

- Launched the Amazon SageMaker smart sifting library at Amazon re:Invent 2023.

Migration to Amazon Deep Learning Containers

- The SageMaker smart sifting library passed integration testing and is available in Amazon Deep Learning Containers. To find a complete list of the pre-built containers with the SageMaker smart sifting library, see the section called "Supported frameworks and Amazon Regions".

Debugging and improving model performance

The essence of training machine learning models, deep learning neural networks, transformer models is in achieving stable model convergence, and as such, state-of-the-art models have millions, billions, or trillions of model parameters. The number of operations to update the gigantic number of model parameters during each iteration can easily become astronomical. To identify model convergence issues, it is important to be able to access the model parameters, activations, and gradients computed during optimization processes.

Amazon SageMaker AI provides two debugging tools to help identify such convergence issues and gain visibility into your models.

Amazon SageMaker AI with TensorBoard

To offer greater compatibility with the open-source community tools within the SageMaker AI Training platform, SageMaker AI hosts TensorBoard as an application in SageMaker AI domain. You can bring your training jobs to SageMaker AI and keep using the TensorBoard summary writer to collect the model output tensors. Because TensorBoard is implemented into SageMaker AI domain, it also gives you more options to manage user profiles under the SageMaker AI domain in your Amazon account, and provides fine control over the user profiles by granting access to specific actions and resources. To learn more, see the section called “TensorBoard in SageMaker AI”.

Amazon SageMaker Debugger

Amazon SageMaker Debugger is a capability of SageMaker AI that provides tools to register hooks to callbacks to extract model output tensors and save them in Amazon Simple Storage Service. It provides built-in rules for detecting model convergence issues, such as overfitting, saturated activation functions, vanishing gradients, and more. You can also set up the built-in rules with Amazon CloudWatch Events and Amazon Lambda for taking automated actions against detected issues, and set up Amazon Simple Notification Service to receive email or text notifications. To learn more, see the section called “SageMaker Debugger”.

- Release notes for debugging capabilities of Amazon SageMaker AI

TensorBoard in Amazon SageMaker AI

Amazon SageMaker AI with TensorBoard is a capability of Amazon SageMaker AI that brings the TensorBoard visualization tools to SageMaker AI and integrated with SageMaker Training and domain. It provides options to administer your Amazon account and users belonging to the account through SageMaker AI domain, to give the domain users access to the TensorBoard data with appropriate permissions to Amazon S3, and help the domain users perform model debugging tasks using the TensorBoard visualization plugins. SageMaker AI with TensorBoard is extended with the SageMaker AI Data Manager plugin, with which domain users can access a number of training jobs in one place within the TensorBoard application.

> **Note**
>
> This feature is for debugging the training of deep learning models using PyTorch or TensorFlow.

For data scientists

Training large models can have scientific problems that require data scientists to debug and resolve them in order to improve model convergence and stabilize gradient descent processes.

When you encounter model training issues, such as loss not converging, or vanishing or exploding weights and gradients, you need to access tensor data to dive deep and analyze the model parameters, scalars, and any custom metrics. Using SageMaker AI with TensorBoard, you can visualize model output tensors extracted from training jobs. As you experiment with different models, multiple training runs, and model hyperparameters, you can select multiple training jobs in TensorBoard and compare them in one place.

For administrators

Through the TensorBoard landing page in the SageMaker AI console or SageMaker AI domain, you can manage TensorBoard application users if you are an administrator of an Amazon account or SageMaker AI domain. Each domain user can access their own TensorBoard application given the granted permissions. As a SageMaker AI domain administrator and domain user, you can create and delete the TensorBoard application given the permission level you have.

Note

You cannot share the TensorBoard application for collaboration purposes because SageMaker AI domain does not allow application sharing among users. Users can share the output tensors saved in an S3 bucket, if they have access to the bucket.

Supported frameworks and Amazon Web Services Regions

The TensorBoard application in SageMaker AI is available for the following machine learning frameworks and Amazon Web Services Regions.

Frameworks

- PyTorch
- TensorFlow
- Hugging Face Transformers

Amazon Web Services Regions

- US East (N. Virginia) (`us-east-1`)
- US East (Ohio) (`us-east-2`)
- US West (Oregon) (`us-west-2`)
- Europe (Frankfurt) (`eu-central-1`)
- Europe (Ireland) (`eu-west-1`)

Note

Amazon SageMaker AI with TensorBoard runs on an `ml.r5.large` instance and incurs charges after the SageMaker AI free tier or the free trial period of the feature. For more information, see Amazon SageMaker AI Pricing.

Topics

- Prepare a training job to collect TensorBoard output data

- Accessing the TensorBoard application on SageMaker AI
- Load and visualize output tensors using the TensorBoard application
- Delete unused TensorBoard applications

Prepare a training job to collect TensorBoard output data

A typical training job for machine learning in SageMaker AI consists of two main steps: preparing a training script and configuring a SageMaker AI ModelTrainer (formerly estimator in PySDK v2) object of the SageMaker AI Python SDK. In this section, you'll learn about the required changes to collect TensorBoard-compatible data from SageMaker training jobs.

Prerequisites

The following list shows the prerequisites to start using SageMaker AI with TensorBoard.

- A SageMaker AI domain that's set up with Amazon VPC in your Amazon account.

  For instructions on setting up a domain, see Onboard to Amazon SageMaker AI domain using quick setup. You also need to add domain user profiles for individual users to access the TensorBoard on SageMaker AI. For more information, see Add user profiles.
- Amazon EFS must be enabled on your domain. TensorBoard requires an Amazon EFS file system to function. For domains created through quick setup after June 1, 2026, EFS is not created by default during domain creation. To enable EFS after domain creation, see Amazon EFS creation and auto-mounting in Amazon SageMaker Studio.
- Amazon EFS must be enabled on your domain. TensorBoard requires an Amazon EFS file system to function. For domains created through quick setup after June 1, 2026, EFS is not created by default during domain creation. To enable EFS after domain creation, see Amazon EFS creation and auto-mounting in Amazon SageMaker Studio.
- The following list is the minimum set of permissions for using TensorBoard on SageMaker AI.
  - `sagemaker:CreateApp`
  - `sagemaker:DeleteApp`
  - `sagemaker:DescribeTrainingJob`
  - `sagemaker:Search`
  - `s3:GetObject`
  - `s3:ListBucket`

Step 1: Modify your training script with open-source TensorBoard helper tools

Make sure you determine which output tensors and scalars to collect, and modify code lines in your training script using any of the following tools: TensorBoardX, TensorFlow Summary Writer, PyTorch Summary Writer, or SageMaker Debugger.

Also make sure that you specify the TensorBoard data output path as the log directory (`log_dir`) for callback in the training container.

For more information about callbacks per framework, see the following resources.

- For PyTorch, use torch.utils.tensorboard.SummaryWriter. See also the Using TensorBoard in PyTorch and Log scalars sections in the *PyTorch tutorials*. Alternatively, you can use TensorBoardX Summary Writer.

  ```
  LOG_DIR="/opt/ml/output/tensorboard"
  tensorboard_callback=torch.utils.tensorboard.writer.SummaryWriter(log_dir=LOG_DIR)
  ```

- For TensorFlow, use the native callback for TensorBoard, tf.keras.callbacks.TensorBoard.

  ```
  LOG_DIR="/opt/ml/output/tensorboard"
  tensorboard_callback=tf.keras.callbacks.TensorBoard(
      log_dir=LOG_DIR, histogram_freq=1)
  ```

- For Transformers with PyTorch, you can use transformers.integrations.TensorBoardCallback.

  For Transformers with TensorFlow, use the `tf.keras.tensorboard.callback`, and pass that to the keras callback in transformers.

  > **Tip**
  >
  > You can also use a different container local output path. However, in Step 2: Create a SageMaker training ModelTrainer object with the TensorBoard output configuration, you must map the paths correctly for SageMaker AI to successfully search the local path and save the TensorBoard data to the S3 output bucket.

- For guidance on modifying training scripts using the SageMaker Debugger Python library, see the section called “Adapting your training script to register a hook”.

Step 2: Create a SageMaker training ModelTrainer object with the TensorBoard output configuration

Use the `sagemaker.debugger.TensorBoardOutputConfig` while configuring a SageMaker AI ModelTrainer. This configuration API maps the S3 bucket you specify for saving TensorBoard data with the local path in the training container (`/opt/ml/output/tensorboard`). Pass the object of the module to the `tensorboard_output_config` parameter of the ModelTrainer class. The following code snippet shows an example of preparing a TensorFlow ModelTrainer with the TensorBoard output configuration parameter.

> **Note**
>
> This example assumes that you use the SageMaker Python SDK. If you use the low-level SageMaker API, you should include the following to the request syntax of the CreateTrainingJob API.
>
> ```
> "TensorBoardOutputConfig": {
>   "LocalPath": "/opt/ml/output/tensorboard",
>   "S3OutputPath": "s3_output_bucket"
> }
> ```

```
import os
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import SourceCode
from sagemaker.core.debugger import TensorBoardOutputConfig
from sagemaker.train.configs import Compute

# Set variables for training job information,
# such as s3_out_bucket and other unique tags.
...

LOG_DIR="/opt/ml/output/tensorboard"

output_path = os.path.join(
    "s3_output_bucket", "sagemaker-output", "date_str", "your-training_job_name"
)

tensorboard_output_config = TensorBoardOutputConfig(
    s3_output_path=os.path.join(output_path, 'tensorboard'),
```

```
    container_local_output_path=LOG_DIR
)

model_trainer = ModelTrainer(
    source_code=SourceCode(entry_script="train.py", source_dir="src"),
    role=role,
    training_image=image_uri,
    compute=Compute(instance_count=1, instance_type="ml.c5.xlarge"),
    base_job_name="your-training_job_name",
    tensorboard_output_config=tensorboard_output_config,
    hyperparameters=hyperparameters
)
```

Note

The TensorBoard application does not provide out-of-the-box support for SageMaker AI hyperparameter tuning jobs, as the `CreateHyperParameterTuningJob` API is not integrated with the TensorBoard output configuration for the mapping. To use the TensorBoard application for hyperparameter tuning jobs, you need to write code for uploading metrics to Amazon S3 in your training script. Once the metrics are uploaded to an Amazon S3 bucket, you can then load the bucket into the TensorBoard application on SageMaker AI.

Accessing the TensorBoard application on SageMaker AI

You can access TensorBoard by two methods: programmatically using the `sagemaker.interactive_apps.tensorboard` module that generates an unsigned or a presigned URL, or using the TensorBoard landing page in the SageMaker AI console. After you open TensorBoard, SageMaker AI runs the TensorBoard plugin and automatically finds all training job output data in a TensorBoard-compatible file format.

Topics

- Open TensorBoard using the sagemaker.interactive_apps.tensorboard module
- Open TensorBoard using the get_app_url function as an ModelTrainer class method
- Open TensorBoard through the SageMaker AI console

Open TensorBoard using the `sagemaker.interactive_apps.tensorboard` module

The `sagemaker.interactive_apps.tensorboard` module provides a function called `get_app_url` that generates unsigned or presigned URLs to open the TensorBoard application in any environment in SageMaker AI or Amazon EC2. This is to provide a unified experience for both Studio Classic and non-Studio Classic users. For the Studio environment, you can open TensorBoard by running the `get_app_url()` function as it is, or you can also specify a job name to start tracking as the TensorBoard application opens. For non-Studio Classic environments, you can open TensorBoard by providing your domain and user profile information to the utility function. With this functionality, regardless of where or how you run training code and launch training jobs, you can directly access TensorBoard by running the `get_app_url` function in your Jupyter notebook or terminal.

> **Note**
>
> This functionality is available in the SageMaker Python SDK v2.184.0 and later. To use this functionality, make sure that you upgrade the SDK by running `pip install sagemaker --upgrade`.

Topics

- Option 1: For SageMaker AI Studio Classic
- Option 2: For non-Studio Classic environments

Option 1: For SageMaker AI Studio Classic

If you are using SageMaker Studio Classic, you can directly open the TensorBoard application or retrieve an unsigned URL by running the `get_app_url` function as follows. As you are already within the Studio Classic environment and signed in as a domain user, `get_app_url()` generates unsigned URL because it is not necessary to authenticate again.

To open the TensorBoard application

The following code automatically opens the TensorBoard application from the unsigned URL that the `get_app_url()` function returns in the your environment's default web browser.

```
from sagemaker.interactive_apps import tensorboard
```

```
region = "us-west-2"
app = tensorboard.TensorBoardApp(region)

app.get_app_url(
    training_job_name="your-training_job_name" # Optional. Specify the job name to
 track a specific training job
)
```

To retrieve an unsigned URL and open the TensorBoard application manually

The following code prints an unsigned URL that you can copy to a web browser and open the TensorBoard application.

```
from sagemaker.interactive_apps import tensorboard

region = "us-west-2"
app = tensorboard.TensorBoardApp(region)
print("Navigate to the following URL:")
print(
    app.get_app_url(
        training_job_name="your-training_job_name", # Optional. Specify the name of the
 job to track.
        open_in_default_web_browser=False           # Set to False to print the URL to
 terminal.
    )
)
```

Note that if you run the preceding two code samples outside the SageMaker AI Studio Classic environment, the function will return a URL to the TensorBoard landing page in the SageMaker AI console, because these do not have sign-in information to your domain and user profile. For creating a presigned URL, see Option 2 in the following section.

Option 2: For non-Studio Classic environments

If you use non-Studio Classic environments, such as SageMaker Notebook instance or Amazon EC2, and want to open TensorBoard directly from the environment you are in, you need to generate a URL presigned with your domain and user profile information. A *presigned* URL is a URL that's signed in to Amazon SageMaker Studio Classic while the URL is being created with your domain and user profile, and therefore granted access to all of the domain applications and files associated with your domain. To open TensorBoard through a presigned URL, use the `get_app_url` function with your domain and user profile name as follows.

Note that this option requires the domain user to have the `sagemaker:CreatePresignedDomainUrl` permission. Without the permission, the domain user will receive an exception error.

Important

Do not share any presigned URLs. The `get_app_url` function creates presigned URLs, which automatically authenticates with your domain and user profile and gives access to any applications and files associated with your domain.

```
print(
    app.get_app_url(
        training_job_name="your-training_job_name", # Optional. Specify the name of the
 job to track.
        create_presigned_domain_url=True,           # Reguired to be set to True for
 creating a presigned URL.
        domain_id="your-domain-id",                 # Required if creating a presigned
 URL (create_presigned_domain_url=True).
        user_profile_name="your-user-profile-name", # Required if creating a presigned
 URL (create_presigned_domain_url=True).
        open_in_default_web_browser=False,          # Optional. Set to False to print
 the URL to terminal.
        optional_create_presigned_url_kwargs={}     # Optional. Add any additional args
 for Boto3 create_presigned_domain_url
    )
)
```

Tip

The `get_app_url` function runs the [SageMaker.Client.create_presigned_domain_url] API in the Amazon SDK for Python (Boto3) in the backend. As the Boto3 `create_presigned_domain_url` API creates presigned domain URLs that expire in 300 seconds by default, presigned TensorBoard application URLs also expire in 300 seconds. If you want to extend the expiration time, pass the `ExpiresInSeconds` argument to the `optional_create_presigned_url_kwargs` argument of the `get_app_url` function as follows.

```
optional_create_presigned_url_kwargs={"ExpiresInSeconds": 1500}
```

Note

If any of your input passed to the arguments of `get_app_url` is invalid, the function outputs a URL to the TensorBoard landing page instead of opening the TensorBoard application. The output message would be similar to the following.

```
Navigate to the following URL:
https://us-west-2.console.aws.amazon.com/sagemaker/home?region=us-west-2#/
tensor-board-landing
```

Open TensorBoard using the `get_app_url` function as an `ModelTrainer` class method

If you are in the process of running a training job using the `ModelTrainer` class of the SageMaker Python SDK and have an active object of the `ModelTrainer` class, you can also access the `get_app_url` function as a class method of the `ModelTrainer` class. Open the TensorBoard application or retrieve an unsigned URL by running the `get_app_url` method as follows. The `get_app_url` class method pulls the training job name from the ModelTrainer and opens the TensorBoard application with the specified job.

Note

This functionality is available in the SageMaker Python SDK v2.184.0 and later. To use this functionality, make sure that you upgrade the SDK by running `pip install sagemaker --upgrade`.

Topics

- Option 1: For SageMaker Studio Classic
- Option 2: For non-Studio Classic environments

Option 1: For SageMaker Studio Classic

To open the TensorBoard application

The following code automatically opens the TensorBoard application from the unsigned URL that the `get_app_url()` method returns in the your environment's default web browser.

```
model_trainer.get_app_url(
    app_type=SupportedInteractiveAppTypes.TENSORBOARD # Required.
)
```

To retrieve an unsigned URL and open the TensorBoard application manually

The following code prints an unsigned URL that you can copy to a web browser and open the TensorBoard application.

```
print(
    model_trainer.get_app_url(
        app_type=SupportedInteractiveAppTypes.TENSORBOARD, # Required.
        open_in_default_web_browser=False, # Optional. Set to False to print the URL to
 terminal.
    )
)
```

Note that if you run the preceding two code samples outside the SageMaker AI Studio Classic environment, the function will return a URL to the TensorBoard landing page in the SageMaker AI console, because these do not have sign-in information to your domain and user profile. For creating a presigned URL, see Option 2 in the following section.

Option 2: For non-Studio Classic environments

If you use non-Studio Classic environments, such as SageMaker Notebook instance and Amazon EC2, and want to generate a presigned URL to open the TensorBoard application, use the `get_app_url` method with your domain and user profile information as follows.

Note that this option requires the domain user to have the `sagemaker:CreatePresignedDomainUrl` permission. Without the permission, the domain user will receive an exception error.

> **Important**
>
> Do not share any presigned URLs. The `get_app_url` function creates presigned URLs, which automatically authenticates with your domain and user profile and gives access to any applications and files associated with your domain.

```
print(
    model_trainer.get_app_url(
        app_type=SupportedInteractiveAppTypes.TENSORBOARD, # Required
        create_presigned_domain_url=True,           # Reguired to be set to True for
 creating a presigned URL.
        domain_id="your-domain-id",                 # Required if creating a presigned
 URL (create_presigned_domain_url=True).
        user_profile_name="your-user-profile-name", # Required if creating a presigned
 URL (create_presigned_domain_url=True).
        open_in_default_web_browser=False,            # Optional. Set to False to print
 the URL to terminal.
        optional_create_presigned_url_kwargs={}       # Optional. Add any additional
 args for Boto3 create_presigned_domain_url
    )
)
```

Open TensorBoard through the SageMaker AI console

You can also use the SageMaker AI console UI to open the TensorBoard application. There are two options to open the TensorBoard application through the SageMaker AI console.

Topics

- Option 1: Launch TensorBoard from the domain details page
- Option 2: Launch TensorBoard from the TensorBoard landing page

Option 1: Launch TensorBoard from the domain details page

Navigate to the domain details page

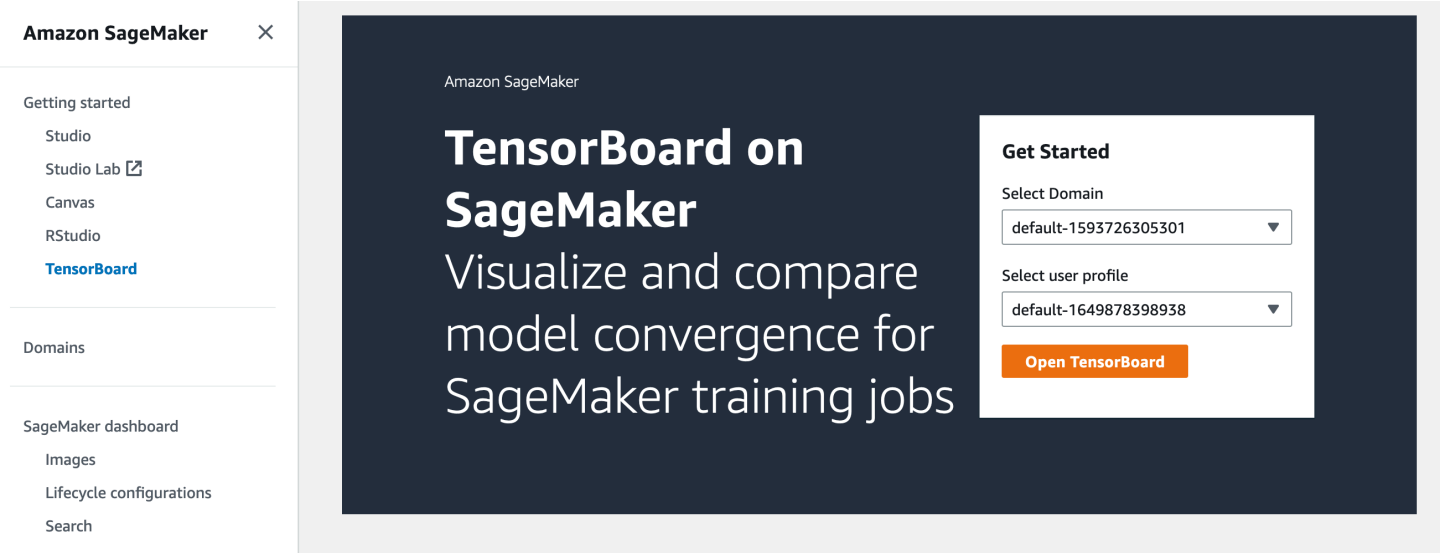
The following procedure shows how to navigate to the domain details page.

1. Open the Amazon SageMaker AI console at https://console.aws.amazon.com/sagemaker/.

2. On the left navigation pane, choose **Admin configurations**.
3. Under **Admin configurations**, choose **domains**.
4. From the list of domains, select the domain in which you want to launch the TensorBoard application.

Launch a user profile application

The following procedure shows how to launch a Studio Classic application that is scoped to a user profile.



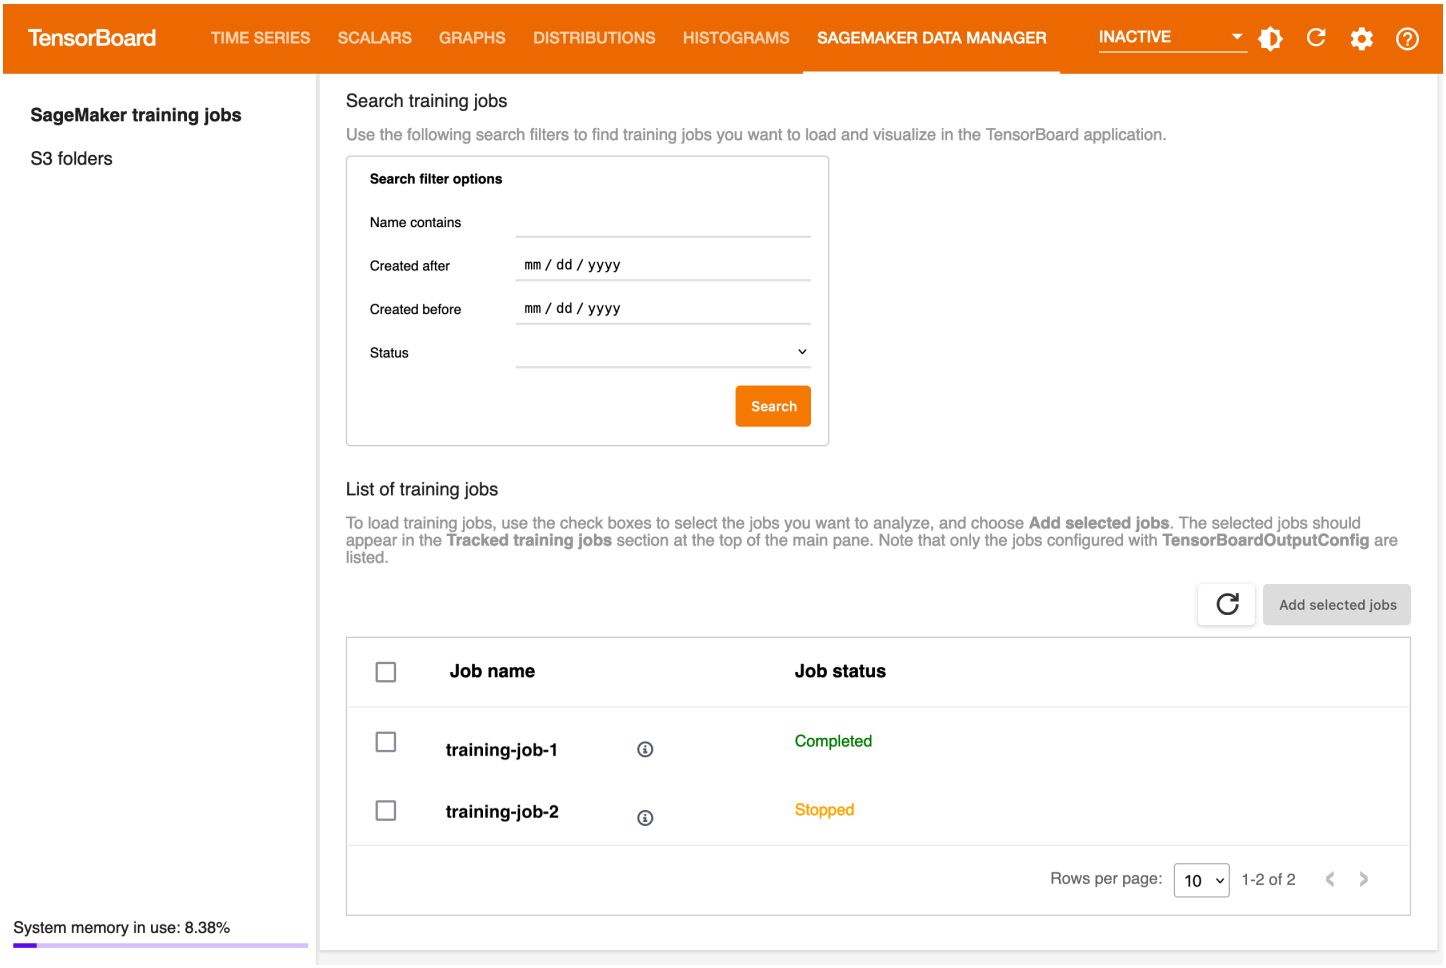
1. On the domain details page, choose the **User profiles** tab.
2. Identify the user profile for which you want to launch the Studio Classic application.
3. Choose **Launch** for your selected user profile, then choose **TensorBoard**.

Option 2: Launch TensorBoard from the TensorBoard landing page

The following procedure describes how to launch a TensorBoard application from the TensorBoard landing page.

1. Open the Amazon SageMaker AI console at https://console.aws.amazon.com/sagemaker/.
2. On the left navigation pane, choose **TensorBoard**.
3. Under **Get started**, select the domain in which you want to launch the Studio Classic application. If your user profile only belongs to one domain, you do not see the option for selecting a domain.
4. Select the user profile for which you want to launch the Studio Classic application. If there is no user profile in the domain, choose **Create user profile**. For more information, see Add and Remove User Profiles.
5. Choose **Open TensorBoard**.

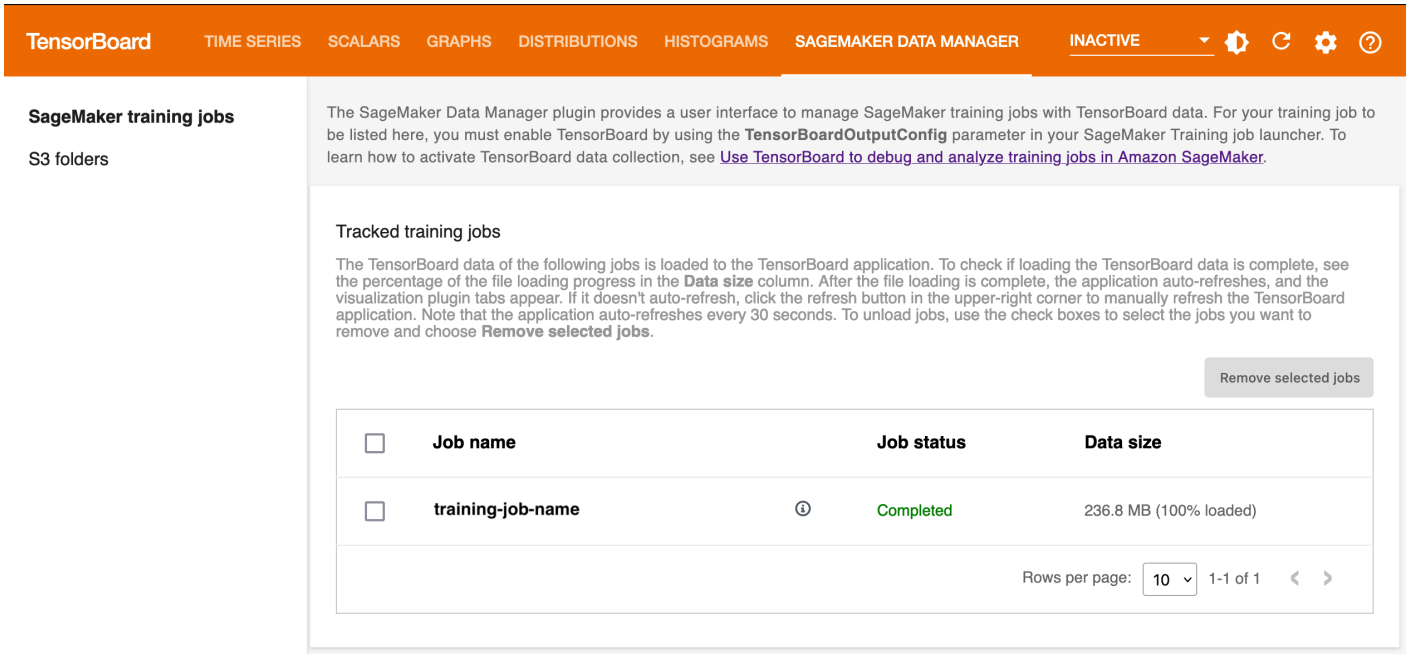
The following screenshot shows the location of TensorBoard in the left navigation pane of the SageMaker AI console and the SageMaker AI with TensorBoard landing page in the main pane.



Load and visualize output tensors using the TensorBoard application

You can conduct an online or offline analysis by loading collected output tensors from S3 buckets paired with training jobs during or after training.

When you open the TensorBoard application, TensorBoard opens with the **SageMaker AI Data Manager** tab. The following screenshot shows the full view of the SageMaker AI Data Manager tab in the TensorBoard application.



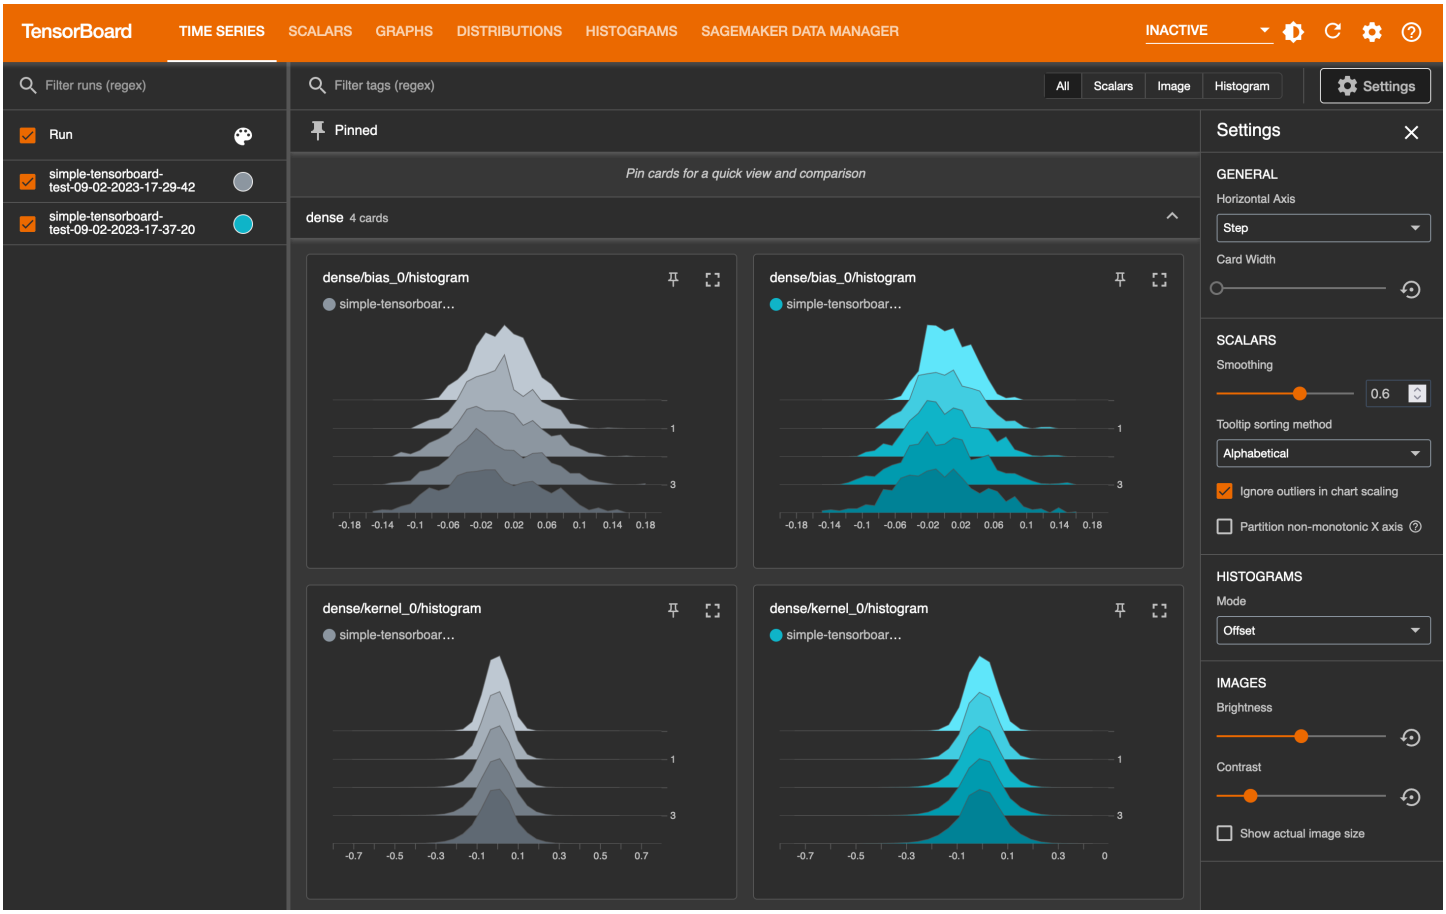
> **Note**
>
> The visualization plugins might not appear when you first launch the TensorBoard application. After you select training jobs in the SageMaker AI Data Manager plugin, the TensorBoard application loads the TensorBoard data and populates the visualization plugins.

> **Note**
>
> The TensorBoard application automatically shuts down after 1 hour of inactivity. If you want to shut the application down when you are done using it, make sure to manually shut down TensorBoard to avoid paying for the instance hosting it. For instructions on deleting the application, see Delete unused TensorBoard applications.

In the **SageMaker AI Data Manager** tab, you can select any training job and load TensorBoard-compatible training output data from Amazon S3.

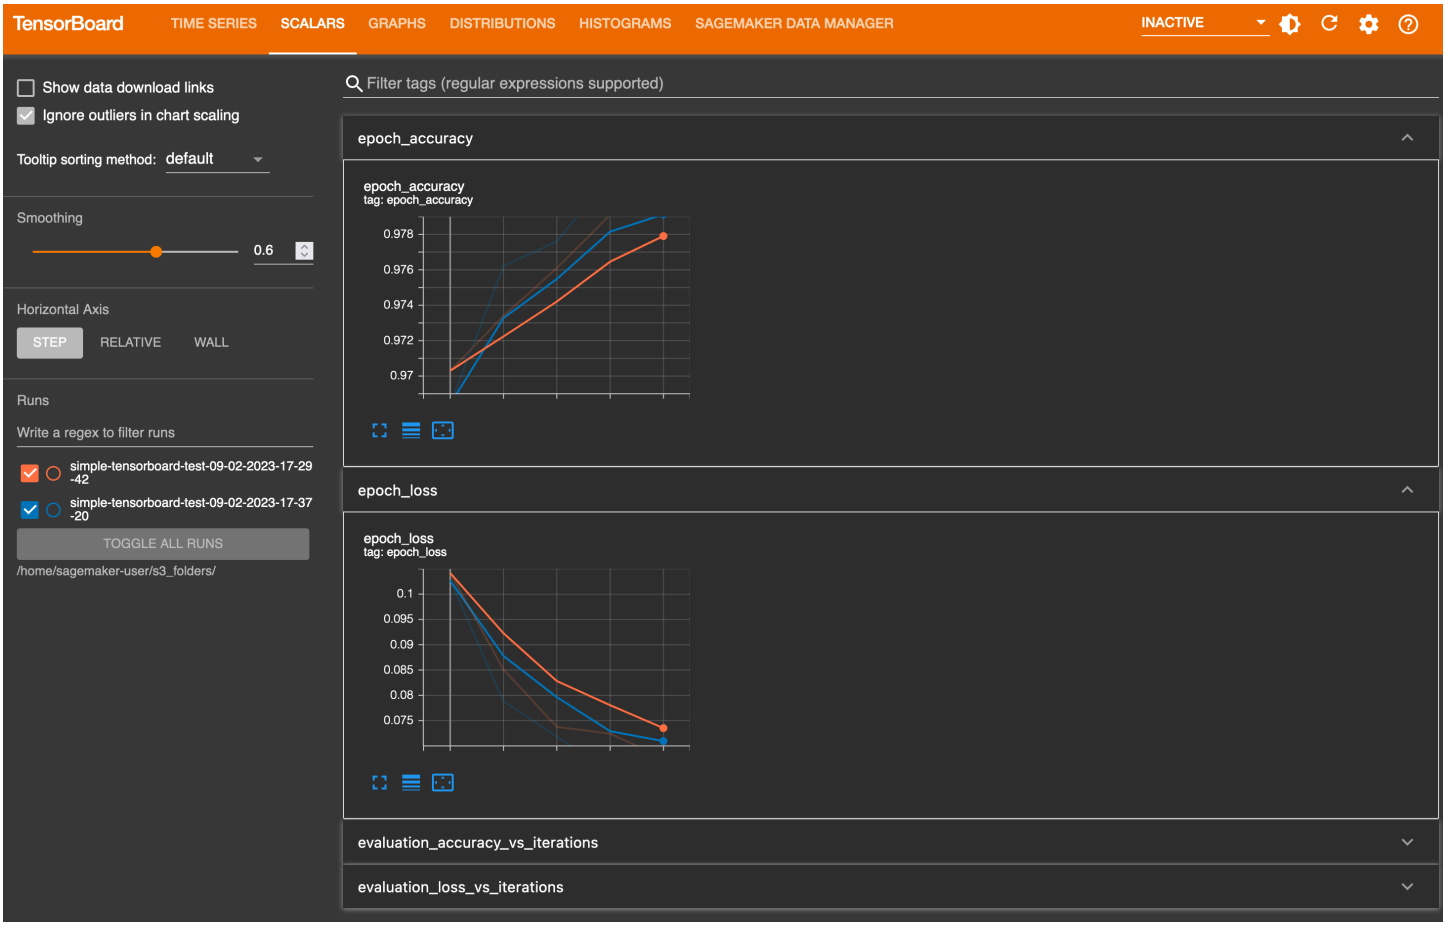
1. In the **Search training jobs** section, use the filters to narrow down the list of training jobs you want to find, load, and visualize.
2. In the **List of training jobs** section, use the check boxes to choose training jobs from which you want to pull data and visualize for debugging.
3. Choose **Add selected jobs**. The selected jobs should appear in the **Tracked training jobs** section, as shown in the following screenshot.

> **Note**
>
> The **SageMaker AI Data Manager** tab only shows training jobs configured with the `TensorBoardOutputConfig` parameter. Make sure you have configured the SageMaker AI ModelTrainer with this parameter. For more information, see Step 2: Create a SageMaker training ModelTrainer object with the TensorBoard output configuration.



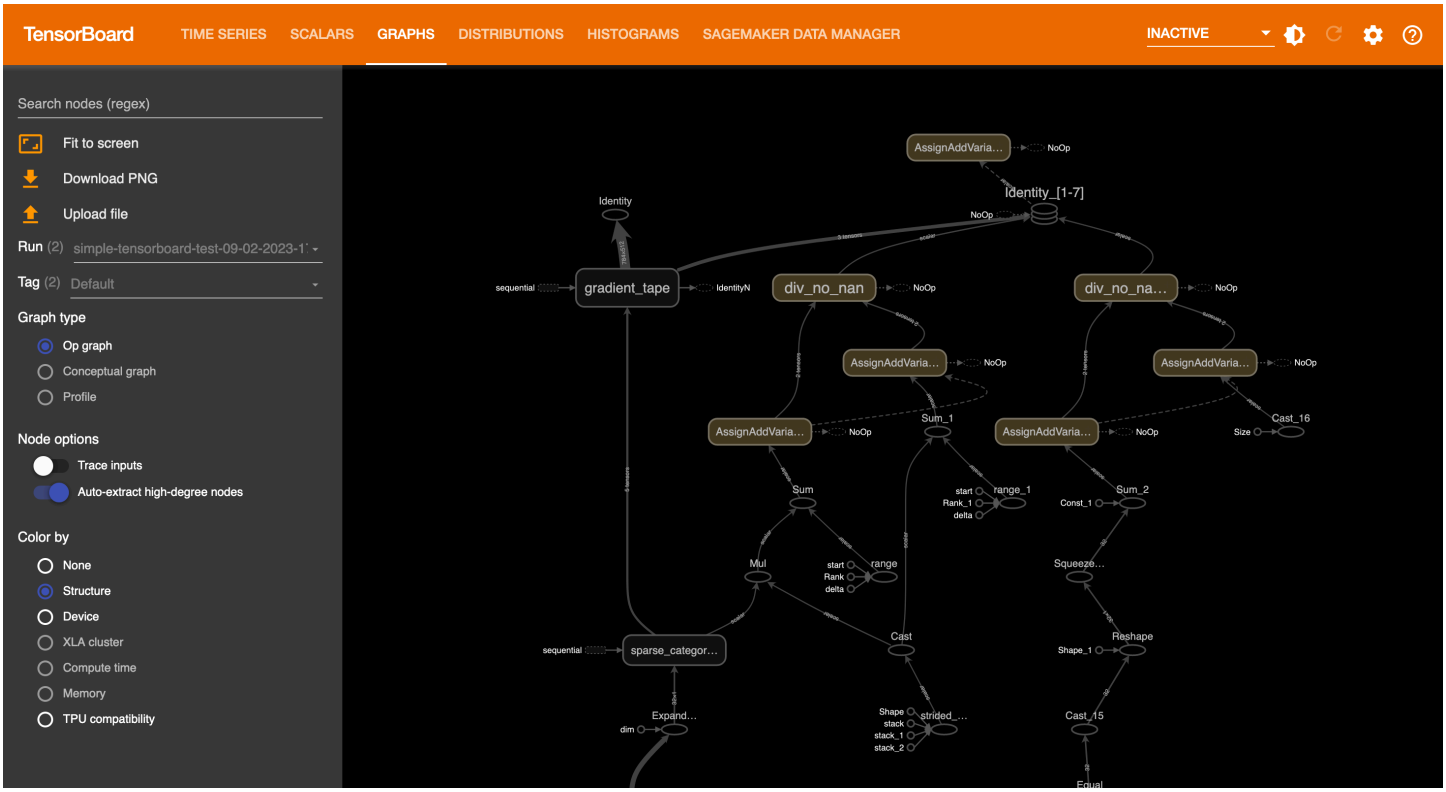
> **Note**
>
> The visualization tabs might not appear if you are using SageMaker AI with TensorBoard for the first time or no data is loaded from a previous use. After adding training jobs and waiting for a few seconds, refresh the viewer by choosing the clockwise circular arrow on the upper-right corner. The visualization tabs should appear after the job data are successfully loaded. You can also set to auto-refresh using the **Settings** button next to the refresh button in the upper right corner.

Visualization of the output tensors in TensorBoard

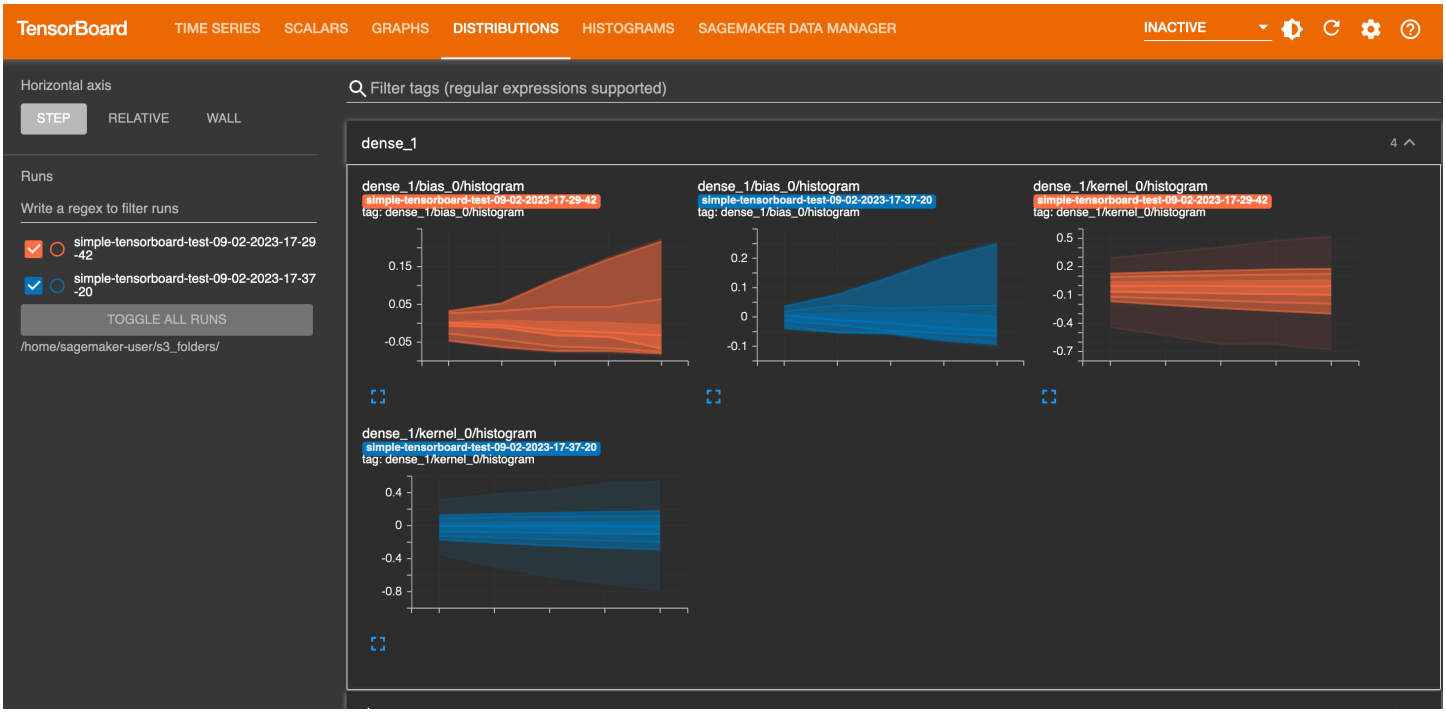


In the graphics tabs, you can find the list of the loaded training jobs in the left pane. You can also use the check boxes of the training jobs to show or hide visualizations. The TensorBoard dynamic

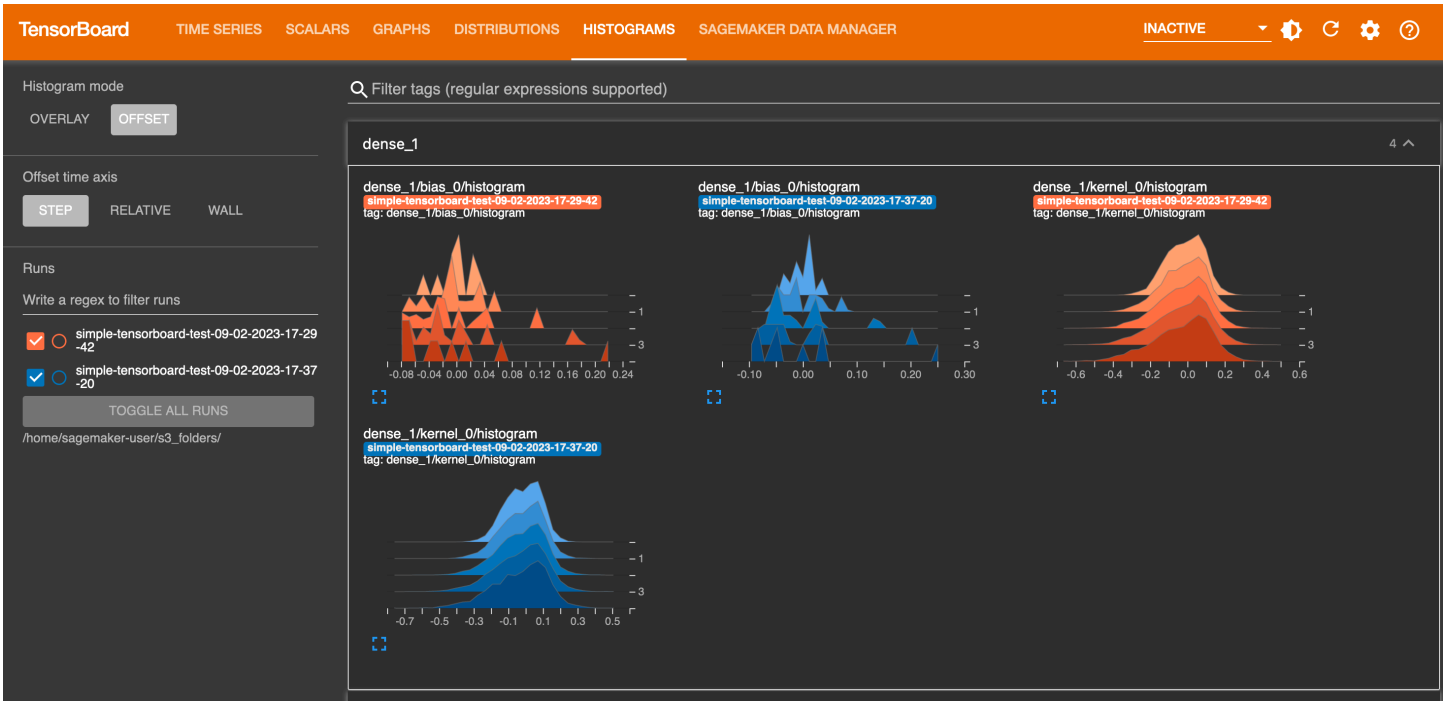
plugins are activated dynamically depending on how you have set your training script to include summary writers and pass callbacks for tensor and scalar collection, and therefore the graphics tabs also appear dynamically. The following screenshots show example views of each tab with visualization of two training jobs that collected metrics for time series, scalar, graph, distribution, and histogram plugins.



The TIME SERIES tab view



The SCALARS tab view



The GRAPHS tab view

The DISTRIBUTIONS tab view

The HISTOGRAMS tab view

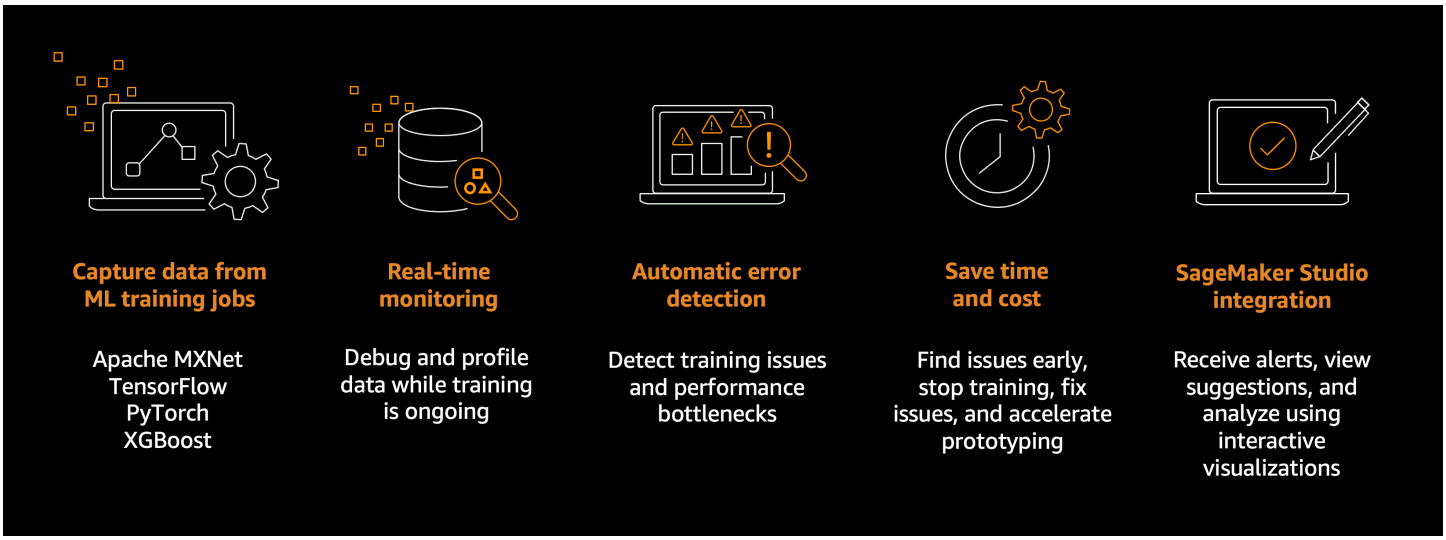
Delete unused TensorBoard applications

After you are done with monitoring and experimenting with jobs in TensorBoard, shut the TensorBoard application down.

1. Open the SageMaker AI console.
2. On the left navigation pane, choose **Admin configurations**.
3. Under **Admin configurations**, choose **domains**.
4. Choose your domain.
5. Choose your user profile.
6. Under **Apps**, choose **Delete App** for the TensorBoard row.
7. Choose **Yes, delete app**.
8. Type **`delete`** in the text box, then choose **Delete**.
9. A blue message should appear at the top of the screen: **default is being deleted**.

Amazon SageMaker Debugger

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.



Debug model output tensors from machine learning training jobs in real time and detect non-converging issues using Amazon SageMaker Debugger.

Amazon SageMaker Debugger features

A machine learning (ML) training job can have problems such as overfitting, saturated activation functions, and vanishing gradients, which can compromise model performance.

SageMaker Debugger provides tools to debug training jobs and resolve such problems to improve the performance of your model. Debugger also offers tools to send alerts when training anomalies are found, take actions against the problems, and identify the root cause of them by visualizing collected metrics and tensors.

SageMaker Debugger supports the Apache MXNet, PyTorch, TensorFlow, and XGBoost frameworks. For more information about available frameworks and versions supported by SageMaker Debugger, see Supported frameworks and algorithms.

The high-level Debugger workflow is as follows:

1. Modify your training script with the `sagemaker-debugger` Python SDK if needed.
2. Configure a SageMaker training job with SageMaker Debugger.
   - Configure using the SageMaker AI ModelTrainer API (for Python SDK).
   - Configure using the SageMaker AI `CreateTrainingJob` request (for Boto3 or CLI).
   - Configure custom training containers with SageMaker Debugger.
3. Start a training job and monitor training issues in real time.
   - List of Debugger built-in rules.
4. Get alerts and take prompt actions against the training issues.
   - Receive texts and emails and stop training jobs when training issues are found using Use Debugger built-in actions for rules.
   - Set up your own actions using Amazon CloudWatch Events and Amazon Lambda.
5. Explore deep analysis of the training issues.
   - For debugging model output tensors, see Visualize Debugger Output Tensors in TensorBoard.
6. Fix the issues, consider the suggestions provided by Debugger, and repeat steps 1–5 until you optimize your model and achieve target accuracy.

The SageMaker Debugger developer guide walks you through the following topics.

Topics

- Debugger availability change

Debugger availability change

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features.

Replacing Amazon SageMaker Debugger

Follow this guide to transition to alternative services.

Overview

Amazon SageMaker Debugger provided training observability, model debugging, and system profiling as a built-in SageMaker capability. These capabilities are now better served by a combination of Amazon SageMaker AI MLflow, TensorBoard on SageMaker, and Amazon CloudWatch for training observability, model debugging, and system performance monitoring. These tools provide flexible capabilities that adapt to your specific training workflow, whether you're fine-tuning foundation models, training custom architectures, or running distributed workloads.

Capability mapping

Debugger capability	Replaced by	What it provides
Training metric logging	MLflow / TensorBoard	Log, visualize, and compare metrics across training runs
Model and parameter tracking	MLflow	Track hyperparameters, model versions, and artifacts with full reproducibility
Gradient, activation, and weight analysis	TensorBoard	Histogram and distribution plugins for inspecting model internals across training steps

Debugger capability	Replaced by	What it provides
System resource profiling (CPU, GPU, memory, disk)	Amazon CloudWatch	Real-time utilization metrics with configurable dashboards
Automated training diagnostics	Amazon CloudWatch Alarms + MLflow	Monitor any logged metric such as loss convergence, gradient norms, resource utilization and alert on threshold breaches. MLflow run comparison identifies regressions across experiments

Step 1: Removing Debugger configuration

Remove DebuggerHookConfig from your estimator

If your training script or SageMaker estimator includes `DebuggerHookConfig`, Debugger-specific `TensorBoardOutputConfig`, or `rules` configurations, remove them. This disables automatic tensor capture and rule evaluation.

> **Note**
>
> If you are using the SageMaker Python SDK v2 `Estimator` class, consider also transitioning to the newer SageMaker Python SDK training APIs or direct Boto3 `CreateTrainingJob` calls, as Estimators are a legacy construct.

Delete Debugger output in Amazon S3

Debugger stored tensor data and profiling output in S3 under paths like:

```
s3://<bucket>/<training-job-name>/debug-output/
s3://<bucket>/<training-job-name>/profiler-output/
```

Delete these prefixes if you no longer need the historical data. Your training job logs and model artifacts in S3 remain unaffected.

Delete custom Debugger rules (if used)

If you defined custom rule containers:

- Delete Amazon ECR images used for custom Debugger rule evaluation
- Remove rule definition scripts or JSON configurations that are no longer needed

Delete CloudWatch log groups (optional)

Debugger created log groups under `/aws/sagemaker/TrainingJobs` for rule evaluation. Delete these if no longer needed to reduce log storage costs.

Review IAM policies

Remove IAM policies that granted access specifically for Debugger usage:

- `s3:GetObject` / `s3:PutObject` scoped to Debugger output paths
- `logs:PutLogEvents` for Debugger-specific log groups
- Permissions for Debugger rule container execution

Retain any policies still needed for your training jobs, MLflow, or CloudWatch.

Step 2: Configuring replacements

Integrate MLflow for experiment tracking

Amazon SageMaker AI offers a serverless MLflow capability that dynamically scales to support AI model development tasks at no additional cost. See the launch blog.

Use MLflow to:

- Log hyperparameters, training metrics, and model artifacts
- Compare runs side-by-side to identify regressions or improvements
- Track model versions and lineage from experiment to production

Get started: Machine learning experiments using Amazon SageMaker AI with MLflow – covers setup, creating a tracking server, and integrating with your training code.

Use TensorBoard for model introspection

TensorBoard in Amazon SageMaker AI provides deep visibility into model internals during training:

- Visualize gradient distributions and weight histograms across steps
- Monitor activation patterns and layer behavior
- Track scalar metrics, images, and custom visualizations

When to use TensorBoard vs. MLflow: MLflow tracks scalar metrics and supports basic visualization for run comparison. TensorBoard excels at multi-dimensional model introspection – gradient histograms, weight distributions, computational graphs, and embedding projections. Use both together: MLflow for experiment management, TensorBoard for deep debugging sessions.

Get started: TensorBoard in Amazon SageMaker AI

Use Amazon CloudWatch for system monitoring and alerts

Amazon CloudWatch captures resource utilization metrics for your training jobs and supports configurable alarms:

- Monitor CPU, GPU, memory, and disk utilization in real time
- Set alarms on any training metric to detect anomalies – loss plateaus, resource bottlenecks, or unexpected metric behavior
- Build dashboards combining system metrics and training metrics for unified visibility

Get started: Amazon CloudWatch Metrics for Monitoring and Analyzing Training Jobs

What happens to your existing data

- **Training logs in S3:** Your training job output, model artifacts, and logs remain accessible. These are independent of Debugger.
- **Debugger tensor data:** Historical tensor collections stored by Debugger remain in S3 at the paths listed above until you delete them. The `smdebug` client library can still read this data for reference.
- **CloudWatch metrics:** Historical training metrics already in CloudWatch are retained per your account's log retention settings.

Supported frameworks and algorithms

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

The following table shows SageMaker AI machine learning frameworks and algorithms supported by Debugger.

SageMaker AI-supported frameworks and algorithms	Debugging output tensors
TensorFlow	Amazon TensorFlow deep learning containers 1.15.4 or later
PyTorch	Amazon PyTorch deep learning containers 1.5.0 or later
MXNet	Amazon MXNet deep learning containers 1.6.0 or later
XGBoost	1.0-1, 1.2-1, 1.3-1
SageMaker AI generic ModelTrainer	Custom training containers (available for TensorFlow, PyTorch, MXNet, and XGBoost with manual hook registration)

- **Debugging output tensors** – Track and debug model parameters, such as weights, gradients, biases, and scalar values of your training job. Available deep learning frameworks are Apache MXNet, TensorFlow, PyTorch, and XGBoost.

Important

For the TensorFlow framework with Keras, SageMaker Debugger deprecates the zero code change support for debugging models built using the `tf.keras` modules of TensorFlow 2.6 and later. This is due to breaking changes announced in the TensorFlow 2.6.0 release note. For instructions on how to update your training script, see the section called "TensorFlow".

Important

From PyTorch v1.12.0 and later, SageMaker Debugger deprecates the zero code change support for debugging models.
This is due to breaking changes that cause SageMaker Debugger to interfere with the `torch.jit` functionality. For instructions on how to update your training script, see the section called "PyTorch".

If the framework or algorithm that you want to train and debug is not listed in the table, go to the Amazon Discussion Forum and leave feedback on SageMaker Debugger.

Amazon Web Services Regions

Amazon SageMaker Debugger is available in all regions where Amazon SageMaker AI is in service except the following region.

- Asia Pacific (Jakarta): `ap-southeast-3`

To find if Amazon SageMaker AI is in service in your Amazon Web Services Region, see Amazon Regional Services.

Use Debugger with Custom Training Containers

Bring your training containers to SageMaker AI and gain insights into your training jobs using Debugger. Maximize your work efficiency by optimizing your model on Amazon EC2 instances using the monitoring and debugging features.

For more information about how to build your training container with the `sagemaker-debugger` client library, push it to the Amazon Elastic Container Registry (Amazon ECR), and monitor and debug, see Use Debugger with custom training containers.

Debugger Open-Source GitHub Repositories

Debugger APIs are provided through the SageMaker Python SDK and designed to construct Debugger hook and rule configurations for the SageMaker AI CreateTrainingJob and DescribeTrainingJob API operations. The `sagemaker-debugger` client library provides tools to register *hooks* and access the training data through its *trial* feature, all through its flexible and powerful API operations. It supports the machine learning frameworks TensorFlow, PyTorch, MXNet, and XGBoost on Python 3.6 and later.

For direct resources about the Debugger and `sagemaker-debugger` API operations, see the following links:

- The Amazon SageMaker Python SDK documentation
- The Amazon SageMaker Python SDK - Debugger APIs
- The `sagemaker-debugger` Python SDK documentation for the Amazon SageMaker Debugger open source client library
- The `sagemaker-debugger` PyPI

If you use the SDK for Java to conduct SageMaker training jobs and want to configure Debugger APIs, see the following references:

- Amazon SageMaker Debugger APIs
- Configure Debugger using SageMaker API

Amazon SageMaker Debugger architecture

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

This topic walks you through a high-level overview of the Amazon SageMaker Debugger workflow.

Debugger supports profiling functionality for *performance optimization* to identify computation issues, such as system bottlenecks and underutilization, and to help optimize hardware resource utilization at scale.

Debugger's debugging functionality for *model optimization* is about analyzing non-converging training issues that can arise while minimizing the loss functions using optimization algorithms, such as gradient descent and its variations.

The following diagram shows the architecture of SageMaker Debugger. The blocks with bold boundary lines are what Debugger manages to analyze your training job.

Debugger stores the following data from your training jobs in your secured Amazon S3 bucket:

- **Output tensors** – Collections of scalars and model parameters that are continuously updated during the forward and backward passes while training ML models. The output tensors include

scalar values (accuracy and loss) and matrices (weights, gradients, input layers, and output layers).

> **Note**
>
> By default, Debugger monitors and debugs SageMaker training jobs without any Debugger-specific parameters configured in SageMaker AI ModelTrainers. Debugger collects system metrics every 500 milliseconds and basic output tensors (scalar outputs such as loss and accuracy) every 500 steps. It also runs the `ProfilerReport` rule to analyze the system metrics and aggregate the Studio Debugger insights dashboard and a profiling report. Debugger saves the output data in your secured Amazon S3 bucket.

The Debugger built-in rules run on processing containers, which are designed to evaluate machine learning models by processing the training data collected in your S3 bucket (see Process Data and Evaluate Models). The built-in rules are fully managed by Debugger. You can also create your own rules customized to your model to watch for any issues you want to monitor.

Debugger tutorials

Debugging models with Amazon SageMaker Debugger in Studio Classic

Julien Simon, Amazon Technical Evangelist | Length: 14 minutes 17 seconds

This tutorial video demonstrates how to use Amazon SageMaker Debugger to capture and inspect debugging information from a training model. The example training model used in this video is a simple convolutional neural network (CNN) based on Keras with the TensorFlow backend. SageMaker AI in a TensorFlow framework and Debugger enable you to build an ModelTrainer directly using the training script and debug the training job.

Debug Models with Amazon SageMaker Debugger (part 1)

You can find the example notebook in the video in this Studio Demo repository provided by the author. You need to clone the `debugger.ipynb` notebook file and the `mnist_keras_tf.py` training script to your SageMaker Studio or a SageMaker notebook instance. After you clone the two files, specify the path `keras_script_path` to the `mnist_keras_tf.py` file inside the `debugger.ipynb` notebook. For example, if you cloned the two files in the same directory, set it as `keras_script_path = "mnist_keras_tf.py"`.

Deep dive on Amazon SageMaker Debugger and SageMaker AI model monitor

Julien Simon, Amazon Technical Evangelist | Length: 44 minutes 34 seconds

This video session explores advanced features of Debugger and SageMaker Model Monitor that help boost productivity and the quality of your models. First, this video shows how to detect and fix training issues, visualize tensors, and improve models with Debugger. Next, at 22:41, the video shows how to monitor models in production and identify prediction issues such as missing features or data drift using SageMaker AI Model Monitor. Finally, it offers cost optimization tips to help you make the most of your machine learning budget.

Debug Models with Debugger (part 2)

You can find the example notebook in the video in this Amazon Dev Days 2020 repository offered by the author.

Debugger example notebooks

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

SageMaker Debugger example notebooks are provided in the aws/amazon-sagemaker-examples repository. The Debugger example notebooks walk you through basic to advanced use cases of debugging and profiling training jobs.

We recommend that you run the example notebooks on SageMaker Studio or a SageMaker Notebook instance because most of the examples are designed for training jobs in the SageMaker AI ecosystem, including Amazon EC2, Amazon S3, and Amazon SageMaker Python SDK.

To clone the example repository to SageMaker Studio, follow the instructions at Amazon SageMaker Studio Tour.

> **Important**
>
> To use the new Debugger features, you need to upgrade the SageMaker Python SDK and the `SMDebug` client library. In your iPython kernel, Jupyter Notebook, or JupyterLab environment, run the following code to install the latest versions of the libraries and restart the kernel.

```
import sys
import IPython
!{sys.executable} -m pip install -U sagemaker smdebug
IPython.Application.instance().kernel.do_shutdown(True)
```

Debugger example notebooks for profiling training jobs

The following list shows Debugger example notebooks introducing Debugger's adaptability to monitor and profile training jobs for various machine learning models, datasets, and frameworks.

Notebook Title	Framework	Model	Dataset	Description
Amazon SageMaker Debugger Profiling Data Analysis	TensorFlow	Keras ResNet50	Cifar-10	This notebook provides an introduction to interacti ve analysis of profiled data captured by SageMaker Debugger. Explore the full functionality of the SMDebug interactive analysis tools.
Profile machine learning training with Amazon SageMaker Debugger	TensorFlow	1-D Convoluti onal Neural Network	IMDB dataset	Profile a TensorFlow 1-D CNN for sentiment analysis of IMDB data that consists of movie reviews labeled as having positive or negative sentiment. Explore the Studio Debugger insights and Debugger profiling report.
Profiling TensorFlo w ResNet model training with various	TensorFlow	ResNet50	Cifar-10	Run TensorFlow training jobs with various distribut ed training settings, monitor system resource utilization, and profile model performan ce using Debugger.

- Using SageMaker Debugger to visualize class activation maps in convolutional neural networks (CNNs)

Training and pruning models with Amazon SageMaker Experiments and Debugger

Dr. Nathalie Rauschmayr, Amazon Applied Scientist | Length: 49 minutes 26 seconds

Train and Prune Models with SageMaker AI Experiments and Debugger

Find out how Amazon SageMaker Experiments and Debugger can simplify the management of your training jobs. Amazon SageMaker Debugger provides transparent visibility into training jobs and saves training metrics into your Amazon S3 bucket. SageMaker Experiments enables you to call the training information as *trials* through SageMaker Studio and supports visualization of the training job. This helps you keep model quality high while reducing less important parameters based on importance rank.

This video demonstrates a *model pruning* technique that makes pre-trained ResNet50 and AlexNet models lighter and affordable while keeping high standards for model accuracy.

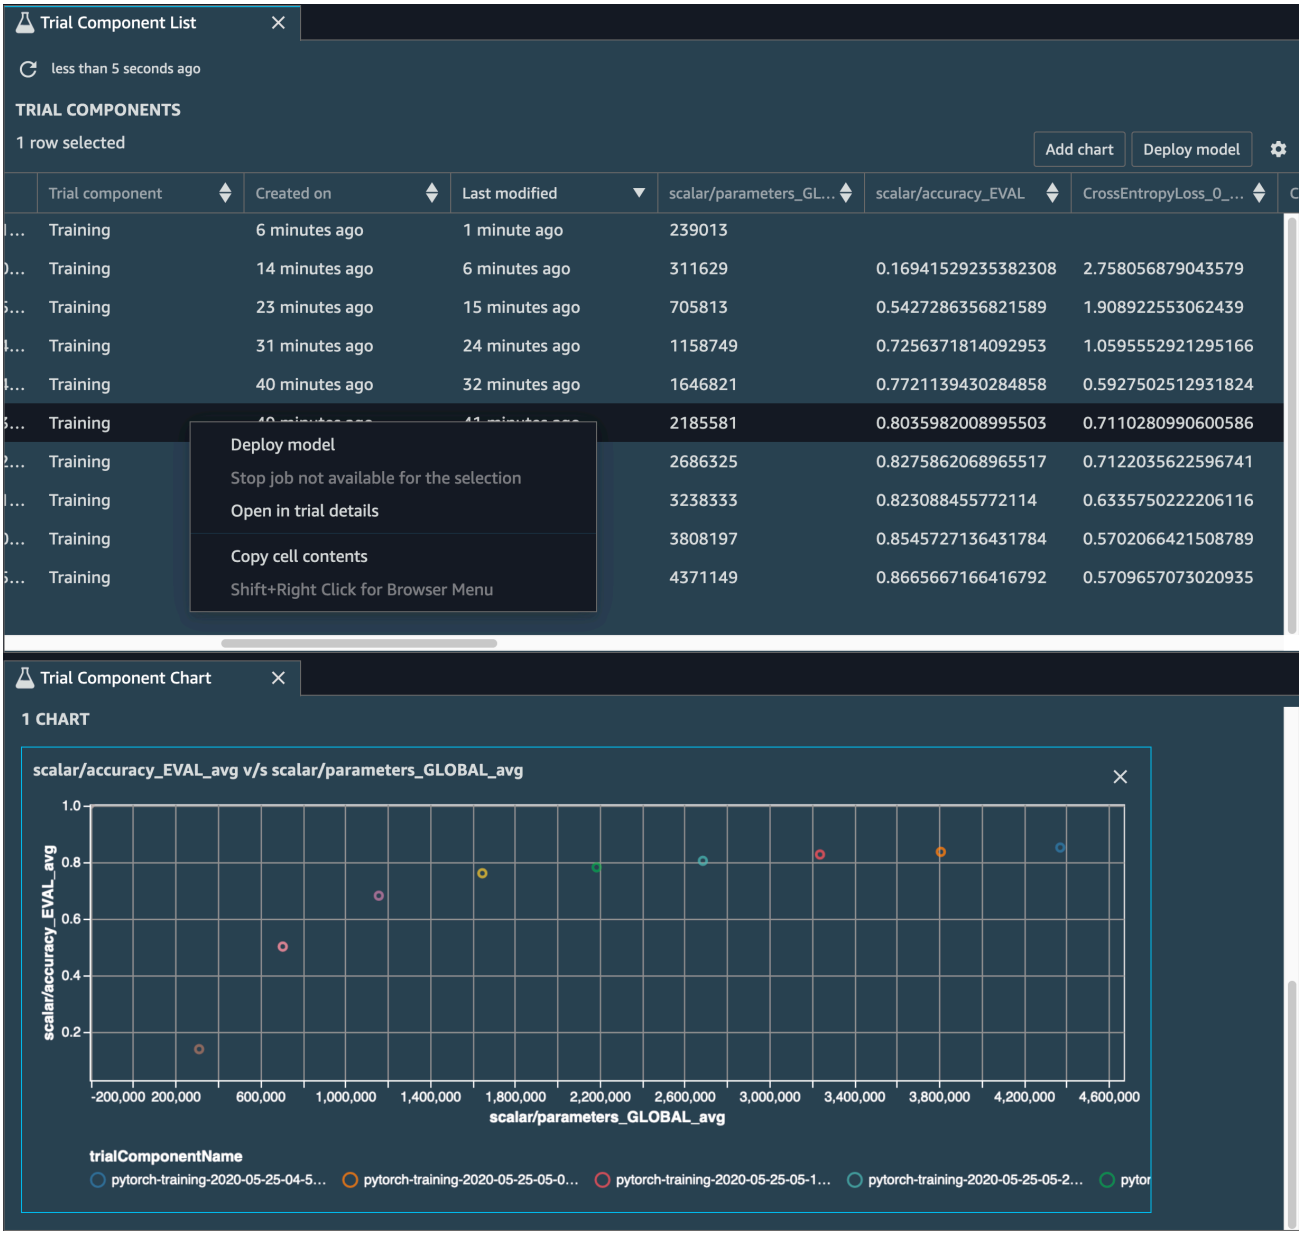
SageMaker AI ModelTrainer trains those algorithms supplied from the PyTorch model zoo in an Amazon Deep Learning Containers with PyTorch framework, and Debugger extracts training metrics from the training process.

The video also demonstrates how to set up a Debugger custom rule to watch the accuracy of a pruned model, to trigger an Amazon CloudWatch event and an Amazon Lambda function when the accuracy hits a threshold, and to automatically stop the pruning process to avoid redundant iterations.

Learning objectives are as follows:

- Learn how to use SageMaker AI to accelerate ML model training and improve model quality.

- Understand how to manage training iterations with SageMaker Experiments by automatically capturing input parameters, configurations, and results.
- Discover how Debugger makes the training process transparent by automatically capturing real-time tensor data from metrics such as weights, gradients, and activation outputs of convolutional neural networks.
- Use CloudWatch to trigger Lambda when Debugger catches issues.
- Master the SageMaker training process using SageMaker Experiments and Debugger.



You can find the notebooks and training scripts used in this video from SageMaker Debugger PyTorch Iterative Model Pruning.

The following image shows how the iterative model pruning process reduces the size of AlexNet by cutting out the 100 least significant filters based on importance rank evaluated by activation outputs and gradients.

The pruning process reduced the initial 50 million parameters to 18 million. It also reduced the estimated model size from 201 MB to 73 MB.

```
Pruning iteration: 0

Params size (MB): 194.10
Estimated Total Size (MB): 201.95
----------------------------------------------------------------
```

You also need to track model accuracy, and the following image shows how you can plot the model pruning process to visualize changes in model accuracy based on the number of parameters in SageMaker Studio.

In SageMaker Studio, choose the **Experiments** tab, select a list of tensors saved by Debugger from the pruning process, and then compose a **Trial Component List** panel. Select all ten iterations and then choose **Add chart** to create a **Trial Component Chart**. After you decide on a model to deploy, choose the trial component and choose a menu to perform an action or choose **Deploy model**.

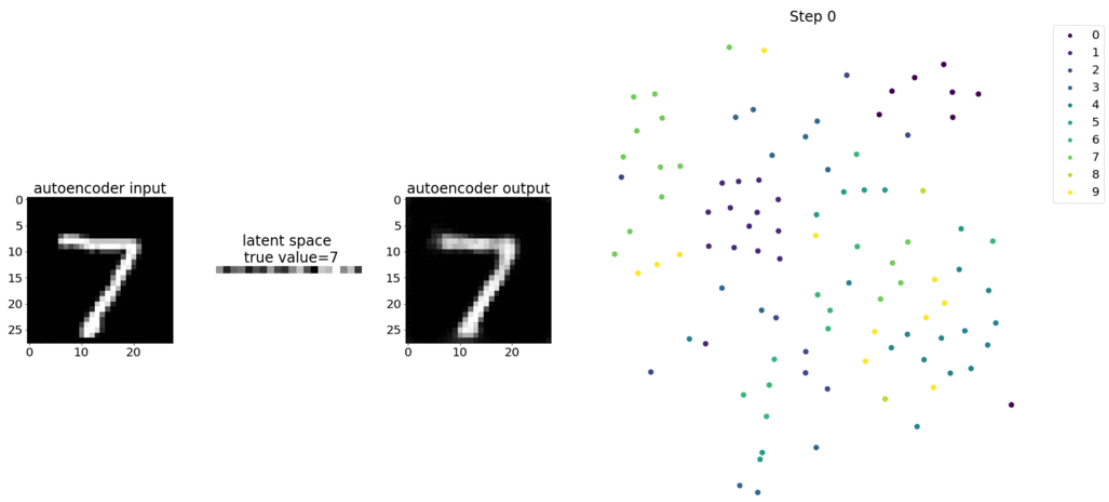
> **Note**
>
> To deploy a model through SageMaker Studio using the following notebook example, add a line at the end of the `train` function in the `train.py` script.

```
# In the train.py script, look for the train function in line 58.
def train(epochs, batch_size, learning_rate):
    ...
        print('acc:{:.4f}'.format(correct/total))
        hook.save_scalar("accuracy", correct/total, sm_metric=True)

    # Add the following code to line 128 of the train.py script to save the
 pruned models
    # under the current SageMaker Studio model directory
    torch.save(model.state_dict(), os.environ['SM_MODEL_DIR'] + '/model.pt')
```

Using SageMaker Debugger to monitor a convolutional autoencoder model training

This notebook demonstrates how SageMaker Debugger visualizes tensors from an unsupervised (or self-supervised) learning process on a MNIST image dataset of handwritten numbers.



The training model in this notebook is a convolutional autoencoder with the MXNet framework. The convolutional autoencoder has a bottleneck-shaped convolutional neural network that consists of an encoder part and a decoder part.

The encoder in this example has two convolution layers to produce compressed representation (latent variables) of the input images. In this case, the encoder produces a latent variable of size (1, 20) from an original input image of size (28, 28) and significantly reduces the size of data for training by 40 times.

The decoder has two *deconvolutional* layers and ensures that the latent variables preserve key information by reconstructing output images.

The convolutional encoder powers clustering algorithms with smaller input data size and the performance of clustering algorithms such as k-means, k-NN, and t-Distributed Stochastic Neighbor Embedding (t-SNE).

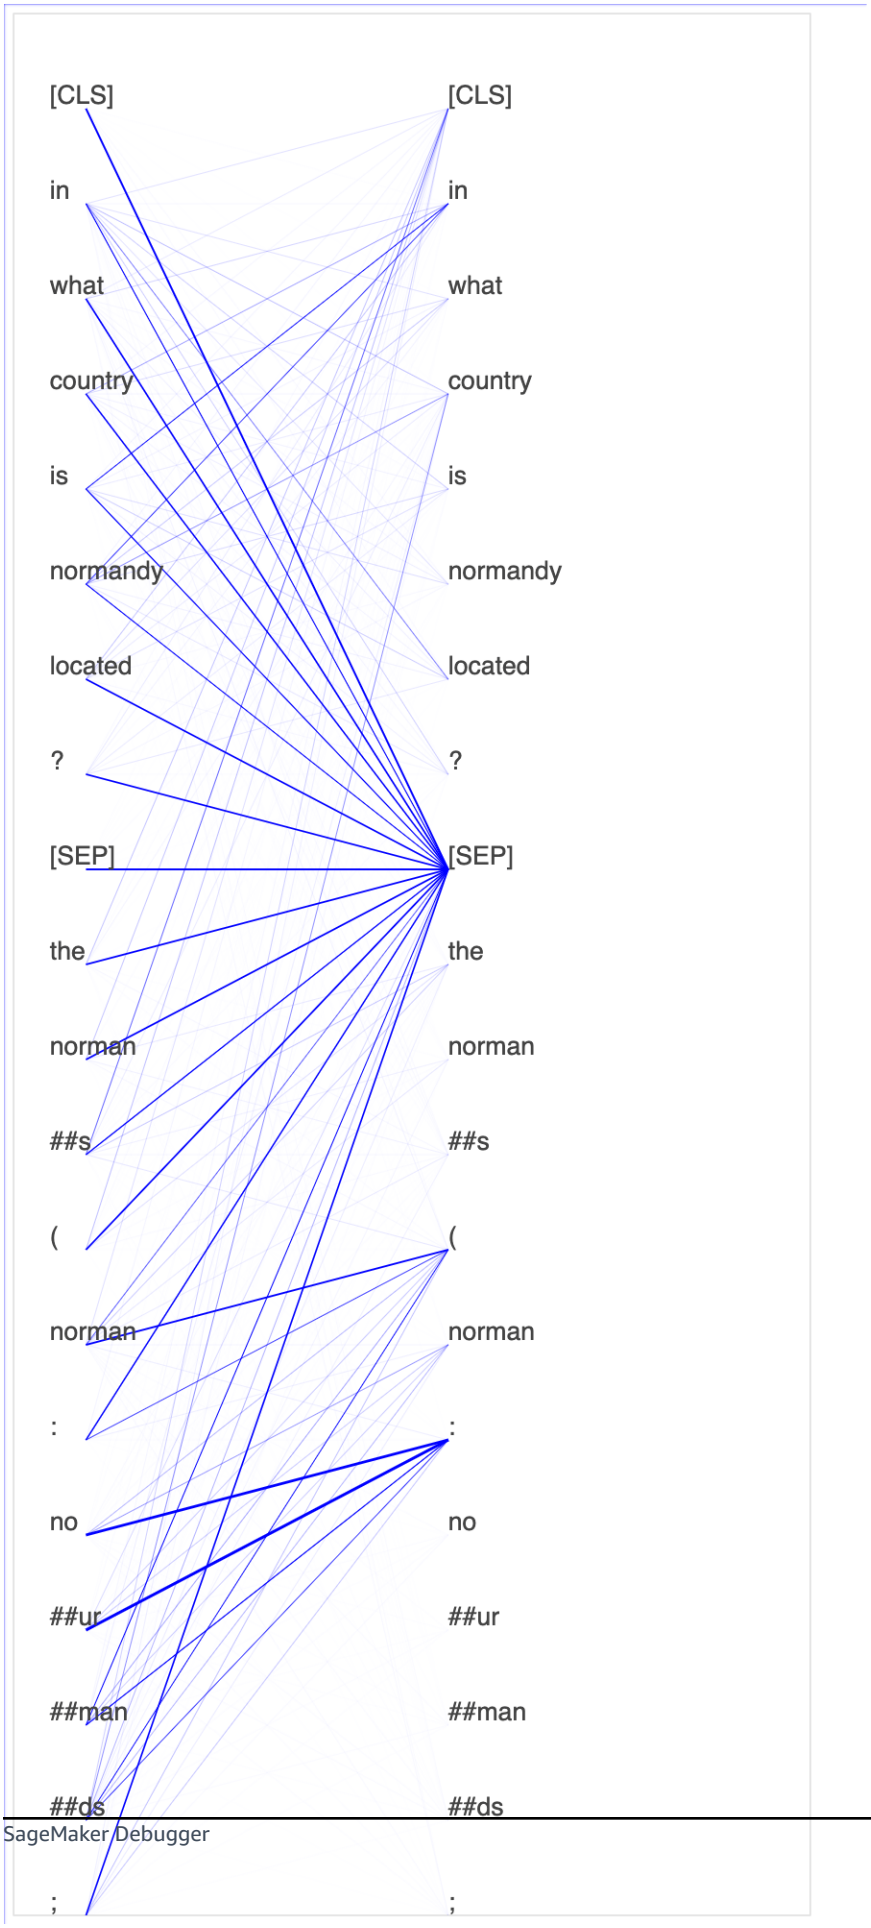
This notebook example demonstrates how to visualize the latent variables using Debugger, as shown in the following animation. It also demonstrates how the t-SNE algorithm classifies the latent variables into ten clusters and projects them into a two-dimensional space. The scatter plot color scheme on the right side of the image reflects the true values to show how well the BERT model and t-SNE algorithm organize the latent variables into the clusters.

Using SageMaker Debugger to monitor attentions in BERT model training

Bidirectional Encode Representations from Transformers (BERT) is a language representation model. As the name of model reflects, the BERT model builds on *transfer learning* and the *Transformer model* for natural language processing (NLP).

The BERT model is pre-trained on unsupervised tasks such as predicting missing words in a sentence or predicting the next sentence that naturally follows a previous sentence. The training data contains 3.3 billion words (tokens) of English text, from sources such as Wikipedia and electronic books. For a simple example, the BERT model can give a high *attention* to appropriate verb tokens or pronoun tokens from a subject token.

The pre-trained BERT model can be fine-tuned with an additional output layer to achieve state-of-the-art model training in NLP tasks, such as automated responses to questions, text classification, and many others.

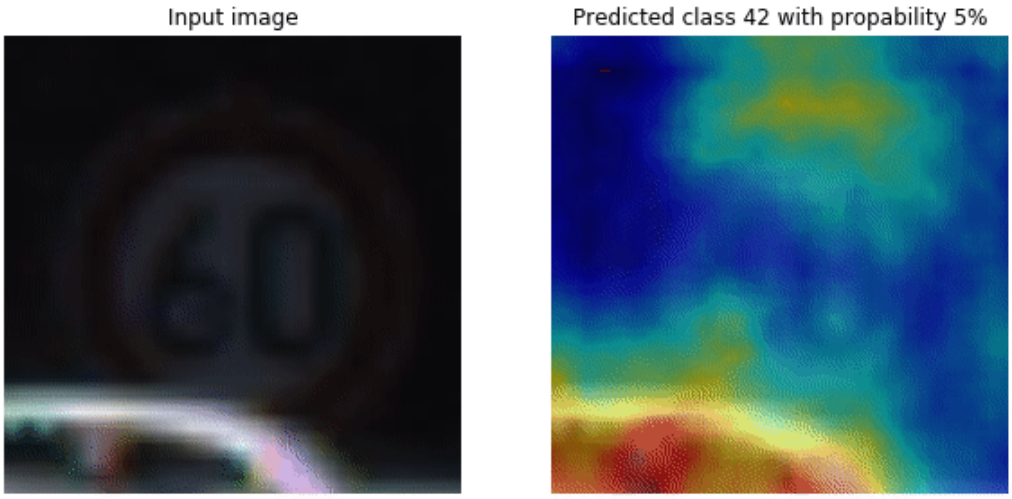


Debugger collects tensors from the fine-tuning process. In the context of NLP, the weight of neurons is called *attention*.

This notebook demonstrates how to use the pre-trained BERT model from the GluonNLP model zoo on the Stanford Question and Answering dataset and how to set up SageMaker Debugger to monitor the training job.

Plotting *attention scores* and individual neurons in the query and key vectors can help to identify causes of incorrect model predictions. With SageMaker AI Debugger, you can retrieve the tensors

and plot the *attention-head view* in real time as training progresses and understand what the model is learning.



The following animation shows the attention scores of the first 20 input tokens for ten iterations in the training job provided in the notebook example.

Using SageMaker Debugger to visualize class activation maps in convolutional neural networks (CNNs)

This notebook demonstrates how to use SageMaker Debugger to plot class activation maps for image detection and classification in convolutional neural networks (CNNs). In deep learning, a *convolutional neural network (CNN or ConvNet)* is a class of deep neural networks, most commonly applied to analyzing visual imagery. One of the applications that adopts the class activation maps is self-driving cars, which require instantaneous detection and classification of images such as traffic signs, roads, and obstacles.

In this notebook, the PyTorch ResNet model is trained on the German Traffic Sign Dataset, which contains more than 40 classes of traffic-related objects and more than 50,000 images in total.

During the training process, SageMaker Debugger collects tensors to plot the class activation maps in real time. As shown in the animated image, the class activation map (also called as a *saliency map*) highlights regions with high activation in red color.

Using tensors captured by Debugger, you can visualize how the activation map evolves during the model training. The model starts by detecting the edge on the lower-left corner at the beginning of the training job. As the training progresses, the focus shifts to the center and detects the speed limit sign, and the model successfully predicts the input image as Class 3, which is a class of speed limit 60km/h signs, with a 97% confidence level.

Debugging training jobs using Amazon SageMaker Debugger

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

To prepare your training script and run training jobs with SageMaker Debugger to debug model training progress, you follow the typical two-step process: modify your training script using the `sagemaker-debugger` Python SDK, and construct a SageMaker AI ModelTrainer using the SageMaker Python SDK. Go through the following topics to learn how to use SageMaker Debugger's debugging functionality.

Topics

- Adapting your training script to register a hook
- Launch training jobs with Debugger using the SageMaker Python SDK
- SageMaker Debugger interactive report for XGBoost
- Action on Amazon SageMaker Debugger rules
- Visualize Amazon SageMaker Debugger output tensors in TensorBoard

Adapting your training script to register a hook

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

Amazon SageMaker Debugger comes with a client library called the `sagemaker-debugger` Python SDK. The `sagemaker-debugger` Python SDK provides tools for adapting your training

script before training and analysis tools after training. In this page, you'll learn how to adapt your training script using the client library.

The `sagemaker-debugger` Python SDK provides wrapper functions that help register a hook to extract model tensors, without altering your training script. To get started with collecting model output tensors and debug them to find training issues, make the following modifications in your training script.

> **Tip**
>
> While you're following this page, use the `sagemaker-debugger` open source SDK documentation for API references.

Topics

- Adapt your PyTorch training script
- Adapt your TensorFlow training script

Adapt your PyTorch training script

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

To start collecting model output tensors and debug training issues, make the following modifications to your PyTorch training script.

> **Note**
>
> SageMaker Debugger cannot collect model output tensors from the `torch.nn.functional` API operations. When you write a PyTorch training script, it is recommended to use the `torch.nn` modules instead.

For PyTorch 1.12.0

If you bring a PyTorch training script, you can run the training job and extract model output tensors with a few additional code lines in your training script. You need to use the hook APIs in the `sagemaker-debugger` client library. Walk through the following instructions that break down the steps with code examples.

1. Create a hook.

   (Recommended) For training jobs within SageMaker AI

   ```
   import smdebug.pytorch as smd
   hook=smd.get_hook(create_if_not_exists=True)
   ```

   When you launch a training job in the section called "Launch training jobs with Debugger using the SageMaker Python SDK" with any of the DebuggerHookConfig, TensorBoardConfig, or Rules in your ModelTrainer, SageMaker AI adds a JSON configuration file to your training instance that is picked up by the `get_hook` function. Note that if you do not include any of the configuration APIs in your ModelTrainer, there will be no configuration file for the hook to find, and the function returns None.

   (Optional) For training jobs outside SageMaker AI

   If you run training jobs in local mode, directly on SageMaker Notebook instances, Amazon EC2 instances, or your own local devices, use `smd.Hook` class to create a hook. However, this approach can only store the tensor collections and usable for TensorBoard visualization. SageMaker Debugger's built-in Rules don't work with the local mode because the Rules require SageMaker AI ML training instances and S3 to store outputs from the remote instances in real time. The `smd.get_hook` API returns None in this case.

   If you want to create a manual hook to save tensors in local mode, use the following code snippet with the logic to check if the `smd.get_hook` API returns None and create a manual hook using the `smd.Hook` class. Note that you can specify any output directory in your local machine.

   ```
   import smdebug.pytorch as smd
   hook=smd.get_hook(create_if_not_exists=True)

   if hook is None:
       hook=smd.Hook(
   ```

```
        out_dir='/path/to/your/local/output/',
        export_tensorboard=True
    )
```

2. Wrap your model with the hook's class methods.

   The hook.register_module() method takes your model and iterates through each layer, looking for any tensors that match with regular expressions that you'll provide through the configuration in the section called "Launch training jobs with Debugger using the SageMaker Python SDK". The collectable tensors through this hook method are weights, biases, activations, gradients, inputs, and outputs.

   ```
   hook.register_module(model)
   ```

   > **Tip**
   >
   > If you collect the entire output tensors from a large deep learning model, the total size of those collections can exponentially grow and might cause bottlenecks. If you want to save specific tensors, you can also use the hook.save_tensor() method. This method helps you pick the variable for the specific tensor and save to a custom collection named as you want. For more information, see step 7 of this instruction.

3. Warp the loss function with the hook's class methods.

   The hook.register_loss method is to wrap the loss function. It extracts loss values every save_interval that you'll set during configuration in the section called "Launch training jobs with Debugger using the SageMaker Python SDK", and saves them to the "losses" collection.

   ```
   hook.register_loss(loss_function)
   ```

4. Add hook.set_mode(ModeKeys.TRAIN) in the train block. This indicates the tensor collection is extracted during the training phase.

   ```
   def train():
       ...
       hook.set_mode(ModeKeys.TRAIN)
   ```

5. Add hook.set_mode(ModeKeys.EVAL) in the validation block. This indicates the tensor collection is extracted during the validation phase.

```
def validation():
    ...
    hook.set_mode(ModeKeys.EVAL)
```

6. Use `hook.save_scalar()` to save custom scalars. You can save scalar values that aren't in your model. For example, if you want to record the accuracy values computed during evaluation, add the following line of code below the line where you calculate accuracy.

   ```
   hook.save_scalar("accuracy", accuracy)
   ```

   Note that you need to provide a string as the first argument to name the custom scalar collection. This is the name that'll be used for visualizing the scalar values in TensorBoard, and can be any string you want.

7. Use `hook.save_tensor()` to save custom tensors. Similarly to `hook.save_scalar()`, you can save additional tensors, defining your own tensor collection. For example, you can extract input image data that are passed into the model and save as a custom tensor by adding the following code line, where `"images"` is an example name of the custom tensor, `image_inputs` is an example variable for the input image data.

   ```
   hook.save_tensor("images", image_inputs)
   ```

   Note that you must provide a string to the first argument to name the custom tensor. `hook.save_tensor()` has the third argument `collections_to_write` to specify the tensor collection to save the custom tensor. The default is `collections_to_write="default"`. If you don't explicitely specify the third argument, the custom tensor is saved to the `"default"` tensor collection.

After you have completed adapting your training script, proceed to the section called "Launch training jobs with Debugger using the SageMaker Python SDK".

Adapt your TensorFlow training script

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and

availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

To start collecting model output tensors and debug training issues, make the following modifications to your TensorFlow training script.

Create a hook for training jobs within SageMaker AI

```
import smdebug.tensorflow as smd

hook=smd.get_hook(hook_type="keras", create_if_not_exists=True)
```

This creates a hook when you start a SageMaker training job. When you launch a training job in the section called "Launch training jobs with Debugger using the SageMaker Python SDK" with any of the `DebuggerHookConfig`, `TensorBoardConfig`, or `Rules` in your ModelTrainer, SageMaker AI adds a JSON configuration file to your training instance that is picked up by the `smd.get_hook` method. Note that if you do not include any of the configuration APIs in your ModelTrainer, there will be no configuration file for the hook to find, and the function returns `None`.

(Optional) Create a hook for training jobs outside SageMaker AI

If you run training jobs in local mode, directly on SageMaker Notebook instances, Amazon EC2 instances, or your own local devices, use `smd.Hook` class to create a hook. However, this approach can only store the tensor collections and usable for TensorBoard visualization. SageMaker Debugger's built-in Rules don't work with the local mode. The `smd.get_hook` method also returns `None` in this case.

If you want to create a manual hook, use the following code snippet with the logic to check if the hook returns `None` and create a manual hook using the `smd.Hook` class.

```
import smdebug.tensorflow as smd

hook=smd.get_hook(hook_type="keras", create_if_not_exists=True)

if hook is None:
    hook=smd.KerasHook(
        out_dir='/path/to/your/local/output/',
        export_tensorboard=True
```

```
    )
```

After adding the hook creation code, proceed to the following topic for TensorFlow Keras.

> **Note**
>
> SageMaker Debugger currently supports TensorFlow Keras only.

Register the hook in your TensorFlow Keras training script

The following precedure walks you through how to use the hook and its methods to collect output scalars and tensors from your model and optimizer.

1. Wrap your Keras model and optimizer with the hook's class methods.

   The hook`.register_model()` method takes your model and iterates through each layer, looking for any tensors that match with regular expressions that you'll provide through the configuration in the section called "Launch training jobs with Debugger using the SageMaker Python SDK". The collectable tensors through this hook method are weights, biases, and activations.

   ```
   model=tf.keras.Model(...)
   hook.register_model(model)
   ```

2. Wrap the optimizer by the hook`.wrap_optimizer()` method.

   ```
   optimizer=tf.keras.optimizers.Adam(...)
   optimizer=hook.wrap_optimizer(optimizer)
   ```

3. Compile the model in eager mode in TensorFlow.

   To collect tensors from the model, such as the input and output tensors of each layer, you must run the training in eager mode. Otherwise, SageMaker AI Debugger will not be able to collect the tensors. However, other tensors, such as model weights, biases, and the loss, can be collected without explicitly running in eager mode.

   ```
   model.compile(
       loss="categorical_crossentropy",
       optimizer=optimizer,
   ```

```
    metrics=["accuracy"],
    # Required for collecting tensors of each layer
    run_eagerly=True
)
```

4. Register the hook to the `tf.keras.Model.fit()` method.

   To collect the tensors from the hooks that you registered, add `callbacks=[hook]` to the Keras `model.fit()` class method. This will pass the `sagemaker-debugger` hook as a Keras callback.

```
model.fit(
    X_train, Y_train,
    batch_size=batch_size,
    epochs=epoch,
    validation_data=(X_valid, Y_valid),
    shuffle=True,
    callbacks=[hook]
)
```

5. TensorFlow 2.x provides only symbolic gradient variables that do not provide access to their values. To collect gradients, wrap `tf.GradientTape` by the `hook.wrap_tape()` method, which requires you to write your own training step as follows.

```
def training_step(model, dataset):
    with hook.wrap_tape(tf.GradientTape()) as tape:
        pred=model(data)
        loss_value=loss_fn(labels, pred)
    grads=tape.gradient(loss_value, model.trainable_variables)
    optimizer.apply_gradients(zip(grads, model.trainable_variables))
```

   By wrapping the tape, the `sagemaker-debugger` hook can identify output tensors such as gradients, parameters, and losses. Wrapping the tape ensures that the `hook.wrap_tape()` method around functions of the tape object, such as `push_tape()`, `pop_tape()`, `gradient()`, will set up the writers of SageMaker Debugger and save tensors that are provided as input to `gradient()` (trainable variables and loss) and output of `gradient()` (gradients).

   > **Note**
   >
   > To collect with a custom training loop, make sure that you use eager mode. Otherwise, SageMaker Debugger is not able to collect any tensors.

For a full list of actions that the `sagemaker-debugger` hook APIs offer to construct hooks and save tensors, see Hook Methods in the *`sagemaker-debugger` Python SDK documentation*.

After you have completed adapting your training script, proceed to the section called "Launch training jobs with Debugger using the SageMaker Python SDK".

Launch training jobs with Debugger using the SageMaker Python SDK

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

To configure a SageMaker AI estimator with SageMaker Debugger, use Amazon SageMaker Python SDK and specify Debugger-specific parameters. To fully utilize the debugging functionality, there are three parameters you need to configure: `debugger_hook_config`, `tensorboard_output_config`, and `rules`.

> **Important**
>
> Before constructing and running the estimator fit method to launch a training job, make sure that you adapt your training script following the instructions at the section called "Adapting your training script to register a hook".

Constructing a SageMaker AI Estimator with Debugger-specific parameters

The code examples in this section show how to construct a SageMaker AI estimator with the Debugger-specific parameters.

> **Note**
>
> The following code examples are templates for constructing the SageMaker AI framework estimators and not directly executable. You need to proceed to the next sections and configure the Debugger-specific parameters.

```
# An example of creating a training job with debugger configuration
import boto3
from sagemaker.core import image_uris
from sagemaker.core.resources import TrainingJob
from sagemaker.core.shapes import (
    AlgorithmSpecification,
    ResourceConfig,
    OutputDataConfig,
    StoppingCondition,
    DebugHookConfig,
    CollectionConfiguration,
    DebugRuleConfiguration,
)

session=boto3.session.Session()
region=session.region_name

# Retrieve the training image for your framework
# Change framework to "tensorflow", "mxnet", "xgboost", etc. as needed
training_image = image_uris.retrieve(
    framework="pytorch",  # or "tensorflow", "mxnet", "xgboost"
    region=region,
    version="1.12.0",
    py_version="py37",
    instance_type="ml.p3.2xlarge",
    image_scope="training"
)

debug_hook_config=DebugHookConfig(...)
debug_rule_configurations=[
    DebugRuleConfiguration(
        rule_configuration_name="built_in_rule",
        rule_evaluator_image="rule-evaluator-image-uri",
    )
]

TrainingJob.create(
    training_job_name="debugger-demo",
    algorithm_specification=AlgorithmSpecification(
        training_image=training_image,
        training_input_mode="File",
    ),
    role_arn="arn:aws:iam::123456789012:role/SageMakerRole",
```

```
    resource_config=ResourceConfig(instance_type="ml.p3.2xlarge", instance_count=1,
 volume_size_in_gb=30),
    output_data_config=OutputDataConfig(s3_output_path="s3://bucket/output"),
    stopping_condition=StoppingCondition(max_runtime_in_seconds=3600),

    # Debugger-specific parameters
    debug_hook_config=debug_hook_config,
    debug_rule_configurations=debug_rule_configurations,
)
```

Configure the following parameters to activate SageMaker Debugger:

- `debugger_hook_config` (an object of `DebuggerHookConfig`) – Required to activate the hook in the adapted training script during the section called "Adapting your training script to register a hook", configure the SageMaker training launcher (estimator) to collect output tensors from your training job, and save the tensors into your secured S3 bucket or local machine. To learn how to configure the `debugger_hook_config` parameter, see Configuring SageMaker Debugger to save tensors.
- `rules` (a list of `Rule` objects) – Configure this parameter to activate SageMaker Debugger built-in rules that you want to run in real time. The built-in rules are logics that automatically debug the training progress of your model and find training issues by analyzing the output tensors saved in your secured S3 bucket. To learn how to configure the `rules` parameter, see How to configure Debugger built-in rules. To find a complete list of built-in rules for debugging output tensors, see the section called "Debugger rule". If you want to create your own logic to detect any training issues, see the section called "Creating custom rules".

  > **Note**
  >
  > The built-in rules are available only through SageMaker training instances. You cannot use them in local mode.

- `tensorboard_output_config` (an object of `TensorBoardOutputConfig`) – Configure SageMaker Debugger to collect output tensors in the TensorBoard-compatible format and save to your S3 output path specified in the `TensorBoardOutputConfig` object. To learn more, see the section called "Visualize Debugger Output Tensors in TensorBoard".

> **Note**
>
> The `tensorboard_output_config` must be configured with the `debugger_hook_config` parameter, which also requires you to adapt your training script by adding the `sagemaker-debugger` hook.

> **Note**
>
> SageMaker Debugger securely saves output tensors in subfolders of your S3 bucket. For example, the format of the default S3 bucket URI in your account is `s3://amzn-s3-demo-bucket-sagemaker-<region>-<12digit_account_id>/<base-job-name>/<debugger-subfolders>/`. There are two subfolders created by SageMaker Debugger: `debug-output`, and `rule-output`. If you add the `tensorboard_output_config` parameter, you'll also find `tensorboard-output` folder.

See the following topics to find more examples of how to configure the Debugger-specific parameters in detail.

Topics

- Configuring SageMaker Debugger to save tensors
- How to configure Debugger built-in rules
- Turn off Debugger
- Useful SageMaker AI estimator class methods for Debugger

Configuring SageMaker Debugger to save tensors

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

Tensors are data collections of updated parameters from the backward and forward pass of each training iteration. SageMaker Debugger collects the output tensors to analyze the state of a training job. SageMaker Debugger's `CollectionConfig` and `DebuggerHookConfig` API operations provide methods for grouping tensors into *collections* and saving them to a target S3 bucket. The following topics show how to use the `CollectionConfig` and `DebuggerHookConfig` API operations, followed by examples of how to use Debugger hook to save, access, and visualize output tensors.

While constructing a SageMaker AI estimator, activate SageMaker Debugger by specifying the `debugger_hook_config` parameter. The following topics include examples of how to set up the `debugger_hook_config` using the `CollectionConfig` and `DebuggerHookConfig` API operations to pull tensors out of your training jobs and save them.

> **Note**
>
> After properly configured and activated, SageMaker Debugger saves the output tensors in a default S3 bucket, unless otherwise specified. The format of the default S3 bucket URI is `s3://amzn-s3-demo-bucket-sagemaker-<region>-<12digit_account_id>/<training-job-name>/debug-output/`.

Topics

- Configure tensor collections using the CollectionConfig API
- Configure the DebuggerHookConfig API to save tensors
- Example notebooks and code samples to configure Debugger hook

Configure tensor collections using the `CollectionConfig` API

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

Use the `CollectionConfig` API operation to configure tensor collections. Debugger provides pre-built tensor collections that cover a variety of regular expressions (regex) of parameters if using Debugger-supported deep learning frameworks and machine learning algorithms. As shown in the following example code, add the built-in tensor collections you want to debug.

```
from sagemaker.core.debugger import CollectionConfig

collection_configs=[
    CollectionConfig(name="weights"),
    CollectionConfig(name="gradients")
]
```

The preceding collections set up the Debugger hook to save the tensors every 500 steps based on the default `"save_interval"` value.

For a full list of available Debugger built-in collections, see Debugger Built-in Collections.

If you want to customize the built-in collections, such as changing the save intervals and tensor regex, use the following `CollectionConfig` template to adjust parameters.

```
from sagemaker.core.debugger import CollectionConfig

collection_configs=[
    CollectionConfig(
        name="tensor_collection",
        parameters={
            "key_1": "value_1",
            "key_2": "value_2",
            ...
            "key_n": "value_n"
        }
    )
]
```

For more information about available parameter keys, see CollectionConfig in the Amazon SageMaker Python SDK. For example, the following code example shows how you can adjust the save intervals of the "losses" tensor collection at different phases of training: save loss every 100 steps in training phase and validation loss every 10 steps in validation phase.

```
from sagemaker.core.debugger import CollectionConfig
```

```
collection_configs=[
    CollectionConfig(
        name="losses",
        parameters={
            "train.save_interval": "100",
            "eval.save_interval": "10"
        }
    )
]
```

> **Tip**
>
> This tensor collection configuration object can be used for both DebuggerHookConfig and Rule API operations.

Configure the `DebuggerHookConfig` API to save tensors

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

Use the DebuggerHookConfig API to create a `debugger_hook_config` object using the `collection_configs` object you created in the previous step.

```
from sagemaker.core.debugger import DebuggerHookConfig

debugger_hook_config=DebuggerHookConfig(
    collection_configs=collection_configs
)
```

Debugger saves the model training output tensors into the default S3 bucket. The format of the default S3 bucket URI is `s3://amzn-s3-demo-bucket-sagemaker-<region>-<12digit_account_id>/<training-job-name>/debug-output/`.

If you want to specify an exact S3 bucket URI, use the following code example:

```
from sagemaker.core.debugger import DebuggerHookConfig

debugger_hook_config=DebuggerHookConfig(
    s3_output_path="specify-uri",
    collection_configs=collection_configs
)
```

For more information, see DebuggerHookConfig in the Amazon SageMaker Python SDK.

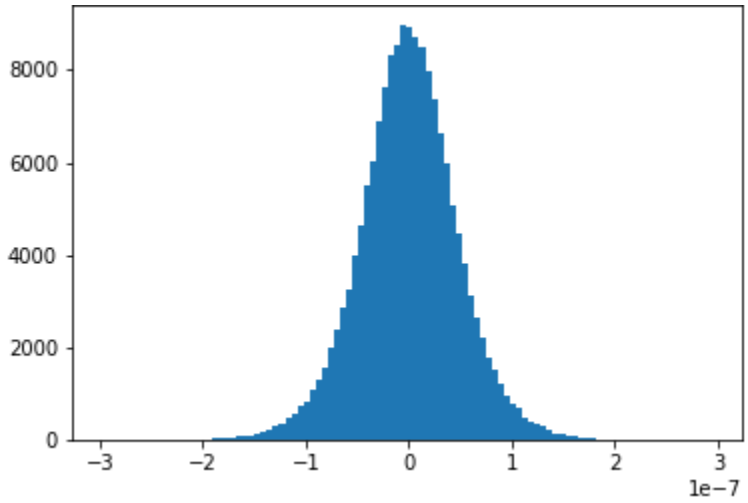
Example notebooks and code samples to configure Debugger hook

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

The following sections provide notebooks and code examples of how to use Debugger hook to save, access, and visualize output tensors.

Topics

- Tensor visualization example notebooks
- Save tensors using Debugger built-in collections
- Save tensors by modifying Debugger built-in collections
- Save tensors using Debugger custom collections

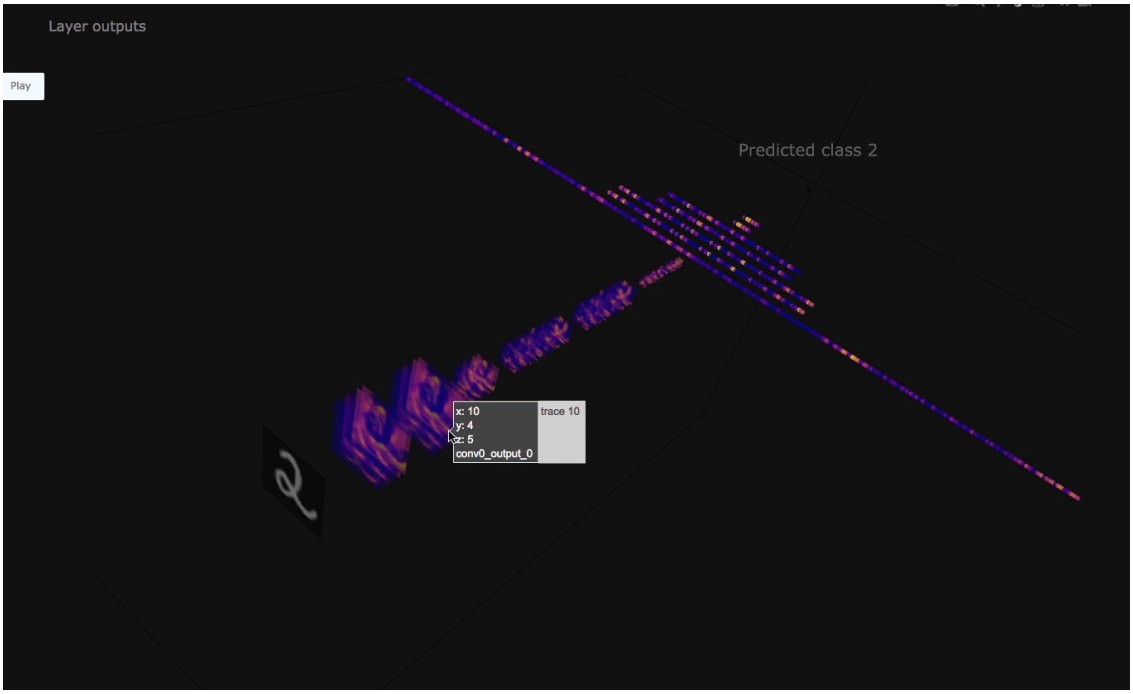


Tensor visualization example notebooks

The following two notebook examples show advanced use of Amazon SageMaker Debugger for visualizing tensors. Debugger provides a transparent view into training deep learning models.

- Interactive Tensor Analysis in SageMaker Studio Notebook with MXNet

  This notebook example shows how to visualize saved tensors using Amazon SageMaker Debugger. By visualizing the tensors, you can see how the tensor values change while training deep learning algorithms. This notebook includes a training job with a poorly configured



neural network and uses Amazon SageMaker Debugger to aggregate and analyze tensors, including gradients, activation outputs, and weights. For example, the following plot shows the distribution of gradients of a convolutional layer that is suffering from a vanishing gradient problem.

This notebook also illustrates how a good initial hyperparameter setting improves the training process by generating the same tensor distribution plots.

- Visualizing and Debugging Tensors from MXNet Model Training

  This notebook example shows how to save and visualize tensors from an MXNet Gluon model training job using Amazon SageMaker Debugger. It illustrates that Debugger is set to save all tensors to an Amazon S3 bucket and retrieves ReLu activation outputs for the visualization. The following figure shows a three-dimensional visualization of the ReLu activation outputs. The color scheme is set to blue to indicate values close to 0 and yellow to indicate values close to 1.

In this notebook, the `TensorPlot` class imported from `tensor_plot.py` is designed to plot convolutional neural networks (CNNs) that take two-dimensional images for inputs. The `tensor_plot.py` script provided with the notebook retrieves tensors using Debugger and visualizes the CNN. You can run this notebook on SageMaker Studio to reproduce the tensor visualization and implement your own convolutional neural network model.

- Real-time Tensor Analysis in a SageMaker Notebook with MXNet

  This example guides you through installing required components for emitting tensors in an Amazon SageMaker training job and using the Debugger API operations to access those tensors while training is running. A gluon CNN model is trained on the Fashion MNIST dataset. While the job is running, you will see how Debugger retrieves activation outputs of the first convolutional layer from each of 100 batches and visualizes them. Also, this will show you how to visualize weights after the job is done.

Save tensors using Debugger built-in collections

You can use built-in collections of tensors using the `CollectionConfig` API and save them using the `DebuggerHookConfig` API. The following example shows how to use the default settings of Debugger hook configurations to construct a SageMaker AI TensorFlow estimator. You can also utilize this for MXNet, PyTorch, and XGBoost estimators.

Note

In the following example code, the `s3_output_path` parameter for `DebuggerHookConfig` is optional. If you do not specify it, Debugger saves the tensors at `s3://<output_path>/debug-output/`, where the `<output_path>` is the default output path of SageMaker training jobs. For example:

```
"s3://sagemaker-us-east-1-111122223333/sagemaker-debugger-training-YYYY-MM-DD-HH-MM-SS-123/debug-output"
```

```
import boto3
import sagemaker
from sagemaker.train import ModelTrainer
from sagemaker.core.debugger import DebuggerHookConfig, CollectionConfig
from sagemaker.core.helper.session_helper import Session, get_execution_role

# use Debugger CollectionConfig to call built-in collections
collection_configs=[
        CollectionConfig(name="weights"),
        CollectionConfig(name="gradients"),
        CollectionConfig(name="losses"),
        CollectionConfig(name="biases")
    ]

# configure Debugger hook
# set a target S3 bucket as you want
sagemaker_session=Session()
BUCKET_NAME=sagemaker_session.default_bucket()
LOCATION_IN_BUCKET='debugger-built-in-collections-hook'

hook_config=DebuggerHookConfig(
    s3_output_path='s3://{BUCKET_NAME}/{LOCATION_IN_BUCKET}'.
                    format(BUCKET_NAME=BUCKET_NAME,
                           LOCATION_IN_BUCKET=LOCATION_IN_BUCKET),
    collection_configs=collection_configs
)

from sagemaker.core import image_uris
from sagemaker.train.configs import SourceCode, Compute
```

```
training_image = image_uris.retrieve(
    framework="tensorflow",
    region=boto3.Session().region_name,
    version="2.9.0",
    py_version="py39",
    instance_type="ml.p3.2xlarge",
    image_scope="training"
)

# construct a SageMaker ModelTrainer
sagemaker_model_trainer=ModelTrainer(
    training_image=training_image,
    source_code=SourceCode(entry_script='directory/to/your_training_script.py'),
    role=get_execution_role(),
    base_job_name='debugger-demo-job',
    compute=Compute(instance_type="ml.p3.2xlarge", instance_count=1),

    # debugger-specific hook argument below
    debugger_hook_config=hook_config
)

sagemaker_model_trainer.train()
```

To see a list of Debugger built-in collections, see Debugger Built-in Collections.

Save tensors by modifying Debugger built-in collections

You can modify the Debugger built-in collections using the `CollectionConfig` API operation. The following example shows how to tweak the built-in `losses` collection and construct a SageMaker AI TensorFlow estimator. You can also use this for MXNet, PyTorch, and XGBoost estimators.

```
import boto3
import sagemaker
from sagemaker.train import ModelTrainer
from sagemaker.core.debugger import DebuggerHookConfig, CollectionConfig
from sagemaker.core.helper.session_helper import Session, get_execution_role

# use Debugger CollectionConfig to call and modify built-in collections
collection_configs=[
    CollectionConfig(
                name="losses",
                parameters={"save_interval": "50"})]
```

```
# configure Debugger hook
# set a target S3 bucket as you want
sagemaker_session=Session()
BUCKET_NAME=sagemaker_session.default_bucket()
LOCATION_IN_BUCKET='debugger-modified-collections-hook'

hook_config=DebuggerHookConfig(
    s3_output_path='s3://{BUCKET_NAME}/{LOCATION_IN_BUCKET}'.
                   format(BUCKET_NAME=BUCKET_NAME,
                          LOCATION_IN_BUCKET=LOCATION_IN_BUCKET),
    collection_configs=collection_configs
)

from sagemaker.core import image_uris
from sagemaker.train.configs import SourceCode, Compute

training_image = image_uris.retrieve(
    framework="tensorflow",
    region=boto3.Session().region_name,
    version="2.9.0",
    py_version="py39",
    instance_type="ml.p3.2xlarge",
    image_scope="training"
)

# construct a SageMaker ModelTrainer
sagemaker_model_trainer=ModelTrainer(
    training_image=training_image,
    source_code=SourceCode(entry_script='directory/to/your_training_script.py'),
    role=get_execution_role(),
    base_job_name='debugger-demo-job',
    compute=Compute(instance_type="ml.p3.2xlarge", instance_count=1),

    # debugger-specific hook argument below
    debugger_hook_config=hook_config
)

sagemaker_model_trainer.train()
```

For a full list of `CollectionConfig` parameters, see Debugger CollectionConfig API.

Save tensors using Debugger custom collections

You can also save a reduced number of tensors instead of the full set of tensors (for example, if you want to reduce the amount of data saved in your Amazon S3 bucket). The following example shows how to customize the Debugger hook configuration to specify target tensors that you want to save. You can use this for TensorFlow, MXNet, PyTorch, and XGBoost estimators.

```
import boto3
import sagemaker
from sagemaker.train import ModelTrainer
from sagemaker.core.debugger import DebuggerHookConfig, CollectionConfig
from sagemaker.core.helper.session_helper import Session, get_execution_role

# use Debugger CollectionConfig to create a custom collection
collection_configs=[
        CollectionConfig(
            name="custom_activations_collection",
            parameters={
                "include_regex": "relu|tanh", # Required
                "reductions": "mean,variance,max,abs_mean,abs_variance,abs_max"
            })
    ]

# configure Debugger hook
# set a target S3 bucket as you want
sagemaker_session=Session()
BUCKET_NAME=sagemaker_session.default_bucket()
LOCATION_IN_BUCKET='debugger-custom-collections-hook'

hook_config=DebuggerHookConfig(
    s3_output_path='s3://{BUCKET_NAME}/{LOCATION_IN_BUCKET}'.
                    format(BUCKET_NAME=BUCKET_NAME,
                           LOCATION_IN_BUCKET=LOCATION_IN_BUCKET),
    collection_configs=collection_configs
)

from sagemaker.core import image_uris
from sagemaker.train.configs import SourceCode, Compute

training_image = image_uris.retrieve(
    framework="tensorflow",
    region=boto3.Session().region_name,
    version="2.9.0",
```

```
    py_version="py39",
    instance_type="ml.p3.2xlarge",
    image_scope="training"
)

# construct a SageMaker ModelTrainer
sagemaker_model_trainer=ModelTrainer(
    training_image=training_image,
    source_code=SourceCode(entry_script='directory/to/your_training_script.py'),
    role=get_execution_role(),
    base_job_name='debugger-demo-job',
    compute=Compute(instance_type="ml.p3.2xlarge", instance_count=1),

    # debugger-specific hook argument below
    debugger_hook_config=hook_config
)

sagemaker_model_trainer.train()
```

For a full list of `CollectionConfig` parameters, see Debugger CollectionConfig.

How to configure Debugger built-in rules

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

In the following topics, you'll learn how to use the SageMaker Debugger built-in rules. Amazon SageMaker Debugger's built-in rules analyze tensors emitted during the training of a model. SageMaker AI Debugger offers the `Rule` API operation that monitors training job progress and errors for the success of training your model. For example, the rules can detect whether gradients are getting too large or too small, whether a model is overfitting or overtraining, and whether a training job does not decrease loss function and improve. To see a full list of available built-in rules, see List of Debugger built-in rules.

Topics

- Use Debugger built-in rules with the default parameter settings

- Use Debugger built-in rules with custom parameter values
- Example notebooks and code samples to configure Debugger rules

Use Debugger built-in rules with the default parameter settings

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

To specify Debugger built-in rules in an estimator, you need to configure a list object. The following example code shows the basic structure of listing the Debugger built-in rules:

```
from sagemaker.core.debugger import Rule, rule_configs

rules=[
    Rule.sagemaker(rule_configs.built_in_rule_name_1()),
    Rule.sagemaker(rule_configs.built_in_rule_name_2()),
    ...
    Rule.sagemaker(rule_configs.built_in_rule_name_n()),
    ... # You can also append more profiler rules in the
 ProfilerRule.sagemaker(rule_configs.*()) format.
]
```

For more information about default parameter values and descriptions of the built-in rule, see List of Debugger built-in rules.

To find the SageMaker Debugger API reference, see `sagemaker.debugger.rule_configs` and `sagemaker.debugger.Rule`.

For example, to inspect the overall training performance and progress of your model, construct a SageMaker AI estimator with the following built-in rule configuration.

```
from sagemaker.core.debugger import Rule, rule_configs

rules=[
    Rule.sagemaker(rule_configs.loss_not_decreasing()),
```

```
    Rule.sagemaker(rule_configs.overfit()),
    Rule.sagemaker(rule_configs.overtraining()),
    Rule.sagemaker(rule_configs.stalled_training_rule())
]
```

When you start the training job, Debugger collects system resource utilization data every 500 milliseconds and the loss and accuracy values every 500 steps by default. Debugger analyzes the resource utilization to identify if your model is having bottleneck problems. The `loss_not_decreasing`, `overfit`, `overtraining`, and `stalled_training_rule` monitors if your model is optimizing the loss function without those training issues. If the rules detect training anomalies, the rule evaluation status changes to `IssueFound`. You can set up automated actions, such as notifying training issues and stopping training jobs using Amazon CloudWatch Events and Amazon Lambda. For more information, see Action on Amazon SageMaker Debugger rules.

Use Debugger built-in rules with custom parameter values

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

If you want to adjust the built-in rule parameter values and customize tensor collection regex, configure the `base_config` and `rule_parameters` parameters for the `ProfilerRule.sagemaker` and `Rule.sagemaker` classmethods. In case of the `Rule.sagemaker` class methods, you can also customize tensor collections through the `collections_to_save` parameter. The instruction of how to use the `CollectionConfig` class is provided at Configure tensor collections using the `CollectionConfig` API.

Use the following configuration template for built-in rules to customize parameter values. By changing the rule parameters as you want, you can adjust the sensitivity of the rules to be triggered.

- The `base_config` argument is where you call the built-in rule methods.
- The `rule_parameters` argument is to adjust the default key values of the built-in rules listed in List of Debugger built-in rules.

- The `collections_to_save` argument takes in a tensor configuration through the `CollectionConfig` API, which requires `name` and `parameters` arguments.
  - To find available tensor collections for `name`, see Debugger Built-in Tensor Collections .
  - For a full list of adjustable `parameters`, see Debugger CollectionConfig API.

For more information about the Debugger rule class, methods, and parameters, see SageMaker AI Debugger Rule class in the Amazon SageMaker Python SDK.

```
from sagemaker.core.debugger import Rule, ProfilerRule, rule_configs, CollectionConfig

rules=[
    Rule.sagemaker(
        base_config=rule_configs.built_in_rule_name(),
        rule_parameters={
                "key": "value"
        },
        collections_to_save=[
            CollectionConfig(
                name="tensor_collection_name",
                parameters={
                    "key": "value"
                }
            )
        ]
    )
]
```

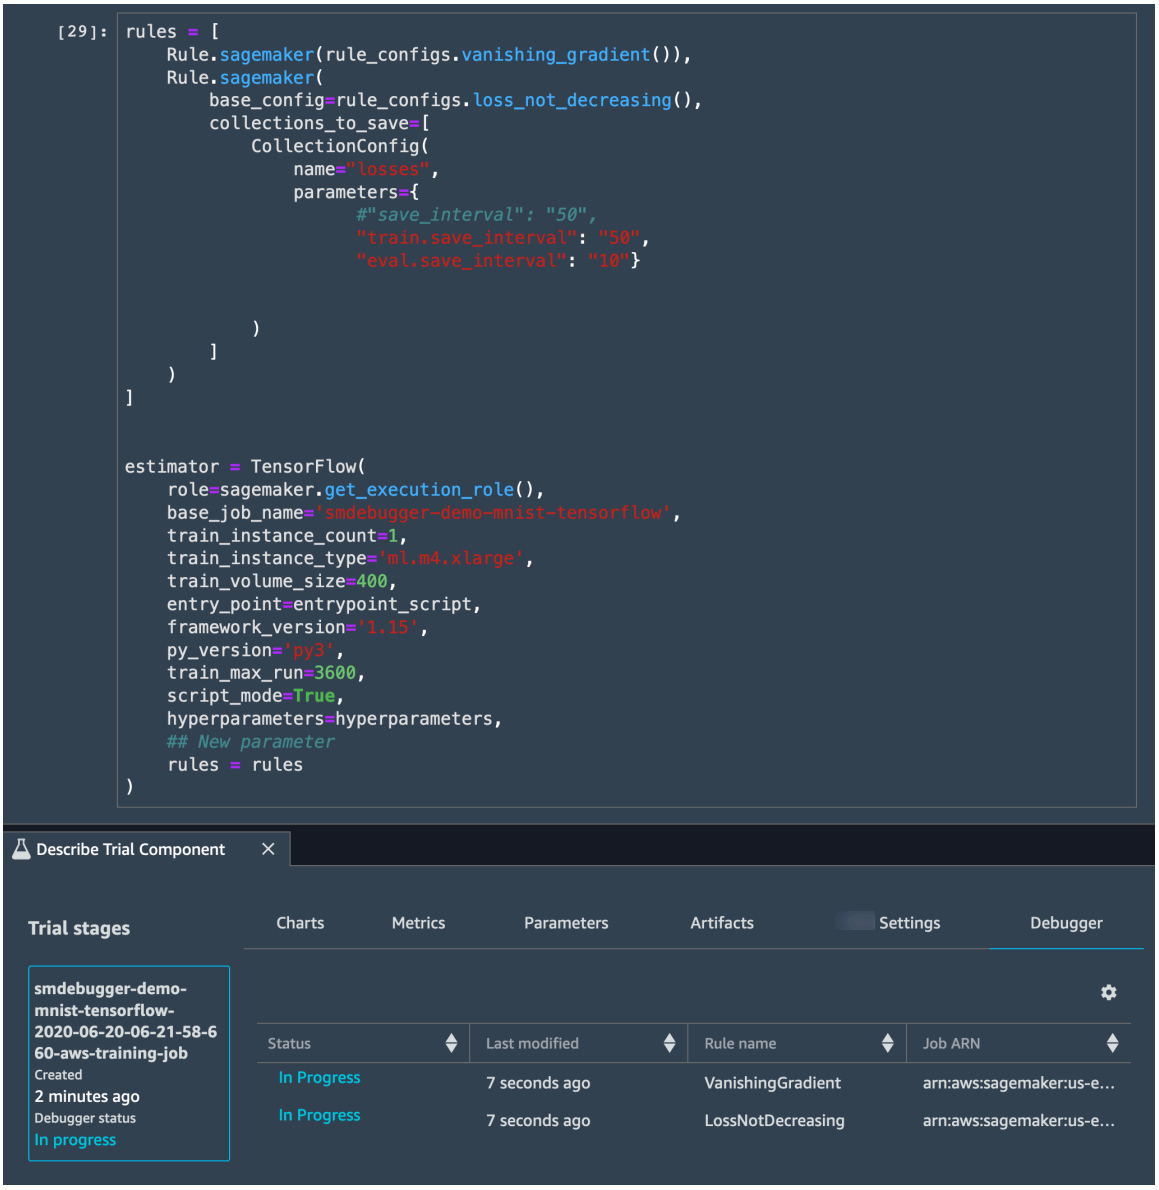
The parameter descriptions and value customization examples are provided for each rule at List of Debugger built-in rules.

Example notebooks and code samples to configure Debugger rules

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

In the following sections, notebooks and code samples of how to use Debugger rules to monitor SageMaker training jobs are provided.

Topics



- Debugger built-in rules example notebooks
- Debugger built-in rules example code
- Use Debugger built-in rules with parameter modifications

Debugger built-in rules example notebooks

The following example notebooks show how to use Debugger built-in rules when running training jobs with Amazon SageMaker AI:

- Using a SageMaker Debugger built-in rule with TensorFlow
- Using a SageMaker Debugger built-in rule with Managed Spot Training and MXNet
- Using a SageMaker Debugger built-in rule with parameter modifications for a real-time training job analysis with XGBoost

While running the example notebooks in SageMaker Studio, you can find the training job trial created on the **Studio Experiment List** tab. For example, as shown in the following screenshot, you can find and open a **Describe Trial Component** window of your current training job. On the Debugger tab, you can check if the Debugger rules, `vanishing_gradient()` and `loss_not_decreasing()`, are monitoring the training session in parallel. For a full instruction of how to find your training job trial components in the Studio UI, see SageMaker Studio - View Experiments, Trials, and Trial Components.

There are two ways of using the Debugger built-in rules in the SageMaker AI environment: deploy the built-in rules as it is prepared or adjust their parameters as you want. The following topics show you how to use the built-in rules with example codes.

Debugger built-in rules example code

The following code sample shows how to set the Debugger built-in rules using the `Rule.sagemaker` method. To specify built-in rules that you want to run, use the `rules_configs` API operation to call the built-in rules. To find a full list of Debugger built-in rules and default parameter values, see List of Debugger built-in rules.

```
import boto3
```

```
import sagemaker
from sagemaker.train import ModelTrainer
from sagemaker.core.debugger import Rule, CollectionConfig, rule_configs
from sagemaker.core.helper.session_helper import get_execution_role
built_in_rules=[
            Rule.sagemaker(rule_configs.vanishing_gradient()),
            Rule.sagemaker(rule_configs.loss_not_decreasing())
]

from sagemaker.core import image_uris
from sagemaker.train.configs import SourceCode, Compute

training_image = image_uris.retrieve(
    framework="tensorflow",
    region=boto3.Session().region_name,
    version="2.9.0",
    py_version="py39",
    instance_type="ml.p3.2xlarge",
    image_scope="training"
)

# construct a SageMaker AI ModelTrainer with the Debugger built-in rules
sagemaker_model_trainer=ModelTrainer(
    training_image=training_image,
    source_code=SourceCode(entry_script='directory/to/your_training_script.py'),
    role=get_execution_role(),
    base_job_name='debugger-built-in-rules-demo',
    compute=Compute(instance_type="ml.p3.2xlarge", instance_count=1),

    # debugger-specific arguments below
    rules=built_in_rules
)
sagemaker_model_trainer.train()
```

Note

The Debugger built-in rules run in parallel with your training job. The maximum number of built-in rule containers for a training job is 20.

For more information about the Debugger rule class, methods, and parameters, see the SageMaker Debugger Rule class in the Amazon SageMaker Python SDK.

To find an example of how to adjust the Debugger rule parameters, see the following Use Debugger built-in rules with parameter modifications section.

Use Debugger built-in rules with parameter modifications

The following code example shows the structure of built-in rules to adjust parameters. In this example, the `stalled_training_rule` collects the `losses` tensor collection from a training job at every 50 steps and an evaluation stage at every 10 steps. If the training process starts stalling and not collecting tensor outputs for 120 seconds, the `stalled_training_rule` stops the training job.

```
import boto3
import time
import sagemaker
from sagemaker.train import ModelTrainer
from sagemaker.core.debugger import Rule, CollectionConfig, rule_configs
from sagemaker.core.helper.session_helper import get_execution_role

# call the built-in rules and modify the CollectionConfig parameters

base_job_name_prefix= 'smdebug-stalled-demo-' + str(int(time.time()))

built_in_rules_modified=[
    Rule.sagemaker(
        base_config=rule_configs.stalled_training_rule(),
        rule_parameters={
                'threshold': '120',
                'training_job_name_prefix': base_job_name_prefix,
                'stop_training_on_fire' : 'True'
        },
        collections_to_save=[
            CollectionConfig(
                name="losses",
                parameters={
                      "train.save_interval": "50",
                      "eval.save_interval": "10"
                }
            )
        ]
    )
]

from sagemaker.core import image_uris
```

```
from sagemaker.train.configs import SourceCode, Compute

training_image = image_uris.retrieve(
    framework="tensorflow",
    region=boto3.Session().region_name,
    version="2.9.0",
    py_version="py39",
    instance_type="ml.p3.2xlarge",
    image_scope="training"
)

# construct a SageMaker AI ModelTrainer with the modified Debugger built-in rule
sagemaker_model_trainer=ModelTrainer(
    training_image=training_image,
    source_code=SourceCode(entry_script='directory/to/your_training_script.py'),
    role=get_execution_role(),
    base_job_name=base_job_name_prefix,
    compute=Compute(instance_type="ml.p3.2xlarge", instance_count=1),

    # debugger-specific arguments below
    rules=built_in_rules_modified
)
sagemaker_model_trainer.train()
```

For an advanced configuration of the Debugger built-in rules using the `CreateTrainingJob` API, see Configure Debugger using SageMaker API.

Turn off Debugger

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

If you want to completely turn off Debugger, do one of the following:

- Before starting a training job, do the following:

To stop both monitoring and profiling, include the `disable_profiler` parameter to your estimator and set it to `True`.

> **Warning**
>
> If you disable it, you won't be able to view the comprehensive Studio Debugger insights dashboard and the autogenerated profiling report.

To stop debugging, set the `debugger_hook_config` parameter to `False`.

> **Warning**
>
> If you disable it, you won't be able to collect output tensors and cannot debug your model parameters.

```
estimator=Estimator(
    ...
    disable_profiler=True
    debugger_hook_config=False
)
```

For more information about the Debugger-specific parameters, see SageMaker AI Estimator in the Amazon SageMaker Python SDK.

- While a training job is running, do the following:

  To disable both monitoring and profiling while your training job is running, use the following estimator classmethod:

  ```
  estimator.disable_profiling()
  ```

  To disable framework profiling only and keep system monitoring, use the `update_profiler` method:

  ```
  estimator.update_profiler(disable_framework_metrics=true)
  ```

For more information about the estimator extension methods, see the estimator.disable_profiling and estimator.update_profiler classmethods in the Amazon SageMaker Python SDK documentation.

Useful SageMaker AI estimator class methods for Debugger

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

The following estimator class methods are useful for accessing your SageMaker training job information and retrieving output paths of training data collected by Debugger. The following methods are executable after you initiate a training job with the `estimator.fit()` method.

- To check the base S3 bucket URI of a SageMaker training job:

```
estimator.output_path
```

- To check the base job name of a SageMaker training job:

```
estimator.latest_training_job.job_name
```

- To see a full `CreateTrainingJob` API operation configuration of a SageMaker training job:

```
estimator.latest_training_job.describe()
```

- To check a full list of the Debugger rules while a SageMaker training job is running:

```
estimator.latest_training_job.rule_job_summary()
```

- To check the S3 bucket URI where the model parameter data (output tensors) are saved:

```
estimator.latest_job_debugger_artifacts_path()
```

- To check the S3 bucket URI at where the model performance data (system and framework metrics) are saved:

```
estimator.latest_job_profiler_artifacts_path()
```

- To check the Debugger rule configuration for debugging output tensors:

```
estimator.debugger_rule_configs
```

- To check the list of the Debugger rules for debugging while a SageMaker training job is running:

```
estimator.debugger_rules
```

- To check the Debugger rule configuration for monitoring and profiling system and framework metrics:

```
estimator.profiler_rule_configs
```

- To check the list of the Debugger rules for monitoring and profiling while a SageMaker training job is running:

```
estimator.profiler_rules
```

For more information about the SageMaker AI estimator class and its methods, see Estimator API in the Amazon SageMaker Python SDK.

SageMaker Debugger interactive report for XGBoost

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

Receive training reports autogenerated by Debugger. The Debugger reports provide insights into your training jobs and suggest recommendations to improve your model performance. For SageMaker AI XGBoost training jobs, use the Debugger CreateXgboostReport rule to receive a

comprehensive training report of the training progress and results. Following this guide, specify the CreateXgboostReport rule while constructing an XGBoost ModelTrainer, download the report using the Amazon SageMaker Python SDK or the Amazon S3 console, and gain insights into the training results.

> **Note**
>
> You can download a Debugger reports while your training job is running or after the job has finished. During training, Debugger concurrently updates the report reflecting the current rules' evaluation status. You can download a complete Debugger report only after the training job has completed.

> **Important**
>
> In the report, plots and recommendations are provided for informational purposes and are not definitive. You are responsible for making your own independent assessment of the information.

Topics

- Construct a SageMaker AI XGBoost ModelTrainer with the Debugger XGBoost Report rule
- Download the Debugger XGBoost training report
- Debugger XGBoost training report walkthrough

Construct a SageMaker AI XGBoost ModelTrainer with the Debugger XGBoost Report rule

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

The CreateXgboostReport rule collects the following output tensors from your training job:

- `hyperparameters` – Saves at the first step.
- `metrics` – Saves loss and accuracy every 5 steps.
- `feature_importance` – Saves every 5 steps.
- `predictions` – Saves every 5 steps.
- `labels` – Saves every 5 steps.

The output tensors are saved at a default S3 bucket. For example, `s3://sagemaker-<region>-<12digit_account_id>/<base-job-name>/debug-output/`.

When you construct a SageMaker AI ModelTrainer for an XGBoost training job, specify the rule as shown in the following example code.

```
import boto3
import sagemaker
from sagemaker.train import ModelTrainer
from sagemaker import image_uris
from sagemaker.debugger import Rule, rule_configs

rules=[
    Rule.sagemaker(rule_configs.create_xgboost_report())
]

region = boto3.Session().region_name
xgboost_container=sagemaker.image_uris.retrieve("xgboost", region, "1.2-1")

model_trainer=ModelTrainer(
    role=sagemaker.get_execution_role()
    image_uri=xgboost_container,
    base_job_name="debugger-xgboost-report-demo",
    instance_count=1,
    instance_type="ml.m5.2xlarge",

    # Add the Debugger XGBoost report rule
    rules=rules
)

model_trainer.train()
```

Download the Debugger XGBoost training report

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

Download the Debugger XGBoost training report while your training job is running or after the job has finished using the Amazon SageMaker Python SDK and Amazon Command Line Interface (CLI).

Download using the SageMaker Python SDK and Amazon CLI

1. Check the current job's default S3 output base URI.

   ```
   model_trainer.output_path
   ```

2. Check the current job name.

   ```
   model_trainer.latest_training_job.job_name
   ```

3. The Debugger XGBoost report is stored under `<default-s3-output-base-uri>/<training-job-name>/rule-output`. Configure the rule output path as follows:

   ```
   rule_output_path = model_trainer.output_path + "/" +
    model_trainer.latest_training_job.job_name + "/rule-output"
   ```

4. To check if the report is generated, list directories and files recursively under the `rule_output_path` using `aws s3 ls` with the `--recursive` option.

   ```
   ! aws s3 ls {rule_output_path} --recursive
   ```

   This should return a complete list of files under autogenerated folders that are named `CreateXgboostReport` and `ProfilerReport-1234567890`. The XGBoost training report is stored in the `CreateXgboostReport`, and the profiling report is stored in the `ProfilerReport-1234567890` folder. To learn more about the profiling report

generated by default with the XGBoost training job, see [SageMaker Debugger interactive report].

```
[14]: rule_output_path = xgboost_algorithm_mode_estimator.output_path + xgboost_algorithm_mode_estimator.latest_training_job.job_name + "/rule-output"

[15]: ! s3 ls {rule_output_path} --recursive

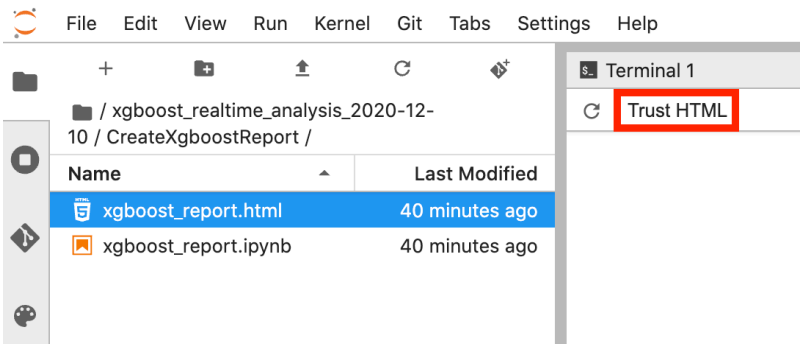
```

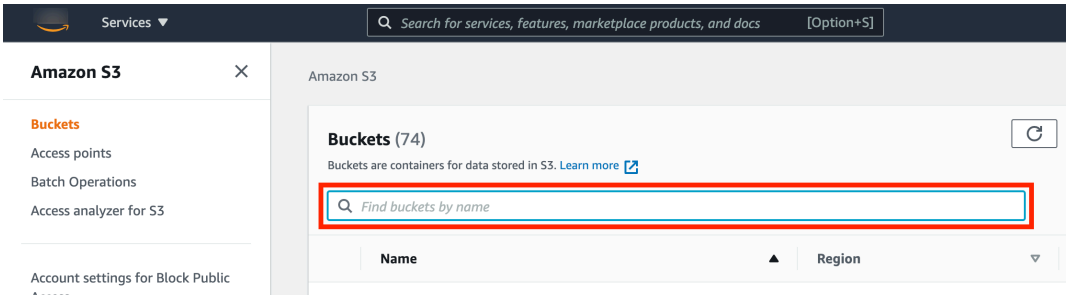


The `xgboost_report.html` is an autogenerated XGBoost training report by Debugger. The `xgboost_report.ipynb` is a Jupyter notebook that's used to aggregate training results into the report. You can download all of the files, browse the HTML report file, and modify the report using the notebook.

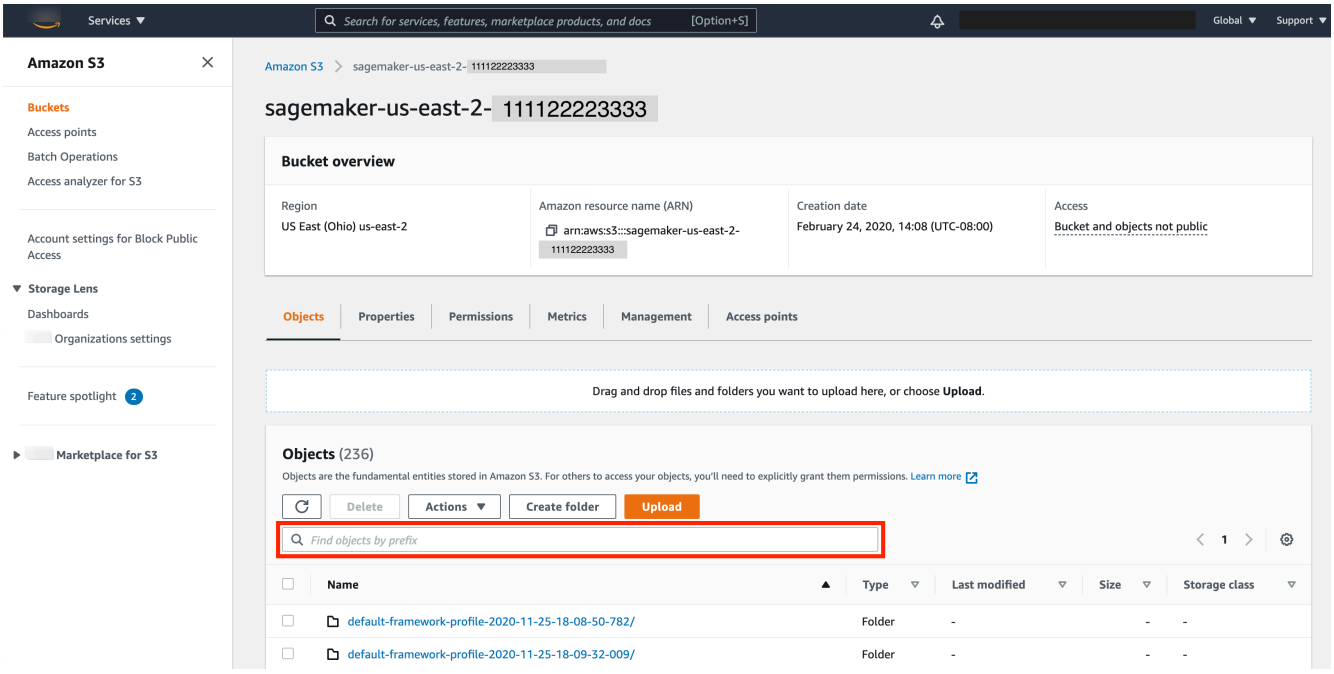
5. Download the files recursively using `aws s3 cp`. The following command saves all of the rule output files to the `ProfilerReport-1234567890` folder under the current working directory.

```
! aws s3 cp {rule_output_path} ./ --recursive
```

> **Tip**
>
> If you are using a Jupyter notebook server, run `!pwd` to verify the current working directory.

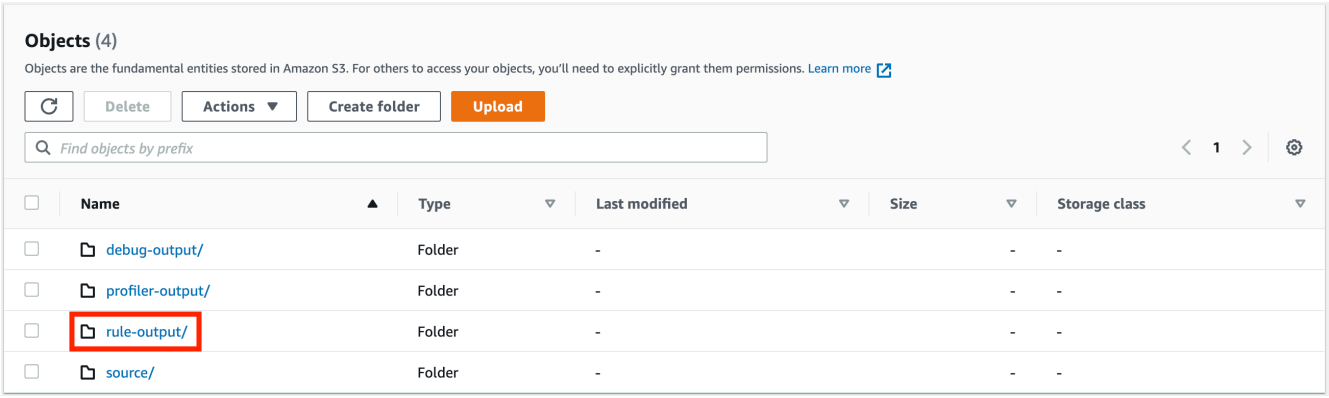


6. Under the `/CreateXgboostReport` directory, open `xgboost_report.html`. If you are using JupyterLab, choose **Trust HTML** to see the autogenerated Debugger training report.

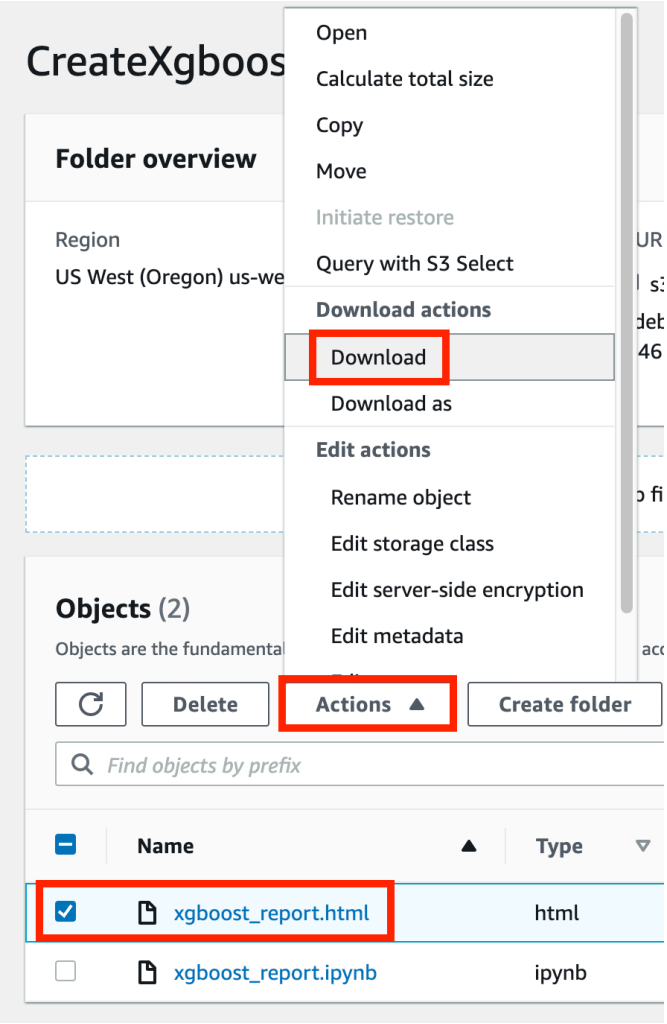


7. Open the `xgboost_report.ipynb` file to explore how the report is generated. You can customize and extend the training report using the Jupyter notebook file.

Download using the Amazon S3 console



1. Sign in to the Amazon Web Services Management Console and open the Amazon S3 console at https://console.amazonaws.cn/s3/.
2. Search for the base S3 bucket. For example, if you haven't specified any base job name, the base S3 bucket name should be in the following format: `sagemaker-<region>-111122223333`. Look up the base S3 bucket through the **Find bucket by name** field.



3. In the base S3 bucket, look up the training job name by entering your job name prefix in **Find objects by prefix** and then choosing the training job name.

4. In the training job's S3 bucket, choose **rule-output/** subfolder. There must be three subfolders for training data collected by Debugger: **debug-output/**, **profiler-output/**, and **rule-output/**.

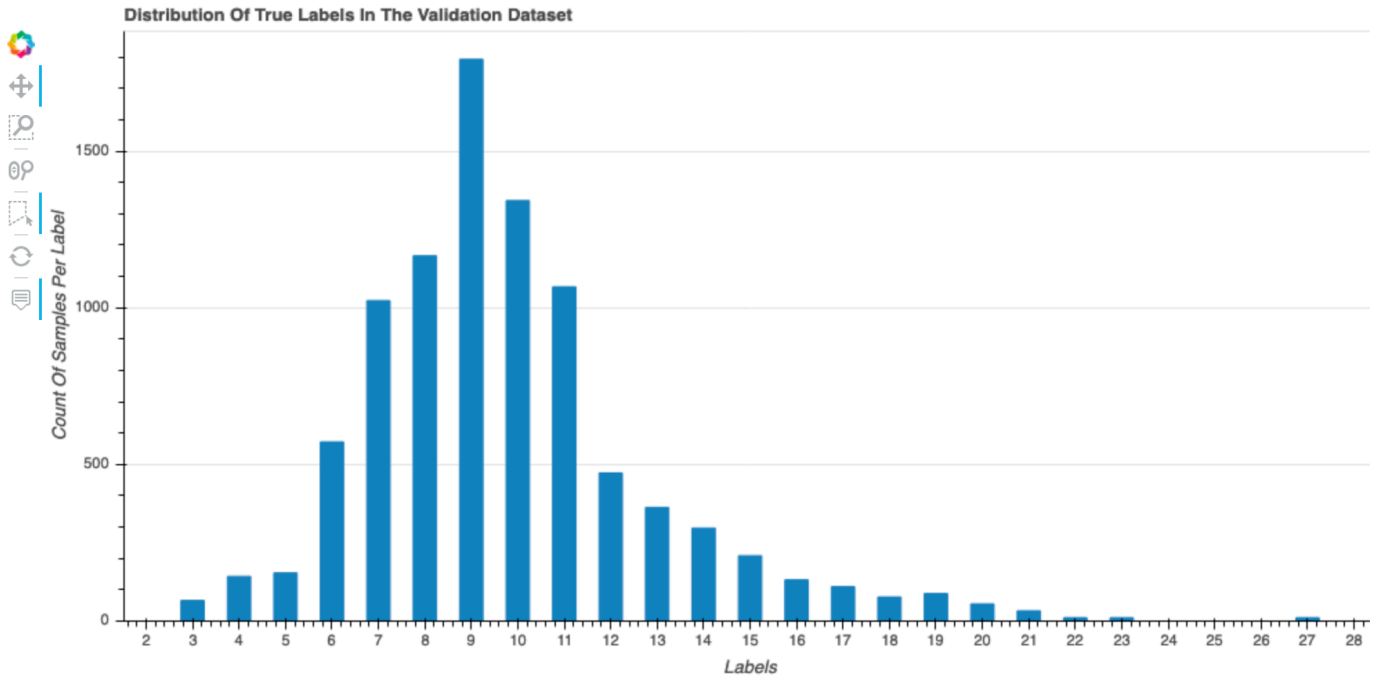
5. In the **rule-output/** folder, choose the **CreateXgboostReport/** folder. The folder contains **xbgoost_report.html** (the autogenerated report in html) and **xbgoost_report.ipynb** (a Jupyter notebook with scripts that are used for generating the report).
6. Choose the **xbgoost_report.html** file, choose **Download actions**, and then choose **Download**.

7. Open the downloaded **xbgoost_report.html** file in a web browser.

Debugger XGBoost training report walkthrough

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

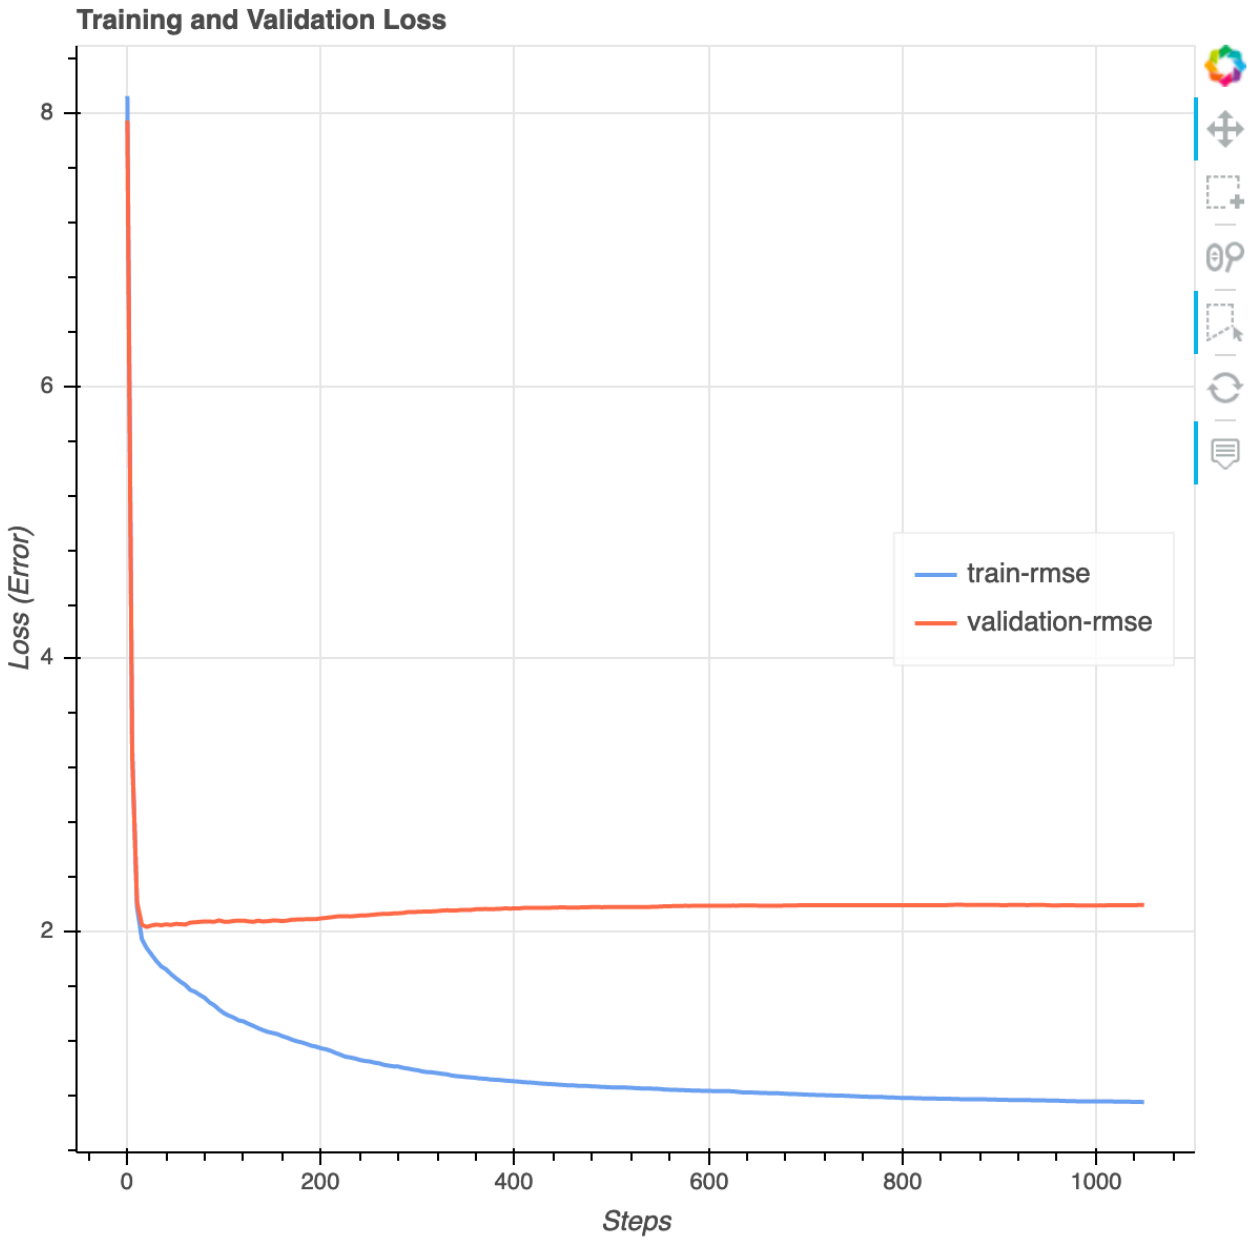
This section walks you through the Debugger XGBoost training report. The report is automatically aggregated depending on the output tensor regex, recognizing what type of your training job is among binary classification, multiclass classification, and regression.



> **Important**
>
> In the report, plots and and recommendations are provided for informational purposes and are not definitive. You are responsible for making your own independent assessment of the information.

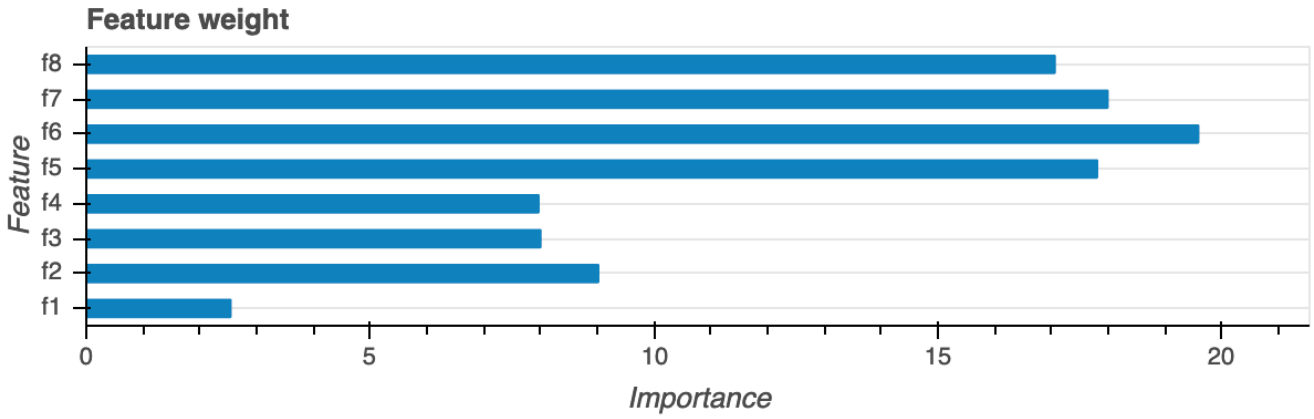
Topics

- Distribution of true labels of the dataset
- Loss versus step graph
- Feature importance
- Confusion matrix
- Evaluation of the confusion matrix
- Accuracy rate of each diagonal element over iteration
- Receiver operating characteristic curve
- Distribution of residuals at the last saved step
- Absolute validation error per label bin over iteration

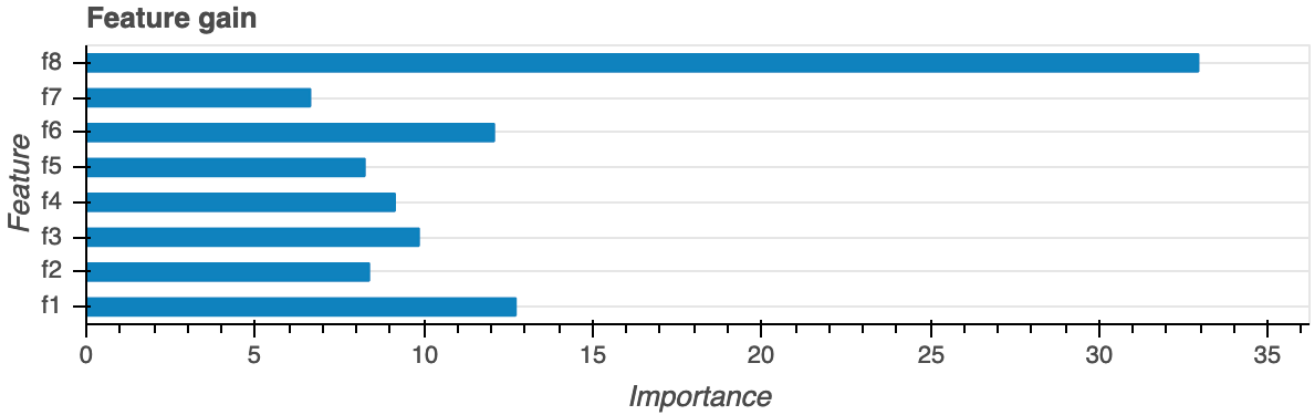


Distribution of true labels of the dataset

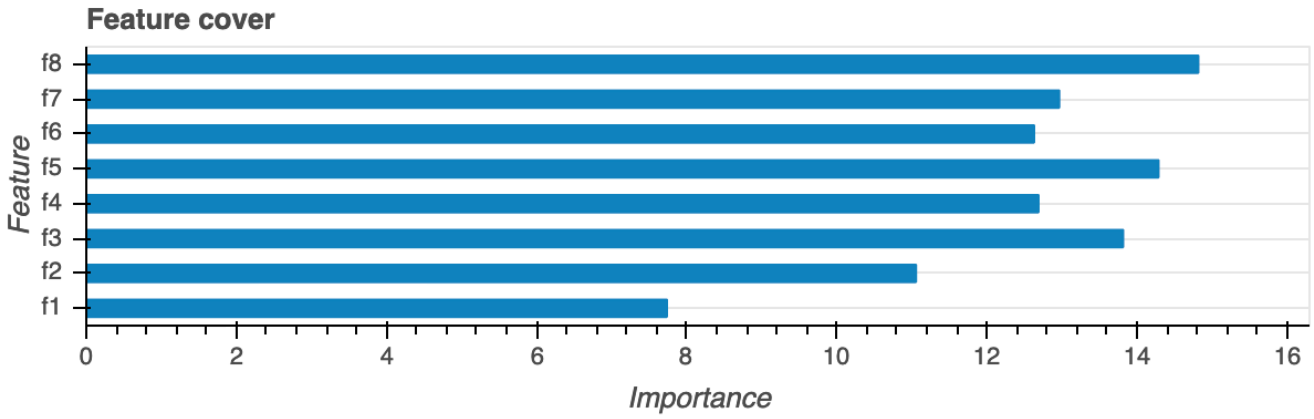
This histogram shows the distribution of labeled classes (for classification) or values (for regression) in your original dataset. Skewness in your dataset could contribute to inaccuracies. This visualization is available for the following model types: binary classification, multiclassification, and regression.



Loss versus step graph

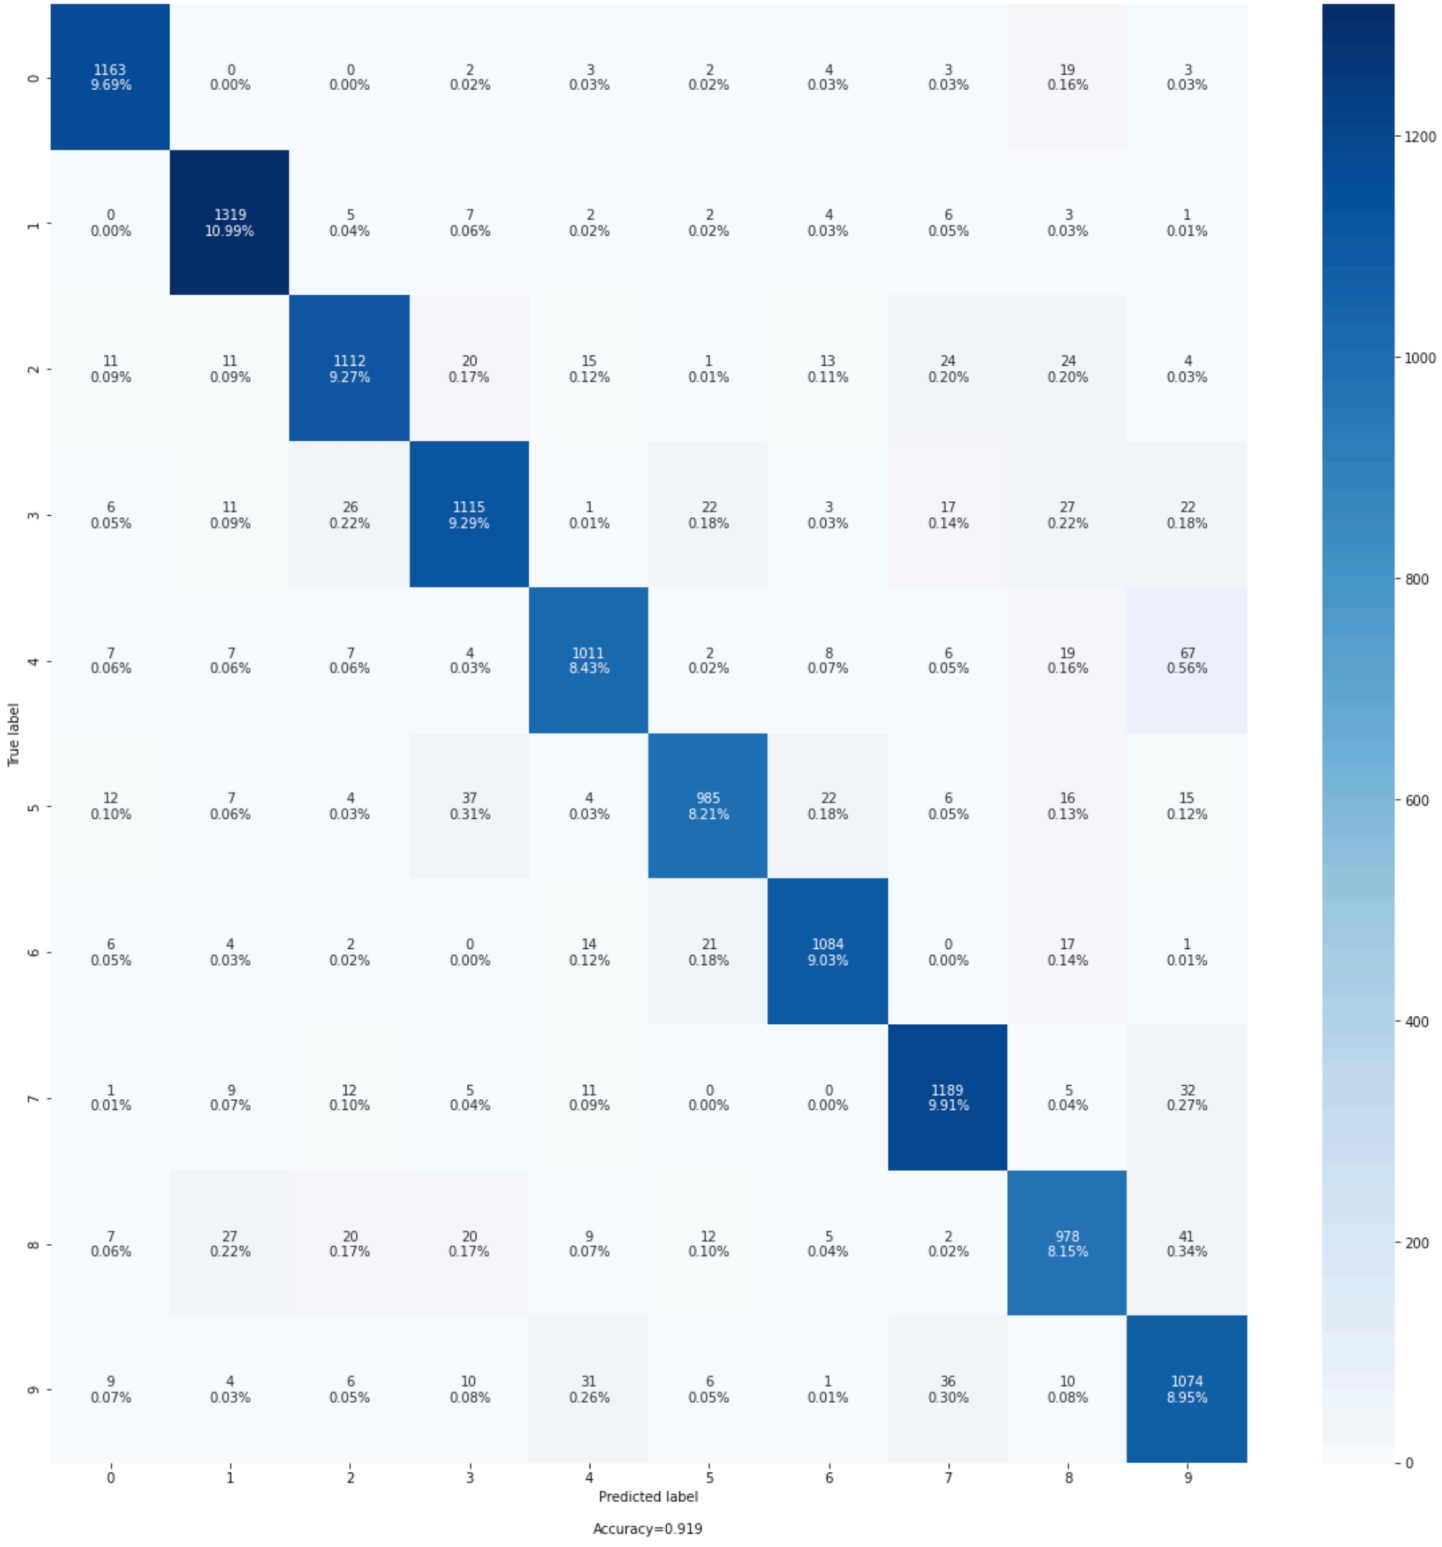


This is a line chart that shows the progression of loss on training data and validation data throughout training steps. The loss is what you defined in your objective function, such as mean squared error. You can gauge whether the model is overfit or underfit from this plot. This section also provides insights that you can use to determine how to resolve the overfit and underfit problems. This visualization is available for the following model types: binary classification, multiclassification, and regression.



Feature importance

There are three different types of feature importance visualizations provided: Weight, Gain and Coverage. We provide detailed definitions for each of the three in the report. Feature importance visualizations help you learn what features in your training dataset contributed to the predictions. Feature importance visualizations are available for the following model types: binary classification, multiclassification, and regression.



Confusion matrix

This visualization is only applicable to binary and multiclass classification models. Accuracy alone might not be sufficient for evaluating the model performance. For some use cases, such as healthcare and fraud detection, it's also important to know the false positive rate and false

negative rate. A confusion matrix gives you the additional dimensions for evaluating your model performance.

Evaluation of the confusion matrix

This section provides you with more insights on the micro, macro, and weighted metrics on precision, recall, and F1-score for your model.

Overall Accuracy

```
    Overall Accuracy: 0.919
```

Micro Performance Metrics

```
    Performance metrics calculated globally by counting the total true positives, false negatives, and false positive
s.

    Micro Precision: 0.919
    Micro Recall: 0.919
    Micro F1-score: 0.919
```

Macro Performance Metrics

```
    Performance metrics calculated for each label, and find their unweighted mean.
    This does not take the class imbalance problem into account.

    Macro Precision: 0.919
    Macro Recall: 0.918
    Macro F1-score: 0.918
```

Weighted Performance Metrics

```
    Performance metrics calculated for each label and their average weighted by support
    (the number of true instances for each label).
    This extends the macro option to take the class imbalance into account.
    It might result in an F-score that is not between precision and recall.

    Weighted Precision: 0.92
    Weighted Recall: 0.919
    Weighted F1-score: 0.919
```

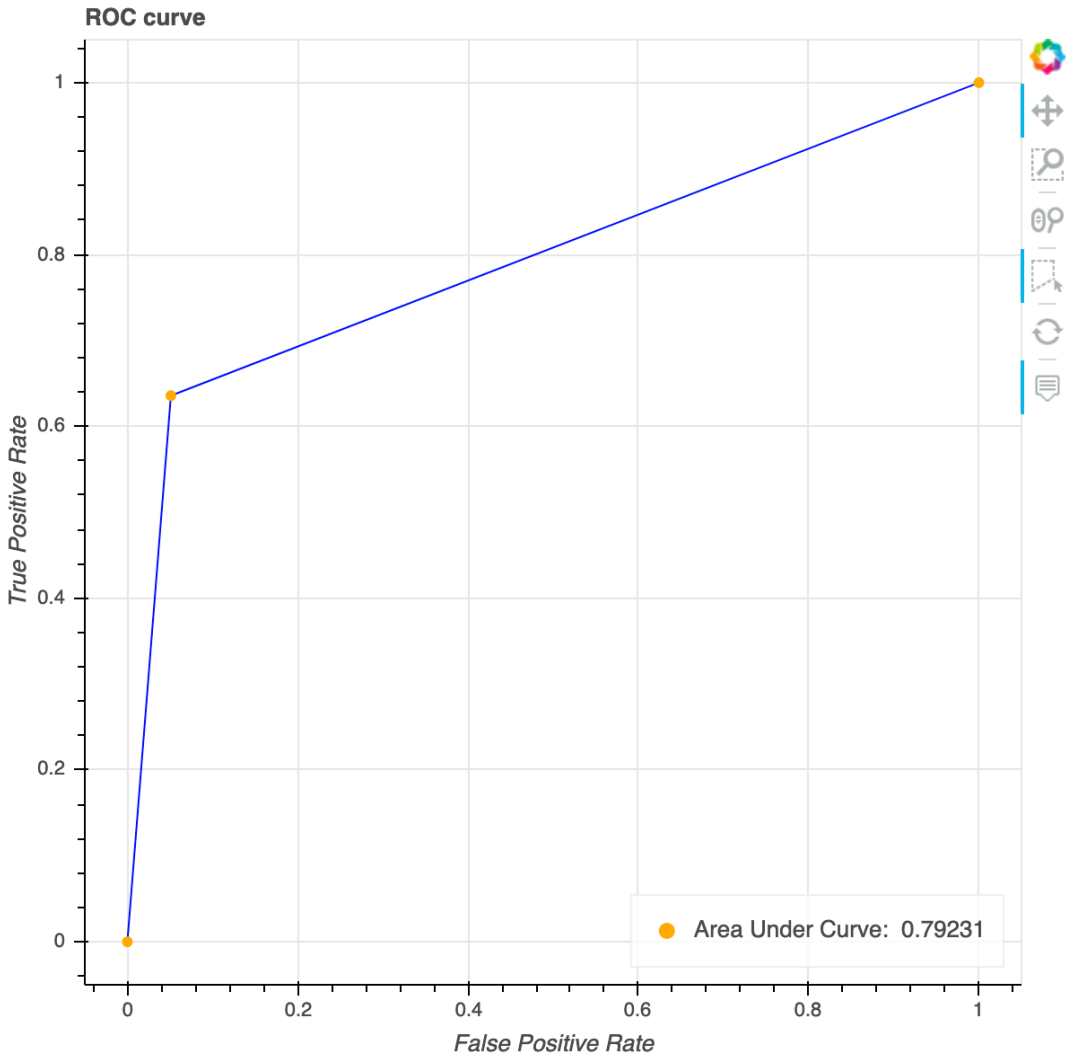
Classification Report

```
        The summary of the precision, recall, and F1-score for each class.

              precision    recall  f1-score   support

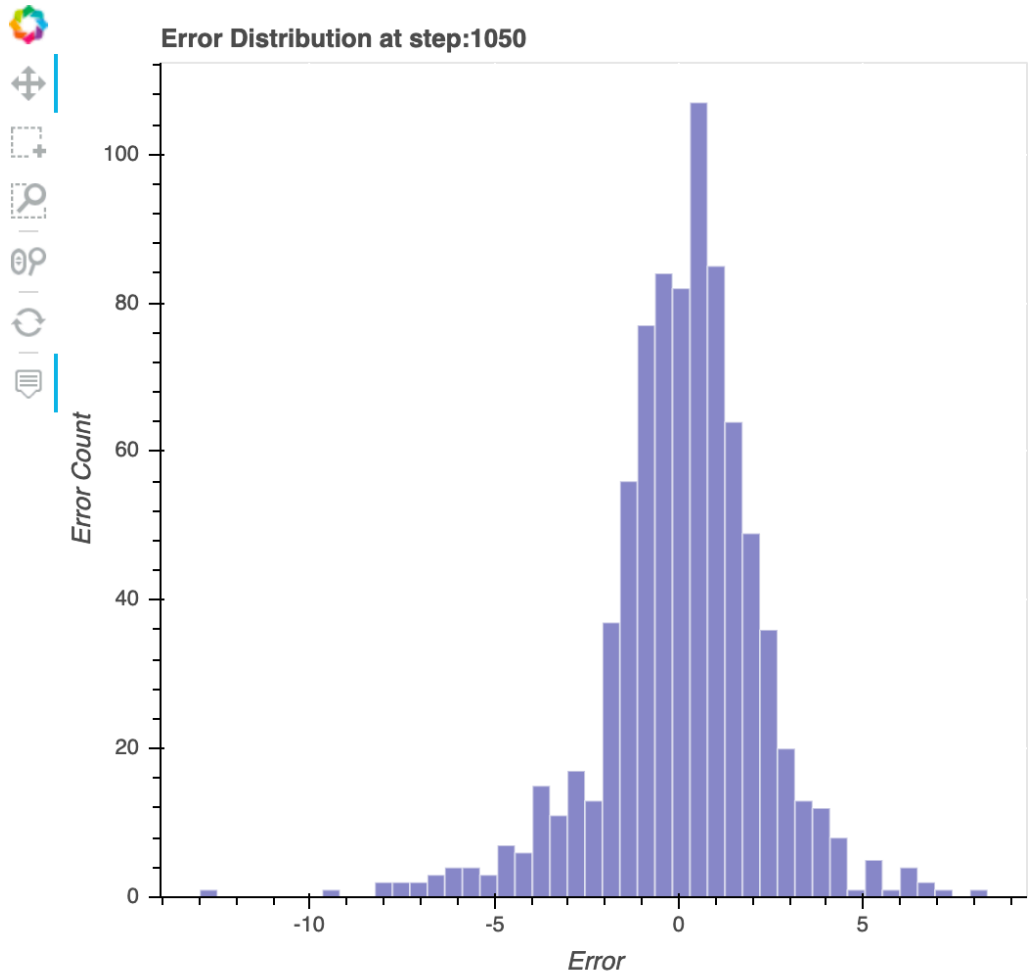
         0.0       0.95      0.97      0.96      1199
         1.0       0.94      0.98      0.96      1349
         2.0       0.93      0.90      0.92      1235
         3.0       0.91      0.89      0.90      1250
         4.0       0.92      0.89      0.90      1138
         5.0       0.94      0.89      0.91      1108
         6.0       0.95      0.94      0.95      1149
         7.0       0.92      0.94      0.93      1264
         8.0       0.87      0.87      0.87      1121
         9.0       0.85      0.90      0.88      1187

    accuracy                           0.92     12000
   macro avg       0.92      0.92      0.92     12000
weighted avg       0.92      0.92      0.92     12000
```



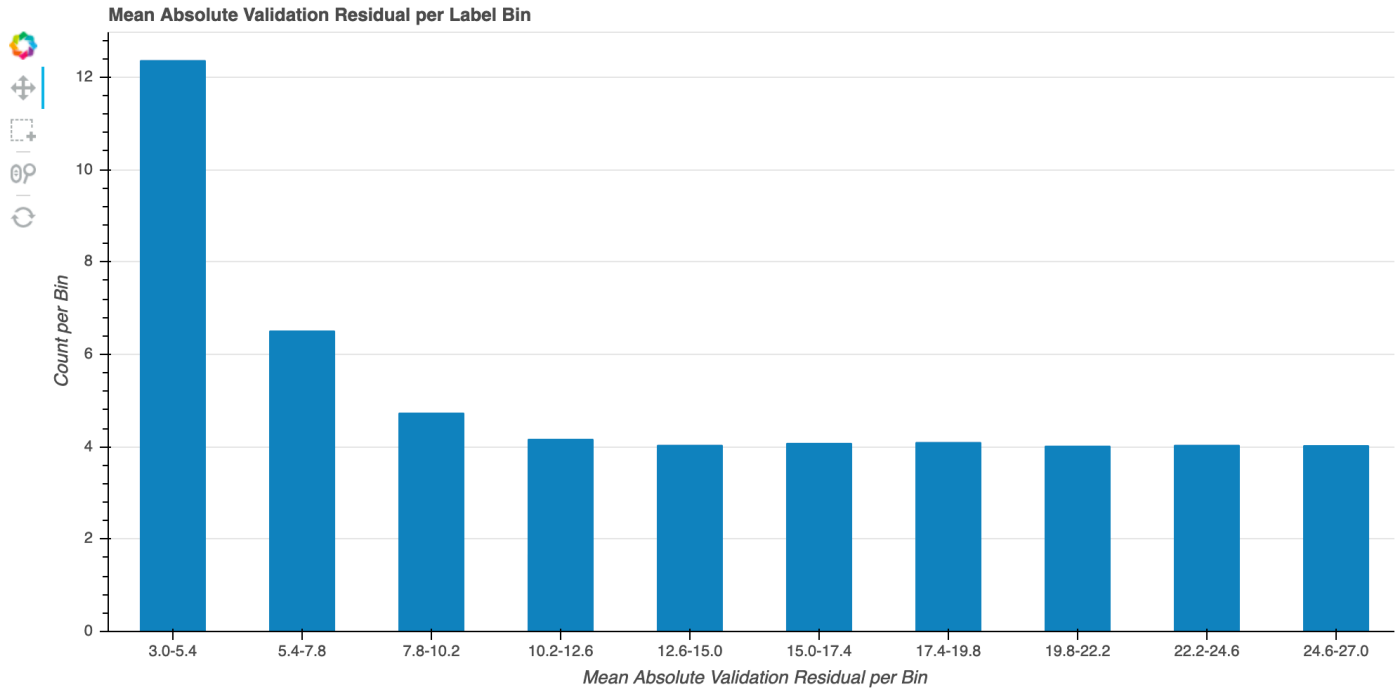
Accuracy rate of each diagonal element over iteration

This visualization is only applicable to binary classification and multiclass classification models. This is a line chart that plots the diagonal values in the confusion matrix throughout the training steps for each class. This plot shows you how the accuracy of each class progresses throughout the training steps. You can identify the under-performing classes from this plot.



Receiver operating characteristic curve

This visualization is only applicable to binary classification models. The Receiver Operating Characteristic curve is commonly used to evaluate binary classification model performance. The y-axis of the curve is True Positive Rate (TPF) and x-axis is false positive rate (FPR). The plot also displays the value for the area under the curve (AUC). The higher the AUC value, the more predictive your classifier. You can also use the ROC curve to understand the trade-off between TPR and FPR and identify the optimum classification threshold for your use case. The classification threshold can be adjusted to tune the behavior of the model to reduce more of one or another type of error (FP/FN).



Distribution of residuals at the last saved step

This visualization is a column chart that shows the residual distributions in the last step Debugger captures. In this visualization, you can check whether the residual distribution is close to normal distribution that's centered at zero. If the residuals are skewed, your features may not be sufficient for predicting the labels.

Absolute validation error per label bin over iteration

This visualization is only applicable to regression models. The actual target values are split into 10 intervals. This visualization shows how validation errors progress for each interval throughout the training steps in line plots. Absolute validation error is the absolute value of difference between prediction and actual during validation. You can identify the underperforming intervals from this visualization.

Action on Amazon SageMaker Debugger rules

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

Based on the Debugger rule evaluation status, you can set up automated actions such as stopping a training job and sending notifications using Amazon Simple Notification Service (Amazon SNS). You can also create your own actions using Amazon CloudWatch Events and Amazon Lambda. To learn how to set up automated actions based on the Debugger rule evaluation status, see the following topics.

Topics

- Use Debugger built-in actions for rules
- Actions on rules using Amazon CloudWatch and Amazon Lambda

Use Debugger built-in actions for rules

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

Use Debugger built-in actions to respond to issues found by Debugger rule. The Debugger `rule_configs` class provides tools to configure a list of actions, including automatically stopping training jobs and sending notifications using Amazon Simple Notification Service (Amazon SNS) when the Debugger rules find training issues. The following topics takes you through the steps to accomplish these tasks.

Topics

- Set up Amazon SNS, create an SMDebugRules topic, and subscribe to the topic
- Set up your IAM role to attach required policies
- Configure Debugger rules with the built-in actions
- Considerations for using the Debugger built-in actions

Set up Amazon SNS, create an `SMDebugRules` topic, and subscribe to the topic

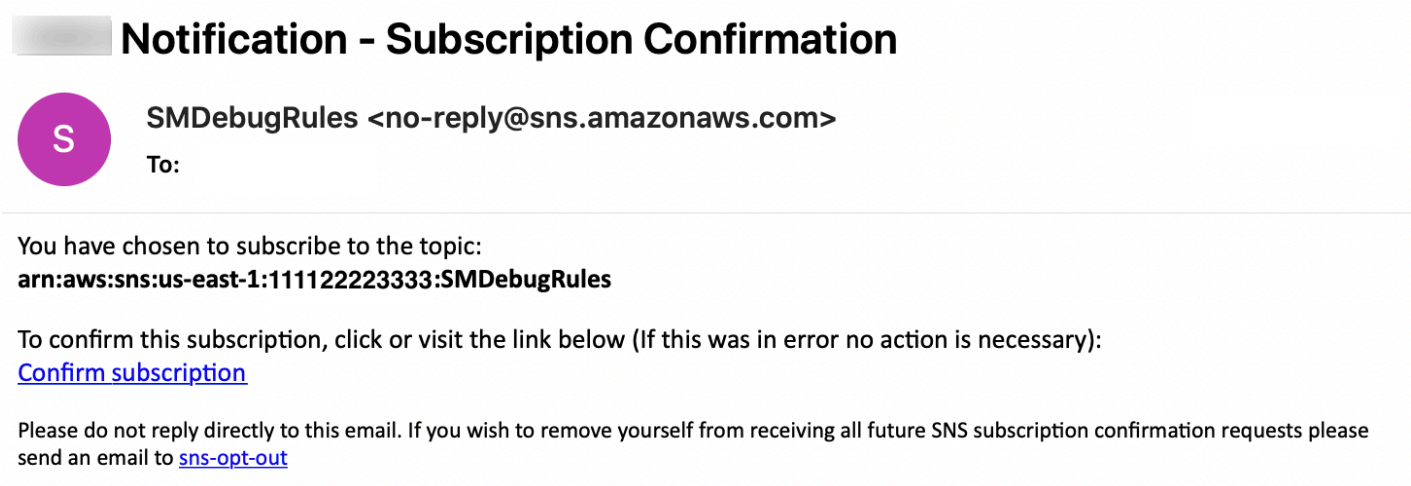
This section walks you through how to set up an Amazon SNS **`SMDebugRules`** topic, subscribe to it, and confirm the subscription to receive notifications from the Debugger rules.

> **Note**
>
> For more information about billing for Amazon SNS, see Amazon SNS pricing and Amazon SNS FAQs.

To create a SMDebugRules topic

1. Sign in to the Amazon Web Services Management Console and open the Amazon SNS console at https://console.amazonaws.cn/sns/v3/home.

2. In the left navigation pane, choose **Topics**.
3. On the **Topics** page, choose **Create topic**.
4. On the **Create topic** page, in the **Details** section, do the following:
   a. For **Type**, choose **Standard** for topic type.
   b. In **Name**, enter **`SMDebugRules`**.
5. Skip all other optional settings and choose **Create topic**. If you want to learn more about the optional settings, see Creating an Amazon SNS topic.



To subscribe to the SMDebugRules topic

1. Open the Amazon SNS console at https://console.amazonaws.cn/sns/v3/home.
2. In the left navigation pane, choose **Subscriptions**.
3. On the **Subscriptions** page, choose **Create subscription**.
4. On the **Create subscription** page, in the **Details** section, do the following:
   a. For **Topic ARN**, choose the **SMDebugRules** topic ARN. The ARN should be in format of `arn:aws:sns:<region-id>:111122223333:SMDebugRules`.
   b. For **Protocol**, choose **Email** or **SMS**.
   c. For **Endpoint**, enter the endpoint value, such as an email address or a phone number that you want to receive notifications.

   > **Note**
   >
   > Make sure you type the correct email address and phone number. Phone numbers must include +, a country code, and phone number, with no special characters or spaces. For example, the phone number +1 (222) 333-4444 is formatted as **+12223334444**.

5. Skip all other optional settings and choose **Create subscription**. If you want to learn more about the optional settings, see Subscribing to an Amazon SNS topic.

After you subscribe to the **SMDebugRules** topic, you receive the following confirmation message in email or by phone:

For more information about Amazon SNS, see Mobile text messaging (SMS) and Email notifications in the *Amazon SNS Developer Guide*.

Set up your IAM role to attach required policies

In this step, you add the required policies to your IAM role.

To add the required policies to your IAM role

1. Sign in to the Amazon Web Services Management Console and open the IAM console at https://console.amazonaws.cn/iam/.
2. In the left navigation pane, choose **Policies**, and choose **Create policy**.
3. On the **Create policy** page, do the following to create a new sns-access policy:

   a. Choose the **JSON** tab.

   b. Paste the JSON strings formatted in bold in the following code into the `"Statement"`, replacing the 12-digit Amazon account ID with your Amazon account ID.

   JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": [
```

```
                "sns:Publish",
                "sns:CreateTopic",
                "sns:Subscribe"
            ],
            "Resource": "arn:aws-cn:sns:*:111122223333:SMDebugRules"
        }
    ]
}
```

c. At the bottom of the page, choose **Review policy**.

d. On the **Review policy** page, for **Name**, enter **`sns-access`**.

e. At the bottom of the page, choose **Create policy**.

4. Go back to the IAM console, and choose **Roles** in the left navigation pane.
5. Look up the IAM role that you use for SageMaker AI model training and choose that IAM role.
6. On the **Permissions** tab of the **Summary** page, choose **Attach policies**.
7. Search for the **sns-access** policy, select the check box next to the policy, and then choose **Attach policy**.

For more examples of setting up IAM policies for Amazon SNS, see Example cases for Amazon SNS access control.

Configure Debugger rules with the built-in actions

After successfully finishing the required settings in the preceding steps, you can configure the Debugger built-in actions for debugging rules as shown in the following example script. You can choose which built-in actions to use while building the `actions` list object. The `rule_configs` is a helper module that provides high-level tools to configure Debugger built-in rules and actions. The following built-in actions are available for Debugger:

- `rule_configs.StopTraining()` – Stops a training job when the Debugger rule finds an issue.
- `rule_configs.Email("abc@abc.com")` – Sends a notification via email when the Debugger rule finds an issue. Use the email address that you used when you set up your SNS topic subscription.
- `rule_configs.SMS("+1234567890")` – Sends a notification via text message when the Debugger rule finds an issue. Use the phone number that you used when you set up your SNS topic subscription.

> **Note**
>
> Make sure you type the correct email address and phone number. Phone numbers must include +, a country code, and a phone number, with no special characters or spaces. For example, the phone number +1 (222) 333-4444 is formatted as **+12223334444**.

You can use all of the built-in actions or a subset of actions by wrapping up using the `rule_configs.ActionList()` method, which takes the built-in actions and configures a list of actions.

To add all of the three built-in actions to a single rule

If you want to assign all of the three built-in actions to a single rule, configure a Debugger built-in action list while constructing a ModelTrainer. Use the following template to construct the ModelTrainer, and Debugger will stop training jobs and send notifications through email and text for any rules that you use to monitor your training job progress.

```
from sagemaker.core.debugger import Rule, rule_configs

# Configure an action list object for Debugger rules
actions = rule_configs.ActionList(
    rule_configs.StopTraining(),
    rule_configs.Email("abc@abc.com"),
    rule_configs.SMS("+1234567890")
)

# Configure rules for debugging with the actions parameter
rules = [
    Rule.sagemaker(
        base_config=rule_configs.built_in_rule(),         # Required
        rule_parameters={"paramter_key": value },        # Optional
        actions=actions
    )
]

model_trainer = ModelTrainer(
    ...
    rules = rules
)
```

```
model_trainer.train()
```

To create multiple built-in action objects to assign different actions to a single rule

If you want to assign the built-in actions to be triggered at different threshold values of a single rule, you can create multiple built-in action objects as shown in the following script. To avoid a conflict error by running the same rule, you must submit different rule job names (specify different strings for the rules' name attribute) as shown in the following example script template. This example shows how to set up StalledTrainingRule to take two different actions: send an email to abc@abc.com when a training job stalls for 60 seconds, and stop the training job if stalling for 120 seconds.

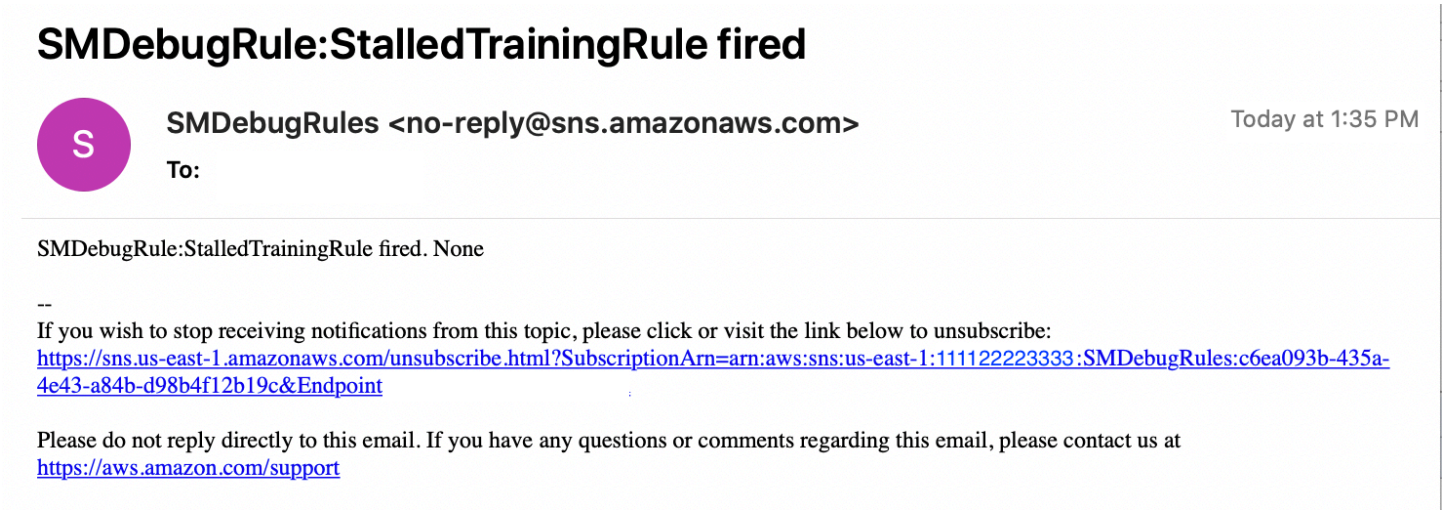
```
from sagemaker.core.debugger import Rule, rule_configs
import time

base_job_name_prefix= 'smdebug-stalled-demo-' + str(int(time.time()))

# Configure an action object for StopTraining
action_stop_training = rule_configs.ActionList(
    rule_configs.StopTraining()
)

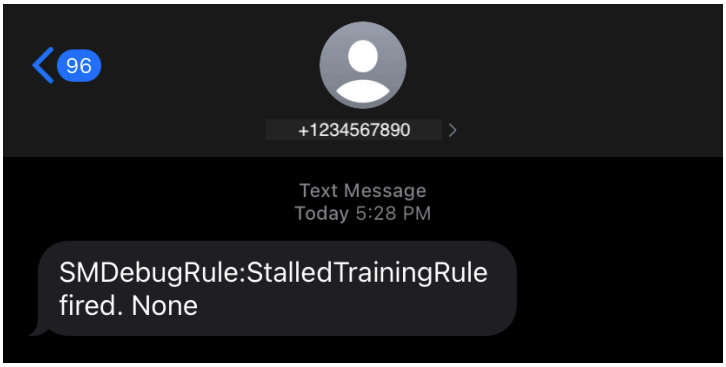
# Configure an action object for Email
action_email = rule_configs.ActionList(
    rule_configs.Email("abc@abc.com")
)

# Configure a rule with the Email built-in action to trigger if a training job stalls
 for 60 seconds
stalled_training_job_rule_email = Rule.sagemaker(
        base_config=rule_configs.stalled_training_rule(),
        rule_parameters={
                "threshold": "60",
                "training_job_name_prefix": base_job_name_prefix
        },
        actions=action_email
)
stalled_training_job_rule_text.name="StalledTrainingJobRuleEmail"



# Configure a rule with the StopTraining built-in action to trigger if a training job
 stalls for 120 seconds
stalled_training_job_rule = Rule.sagemaker(
```

```
        base_config=rule_configs.stalled_training_rule(),
        rule_parameters={
                "threshold": "120",
                "training_job_name_prefix": base_job_name_prefix
        },
        actions=action_stop_training
)
stalled_training_job_rule.name="StalledTrainingJobRuleStopTraining"



model_trainer = ModelTrainer(
    ...
    rules = [stalled_training_job_rule_email, stalled_training_job_rule]
)

model_trainer.train()
```

While the training job is running, the Debugger built-in action sends notification emails and text messages whenever the rule finds issues with your training job. The following screenshot shows an example of email notification for a training job that has a stalled training job issue.

The following screenshot shows an example text notification that Debugger sends when the rule finds a StalledTraining issue.

Considerations for using the Debugger built-in actions

- To use the Debugger built-in actions, an internet connection is required. This feature is not supported in the network isolation mode provided by Amazon SageMaker AI or Amazon VPC.
- The built-in actions cannot be used for Profiler rules.
- The built-in actions cannot be used on training jobs with spot training interruptions.
- In email or text notifications, None appears at the end of messages. This does not have any meaning, so you can disregard the text None.

Actions on rules using Amazon CloudWatch and Amazon Lambda

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

Amazon CloudWatch collects Amazon SageMaker AI model training job logs and Amazon SageMaker Debugger rule processing job logs. Configure Debugger with Amazon CloudWatch Events and Amazon Lambda to take action based on Debugger rule evaluation status.

Example notebooks

You can run the following example notebooks, which are prepared for experimenting with stopping a training job using actions on Debugger's built-in rules using Amazon CloudWatch and Amazon Lambda.

- Amazon SageMaker Debugger - Reacting to CloudWatch Events from Rules

  This example notebook runs a training job that has a vanishing gradient issue. The Debugger VanishingGradient built-in rule is used while constructing the SageMaker AI TensorFlow ModelTrainer. When the Debugger rule detects the issue, the training job is terminated.
- Detect Stalled Training and Invoke Actions Using SageMaker Debugger Rule

  This example notebook runs a training script with a code line that forces it to sleep for 10 minutes. The Debugger StalledTrainingRule built-in rule invokes issues and stops the training job.

Topics

- Access CloudWatch logs for Debugger rules and training jobs
- Set up Debugger for automated training job termination using CloudWatch and Lambda
- Disable the CloudWatch Events rule to stop using the automated training job termination

Access CloudWatch logs for Debugger rules and training jobs

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

You can use the training and Debugger rule job status in the CloudWatch logs to take further actions when there are training issues. The following procedure shows how to access the related CloudWatch logs. For more information about monitoring training jobs using CloudWatch, see Monitor Amazon SageMaker AI.

To access training job logs and Debugger rule job logs

1. Open the CloudWatch console at https://console.amazonaws.cn/cloudwatch/.
2. In the left navigation pane under the **Log** node, choose **Log Groups**.
3. In the log groups list, do the following:
   - Choose **/aws/sagemaker/TrainingJobs** for training job logs.

- Choose **/aws/sagemaker/ProcessingJobs** for Debugger rule job logs.

Set up Debugger for automated training job termination using CloudWatch and Lambda

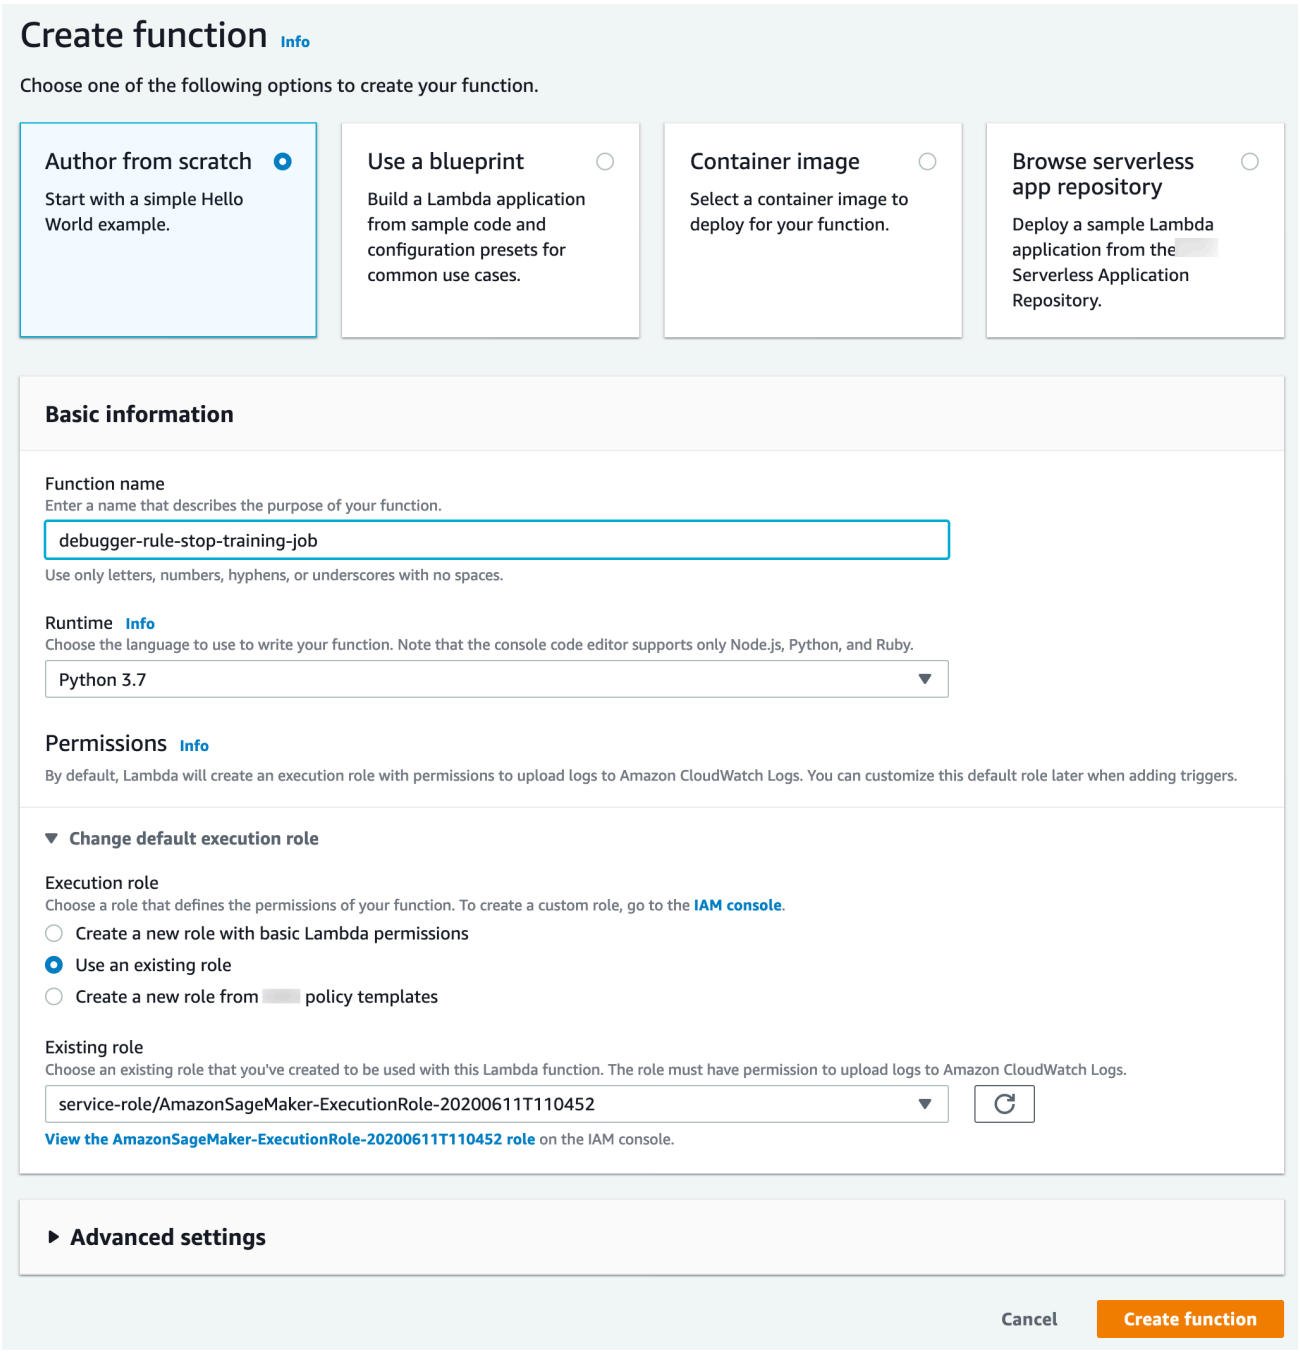
> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

The Debugger rules monitor training job status, and a CloudWatch Events rule watches the Debugger rule training job evaluation status. The following sections outline the process needed to automate training job termination using using CloudWatch and Lambda.

Topics

- Step 1: Create a Lambda function
- Step 2: Configure the Lambda function
- Step 3: Create a CloudWatch events rule and link to the Lambda function for Debugger

Step 1: Create a Lambda function



To create a Lambda function

1. Open the Amazon Lambda console at https://console.amazonaws.cn/lambda/.
2. In the left navigation pane, choose **Functions** and then choose **Create function**.
3. On the **Create function** page, choose **Author from scratch** option.
4. In the **Basic information** section, enter a **Function name** (for example, **debugger-rule-stop-training-job**).
5. For **Runtime**, choose **Python 3.7**.
6. For **Permissions**, expand the drop down option, and choose **Change default execution role**.
7. For **Execution role**, choose **Use an existing role** and choose the IAM role that you use for training jobs on SageMaker AI.

> **Note**
>
> Make sure you use the execution role with `AmazonSageMakerFullAccess` and `AWSLambdaBasicExecutionRole` attached. Otherwise, the Lambda function won't properly react to the Debugger rule status changes of the training job. If you are unsure which execution role is being used, run the following code in a Jupyter notebook cell to retrieve the execution role output:
>
> ```
> import sagemaker
> from sagemaker.core.helper.session_helper import get_execution_role
> get_execution_role()
> ```

8. At the bottom of the page, choose **Create function**.

The following figure shows an example of the **Create function** page with the input fields and selections completed.

Step 2: Configure the Lambda function

To configure the Lambda function

1. In the **Function code** section of the configuration page, paste the following Python script in the Lambda code editor pane. The `lambda_handler` function monitors the Debugger rule evaluation status collected by CloudWatch and triggers the `StopTrainingJob` API operation.

The Amazon SDK for Python (Boto3) `client` for SageMaker AI provides a high-level method, `stop_training_job`, which triggers the `StopTrainingJob` API operation.

```
import json
import boto3
import logging

logger = logging.getLogger()
logger.setLevel(logging.INFO)

def lambda_handler(event, context):
    training_job_name = event.get("detail").get("TrainingJobName")
    logging.info(f'Evaluating Debugger rules for training job:
 {training_job_name}')
    eval_statuses = event.get("detail").get("DebugRuleEvaluationStatuses", None)

    if eval_statuses is None or len(eval_statuses) == 0:
        logging.info("Couldn't find any debug rule statuses, skipping...")
        return {
            'statusCode': 200,
            'body': json.dumps('Nothing to do')
        }

    # should only attempt stopping jobs with InProgress status
    training_job_status = event.get("detail").get("TrainingJobStatus", None)
    if training_job_status != 'InProgress':
        logging.debug(f"Current Training job status({training_job_status}) is not
 'InProgress'. Exiting")
        return {
            'statusCode': 200,
            'body': json.dumps('Nothing to do')
        }

    client = boto3.client('sagemaker')

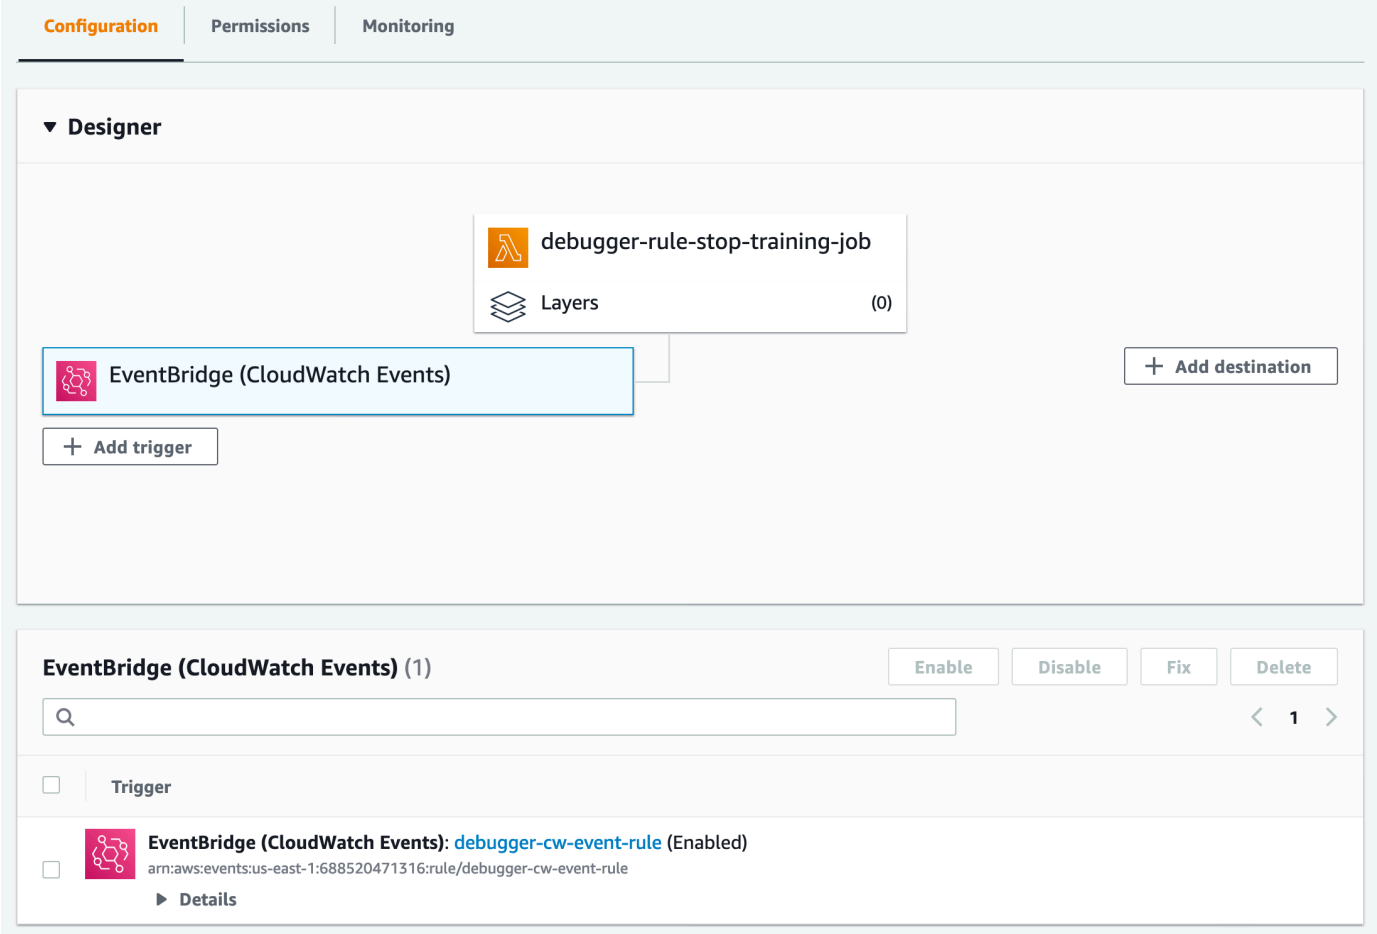
    for status in eval_statuses:
        logging.info(status.get("RuleEvaluationStatus") + ', RuleEvaluationStatus='
 + str(status))
        if status.get("RuleEvaluationStatus") == "IssuesFound":
            secondary_status = event.get("detail").get("SecondaryStatus", None)
            logging.info(
                f'About to stop training job, since evaluation of rule
 configuration {status.get("RuleConfigurationName")} resulted in "IssuesFound". ' +
```

```
                f'\ntraining job "{training_job_name}" status is
 "{training_job_status}", secondary status is "{secondary_status}"' +
                f'\nAttempting to stop training job "{training_job_name}"'
            )
            try:
                client.stop_training_job(
                    TrainingJobName=training_job_name
                )
            except Exception as e:
                logging.error(
                    "Encountered error while trying to "
                    "stop training job {}: {}".format(
                        training_job_name, str(e)
                    )
                )
                raise e
    return None
```

For more information about the Lambda code editor interface, see Creating functions using the Amazon Lambda console editor.

2. Skip all other settings and choose **Save** at the top of the configuration page.

Step 3: Create a CloudWatch events rule and link to the Lambda function for Debugger



To create a CloudWatch Events rule and link to the Lambda function for Debugger

1. Open the CloudWatch console at https://console.amazonaws.cn/cloudwatch/.
2. In the left navigation pane, choose **Rules** under the **Events** node.
3. Choose **Create rule**.
4. In the **Event Source** section of the **Step 1: Create rule** page, choose **SageMaker AI** for **Service Name**, and choose **SageMaker AI Training Job State Change** for **Event Type**. The Event Pattern Preview should look like the following example JSON strings:

```
{
    "source": [
        "aws.sagemaker"
    ],
    "detail-type": [
        "SageMaker Training Job State Change"
    ]
```

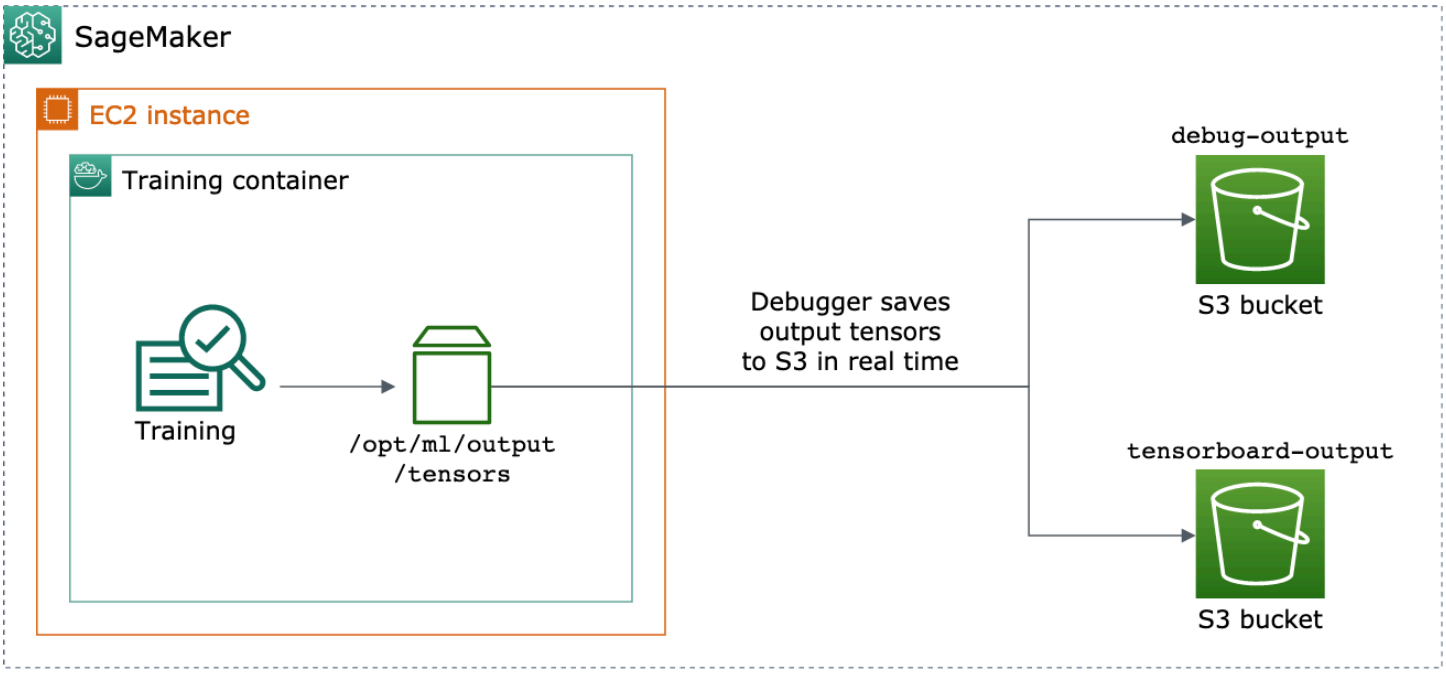
```
}
```

5. In the **Targets** section, choose **Add target***, and choose the **debugger-rule-stop-training-job** Lambda function that you created. This step links the CloudWatch Events rule with the Lambda function.
6. Choose **Configure details** and go to the **Step 2: Configure rule details** page.
7. Specify the CloudWatch rule definition name. For example, **debugger-cw-event-rule**.
8. Choose **Create rule** to finish.
9. Go back to the Lambda function configuration page and refresh the page. Confirm that it's configured correctly in the **Designer** panel. The CloudWatch Events rule should be registered as a trigger for the Lambda function. The configuration design should look like the following example:

Disable the CloudWatch Events rule to stop using the automated training job termination

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

If you want to disable the automated training job termination, you need to disable the CloudWatch Events rule. In the Lambda **Designer** panel, choose the **EventBridge (CloudWatch Events)** block linked to the Lambda function. This shows an **EventBridge** panel below the **Designer** panel (for example, see the previous screen shot). Select the check box next to **EventBridge (CloudWatch Events): debugger-cw-event-rule**, and then choose **Disable**. If you want to use the automated termination functionality later, you can enable the CloudWatch Events rule again.



Visualize Amazon SageMaker Debugger output tensors in TensorBoard

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

> **Important**
>
> This page is deprecated in favor of Amazon SageMaker AI with TensoBoard, which provides a comprehensive TensorBoard experience integrated with SageMaker Training and the access control functionalities of SageMaker AI domain. To learn more, see TensorBoard in Amazon SageMaker AI.

Use SageMaker Debugger to create output tensor files that are compatible with TensorBoard. Load the files to visualize in TensorBoard and analyze your SageMaker training jobs. Debugger automatically generates output tensor files that are compatible with TensorBoard. For any hook

configuration you customize for saving output tensors, Debugger has the flexibility to create scalar summaries, distributions, and histograms that you can import to TensorBoard.

You can enable this by passing `DebuggerHookConfig` and `TensorBoardOutputConfig` objects to an `ModelTrainer`.

The following procedure explains how to save scalars, weights, and biases as full tensors, histograms, and distributions that can be visualized with TensorBoard. Debugger saves them to the training container's local path (the default path is `/opt/ml/output/tensors`) and syncs to the Amazon S3 locations passed through the Debugger output configuration objects.

To save TensorBoard compatible output tensor files using Debugger

1. Set up a `tensorboard_output_config` configuration object to save TensorBoard output using the Debugger `TensorBoardOutputConfig` class. For the `s3_output_path` parameter, specify the default S3 bucket of the current SageMaker AI session or a preferred S3 bucket. This example does not add the `container_local_output_path` parameter; instead, it is set to the default local path `/opt/ml/output/tensors`.

```
from sagemaker.core.debugger import TensorBoardOutputConfig
from sagemaker.core.helper.session_helper import Session

bucket = Session().default_bucket()
tensorboard_output_config = TensorBoardOutputConfig(
    s3_output_path='s3://{}'.format(bucket)
```

```
)
```

For additional information, see the Debugger TensorBoardOutputConfig API in the Amazon SageMaker Python SDK.

2. Configure the Debugger hook and customize the hook parameter values. For example, the following code configures a Debugger hook to save all scalar outputs every 100 steps in training phases and 10 steps in validation phases, the `weights` parameters every 500 steps (the default `save_interval` value for saving tensor collections is 500), and the `bias` parameters every 10 global steps until the global step reaches 500.

```
from sagemaker.debugger import CollectionConfig, DebuggerHookConfig

hook_config = DebuggerHookConfig(
    hook_parameters={
        "train.save_interval": "100",
        "eval.save_interval": "10"
    },
    collection_configs=[
        CollectionConfig("weights"),
        CollectionConfig(
            name="biases",
            parameters={
                "save_interval": "10",
                "end_step": "500",
                "save_histogram": "True"
            }
        ),
    ]
)
```

For more information about the Debugger configuration APIs, see the Debugger CollectionConfig and DebuggerHookConfig APIs in the Amazon SageMaker Python SDK.

3. Construct a SageMaker AI ModelTrainer with the Debugger parameters passing the configuration objects. The following example template shows how to create a generic SageMaker AI ModelTrainer. Available ModelTrainer frameworks for this functionality are TensorFlow, PyTorch, and MXNet.

```
from sagemaker.train import ModelTrainer

model_trainer = ModelTrainer(
```

```
    ...
    # Debugger parameters
    debugger_hook_config=hook_config,
    tensorboard_output_config=tensorboard_output_config
)
model_trainer.train()
```

The `model_trainer.train()` method starts a training job, and Debugger writes the output tensor files in real time to the Debugger S3 output path and to the TensorBoard S3 output path. To retrieve the output paths, use the following ModelTrainer methods:

- For the Debugger S3 output path, use `model_trainer.latest_job_debugger_artifacts_path()`.
- For the TensorBoard S3 output path, use `model_trainer.latest_job_tensorboard_artifacts_path()`.

4. After the training has completed, check the names of saved output tensors:

```
from smdebug.trials import create_trial
trial = create_trial(model_trainer.latest_job_debugger_artifacts_path())
trial.tensor_names()
```

5. Check the TensorBoard output data in Amazon S3:

```
tensorboard_output_path=model_trainer.latest_job_tensorboard_artifacts_path()
print(tensorboard_output_path)
!aws s3 ls {tensorboard_output_path}/
```

6. Download the TensorBoard output data to your notebook instance. For example, the following Amazon CLI command downloads the TensorBoard files to `/logs/fit` under the current working directory of your notebook instance.

```
!aws s3 cp --recursive {tensorboard_output_path} ./logs/fit
```

7. Compress the file directory to a TAR file to download to your local machine.

```
!tar -cf logs.tar logs
```

8. Download and extract the Tensorboard TAR file to a directory on your device, launch a Jupyter notebook server, open a new notebook, and run the TensorBoard app.

```
!tar -xf logs.tar
%load_ext tensorboard
%tensorboard --logdir logs/fit
```

List of Debugger built-in rules

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

You can use the Debugger built-in rules, provided by Amazon SageMaker Debugger, to analyze metrics and tensors collected while training your models. The following lists the debugger rules, including information and an example on how to configure and deploy each built-in rule.

The Debugger built-in rules monitor various common conditions that are critical for the success of a training job. You can call the built-in rules using Amazon SageMaker Python SDK or the low-level SageMaker API operations.

There's no additional cost for using the built-in rules. For more information about billing, see the Amazon SageMaker Pricing page.

> **Note**
>
> The maximum numbers of built-in rules that you can attach to a training job is 20. SageMaker Debugger fully manages the built-in rules and analyzes your training job synchronously.

> **Important**
>
> To use the new Debugger features, you need to upgrade the SageMaker Python SDK and the SMDebug client library. In your iPython kernel, Jupyter notebook, or JupyterLab

environment, run the following code to install the latest versions of the libraries and restart the kernel.

```
import sys
import IPython
!{sys.executable} -m pip install -U sagemaker smdebug
IPython.Application.instance().kernel.do_shutdown(True)
```

Debugger rule

The following rules are the Debugger built-in rules that are callable using the `Rule.sagemaker` classmethod.

Debugger built-in rules for generating training reports

Scope of Validity	Built-in Rules
Training Report for SageMaker AI XGboost training job	• create_xgboost_report

Debugger built-in rules for debugging model training data (output tensors)

Scope of Validity	Built-in Rules
Deep learning frameworks (TensorFlow, MXNet, and PyTorch)	• dead_relu • exploding_tensor • poor_weight_initialization • saturated_activation • vanishing_gradient • weight_update_ratio
Deep learning frameworks (TensorFlow, MXNet, and PyTorch) and the XGBoost algorithm	• all_zero • class_imbalance • loss_not_decreasing • overfit

Scope of Validity	Built-in Rules
	• overtraining • similar_across_runs • stalled_training_rule • tensor_variance • unchanged_tensor
Deep learning applications	• check_input_images • nlp_sequence_ratio
XGBoost algorithm	• confusion • feature_importance_overweight • tree_depth

To use the built-in rules with default parameter values – use the following configuration format:

```
from sagemaker.core.debugger import Rule, ProfilerRule, rule_configs

rules = [
    Rule.sagemaker(rule_configs.built_in_rule_name_1()),
    Rule.sagemaker(rule_configs.built_in_rule_name_2()),
    ...
    Rule.sagemaker(rule_configs.built_in_rule_name_n())
]
```

To use the built-in rules with customizing the parameter values – use the following configuration format:

```
from sagemaker.core.debugger import Rule, ProfilerRule, rule_configs

rules = [
    Rule.sagemaker(
        base_config=rule_configs.built_in_rule_name(),
        rule_parameters={
                "key": "value"
        }
        collections_to_save=[
```

```
            CollectionConfig(
                name="tensor_collection_name",
                parameters={
                    "key": "value"
                }
            )
        ]
    )
]
```

To find available keys for the `rule_parameters` parameter, see the parameter description tables.

Sample rule configuration codes are provided for each built-in rule below the parameter description tables.

- For a full instruction and examples of using the Debugger built-in rules, see Debugger built-in rules example code.
- For a full instruction on using the built-in rules with the low-level SageMaker API operations, see Configure Debugger using SageMaker API.

CreateXgboostReport

The CreateXgboostReport rule collects output tensors from an XGBoost training job and autogenerates a comprehensive training report. You can download a comprehensive profiling report while a training job is running or after the training job is complete, and check progress of training or the final result of the training job. The CreateXgboostReport rule collects the following output tensors by default:

- `hyperparameters` – Saves at the first step
- `metrics` – Saves loss and accuracy every 5 steps
- `feature_importance` – Saves every 5 steps
- `predictions` – Saves every 5 steps
- `labels` – Saves every 5 steps

Parameter Descriptions for the CreateXgboostReport Rule

Parameter Name	Description
base_trial	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String

```
rules=[
    Rule.sagemaker(
        rule_configs.create_xgboost_report()
    )
]
```

DeadRelu

This rule detects when the percentage of rectified linear unit (ReLU) activation functions in a trial are considered dead because their activation activity has dropped below a threshold. If the percent of inactive ReLUs in a layer is greater than the `threshold_layer` value of inactive ReLUs, the rule returns `True`.

Parameter Descriptions for the DeadRelu Rule

Parameter Name	Description
base_trial	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
tensor_regex	A list of regex patterns used to restrict this comparison to specific scalar-valued tensors. The rule inspects only the tensors that match

Parameter Name	Description
	the regex patterns specified in the list. If no patterns are passed, the rule compares all tensors gathered in the trials by default. Only scalar-valued tensors can be matched. **Optional** Valid values: List of strings or a comma-sep arated string Default value: `".*relu_output"`
`threshold_inactivity`	Defines a level of activity below which a ReLU is considered to be dead. A ReLU might be active in the beginning of a trial and then slowly die during the training process. If the ReLU is active less than the `threshold _inactivity` , it is considered to be dead. **Optional** Valid values: Float Default values: `1.0` (in percentage)
`threshold_layer`	Returns `True` if the percentage of inactive ReLUs in a layer is greater than `threshold _layer .` Returns `False` if the percentage of inactive ReLUs in a layer is less than `threshold _layer .` **Optional** Valid values: Float Default values: `50.0` (in percentage)

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.dead_relu(),
        rule_parameters={
                "tensor_regex": ".*relu_output|.*ReLU_output",
                "threshold_inactivity": "1.0",
                "threshold_layer": "50.0"
        },
        collections_to_save=[
            CollectionConfig(
                name="custom_relu_collection",
                parameters={
                    "include_regex: ".*relu_output|.*ReLU_output",
                    "save_interval": "500"
                }
            )
        ]
    )
]
```

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

> **Note**
>
> This rule is not available for the XGBoost algorithm.

ExplodingTensor

This rule detects whether the tensors emitted during training have non-finite values, either infinite or NaN (not a number). If a non-finite value is detected, the rule returns `True`.

Parameter Descriptions for the ExplodingTensor Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger.

Parameter Name	Description
	Required Valid values: String
`collection_names`	The list of collection names whose tensors the rule inspects. **Optional** Valid values: String Default value: None
`tensor_regex`	A list of regex patterns used to restrict this comparison to specific scalar-valued tensors. The rule inspects only the tensors that match the regex patterns specified in the list. If no patterns are passed, the rule compares all tensors gathered in the trials by default. Only scalar-valued tensors can be matched. **Optional** Valid values: String Default value: None
`only_nan`	`True` to monitor the `base_trial` tensors only for `NaN` values and not for infinity. `False` to treat both `NaN` and infinity as exploding values and to monitor for both. **Optional** Default value: `False`

```
built_in_rules = [
```

```
    Rule.sagemaker(
        base_config=rule_configs.exploding_tensor(),
        rule_parameters={
                "tensor_regex": ".*gradient",
                "only_nan": "False"
        },
        collections_to_save=[
            CollectionConfig(
                name="gradients",
                parameters={
                    "save_interval": "500"
                }
            )
        ]
    )
]
```

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

> **Note**
>
> This rule is not available for the XGBoost algorithm.

PoorWeightInitialization

This rule detects if your model parameters have been poorly initialized.

Good initialization breaks the symmetry of the weights and gradients in a neural network and maintains commensurate activation variances across layers. Otherwise, the neural network doesn't learn effectively. Initializers like Xavier aim to keep variance constant across activations, which is especially relevant for training very deep neural nets. Too small an initialization can lead to vanishing gradients. Too large an initialization can lead to exploding gradients. This rule checks the variance of activation inputs across layers, the distribution of gradients, and the loss convergence for the initial steps to determine if a neural network has been poorly initialized.

Parameter Descriptions for the PoorWeightInitialization Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`activation_inputs_regex`	A list of regex patterns used to restrict this comparison to specific scalar-valued tensors. The rule inspects only the tensors that match the regex patterns specified in the list. If no patterns are passed, the rule compares all tensors gathered in the trials by default. Only scalar-valued tensors can be matched. **Optional** Valid values: String Default value: `".*relu_input"`
`threshold`	If the ratio between minimum and maximum variance of weights per layer exceeds the `threshold` at a step, the rule returns `True`. **Optional** Valid values: Float Default value: `10.0`
`distribution_range`	If the minimum difference between 5th and 95th percentiles of the gradient distribution is less than the `distribution_range` , the rule returns `True`. **Optional**

Parameter Name	Description
	Valid values: Float Default value: `0.001`
`patience`	The number of steps to wait until the loss is considered to be no longer decreasing. **Optional** Valid values: Integer Default value: 5
`steps`	The number of steps this rule analyzes. You typically need to check only the first few iterations. **Optional** Valid values: Float Default value: `10`

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.poor_weight_initialization(),
        rule_parameters={
                "activation_inputs_regex": ".*relu_input|.*ReLU_input",
                "threshold": "10.0",
                "distribution_range": "0.001",
                "patience": "5",
                "steps": "10"
        },
        collections_to_save=[
            CollectionConfig(
                name="custom_relu_collection",
                parameters={
                    "include_regex": ".*relu_input|.*ReLU_input",
                    "save_interval": "500"
```

```
                }
            )
        ]
    )
]
```

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

> **Note**
>
> This rule is not available for the XGBoost algorithm.

SaturatedActivation

This rule detects if the tanh and sigmoid activation layers are becoming saturated. An activation layer is saturated when the input of the layer is close to the maximum or minimum of the activation function. The minimum and maximum of the tanh and sigmoid activation functions are defined by their respective `min_threshold` and `max_thresholds` values. If the activity of a node drops below the `threshold_inactivity` percentage, it is considered saturated. If more than a `threshold_layer` percent of the nodes are saturated, the rule returns `True`.

Parameter Descriptions for the SaturatedActivation Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`collection_names`	The list of collection names whose tensors the rule inspects. **Optional**

Parameter Name	Description
	Valid values: List of strings or a comma-sep arated string Default value: None
`tensor_regex`	A list of regex patterns used to restrict this comparison to specific scalar-valued tensors. The rule inspects only the tensors that match the regex patterns specified in the list. If no patterns are passed, the rule compares all tensors gathered in the trials by default. Only scalar-valued tensors can be matched. **Optional** Valid values: String Default value: `".*tanh_input|.*si gmoid_input".`
`threshold_tanh_min`	The minimum and maximum thresholds that define the extremes of the input for a tanh activation function, defined as: `(min_thre shold, max_threshold)` . The default values are determined based on a vanishing gradient threshold of 0.0000001. **Optional** Valid values: Float Default values: `-9.4999`

Parameter Name	Description
`threshold_tanh_max`	The minimum and maximum thresholds that define the extremes of the input for a tanh activation function, defined as: `(min_threshold, max_threshold)` . The default values are determined based on a vanishing gradient threshold of 0.0000001. **Optional** Valid values: Float Default values: `9.4999`
`threshold_sigmoid_min`	The minimum and maximum thresholds that define the extremes of the input for a sigmoid activation function, defined as: `(min_threshold, max_threshold)` . The default values are determined based on a vanishing gradient threshold of 0.0000001. **Optional** Valid values: Float Default values: `-23`
`threshold_sigmoid_max`	The minimum and maximum thresholds that define the extremes of the input for a sigmoid activation function, defined as: `(min_threshold, max_threshold)` . The default values are determined based on a vanishing gradient threshold of 0.0000001. **Optional** Valid values: Float Default values: `16.99999`

Parameter Name	Description
`threshold_inactivity`	The percentage of inactivity below which the activation layer is considered to be saturated. The activation might be active in the beginning of a trial and then slowly become less active during the training process. **Optional** Valid values: Float Default values: `1.0`
`threshold_layer`	Returns `True` if the number of saturated activations in a layer is greater than the `threshold_layer` percentage. Returns `False` if the number of saturated activations in a layer is less than the `threshold_layer` percentage. **Optional** Valid values: Float Default values: `50.0`

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.saturated_activation(),
        rule_parameters={
                "tensor_regex": ".*tanh_input|.*sigmoid_input",
                "threshold_tanh_min": "-9.4999",
                "threshold_tanh_max": "9.4999",
                "threshold_sigmoid_min": "-23",
                "threshold_sigmoid_max": "16.99999",
                "threshold_inactivity": "1.0",
                "threshold_layer": "50.0"
        },
```

```
        collections_to_save=[
            CollectionConfig(
                name="custom_activations_collection",
                parameters={
                    "include_regex": ".*tanh_input|.*sigmoid_input"
                    "save_interval": "500"
                }
            )
        ]
    )
]
```

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

VanishingGradient

This rule detects if the gradients in a trial become extremely small or drop to a zero magnitude. If the mean of the absolute values of the gradients drops below a specified `threshold`, the rule returns `True`.

Parameters Descriptions for the VanishingGradient Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`threshold`	The value at which the gradient is determined to be vanishing.

Parameter Name	Description
	Optional Valid values: Float Default value: `0.0000001` .

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.vanishing_gradient(),
        rule_parameters={
                "threshold": "0.0000001"
        },
        collections_to_save=[
            CollectionConfig(
                name="gradients",
                parameters={
                    "save_interval": "500"
                }
            )
        ]
    )
]
```

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

> **Note**
>
> This rule is not available for the XGBoost algorithm.

WeightUpdateRatio

This rule keeps track of the ratio of updates to weights during training and detects if that ratio gets too large or too small. If the ratio of updates to weights is larger than the `large_threshold value` or if this ratio is smaller than `small_threshold`, the rule returns `True`.

Conditions for training are best when the updates are commensurate to gradients. Excessively large updates can push the weights away from optimal values, and very small updates result in very slow convergence. This rule requires weights to be available for two training steps, and `train.save_interval` needs to be set equal to `num_steps`.

Parameter Descriptions for the WeightUpdateRatio Rule

Parameter Name,	**Description**
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`num_steps`	The number of steps across which the rule checks to determine if the tensor has changed. The number of steps across which you want to compare the weight ratios. If you pass no value, the rule runs by default against the current step and the immediately previous saved step. If you override the default by passing a value for this parameter, the comparison is done between weights at step `s` and at a step `>= s - num_steps` . **Optional** Valid values: Integer Default value: None
`large_threshold`	The maximum value that the ratio of updates to weight can take before the rule returns `True`. **Optional**

Parameter Name,	Description
	Valid values: Float Default value: `10.0`
`small_threshold`	The minimum value that the ratio of updates to weight can take, below which the rule returns `True`. **Optional** Valid values: Float Default value: `0.00000001`
`epsilon`	A small constant used to ensure that Debugger does not divide by zero when computing the ratio updates to weigh. **Optional** Valid values: Float Default value: `0.000000001`

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.weight_update_ratio(),
        rule_parameters={
                "num_steps": "100",
                "large_threshold": "10.0",
                "small_threshold": "0.00000001",
                "epsilon": "0.000000001"
        },
        collections_to_save=[
            CollectionConfig(
                name="weights",
                parameters={
                    "train.save_interval": "100"
                }
```

```
            )
        ]
    )
]
```

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

> **Note**
>
> This rule is not available for the XGBoost algorithm.

AllZero

This rule detects if all or a specified percentage of the tensor values are zero.

This rule can be applied either to one of the supported deep learning frameworks (TensorFlow, MXNet, and PyTorch) or to the XGBoost algorithm. You must specify either the `collection_names` or `tensor_regex` parameter. If both the parameters are specified, the rule inspects the union of tensors from both sets.

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

Parameters Descriptions for the AllZero Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`collection_names`	The list of collection names whose tensors the rule inspects. **Optional**

Parameter Name	Description
	Valid values: List of strings or a comma-sep arated string Default value: None
`tensor_regex`	A list of regex patterns used to restrict this comparison to specific scalar-valued tensors. The rule inspects only the tensors that match the regex patterns specified in the list. If no patterns are passed, the rule compares all tensors gathered in the trials by default. Only scalar-valued tensors can be matched. **Optional** Valid values: List of strings or a comma-sep arated string Default value: None
`threshold`	Specifies the percentage of values in the tensor that needs to be zero for this rule to be invoked. **Optional** Valid values: Float Default value: 100 (in percentage)

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.all_zero(),
        rule_parameters={
                "tensor_regex": ".*",
                "threshold": "100"
        },
        collections_to_save=[
```

```
            CollectionConfig(
                name="all",
                parameters={
                    "save_interval": "500"
                }
            )
        ]
    )
]
```

ClassImbalance

This rule measures sampling imbalances between classes and throws errors if the imbalance exceeds a threshold or if too many mispredictions for underrepresented classes occur as a result of the imbalance.

Classification models require well-balanced classes in the training dataset or a proper weighting/sampling of classes during training. The rule performs the following checks:

- It counts the occurrences per class. If the ratio of number of samples between smallest and largest class is larger than the `threshold_imbalance`, an error is thrown.
- It checks the prediction accuracy per class. If resampling or weighting has not been correctly applied, then the model can reach high accuracy for the class with many training samples, but low accuracy for the classes with few training samples. If a fraction of mispredictions for a certain class is above `threshold_misprediction`, an error is thrown.

This rule can be applied either to one of the supported deep learning frameworks (TensorFlow, MXNet, and PyTorch) or to the XGBoost algorithm.

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

Parameter Descriptions for the ClassImbalance Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger.

Parameter Name	Description
	Required Valid values: String
`threshold_imbalance`	The acceptable imbalance between the number of samples in the smallest class and in the largest class. Exceeding this threshold value throws an error. **Optional** Valid values: Float Default value: `10`
`threshold_misprediction`	A limit on the fraction of mispredictions allowed for each class. Exceeding this threshold throws an error. The underrepr esented classes are most at risk of crossing this threshold. **Optional** Valid values: Float Default value: `0.7`

Parameter Name	Description
`samples`	The number of labels that have to be processed before an imbalance is evaluated . The rule might not be triggered until it has seen sufficient samples across several steps. The more classes that your dataset contains, the larger this `sample` number should be. **Optional** Valid values: Integer Default value: `500` (assuming a dataset like MNIST with 10 classes)
`argmax`	If `True`, np.argmax is applied to the predictio n tensor. Required when you have a vector of probabilities for each class. It is used to determine which class has the highest probability. **Conditional** Valid values: Boolean Default value: `False`
`labels_regex`	The name of the tensor that contains the labels. **Optional** Valid values: String Default value: `".*labels"`

Parameter Name	Description
`predictions_regex`	The name of the tensor that contains the predictions. **Optional** Valid values: String Default value: `".*predictions"`

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.class_imbalance(),
        rule_parameters={
                "threshold_imbalance": "10",
                "threshold_misprediction": "0.7",
                "samples": "500",
                "argmax": "False",
                "labels_regex": ".*labels",
                "predictions_regex": ".*predictions"
        },
        collections_to_save=[
            CollectionConfig(
                name="custom_output_collection",
                parameters={
                    "include_regex": ".*labels|.*predictions",
                    "save_interval": "500"
                }
            )
        ]
    )
]
```

LossNotDecreasing

This rule detects when the loss is not decreasing in value at an adequate rate. These losses must be scalars.

This rule can be applied either to one of the supported deep learning frameworks (TensorFlow, MXNet, and PyTorch) or to the XGBoost algorithm. You must specify either the

`collection_names` or `tensor_regex` parameter. If both the parameters are specified, the rule inspects the union of tensors from both sets.

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

Parameter Descriptions for the LossNotDecreasing Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`collection_names`	The list of collection names whose tensors the rule inspects. **Optional** Valid values: List of strings or a comma-sep arated string Default value: None
`tensor_regex`	A list of regex patterns that is used to restrict this comparison to specific scalar-valued tensors. The rule inspects only the tensors that match the regex patterns specified in the list. If no patterns are passed, the rule compares all tensors gathered in the trials by default. Only scalar-valued tensors can be matched. **Optional** Valid values: List of strings or a comma-sep arated string

Parameter Name	Description
	Default value: None
use_losses_collection	If set to True, looks for losses in the collection named "losses" when the collection is present. **Optional** Valid values: Boolean Default value: True
num_steps	The minimum number of steps after which the rule checks if the loss has decreased. Rule evaluation happens every num_steps . The rule compares the loss for this step with the loss at a step which is at least num_steps behind the current step. For example, suppose that the loss is being saved every three steps, but num_steps is set to 10. At step 21, loss for step 21 is compared with loss for step 9. The next step at which loss is checked is step 33, because ten steps after step 21 is step 31, and at step 31 and step 32 loss is not saved. **Optional** Valid values: Integer Default value: 10

Parameter Name	Description
`diff_percent`	The minimum percentage difference by which the loss should decrease between `num_steps` . **Optional** Valid values: `0.0` < float < `100` Default value: `0.1` (in percentage)
`increase_threshold_percent`	The maximum threshold percent that loss is allowed to increase in case loss has been increasing **Optional** Valid values: `0` < float < `100` Default value: 5 (in percentage)
`mode`	The name of the Debugger mode to query tensor values for rule checking. If this is not passed, the rule checks in order by default for the `mode.EVAL` , then `mode.TRAIN` , and then `mode.GLOBAL` . **Optional** Valid values: String (`EVAL`, `TRAIN`, or `GLOBAL`) Default value: `GLOBAL`

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.loss_not_decreasing(),
        rule_parameters={
                "tensor_regex": ".*",
                "use_losses_collection": "True",
```

```
                "num_steps": "10",
                "diff_percent": "0.1",
                "increase_threshold_percent": "5",
                "mode": "GLOBAL"
        },
        collections_to_save=[
            CollectionConfig(
                name="losses",
                parameters={
                    "save_interval": "500"
                }
            )
        ]
    )
]
```

Overfit

This rule detects if your model is being overfit to the training data by comparing the validation and training losses.

This rule can be applied either to one of the supported deep learning frameworks (TensorFlow, MXNet, and PyTorch) or to the XGBoost algorithm.

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

> **Note**
>
> A standard way to prevent overfitting is to regularize your model.

Parameter Descriptions for the Overfit Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required**

Parameter Name	Description
	Valid values: String
`tensor_regex`	A list of regex patterns used to restrict this comparison to specific scalar-valued tensors. The rule inspects only the tensors that match the regex patterns specified in the list. If no patterns are passed, the rule compares all tensors gathered in the trials by default. Only scalar-valued tensors can be matched. **Optional** Valid values: List of strings or a comma-sep arated string Default value: None
`start_step`	The step from which to start comparing the validation and training loss. **Optional** Valid values: Integer Default value: `0`
`patience`	The number of steps for which the `ratio_threshold` is allowed to exceed the value set before the model is considered to be overfit. **Optional** Valid values: Integer Default value: 1

Parameter Name	Description
`ratio_threshold`	The maximum ratio of the difference between the mean validation loss and mean training loss to the mean training loss. If this threshold is exceeded for a `patience` number of steps, the model is being overfit and the rule returns `True`. **Optional** Valid values: Float Default value: `0.1`

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.overfit(),
        rule_parameters={
                "tensor_regex": ".*",
                "start_step": "0",
                "patience": "1",
                "ratio_threshold": "0.1"
        },
        collections_to_save=[
            CollectionConfig(
                name="losses",
                parameters={
                    "train.save_interval": "100",
                    "eval.save_interval": "10"
                }
            )
        ]
    )
]
```

Overtraining

This rule detects if a model is being overtrained. After a number of training iterations on a well-behaved model (both training and validation loss decrease), the model approaches to a minimum

of the loss function and does not improve anymore. If the model continues training it can happen that validation loss starts increasing, because the model starts overfitting. This rule sets up thresholds and conditions to determine if the model is not improving, and prevents overfitting problems due to overtraining.

This rule can be applied either to one of the supported deep learning frameworks (TensorFlow, MXNet, and PyTorch) or to the XGBoost algorithm.

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

> **Note**
>
> Overtraining can be avoided by early stopping. For information on early stopping, see Stop Training Jobs Early. For an example that shows how to use spot training with Debugger, see Enable Spot Training with Amazon SageMaker Debugger.

Parameter Descriptions for the Overtraining Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`patience_train`	The number of steps to wait before the training loss is considered to not to be improving anymore. **Optional** Valid values: Integer Default value: 5

Parameter Name	Description
`patience_validation`	The number of steps to wait before the validation loss is considered to not to be improving anymore. **Optional** Valid values: Integer Default value: `10`
`delta`	The minimum threshold by how much the error should improve before it is considered as a new optimum. **Optional** Valid values: Float Default value: `0.01`

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.overtraining(),
        rule_parameters={
                "patience_train": "5",
                "patience_validation": "10",
                "delta": "0.01"
        },
        collections_to_save=[
            CollectionConfig(
                name="losses",
                parameters={
                    "save_interval": "500"
                }
            )
        ]
    )
]
```

SimilarAcrossRuns

This rule compares tensors gathered from a base trial with tensors from another trial.

This rule can be applied either to one of the supported deep learning frameworks (TensorFlow, MXNet, and PyTorch) or to the XGBoost algorithm.

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

Parameter Descriptions for the SimilarAcrossRuns Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`other_trials`	A completed training job name whose tensors you want to compare to those tensors gathered from the current `base_trial` . **Required** Valid values: String
`collection_names`	The list of collection names whose tensors the rule inspects. **Optional** Valid values: List of strings or a comma-sep arated string Default value: None
`tensor_regex`	A list of regex patterns used to restrict this comparison to specific scalar-valued tensors.

Parameter Name	Description
	The rule inspects only the tensors that match the regex patterns specified in the list. If no patterns are passed, the rule compares all tensors gathered in the trials by default. Only scalar-valued tensors can be matched. **Optional** Valid values: List of strings or a comma-sep arated string Default value: None

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.similar_across_runs(),
        rule_parameters={
                "other_trials": "<specify-another-job-name>",
                "collection_names": "losses",
                "tensor_regex": ".*"
        },
        collections_to_save=[
            CollectionConfig(
                name="losses",
                parameters={
                    "save_interval": "500"
                }
            )
        ]
    )
]
```

StalledTrainingRule

StalledTrainingRule detects if there is no progress made on training job, and stops the training job if the rule fires. This rule requires tensors to be periodically saved in a time interval defined by its `threshold` parameter. This rule keeps on monitoring for new tensors, and if no new tensor has been emitted for threshold interval rule gets fired.

Parameter Descriptions for the StalledTrainingRule Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`threshold`	A threshold that defines by how much time in seconds the rule waits for a tensor output until it fires a stalled training issue. Default value is 1800 seconds. **Optional** Valid values: Integer Default value: `1800`
`stop_training_on_fire`	If set to `True`, watches if the base training job outputs tensors in "`threshold` " seconds. **Optional** Valid values: Boolean Default value: `False`
`training_job_name_prefix`	The prefix of base training job name. If `stop_training_on_fire` is true, the rule searches for SageMaker training jobs with this prefix in the same account. If there is an inactivity found, the rule takes a `StopTrainingJob` action. Note if there are multiple jobs found with same prefix, the rule skips

Parameter Name	Description
	termination. It is important that the prefix is set unique per each training job. **Optional** Valid values: String

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.stalled_training_rule(),
        rule_parameters={
                "threshold": "1800",
                "stop_training_on_fire": "True",
                "training_job_name_prefix": "<specify-training-base-job-name>"
        },
        collections_to_save=[
            CollectionConfig(
                name="losses",
                parameters={
                    "save_interval": "500"
                }
            )
        ]
    )
]
```

TensorVariance

This rule detects if you have tensors with very high or low variances. Very high or low variances in a tensor could lead to neuron saturation, which reduces the learning ability of the neural network. Very high variance in tensors can also eventually lead to exploding tensors. Use this rule to detect such issues early.

This rule can be applied either to one of the supported deep learning frameworks (TensorFlow, MXNet, and PyTorch) or to the XGBoost algorithm. You must specify either the `collection_names` or `tensor_regex` parameter. If both the parameters are specified, the rule inspects the union of tensors from both sets.

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

Parameter Descriptions for the TensorVariance Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`collection_names`	The list of collection names whose tensors the rule inspects. **Optional** Valid values: List of strings or a comma-sep arated string Default value: None
`tensor_regex`	A list of regex patterns used to restrict this comparison to specific scalar-valued tensors. The rule inspects only the tensors that match the regex patterns specified in the list. If no patterns are passed, the rule compares all tensors gathered in the trials by default. Only scalar-valued tensors can be matched. **Optional** Valid values: List of strings or a comma-sep arated string Default value: None

Parameter Name	Description
max_threshold	The threshold for the upper bound of tensor variance. **Optional** Valid values: Float Default value: None
min_threshold	The threshold for the lower bound of tensor variance. **Optional** Valid values: Float Default value: None

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.tensor_variance(),
        rule_parameters={
                "collection_names": "weights",
                "max_threshold": "10",
                "min_threshold": "0.00001",
        },
        collections_to_save=[
            CollectionConfig(
                name="weights",
                parameters={
                    "save_interval": "500"
                }
            )
        ]
    )
]
```

UnchangedTensor

This rule detects whether a tensor is no longer changing across steps.

This rule runs the numpy.allclose method to check if the tensor isn't changing.

This rule can be applied either to one of the supported deep learning frameworks (TensorFlow, MXNet, and PyTorch) or to the XGBoost algorithm. You must specify either the `collection_names` or `tensor_regex` parameter. If both the parameters are specified, the rule inspects the union of tensors from both sets.

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

Parameter Descriptions for the UnchangedTensor Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`collection_names`	The list of collection names whose tensors the rule inspects. **Optional** Valid values: List of strings or a comma-sep arated string Default value: None
`tensor_regex`	A list of regex patternsused to restrict this comparison to specific scalar-valued tensors. The rule inspects only the tensors that match the regex patterns specified in the list. If no patterns are passed, the rule compares all

Parameter Name	Description
	tensors gathered in the trials by default. Only scalar-valued tensors can be matched. **Optional** Valid values: List of strings or a comma-sep arated string Default value: None
`num_steps`	The number of steps across which the rule checks to determine if the tensor has changed. This checks the last `num_steps` that are available. They don't need to be consecutive. If `num_steps` is 2, at step s it doesn't necessari ly check for s-1 and s. If s-1 isn't available, it checks the last available step along with s. In that case, it checks the last available step with the current step. **Optional** Valid values: Integer Default value: 3
`rtol`	The relative tolerance parameter to be passed to the `numpy.allclose` method. **Optional** Valid values: Float Default value: `1e-05`

Parameter Name	Description
`atol`	The absolute tolerance parameter to be passed to the `numpy.allclose` method. **Optional** Valid values: Float Default value: `1e-08`
`equal_nan`	Whether to compare NaNs as equal. If `True`, NaNs in input array a are considered equal to NaNs in input array b in the output array. This parameter is passed to the `numpy.allclose` method. **Optional** Valid values: Boolean Default value: `False`

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.unchanged_tensor(),
        rule_parameters={
                "collection_names": "losses",
                "tensor_regex": "",
                "num_steps": "3",
                "rtol": "1e-05",
                "atol": "1e-08",
                "equal_nan": "False"
        },
        collections_to_save=[
            CollectionConfig(
                name="losses",
                parameters={
                    "save_interval": "500"
                }
            )
```

```
        ]
    )
]
```

CheckInputImages

This rule checks if input images have been correctly normalized. Specifically, it detects if the mean of the sample data differs by more than a threshold value from zero. Many computer vision models require that input data has a zero mean and unit variance.

This rule is applicable to deep learning applications.

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

Parameter Descriptions for the CheckInputImages Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`threshold_mean`	A threshold that defines by how much mean of the input data can differ from 0. **Optional** Valid values: Float Default value: `0.2`
`threshold_samples`	The number of images that have to be sampled before an error can be thrown. If the value is too low, the estimation of the dataset mean will be inaccurate. **Optional**

Parameter Name	Description
	Valid values: Integer Default value: 500
regex	The name of the input data tensor. **Optional** Valid values: String Default value: ".*hybridsequential0_input_0" (the name of the input tensor for Apache MXNet models using HybridSequential)
channel	The position of the color channel in the input tensor shape array. **Optional** Valid values: Integer Default value: 1 (for example, MXNet expects input data in the form of (batch_size, channel, height, width))

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.check_input_images(),
        rule_parameters={
                "threshold_mean": "0.2",
                "threshold_samples": "500",
                "regex": ".*hybridsequential0_input_0",
                "channel": "1"
        },
        collections_to_save=[
            CollectionConfig(
                name="custom_inputs_collection",
                parameters={
```

```
                    "include_regex": ".*hybridsequential0_input_0",
                    "save_interval": "500"
                }
            )
        ]
    )
]
```

NLPSequenceRatio

This rule calculates the ratio of specific tokens given the rest of the input sequence that is useful for optimizing performance. For example, you can calculate the percentage of padding end-of-sentence (EOS) tokens in your input sequence. If the number of EOS tokens is too high, an alternate bucketing strategy should be performed. You also can calculate the percentage of unknown tokens in your input sequence. If the number of unknown words is too high, an alternate vocabulary could be used.

This rule is applicable to deep learning applications.

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

Parameter Descriptions for the NLPSequenceRatio Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`tensor_regex`	A list of regex patterns used to restrict this comparison to specific scalar-valued tensors. The rule inspects only the tensors that match the regex patterns specified in the list. If no patterns are passed, the rule compares all tensors gathered in the trials by default. Only scalar-valued tensors can be matched.

Parameter Name	Description
	Optional Valid values: List of strings or a comma-separated string Default value: `".*embedding0_input_0"` (assuming an embedding as the initial layer of the network)
`token_values`	A string of a list of the numerical values of the tokens. For example, "3, 0". **Optional** Valid values: Comma-separated string of numerical values Default value: `0`
`token_thresholds_percent`	A string of a list of thresholds (in percentages) that correspond to each of the `token_values` . For example,"50.0, 50.0". **Optional** Valid values: Comma-separated string of floats Default value: `"50"`

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.nlp_sequence_ratio(),
        rule_parameters={
                "tensor_regex": ".*embedding0_input_0",
                "token_values": "0",
                "token_thresholds_percent": "50"
        },
        collections_to_save=[
            CollectionConfig(
```

```
                name="custom_inputs_collection",
                parameters={
                    "include_regex": ".*embedding0_input_0"
                }
            )
        ]
    )
]
```

Confusion

This rule evaluates the goodness of a confusion matrix for a classification problem.

It creates a matrix of size `category_no*category_no` and populates it with data coming from (`labels`, `predictions`) pairs. For each (`labels`, `predictions`) pair, the count in `confusion[labels][predictions]` is incremented by 1. When the matrix is fully populated, the ratio of data on-diagonal values and off-diagonal values are evaluated as follows:

- For elements on the diagonal: `confusion[i][i]/sum_j(confusion[j][j])>=min_diag`
- For elements off the diagonal: `confusion[j][i])/sum_j(confusion[j][i])<=max_off_diag`

This rule can be applied to the XGBoost algorithm.

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

Parameter Descriptions for the Confusion Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`category_no`	The number of categories.

Parameter Name	Description
	Optional Valid values: Integer ≥2 Default value: `"None"`
`labels`	The `labels` tensor collection or an 1-d vector of true labels. **Optional** Valid values: String Default value: `"labels"`
`predictions`	The `predictions` tensor collection or an 1-d vector of estimated labels. **Optional** Valid values: String Default value: `"predictions"`
`labels_collection`	The rule inspects the tensors in this collection for `labels`. **Optional** Valid values: String Default value: `"labels"`

Parameter Name	Description
`predictions_collection`	The rule inspects the tensors in this collection for `predictions` . **Optional** Valid values: String Default value: `"predictions"`
`min_diag`	The minimum threshold for the ratio of data on the diagonal. **Optional** Valid values: `0`≤float≤`1` Default value: `0.9`
`max_off_diag`	The maximum threshold for the ratio of data off the diagonal. **Optional** Valid values: `0`≤float≤`1` Default value: `0.1`

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.confusion(),
        rule_parameters={
                "category_no": "10",
                "labels": "labels",
                "predictions": "predictions",
                "labels_collection": "labels",
                "predictions_collection": "predictions",
                "min_diag": "0.9",
                "max_off_diag": "0.1"
        },
```

```
        collections_to_save=[
            CollectionConfig(
                name="labels",
                parameters={
                    "save_interval": "500"
                }
            ),
            CollectionConfig(
                name="predictions",
                parameters={
                    "include_regex": "500"
                }
            )
        ]
    )
]
```

> **Note**
>
> This rule infers default values for the optional parameters if their values aren't specified.

FeatureImportanceOverweight

This rule accumulates the weights of the n largest feature importance values per step and ensures that they do not exceed the threshold. For example, you can set the threshold for the top 3 features to not hold more than 80 percent of the total weights of the model.

This rule is valid only for the XGBoost algorithm.

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

Parameter Descriptions for the FeatureImportanceOverweight Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required**

Parameter Name	Description
	Valid values: String
`threshold`	Defines the threshold for the proportion of the cumulative sum of the n largest features. The number n is defined by the `nfeatures` parameter. **Optional** Valid values: Float Default value: `0.8`
`nfeatures`	The number of largest features. **Optional** Valid values: Integer Default value: 3
`tensor_regex`	Regular expression (regex) of tensor names the rule to analyze. **Optional** Valid values: String Default value: `".*feature_importance/weight"`

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.feature_importance_overweight(),
        rule_parameters={
                "threshold": "0.8",
                "nfeatures": "3",
                "tensor_regex": ".*feature_importance/weight"
        },
```

```
        collections_to_save=[
            CollectionConfig(
                name="feature_importance",
                parameters={
                    "save_interval": "500"
                }
            )
        ]
    )
]
```

TreeDepth

This rule measures the depth of trees in an XGBoost model. XGBoost rejects splits if they do not improve loss. This regularizes the training. As a result, the tree might not grow as deep as defined by the `depth` parameter.

This rule is valid only for the XGBoost algorithm.

For an example of how to configure and deploy a built-in rule, see How to configure Debugger built-in rules.

Parameter Descriptions for the TreeDepth Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`depth`	The depth of the tree. The depth of the tree is obtained by computing the base 2 logarithm of the largest node ID. **Optional** Valid values: Float

Parameter Name	Description
	Default value: 4

```
built_in_rules = [
    Rule.sagemaker(
        base_config=rule_configs.tree_depth(),
        rule_parameters={
                "depth": "4"
        },
        collections_to_save=[
            CollectionConfig(
                name="tree",
                parameters={
                    "save_interval": "500"
                }
            )
        ]
    )
]
```

Creating custom rules using the Debugger client library

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

You can create custom rules to monitor your training job using the Debugger rule APIs and the open source smdebug Python library that provide tools to build your own rule containers.

Prerequisites for creating a custom rule

To create Debugger custom rules, you need the following prerequisites.

- SageMaker Debugger Rule.custom API
- The open source smdebug Python library

- Your own custom rule python script
- Amazon SageMaker Debugger image URIs for custom rule evaluators

Topics

- Use the smdebug client library to create a custom rule as a Python script
- Use the Debugger APIs to run your own custom rules

Use the smdebug client library to create a custom rule as a Python script

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

The smdebug Rule API provides an interface to set up your own custom rules. The following python script is a sample of how to construct a custom rule, `CustomGradientRule`. This tutorial custom rule watches if the gradients are getting too large and set the default threshold as 10. The custom rule takes a base trial created by a SageMaker AI estimator when it initiates training job.

```
from smdebug.rules.rule import Rule

class CustomGradientRule(Rule):
    def __init__(self, base_trial, threshold=10.0):
        super().__init__(base_trial)
        self.threshold = float(threshold)

    def invoke_at_step(self, step):
        for tname in self.base_trial.tensor_names(collection="gradients"):
            t = self.base_trial.tensor(tname)
            abs_mean = t.reduction_value(step, "mean", abs=True)
            if abs_mean > self.threshold:
                return True
        return False
```

You can add multiple custom rule classes as many as you want in the same python script and deploy them to any training job trials by constructing custom rule objects in the following section.

Use the Debugger APIs to run your own custom rules

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

The following code sample shows how to configure a custom rule with the Amazon SageMaker Python SDK. This example assumes that the custom rule script you created in the previous step is located at '*path/to/my_custom_rule.py*'.

```
from sagemaker.core.debugger import Rule, CollectionConfig

custom_rule = Rule.custom(
    name='MyCustomRule',
    image_uri='759209512951.dkr.ecr.us-west-2.amazonaws.com/sagemaker-debugger-rule-
evaluator:latest',
    instance_type='ml.t3.medium',
    source='path/to/my_custom_rule.py',
    rule_to_invoke='CustomGradientRule',
    collections_to_save=[CollectionConfig("gradients")],
    rule_parameters={"threshold": "20.0"}
)
```

The following list explains the Debugger `Rule.custom` API arguments.

- `name` (str): Specify a custom rule name as you want.
- `image_uri` (str): This is the image of the container that has the logic of understanding your custom rule. It sources and evaluates the specified tensor collections you save in the training job. You can find the list of open source SageMaker AI rule evaluator images from Amazon SageMaker Debugger image URIs for custom rule evaluators.
- `instance_type` (str): You need to specify an instance to build a rule docker container. This spins up the instance in parallel with a training container.

- `source` (str): This is the local path or the Amazon S3 URI to your custom rule script.
- `rule_to_invoke` (str): This specifies the particular Rule class implementation in your custom rule script. SageMaker AI supports only one rule to be evaluated at a time in a rule job.
- `collections_to_save` (str): This specifies which tensor collections you will save for the rule to run.
- `rule_parameters` (dictionary): This accepts parameter inputs in a dictionary format. You can adjust the parameters that you configured in the custom rule script.

After you set up the `custom_rule` object, you can use it for building a SageMaker AI estimator for any training jobs. Specify the `entry_point` to your training script. You do not need to make any change of your training script.

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import SourceCode, Compute
from sagemaker.core.helper.session_helper import get_execution_role

model_trainer = ModelTrainer(
                role=get_execution_role(),
                base_job_name='smdebug-custom-rule-demo-tf-keras',
                source_code=SourceCode(entry_script='path/to/your_training_script.py'),
                compute=Compute(instance_type='ml.p2.xlarge'),
                ...

                # debugger-specific arguments below
                rules = [custom_rule]
)

model_trainer.train()
```

For more variations and advanced examples of using Debugger custom rules, see the following example notebooks.

- Monitor your training job with Amazon SageMaker Debugger custom rules
- PyTorch iterative model pruning of ResNet and AlexNet
- Trigger Amazon CloudWatch Events using Debugger Rules to Take an Action Based on Training Status with TensorFlow

Use Debugger with custom training containers

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

Amazon SageMaker Debugger is available for any deep learning models that you bring to Amazon SageMaker AI. The Amazon CLI, SageMaker AI `ModelTrainer` API, and the Debugger APIs enable you to use any Docker base images to build and customize containers to train your models. To use Debugger with customized containers, you need to make a minimal change to your training script to implement the Debugger hook callback and retrieve tensors from training jobs. The following sections will walk you through how to use Debugger with Custom Training Containers.

You need the following resources to build a customized container with Debugger.

- Amazon SageMaker Python SDK
- The SMDebug open source client library
- A Docker base image of your choice
- Your training script with a Debugger hook registered – For more information about registering a Debugger hook to your training script, see Register Debugger hook to your training script.

For an end-to-end example of using Debugger with a custom training container, see the following example notebook.

- Build a Custom Training Container and Debug Training Jobs with Debugger

> **Tip**
>
> This custom container with Debugger guide is an extension of the Adapting your own training container guide which walks you thorough how to build and push your custom training container to Amazon ECR.

Prepare to build a custom training container

To build a docker container, the basic structure of files should look like the following:

```
### debugger_custom_container_test_notebook.ipynb      # a notebook to run python
 snippet codes
### debugger_custom_container_test_folder              # this is a docker folder
    ###  your-training-script.py                       # your training script with
 Debugger hook
    ###  Dockerfile                                    # a Dockerfile to build your own
 container
```

Register Debugger hook to your training script

To debug your model training, you need to add a Debugger hook to your training script.

> **Note**
>
> This step is required to collect model parameters (output tensors) for debugging your model training. If you only want to monitor and profile, you can skip this hook registration step and exclude the `debugger_hook_config` parameter when constructing an estimater.

The following example code shows the structure of a training script using the Keras ResNet50 model and how to pass the Debugger hook as a Keras callback for debugging. To find a complete training script, see TensorFlow training script with SageMaker Debugger hook.

```
# An example of training script (your-training-script.py)
import tensorflow.compat.v2 as tf
from tensorflow.keras.applications.resnet50 import ResNet50
import smdebug.tensorflow as smd

def train(batch_size, epoch, model, hook):

    ...
    model.fit(X_train, Y_train,
              batch_size=batch_size,
              epochs=epoch,
              validation_data=(X_valid, Y_valid),
              shuffle=True,
```

```
                # smdebug modification: Pass the Debugger hook in the main() as a Keras
 callback
                callbacks=[hook])

def main():
    parser=argparse.ArgumentParser(description="Train resnet50 cifar10")

    # hyperparameter settings
    parser.add_argument(...)

    args = parser.parse_args()

    model=ResNet50(weights=None, input_shape=(32,32,3), classes=10)

    # Add the following line to register the Debugger hook for Keras.
    hook=smd.KerasHook.create_from_json_file()

    # Start the training.
    train(args.batch_size, args.epoch, model, hook)

if __name__ == "__main__":
    main()
```

For more information about registering the Debugger hook for the supported frameworks and algorithm, see the following links in the SMDebug client library:

- SMDebug TensorFlow hook
- SMDebug PyTorch hook
- SMDebug MXNet hook
- SMDebug XGBoost hook

In the following example notebooks' training scripts, you can find more examples about how to add the Debugger hooks to training scripts and collect output tensors in detail:

- Debugger in script mode with the TensorFlow 2.1 framework

  To see the difference between using Debugger in a Deep Learning Container and in script mode, open this notebook and put it and the previous Debugger in a Deep Learning Container TensorFlow v2.1 notebook example side by side.

In script mode, the hook configuration part is removed from the script in which you set the ModelTrainer. Instead, the Debugger hook feature is merged into the training script, TensorFlow Keras ResNet training script in script mode. The training script imports the `smdebug` library in the required TensorFlow Keras environment to communicate with the TensorFlow ResNet50 algorithm. It also manually implements the `smdebug` hook functionality by adding the `callbacks=[hook]` argument inside the `train` function (in line 49), and by adding the manual hook configuration (in line 89) provided through SageMaker Python SDK.

This script mode example runs the training job in the TF 2.1 framework for direct comparison with the zero script change in the TF 2.1 example. The benefit of setting up Debugger in script mode is the flexibility to choose framework versions not covered by Amazon Deep Learning Containers.

- Using Amazon SageMaker Debugger in a PyTorch Container in Script Mode

  This notebook enables Debugger in script mode in PyTorch v1.3.1 framework. PyTorch v1.3.1 is supported by SageMaker AI containers, and this example shows details of how to modify a training script.

  The SageMaker AI PyTorch ModelTrainer is already in script mode by default. In the notebook, the line to activate `script_mode` is not included in the ModelTrainer configuration.

  This notebook shows detailed steps to change the original PyTorch training script to a modified version to enable Debugger. Additionally, this example shows how you can use Debugger built-in rules to detect training issues such as the vanishing gradients problem, and the Debugger trial features to call and analyze the saved tensors.

Create and configure a Dockerfile

Open your SageMaker AI JupyterLab and create a new folder, `debugger_custom_container_test_folder` in this example, to save your training script and `Dockerfile`. The following code example is a `Dockerfile` that includes essential docker build commends. Paste the following code into the `Dockerfile` text file and save it. Upload your training script to the same folder.

```
# Specify a docker base image
FROM tensorflow/tensorflow:2.2.0rc2-gpu-py3
RUN /usr/bin/python3 -m pip install --upgrade pip
RUN pip install --upgrade protobuf
```

```
# Install required packages to enable the SageMaker Python SDK and the smdebug library
RUN pip install sagemaker-training
RUN pip install smdebug
CMD ["bin/bash"]
```

If you want to use a pre-built Amazon Deep Learning Container image, see Available Amazon Deep Learning Containers Images.

Build and push the custom training image to Amazon ECR

Create a test notebook, `debugger_custom_container_test_notebook.ipynb`, and run the following code in the notebook cell. This will access the `debugger_byoc_test_docker` directory, build the docker with the specified `algorithm_name`, and push the docker container to your Amazon ECR.

```
import boto3

account_id = boto3.client('sts').get_caller_identity().get('Account')
ecr_repository = 'sagemaker-debugger-mnist-byoc-tf2'
tag = ':latest'

region = boto3.session.Session().region_name

uri_suffix = 'amazonaws.com'
if region in ['cn-north-1', 'cn-northwest-1']:
    uri_suffix = 'amazonaws.com.cn'
byoc_image_uri = '{}.dkr.ecr.{}.{}/{}'.format(account_id, region, uri_suffix,
 ecr_repository + tag)

!docker build -t $ecr_repository docker
!$(aws ecr get-login --region $region --registry-ids $account_id --no-include-email)
!aws ecr create-repository --repository-name $ecr_repository
!docker tag {ecr_repository + tag} $byoc_image_uri
!docker push $byoc_image_uri
```

Tip

If you use one of the Amazon Deep Learning Container base images, run the following code to log in to Amazon ECR and access to the Deep Learning Container image repository.

```
! aws ecr get-login-password --region {region} | docker login --username Amazon
 --password-stdin 763104351884.dkr.ecr.us-east-1.amazonaws.com
```

Run and debug training jobs using the custom training container

After you build and push your docker container to Amazon ECR, configure a SageMaker AI ModelTrainer with your training script and the Debugger-specific parameters. After you execute the `model_trainer.train()`, Debugger will collect output tensors, monitor them, and detect training issues. Using the saved tensors, you can further analyze the training job by using the smdebug core features and tools. Configuring a workflow of Debugger rule monitoring process with Amazon CloudWatch Events and Amazon Lambda, you can automate a stopping training job process whenever the Debugger rules spots training issues.

```
import sagemaker
from sagemaker.train import ModelTrainer
from sagemaker.core.debugger import Rule, DebuggerHookConfig, CollectionConfig,
 rule_configs
from sagemaker.core.helper.session_helper import get_execution_role

profiler_config=ProfilerConfig(...)
debugger_hook_config=DebuggerHookConfig(...)
rules=[
    Rule.sagemaker(rule_configs.built_in_rule()),
    ProfilerRule.sagemaker(rule_configs.BuiltInRule())
]

from sagemaker.train.configs import SourceCode, Compute

model_trainer=ModelTrainer(
    training_image=byoc_image_uri,
    source_code=SourceCode(entry_script="./debugger_custom_container_test_folder/your-
training-script.py"),
    role=get_execution_role(),
    base_job_name='debugger-custom-container-test',
    compute=Compute(instance_type='ml.p3.2xlarge', instance_count=1),

    # Debugger-specific parameters
    profiler_config=profiler_config,
    debugger_hook_config=debugger_hook_config,
```

```
    rules=rules
)

# start training
model_trainer.train()
```

Configure Debugger using SageMaker API

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

The preceding topics focus on using Debugger through Amazon SageMaker Python SDK, which is a wrapper around Amazon SDK for Python (Boto3) and SageMaker API operations. This offers a high-level experience of accessing the Amazon SageMaker API operations. In case you need to manually configure the SageMaker API operations using Amazon Boto3 or Amazon Command Line Interface (CLI) for other SDKs, such as Java, Go, and C++, this section covers how to configure the following low-level API operations.

Topics

- JSON (Amazon CLI)
- SDK for Python (Boto3)

JSON (Amazon CLI)

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

Amazon SageMaker Debugger built-in rules can be configured for a training job using the DebugHookConfig, DebugRuleConfiguration, ProfilerConfig, and ProfilerRuleConfiguration objects through the SageMaker AI CreateTrainingJob API operation. You need to specify the right image URI in the `RuleEvaluatorImage` parameter, and the following examples walk you through how to set up the JSON strings to request CreateTrainingJob.

The following code shows a complete JSON template to run a training job with required settings and Debugger configurations. Save the template as a JSON file in your working directory and run the training job using Amazon CLI. For example, save the following code as `debugger-training-job-cli.json`.

> **Note**
>
> Ensure that you use the correct Docker container images. To find Amazon Deep Learning Container images, see Available Deep Learning Containers Images. To find a complete list of available Docker images for using the Debugger rules, see Docker images for Debugger rules.

```

      "ProfilingParameters": {
          "DataloaderProfilingConfig": "{\"StartStep\": 5, \"NumSteps\": 3,
 \"MetricsRegex\": \".*\", }",
          "DetailedProfilingConfig": "{\"StartStep\": 5, \"NumSteps\": 3, }",
          "PythonProfilingConfig": "{\"StartStep\": 5, \"NumSteps\": 3, \"ProfilerName
\": \"cprofile\", \"cProfileTimer\": \"total_time\"}",
          "LocalPath": "/opt/ml/output/profiler/"
      }
   },
   "ProfilerRuleConfigurations": [
      {
         "RuleConfigurationName": "ProfilerReport",
         "RuleEvaluatorImage": "895741380848.dkr.ecr.us-west-2.amazonaws.com/sagemaker-
debugger-rules:latest",
         "RuleParameters": {"rule_to_invoke": "ProfilerReport"}
      }
   ],
   "ResourceConfig": {
      "InstanceType": "ml.p3.8xlarge",
      "InstanceCount": 1,
      "VolumeSizeInGB": 30
```

```
    },

    "StoppingCondition": {
        "MaxRuntimeInSeconds": 86400
    }
}
```

After saving the JSON file, run the following command in your terminal. (Use ! at the beginning of the line if you use a Jupyter notebook.)

```
aws sagemaker create-training-job --cli-input-json file://debugger-training-job-
cli.json
```

To configure a Debugger rule for debugging model parameters

The following code samples show how to configure a built-in `VanishingGradient` rule using this SageMaker API.

To enable Debugger to collect output tensors

Specify the Debugger hook configuration as follows:

```
"DebugHookConfig": {
    "S3OutputPath": "s3://<default-bucket>/<training-job-name>/debug-output",
    "CollectionConfigurations": [
        {
            "CollectionName": "gradients",
            "CollectionParameters" : {
                "save_interval": "500"
            }
        }
    ]
}
```

This will make the training job save the tensor collection, `gradients`, every `save_interval` of 500 steps. To find available `CollectionName` values, see Debugger Built-in Collections in the *SMDebug client library documentation*. To find available `CollectionParameters` parameter keys and values, see the `sagemaker.debugger.CollectionConfig` class in the *SageMaker Python SDK documentation*.

To enable Debugger rules for debugging the output tensors

The following DebugRuleConfigurations API example shows how to run the built-in VanishingGradient rule on the saved gradients collection.

```
"DebugRuleConfigurations": [
    {
        "RuleConfigurationName": "VanishingGradient",
        "RuleEvaluatorImage": "503895931360.dkr.ecr.us-east-1.amazonaws.com/sagemaker-debugger-rules:latest",
        "RuleParameters": {
            "rule_to_invoke": "VanishingGradient",
            "threshold": "20.0"
        }
    }
]
```

With a configuration like the one in this sample, Debugger starts a rule evaluation job for your training job using the VanishingGradient rule on the collection of gradients tensor. To find a complete list of available Docker images for using the Debugger rules, see Docker images for Debugger rules. To find the key-value pairs for RuleParameters, see List of Debugger built-in rules.

To configure a Debugger built-in rule for profiling system and framework metrics

The following example code shows how to specify the ProfilerConfig API operation to enable collecting system and framework metrics.

To enable Debugger profiling to collect system and framework metrics

Target Step

```
"ProfilerConfig": {
    // Optional. Path to an S3 bucket to save profiling outputs
    "S3OutputPath": "s3://<default-bucket>/<training-job-name>/profiler-output",
    // Available values for ProfilingIntervalInMilliseconds: 100, 200, 500, 1000 (1 second), 5000 (5 seconds), and 60000 (1 minute) milliseconds.
    "ProfilingIntervalInMilliseconds": 500,
    "ProfilingParameters": {
        "DataloaderProfilingConfig": "{ \"StartStep\": 5, \"NumSteps\": 3, \"MetricsRegex\": \".*\" }",
        "DetailedProfilingConfig": "{ \"StartStep\": 5, \"NumSteps\": 3 }",
        // For PythonProfilingConfig,
        // available ProfilerName options: cProfile, Pyinstrument
```

```
        // available cProfileTimer options only when using cProfile: cpu, off_cpu,
 total_time
        "PythonProfilingConfig": "{ \"StartStep\": 5, \"NumSteps\": 3,
 \"ProfilerName\": \"cProfile\", \"cProfileTimer\": \"total_time\" }",
        // Optional. Local path for profiling outputs
        "LocalPath": "/opt/ml/output/profiler/"
    }
}
```

Target Time Duration

```
"ProfilerConfig": {
    // Optional. Path to an S3 bucket to save profiling outputs
    "S3OutputPath": "s3://<default-bucket>/<training-job-name>/profiler-output",
    // Available values for ProfilingIntervalInMilliseconds: 100, 200, 500, 1000 (1
 second), 5000 (5 seconds), and 60000 (1 minute) milliseconds.
    "ProfilingIntervalInMilliseconds": 500,
    "ProfilingParameters": {
        "DataloaderProfilingConfig": "{ \"StartTimeInSecSinceEpoch\": 12345567789,
 \"DurationInSeconds\": 10, \"MetricsRegex\": \".*\" }",
        "DetailedProfilingConfig": "{ \"StartTimeInSecSinceEpoch\": 12345567789,
 \"DurationInSeconds\": 10 }",
        // For PythonProfilingConfig,
        // available ProfilerName options: cProfile, Pyinstrument
        // available cProfileTimer options only when using cProfile: cpu, off_cpu,
 total_time
        "PythonProfilingConfig": "{ \"StartTimeInSecSinceEpoch\": 12345567789,
 \"DurationInSeconds\": 10, \"ProfilerName\": \"cProfile\", \"cProfileTimer\":
 \"total_time\" }",
        // Optional. Local path for profiling outputs
        "LocalPath": "/opt/ml/output/profiler/"
    }
}
```

To enable Debugger rules for profiling the metrics

The following example code shows how to configure the `ProfilerReport` rule.

```
"ProfilerRuleConfigurations": [
    {
        "RuleConfigurationName": "ProfilerReport",
```

```
        "RuleEvaluatorImage": "895741380848.dkr.ecr.us-west-2.amazonaws.com/sagemaker-debugger-rules:latest",
        "RuleParameters": {
            "rule_to_invoke": "ProfilerReport",
            "CPUBottleneck_cpu_threshold": "90",
            "IOBottleneck_threshold": "90"
        }
    }
]
```

To find a complete list of available Docker images for using the Debugger rules, see Docker images for Debugger rules. To find the key-value pairs for `RuleParameters`, see List of Debugger built-in rules.

Update Debugger profiling configuration using the `UpdateTrainingJob` API

Debugger profiling configuration can be updated while your training job is running by using the UpdateTrainingJob API operation. Configure new ProfilerConfig and ProfilerRuleConfiguration objects, and specify the training job name to the `TrainingJobName` parameter.

```
{
    "ProfilerConfig": {
        "DisableProfiler": boolean,
        "ProfilingIntervalInMilliseconds": number,
        "ProfilingParameters": {
            "string" : "string"
        }
    },
    "ProfilerRuleConfigurations": [
        {
            "RuleConfigurationName": "string",
            "RuleEvaluatorImage": "string",
            "RuleParameters": {
                "string" : "string"
            }
        }
    ],
    "TrainingJobName": "your-training-job-name-YYYY-MM-DD-HH-MM-SS-SSS"
}
```

Add Debugger custom rule configuration to the `CreateTrainingJob` API

A custom rule can be configured for a training job using the DebugHookConfig and DebugRuleConfiguration objects in the CreateTrainingJob API operation. The following code sample shows how to configure a custom `ImproperActivation` rule written with the *smdebug* library using this SageMaker API operation. This example assumes that you've written the custom rule in *custom_rules.py* file and uploaded it to an Amazon S3 bucket. The example provides pre-built Docker images that you can use to run your custom rules. These are listed at Amazon SageMaker Debugger image URIs for custom rule evaluators. You specify the URL registry address for the pre-built Docker image in the `RuleEvaluatorImage` parameter.

```
"DebugHookConfig": {
    "S3OutputPath": "s3://<default-bucket>/<training-job-name>/debug-output",
    "CollectionConfigurations": [
        {
            "CollectionName": "relu_activations",
            "CollectionParameters": {
                "include_regex": "relu",
                "save_interval": "500",
                "end_step": "5000"
            }
        }
    ]
},
"DebugRulesConfigurations": [
    {
        "RuleConfigurationName": "improper_activation_job",
        "RuleEvaluatorImage": "552407032007.dkr.ecr.ap-south-1.amazonaws.com/sagemaker-
debugger-rule-evaluator:latest",
        "InstanceType": "ml.c4.xlarge",
        "VolumeSizeInGB": 400,
        "RuleParameters": {
           "source_s3_uri": "s3://bucket/custom_rules.py",
           "rule_to_invoke": "ImproperActivation",
           "collection_names": "relu_activations"
        }
    }
]
```

To find a complete list of available Docker images for using the Debugger rules, see Docker images for Debugger rules. To find the key-value pairs for `RuleParameters`, see List of Debugger built-in rules.

SDK for Python (Boto3)

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

Amazon SageMaker Debugger built-in rules can be configured for a training job using the `create_training_job()` function of the Amazon Boto3 SageMaker AI client. You need to specify the right image URI in the `RuleEvaluatorImage` parameter, and the following examples walk you through how to set up the request body for the `create_training_job()` function.

The following code shows a complete example of how to configure Debugger for the `create_training_job()` request body and start a training job in `us-west-2`, assuming that a training script `entry_point/train.py` is prepared using TensorFlow. To find an end-to-end example notebook, see Profiling TensorFlow Multi GPU Multi Node Training Job with Amazon SageMaker Debugger (Boto3).

> **Note**
>
> Ensure that you use the correct Docker container images. To find available Amazon Deep Learning Container images, see Available Deep Learning Containers Images. To find a complete list of available Docker images for using the Debugger rules, see Docker images for Debugger rules.

```
import sagemaker, boto3
import datetime, tarfile

# Start setting up a SageMaker session and a Boto3 SageMaker client
session = sagemaker.Session()
region = session.boto_region_name
```

```
bucket = session.default_bucket()

# Upload a training script to a default Amazon S3 bucket of the current SageMaker
 session
source = 'source.tar.gz'
project = 'debugger-boto3-test'

tar = tarfile.open(source, 'w:gz')
tar.add ('entry_point/train.py') # Specify the directory and name of your training
 script
tar.close()

s3 = boto3.client('s3')
s3.upload_file(source, bucket, project+'/'+source)

# Set up a Boto3 session client for SageMaker
sm = boto3.Session(region_name=region).client("sagemaker")

# Start a training job
sm.create_training_job(
    TrainingJobName='debugger-boto3-'+datetime.datetime.now().strftime('%Y-%m-%d-%H-%M-
%S'),
    HyperParameters={
        'sagemaker_submit_directory': 's3://'+bucket+'/'+project+'/'+source,
        'sagemaker_program': '/entry_point/train.py' # training scrip file location and
 name under the sagemaker_submit_directory
    },
    AlgorithmSpecification={
        # Specify a training Docker container image URI (Deep Learning Container or
 your own training container) to TrainingImage.
        'TrainingImage': '763104351884.dkr.ecr.us-west-2.amazonaws.com/tensorflow-
training:2.4.1-gpu-py37-cu110-ubuntu18.04',
        'TrainingInputMode': 'File',
        'EnableSageMakerMetricsTimeSeries': False
    },

            'LocalPath': '/opt/ml/output/profiler/' # Optional. Local path for
 profiling outputs
        }
    },
    ProfilerRuleConfigurations=[
        {
            'RuleConfigurationName': 'ProfilerReport',
            'RuleEvaluatorImage': '895741380848.dkr.ecr.us-west-2.amazonaws.com/
sagemaker-debugger-rules:latest',
            'RuleParameters': {'rule_to_invoke': 'ProfilerReport'}
        }
    ]
```

```
)
```

To configure a Debugger rule for debugging model parameters

The following code samples show how to configure a built-in `VanishingGradient` rule using this SageMaker API.

To enable Debugger to collect output tensors

Specify the Debugger hook configuration as follows:

```
DebugHookConfig={
    'S3OutputPath': 's3://<default-bucket>/<training-job-name>/debug-output',
    'CollectionConfigurations': [
        {
            'CollectionName': 'gradients',
            'CollectionParameters' : {
                'train.save_interval': '500',
                'eval.save_interval': '50'
            }
        }
    ]
}
```

This will make the training job save a tensor collection, `gradients`, every `save_interval` of 500 steps. To find available `CollectionName` values, see Debugger Built-in Collections in the *SMDebug client library documentation*. To find available `CollectionParameters` parameter keys and values, see the `sagemaker.debugger.CollectionConfig` class in the *SageMaker Python SDK documentation*.

To enable Debugger rules for debugging the output tensors

The following `DebugRuleConfigurations` API example shows how to run the built-in `VanishingGradient` rule on the saved `gradients` collection.

```
DebugRuleConfigurations=[
    {
        'RuleConfigurationName': 'VanishingGradient',
        'RuleEvaluatorImage': '895741380848.dkr.ecr.us-west-2.amazonaws.com/sagemaker-
debugger-rules:latest',
        'RuleParameters': {
            'rule_to_invoke': 'VanishingGradient',
```

```
            'threshold': '20.0'
        }
    }
]
```

With a configuration like the one in this sample, Debugger starts a rule evaluation job for your training job using the `VanishingGradient` rule on the collection of `gradients` tensor. To find a complete list of available Docker images for using the Debugger rules, see Docker images for Debugger rules. To find the key-value pairs for `RuleParameters`, see List of Debugger built-in rules.

To configure a Debugger built-in rule for profiling system and framework metrics

The following example code shows how to specify the ProfilerConfig API operation to enable collecting system and framework metrics.

To enable Debugger profiling to collect system and framework metrics

Target Step

```
ProfilerConfig={
    'S3OutputPath': 's3://<default-bucket>/<training-job-name>/profiler-output', #
 Optional. Path to an S3 bucket to save profiling outputs
    # Available values for ProfilingIntervalInMilliseconds: 100, 200, 500, 1000 (1
 second), 5000 (5 seconds), and 60000 (1 minute) milliseconds.
    'ProfilingIntervalInMilliseconds': 500,
    'ProfilingParameters': {
        'DataloaderProfilingConfig': '{
            "StartStep": 5,
            "NumSteps": 3,
            "MetricsRegex": ".*"
        }',
        'DetailedProfilingConfig': '{
            "StartStep": 5,
            "NumSteps": 3
        }',
        'PythonProfilingConfig': '{
            "StartStep": 5,
            "NumSteps": 3,
            "ProfilerName": "cprofile",  # Available options: cprofile, pyinstrument
            "cProfileTimer": "total_time"  # Include only when using cprofile.
 Available options: cpu, off_cpu, total_time
        }',
```

```
        'LocalPath': '/opt/ml/output/profiler/' # Optional. Local path for profiling
 outputs
    }
}
```

Target Time Duration

```
ProfilerConfig={
    'S3OutputPath': 's3://<default-bucket>/<training-job-name>/profiler-output', #
 Optional. Path to an S3 bucket to save profiling outputs
    # Available values for ProfilingIntervalInMilliseconds: 100, 200, 500, 1000 (1
 second), 5000 (5 seconds), and 60000 (1 minute) milliseconds.
    'ProfilingIntervalInMilliseconds': 500,
    'ProfilingParameters': {
        'DataloaderProfilingConfig': '{
            "StartTimeInSecSinceEpoch": 12345567789,
            "DurationInSeconds": 10,
            "MetricsRegex": ".*"
        }',
        'DetailedProfilingConfig': '{
            "StartTimeInSecSinceEpoch": 12345567789,
            "DurationInSeconds": 10
        }',
        'PythonProfilingConfig': '{
            "StartTimeInSecSinceEpoch": 12345567789,
            "DurationInSeconds": 10,
            "ProfilerName": "cprofile",  # Available options: cprofile, pyinstrument
            "cProfileTimer": "total_time"  # Include only when using cprofile.
 Available options: cpu, off_cpu, total_time
        }',
        'LocalPath': '/opt/ml/output/profiler/' # Optional. Local path for profiling
 outputs
    }
}
```

To enable Debugger rules for profiling the metrics

The following example code shows how to configure the `ProfilerReport` rule.

```
ProfilerRuleConfigurations=[
    {
        'RuleConfigurationName': 'ProfilerReport',
```

```
        'RuleEvaluatorImage': '895741380848.dkr.ecr.us-west-2.amazonaws.com/sagemaker-debugger-rules:latest',
        'RuleParameters': {
            'rule_to_invoke': 'ProfilerReport',
            'CPUBottleneck_cpu_threshold': '90',
            'IOBottleneck_threshold': '90'
        }
    }
]
```

To find a complete list of available Docker images for using the Debugger rules, see Docker images for Debugger rules. To find the key-value pairs for `RuleParameters`, see List of Debugger built-in rules.

Update Debugger Profiling Configuration Using the `UpdateTrainingJob` API Operation

Debugger profiling configuration can be updated while your training job is running by using the `update_training_job()` function of the Amazon Boto3 SageMaker AI client. Configure new ProfilerConfig and ProfilerRuleConfiguration objects, and specify the training job name to the `TrainingJobName` parameter.

```
ProfilerConfig={
    'DisableProfiler': boolean,
    'ProfilingIntervalInMilliseconds': number,
    'ProfilingParameters': {
        'string' : 'string'
    }
},
ProfilerRuleConfigurations=[
    {
        'RuleConfigurationName': 'string',
        'RuleEvaluatorImage': 'string',
        'RuleParameters': {
            'string' : 'string'
        }
    }
],
TrainingJobName='your-training-job-name-YYYY-MM-DD-HH-MM-SS-SSS'
```

Add Debugger Custom Rule Configuration to the CreateTrainingJob API Operation

A custom rule can be configured for a training job using the DebugHookConfig and DebugRuleConfiguration objects using the Amazon Boto3 SageMaker AI client's `create_training_job()` function. The following code sample shows how to configure a custom `ImproperActivation` rule written with the *smdebug* library using this SageMaker API operation. This example assumes that you've written the custom rule in *custom_rules.py* file and uploaded it to an Amazon S3 bucket. The example provides pre-built Docker images that you can use to run your custom rules. These are listed at Amazon SageMaker Debugger image URIs for custom rule evaluators. You specify the URL registry address for the pre-built Docker image in the `RuleEvaluatorImage` parameter.

```
DebugHookConfig={
    'S3OutputPath': 's3://<default-bucket>/<training-job-name>/debug-output',
    'CollectionConfigurations': [
        {
            'CollectionName': 'relu_activations',
            'CollectionParameters': {
                'include_regex': 'relu',
                'save_interval': '500',
                'end_step': '5000'
            }
        }
    ]
},
DebugRulesConfigurations=[
    {
        'RuleConfigurationName': 'improper_activation_job',
        'RuleEvaluatorImage': '552407032007.dkr.ecr.ap-south-1.amazonaws.com/sagemaker-
debugger-rule-evaluator:latest',
        'InstanceType': 'ml.c4.xlarge',
        'VolumeSizeInGB': 400,
        'RuleParameters': {
           'source_s3_uri': 's3://bucket/custom_rules.py',
           'rule_to_invoke': 'ImproperActivation',
           'collection_names': 'relu_activations'
        }
    }
]
```

To find a complete list of available Docker images for using the Debugger rules, see Docker images for Debugger rules. To find the key-value pairs for `RuleParameters`, see List of Debugger built-in rules.

Amazon SageMaker Debugger references

> **Note**
>
> Amazon SageMaker Debugger is no longer open to new customers. Existing customers can continue to use the service as normal. Amazon continues to invest in security and availability improvements for Debugger, but we do not plan to introduce new features. For more information, see Debugger availability change.

Find more information and references about using Amazon SageMaker Debugger in the following topics.

Topics

- Amazon SageMaker Debugger APIs
- Docker images for Debugger rules
- Amazon SageMaker Debugger exceptions
- Distributed training supported by Amazon SageMaker Debugger

Amazon SageMaker Debugger APIs

Amazon SageMaker Debugger has API operations in several locations that are used to implement its monitoring and analysis of model training.

Amazon SageMaker Debugger also provides the open source `sagemaker-debugger` Python SDK that is used to configure built-in rules, define custom rules, and register hooks to collect output tensor data from training jobs.

The Amazon SageMaker AI Python SDK is a high-level SDK focused on machine learning experimentation. The SDK can be used to deploy built-in or custom rules defined with the `SMDebug` Python library to monitor and analyze these tensors using SageMaker AI ModelTrainers.

Debugger has added operations and types to the Amazon SageMaker API that enable the platform to use Debugger when training a model and to manage the configuration of inputs and outputs.

- `CreateTrainingJob` and `UpdateTrainingJob` use the following Debugger APIs to configure tensor collections, rules, rule images, and profiling options:
  - `CollectionConfiguration`
  - `DebugHookConfig`
  - `DebugRuleConfiguration`
  - `TensorBoardOutputConfig`
  - `ProfilerConfig`
  - `ProfilerRuleConfiguration`
- `DescribeTrainingJob` provides a full description of a training job, including the following Debugger configurations and rule evaluation statuses:
  - `DebugHookConfig`
  - `DebugRuleConfiguration`
  - `DebugRuleEvaluationStatus`
  - `ProfilerConfig`
  - `ProfilerRuleConfiguration`
  - `ProfilerRuleEvaluationStatus`

The rule configuration API operations use the SageMaker Processing functionality when analyzing a model training. For more information about SageMaker Processing, see Data transformation workloads with SageMaker Processing.

Docker images for Debugger rules

Amazon SageMaker AI provides two sets of Docker images for rules: one set for evaluating rules provided by SageMaker AI (built-in rules) and one set for evaluating custom rules provided in Python source files.

If you use the Amazon SageMaker Python SDK, you can simply use SageMaker AI high-level Debugger API operations with SageMaker AI ModelTrainer API operations, without having to manually retrieve the Debugger Docker images and configure the `ConfigureTrainingJob`API.

If you are not using the SageMaker Python SDK, you have to retrieve a relevant pre-built container base image for the Debugger rules. Amazon SageMaker Debugger provides pre-built Docker images for built-in and custom rules, and the images are stored in Amazon Elastic Container Registry (Amazon ECR). To pull an image from an Amazon ECR repository (or to push an image to

one), use the full name registry URL of the image using the `CreateTrainingJob` API. SageMaker AI uses the following URL patterns for the Debugger rule container image registry address.

```
<account_id>.dkr.ecr.<Region>.amazonaws.com/<ECR repository name>:<tag>
```

For the account ID in each Amazon Region, the Amazon ECR repository name, and the tag value, see the following topics.

Amazon SageMaker Debugger exceptions

Amazon SageMaker Debugger is designed to be aware of that tensors required to execute a rule might not be available at every step. As a result, it raises a few exceptions, which enable you to control what happens when a tensor is missing. These exceptions are available in the smdebug.exceptions module. You can import them as follows:

```
from smdebug.exceptions import *
```

The following exceptions are available:

- `TensorUnavailableForStep` – The tensor requested is not available for the step. This might mean that this step might not be saved at all by the hook, or that this step might have saved some tensors but the requested tensor is not part of them. Note that when you see this exception, it means that this tensor can never become available for this step in the future. If the tensor has reductions saved for the step, it notifies you they can be queried.

- `TensorUnavailable` – This tensor is not being saved or has not been saved by the `smdebug` API. This means that this tensor is never seen for any step in `smdebug`.
- `StepUnavailable` – The step was not saved and Debugger has no data from the step.
- `StepNotYetAvailable` – The step has not yet been seen by `smdebug`. It might be available in the future if the training is still going on. Debugger automatically loads new data as it becomes available.
- `NoMoreData` – Raised when the training ends. Once you see this, you know that there are no more steps and no more tensors to be saved.
- `IndexReaderException` – The index reader is not valid.
- `InvalidWorker` – A worker was invoked that was not valid.
- `RuleEvaluationConditionMet` – Evaluation of the rule at the step resulted in the condition being met.
- `InsufficientInformationForRuleInvocation` – Insufficient information was provided to invoke the rule.

Distributed training supported by Amazon SageMaker Debugger

The following list shows the scope of validity and considerations for using Debugger on training jobs with deep learning frameworks and various distributed training options.

- **Horovod**

  Scope of validity of using Debugger for training jobs with Horovod

Deep Learning Framework	Apache MXNet	TensorFlow 1.x	TensorFlow 2.x	TensorFlow 2.x with Keras	PyTorch
Monitoring system bottlenecks	Yes	Yes	Yes	Yes	Yes
Profiling framework operations	No	No	No	Yes	Yes

Deep Learning Framework	Apache MXNet	TensorFlow 1.x	TensorFlow 2.x	TensorFlow 2.x with Keras	PyTorch
Debugging model output tensors	Yes	Yes	Yes	Yes	Yes

- **SageMaker AI distributed data parallel**

  Scope of validity of using Debugger for training jobs with SageMaker AI distributed data parallel

Deep Learning Framework	TensorFlow 2.x	TensorFlow 2.x with Keras	PyTorch
Monitoring system bottlenecks	Yes	Yes	Yes
Profiling framework operations	No*	No**	Yes
Debugging model output tensors	Yes	Yes	Yes

  * Debugger does not support framework profiling for TensorFlow 2.x.

  ** SageMaker AI distributed data parallel does not support TensorFlow 2.x with Keras implementation.

- **SageMaker AI distributed model parallel** – Debugger does not support SageMaker AI distributed model parallel training.
- **Distributed training with SageMaker AI checkpoints** – Debugger is not available for training jobs when both the distributed training option and SageMaker AI checkpoints are enabled. You might see an error that looks like the following:

```
SMDebug Does Not Currently Support Distributed Training Jobs With Checkpointing
 Enabled
```

To use Debugger for training jobs with distributed training options, you need to disable SageMaker AI checkpointing and add manual checkpointing functions to your training script. For more information about using Debugger with distributed training options and checkpoints, see Using SageMaker AI distributed data parallel with Amazon SageMaker Debugger and checkpoints and Saving Checkpoints.

- **Parameter Server** – Debugger does not support parameter server-based distributed training.
- Profiling distributed training framework operations, such as the `AllReduced` operation of SageMaker AI distributed data parallel and Horovod operations, is not available.

Access a training container through Amazon Systems Manager for remote debugging

You can securely connect to SageMaker training containers through Amazon Systems Manager (SSM). This gives you a shell-level access to debug training jobs that are running within the container. You can also log commands and responses that are streamed to Amazon CloudWatch. If you use your own Amazon Virtual Private Cloud (VPC) to train a model, you can use Amazon PrivateLink to set up a VPC endpoint for SSM and connect to containers privately through SSM.

You can connect to SageMaker AI Framework Containers or connect to your own training container set up with the SageMaker Training environment.

Set up IAM permissions

To enable SSM in your SageMaker training container, you need to set up an IAM role for the container. For you or users in your Amazon account to access the training containers through SSM, you need to set up IAM users with permissions to use SSM.

IAM role

For a SageMaker training container to start with the SSM agent, provide an IAM role with SSM permissions.

To enable remote debugging for your training job, SageMaker AI needs to start the SSM agent in the training container when the training job starts. To allow the SSM agent to communicate with the SSM service, add the following policy to the IAM role that you use to run your training job.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ssmmessages:CreateControlChannel",
                "ssmmessages:CreateDataChannel",
                "ssmmessages:OpenControlChannel",
                "ssmmessages:OpenDataChannel"
            ],
            "Resource": "*"
        }
    ]
 }
```

IAM user

Add the following policy to provide an IAM user with SSM session permissions to connect to an SSM target. In this case, the SSM target is a SageMaker training container.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ssm:StartSession",
                "ssm:TerminateSession"
            ],
            "Resource": "*"
        }
    ]
}
```

You can restrict IAM users to connect only to containers for specific training jobs by adding the `Condition` key, as shown in the following policy sample.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ssm:StartSession",
                "ssm:TerminateSession"
            ],
            "Resource": [
                "*"
            ],
            "Condition": {
                "StringLike": {
                    "ssm:resourceTag/aws:ssmmessages:target-id": [
                        "sagemaker-training-job:*"
                    ]
                }
            }
        }
    ]
}
```

You can also explicitly use the `sagemaker:EnableRemoteDebug` condition key to restrict remote debugging. The following is an example policy for IAM users to restrict remote debugging.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "DenyRemoteDebugInTrainingJob",
            "Effect": "Allow",
            "Action": [
```

```
                "sagemaker:CreateTrainingJob",
                "sagemaker:UpdateTrainingJob"
            ],
            "Resource": "*",
            "Condition": {
                "BoolIfExists": {
                    "sagemaker:EnableRemoteDebug": false
                }
            }
        }
    ]
}
```

For more information, see Condition keys for Amazon SageMaker AI in the *Amazon Service Authorization Reference*.

How to enable remote debugging for a SageMaker training job

In this section, learn how to enable remote debugging when starting or updating a training job in Amazon SageMaker AI.

SageMaker Python SDK

Using the ModelTrainer class in the SageMaker Python SDK, you can turn remote debugging on or off using the `enable_remote_debug` parameter or the `enable_remote_debug()` and `disable_remote_debug()` methods.

To enable remote debugging when you create a training job

To enable remote debugging when you create a new training job, set the `enable_remote_debug` parameter to `True`. The default value is `False`, so if you don't set this parameter at all, or you explicitly set it to `False`, remote debugging functionality is disabled.

```
from sagemaker.core.helper.session_helper import Session
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Compute

session = Session()

model_trainer = ModelTrainer(
    ...,
```

```
    sagemaker_session=session,
    training_image="<your_image_uri>", #must be owned by your organization or Amazon
 DLCs
    role=role,
    compute=Compute(
        instance_type="ml.m5.xlarge",
        instance_count=1,
    ),
    output_path=output_path,
    max_run=1800,
    enable_remote_debug=True
)
```

To enable remote debugging by updating a training job

Using the following ModelTrainer class methods, you can enable or disable remote debugging while a training job is running when the `SecondaryStatus` of the job is `Downloading` or `Training`.

```
# Enable RemoteDebug
model_trainer.enable_remote_debug()

# Disable RemoteDebug
model_trainer.disable_remote_debug()
```

Amazon SDK for Python (Boto3)

To enable remote debugging when you create a training job

To enable remote debugging when you create a new training job, set the value for the `EnableRemoteDebug` key to `True` in the `RemoteDebugConfig` parameter.

```
import boto3

sm = boto3.Session(region_name=region).client("sagemaker")

# Start a training job
sm.create_training_job(
    ...,
    TrainingJobName=job_name,
    AlgorithmSpecification={
        // Specify a training Docker container image URI
```

```
        // (Deep Learning Container or your own training container) to
 TrainingImage.
        "TrainingImage": "<your_image_uri>",
        "TrainingInputMode": "File"
    },
    RoleArn=iam_role_arn,
    OutputDataConfig=output_path,
    ResourceConfig={
        "InstanceType": "ml.m5.xlarge",
        "InstanceCount": 1,
        "VolumeSizeInGB": 30
    },
    StoppingCondition={
        "MaxRuntimeInSeconds": 86400
    },
    RemoteDebugConfig={
        "EnableRemoteDebug": True
    }
)
```

To enable remote debugging by updating a training job

Using the `update_traing_job` API, you can enable or disable remote debugging while a training job is running when the `SecondaryStatus` of the job is `Downloading` or `Training`.

```
# Update a training job
sm.update_training_job(
    TrainingJobName=job_name,
    RemoteDebugConfig={
        "EnableRemoteDebug": True     # True | False
    }
)
```

Amazon Command Line Interface (CLI)

To enable remote debugging when you create a training job

Prepare a `CreateTrainingJob` request file in JSON format, as follows.

```
// train-with-remote-debug.json
{
    "TrainingJobName": job_name,
```

```
    "RoleArn": iam_role_arn,
    "AlgorithmSpecification": {
        // Specify a training Docker container image URI (Deep Learning Container or
 your own training container) to TrainingImage.
        "TrainingImage": "<your_image_uri>",
        "TrainingInputMode": "File"
    },
    "OutputDataConfig": {
        "S3OutputPath": output_path
    },
    "ResourceConfig": {
        "InstanceType": "ml.m5.xlarge",
        "InstanceCount": 1,
        "VolumeSizeInGB": 30
    },
    "StoppingCondition": {
        "MaxRuntimeInSeconds": 86400
    },
    "RemoteDebugConfig": {
        "EnableRemoteDebug": True
    }
}
```

After saving the JSON file, run the following command in the terminal where you submit the training job. The following example command assumes that the JSON file is named `train-with-remote-debug.json`. If you run it from a Jupyter notebook, add an exclamation point (`!`) to the beginning of the line.

```
aws sagemaker create-training-job \
    --cli-input-json file://train-with-remote-debug.json
```

To enable remote debugging by updating a training job

Prepare an `UpdateTrainingJob` request file in JSON format, as follows.

```
// update-training-job-with-remote-debug-config.json
{
    "TrainingJobName": job_name,
    "RemoteDebugConfig": {
        "EnableRemoteDebug": True
    }
}
```

After saving the JSON file, run the following command in the terminal where you submit the training job. The following example command assumes that the JSON file is named `train-with-remote-debug.json`. If you run it from a Jupyter notebook, add an exclamation point (`!`) to the beginning of the line.

```
aws sagemaker update-training-job \
    --cli-input-json file://update-training-job-with-remote-debug-config.json
```

Access your training container

You can access a training container when the `SecondaryStatus` of the corresponding training job is `Training`. The following code examples demonstrate how to check the status of your training job using the `DescribeTrainingJob` API, how to check the training job logs in CloudWatch, and how to log in to the training container.

To check the status of a training job

SageMaker Python SDK

To check the `SecondaryStatus` of a training job, run the following SageMaker Python SDK code.

```
import sagemaker
from sagemaker.core.helper.session_helper import Session

session = Session()

# Describe the job status
training_job_info = session.describe_training_job(job_name)
print(training_job_info)
```

Amazon SDK for Python (Boto3)

To check the `SecondaryStatus` of a training job, run the following SDK for Python (Boto3) code.

```
import boto3

session = boto3.session.Session()
```

```
region = session.region_name
sm = boto3.Session(region_name=region).client("sagemaker")

# Describe the job status
sm.describe_training_job(TrainingJobName=job_name)
```

Amazon Command Line Interface (CLI)

To check the `SecondaryStatus` of a training job, run the following Amazon CLI command for SageMaker AI.

```
aws sagemaker describe-training-job \
    --training-job-name job_name
```

To find the host name of a training container

To connect to the training container through SSM, use this format for the target ID: `sagemaker-training-job:<training-job-name>_algo-<n>`, where `algo-<n>` is the name of the container host. If your job is running on a single instance, the host is always `algo-1`. If you run a distributed training job on multiple instances, SageMaker AI creates an equal number of hosts and log streams. For example, if you use 4 instances, SageMaker AI creates `algo-1`, `algo-2`, `algo-3`, and `algo-4`. You must determine which log stream you want to debug, and its host number. To access log streams that are associated with a training job, do the following.

1. Open the Amazon SageMaker AI console at https://console.amazonaws.cn/sagemaker/.
2. In the left navigation pane, choose **Training**, then choose **Training jobs**.
3. From the **Training jobs** list, choose the training job that you want to debug. The training job details page opens.
4. In the **Monitor** section, choose **View logs**. The related training job log stream list opens in the CloudWatch console.
5. Log stream names appear in `<training-job-name>/algo-<n>-<time-stamp>` format, with `algo-<n>` representing the host name.

To learn more about how SageMaker AI manages configuration information for multi-instance distributed training, see Distributed Training Configuration.

To access the training container

Use the following command in terminal to start the SSM session (`aws ssm start-session`) and connect to the training container.

```
aws ssm start-session --target sagemaker-training-job:<training-job-name>_algo-<n>
```

For example, if the training job name is `training-job-test-remote-debug` and the host name is `algo-1`, the target ID becomes `sagemaker-training-job:training-job-test-remote-debug_algo-1`. If the output of this command is similar to `Starting session with SessionId:xxxxx`, the connection is successful.

SSM access with Amazon PrivateLink

If your training containers run within a Amazon Virtual Private Cloud that is not connected to the public internet, you can use Amazon PrivateLink to enable SSM. Amazon PrivateLink restricts all network traffic between your endpoint instances, SSM, and Amazon EC2 to the Amazon network. For more information on how to setup SSM access with Amazon PrivateLink, see Set up an Amazon VPC endpoint for Session Manager.

Log SSM session commands and results

After following the instructions at Create a Session Manager preferences document (command line), you can create SSM documents that define your preferences for SSM sessions. You can use SSM documents to configure session options, including data encryption, session duration, and logging. For example, you can specify whether to store session log data in an Amazon Simple Storage Service (Amazon S3) bucket or in an Amazon CloudWatch Logs group. You can create documents that define general preferences for all sessions for an Amazon account and Amazon Web Services Region, or documents that define preferences for individual sessions.

Troubleshooting issues by checking error logs from SSM

Amazon SageMaker AI uploads errors from the SSM agent to your CloudWatch Logs in the `/aws/sagemaker/TrainingJobs` log group. SSM agent log streams are named in this format: `<job-name>/algo-<n>-<timestamp>/ssm`. For example, if you create a two-node training job named `training-job-test-remote-debug`, the training job log `training-job-test-remote-debug/algo-<n>-<timestamp>` and multiple SSM agent error logs `training-job-test-remote-debug/algo-<n>-<timestamp>/ssm` are uploaded to your CloudWatch Logs. In this example, you can review the `*/ssm` log streams to troubleshoot SSM issues.

```
training-job-test-remote-debug/algo-1-1680535238
```

```
training-job-test-remote-debug/algo-2-1680535238
training-job-test-remote-debug/algo-1-1680535238/ssm
training-job-test-remote-debug/algo-2-1680535238/ssm
```

Considerations

Consider the following when using SageMaker AI remote debugging.

- Remote debugging isn't supported for SageMaker AI algorithm containers or containers from SageMaker AI on Amazon Web Services Marketplace.
- You can't start an SSM session for containers that have network isolation enabled because the isolation prevents outbound network calls.

Release notes for debugging capabilities of Amazon SageMaker AI

See the following release notes to track the latest updates for debugging capabilities of Amazon SageMaker AI.

December 21, 2023

New features

Released a remote debugging functionality, a new debugging capability of SageMaker AI that gives you a shell-level access to training containers. With this release, you can debug training jobs by logging into the job containers running on SageMaker AI ML instances. To learn more, see the section called “Access a training container through SSM for remote debugging”.

September 7, 2023

New features

Added a new utility module `sagemaker.interactive_apps.tensorboard.TensorBoardApp` that provides a function called `get_app_url()`. The `get_app_url()` function generates unsigned or presigned URLs to open the TensorBoard application in any environment in SageMaker AI or Amazon EC2. This is to provide a unified experience for both Studio Classic and non-Studio Classic users. For the Studio Classic environment, you can open TensorBoard by running the `get_app_url()` function as it is, or you can also specify a job name to start tracking as the TensorBoard application opens. For non-Studio Classic environments, you can open TensorBoard by providing your domain information to the utility function. With this functionality, regardless of

where or how you run training code and launch training jobs, you can directly access TensorBoard by running the `get_app_url` function in your Jupyter notebook or terminal. This functionality is available in the SageMaker Python SDK v2.184.0 and later. For more information, see the section called "Accessing the TensorBoard application on SageMaker AI".

April 4, 2023

New features

Released SageMaker AI with TensorBoard, a capability that hosts TensorBoard on SageMaker AI. TensorBoard is available as an application through SageMaker AI domain, and the SageMaker AI Training platform supports TensorBoard output data collection to S3 and loading them automatically to the hosted TensorBoard on SageMaker AI. With this capability, you can run training jobs set up with TensorBoard summary writers in SageMaker AI, save the TensorBoard output files in Amazon S3, open the TensorBoard application directly from the SageMaker AI console, and load the output files using SageMaker AI Data Manager plugin implemented to the hosted TensorBoard interface. You don't need to install TensorBoard manually and host locally on the SageMaker AI IDEs or local machine. To learn more, see the section called "TensorBoard in SageMaker AI".

March 16, 2023

Deprecation notes

SageMaker Debugger deprecates the framework profiling feature starting from TensorFlow 2.11 and PyTorch 2.0. You can still use the feature in the previous versions of the frameworks and SDKs as follows.

- SageMaker Python SDK <= v2.130.0
- PyTorch >= v1.6.0, < v2.0
- TensorFlow >= v2.3.1, < v2.11

With the deprecation, SageMaker Debugger also discontinues support for the following three `ProfilerRules` for framework profiling.

- MaxInitializationTime
- OverallFrameworkMetrics
- StepOutlier

February 21, 2023

Other changes

- The XGBoost report tab has been removed from the SageMaker Debugger's profiler dashboard. You can still access the XGBoost report by downloading it as a Jupyter notebook or a HTML file. For more information, see SageMaker Debugger XGBoost Training Report.
- Starting from this release, the built-in profiler rules are not activated by default. To use the SageMaker Debugger profiler rules to detect certain computational problems, you need to add the rules when you configure a SageMaker training job launcher.

December 1, 2020

Amazon SageMaker Debugger launched deep profiling features at re:Invent 2020.

December 3, 2019

Amazon SageMaker Debugger initially launched at re:Invent 2019.

Profile and optimize computational performance

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

When training state-of-the-art deep learning models that rapidly grow in size, scaling the training job of such models to a large GPU cluster and identifying computational performance issues from billions and trillions of operations and communications in every iteration of the gradient descent process become a challenge.

SageMaker AI provides profiling tools to visualize and diagnose such complex computation issues arising from running training jobs on Amazon cloud computing resources. There are two profiling options that SageMaker AI offers: Amazon SageMaker Profiler and a resource utilzation monitor in Amazon SageMaker Studio Classic. See the following introductions of the two functionalities to gain quick insights and learn which one to use depending on your needs.

Amazon SageMaker Profiler

Amazon SageMaker Profiler is a profiling capability of SageMaker AI with which you can deep dive into compute resources provisioned while training deep learning models, and gain visibility into operation-level details. SageMaker Profiler provides Python modules for adding annotations throughout PyTorch or TensorFlow training scripts and activating SageMaker Profiler. You can access the modules through the SageMaker Python SDK and Amazon Deep Learning Containers.

With SageMaker Profiler, you can track all activities on CPUs and GPUs, such as CPU and GPU utilizations, kernel runs on GPUs, kernel launches on CPUs, sync operations, memory operations across CPUs and GPUs, latencies between kernel launches and corresponding runs, and data transfer between CPUs and GPUs.

SageMaker Profiler also offers a user interface (UI) that visualizes the *profile*, a statistical summary of profiled events, and the timeline of a training job for tracking and understanding the time relationship of the events between GPUs and CPUs.

To learn more about SageMaker Profiler, see the section called “SageMaker Profiler”.

Monitoring Amazon compute resources in Amazon SageMaker Studio Classic

SageMaker AI also provides a user interface in Studio Classic for monitoring resource utilization at high level, but with more granularity compared to the default utilization metrics collected from SageMaker AI to CloudWatch.

For any training job you run in SageMaker AI using the SageMaker Python SDK, SageMaker AI starts profiling basic resource utilization metrics, such as CPU utilization, GPU utilization, GPU memory utilization, network, and I/O wait time. It collects these resource utilization metrics every 500 milliseconds.

Compared to Amazon CloudWatch metrics, which collect metrics at intervals of 1 second, the monitoring functionality of SageMaker AI provides finer granularity into the resource utilization metrics down to 100-millisecond (0.1 second) intervals, so you can dive deep into the metrics at the level of an operation or a step.

To access the dashboard for monitoring the resource utilization metrics of a training job, see the SageMaker AI Debugger UI in SageMaker Studio Experiments.

Profiler availability change

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources.

Replacing Amazon SageMaker Profiler

If you are currently using SageMaker Profiler, follow this guidance to transition to alternative services.

Overview

Amazon SageMaker Profiler provided deep visibility into GPU and CPU activity during training, including kernel runs, kernel launches, sync operations, memory operations, and latencies between CPU-initiated launches and GPU kernel execution. This guide walks you through removing your existing Profiler configuration and adopting framework-native profilers, TensorBoard, and Amazon CloudWatch for training performance diagnostics.

For PyTorch and TensorFlow workloads, the combination of framework-native profilers and TensorBoard provides equivalent kernel-level visibility with direct integration into the open-source ecosystem. Amazon CloudWatch provides system-level resource monitoring with configurable alarms. Together, these tools offer alternatives to SageMaker Profiler's training performance diagnostics.

Capability mapping

Profiler capability	Replaced by
GPU kernel traces, CPU/GPU utilization, sync analysis, kernel launch-to-execution latency	PyTorch Profiler / TensorFlow Profiler + TensorBoard

Profiler capability	Replaced by
Data loader and input pipeline profiling	Framework Profilers + TensorBoard
System resource monitoring (CPU, GPU, memory, disk)	Amazon CloudWatch
Custom operation annotations	Framework Profiler annotations
Profiler UI timeline visualization	TensorBoard Profiler Plugin

Step 1: Remove Profiler configuration

Remove smprof annotations from your training script

If your training script uses the SageMaker Profiler Python modules (`smprof` or the older `smppy`), remove:

- `import smprof` (or `import smppy as smprof`)
- `SMProfiler.instance()`, `SMProf.configure()`, `SMProf.start_profiling()`, `SMProf.stop_profiling()`
- All `smprof.annotate()` context managers and `smprof.annotation_begin()` / `smprof.annotation_end()` calls

Remove ProfilerConfig from your training configuration

Remove the `profiler_config` parameter from your SageMaker training configuration:

```
# Remove this configuration
# V2
from sagemaker import ProfilerConfig, Profiler

profiler_config = ProfilerConfig(
    profile_params = Profiler(cpu_profiling_duration=3600)
)

# V3
from sagemaker.core.debugger.profiler_config import ProfilerConfig
from sagemaker.core.debugger.profiler import Profiler
```

Delete Profiler output in Amazon S3

SageMaker Profiler stored profile data under the `rule-output` path of your training job:

```
s3://<output-path>/<training-job-name>/rule-output/
```

Delete this prefix if you no longer need the historical profiling data. Your training job logs and model artifacts remain unaffected.

Remove SageMaker Profiler Python package (if manually installed)

If you added the `smprof` package to a `requirements.txt` or custom Docker container, remove any lines referencing `smppy.s3.amazonaws.com`.

Delete CloudWatch Log Groups (optional)

Check for CloudWatch log groups created by Profiler rule processing under `/aws/sagemaker/ProcessingJobs`. Delete these if no longer needed to reduce storage costs.

Review IAM policies

Remove IAM policies that granted permissions specifically for Profiler usage:

- `s3:GetObject` / `s3:PutObject` scoped to Profiler rule-output paths
- Roles attached to training jobs solely for Profiler support

Retain any policies still needed for your training jobs or CloudWatch monitoring.

Disable dependent automation

Update or delete any automation that consumed Profiler output:

- Step Functions workflows that processed Profiler data
- Amazon EventBridge rules triggered by Profiler output
- Post-training processors that read from Profiler S3 paths

Step 2: Configure replacements

Enable framework-level profiling

Update your training script to use your framework's built-in profiler. Both PyTorch and TensorFlow profilers integrate directly with TensorBoard for visualization, including timeline views, kernel statistics, and performance recommendations.

PyTorch:

```
import torch
from torch.profiler import profile, schedule, tensorboard_trace_handler

with profile(
    activities=[torch.profiler.ProfilerActivity.CPU,
 torch.profiler.ProfilerActivity.CUDA],
    schedule=schedule(wait=1, warmup=1, active=3, repeat=1),
    on_trace_ready=tensorboard_trace_handler("./tensorboard/logs"),
    record_shapes=True,
    profile_memory=True,
    with_stack=True
) as prof:
    for step, batch in enumerate(train_loader):
        inputs, labels = batch
        outputs = model(inputs)
        loss = criterion(outputs, labels)
        loss.backward()
        optimizer.step()
        prof.step()
```

To annotate specific operations (replacing `smprof.annotate()`):

```
with torch.profiler.record_function("forward_pass"):
    outputs = model(inputs)

with torch.profiler.record_function("backward_pass"):
    loss.backward()
```

TensorFlow:

```
import tensorflow as tf
```

```
tf.profiler.experimental.start("./tensorboard/logs")
model.fit(train_dataset, epochs=5)
tf.profiler.experimental.stop()
```

> **Note**
>
> As with SageMaker Profiler, profiling an entire training job is not recommended. Profile a representative subset of steps (up to a few hundred) to minimize overhead.

Visualize with TensorBoard

Launch TensorBoard to view profiling results, execution timelines, and performance recommendations:

```
tensorboard --logdir=./tensorboard/logs
```

The TensorBoard Profiler Plugin provides GPU kernel timelines equivalent to the SageMaker Profiler UI, along with kernel statistics, execution summaries, input pipeline analysis, and performance recommendations. For managed TensorBoard in SageMaker AI, refer to TensorBoard in Amazon SageMaker AI. Managed TensorBoard requires a SageMaker Domain and is available in select regions.

Use Amazon CloudWatch for system monitoring and alerts

Amazon CloudWatch captures resource utilization metrics for your training jobs, including CPU, GPU, memory, and disk, in real time, with support for configurable alarms to detect resource bottlenecks, underutilization, or unexpected spikes, and dashboards combining system metrics across training runs. For detailed steps, refer to Amazon CloudWatch Metrics for Monitoring and Analyzing Training Jobs. Alternatively, you can log system performance metrics from your training script directly to MLflow for unified tracking alongside your experiment metrics.

What happens to your existing data

- **Training logs and artifacts in S3** – Your training job output and model artifacts remain accessible. These are independent of Profiler.
- **Profiler trace data** – Historical profiling data remains in S3 under `rule-output/` until you delete it.

- **CloudWatch metrics** – Historical system metrics already in CloudWatch are retained per your account's retention settings.

Amazon SageMaker Profiler

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

Amazon SageMaker Profiler is currently in preview release and available at no cost in supported Amazon Web Services Regions. The generally available version of Amazon SageMaker Profiler (if any) may include features and pricing that are different than those offered in preview.

Amazon SageMaker Profiler is a capability of Amazon SageMaker AI that provides a detailed view into the Amazon compute resources provisioned during training deep learning models on SageMaker AI. It focuses on profiling the CPU and GPU usage, kernel runs on GPUs, kernel launches on CPUs, sync operations, memory operations across CPUs and GPUs, latencies between kernel launches and corresponding runs, and data transfer between CPUs and GPUs. SageMaker Profiler also offers a user interface (UI) that visualizes the *profile*, a statistical summary of profiled events, and the timeline of a training job for tracking and understanding the time relationship of the events between GPUs and CPUs.

> **Note**
>
> SageMaker Profiler supports PyTorch and TensorFlow and is available in Amazon Deep Learning Containers for SageMaker AI. To learn more, see the section called “Supported framework images, Amazon Web Services Regions, and instance types”.

For data scientists

Training deep learning models on a large compute cluster often has computational optimization problems, such as bottlenecks, kernel launch latencies, memory limit, and low resource utilization.

To identify such computational performance issues, you need to profile deeper into the compute resources to understand which kernels introduce latencies and which operations cause bottlenecks. Data scientists can take the benefit from using the SageMaker Profiler UI for visualizing the detailed profile of training jobs. The UI provides a dashboard furnished with summary charts and a timeline interface to track every event on the compute resources. Data scientists can also add custom annotations to track certain parts of the training job using the SageMaker Profiler Python modules.

For administrators

Through the Profiler landing page in the SageMaker AI console or SageMaker AI domain, you can manage the Profiler application users if you are an administrator of an Amazon account or SageMaker AI domain. Each domain user can access their own Profiler application given the granted permissions. As a SageMaker AI domain administrator and domain user, you can create and delete the Profiler application given the permission level you have.

Topics

- Supported framework images, Amazon Web Services Regions, and instance types
- Prerequisites for SageMaker Profiler
- Prepare and run a training job with SageMaker Profiler
- Open the SageMaker Profiler UI application

- Troubleshooting for SageMaker Profiler

Supported framework images, Amazon Web Services Regions, and instance types

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

This feature supports the following machine learning frameworks and Amazon Web Services Regions.

> **Note**
>
> To use this feature, make sure that you have installed the SageMaker Python SDK version 2.180.0 or later.

SageMaker AI framework images pre-installed with SageMaker Profiler

SageMaker Profiler is pre-installed in the following Amazon Deep Learning Containers for SageMaker AI.

PyTorch images

PyTorch versions	Amazon DLC image URI
2.2.0	*763104351884* .dkr.ecr.*<region>*.amazonaws.com/pytorch-training:2.2.0-gpu-py310-cu121-ubuntu20.04-sagemaker
2.1.0	*763104351884* .dkr.ecr.*<region>*.amazonaws.com/pytorch-training:2.1.0-gpu-py310-cu121-ubuntu20.04-sagemaker
2.0.1	*763104351884* .dkr.ecr.*<region>*.amazonaws.com/pytorch-training:2.0.1-gpu-py310-cu118-ubuntu20.04-sagemaker *763104351884* .dkr.ecr.*<region>*.amazonaws.com/pytorch-training:2.0.1-gpu-py310-cu121-ubuntu20.04-sagemaker
1.13.1	*763104351884* .dkr.ecr.*<region>*.amazonaws.com/pytorch-training:1.13.1-gpu-py39-cu117-ubuntu20.04-sagemaker

TensorFlow images

TensorFlow versions	Amazon DLC image URI
2.13.0	*763104351884* .dkr.ecr.*<region>*.amazonaws.com/tensorflow-training:2.13.0-gpu-py310-cu118-ubuntu20.04-sagemaker
2.12.0	*763104351884* .dkr.ecr.*<region>*.amazonaws.com/tensorflow-training:2.12.0-gpu-py310-cu118-ubuntu20.04-sagemaker
2.11.0	*763104351884* .dkr.ecr.*<region>*.amazonaws.com/tensorflow-training:2.11.0-gpu-py39-cu112-ubuntu20.04-sagemaker

Important

Distribution and maintenance of the framework containers in the preceding tables are under the Framework Support Policy managed by the Amazon Deep Learning Containers service. We highly recommend you to upgrade to the currently supported framework versions, if you are using prior framework versions that are no longer supported.

Note

If you want to use SageMaker Profiler for other framework images or your own Docker images, you can install SageMaker Profiler using the SageMaker Profiler Python package binary files provided in the following section.

SageMaker Profiler Python package binary files

If you want to configure your own Docker container, use SageMaker Profiler in other pre-built containers for PyTorch and TensorFlow, or install the SageMaker Profiler Python package locally, use one the following binary files. Depending on the Python and CUDA versions in your environment, choose one of the following.

PyTorch

- Python3.8, CUDA 11.3: https://smppy.s3.amazonaws.com/pytorch/cu113/smprof-0.3.334-cp38-cp38-linux_x86_64.whl
- Python3.9, CUDA 11.7: https://smppy.s3.amazonaws.com/pytorch/cu117/smprof-0.3.334-cp39-cp39-linux_x86_64.whl
- Python3.10, CUDA 11.8: https://smppy.s3.amazonaws.com/pytorch/cu118/smprof-0.3.334-cp310-cp310-linux_x86_64.whl
- Python3.10, CUDA 12.1: https://smppy.s3.amazonaws.com/pytorch/cu121/smprof-0.3.334-cp310-cp310-linux_x86_64.whl

TensorFlow

- Python3.9, CUDA 11.2: https://smppy.s3.amazonaws.com/tensorflow/cu112/smprof-0.3.334-cp39-cp39-linux_x86_64.whl
- Python3.10, CUDA 11.8: https://smppy.s3.amazonaws.com/tensorflow/cu118/smprof-0.3.334-cp310-cp310-linux_x86_64.whl

For more information about how to install SageMaker Profiler using the binary files, see the section called “(Optional) Install the SageMaker Profiler Python package”.

Supported Amazon Web Services Regions

SageMaker Profiler is available in the following Amazon Web Services Regions.

- US East (N. Virginia) (`us-east-1`)
- US East (Ohio) (`us-east-2`)
- US West (Oregon) (`us-west-2`)
- Europe (Frankfurt) (`eu-central-1`)
- Europe (Ireland) (`eu-west-1`)

Supported instance types

SageMaker Profiler supports profiling of training jobs on the following instance types.

CPU and GPU profiling

- `ml.g4dn.12xlarge`
- `ml.g5.24xlarge`
- `ml.g5.48xlarge`
- `ml.p3dn.24xlarge`
- `ml.p4de.24xlarge`
- `ml.p4d.24xlarge`
- `ml.p5.48xlarge`

GPU profiling only

- `ml.g5.2xlarge`
- `ml.g5.4xlarge`
- `ml.g5.8xlarge`
- `ml.g5.16.xlarge`

Prerequisites for SageMaker Profiler

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

The following list shows the prerequisites to start using SageMaker Profiler.

- A SageMaker AI domain set up with Amazon VPC in your Amazon account.

  For instructions on setting up a domain, see Onboard to Amazon SageMaker AI domain using quick setup. You also need to add domain user profiles for individual users to access the Profiler UI application. For more information, see Add user profiles.
- The following list is the minimum set of permissions for using the Profiler UI application.
  - `sagemaker:CreateApp`
  - `sagemaker:DeleteApp`

- `sagemaker:DescribeTrainingJob`
- `sagemaker:Search`
- `s3:GetObject`
- `s3:ListBucket`

Prepare and run a training job with SageMaker Profiler

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

Setting up to running a training job with the SageMaker Profiler consists of two steps: adapting the training script and configuring the SageMaker training job launcher.

Topics

- Step 1: Adapt your training script using the SageMaker Profiler Python modules
- Step 2: Create a SageMaker AI ModelTrainer and activate SageMaker Profiler
- (Optional) Install the SageMaker Profiler Python package

Step 1: Adapt your training script using the SageMaker Profiler Python modules

To start capturing kernel runs on GPUs while the training job is running, modify your training script using the SageMaker Profiler Python modules. Import the library and add the `start_profiling()` and `stop_profiling()` methods to define the beginning and the end of profiling. You can also use optional custom annotations to add markers in the training script to visualize hardware activities during particular operations in each step.

Note that the annotators extract operations from GPUs. For profiling operations in CPUs, you don't need to add any additional annotations. CPU profiling is also activated when you specify the profiling configuration, which you'll practice in the section called "Step 2: Create a SageMaker AI ModelTrainer and activate SageMaker Profiler".

Note

Profiling an entire training job is not the most efficient use of resources. We recommend profiling at most 300 steps of a training job.

Important

The release on December 14, 2023 involves a breaking change. The SageMaker Profiler Python package name is changed from `smppy` to `smprof`. This is effective in the SageMaker AI Framework Containers for TensorFlow v2.12 and later.
If you use one of the previous versions of the SageMaker AI Framework Containers such TensorFlow v2.11.0, the SageMaker Profiler Python package is still available as `smppy`. If you are uncertain about which version or the package name you should use, replace the import statement of the SageMaker Profiler package with the following code snippet.

```
try:
    import smprof
except ImportError:
    # backward-compatability for TF 2.11 and PT 1.13.1 images
    import smppy as smprof
```

Approach 1. Use the context manager `smprof.annotate` to annotate full functions

You can wrap full functions with the `smprof.annotate()` context manager. This wrapper is recommended if you want to profile by functions instead of code lines. The following example script shows how to implement the context manager to wrap the training loop and full functions in each iteration.

```
import smprof

SMProf = smprof.SMProfiler.instance()
config = smprof.Config()
config.profiler = {
    "EnableCuda": "1",
}
SMProf.configure(config)
SMProf.start_profiling()
```

```
for epoch in range(args.epochs):
    if world_size > 1:
        sampler.set_epoch(epoch)
    tstart = time.perf_counter()
    for i, data in enumerate(trainloader, 0):
        with smprof.annotate("step_"+str(i)):
            inputs, labels = data
            inputs = inputs.to("cuda", non_blocking=True)
            labels = labels.to("cuda", non_blocking=True)

            optimizer.zero_grad()

            with smprof.annotate("Forward"):
                outputs = net(inputs)
            with smprof.annotate("Loss"):
                loss = criterion(outputs, labels)
            with smprof.annotate("Backward"):
                loss.backward()
            with smprof.annotate("Optimizer"):
                optimizer.step()

SMProf.stop_profiling()
```

Approach 2. Use `smprof.annotation_begin()` and `smprof.annotation_end()` to annotate specific code line in functions

You can also define annotations to profile specific code lines. You can set the exact starting point and end point of profiling at the level of individual code lines, not by the functions. For example, in the following script, the `step_annotator` is defined at the beginning of each iteration and ends at the end of the iteration. Meanwhile, other detailed annotators for each operations are defined and wrap around the target operations throughout each iteration.

```
import smprof

SMProf = smprof.SMProfiler.instance()
config = smprof.Config()
config.profiler = {
    "EnableCuda": "1",
}
SMProf.configure(config)
SMProf.start_profiling()
```

```
for epoch in range(args.epochs):
    if world_size > 1:
        sampler.set_epoch(epoch)
    tstart = time.perf_counter()
    for i, data in enumerate(trainloader, 0):
        step_annotator = smprof.annotation_begin("step_" + str(i))

        inputs, labels = data
        inputs = inputs.to("cuda", non_blocking=True)
        labels = labels.to("cuda", non_blocking=True)
        optimizer.zero_grad()

        forward_annotator = smprof.annotation_begin("Forward")
        outputs = net(inputs)
        smprof.annotation_end(forward_annotator)

        loss_annotator = smprof.annotation_begin("Loss")
        loss = criterion(outputs, labels)
        smprof.annotation_end(loss_annotator)

        backward_annotator = smprof.annotation_begin("Backward")
        loss.backward()
        smprof.annotation_end(backward_annotator)

        optimizer_annotator = smprof.annotation_begin("Optimizer")
        optimizer.step()
        smprof.annotation_end(optimizer_annotator)

        smprof.annotation_end(step_annotator)

SMProf.stop_profiling()
```

After annotating and setting up the profiler initiation modules, save the script to submit using a SageMaker training job launcher in the following Step 2. The sample launcher assumes that the training script is named `train_with_profiler_demo.py`.

Step 2: Create a SageMaker AI ModelTrainer and activate SageMaker Profiler

The following procedure shows how to prepare a SageMaker AI ModelTrainer for training using the SageMaker Python SDK.

1. Set up a `profiler_config` object using the `ProfilerConfig` and `Profiler` modules as follows.

```
from sagemaker import ProfilerConfig, Profiler
profiler_config = ProfilerConfig(
    profile_params = Profiler(cpu_profiling_duration=3600)
)
```

The following is the description of the `Profiler` module and its argument.

- `Profiler`: The module for activating SageMaker Profiler with the training job.
  - `cpu_profiling_duration` (int): Specify the time duration in seconds for profiling on CPUs. Default is 3600 seconds.

2. Create a SageMaker AI ModelTrainer with the `profiler_config` object created in the previous step. The following code shows an example of creating a PyTorch ModelTrainer. If you want to create a TensorFlow ModelTrainer, import `sagemaker.tensorflow.TensorFlow` instead, and specify one of the TensorFlow versions supported by SageMaker Profiler. For more information about supported frameworks and instance types, see the section called "SageMaker AI framework images pre-installed with SageMaker Profiler".

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import SourceCode
from sagemaker.core.helper.session_helper import get_execution_role
from sagemaker.core import image_uris

training_image = image_uris.retrieve(
    framework="pytorch", region=region, version="2.0.0",
    image_scope="training", instance_type=ml.p4d.24xlarge
)

model_trainer = ModelTrainer(
    training_image=training_image,
    role=get_execution_role(),
    source_code=SourceCode(entry_script="train_with_profiler_demo.py",
 source_dir=source_dir), # your training job entry point
    output_path=output_path,
    base_job_name="sagemaker-profiler-demo",
    hyperparameters=hyperparameters, # if any
    instance_count=1, # Recommended to test with < 8
    instance_type=ml.p4d.24xlarge,
    profiler_config=profiler_config
)
```

3. Start the training job by running the `train` method. With `wait=False`, you can silence the training job logs and let it run in the background.

```
model_trainer.train(wait=False)
```

While running the training job or after the job has completed, you can go to the next topic at the section called "Open the SageMaker Profiler UI application" and start exploring and visualizing the saved profiles.

If you want to directly access the profile data saved in the Amazon S3 bucket, use the following script to retrieve the S3 URI.

```
import os
# This is an ad-hoc function to get the S3 URI
# to where the profile output data is saved
def get_detailed_profiler_output_uri(model_trainer):
    config_name = None
    for processing in model_trainer.profiler_rule_configs:
        params = processing.get("RuleParameters", dict())
        rule = config_name = params.get("rule_to_invoke", "")
        if rule == "DetailedProfilerProcessing":
            config_name = processing.get("RuleConfigurationName")
            break
    return os.path.join(
        model_trainer.output_path,
        model_trainer.latest_training_job.name,
        "rule-output",
        config_name,
    )

print(
    f"Profiler output S3 bucket: ",
    get_detailed_profiler_output_uri(model_trainer)
)
```

(Optional) Install the SageMaker Profiler Python package

To use SageMaker Profiler on PyTorch or TensorFlow framework images not listed in the section called "SageMaker AI framework images pre-installed with SageMaker Profiler", or on your own custom Docker container for training, you can install SageMaker Profiler by using one of the the section called "SageMaker Profiler Python package binary files".

Option 1: Install the SageMaker Profiler package while launching a training job

If you want to use SageMaker Profiler for training jobs using PyTorch or TensorFlow images not listed in the section called "SageMaker AI framework images pre-installed with SageMaker Profiler", create a `requirements.txt` file and locate it under the path you specify to the `source_dir` parameter of the SageMaker AI ModelTrainer in Step 2. For more information about setting up a `requirements.txt` file in general, see Using third-party libraries in the *SageMaker Python SDK documentation*. In the `requirements.txt` file, add one of the S3 bucket paths for the the section called "SageMaker Profiler Python package binary files".

```
# requirements.txt
https://smppy.s3.amazonaws.com/tensorflow/cu112/smprof-0.3.332-cp39-cp39-
linux_x86_64.whl
```

Option 2: Install the SageMaker Profiler package in your custom Docker containers

If you use a custom Docker container for training, add one of the the section called "SageMaker Profiler Python package binary files" to your Dockerfile.

```
# Install the smprof package version compatible with your CUDA version
RUN pip install https://smppy.s3.amazonaws.com/tensorflow/cu112/smprof-0.3.332-cp39-
cp39-linux_x86_64.whl
```

For guidance on running a custom Docker container for training on SageMaker AI in general, see Adapting your own training container.

Open the SageMaker Profiler UI application

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

You can access the SageMaker Profiler UI application through the following options.

Topics

- Option 1: Launch the SageMaker Profiler UI from the domain details page
- Option 2: Launch the SageMaker Profiler UI application from the SageMaker Profiler landing page in the SageMaker AI console
- Option 3: Use the application launcher function in the SageMaker AI Python SDK

Option 1: Launch the SageMaker Profiler UI from the domain details page

If you have access to the SageMaker AI console, you can take this option.

Navigate to the domain details page

The following procedure shows how to navigate to the domain details page.

1. Open the Amazon SageMaker AI console at https://console.aws.amazon.com/sagemaker/.
2. On the left navigation pane, choose **domains**.
3. From the list of domains, select the domain in which you want to launch the SageMaker Profiler application.

Launch the SageMaker Profiler UI application

The following procedure shows how to launch the SageMaker Profiler application that is scoped to a user profile.

1. On the domain details page, choose the **User profiles** tab.
2. Identify the user profile for which you want to launch the SageMaker Profiler UI application.
3. Choose **Launch** for the selected user profile, and choose **Profiler**.

Option 2: Launch the SageMaker Profiler UI application from the SageMaker Profiler landing page in the SageMaker AI console

The following procedure describes how to launch the SageMaker Profiler UI application from the SageMaker Profiler landing page in the SageMaker AI console. If you have access to the SageMaker AI console, you can take this option.

1. Open the Amazon SageMaker AI console at https://console.aws.amazon.com/sagemaker/.
2. On the left navigation pane, choose **Profiler**.

3. Under **Get started**, select the domain in which you want to launch the Studio Classic application. If your user profile only belongs to one domain, you do not see the option for selecting a domain.
4. Select the user profile for which you want to launch the SageMaker Profiler UI application. If there is no user profile in the domain, choose **Create user profile**. For more information about creating a new user profile, see Add user profiles.
5. Choose **Open Profiler**.

Option 3: Use the application launcher function in the SageMaker AI Python SDK

If you are a SageMaker AI domain user and have access only to SageMaker Studio, you can access the SageMaker Profiler UI application through SageMaker Studio Classic by running the `sagemaker.interactive_apps.detail_profiler_app.DetailProfilerApp` function.

Note that SageMaker Studio Classic is the previous Studio UI experience before re:Invent 2023, and is migrated as an application into a newly designed Studio UI at re:Invent 2023. The SageMaker Profiler UI application is available at SageMaker AI domain level, and thus requires your domain ID and user profile name. Currently, the `DetailedProfilerApp` function only works within the SageMaker Studio Classic application; the function properly takes in the domain and user profile information from SageMaker Studio Classic.

For domain, domain users, and Studio created before re:Invent 2023, Studio Classic would be the default experience unless you have updated it following the instructions at Migrating from Amazon SageMaker Studio Classic. If this is your case, there's no further action needed, and you can directly launch the SageMaker Profiler UI application by running the `DetailProfilerApp` funciton.

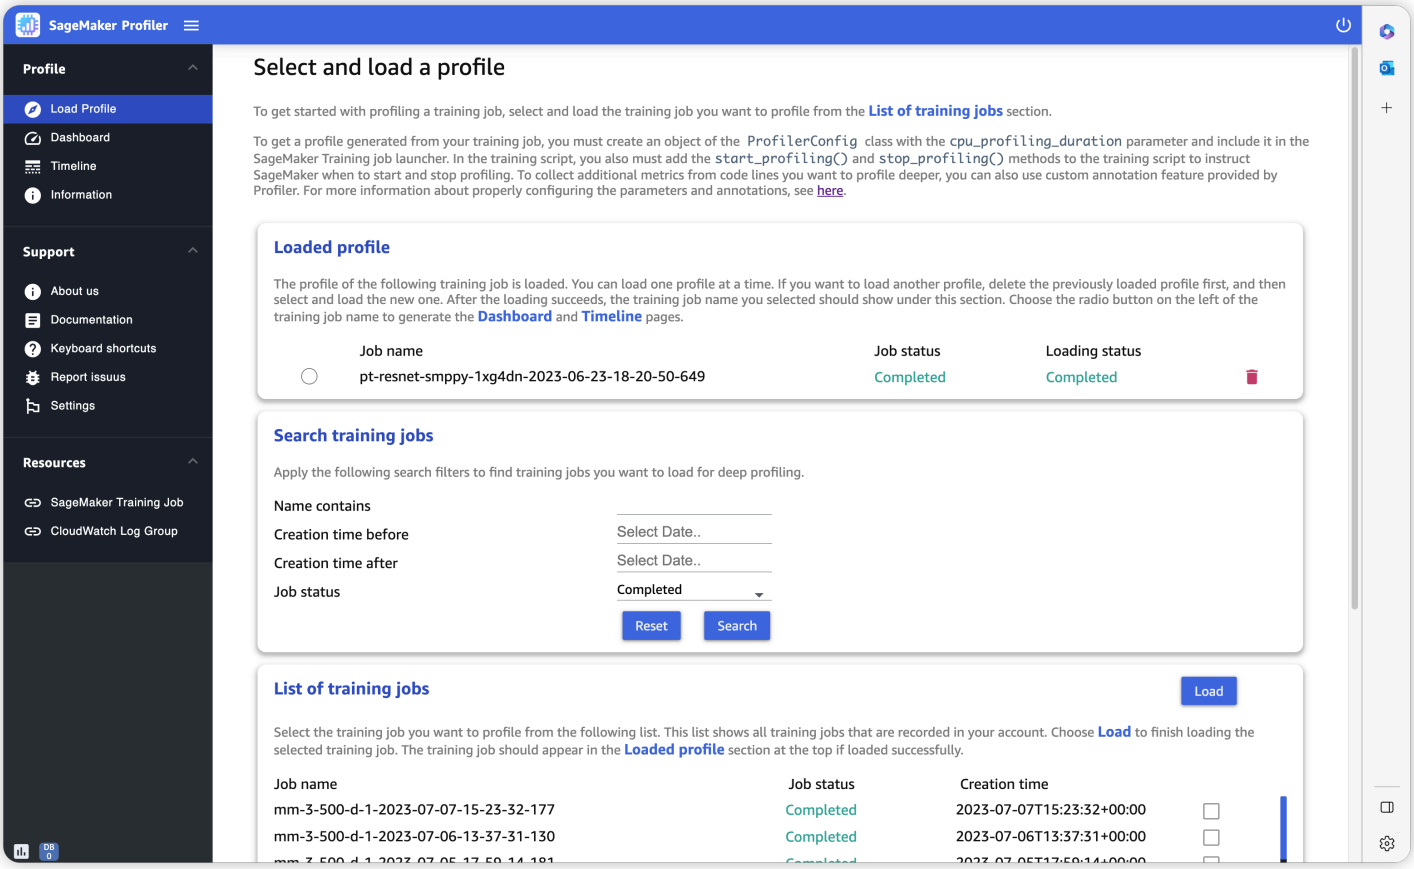
If you created a new domain and Studio after re:Invent 2023, launch the Studio Classic application within the Studio UI and then run the `DetailProfilerApp` function to launch the SageMaker Profiler UI application.

Note that the `DetailedProfilerApp` function doesn't work in other SageMaker AI machine learning IDEs, such as the SageMaker Studio JupyterLab application, the SageMaker Studio Code Editor application, and SageMaker Notebook instances. If you run the `DetailedProfilerApp` function in those IDEs, it returns a URL to the Profiler landing page in the SageMaker AI console, instead of a direct link to open the Profiler UI application.

Explore the profile output data visualized in the SageMaker Profiler UI

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

This section walks through the SageMaker Profiler UI and provides tips for how to use and gain insights from it.



Load profile

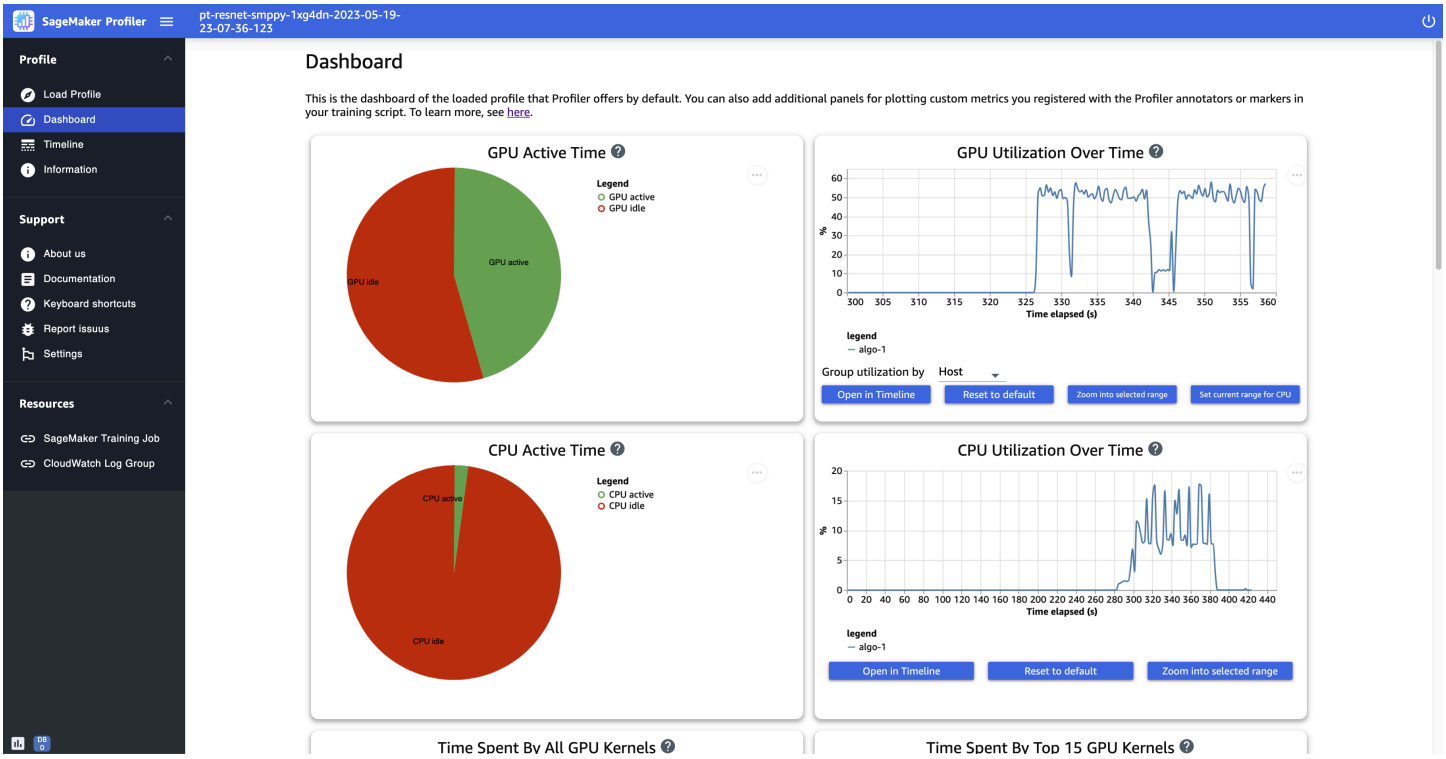
When you open the SageMaker Profiler UI, the **Load profile** page opens up. To load and generate the **Dashboard** and **Timeline**, go through the following procedure.

To load the profile of a training job

1. From the **List of training jobs** section, use the check box to choose the training job for which you want to load the profile.
2. Choose **Load**. The job name should appear in the **Loaded profile** section at the top.
3. Choose the radio button on the left of the **Job name** to generate the **Dashboard** and **Timeline**. Note that when you choose the radio button, the UI automatically opens the **Dashboard**. Note also that if you generate the visualizations while the job status and loading status still appear to be in progress, the SageMaker Profiler UI generates **Dashboard** plots and a **Timeline** up to the most recent profile data collected from the ongoing training job or the partially loaded profile data.

> **Tip**
>
> You can load and visualize one profile at a time. To load another profile, you must first unload the previously loaded profile. To unload a profile, use the trash bin icon on the right end of the profile in the **Loaded profile** section.

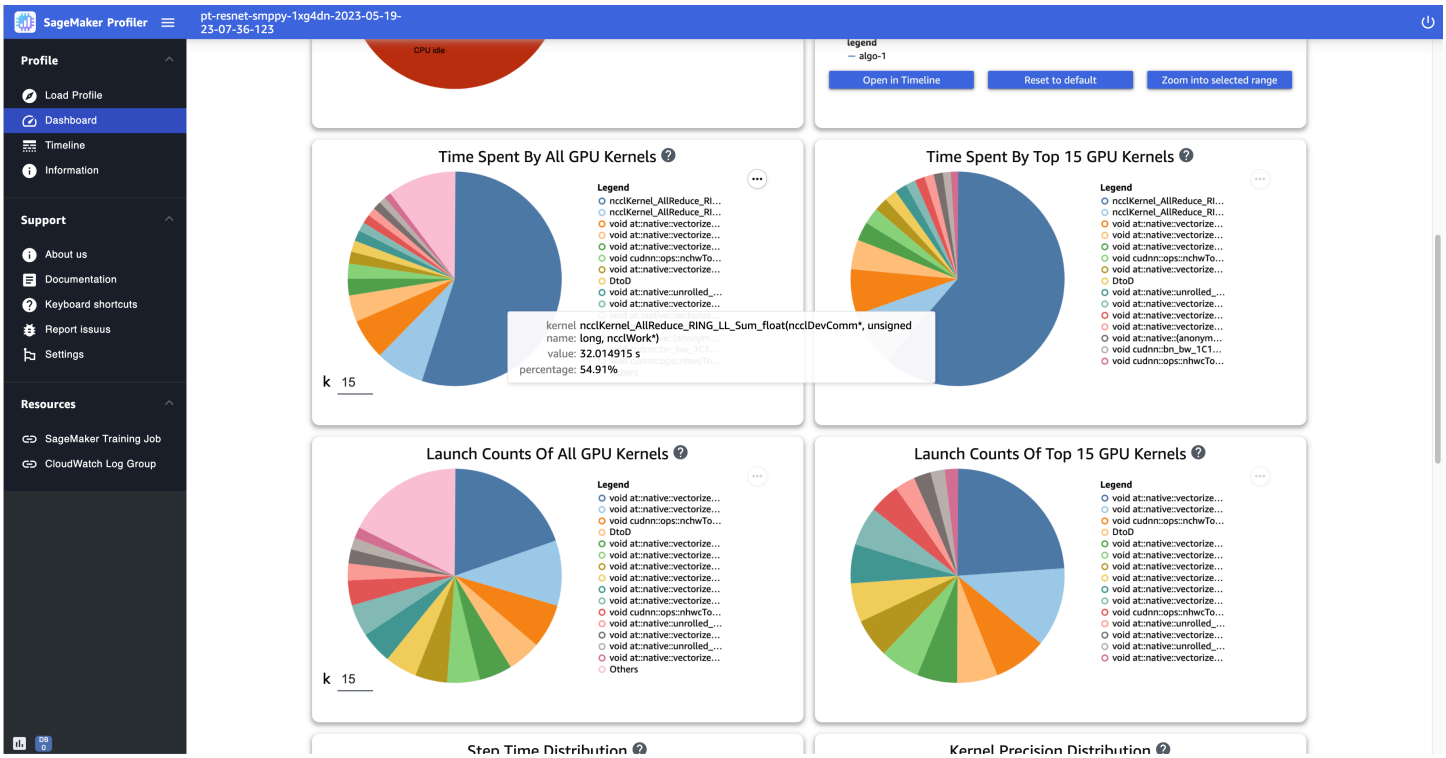
Dashboard



After you finish loading and selecting the training job, the UI opens the **Dashboard** page furnished with the following panels by default.

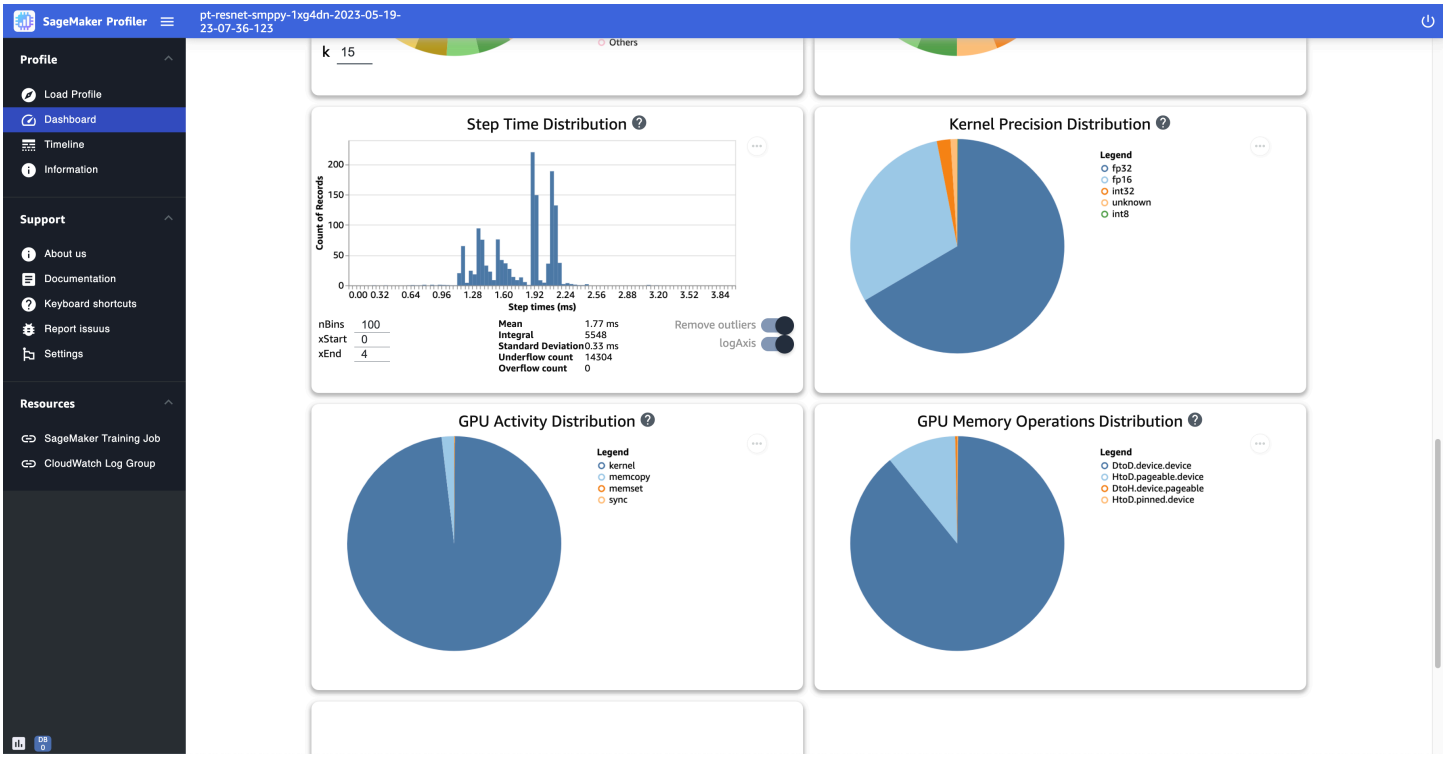
- **GPU active time** – This pie chart shows the percentage of GPU active time versus GPU idle time. You can check if your GPUs are more active than idle throughout the entire training job. GPU active time is based on the profile data points with a utilization rate greater than 0%, whereas GPU idle time is the profiled data points with 0% utilization.
- **GPU utilization over time** – This timeline graph shows the average GPU utilization rate over time per node, aggregating all of the nodes in a single chart. You can check if the GPUs have an unbalanced workload, under-utilization issues, bottlenecks, or idle issues during certain time intervals. To track the utilization rate at the individual GPU level and related kernel runs, use the the section called “Timeline interface”. Note that the GPU activity collection starts from where you added the profiler starter function `SMProf.start_profiling()` in your training script, and stops at `SMProf.stop_profiling()`.

- **CPU active time** – This pie chart shows the percentage of CPU active time versus CPU idle time. You can check if your CPUs are more active than idle throughout the entire training job. CPU active time is based on the profiled data points with a utilization rate greater than 0%, whereas CPU idle time is the profiled data points with 0% utilization.
- **CPU utilization over time** – This timeline graph shows the average CPU utilization rate over time per node, aggregating all of the nodes in a single chart. You can check if the CPUs are bottlenecked or underutilized during certain time intervals. To track the utilization rate of the CPUs aligned with the individual GPU utilization and kernel runs, use the the section called "Timeline interface". Note that the utilization metrics start from the start from the job initialization.
- **Time spent by all GPU kernels** – This pie chart shows all GPU kernels operated throughout the training job. It shows the top 15 GPU kernels by default as individual sectors and all other kernels in one sector. Hover over the sectors to see more detailed information. The value shows the total time of the GPU kernels operated in seconds, and the percentage is based on the entire time of the profile.
- **Time spent by top 15 GPU kernels** – This pie chart shows all GPU kernels operated throughout the training job. It shows the top 15 GPU kernels as individual sectors. Hover over the sectors to see more detailed information. The value shows the total time of the GPU kernels operated in seconds, and the percentage is based on the entire time of the profile.
- **Launch counts of all GPU kernels** – This pie chart shows the number of counts for every GPU kernel launched throughout the training job. It shows the top 15 GPU kernels as individual sectors and all other kernels in one sector. Hover over the sectors to see more detailed information. The value shows the total count of the launched GPU kernels, and the percentage is based on the entire count of all kernels.
- **Launch counts of top 15 GPU kernels** – This pie chart shows the number of counts of every GPU kernel launched throughout the training job. It shows the top 15 GPU kernels. Hover over the sectors to see more detailed information. The value shows the total count of the launched GPU kernels, and the percentage is based on the entire count of all kernels.
- **Step time distribution** – This histogram shows the distribution of step durations on GPUs. This plot is generated only after you add the step annotator in your training script.
- **Kernel precision distribution** – This pie chart shows the percentage of time spent on running kernels in different data types such as FP32, FP16, INT32, and INT8.
- **GPU activity distribution** – This pie chart shows the percentage of time spent on GPU activities, such as running kernels, memory (`memcpy` and `memset`), and synchronization (`sync`).



- **GPU memory operations distribution** – This pie chart shows the percentage of time spent on GPU memory operations. This visualizes the `memcopy` activities and helps identify if your training job is spending excessive time on certain memory operations.
- **Create a new histogram** – Create a new diagram of a custom metric you annotated manually during the section called "Step 1: Adapt your training script using the SageMaker Profiler Python modules". When adding a custom annotation to a new histogram, select or type the name of the annotation you added in the training script. For example, in the demo training script in Step 1, `step`, `Forward`, `Backward`, `Optimize`, and `Loss` are the custom annotations. While creating a new histogram, these annotation names should appear in the drop-down menu for metric selection. If you choose `Backward`, the UI adds the histogram of the time spent on backward passes throughout the profiled time to the **Dashboard**. This type of histogram is useful for checking if there are outliers taking abnormally longer time and causing bottleneck problems.

The following screenshots show the GPU and CPU active time ratio and the average GPU and CPU utilization rate with respect to time per compute node.



The following screenshot shows an example of pie charts for comparing how many times the GPU kernels are launched and measuring the time spent on running them. In the **Time spent by all GPU kernels** and **Launch counts of all GPU kernels** panels, you can also specify an integer to the input

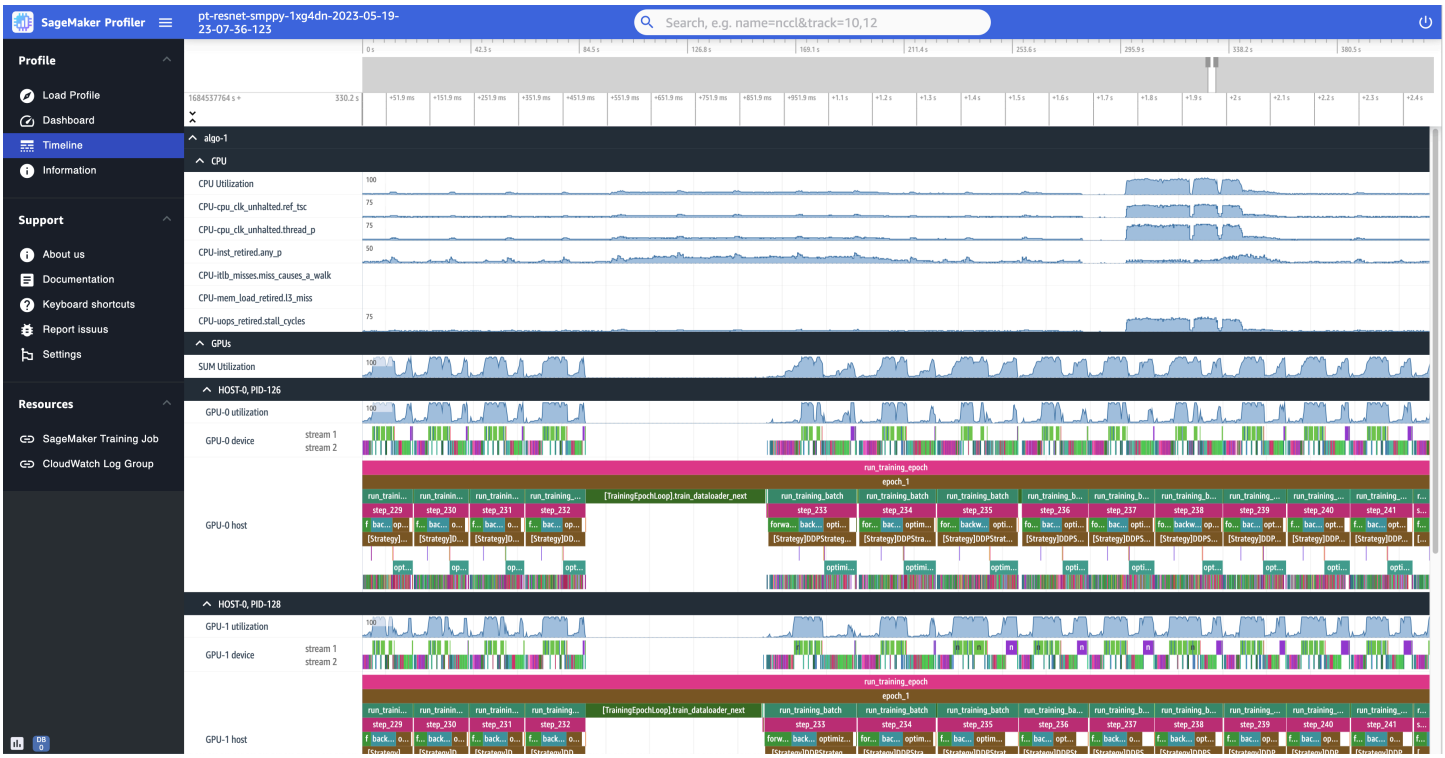
field for *k* to adjust the number of legend to show in the plots. For example, if you specify 10, the plots show the top 10 most run and launched kernels respectively.

The following screenshot shows an example of step time duration histogram, and pie charts for the kernel precision distribution, GPU activity distribution, and GPU memory operation distribution.

Timeline interface

To gain a detailed view into the compute resources at the level of operations and kernels scheduled on the CPUs and run on the GPUs, use the **Timeline** interface.

You can zoom in and out and pan left or right in the timeline interface using your mouse, the `[w, a, s, d]` keys, or the four arrow keys on the keyboard.



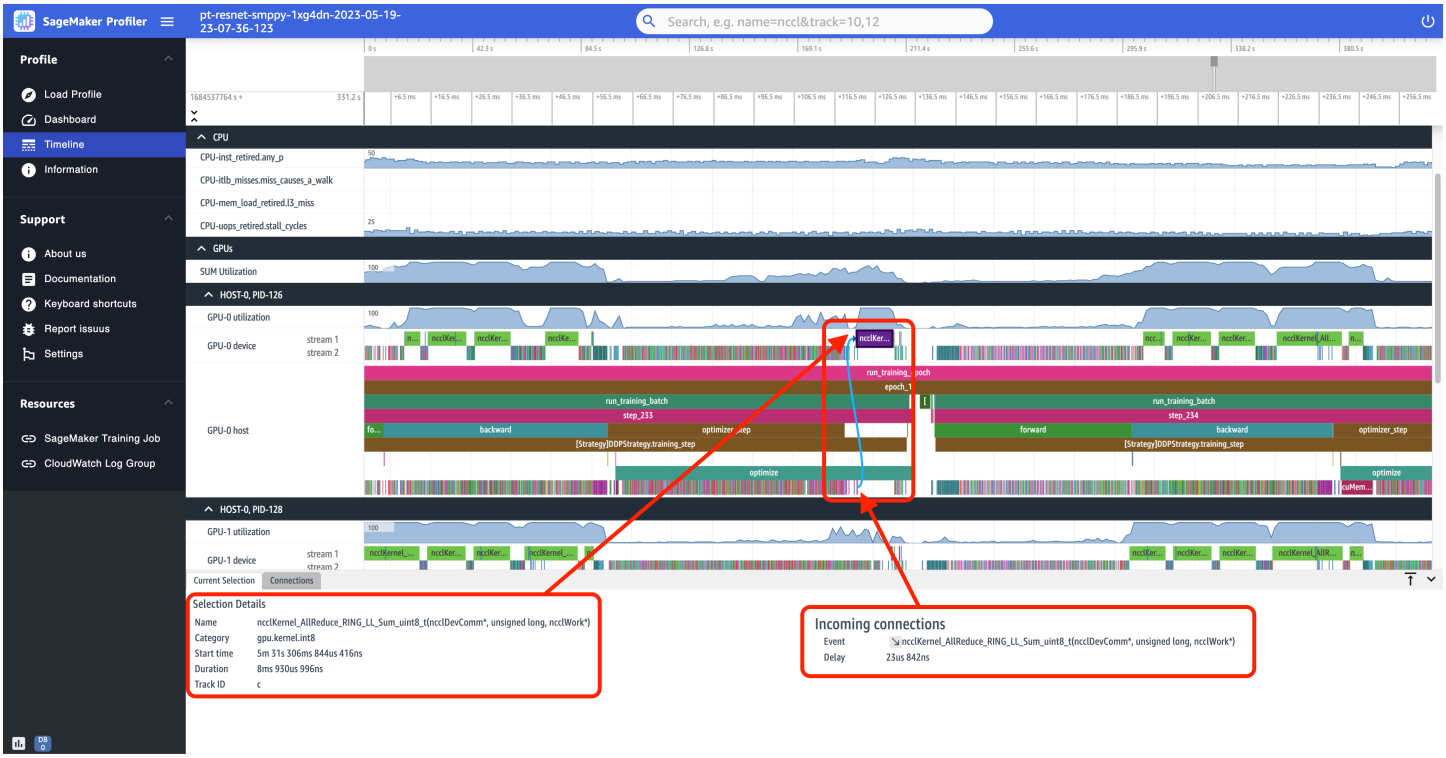
> **Tip**
>
> For more tips on the keyboard shortcuts to interact with the **Timeline** interface, choose **Keyboard shortcuts** in the left pane.

The timeline tracks are organized in a tree structure, giving you information from the host level to the device level. For example, if you run `N` instances with eight GPUs in each, the timeline structure of each instance would be as follows.

- **algo-i_{node}** – This is what SageMaker AI tags to assign jobs to provisioned instances. The digit i_{node} is randomly assigned. For example, if you use 4 instances, this section expands from **algo-1** to **algo-4**.
  - **CPU** – In this section, you can check the average CPU utilization rate and performance counters.
  - **GPUs** – In this section, you can check the average GPU utilization rate, individual GPU utilization rate, and kernels.
    - **SUM Utilization** – The average GPU utilization rates per instance.
    - **HOST-0 PID-123** – A unique name assigned to each process track. The acronym PID is the process ID, and the number appended to it is the process ID number that's recorded during data capture from the process. This section shows the following information from the process.
      - **GPU-i_{num_gpu} utilization** – The utilization rate of the i_{num_gpu}-th GPU over time.
      - **GPU-i_{num_gpu} device** – The kernel runs on the i_{num_gpu}-th GPU device.
        - **stream i_{cuda_stream}** – CUDA streams showing kernel runs on the GPU device. To learn more about CUDA streams, see the slides in PDF at CUDA C/C++ Streams and Concurrency provided by NVIDIA.
      - **GPU-i_{num_gpu} host** – The kernel launches on the i_{num_gpu}-th GPU host.

The following several screenshots show the **Timeline** of the profile of a training job run on `ml.p4d.24xlarge` instances, which are equipped with 8 NVIDIA A100 Tensor Core GPUs in each.

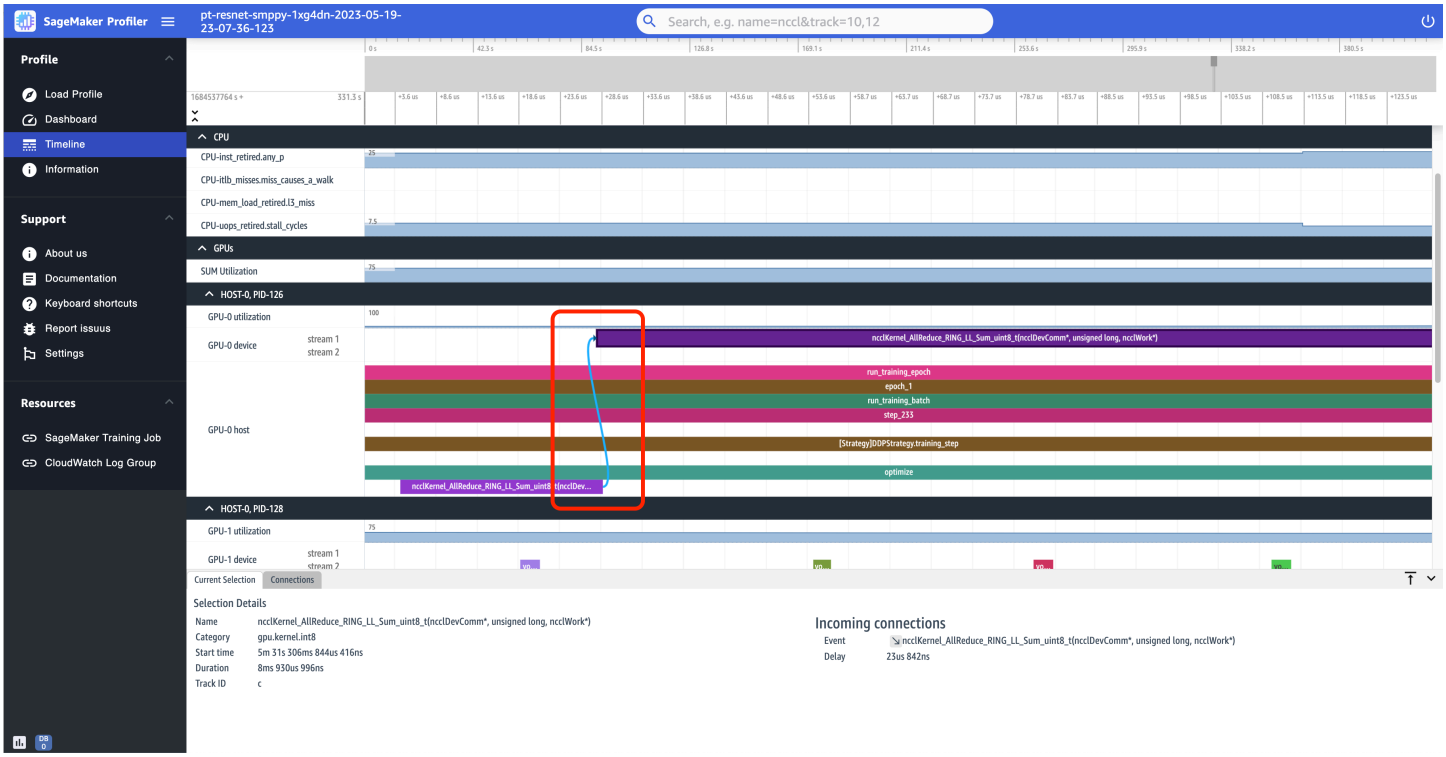
The following is a zoomed-out view of the profile, printing a dozen of steps including an intermittent data loader between `step_232` and `step_233` for fetching the next data batch.



For each CPU, you can track the CPU utilization and performance counters, such as `"clk_unhalted_ref.tsc"` and `"itlb_misses.miss_causes_a_walk"`, which are indicative of instructions run on the CPU.

For each GPU, you can see a host timeline and a device timeline. Kernel launches are on the host timeline and kernel runs are on the device timeline. You can also see annotations (such as forward, backward, and optimize) if you have added in training script in the GPU host timeline.

In the timeline view, you can also track kernel launch-and-run pairs. This helps you understand how a kernel launch scheduled on a host (CPU) is run on the corresponding GPU device.



> **Tip**
>
> Press the `f` key to zoom into the selected kernel.

The following screenshot is a zoomed-in view into `step_233` and `step_234` from the previous screenshot. The timeline interval selected in the following screenshot is the `AllReduce` operation, an essential communication and synchronization step in distributed training, run on the GPU-0 device. In the screenshot, note that the kernel launch in the GPU-0 host connects to the kernel run in the GPU-0 device stream 1, indicated with the arrow in cyan color.

Also two information tabs appear in the bottom pane of the UI when you select a timeline interval, as shown in the previous screenshot. The **Current Selection** tab shows the details of the selected kernel and the connected kernel launch from the host. The connection direction is always from host (CPU) to device (GPU) since each GPU kernel is always called from a CPU. The **Connections** tab shows the chosen kernel launch and run pair. You can select either of them to move it to the center of the **Timeline** view.

The following screenshot zooms in further into the `AllReduce` operation launch and run pair.

Information

In **Information**, you can access information about the loaded training job, such as the instance type, Amazon Resource Names (ARNs) of compute resources provisioned for the job, node names, and hyperparameters.

Settings

The SageMaker AI Profiler UI application instance is configured to shut down after 2 hours of idle time by default. In **Settings**, use the following settings to adjust the auto shutdown timer.

- **Enable app auto shutdown** – Choose and set to **Enabled** to let the application automatically shut down after the specified number of hours of idle time. To turn off the auto-shutdown functionality, choose **Disabled**.
- **Auto shutdown threshold in hours** – If you choose **Enabled** for **Enable app auto shutdown**, you can set the threshold time in hours for the application to shut down automatically. This is set to 2 by default.

Troubleshooting for SageMaker Profiler

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

Use the following question-and-answer pairs to troubleshoot problems while using SageMaker Profiler.

Q. I'm getting an error message, `ModuleNotFoundError: No module named 'smppy'`

Since December 2023, the name of the SageMaker Profiler Python package has changed from `smppy` to `smprof` to resolve a duplicate package name issue; `smppy` is already used by an open source package.

Therefore, if you have been using `smppy` since before December 2023 and experiencing this `ModuleNotFoundError` issue, it might be due to the outdated package name in your training script while having the latested `smprof` package installed or using one of the latest the section called "SageMaker AI framework images pre-installed with SageMaker Profiler". In this case, make sure that you replace all mentions of `smppy` with `smprof` throughout your training script.

While updating the SageMaker Profiler Python package name in your training scripts, to avoid confusion around which version of the package name you should use, consider using a conditional import statement as shown in the following code snippet.

```
try:
    import smprof
except ImportError:
    # backward-compatability for TF 2.11 and PT 1.13.1 images
    import smppy as smprof
```

Also note that if you have been using `smppy` while upgrading to the latest PyTorch or TensorFlow versions, make sure that you install the latest `smprof` package by following instructions at the section called "(Optional) Install the SageMaker Profiler Python package".

Q. I'm getting an error message, `ModuleNotFoundError: No module named 'smprof'`

First, make sure that you use one of the officially supported SageMaker AI Framework Containers. If you don't use one of those, you can install the `smprof` package by following instructions at the section called "(Optional) Install the SageMaker Profiler Python package".

Q. I'm not able to import `ProfilerConfig`

If you are unable to import `ProfilerConfig` in your job launcher script using the SageMaker Python SDK, your local environment or the Jupyter kernel might have a significantly outdated version of the SageMaker Python SDK. Make sure that you upgrade the SDK to the latest version.

```
$ pip install --upgrade sagemaker
```

Q. I'm getting an error message, `aborted: core dumped when importing smprof into my training script`

In an earlier version of `smprof`, this issue occurs with PyTorch 2.0+ and PyTorch Lightning. To resolve this issue, also install the latest `smprof` package by following instructions at the section called "(Optional) Install the SageMaker Profiler Python package".

Q. I cannot find the SageMaker Profiler UI from SageMaker Studio. How can I find it?

If you have access to the SageMaker AI console, choose one of the following options.

- the section called "Option 1: Launch the SageMaker Profiler UI from the domain details page"
- the section called "Option 2: Launch the SageMaker Profiler UI application from the SageMaker Profiler landing page in the SageMaker AI console"

If you are a domain user and don't have access to the SageMaker AI console, you can access the application through SageMaker Studio Classic. If this is your case, choose the following option.

- the section called "Option 3: Use the application launcher function in the SageMaker AI Python SDK"

Monitor Amazon compute resource utilization in Amazon SageMaker Studio Classic

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

To track compute resource utilization of your training job, use the monitoring tools offered by Amazon SageMaker Debugger.

For any training job you run in SageMaker AI using the SageMaker Python SDK, Debugger collects basic resource utilization metrics, such as CPU utilization, GPU utilization, GPU memory utilization, network, and I/O wait time every 500 milliseconds. To see the dashbard of the resource utilization metrics of your training job, simply use the SageMaker Debugger UI in SageMaker Studio Experiments.

Deep learning operations and steps might operate in intervals of milliseconds. Compared to Amazon CloudWatch metrics, which collect metrics at intervals of 1 second, Debugger provides finer granularity into the resource utilization metrics down to 100-millisecond (0.1 second) intervals so you can dive deep into the metrics at the level of an operation or a step.

If you want to change the metric collection time interval, you can add a paramter for profiling configuration to your training job launcher. For example, if you're using the SageMaker AI Python SDK, you need to pass the `profiler_config` parameter when you create an ModelTrainer object. To learn how to adjust the resource utilization metric collection interval, see the section called "Code template for configuring a SageMaker AI estimator object with the SageMaker Debugger Python modules in the SageMaker AI Python SDK" and then the section called "Configure settings for basic profiling of system resource utilization".

Additionally, you can add issue detecting tools called *built-in profiling rules* provided by SageMaker Debugger. The built-in profiling rules run analysis against the resource utilization metrics and detect computational performance issues. For more information, see the section called "Use built-in profiler rules". You can receive rule analysis results through the SageMaker Debugger UI in SageMaker Studio Experiments or the SageMaker Debugger Profiling Report. You can also create custom profiling rules using the SageMaker Python SDK.

To learn more about monitoring functionalities provided by SageMaker Debugger, see the following topics.

Topics

- Estimator configuration with parameters for basic profiling using the Amazon SageMaker Debugger Python modules
- Use built-in profiler rules managed by Amazon SageMaker Debugger

- SageMaker Debugger interactive report
- Analyze data using the Debugger Python client library

Estimator configuration with parameters for basic profiling using the Amazon SageMaker Debugger Python modules

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

By default, SageMaker Debugger basic profiling is on by default and monitors resource utilization metrics, such as CPU utilization, GPU utilization, GPU memory utilization, Network, and I/O wait time, of all SageMaker training jobs submitted using the Amazon SageMaker Python SDK. SageMaker Debugger collects these resource utilization metrics every 500 milliseconds. You don't need to make any additional changes in your code, training script, or the job launcher for tracking basic resource utilization. If you want to change the metric collection interval for basic profiling, you can specify Debugger-specific parameters while creating a SageMaker training job launcher using the SageMaker Python SDK, Amazon SDK for Python (Boto3), or Amazon Command Line Interface (CLI). In this guide, we focus on how to change profiling options using the Amazon SageMaker Python SDK. This page gives reference templates for configuring this estimator object.

If you want to access the resource utilization metrics dashboard of your training job in SageMaker Studio, you can jump onto the Amazon SageMaker Debugger UI in Amazon SageMaker Studio Classic Experiments.

If you want to activate the rules that detect system resource utilization problems automatically, you can add the `rules` parameter in the estimator object for activating the rules.

> **Important**
>
> To use the latest SageMaker Debugger features, you need to upgrade the SageMaker Python SDK and the SMDebug client library. In your iPython kernel, Jupyter Notebook, or JupyterLab environment, run the following code to install the latest versions of the libraries and restart the kernel.
>
> ```
> import sys
> import IPython
> !{sys.executable} -m pip install -U sagemaker smdebug
> IPython.Application.instance().kernel.do_shutdown(True)
> ```

Code template for configuring a SageMaker AI estimator object with the SageMaker Debugger Python modules in the SageMaker AI Python SDK

To adjust the basic profiling configuration (`profiler_config`) or add the profiler rules (`rules`), use the following template for setting up a SageMaker AI training job. In the subsequent pages, you can find more information about how to configure the two parameters.

> **Note**
>
> The following code examples are not directly executable. Proceed to the next sections to learn how to configure each parameter.

```
# An example of creating a training job with profiler configuration
import boto3
from sagemaker.core import image_uris
from sagemaker.core.resources import TrainingJob
from sagemaker.core.shapes import (
    AlgorithmSpecification,
    ResourceConfig,
    OutputDataConfig,
    StoppingCondition,
    ProfilerConfig as CoreProfilerConfig,
    ProfilerRuleConfiguration,
```

```
)

session=boto3.session.Session()
region=session.region_name

# Retrieve the training image for your framework
# Change framework to "tensorflow", "mxnet", "xgboost", etc. as needed
training_image = image_uris.retrieve(
    framework="pytorch",  # or "tensorflow", "mxnet", "xgboost"
    region=region,
    version="1.12.0",
    py_version="py37",
    instance_type="ml.p3.2xlarge",
    image_scope="training"
)

profiler_config=CoreProfilerConfig(...)
profiler_rule_configurations=[
    ProfilerRuleConfiguration(
        rule_configuration_name="BuiltInRule",
        rule_evaluator_image="rule-evaluator-image-uri",
    )
]

TrainingJob.create(
    training_job_name="debugger-profiling-demo",
    algorithm_specification=AlgorithmSpecification(
        training_image=training_image,
        training_input_mode="File",
    ),
    role_arn="arn:aws:iam::123456789012:role/SageMakerRole",
    resource_config=ResourceConfig(instance_type="ml.p3.2xlarge", instance_count=1,
 volume_size_in_gb=30),
    output_data_config=OutputDataConfig(s3_output_path="s3://bucket/output"),
    stopping_condition=StoppingCondition(max_runtime_in_seconds=3600),

    # SageMaker Debugger parameters
    profiler_config=profiler_config,
    profiler_rule_configurations=profiler_rule_configurations,
)
```

> **Note**
>
> For MXNet and XGBoost, when configuring the `profiler_config` parameter, you can only configure for system monitoring. Profiling framework metrics is not supported for MXNet or XGBoost.

The following provides brief descriptions of the parameters.

- `profiler_config` – Configure Debugger to collect system metrics and framework metrics from your training job and save into your secured S3 bucket URI or local machine. You can set how frequently or loosely collect the system metrics. To learn how to configure the `profiler_config` parameter, see Configure settings for basic profiling of system resource utilization and Estimator configuration for framework profiling.
- `rules` – Configure this parameter to activate SageMaker Debugger built-in rules that you want to run in parallel. Make sure that your training job has access to this S3 bucket. The rules runs on processing containers and automatically analyze your training job to find computational and operational performance issues. The ProfilerReport rule is the most integrated rule that runs all built-in profiling rules and saves the profiling results as a report into your secured S3 bucket. To learn how to configure the `rules` parameter, see Use built-in profiler rules managed by Amazon SageMaker Debugger.

> **Note**
>
> Debugger securely saves output data in subfolders of your default S3 bucket. For example, the format of the default S3 bucket URI is `s3://sagemaker-<region>-<12digit_account_id>/<base-job-name>/<debugger-subfolders>/`. There are three subfolders created by Debugger: `debug-output`, `profiler-output`, and `rule-output`. You can also retrieve the default S3 bucket URIs using the SageMaker AI estimator classmethods.

See the following topics to find out how to configure the Debugger-specific parameters in detail.

Topics

- Configure settings for basic profiling of system resource utilization

- Estimator configuration for framework profiling
- Updating Debugger system monitoring and framework profiling configuration while a training job is running
- Turn off Debugger

Configure settings for basic profiling of system resource utilization

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

To adjust the time interval for collecting the utilization metrics, use the `ProfilerConfig` API operation to create a parameter object while constructing a SageMaker AI framework or generic estimator depending on your preference.

> **Note**
>
> By default, for all SageMaker training jobs, Debugger collects resource utilization metrics from Amazon EC2 instances every 500 milliseconds for system monitoring, without any Debugger-specific parameters specified in SageMaker AI estimators.
> Debugger saves the system metrics in the default S3 bucket. The format of the default S3 bucket URI is `s3://sagemaker-<region>-<12digit_account_id>/<training-job-name>/profiler-output/`.

The following code example shows how to set up the `profiler_config` parameter with a system monitoring time interval of 1000 milliseconds.

```
from sagemaker.core.debugger import ProfilerConfig

profiler_config=ProfilerConfig(
    system_monitor_interval_millis=1000
)
```

- `system_monitor_interval_millis` (int) – Specify the monitoring intervals in milliseconds to record system metrics. Available values are 100, 200, 500, 1000 (1 second), 5000 (5 seconds), and 60000 (1 minute) milliseconds. The default value is 500 milliseconds.

To see the progress of system monitoring, see Open the Amazon SageMaker Debugger Insights dashboard.

Estimator configuration for framework profiling

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

> **Warning**
>
> In favor of Amazon SageMaker Profiler, SageMaker AI Debugger deprecates the framework profiling feature starting from TensorFlow 2.11 and PyTorch 2.0. You can still use the feature in the previous versions of the frameworks and SDKs as follows.
>
> - SageMaker Python SDK <= v2.130.0
> - PyTorch >= v1.6.0, < v2.0
> - TensorFlow >= v2.3.1, < v2.11
>
> See also March 16, 2023.

To enable Debugger framework profiling, configure the `framework_profile_params` parameter when you construct an estimator. Debugger framework profiling collects framework metrics, such as data from initialization stage, data loader processes, Python operators of deep learning frameworks and training scripts, detailed profiling within and between steps, with cProfile or Pyinstrument options. Using the `FrameworkProfile` class, you can configure custom framework profiling options.

> **Note**
>
> Before getting started with Debugger framework profiling, verify that the framework used to build your model is supported by Debugger for framework profiling. For more information, see Supported frameworks and algorithms.
> Debugger saves the framework metrics in a default S3 bucket. The format of the default S3 bucket URI is `s3://sagemaker-<region>-<12digit_account_id>/<training-job-name>/profiler-output/`.

Topics

- Default framework profiling
- Default system monitoring and customized framework profiling for target steps or a target time range
- Default system monitoring and customized framework profiling with different profiling options

Default framework profiling

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

Debugger framework default profiling includes the following options: detailed profiling, data loader profiling, and Python profiling. The following example code is the simplest `profiler_config` parameter setting to start the default system monitoring and the default framework profiling. The `FrameworkProfile` class in the following example code initiates the default framework profiling when a training job starts.

```
from sagemaker.core.debugger import ProfilerConfig, FrameworkProfile

profiler_config=ProfilerConfig(
    framework_profile_params=FrameworkProfile()
)
```

With this `profiler_config` parameter configuration, Debugger calls the default settings of monitoring and profiling. Debugger monitors system metrics every 500 milliseconds; profiles the fifth step with the detailed profiling option; the seventh step with the data loader profiling option; and the ninth, tenth, and eleventh steps with the Python profiling option.

To find available profiling configuration options, the default parameter settings, and examples of how to configure them, see Default system monitoring and customized framework profiling with different profiling options and SageMaker Debugger APIs – FrameworkProfile in the Amazon SageMaker Python SDK.

If you want to change the system monitoring interval and enable the default framework profiling, you can specify the `system_monitor_interval_millis` parameter explicitly with the `framework_profile_params` parameter. For example, to monitor every 1000 milliseconds and enable the default framework profiling, use the following example code.

```
from sagemaker.core.debugger import ProfilerConfig, FrameworkProfile

profiler_config=ProfilerConfig(
    system_monitor_interval_millis=1000,
    framework_profile_params=FrameworkProfile()
)
```

For more information about the `FrameworkProfile` class, see SageMaker Debugger APIs – FrameworkProfile in the Amazon SageMaker Python SDK.

Default system monitoring and customized framework profiling for target steps or a target time range

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

If you want to specify target steps or target time intervals to profile your training job, you need to specify parameters for the `FrameworkProfile` class. The following code examples show how to specify the target ranges for profiling along with system monitoring.

- **For a target step range**

With the following example configuration, Debugger monitors the entire training job every 500 milliseconds (the default monitoring) and profiles a target step range from step 5 to step 15 (for 10 steps).

```
from sagemaker.core.debugger import ProfilerConfig, FrameworkProfile

profiler_config=ProfilerConfig(
    framework_profile_params=FrameworkProfile(start_step=5, num_steps=10)
)
```

With the following example configuration, Debugger monitors the entire training job every 1000 milliseconds and profiles a target step range from step 5 to step 15 (for 10 steps).

```
from sagemaker.core.debugger import ProfilerConfig, FrameworkProfile

profiler_config=ProfilerConfig(
    system_monitor_interval_millis=1000,
    framework_profile_params=FrameworkProfile(start_step=5, num_steps=10)
)
```

- **For a target time range**

With the following example configuration, Debugger monitors the entire training job every 500 milliseconds (the default monitoring) and profiles a target time range from the current Unix time for 600 seconds.

```
import time
from sagemaker.core.debugger import ProfilerConfig, FrameworkProfile

profiler_config=ProfilerConfig(
    framework_profile_params=FrameworkProfile(start_unix_time=int(time.time()),
 duration=600)
)
```

With the following example configuration, Debugger monitors the entire training job every 1000 milliseconds and profiles a target time range from the current Unix time for 600 seconds.

```
import time
from sagemaker.core.debugger import ProfilerConfig, FrameworkProfile
```

```
profiler_config=ProfilerConfig(
    system_monitor_interval_millis=1000,
    framework_profile_params=FrameworkProfile(start_unix_time=int(time.time()),
 duration=600)
)
```

The framework profiling is performed for all of the profiling options at the target step or time range.

To find more information about available profiling options, see SageMaker Debugger APIs – FrameworkProfile in the Amazon SageMaker Python SDK.

The next section shows you how to script the available profiling options.

Default system monitoring and customized framework profiling with different profiling options

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

This section gives information about the supported profiling configuration classes, as well as an example configuration. You can use the following profiling configuration classes to manage the framework profiling options:

- DetailedProfilingConfig – Specify a target step or time range to profile framework operations using the native framework profilers (TensorFlow profiler and PyTorch profiler). For example, if using TensorFlow, the Debugger hooks enable the TensorFlow profiler to collect TensorFlow-specific framework metrics. Detailed profiling enables you to profile all framework operators at a pre-step (before the first step), within steps, and between steps of a training job.

  > **Note**
  >
  > Detailed profiling might significantly increase GPU memory consumption. We do not recommend enabling detailed profiling for more than a couple of steps.

- DataloaderProfilingConfig – Specify a target step or time range to profile deep learning framework data loader processes. Debugger collects every data loader event of the frameworks.

  > **Note**
  >
  > Data loader profiling might lower the training performance while collecting information from data loaders. We don't recommend enabling data loader profiling for more than a couple of steps.
  > Debugger is preconfigured to annotate data loader processes only for the Amazon deep learning containers. Debugger cannot profile data loader processes from any other custom or external training containers.

- PythonProfilingConfig – Specify a target step or time range to profile Python functions. You can also choose between two Python profilers: cProfile and Pyinstrument.
  - *cProfile* – The standard Python profiler. cProfile collects information for every Python operator called during training. With cProfile, Debugger saves cumulative time and annotation for each function call, providing complete detail about Python functions. In deep learning, for example, the most frequently called functions might be the convolutional filters and backward pass operators, and cProfile profiles every single of them. For the cProfile option, you can further select a timer option: total time, CPU time, and off-CPU time. While you can profile every function call executing on processors (both CPU and GPU) in CPU time, you can also identify I/O or network bottlenecks with the off-CPU time option. The default is total time, and Debugger profiles both CPU and off-CPU time. With cProfile, you are able to drill down to every single functions when analyzing the profile data.
  - *Pyinstrument* – Pyinstrument is a low-overhead Python profiler that works based on sampling. With the Pyinstrument option, Debugger samples profiling events every millisecond. Because Pyinstrument measures elapsed wall-clock time instead of CPU time, the Pyinstrument option can be a better choice over the cProfile option for reducing profiling noise (filtering out irrelevant function calls that are cumulatively fast) and capturing operators that are actually compute intensive (cumulatively slow) for training your model. With Pyinstrument, you are able to see a tree of function calls and better understand the structure and root cause of the slowness.

  > **Note**
  >
  > Enabling Python profiling might slow down the overall training time. cProfile profiles the most frequently called Python operators at every call, so the processing time on profiling

increases with respect to the number of calls. For Pyinstrument, the cumulative profiling time increases with respect to time because of its sampling mechanism.

The following example configuration shows the full structure when you use the different profiling options with specified values.

```
import time
from sagemaker.core.debugger import (ProfilerConfig,
                                     FrameworkProfile,
                                     DetailedProfilingConfig,
                                     DataloaderProfilingConfig,
                                     PythonProfilingConfig,
                                     PythonProfiler, cProfileTimer)

profiler_config=ProfilerConfig(
    system_monitor_interval_millis=500,
    framework_profile_params=FrameworkProfile(
        detailed_profiling_config=DetailedProfilingConfig(
            start_step=5,
            num_steps=1
        ),
        dataloader_profiling_config=DataloaderProfilingConfig(
            start_step=7,
            num_steps=1
        ),
        python_profiling_config=PythonProfilingConfig(
            start_step=9,
            num_steps=1,
            python_profiler=PythonProfiler.CPROFILE,
            cprofile_timer=cProfileTimer.TOTAL_TIME
        )
    )
)
```

For more information about available profiling options, see DetailedProfilingConfig, DataloaderProfilingConfig, and PythonProfilingConfig in the Amazon SageMaker Python SDK.

Updating Debugger system monitoring and framework profiling configuration while a training job is running

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

If you want to activate or update the Debugger monitoring configuration for a training job that is currently running, use the following SageMaker AI estimator extension methods:

- To activate Debugger system monitoring for a running training job and receive a Debugger profiling report, use the following:

  ```
  estimator.enable_default_profiling()
  ```

  When you use the `enable_default_profiling` method, Debugger initiates the default system monitoring and the `ProfileReport` built-in rule, which generates a comprehensive profiling report at the end of the training job. This method can be called only if the current training job is running without both Debugger monitoring and profiling.

  For more information, see estimator.enable_default_profiling in the Amazon SageMaker Python SDK.

- To update system monitoring configuration, use the following:

  ```
  estimator.update_profiler(
      system_monitor_interval_millis=500
  )
  ```

  For more information, see estimator.update_profiler in the Amazon SageMaker Python SDK.

Turn off Debugger

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

If you want to completely turn off Debugger, do one of the following:

- Before starting a training job, do the following:

  To turn off profiling, include the `disable_profiler` parameter to your estimator and set it to `True`.

  > **Warning**
  >
  > If you disable it, you won't be able to view the comprehensive Studio Debugger insights dashboard and the autogenerated profiling report.

  To turn off debugging, set the `debugger_hook_config` parameter to `False`.

  > **Warning**
  >
  > If you disable it, you won't be able to collect output tensors and cannot debug your model parameters.

```
estimator=Estimator(
    ...
    disable_profiler=True
    debugger_hook_config=False
)
```

  For more information about the Debugger-specific parameters, see SageMaker AI Estimator in the Amazon SageMaker Python SDK.

- While a training job is running, do the following:

  To disable both monitoring and profiling while your training job is running, use the following estimator classmethod:

  ```
  estimator.disable_profiling()
  ```

  To disable framework profiling only and keep system monitoring, use the `update_profiler` method:

  ```
  estimator.update_profiler(disable_framework_metrics=true)
  ```

  For more information about the estimator extension methods, see the estimator.disable_profiling and estimator.update_profiler classmethods in the Amazon SageMaker Python SDK documentation.

Use built-in profiler rules managed by Amazon SageMaker Debugger

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

The Amazon SageMaker Debugger built-in profiler rules analyze system metrics and framework operations collected during the training of a model. Debugger offers the `ProfilerRule` API operation that helps configure the rules to monitor training compute resources and operations and to detect anomalies. For example, the profiling rules can help you detect whether there are computational problems such as CPU bottlenecks, excessive I/O wait time, imbalanced workload across GPU workers, and compute resource underutilization. To see a full list of available built-in profiling rules, see List of Debugger built-in profiler rules. The following topics show how to use the Debugger built-in rules with default parameter settings and custom parameter values.

> **Note**
>
> The built-in rules are provided through Amazon SageMaker processing containers and fully managed by SageMaker Debugger at no additional cost. For more information about billing, see the Amazon SageMaker Pricing page.

Topics

- Use SageMaker Debugger built-in profiler rules with their default parameter settings
- Use Debugger built-in profiler rules with custom parameter values

Use SageMaker Debugger built-in profiler rules with their default parameter settings

To add SageMaker Debugger built-in rules in your ModelTrainer, you need to configure a `rules` list object. The following example code shows the basic structure of listing the SageMaker Debugger built-in rules.

```
from sagemaker.debugger import Rule, ProfilerRule, rule_configs

rules=[
    ProfilerRule.sagemaker(rule_configs.BuiltInProfilerRuleName_1()),
    ProfilerRule.sagemaker(rule_configs.BuiltInProfilerRuleName_2()),
    ...
    ProfilerRule.sagemaker(rule_configs.BuiltInProfilerRuleName_n()),
    ... # You can also append more debugging rules in the
 Rule.sagemaker(rule_configs.*()) format.
]

model_trainer=ModelTrainer(
    ...
    rules=rules
)
```

For a complete list of available built-in rules, see List of Debugger built-in profiler rules.

To use the profiling rules and inspect the computational performance and progress of your training job, add the `ProfilerReport` rule of SageMaker Debugger. This rule activates all built-in rules under the Debugger ProfilerRule `ProfilerRule` family. Furthermore, this rule generates an aggregated profiling report. For more information, see Profiling Report Generated Using

SageMaker Debugger. You can use the following code to add the profiling report rule to your training ModelTrainer.

```
from sagemaker.debugger import Rule, rule_configs

rules=[
    ProfilerRule.sagemaker(rule_configs.ProfilerReport())
]
```

When you start the training job with the `ProfilerReport` rule, Debugger collects resource utilization data every 500 milliseconds. Debugger analyzes the resource utilization to identify if your model is having bottleneck problems. If the rules detect training anomalies, the rule evaluation status changes to `IssueFound`. You can set up automated actions, such as notifying training issues and stopping training jobs using Amazon CloudWatch Events and Amazon Lambda. For more information, see Action on Amazon SageMaker Debugger rules.

Use Debugger built-in profiler rules with custom parameter values

If you want to adjust the built-in rule parameter values and customize tensor collection regex, configure the `base_config` and `rule_parameters` parameters for the `ProfilerRule.sagemaker` and `Rule.sagemaker` class methods. In case of the `Rule.sagemaker` class methods, you can also customize tensor collections through the `collections_to_save` parameter. For instruction on how to use the `CollectionConfig` class, see Configure tensor collections using the `CollectionConfig` API.

Use the following configuration template for built-in rules to customize parameter values. By changing the rule parameters as you want, you can adjust the sensitivity of the rules to be initiated.

- The `base_config` argument is where you call the built-in rule methods.
- The `rule_parameters` argument is to adjust the default key values of the built-in rules listed in List of Debugger built-in profiler rules.

For more information about the Debugger rule class, methods, and parameters, see SageMaker AI Debugger Rule class in the Amazon SageMaker Python SDK.

```
from sagemaker.debugger import Rule, ProfilerRule, rule_configs, CollectionConfig

rules=[
    ProfilerRule.sagemaker(
```

```
        base_config=rule_configs.BuiltInProfilerRuleName(),
        rule_parameters={
                "key": "value"
        }
    )
]
```

The parameter descriptions and value customization examples are provided for each rule at List of Debugger built-in profiler rules.

For a low-level JSON configuration of the Debugger built-in rules using the `CreateTrainingJob` API, see Configure Debugger using SageMaker API.

List of Debugger built-in profiler rules

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

Use the Debugger built-in profiler rules provided by Amazon SageMaker Debugger and analyze metrics collected while training your models. The Debugger built-in rules monitor various common conditions that are critical for the success of running a performant training job. You can call the built-in profiler rules using Amazon SageMaker Python SDK or the low-level SageMaker API operations. There's no additional cost for using the built-in rules. For more information about billing, see the Amazon SageMaker Pricing page.

> **Note**
>
> The maximum numbers of built-in profiler rules that you can attach to a training job is 20. SageMaker Debugger fully manages the built-in rules and analyzes your training job synchronously.

Important

To use the new Debugger features, you need to upgrade the SageMaker Python SDK and the SMDebug client library. In your iPython kernel, Jupyter notebook, or JupyterLab environment, run the following code to install the latest versions of the libraries and restart the kernel.

```
import sys
import IPython
!{sys.executable} -m pip install -U sagemaker smdebug
IPython.Application.instance().kernel.do_shutdown(True)
```

Profiler rules

The following rules are the Debugger built-in rules that are callable using the `ProfilerRule.sagemaker` classmethod.

Debugger built-in rule for generating the profiling report

Scope of Validity	Built-in Rules
Profiling Report for any SageMaker training job	• ProfilerReport

Debugger built-in rules for profiling hardware system resource utilization (system metrics)

Scope of Validity	Built-in Rules
Generic system monitoring rules for any SageMaker training job	• BatchSize • CPUBottleneck • GPUMemoryIncrease • IOBottleneck • LoadBalancing • LowGPUUtilization • OverallSystemUsage

Debugger built-in rules for profiling framework metrics

Scope of Validity	Built-in Rules
Profiling rules for deep learning frameworks (TensorFlow and PyTorch)	• MaxInitializationTime • OverallFrameworkMetrics • StepOutlier

Warning

In favor of Amazon SageMaker Profiler, SageMaker AI Debugger deprecates the framework profiling feature starting from TensorFlow 2.11 and PyTorch 2.0. You can still use the feature in the previous versions of the frameworks and SDKs as follows.

- SageMaker Python SDK <= v2.130.0
- PyTorch >= v1.6.0, < v2.0
- TensorFlow >= v2.3.1, < v2.11

See also March 16, 2023.

To use the built-in rules with default parameter values – use the following configuration format:

```
from sagemaker.core.debugger import Rule, ProfilerRule, rule_configs

rules = [
    ProfilerRule.sagemaker(rule_configs.BuiltInRuleName_1()),
    ProfilerRule.sagemaker(rule_configs.BuiltInRuleName_2()),
    ...
    ProfilerRule.sagemaker(rule_configs.BuiltInRuleName_n())
]
```

To use the built-in rules with customizing the parameter values – use the following configuration format:

```
from sagemaker.core.debugger import Rule, ProfilerRule, rule_configs
```

```
rules = [
    ProfilerRule.sagemaker(
        base_config=rule_configs.BuiltInRuleName(),
        rule_parameters={
                "key": "value"
        }
    )
]
```

To find available keys for the `rule_parameters` parameter, see the parameter description tables.

Sample rule configuration codes are provided for each built-in rule below the parameter description tables.

- For a full instruction and examples of using the Debugger built-in rules, see Debugger built-in rules example code.
- For a full instruction on using the built-in rules with the low-level SageMaker API operations, see Configure Debugger using SageMaker API.

ProfilerReport

The ProfilerReport rule invokes all of the built-in rules for monitoring and profiling. It creates a profiling report and updates when the individual rules are triggered. You can download a comprehensive profiling report while a training job is running or after the training job is complete. You can adjust the rule parameter values to customize sensitivity of the built-in monitoring and profiling rules. The following example code shows the basic format to adjust the built-in rule parameters through the ProfilerReport rule.

```
rules=[
    ProfilerRule.sagemaker(
        rule_configs.ProfilerReport(
            <BuiltInRuleName>_<parameter_name> = value
        )
    )
]
```

If you trigger this ProfilerReport rule without any customized parameter as shown in the following example code, then the ProfilerReport rule triggers all of the built-in rules for monitoring and profiling with their default parameter values.

```
rules=[ProfilerRule.sagemaker(rule_configs.ProfilerReport())]
```

The following example code shows how to specify and adjust the CPUBottleneck rule's `cpu_threshold` parameter and the IOBottleneck rule's `threshold` parameter.

```
rules=[
    ProfilerRule.sagemaker(
        rule_configs.ProfilerReport(
            CPUBottleneck_cpu_threshold = 90,
            IOBottleneck_threshold = 90
        )
    )
]
```

To explore what's in the profiler report, see SageMaker Debugger Profiling Report. Also, because this rule activates all of the profiling rules, you can also check the rule analysis status using the SageMaker Debugger UI in SageMaker Studio Experiments.

Parameter Descriptions for the OverallSystemUsage Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`<BuiltInRuleName>_<parameter_name>`	Customizable parameter to adjust thresholds of other built-in monitoring and profiling rules. **Optional** Default value: None

BatchSize

The BatchSize rule helps detect if GPU is underutilized due to a small batch size. To detect this issue, this rule monitors the average CPU utilization, GPU utilization, and GPU memory utilization. If utilization on CPU, GPU, and GPU memory is low on average, it may indicate that the training job can either run on a smaller instance type or can run with a bigger batch size. This analysis does not work for frameworks that heavily overallocate memory. However, increasing the batch size can lead to processing or data loading bottlenecks because more data preprocessing time is required in each iteration.

Parameter Descriptions for the BatchSize Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`cpu_threshold_p95`	Defines the threshold for 95th quantile of CPU utilization in percentage. **Optional** Valid values: Integer Default value: `70` (in percentage)
`gpu_threshold_p95`	Defines the threshold for 95th quantile of GPU utilization in percentage. **Optional** Valid values: Integer Default value: `70` (in percentage)

Parameter Name	Description
`gpu_memory_threshold_p95`	Defines the threshold for 95th quantile of GPU memory utilization in percentage. **Optional** Valid values: Integer Default values: `70` (in percentage)
`patience`	Defines the number of data points to skip until the rule starts evaluation. The first several steps of training jobs usually show high volume of data processes, so keep the rule patient and prevent it from being invoked too soon with a given number of profiling data that you specify with this parameter. **Optional** Valid values: Integer Default values: `100`
`window`	Window size for computing quantiles. **Optional** Valid values: Integer Default values: `500`
`scan_interval_us`	Time interval that timeline files are scanned. **Optional** Valid values: Integer Default values: `60000000` (in microseconds)

CPUBottleneck

The CPUBottleneck rule helps detect if GPU is underutilized due to CPU bottlenecks. Rule returns True if number of CPU bottlenecks exceeds a predefined threshold.

Parameter Descriptions for the CPUBottleneck Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`threshold`	Defines the threshold for proportion of bottlenecked time to the total training time. If the proportion exceeds the percentage specified to the threshold parameter, the rule switches the rule status to True. **Optional** Valid values: Integer Default value: `50` (in percentage)
`gpu_threshold`	A threshold that defines low GPU utilization. **Optional** Valid values: Integer Default value: `10` (in percentage)
`cpu_threshold`	A threshold that defines high CPU utilization. **Optional** Valid values: Integer

Parameter Name	Description
	Default values: `90` (in percentage)
`patience`	Defines the number of data points to skip until the rule starts evaluation. The first several steps of training jobs usually show high volume of data processes, so keep the rule patient and prevent it from being invoked too soon with a given number of profiling data that you specify with this parameter. **Optional** Valid values: Integer Default values: `100`
`scan_interval_us`	Time interval with which timeline files are scanned. **Optional** Valid values: Integer Default values: `60000000` (in microseconds)

GPUMemoryIncrease

The GPUMemoryIncrease rule helps detect a large increase in memory usage on GPUs.

Parameter Descriptions for the GPUMemoryIncrease Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required**

Parameter Name	Description
	Valid values: String
`increase`	Defines the threshold for absolute memory increase. **Optional** Valid values: Integer Default value: `10` (in percentage)
`patience`	Defines the number of data points to skip until the rule starts evaluation. The first several steps of training jobs usually show high volume of data processes, so keep the rule patient and prevent it from being invoked too soon with a given number of profiling data that you specify with this parameter. **Optional** Valid values: Integer Default values: `100`
`window`	Window size for computing quantiles. **Optional** Valid values: Integer Default values: `500`
`scan_interval_us`	Time interval that timeline files are scanned. **Optional** Valid values: Integer Default values: `60000000` (in microseconds)

IOBottleneck

This rule helps to detect if GPU is underutilized due to data IO bottlenecks. Rule returns True if number of IO bottlenecks exceeds a predefined threshold.

Parameter Descriptions for the IOBottleneck Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`threshold`	Defines the threshold when Rule to return True. **Optional** Valid values: Integer Default value: `50` (in percentage)
`gpu_threshold`	A threshold that defines when GPU is considered underutilized. **Optional** Valid values: Integer Default value: `70` (in percentage)
`io_threshold`	A threshold that defines high IO wait time. **Optional** Valid values: Integer Default values: `50` (in percentage)

Parameter Name	Description
`patience`	Defines the number of data points to skip until the rule starts evaluation. The first several steps of training jobs usually show high volume of data processes, so keep the rule patient and prevent it from being invoked too soon with a given number of profiling data that you specify with this parameter. **Optional** Valid values: Integer Default values: `1000`
`scan_interval_us`	Time interval that timeline files are scanned. **Optional** Valid values: Integer Default values: `60000000` (in microseconds)

LoadBalancing

The LoadBalancing rule helps detect issues in workload balancing among multiple GPUs.

Parameter Descriptions for the LoadBalancing Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String

Parameter Name	Description
`threshold`	Defines the workload percentage. **Optional** Valid values: Integer Default value: `0.5` (unitless proportion)
`patience`	Defines the number of data points to skip until the rule starts evaluation. The first several steps of training jobs usually show high volume of data processes, so keep the rule patient and prevent it from being invoked too soon with a given number of profiling data that you specify with this parameter. **Optional** Valid values: Integer Default values: `10`
`scan_interval_us`	Time interval that timeline files are scanned. **Optional** Valid values: Integer Default values: `60000000` (in microseconds)

LowGPUUtilization

The LowGPUUtilization rule helps detect if GPU utilization is low or suffers from fluctuations. This is checked for each GPU on each worker. Rule returns True if 95th quantile is below threshold_p95 which indicates underutilization. Rule returns true if 95th quantile is above threshold_p95 and 5th quantile is below threshold_p5 which indicates fluctuations.

Parameter Descriptions for the LowGPUUtilization Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`threshold_p95`	A threshold for 95th quantile below which GPU is considered to be underutilized. **Optional** Valid values: Integer Default value: `70` (in percentage)
`threshold_p5`	A threshold for 5th quantile. Default is 10 percent. **Optional** Valid values: Integer Default values: `10` (in percentage)
`patience`	Defines the number of data points to skip until the rule starts evaluation. The first several steps of training jobs usually show high volume of data processes, so keep the rule patient and prevent it from being invoked too soon with a given number of profiling data that you specify with this parameter. **Optional** Valid values: Integer

Parameter Name	Description
	Default values: `1000`
`window`	Window size for computing quantiles. **Optional** Valid values: Integer Default values: `500`
`scan_interval_us`	Time interval that timeline files are scanned. **Optional** Valid values: Integer Default values: `60000000` (in microseconds)

OverallSystemUsage

The OverallSystemUsage rule measures overall system usage per worker node. The rule currently only aggregates values per node and computes their percentiles.

Parameter Descriptions for the OverallSystemUsage Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`scan_interval_us`	Time interval to scan timeline files. **Optional**

Parameter Name	Description
	Valid values: Integer Default values: `60000000` (in microseconds)

MaxInitializationTime

The MaxInitializationTime rule helps detect if the training initialization is taking too much time. The rule waits until the first step is available.

Parameter Descriptions for the MaxInitializationTime Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`threshold`	Defines the threshold in minutes to wait for the first step to become available. **Optional** Valid values: Integer Default value: `20` (in minutes)
`scan_interval_us`	Time interval with which timeline files are scanned. **Optional** Valid values: Integer Default values: `60000000` (in microseconds)

OverallFrameworkMetrics

The OverallFrameworkMetrics rule summarizes the time spent on framework metrics, such as forward and backward pass, and data loading.

Parameter Descriptions for the OverallFrameworkMetrics Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required** Valid values: String
`scan_interval_us`	Time interval to scan timeline files. **Optional** Valid values: Integer Default values: `60000000` (in microseconds)

StepOutlier

The StepOutlier rule helps detect outliers in step durations. This rule returns `True` if there are outliers with step durations larger than `stddev` sigmas of the entire step durations in a time range.

Parameter Descriptions for the StepOutlier Rule

Parameter Name	Description
`base_trial`	The base trial training job name. This parameter is automatically set to the current training job by Amazon SageMaker Debugger. **Required**

Parameter Name	Description
	Valid values: String
`stddev`	Defines a factor by which to multiply the standard deviation. For example, the rule is invoked by default when a step duration is larger or smaller than 5 times the standard deviation. **Optional** Valid values: Integer Default value: 5 (in minutes)
`mode`	Mode under which steps have been saved and on which Rule should run on. Per default rule will run on steps from EVAL and TRAIN phase **Optional** Valid values: Integer Default value: 5 (in minutes)
`n_outliers`	How many outliers to ignore before rule returns True **Optional** Valid values: Integer Default value: `10`

Parameter Name	Description
`scan_interval_us`	Time interval with which timeline files are scanned. **Optional** Valid values: Integer Default values: `60000000` (in microseconds)

Amazon SageMaker Debugger UI in Amazon SageMaker Studio Classic Experiments

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

Use the Amazon SageMaker Debugger Insights dashboard in Amazon SageMaker Studio Classic Experiments to analyze your model performance and system bottlenecks while running training jobs on Amazon Elastic Compute Cloud (Amazon EC2) instances. Gain insights into your training jobs and improve your model training performance and accuracy with the Debugger dashboards. By default, Debugger monitors system metrics (CPU, GPU, GPU memory, network, and data I/O) every 500 milliseconds and basic output tensors (loss and accuracy) every 500 iterations for training jobs. You can also further customize Debugger configuration parameter values and adjust the saving intervals through the Studio Classic UI or using the Amazon SageMaker Python SDK.

> **Important**
>
> If you're using an existing Studio Classic app, delete the app and restart to use the latest Studio Classic features. For instructions on how to restart and update your Studio Classic environment, see Update Amazon SageMaker AI Studio Classic.

Topics

- Open the Amazon SageMaker Debugger Insights dashboard
- Amazon SageMaker Debugger Insights dashboard controller
- Explore the Amazon SageMaker Debugger Insights dashboard
- Shut down the Amazon SageMaker Debugger Insights instance

Open the Amazon SageMaker Debugger Insights dashboard

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

In the SageMaker Debugger Insights dashboard in Studio Classic, you can see the compute resource utilization, resource utilization, and system bottleneck information of your training job that runs on Amazon EC2 instances in real time and after trainings

> **Note**
>
> The SageMaker Debugger Insights dashboard runs a Studio Classic application on an `ml.m5.4xlarge` instance to process and render the visualizations. Each SageMaker Debugger Insights tab runs one Studio Classic kernel session. Multiple kernel sessions for multiple SageMaker Debugger Insights tabs run on the single instance. When you close a SageMaker Debugger Insights tab, the corresponding kernel session is also closed. The Studio Classic application remains active and accrues charges for the `ml.m5.4xlarge` instance usage. For information about pricing, see the Amazon SageMaker Pricing page.

> **Important**
>
> When you are done using the SageMaker Debugger Insights dashboard, you must shut down the `ml.m5.4xlarge` instance to avoid accruing charges. For instructions on how to shut down the instance, see Shut down the Amazon SageMaker Debugger Insights instance.

To open the SageMaker Debugger Insights dashboard

1. On the Studio Classic **Home** page, choose **Experiments** in the left navigation pane.
2. Search your training job in the **Experiments** page. If your training job is set up with an Experiments run, the job should appear in the **Experiments** tab; if you didn't set up an Experiments run, the job should appear in the **Unassigned runs** tab.
3. Choose (click) the link of the training job name to see the job details.
4. Under the **OVERVIEW** menu, choose **Debuggger**. This should show the following two sections.
   - In the **Debugger rules** section, you can browse the status of the Debugger built-in rules associated with the training job.
   - In the **Debugger insights** section, you can find links to open SageMaker Debugger Insights on the dashboard.
5. In the **SageMaker Debugger Insights** section, choose the link of the training job name to open the SageMaker Debugger Insights dashboard. This opens a **Debug [your-training-job-name]** window. In this window, Debugger provides an overview of the computational performance of your training job on Amazon EC2 instances and helps you identify issues in compute resource utilization.

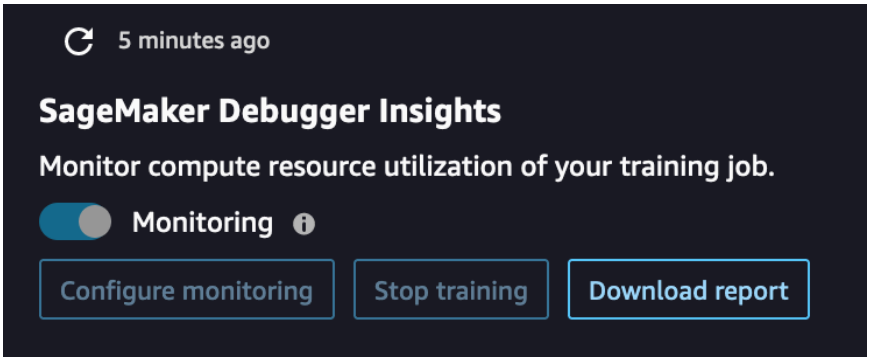
You can also download an aggregated profiling report by adding the built-in ProfilerReport rule of SageMaker Debugger. For more information, see Configure Built-in Profiler Rules and Profiling Report Generated Using SageMaker Debugger.

Amazon SageMaker Debugger Insights dashboard controller

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

There are different components of the Debugger controller for monitoring and profiling. In this guide, you learn about the Debugger controller components.

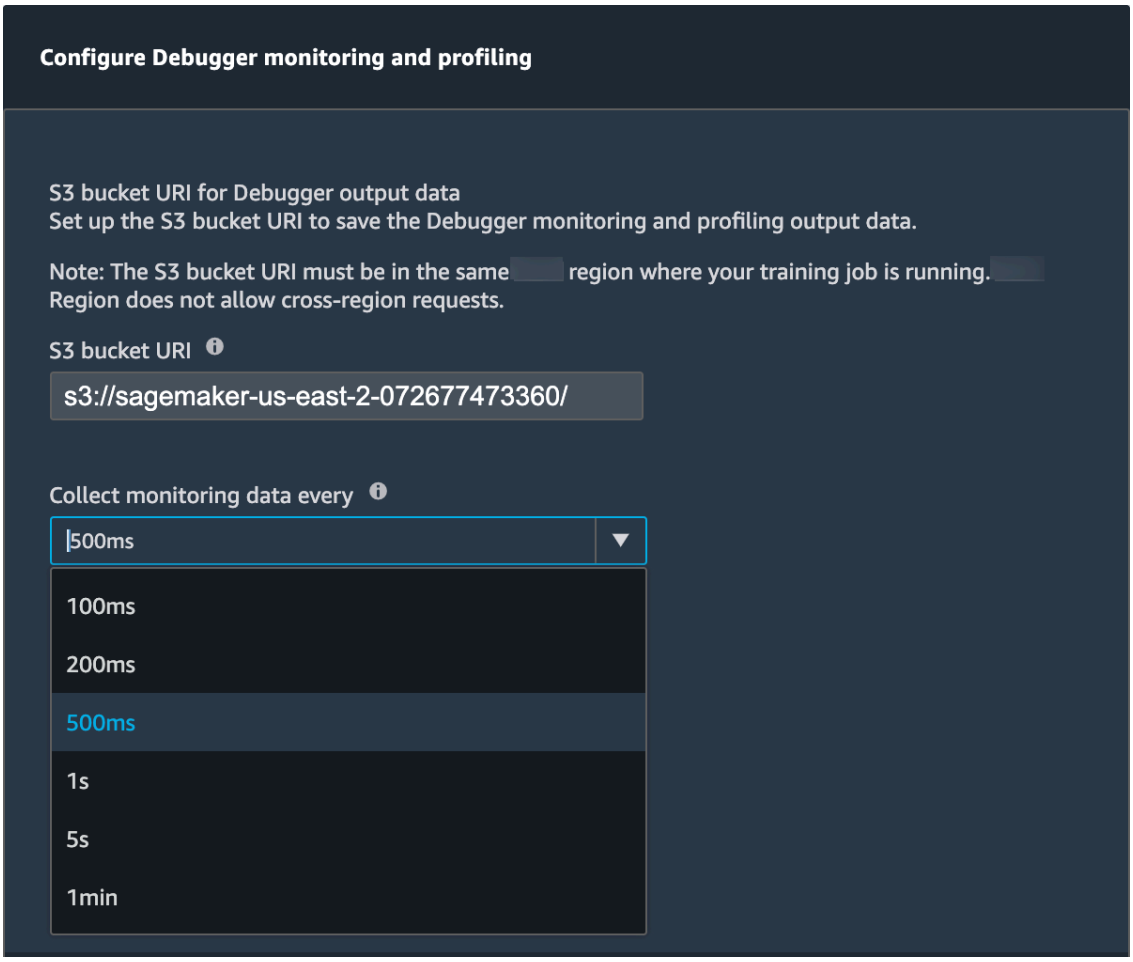
> **Note**
>
> The SageMaker Debugger Insights dashboard runs a Studio Classic app on an `ml.m5.4xlarge` instance to process and render the visualizations. Each SageMaker



Debugger Insights tab runs one Studio Classic kernel session. Multiple kernel sessions for multiple SageMaker Debugger Insights tabs run on the single instance. When you close a SageMaker Debugger Insights tab, the corresponding kernel session is also closed. The Studio Classic app remains active and accrues charges for the `ml.m5.4xlarge` instance usage. For information about pricing, see the Amazon SageMaker Pricing page.

Important

When you are done using the SageMaker Debugger Insights dashboard, shut down the `ml.m5.4xlarge` instance to avoid accruing charges. For instructions on how to shut down the instance, see Shut down the Amazon SageMaker Debugger Insights instance.



SageMaker Debugger Insights controller UI

Using the Debugger controller located at the upper-left corner of the Insights dashboard, you can refresh the dashboard, configure or update Debugger settings for monitoring system metrics, stop a training job, and download a Debugger profiling report.

- If you want to manually refresh the dashboard, choose the refresh button (the round arrow at the upper-left corner) as shown in the preceding screenshot.
- The **Monitoring** toggle button is on by default for any SageMaker training job initiated using the SageMaker Python SDK. If not activated, you can use the toggle button to start monitoring. During monitoring, Debugger only collects resource utilization metrics to detect computational problems such as CPU bottlenecks and GPU underutilization. For a complete list of resource utilization problems that Debugger monitors, see Debugger built-in rules for profiling hardware system resource utilization (system metrics).

- The **Configure monitoring** button opens a pop-up window that you can use to set or update the data collection frequency and the S3 path to save the data.

You can specify values for the following fields.

- **S3 bucket URI**: Specify the base S3 bucket URI.
- **Collect monitoring data every**: Select a time interval to collect system metrics. You can choose one of the monitoring intervals from the dropdown list. Available intervals are 100 milliseconds, 200 milliseconds, 500 milliseconds (default), 1 second, 5 seconds, and 1 minute.

> **Note**
>
> If you choose one of the lower time intervals, you increase the granularity of resource utilization metrics, so you can capture spikes and anomalies with a higher time resolution. However, higher the resolution, larger the size of system metrics to process. This might introduce additional overhead and impact the overall training and processing time.

- Using the **Stop training** button, you can stop the training job when you find anomalies in resource utilization.
- Using the **Download report** button, you can download an aggregated profiling report by using the built-in ProfilerReport rule of SageMaker Debugger. The button is activated when you add the built-in ProfilerReport rule to the ModelTrainer. For more information, see Configure Built-in Profiler Rules and Profiling Report Generated Using SageMaker Debugger.

Explore the Amazon SageMaker Debugger Insights dashboard

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

When you initiate a SageMaker training job, SageMaker Debugger starts monitoring the resource utilization of the Amazon EC2 instances by default. You can track the system utilization rates, statistics overview, and built-in rule analysis through the Insights dashboard. This guide walks you through the content of the SageMaker Debugger Insights dashboard under the following tabs: **System Metrics** and **Rules**.

> **Note**
>
> The SageMaker Debugger Insights dashboard runs a Studio Classic application on an `ml.m5.4xlarge` instance to process and render the visualizations. Each SageMaker Debugger Insights tab runs one Studio Classic kernel session. Multiple kernel sessions for multiple SageMaker Debugger Insights tabs run on the single instance. When you close a SageMaker Debugger Insights tab, the corresponding kernel session is also closed. The Studio Classic application remains active and accrues charges for the `ml.m5.4xlarge` instance usage. For information about pricing, see the Amazon SageMaker Pricing page.

Important

When you are done using the SageMaker Debugger Insights dashboard, shut down the `ml.m5.4xlarge` instance to avoid accruing charges. For instructions on how to shut down the instance, see Shut down the Amazon SageMaker Debugger Insights instance.

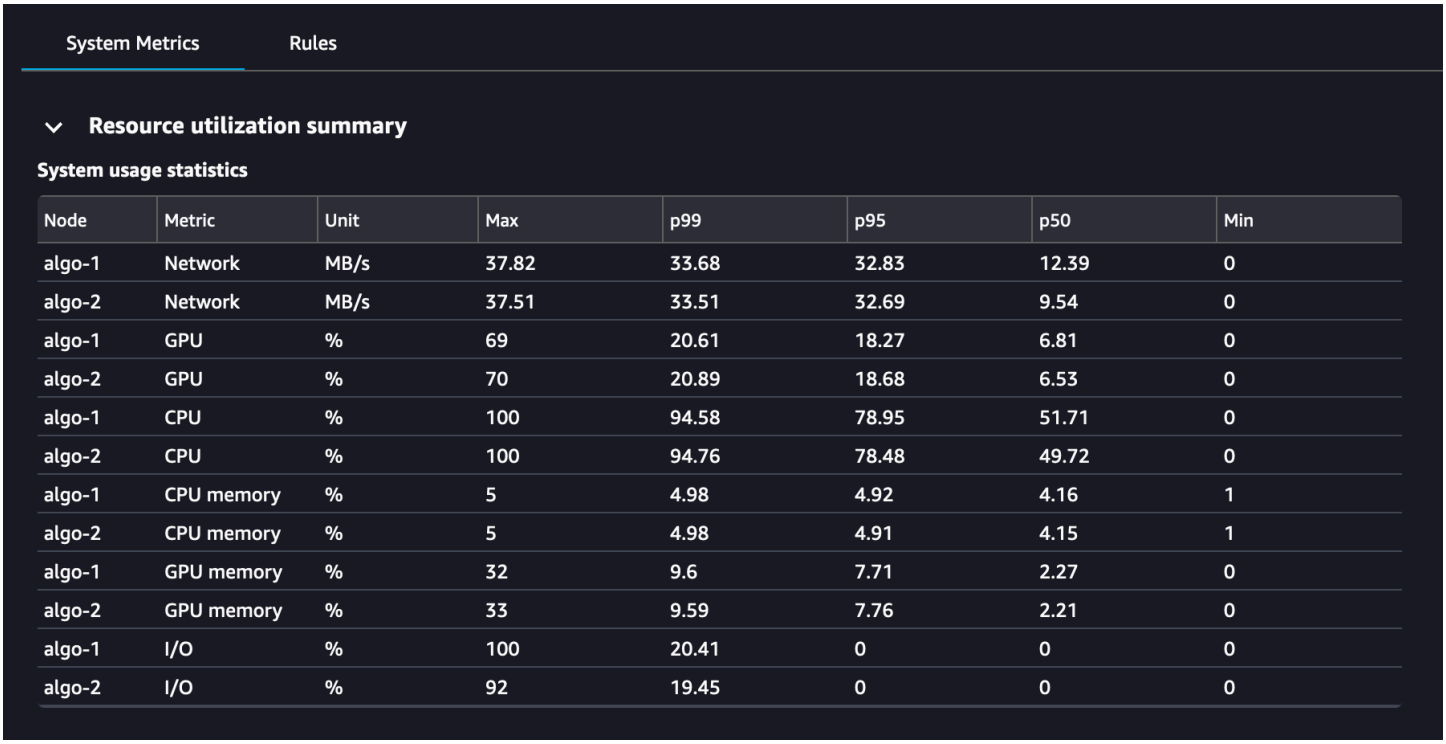
Topics



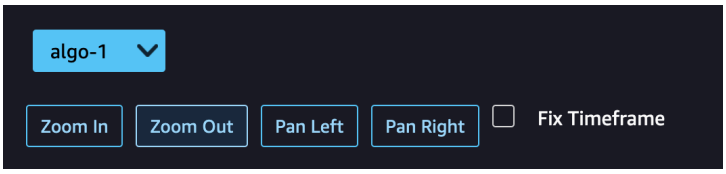
- System metrics
- Rules

System metrics

In the **System Metrics** tab, you can use the summary table and timeseries plots to understand resource utilization.

Resource utilization summary

This summary table shows the statistics of compute resource utilization metrics of all nodes (denoted as algo-*n*). The resource utilization metrics include the total CPU utilization, the total GPU utilization, the total CPU memory utilization, the total GPU memory utilization, the total I/O wait time, and the total network in bytes. The table shows the minimum and the maximum values, and p99, p90, and p50 percentiles.

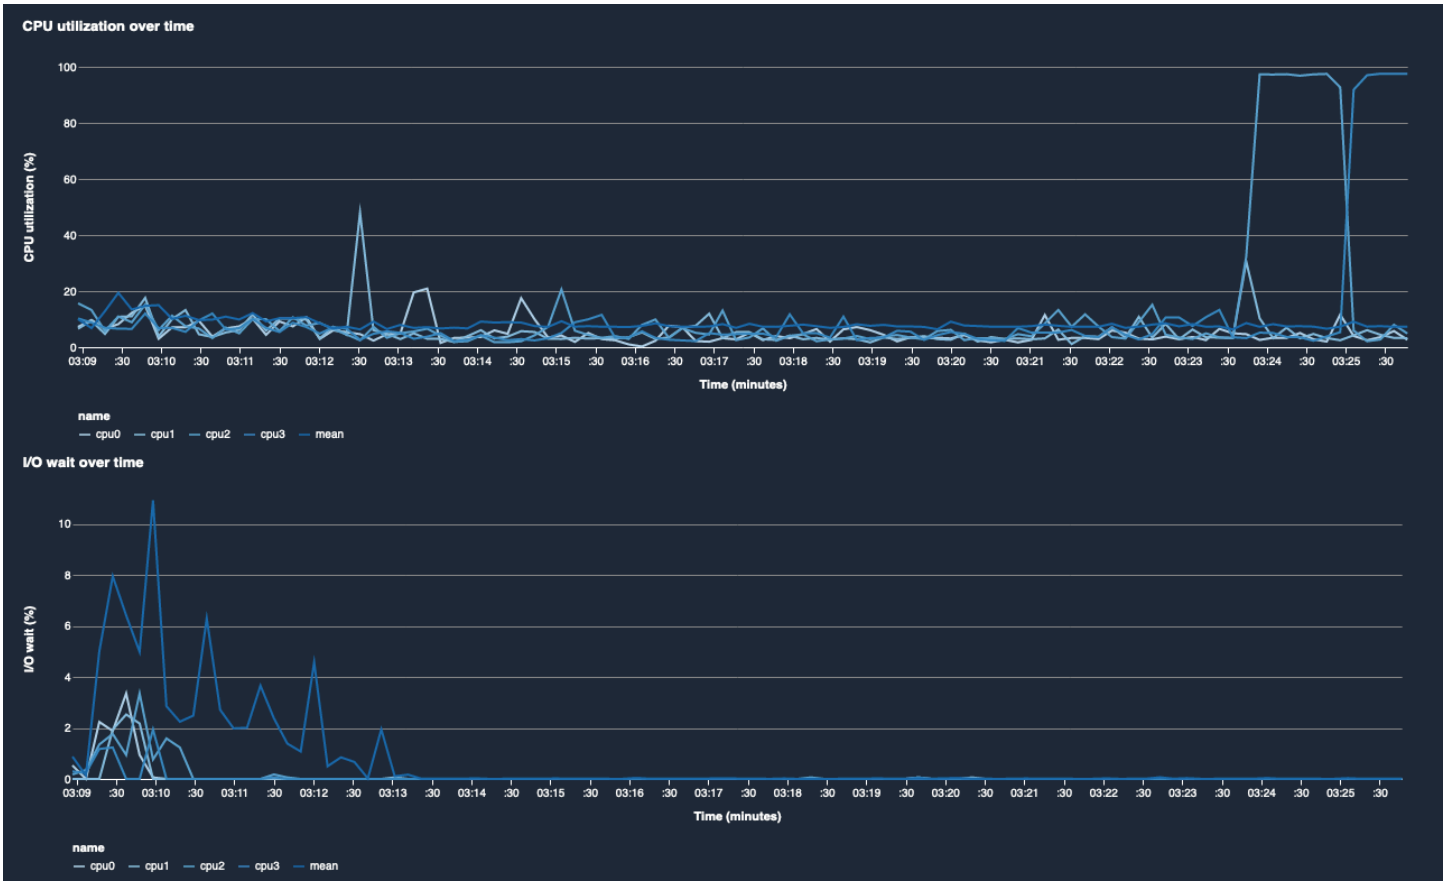


Node	Metric	Unit	Max	p99	p95	p50	Min
algo-1	Network	MB/s	37.82	33.68	32.83	12.39	0
algo-2	Network	MB/s	37.51	33.51	32.69	9.54	0
algo-1	GPU	%	69	20.61	18.27	6.81	0
algo-2	GPU	%	70	20.89	18.68	6.53	0
algo-1	CPU	%	100	94.58	78.95	51.71	0
algo-2	CPU	%	100	94.76	78.48	49.72	0
algo-1	CPU memory	%	5	4.98	4.92	4.16	1
algo-2	CPU memory	%	5	4.98	4.91	4.15	1
algo-1	GPU memory	%	32	9.6	7.71	2.27	0
algo-2	GPU memory	%	33	9.59	7.76	2.21	0
algo-1	I/O	%	100	20.41	0	0	0
algo-2	I/O	%	92	19.45	0	0	0

Resource utilization time series plots

Use the time series graphs to see more details of resource utilization and identify at what time interval each instance shows any undesired utilization rate, such as low GPU utilization and CPU bottlenecks that can cause a waste of the expensive instance.

The time series graph controller UI

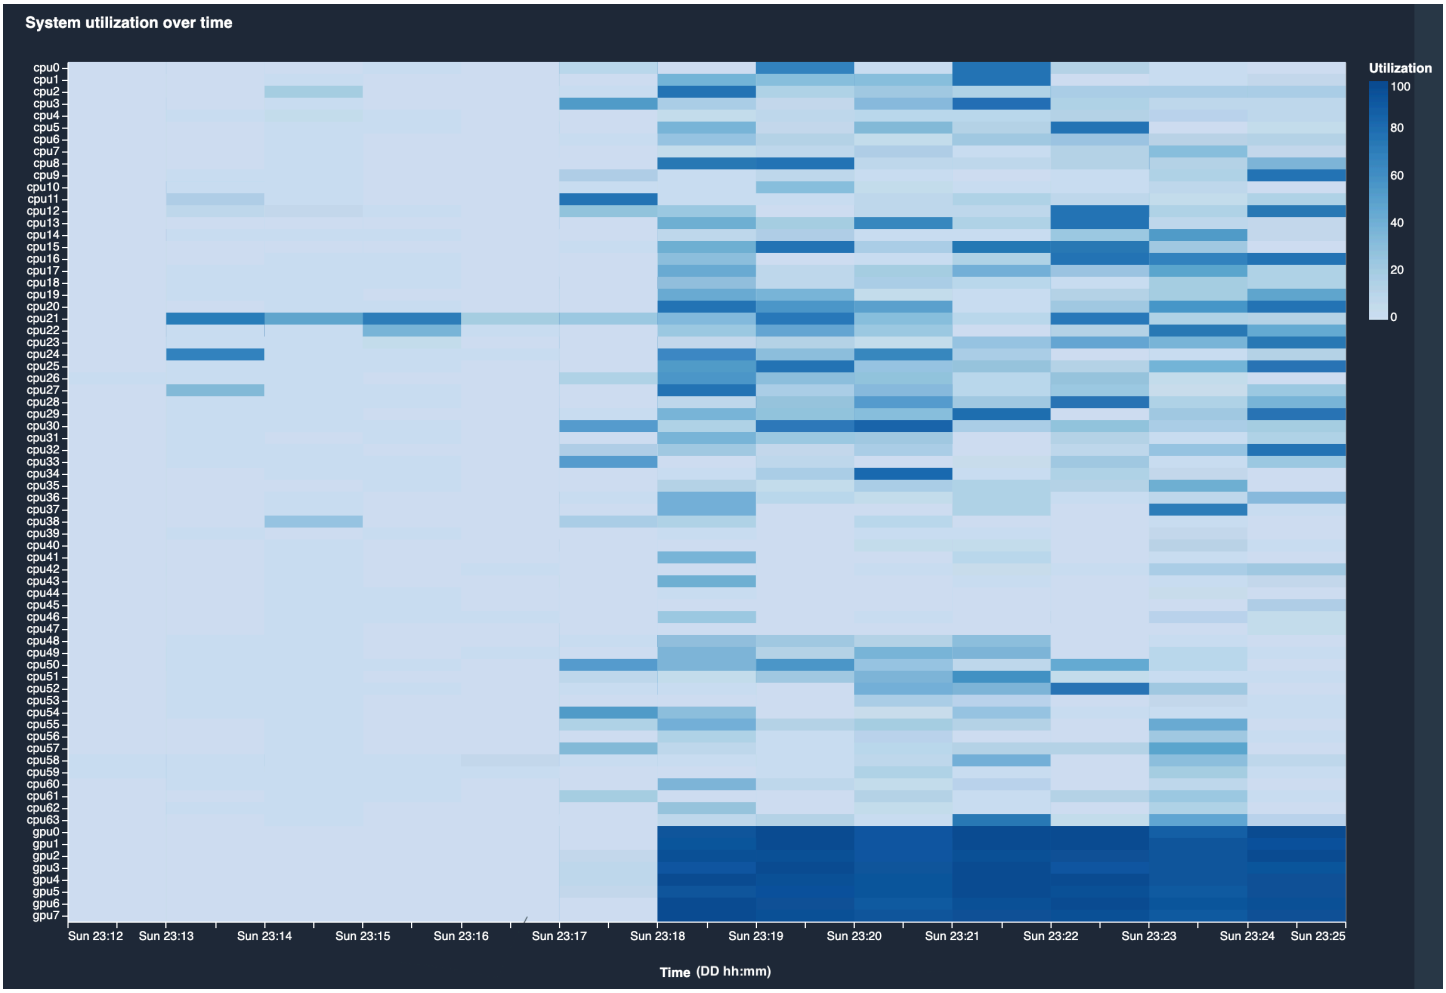


The following screenshot shows the UI controller for adjusting the time series graphs.

- **algo-1**: Use this dropdown menu to choose the node that you want to look into.
- **Zoom In**: Use this button to zoom in the time series graphs and view shorter time intervals.
- **Zoom Out**: Use this button to zoom out the time series graphs and view wider time intervals.
- **Pan Left**: Move the time series graphs to an earlier time interval.
- **Pan Right**: Move the time series graphs to a later time interval.
- **Fix Timeframe**: Use this check box to fix or bring back the time series graphs to show the whole view from the first data point to the last data point.

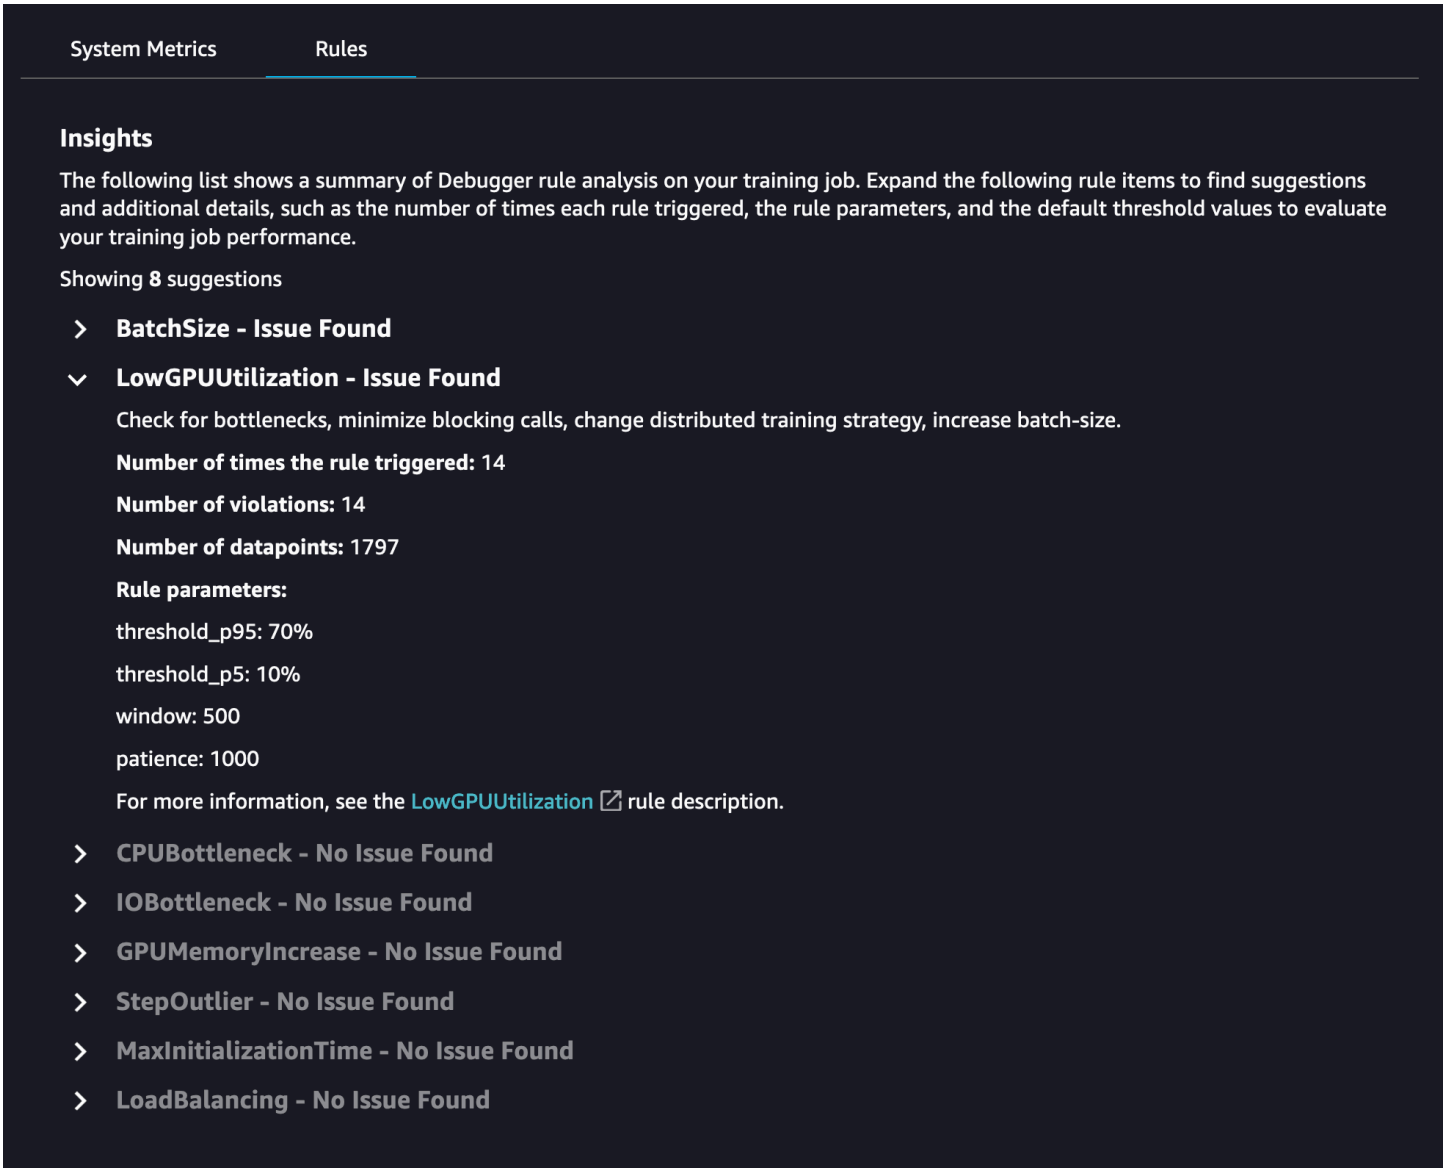
CPU utilization and I/O wait time

The first two graphs show CPU utilization and I/O wait time over time. By default, the graphs show the average of CPU utilization rate and I/O wait time spent on the CPU cores. You can select one or more CPU cores by selecting the labels to graph them on single chart and compare utilization across cores. You can drag and zoom in and out to have a closer look at specific time intervals.



GPU utilization and GPU memory utilization

The following graphs show GPU utilization and GPU memory utilization over time. By default, the graphs show the mean utilization rate over time. You can select the GPU core labels to see the utilization rate of each core. Taking the mean of utilization rate over the total number of GPU cores shows the mean utilization of the entire hardware system resource. By looking at the mean utilization rate, you can check the overall system resource usage of an Amazon EC2 instance. The following figure shows an example training job on an `ml.p3.16xlarge` instance with 8 GPU cores. You can monitor if the training job is well distributed, fully utilizing all GPUs.

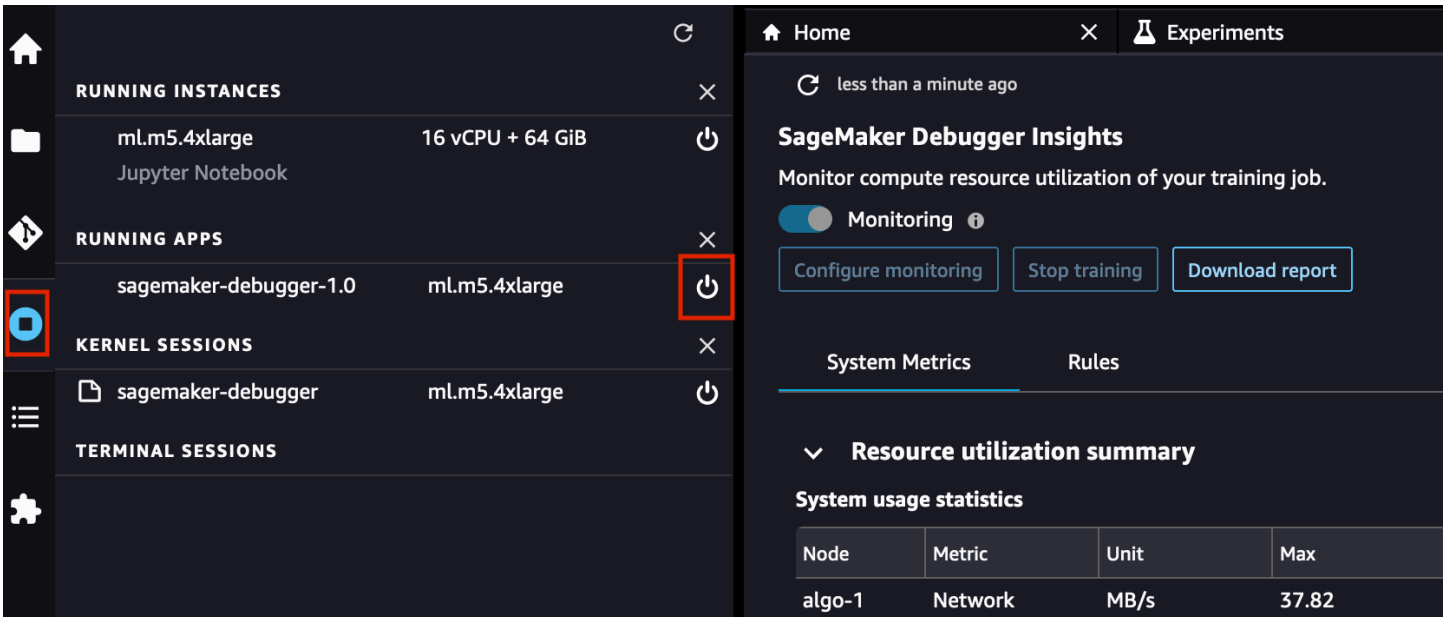


Overall system utilization over time

The following heatmap shows an example of the entire system utilization of an `ml.p3.16xlarge` instance over time, projected onto the two-dimensional plot. Every CPU and GPU core is listed in the vertical axis, and the utilization is recorded over time with a color scheme, where the bright colors represent low utilization and the darker colors represent high utilization. See the labeled color bar on the right side of the plot to find out which color level corresponds to which utilization rate.

Rules

Use the **Rules** tab to find a summary of the profiling rule analysis on your training job. If the profiling rule is activated with the training job, the text appears highlighted with the solid white text. Inactive rules are dimmed in gray text. To activate these rules, follow instructions at the section called “Use built-in profiler rules”.



Shut down the Amazon SageMaker Debugger Insights instance

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

When you are not using the SageMaker Debugger Insights dashboard, you should shut down the app instance to avoid incurring additional fees.

To shut down the SageMaker Debugger Insights app instance in Studio Classic

1. In Studio Classic, select the **Running Instances and Kernels** icon
   ( ).
2. Under the **RUNNING APPS** list, look for the **sagemaker-debugger-1.0** app. Select the shutdown icon
   ( )
   next to the app. The SageMaker Debugger Insights dashboards run on an `ml.m5.4xlarge` instance. This instance also disappears from the **RUNNING INSTANCES** when you shut down the **sagemaker-debugger-1.0** app.

SageMaker Debugger interactive report

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

Receive profiling reports autogenerated by Debugger. The Debugger report provide insights into your training jobs and suggest recommendations to improve your model performance.

The following screenshot shows a collage of the Debugger profiling report. To learn more, see SageMaker Debugger interactive report.

Note

You can download a Debugger reports while your training job is running or after the job has finished. During training, Debugger concurrently updates the report reflecting the current rules' evaluation status. You can download a complete Debugger report only after the training job has completed.

Important

In the reports, plots and and recommendations are provided for informational purposes and are not definitive. You are responsible for making your own independent assessment of the information.

For any SageMaker training jobs, the SageMaker Debugger ProfilerReport rule invokes all of the monitoring and profiling rules and aggregates the rule analysis into a comprehensive report. Following this guide, download the report using the Amazon SageMaker Python SDK or the S3 console, and learn what you can interpret from the profiling results.

Important

In the report, plots and and recommendations are provided for informational purposes and are not definitive. You are responsible for making your own independent assessment of the information.

Download the SageMaker Debugger profiling report

Note

End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

Download the SageMaker Debugger profiling report while your training job is running or after the job has finished using the Amazon SageMaker Python SDK and Amazon Command Line Interface (CLI).

Note

To get the profiling report generated by SageMaker Debugger, you must use the built-in ProfilerReport rule offered by SageMaker Debugger. To activate the rule with your training job, see Configure Built-in Profiler Rules.

Tip

You can also download the report with a single click in the SageMaker Studio Debugger insights dashboard. This doesn't require any additional scripting to download the report. To find out how to download the report from Studio, see Open the Amazon SageMaker Debugger Insights dashboard.

Download using SageMaker Python SDK and Amazon CLI

1. Check the current job's default S3 output base URI.

```
model_trainer.output_path
```

2. Check the current job name.

```
model_trainer.latest_training_job.job_name
```

3. The Debugger profiling report is stored under `<default-s3-output-base-uri>/<training-job-name>/rule-output`. Configure the rule output path as follows:

```
rule_output_path = model_trainer.output_path +
 model_trainer.latest_training_job.job_name + "/rule-output"
```

4. To check if the report is generated, list directories and files recursively under the `rule_output_path` using `aws s3 ls` with the `--recursive` option.

```
! aws s3 ls {rule_output_path} --recursive
```

This should return a complete list of files under an autogenerated folder that's named as `ProfilerReport-1234567890`. The folder name is a combination of strings: `ProfilerReport` and a unique 10-digit tag based on the Unix timestamp when the ProfilerReport rule is initiated.

```
s3://sagemaker-us-east-2-111122223333 /sagemaker-debugger-mnist-byoc-tf2-2020-11-28-06-32-33-097/rule-output

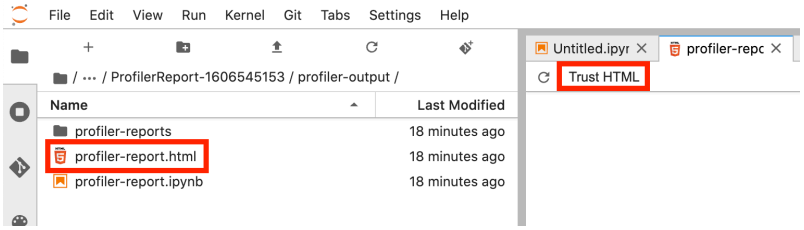
2020-11-28 07:26:03        785 sagemaker-debugger-mnist-byoc-tf2-2020-11-28-06-32-33-097/rule-output/ProfilerReport-1606545153/profiler-output/profiler-reports/LoadBalancing.json
2020-11-28 07:26:03        728 sagemaker-debugger-mnist-byoc-tf2-2020-11-28-06-32-33-097/rule-output/ProfilerReport-1606545153/profiler-output/profiler-reports/LowGPUUtilization.json
2020-11-28 07:26:03        233 sagemaker-debugger-mnist-byoc-tf2-2020-11-28-06-32-33-097/rule-output/ProfilerReport-1606545153/profiler-output/profiler-reports/MaxInitializationTime.json
2020-11-28 07:26:03       1585 sagemaker-debugger-mnist-byoc-tf2-2020-11-28-06-32-33-097/rule-output/ProfilerReport-1606545153/profiler-output/profiler-reports/OverallFrameworkMetrics.json
2020-11-28 07:26:03        575 sagemaker-debugger-mnist-byoc-tf2-2020-11-28-06-32-33-097/rule-output/ProfilerReport-1606545153/profiler-output/profiler-reports/OverallSystemUsage.json
2020-11-28 07:26:03       2208 sagemaker-debugger-mnist-byoc-tf2-2020-11-28-06-32-33-097/rule-output/ProfilerReport-1606545153/profiler-output/profiler-reports/StepOutlier.json
```

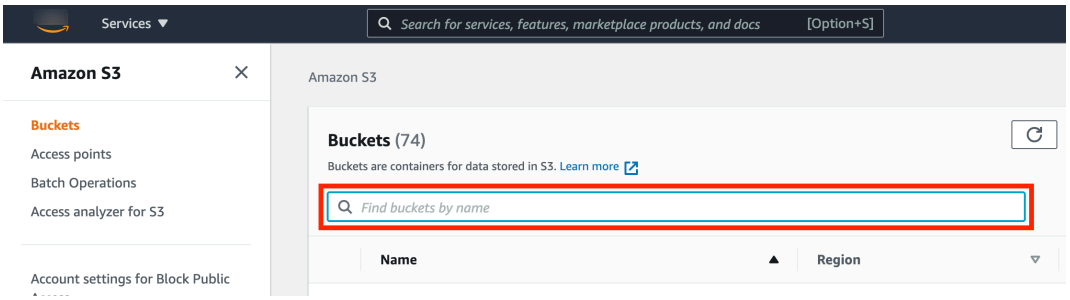


The `profiler-report.html` is an autogenerated profiling report by Debugger. The remaining files are the built-in rule analysis components stored in JSON and a Jupyter notebook that are used to aggregate them into the report.

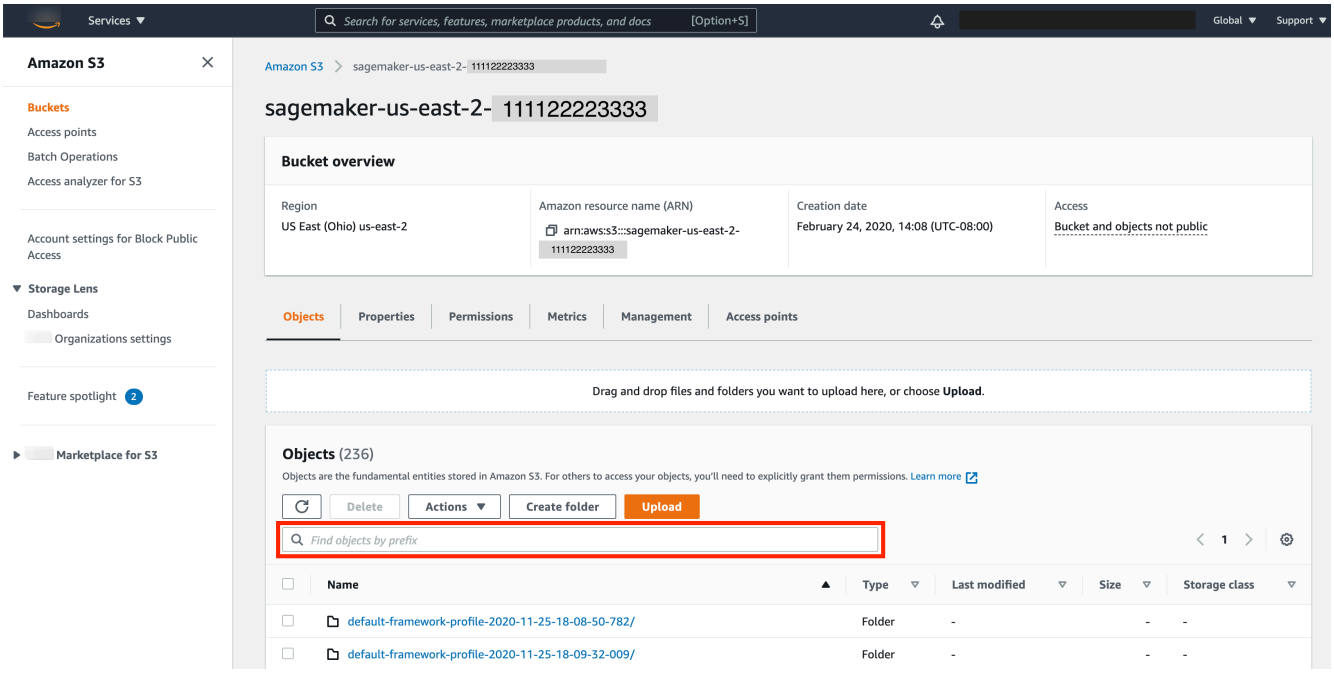
5. Download the files recursively using `aws s3 cp`. The following command saves all of the rule output files to the `ProfilerReport-1234567890` folder under the current working directory.

```
! aws s3 cp {rule_output_path} ./ --recursive
```

> **Tip**
>
> If using a Jupyter notebook server, run `!pwd` to double check the current working directory.

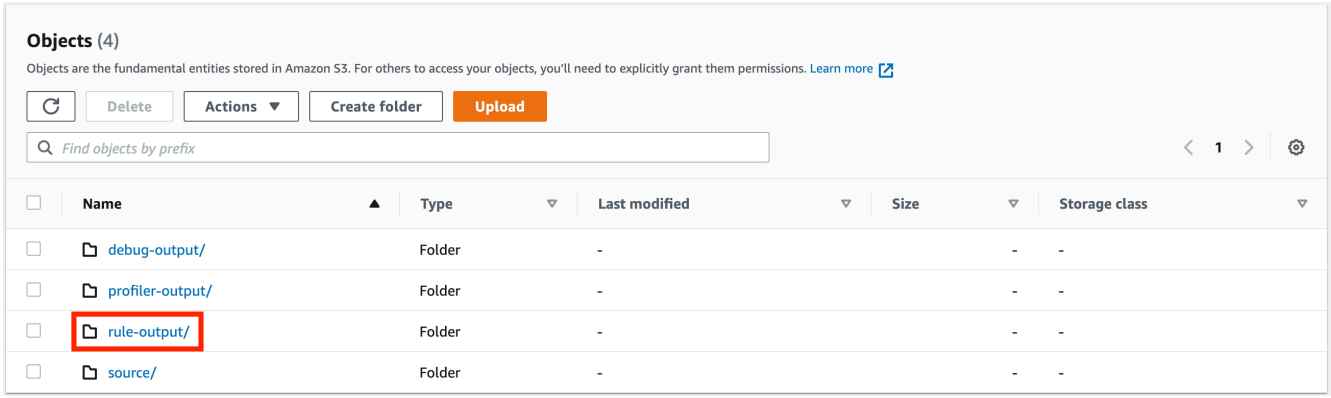


6. Under the `/ProfilerReport-1234567890/profiler-output` directory, open `profiler-report.html`. If using JupyterLab, choose **Trust HTML** to see the autogenerated Debugger profiling report.

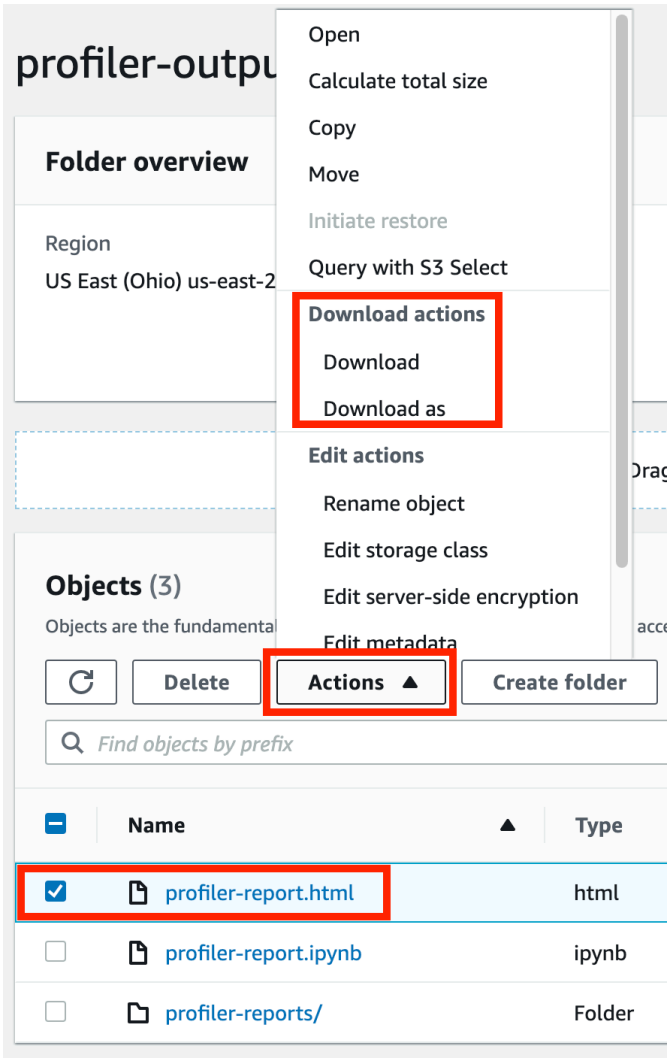


7. Open the `profiler-report.ipynb` file to explore how the report is generated. You can also customize and extend the profiling report using the Jupyter notebook file.

Download using Amazon S3 Console



1. Sign in to the Amazon Web Services Management Console and open the Amazon S3 console at https://console.amazonaws.cn/s3/.
2. Search for the base S3 bucket. For example, if you haven't specified any base job name, the base S3 bucket name should be in the following format: `sagemaker-<region>-111122223333`. Look up the base S3 bucket through the *Find bucket by name* field.



3. In the base S3 bucket, look up the training job name by specifying your job name prefix into the *Find objects by prefix* input field. Choose the training job name.

4. In the training job's S3 bucket, there must be three subfolders for training data collected by Debugger: **debug-output/**, **profiler-output/**, and **rule-output/**. Choose **rule-output/**.

5. In the **rule-output/** folder, choose **ProfilerReport-1234567890**, and choose **profiler-output/** folder. The **profiler-output/** folder contains **profiler-report.html** (the autogenerated profiling report in html), **profiler-report.ipynb** (a Jupyter notebook with scripts that are used for generating the report), and a **profiler-report/** folder (contains rule analysis JSON files that are used as components of the report).
6. Select the **profiler-report.html** file, choose **Actions**, and **Download**.

7. Open the downloaded **profiler-report.html** file in a web browser.

> **Note**
>
> If you started your training job without configuring the Debugger-specific parameters, Debugger generates the report based only on the system monitoring rules because the Debugger parameters are not configured to save framework metrics. To enable framework metrics profiling and receive an extended Debugger profiling report, configure the `profiler_config` parameter when constructing or updating SageMaker AI ModelTrainers.
>
> To learn how to configure the `profiler_config` parameter before starting a training job, see Estimator configuration for framework profiling.

To update the current training job and enable framework metrics profiling, see Update Debugger Framework Profiling Configuration.

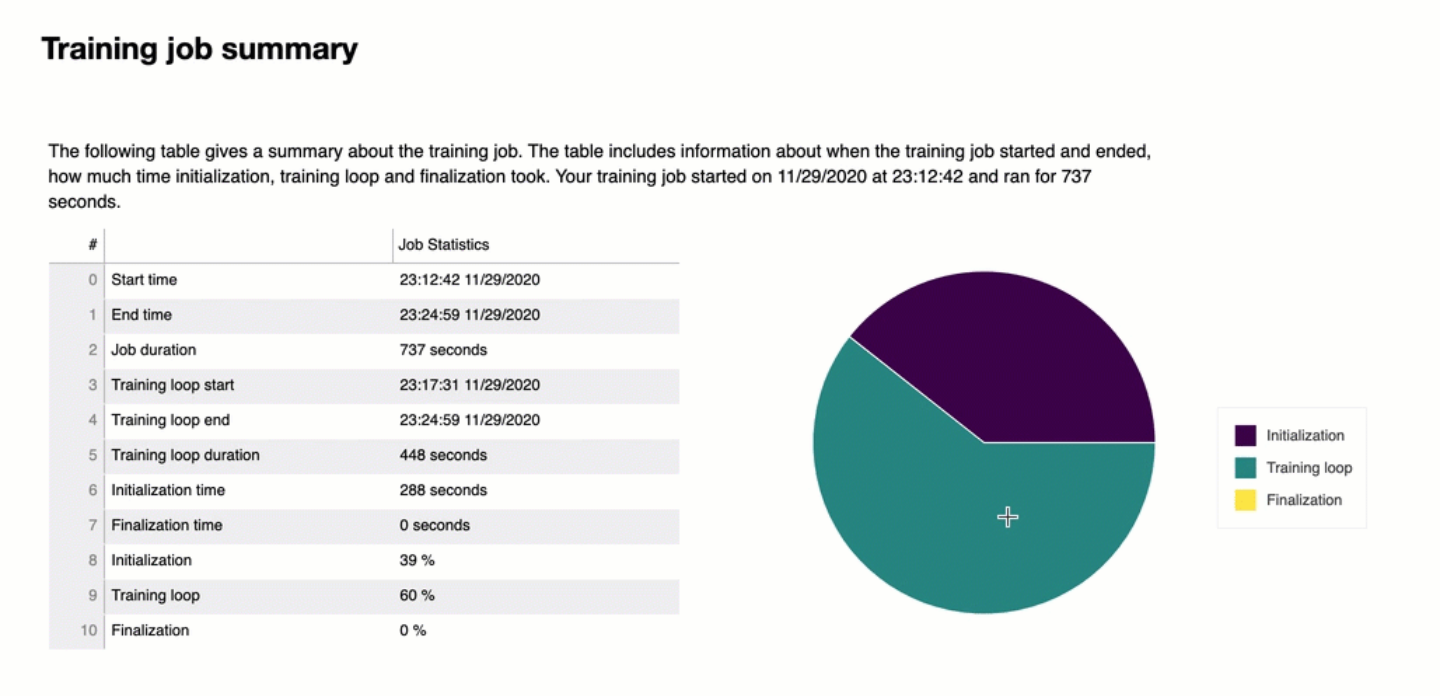
Debugger profiling report walkthrough

Note

End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

This section walks you through the Debugger profiling report section by section. The profiling report is generated based on the built-in rules for monitoring and profiling. The report shows result plots only for the rules that found issues.

Important



In the report, plots and and recommendations are provided for informational purposes and are not definitive. You are responsible for making your own independent assessment of the information.

Topics

- Training job summary
- System usage statistics
- Framework metrics summary
- Rules summary
- Analyzing the training loop – step durations
- GPU utilization analysis
- Batch size
- CPU bottlenecks
- I/O bottlenecks
- Load balancing in multi-GPU training
- GPU memory analysis

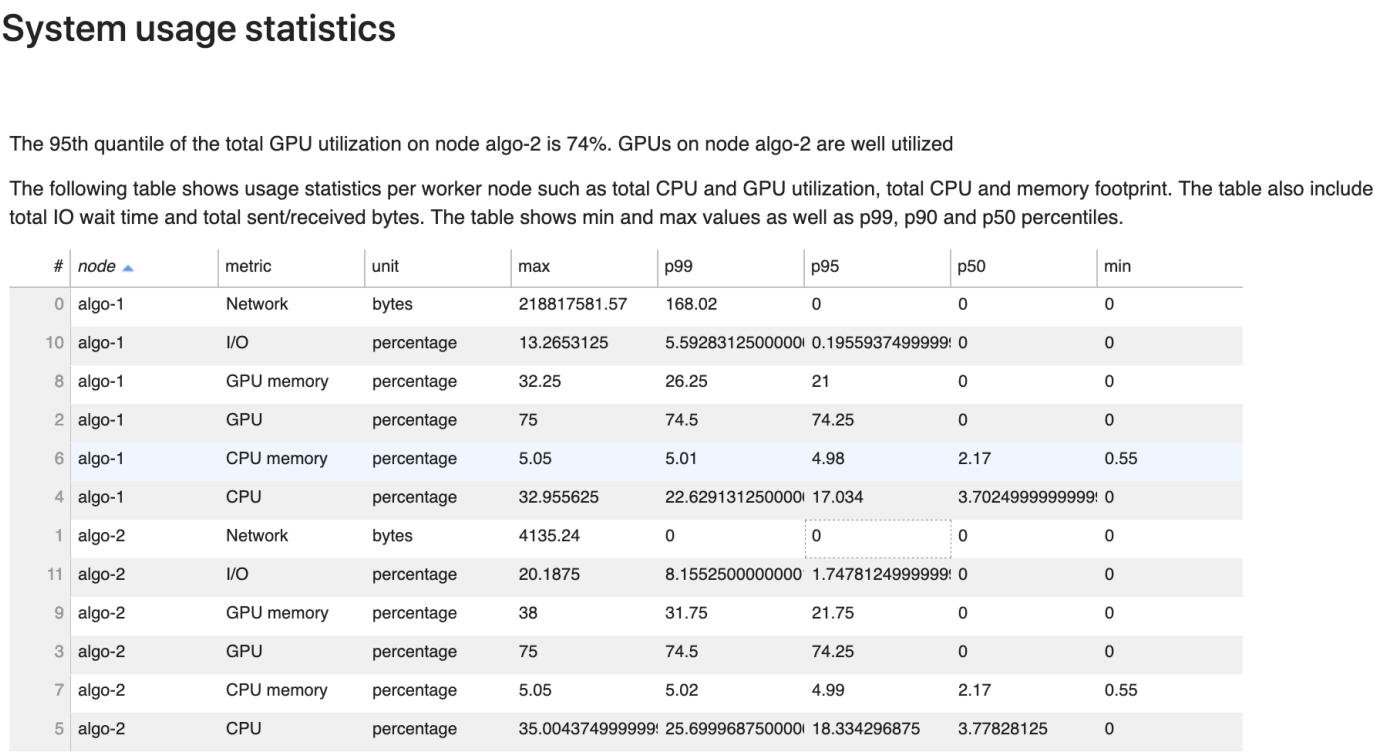
Training job summary

At the beginning of the report, Debugger provides a summary of your training job. In this section, you can overview the time durations and timestamps at different training phases.

Training job summary

The following table gives a summary about the training job. The table includes information about when the training job started and ended, how much time initialization, training loop and finalization took. Your training job started on 11/29/2020 at 23:12:42 and ran for 737 seconds.

#		Job Statistics
0	Start time	23:12:42 11/29/2020
1	End time	23:24:59 11/29/2020
2	Job duration	737 seconds
3	Training loop start	23:17:31 11/29/2020
4	Training loop end	23:24:59 11/29/2020
5	Training loop duration	448 seconds
6	Initialization time	288 seconds
7	Finalization time	0 seconds
8	Initialization	39 %
9	Training loop	60 %
10	Finalization	0 %



The summary table contains the following information:

- **start_time** – The exact time when the training job started.
- **end_time** – The exact time when the training job finished.
- **job_duration_in_seconds** – The total training time from the **start_time** to the **end_time**.
- **training_loop_start** – The exact time when the first step of the first epoch has started.
- **training_loop_end** – The exact time when the last step of the last epoch has finished.
- **training_loop_duration_in_seconds** – The total time between the training loop start time and the training loop end time.
- **initialization_in_seconds** – Time spent on initializing the training job. The initialization phase covers the period from the **start_time** to the **training_loop_start** time. The initialization time is spent on compiling the training script, starting the training script, creating and initializing the model, initiating EC2 instances, and downloading training data.
- **finalization_in_seconds** – Time spent on finalizing the training job, such as finishing the model training, updating the model artifacts, and closing the EC2 instances. The finalization phase covers the period from the **training_loop_end** time to the **end_time**.

- **initialization (%)** – The percentage of time spent on **initialization** over the total **job_duration_in_seconds**.
- **training loop (%)** – The percentage of time spent on **training loop** over the total **job_duration_in_seconds**.
- **finalization (%)** – The percentage of time spent on **finalization** over the total **job_duration_in_seconds**.

System usage statistics

In this section, you can see an overview of system utilization statistics.

System usage statistics

The 95th quantile of the total GPU utilization on node algo-2 is 74%. GPUs on node algo-2 are well utilized

The following table shows usage statistics per worker node such as total CPU and GPU utilization, total CPU and memory footprint. The table also include total IO wait time and total sent/received bytes. The table shows min and max values as well as p99, p90 and p50 percentiles.

#	node	metric	unit	max	p99	p95	p50	min
0	algo-1	Network	bytes	218817581.57	168.02	0	0	0
10	algo-1	I/O	percentage	13.2653125	5.5928312500000	0.1955937499999	0	0
8	algo-1	GPU memory	percentage	32.25	26.25	21	0	0
2	algo-1	GPU	percentage	75	74.5	74.25	0	0
6	algo-1	CPU memory	percentage	5.05	5.01	4.98	2.17	0.55
4	algo-1	CPU	percentage	32.955625	22.629131250000	17.034	3.70249999999999	0
1	algo-2	Network	bytes	4135.24	0	0	0	0
11	algo-2	I/O	percentage	20.1875	8.1552500000000	1.74781249999999	0	0
9	algo-2	GPU memory	percentage	38	31.75	21.75	0	0
3	algo-2	GPU	percentage	75	74.5	74.25	0	0
7	algo-2	CPU memory	percentage	5.05	5.02	4.99	2.17	0.55
5	algo-2	CPU	percentage	35.004374999999	25.699968750000	18.334296875	3.77828125	0

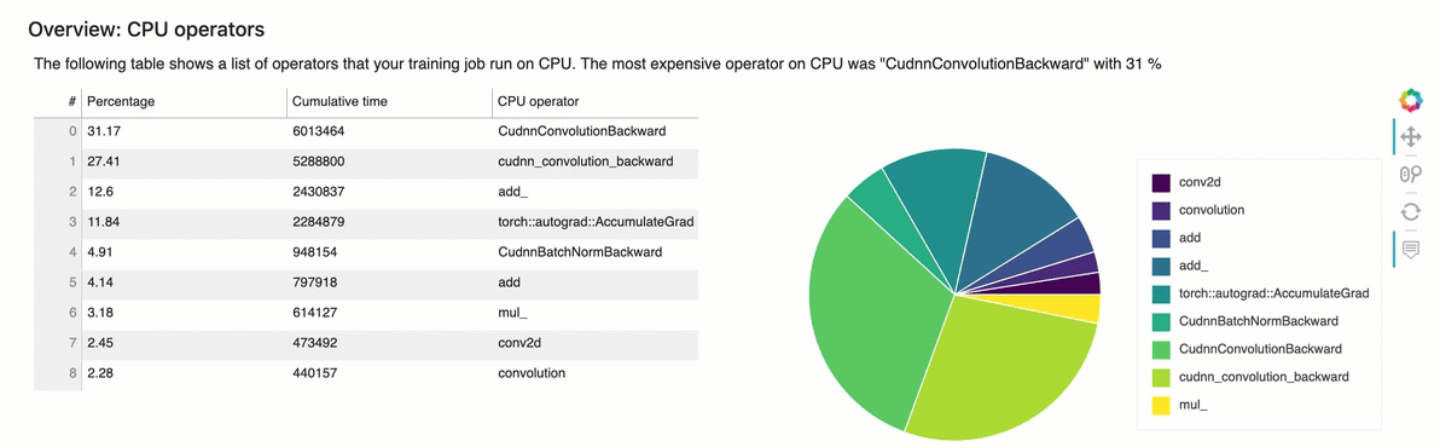
The Debugger profiling report includes the following information:

- **node** – Lists the name of nodes. If using distributed training on multi nodes (multiple EC2 instances), the node names are in format of `algo-n`.
- **metric** – The system metrics collected by Debugger: CPU, GPU, CPU memory, GPU memory, I/O, and Network metrics.
- **unit** – The unit of the system metrics.
- **max** – The maximum value of each system metric.

- **p99** – The 99th percentile of each system utilization.
- **p95** – The 95th percentile of each system utilization.
- **p50** – The 50th percentile (median) of each system utilization.
- **min** – The minimum value of each system metric.

Framework metrics summary

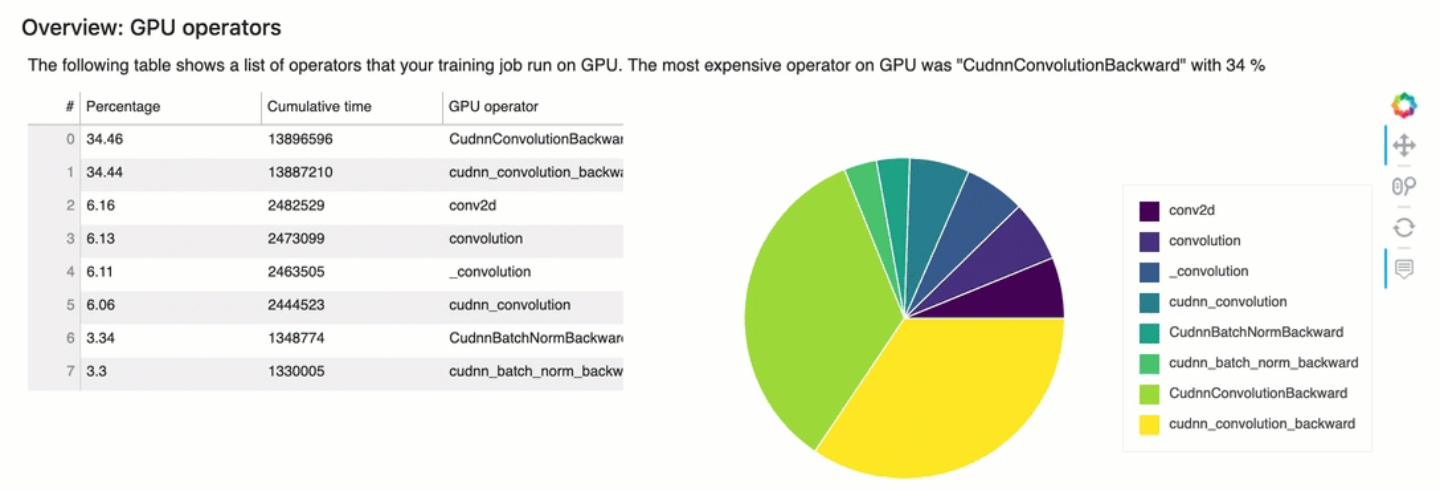
In this section, the following pie charts show the breakdown of framework operations on CPUs and GPUs.



Each of the pie charts analyzes the collected framework metrics in various aspects as follows:

- **Ratio between TRAIN/EVAL phase and others** – Shows the ratio between time durations spent on different training phases.

- **Ratio between forward and backward pass** – Shows the ratio between time durations spent on forward and backward pass in the training loop.
- **Ratio between CPU/GPU operators** – Shows the ratio between time spent on operators running on CPU or GPU, such as convolutional operators.
- **General metrics recorded in framework** – Shows the ratio between time spent on major framework metrics, such as data loading, forward and backward pass.



Overview: CPU Operators

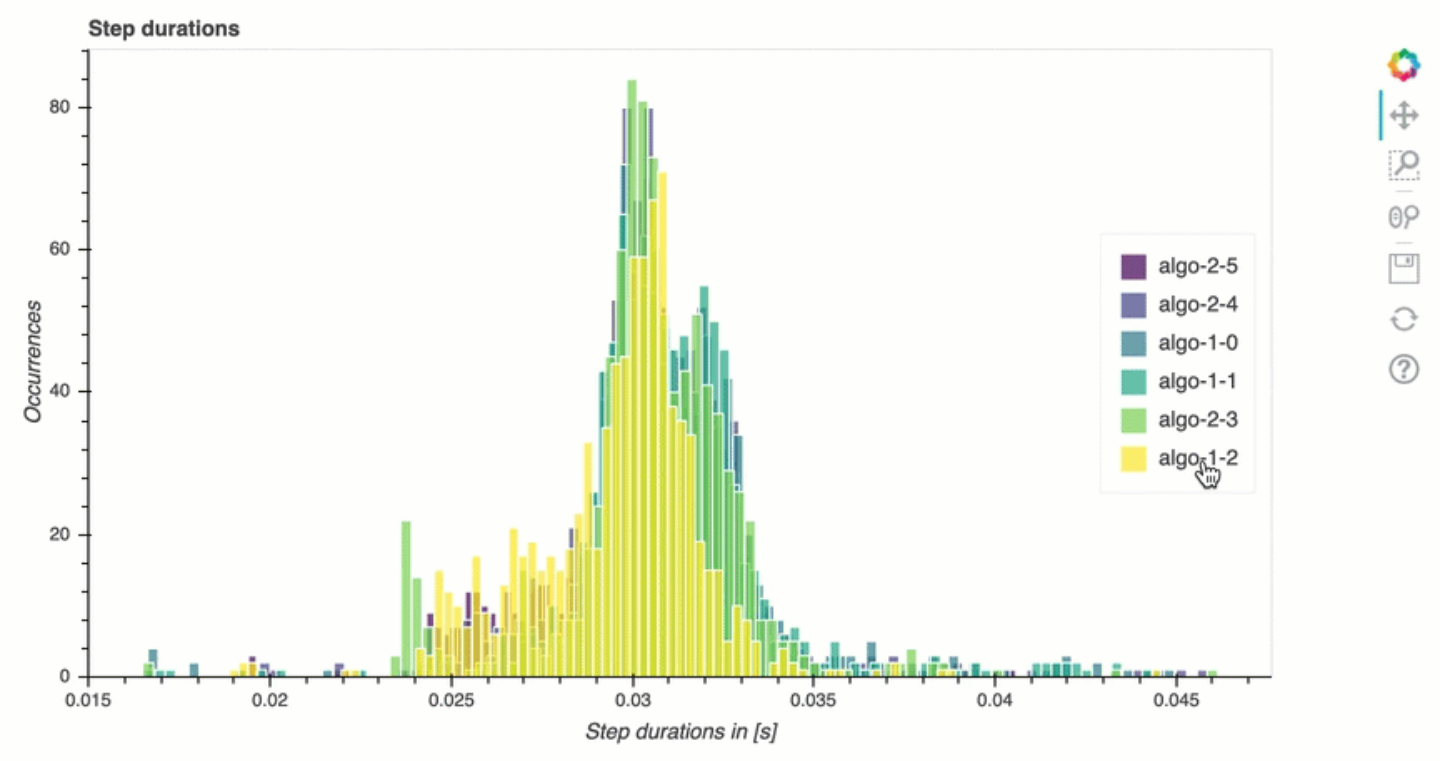
This section provides information of the CPU operators in detail. The table shows the percentage of the time and the absolute cumulative time spent on the most frequently called CPU operators.

Overview: GPU operators

This section provides information of the GPU operators in detail. The table shows the percentage of the time and the absolute cumulative time spent on the most frequently called GPU operators.

Rules summary

In this section, Debugger aggregates all of the rule evaluation results, analysis, rule descriptions, and suggestions.



Rules summary

The following table shows a summary of the executed profiler rules. The table is sorted by the rules that triggered most frequently. In your training job this was the case for rule LoadBalancing. It has processed 5467 datapoints and triggered 263 times.

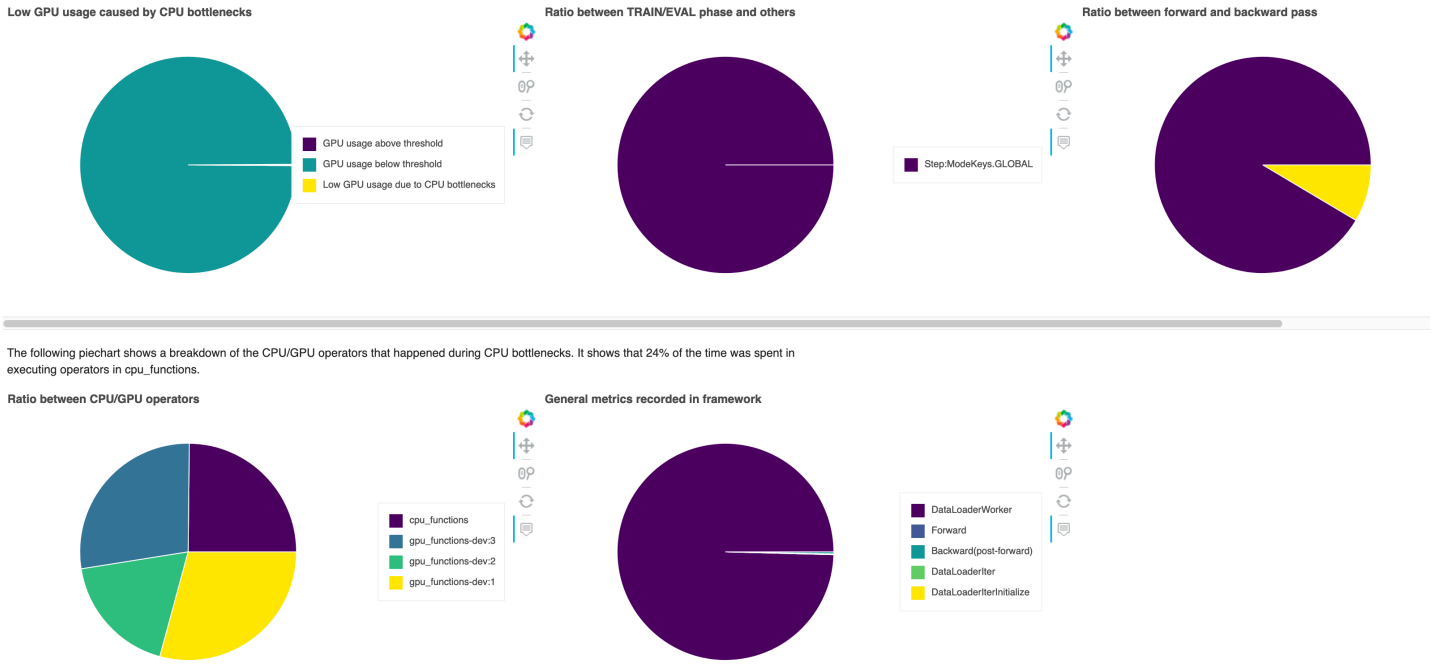
	Description	Recommendation	Number of times rule triggered	Number of datapoints	Rule parameters
LoadBalancing	Detect issues in workload balancing between multiple GPUs. Workload imbalance can for instance occur in data parallel training when gradients are accumulated on primary GPU so this GPU will be overused with regards to other GPUs limiting the effect of parallelization.	Choose different distributed training strategy or different distributed training framework	263	5467	threshold:0.2 patience:1000
LowGPUUtilization	Checks if GPU utilization is low or suffers from fluctuations. This can happen if there are bottlenecks, many blocking calls due to synchronizations or batch size too small.	Check for bottlenecks, minimize blocking calls, change distributed training strategy, increase batch-size.	244	5467	threshold_p95:70 threshold_p5:10 window:500 patience:1000
BatchSize	Checks if GPU is under-utilized because of the batch size being too small. To detect this the rule analyzes the average GPU memory footprint, CPU and GPU utilization.	Run on a smaller instance type or increase batch size	211	5466	cpu_threshold_p95:70 gpu_threshold_p95:70 gpu_memory_threshold_p95:70 patience:1000 window:500
GPUMemoryIncrease	If model and/or batch size is too large then training will run out of memory and crash.	Choose a larger instance type with more memory (if it is not a memory leak) or apply model parallelism (Rubik)	25	5467	increase:5 patience:1000 window:10
CPUBottleneck	Checks if CPU usage is high but GPU usage is low at the same time, it may indicate a CPU bottleneck where GPU is waiting for data to arrive from CPU. The rule triggers if number of CPU bottlenecks exceeds a predefined threshold.	CPU bottlenecks can happen when data preprocessing is very compute intensive. You should consider increasing the number of data-loader processes or apply pre-fetching.	18	10938	threshold:50 cpu_threshold:90 gpu_threshold:10 patience:1000
IOBottleneck	If IO wait time is high but at the same time GPU usage is low, it may indicate an IO bottleneck where GPU is waiting for data to arrive from disk. The rule triggers if number of IO bottlenecks exceeds a predefined threshold.	Pre-fetch data or choose different file formats such as binary formats which improves read performance.	0	10938	threshold:50 io_threshold:50 gpu_threshold:10 patience:1000
StepOutlier	Detect outliers in step duration. Time for forward and backward pass should be roughly the same throughout the training. If there are significant outliers it would indicate an issue due to a system stall or a bottleneck.	Check for bottlenecks	0	4803	threshold:3 mode:None n_outliers:10 stddev:3
MaxInitializationTime	Checks if the training initialization is taking too much time. The rule waits until first step is available. This can happen if you are running in File mode and a lot of data needs to be downloaded from Amazon S3.	Switch from File to Pipe mode	0	4803	threshold:20

Analyzing the training loop – step durations

In this section, you can find a detailed statistics of step durations on each GPU core of each node. Debugger evaluates mean, maximum, p99, p95, p50, and minimum values of step durations, and evaluate step outliers. The following histogram shows the step durations captured on different worker nodes and GPUs. You can enable or disable the histogram of each worker by choosing the legends on the right side. You can check if there is a particular GPU that's causing step duration outliers.

GPU utilization analysis

This section shows the detailed statistics about GPU core utilization based on LowGPUUtilization rule. It also summarizes the GPU utilization statistics, mean, p95, and p5 to determine if the training job is underutilizing GPUs.



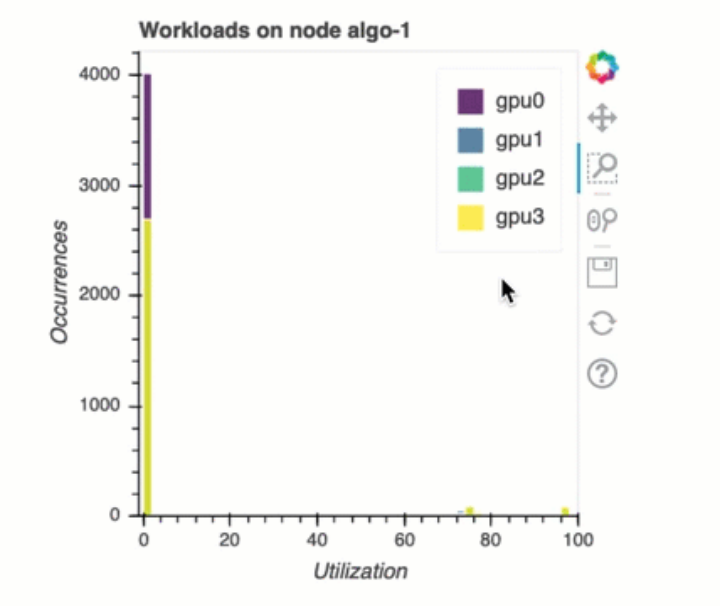
Batch size

This section shows the detailed statistics of total CPU utilization, individual GPU utilizations, and GPU memory footprints. The BatchSize rule determines if you need to change the batch size to better utilize the GPUs. You can check whether the batch size is too small resulting in underutilization or too large causing overutilization and out of memory issues. In the plot, the boxes show the p25 and p75 percentile ranges (filled with dark purple and bright yellow respectively) from the median (p50), and the error bars show the 5th percentile for the lower bound and 95th percentile for the upper bound.

CPU bottlenecks

In this section, you can drill down into the CPU bottlenecks that the CPUBottleneck rule detected from your training job. The rule checks if the CPU utilization is above `cpu_threshold` (90% by default) and also if the GPU utilization is below `gpu_threshold` (10% by default).

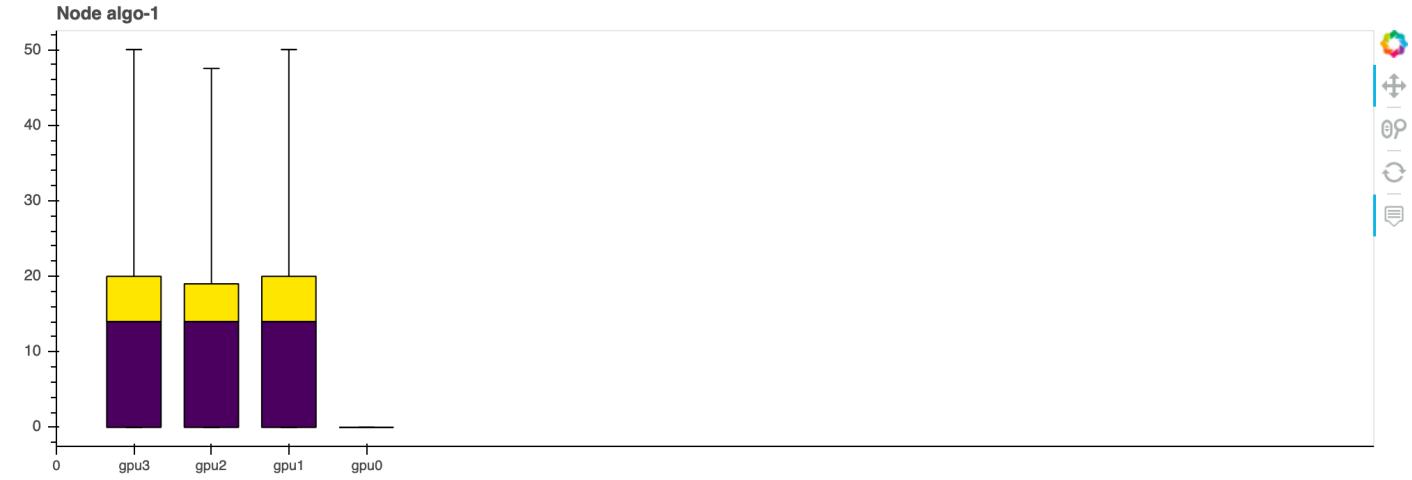
The pie charts show the following information:



- **Low GPU usage caused by CPU bottlenecks** – Shows the ratio of data points between the ones with GPU utilization above and below the threshold and the ones that matches the CPU bottleneck criteria.
- **Ratio between TRAIN/EVAL phase and others** – Shows the ratio between time durations spent on different training phases.
- **Ratio between forward and backward pass** – Shows the ratio between time durations spent on forward and backward pass in the training loop.
- **Ratio between CPU/GPU operators** – Shows the ratio between time durations spent on GPUs and CPUs by Python operators, such as data loader processes and forward and backward pass operators.
- **General metrics recorded in framework** – Shows major framework metrics and the ratio between time durations spent on the metrics.

I/O bottlenecks

In this section, you can find a summary of I/O bottlenecks. The rule evaluates the I/O wait time and GPU utilization rates and monitors if the time spent on the I/O requests exceeds a threshold percent of the total training time. It might indicate I/O bottlenecks where GPUs are waiting for data to arrive from storage.



Load balancing in multi-GPU training

In this section, you can identify workload balancing issue across GPUs.

GPU memory analysis

In this section, you can analyze the GPU memory utilization collected by the GPUMemoryIncrease rule. In the plot, the boxes show the p25 and p75 percentile ranges (filled with dark purple and bright yellow respectively) from the median (p50), and the error bars show the 5th percentile for the lower bound and 95th percentile for the upper bound.

Opt out of the collection of Amazon SageMaker Debugger usage statistics

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

For all SageMaker training jobs, Amazon SageMaker Debugger runs the ProfilerReport rule and autogenerates a SageMaker Debugger interactive report. The `ProfilerReport` rule provides a Jupyter notebook file (`profiler-report.ipynb`) that generates a corresponding HTML file (`profiler-report.html`).

Debugger collects profiling report usage statistics by including code in the Jupyter notebook that collects the unique `ProfilerReport` rule's processing job ARN if the user opens the final `profiler-report.html` file.

Debugger only collects information about whether a user opens the final HTML report. It **DOES NOT** collect any information from training jobs, training data, training scripts, processing jobs, logs, or the content of the profiling report itself.

You can opt out of the collection of usage statistics using one of the following options.

(Recommended) Option 1: Opt out before running a training job

To opt out, you need to add the following Debugger `ProfilerReport` rule configuration to your training job request.

SageMaker Python SDK

```
from sagemaker.train import ModelTrainer

model_trainer=ModelTrainer(
    ...

    rules=ProfilerRule.sagemaker(
        base_config=rule_configs.ProfilerReport()
        rule_parameters={"opt_out_telemetry": "True"}
    )
)
```

Amazon CLI

```
"ProfilerRuleConfigurations": [
    {
        "RuleConfigurationName": "ProfilerReport-1234567890",
        "RuleEvaluatorImage": "895741380848.dkr.ecr.us-west-2.amazonaws.com/
sagemaker-debugger-rules:latest",
        "RuleParameters": {
            "rule_to_invoke": "ProfilerReport",
            "opt_out_telemetry": "True"
        }
    }
]
```

Amazon SDK for Python (Boto3)

```
ProfilerRuleConfigurations=[
    {
        'RuleConfigurationName': 'ProfilerReport-1234567890',
        'RuleEvaluatorImage': '895741380848.dkr.ecr.us-west-2.amazonaws.com/
sagemaker-debugger-rules:latest',
        'RuleParameters': {
            'rule_to_invoke': 'ProfilerReport',
            'opt_out_telemetry': 'True'
        }
    }
]
```

Option 2: Opt out after a training job has completed

To opt out after training has completed, you need to modify the `profiler-report.ipynb` file.

> **Note**
>
> HTML reports autogenerated without **Option 1** already added to your training job request still report the usage statistics even after you opt out using **Option 2**.

1. Follow the instructions on downloading the Debugger profiling report files in the Download the SageMaker Debugger profiling report page.

2. In the `/ProfilerReport-1234567890/profiler-output` directory, open `profiler-report.ipynb`.
3. Add **`opt_out=True`** to the `setup_profiler_report()` function in the fifth code cell as shown in the following example code:

```
setup_profiler_report(processing_job_arn, opt_out=True)
```

4. Run the code cell to finish opting out.

Analyze data using the Debugger Python client library

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

While your training job is running or after it has completed, you can access the training data collected by Debugger using the Amazon SageMaker Python SDK and the SMDebug client library. The Debugger Python client library provides analysis and visualization tools that enable you to drill down into your training job data.

To install the library and use its analysis tools (in a JupyterLab notebook or an iPython kernel)

```
! pip install -U smdebug
```

The following topics walk you through how to use the Debugger Python tools to visualize and analyze the training data collected by Debugger.

Analyze system and framework metrics

- Access the profile data
- Plot the system metrics and framework metrics data
- Access the profiling data using the pandas data parsing tool
- Access the Python profiling stats data
- Merge timelines of multiple profile trace files

- Profiling data loaders

Access the profile data

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

The SMDebug `TrainingJob` class reads data from the S3 bucket where the system and framework metrics are saved.

To set up a `TrainingJob` object and retrieve profiling event files of a training job

```
from smdebug.profiler.analysis.notebook_utils.training_job import TrainingJob
tj = TrainingJob(training_job_name, region)
```

> **Tip**
>
> You need to specify the `training_job_name` and `region` parameters to log to a training job. There are two ways to specify the training job information:
>
> - Use the SageMaker Python SDK while the ModelTrainer is still attached to the training job.
>
>  ```
>  import sagemaker
>  training_job_name=model_trainer.latest_training_job.job_name
>  region=Session().boto_region_name
>  ```
>
> - Pass strings directly.
>
>  ```
>  training_job_name="your-training-job-name-YYYY-MM-DD-HH-MM-SS-SSS"
>  region="us-west-2"
>  ```

Note

By default, SageMaker Debugger collects system metrics to monitor hardware resource utilization and system bottlenecks. Running the following functions, you might receive error messages regarding unavailability of framework metrics. To retrieve framework profiling data and gain insights into framework operations, you must enable framework profiling.

- If you use SageMaker Python SDK to manipulate your training job request, pass the `framework_profile_params` to the `profiler_config` argument of your ModelTrainer. To learn more, see Configure SageMaker Debugger Framework Profiling.
- If you use Studio Classic, turn on profiling using the **Profiling** toggle button in the Debugger insights dashboard. To learn more, see SageMaker Debugger Insights Dashboard Controller.

To retrieve a description of the training job description and the S3 bucket URI where the metric data are saved

```
tj.describe_training_job()
tj.get_config_and_profiler_s3_output_path()
```

To check if the system and framework metrics are available from the S3 URI

```
tj.wait_for_sys_profiling_data_to_be_available()
tj.wait_for_framework_profiling_data_to_be_available()
```

To create system and framework reader objects after the metric data become available

```
system_metrics_reader = tj.get_systems_metrics_reader()
framework_metrics_reader = tj.get_framework_metrics_reader()
```

To refresh and retrieve the latest training event files

The reader objects have an extended method, `refresh_event_file_list()`, to retrieve the latest training event files.

```
system_metrics_reader.refresh_event_file_list()
```

```
framework_metrics_reader.refresh_event_file_list()
```

Plot the system metrics and framework metrics data

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

You can use the system and algorithm metrics objects for the following visualization classes to plot timeline graphs and histograms.

> **Note**
>
> To visualize the data with narrowed-down metrics in the following visualization object plot methods, specify `select_dimensions` and `select_events` parameters. For example, if you specify `select_dimensions=["GPU"]`, the plot methods filter the metrics that include the "GPU" keyword. If you specify `select_events=["total"]`, the plot methods filter the metrics that include the "total" event tags at the end of the metric names. If you enable these parameters and give the keyword strings, the visualization classes return the charts with filtered metrics.

- The `MetricsHistogram` class

```
from smdebug.profiler.analysis.notebook_utils.metrics_histogram import
 MetricsHistogram

metrics_histogram = MetricsHistogram(system_metrics_reader)
metrics_histogram.plot(
    starttime=0,
    endtime=system_metrics_reader.get_timestamp_of_latest_available_file(),
    select_dimensions=["CPU", "GPU", "I/O"], # optional
    select_events=["total"]                  # optional
)
```

- The `StepTimelineChart` class

```
from smdebug.profiler.analysis.notebook_utils.step_timeline_chart import
 StepTimelineChart

view_step_timeline_chart = StepTimelineChart(framework_metrics_reader)
```

- The `StepHistogram` class

```
from smdebug.profiler.analysis.notebook_utils.step_histogram import StepHistogram

step_histogram = StepHistogram(framework_metrics_reader)
step_histogram.plot(
    starttime=step_histogram.last_timestamp - 5 * 1000 * 1000,
    endtime=step_histogram.last_timestamp,
    show_workers=True
)
```

- The `TimelineCharts` class

```
from smdebug.profiler.analysis.notebook_utils.timeline_charts import TimelineCharts

view_timeline_charts = TimelineCharts(
    system_metrics_reader,
    framework_metrics_reader,
    select_dimensions=["CPU", "GPU", "I/O"], # optional
    select_events=["total"]                  # optional
)

view_timeline_charts.plot_detailed_profiler_data([700,710])
```

- The `Heatmap` class

```
from smdebug.profiler.analysis.notebook_utils.heatmap import Heatmap

view_heatmap = Heatmap(
    system_metrics_reader,
    framework_metrics_reader,
    select_dimensions=["CPU", "GPU", "I/O"], # optional
    select_events=["total"],                 # optional
    plot_height=450
)
```

Access the profiling data using the pandas data parsing tool

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

The following `PandasFrame` class provides tools to convert the collected profiling data to Pandas data frame.

```
from smdebug.profiler.analysis.utils.profiler_data_to_pandas import PandasFrame
```

The `PandasFrame` class takes the `tj` object's S3 bucket output path, and its methods `get_all_system_metrics()` `get_all_framework_metrics()` return system metrics and framework metrics in the Pandas data format.

```
pf = PandasFrame(tj.profiler_s3_output_path)
system_metrics_df = pf.get_all_system_metrics()
framework_metrics_df = pf.get_all_framework_metrics(
    selected_framework_metrics=[
        'Step:ModeKeys.TRAIN',
        'Step:ModeKeys.GLOBAL'
    ]
)
```

Access the Python profiling stats data

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

The Python profiling provides framework metrics related to Python functions and operators in your training scripts and the SageMaker AI deep learning frameworks.

Training Modes and Phases for Python Profiling

To profile specific intervals during training to partition statistics for each of these intervals, Debugger provides tools to set modes and phases.

For training modes, use the following `PythonProfileModes` class:

```
from smdebug.profiler.python_profile_utils import PythonProfileModes
```

This class provides the following options:

- `PythonProfileModes.TRAIN` – Use if you want to profile the target steps in the training phase. This mode option available only for TensorFlow.
- `PythonProfileModes.EVAL` – Use if you want to profile the target steps in the evaluation phase. This mode option available only for TensorFlow.
- `PythonProfileModes.PREDICT` – Use if you want to profile the target steps in the prediction phase. This mode option available only for TensorFlow.
- `PythonProfileModes.GLOBAL` – Use if you want to profile the target steps in the global phase, which includes the previous three phases. This mode option available only for PyTorch.
- `PythonProfileModes.PRE_STEP_ZERO` – Use if you want to profile the target steps in the initialization stage before the first training step of the first epoch starts. This phase includes the initial job submission, uploading the training scripts to EC2 instances, preparing the EC2 instances, and downloading input data. This mode option available for both TensorFlow and PyTorch.
- `PythonProfileModes.POST_HOOK_CLOSE` – Use if you want to profile the target steps in the finalization stage after the training job has done and the Debugger hook is closed. This phase includes profiling data while the training jobs are finalized and completed. This mode option available for both TensorFlow and PyTorch.

For training phases, use the following `StepPhase` class:

```
from smdebug.profiler.analysis.utils.python_profile_analysis_utils import StepPhase
```

This class provides the following options:

- `StepPhase.START` – Use to specify the start point of the initialization phase.
- `StepPhase.STEP_START` – Use to specify the start step of the training phase.

- `StepPhase.FORWARD_PASS_END` – Use to specify the steps where the forward pass ends. This option is available only for PyTorch.
- `StepPhase.STEP_END` – Use to specify the end steps in the training phase. This option is available only for TensorFlow.
- `StepPhase.END` – Use to specify the ending point of the finalization (post-hook-close) phase. If the callback hook is not closed, the finalization phase profiling does not occur.

Python Profiling Analysis Tools

Debugger supports the Python profiling with two profiling tools:

- cProfile – The standard python profiler. cProfile collects framework metrics on CPU time for every function called when profiling was enabled.
- Pyinstrument – This is a low overhead Python profiler sampling profiling events every milliseconds.

To learn more about the Python profiling options and what's collected, see Default system monitoring and customized framework profiling with different profiling options.

The following methods of the `PythonProfileAnalysis`, `cProfileAnalysis`, `PyinstrumentAnalysis` classes are provided to fetch and analyze the Python profiling data. Each function loads the latest data from the default S3 URI.

```
from smdebug.profiler.analysis.python_profile_analysis import PythonProfileAnalysis,
 cProfileAnalysis, PyinstrumentAnalysis
```

To set Python profiling objects for analysis, use the cProfileAnalysis or PyinstrumentAnalysis classes as shown in the following example code. It shows how to set a `cProfileAnalysis` object, and if you want to use `PyinstrumentAnalysis`, replace the class name.

```
python_analysis = cProfileAnalysis(
    local_profile_dir=tf_python_stats_dir,
    s3_path=tj.profiler_s3_output_path
)
```

The following methods are available for the `cProfileAnalysis` and `PyinstrumentAnalysis` classes to fetch the Python profiling stats data:

- `python_analysis.fetch_python_profile_stats_by_time(start_time_since_epoch_in_se end_time_since_epoch_in_secs)` – Takes in a start time and end time, and returns the function stats of step stats whose start or end times overlap with the provided interval.
- `python_analysis.fetch_python_profile_stats_by_step(start_step, end_step, mode, start_phase, end_phase)` – Takes in a start step and end step and returns the function stats of all step stats whose profiled `step` satisfies `start_step <= step < end_step`.
  - `start_step` and `end_step` (str) – Specify the start step and end step to fetch the Python profiling stats data.
  - `mode` (str) – Specify the mode of training job using the `PythonProfileModes` enumerator class. The default is `PythonProfileModes.TRAIN`. Available options are provided in the Training Modes and Phases for Python Profiling section.
  - `start_phase` (str) – Specify the start phase in the target step(s) using the `StepPhase` enumerator class. This parameter enables profiling between different phases of training. The default is `StepPhase.STEP_START`. Available options are provided in the Training Modes and Phases for Python Profiling section.
  - `end_phase` (str) – Specify the end phase in the target step(s) using the `StepPhase` enumerator class. This parameter sets up the end phase of training. Available options are as same as the ones for the `start_phase` parameter. The default is `StepPhase.STEP_END`. Available options are provided in the Training Modes and Phases for Python Profiling section.
- `python_analysis.fetch_profile_stats_between_modes(start_mode, end_mode)` – Fetches stats from the Python profiling between the start and end modes.
- `python_analysis.fetch_pre_step_zero_profile_stats()` – Fetches the stats from the Python profiling until step 0.
- `python_analysis.fetch_post_hook_close_profile_stats()` – Fetches stats from the Python profiling after the hook is closed.
- `python_analysis.list_profile_stats()` – Returns a DataFrame of the Python profiling stats. Each row holds the metadata for each instance of profiling and the corresponding stats file (one per step).
- `python_analysis.list_available_node_ids()` – Returns a list the available node IDs for the Python profiling stats.

The `cProfileAnalysis` class specific methods:

- `fetch_profile_stats_by_training_phase()` – Fetches and aggregates the Python profiling stats for every possible combination of start and end modes. For example, if a training and validation phases are done while detailed profiling is enabled, the combinations are `(PRE_STEP_ZERO, TRAIN)`, `(TRAIN, TRAIN)`, `(TRAIN, EVAL)`, `(EVAL, EVAL)`, and `(EVAL, POST_HOOK_CLOSE)`. All stats files within each of these combinations are aggregated.
- `fetch_profile_stats_by_job_phase()` – Fetches and aggregates the Python profiling stats by job phase. The job phases are `initialization` (profiling until step 0), `training_loop` (training and validation), and `finalization` (profiling after the hook is closed).

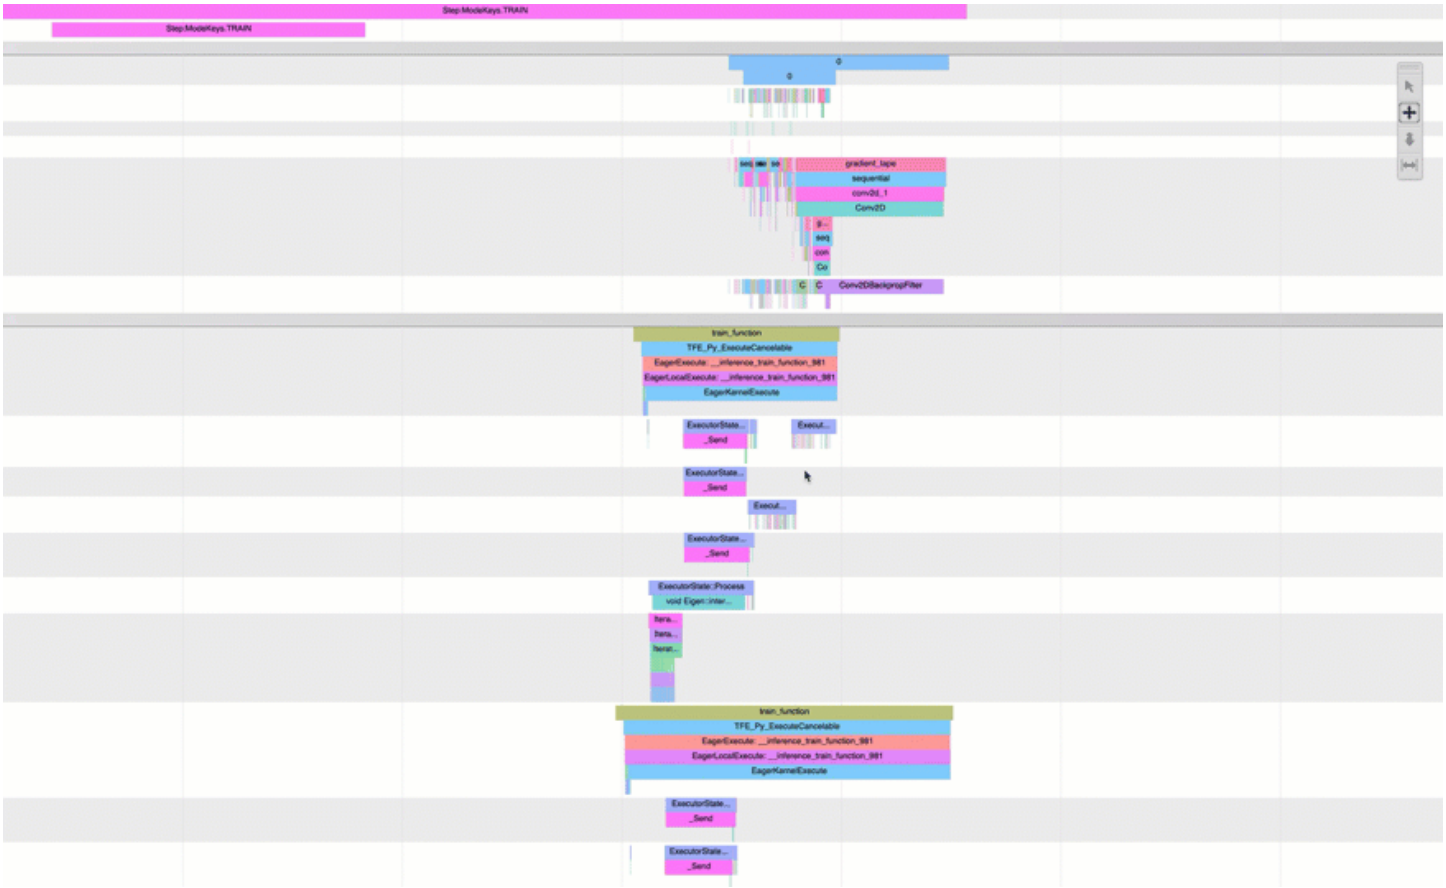
Merge timelines of multiple profile trace files

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

The SMDebug client library provide profiling analysis and visualization tools for merging timelines of system metrics, framework metrics, and Python profiling data collected by Debugger.

> **Tip**
>
> Before proceeding, you need to set a TrainingJob object that will be utilized throughout the examples in this page. For more information about setting up a TrainingJob object, see Access the profile data.

The `MergedTimeline` class provides tools to integrate and correlate different profiling information in a single timeline. After Debugger captures profiling data and annotations from different phases of a training job, JSON files of trace events are saved in a default `tracefolder` directory.



- For annotations in the Python layers, the trace files are saved in `*pythontimeline.json`.
- For annotations in the TensorFlow C++ layers, the trace files are saved in `*model_timeline.json`.
- Tensorflow profiler saves events in a `*trace.json.gz` file.

Tip

If you want to list all of the JSON trace files, use the following Amazon CLI command:

```
! aws s3 ls {tj.profiler_s3_output_path} --recursive | grep '\.json$'
```

As shown in the following animated screenshot, putting and aligning the trace events captured from the different profiling sources in a single plot can provide an overview of the entire events occurring in different phases of the training job.

Tip

To interact with the merged timeline on the traicing app using a keyboard, use the `W` key for zooming in, the `A` key for shifting to the left, the `S` key for zooming out, and the `D` key for shifiting to the right.

The multiple event trace JSON files can be merged into one trace event JSON file using the following `MergedTimeline` API operation and class method from the `smdebug.profiler.analysis.utils.merge_timelines` module.

```
from smdebug.profiler.analysis.utils.merge_timelines import MergedTimeline

combined_timeline = MergedTimeline(path, file_suffix_filter, output_directory)
combined_timeline.merge_timeline(start, end, unit)
```

The `MergedTimeline` API operation passes the following parameters:

- `path` (str) – Specify a root folder (`/profiler-output`) that contains system and framework profiling trace files. You can locate the `profiler-output` using the SageMaker AI ModelTrainer classmethod or the TrainingJob object. For example, `model_trainer.latest_job_profiler_artifacts_path()` or `tj.profiler_s3_output_path`.
- `file_suffix_filter` (list) – Specify a list of file suffix filters to merge timelines. Available suffiex filters are `["model_timeline.json", "pythontimeline.json", "trace.json.gz"].` If this parameter is not manually specified, all of the trace files are merged by default.
- `output_directory` (str) – Specify a path to save the merged timeline JSON file. The default is to the directory specified for the `path` parameter.

The `merge_timeline()` classmethod passes the following parameters to execute the merging process:

- `start` (int) – Specify start time (in microseconds and in Unix time format) or start step to merge timelines.
- end (int) – Specify end time (in microseconds and in Unix time format) or end step to merge timelines.
- `unit` (str) – Choose between `"time"` and `"step"`. The default is `"time"`.

Using the following example codes, execute the `merge_timeline()` method and download the merged JSON file.

- Merge timeline with the `"time"` unit option. The following example code merges all available trace files between the Unix start time (the absolute zero Unix time) and the current Unix time, which means that you can merge the timelines for the entire training duration.

```
import time
from smdebug.profiler.analysis.utils.merge_timelines import MergedTimeline
from smdebug.profiler.profiler_constants import CONVERT_TO_MICROSECS

combined_timeline = MergedTimeline(tj.profiler_s3_output_path, output_directory="./")
combined_timeline.merge_timeline(0, int(time.time() * CONVERT_TO_MICROSECS))
```

- Merge timeline with the `"step"` unit option. The following example code merges all available timelines between step 3 and step 9.

```
from smdebug.profiler.analysis.utils.merge_timelines import MergedTimeline

combined_timeline = MergedTimeline(tj.profiler_s3_output_path, output_directory="./")
combined_timeline.merge_timeline(3, 9, unit="step")
```

Open the Chrome tracing app at `chrome://tracing` on a Chrome browser, and open the JSON file. You can explore the output to plot the merged timeline.

Profiling data loaders

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

In PyTorch, data loader iterators, such as `SingleProcessingDataLoaderIter` and `MultiProcessingDataLoaderIter`, are initiated at the beginning of every iteration over a dataset. During the initialization phase, PyTorch turns on worker processes depending on the configured number of workers, establishes data queue to fetch data and `pin_memory` threads.

To use the PyTorch data loader profiling analysis tool, import the following `PT_dataloader_analysis` class:

```
from smdebug.profiler.analysis.utils.pytorch_dataloader_analysis import
 PT_dataloader_analysis
```

Pass the profiling data retrieved as a Pandas frame data object in the Access the profiling data using the pandas data parsing tool section:

```
pt_analysis = PT_dataloader_analysis(pf)
```

The following functions are available for the `pt_analysis` object:

The SMDebug `S3SystemMetricsReader` class reads the system metrics from the S3 bucket specified to the `s3_trial_path` parameter.

- `pt_analysis.analyze_dataloaderIter_initialization()`

  The analysis outputs the median and maximum duration for these initializations. If there are outliers, (i.e duration is greater than 2 * median), the function prints the start and end times for those durations. These can be used to inspect system metrics during those time intervals.

  The following list shows what analysis is available from this class method:

  - Which type of data loader iterators were initialized.
  - The number of workers per iterator.
  - Inspect whether the iterator was initialized with or without pin_memory.
  - Number of times the iterators were initialized during training.
- `pt_analysis.analyze_dataloaderWorkers()`

  The following list shows what analysis is available from this class method:

  - The number of worker processes that were spun off during the entire training.
  - Median and maximum duration for the worker processes.
  - Start and end time for the worker processes that are outliers.
- `pt_analysis.analyze_dataloader_getnext()`

  The following list shows what analysis is available from this class method:

  - Number of GetNext calls made during the training.
  - Median and maximum duration in microseconds for GetNext calls.
  - Start time, End time, duration and worker id for the outlier GetNext call duration.

- `pt_analysis.analyze_batchtime(start_timestamp, end_timestamp, select_events=[".*"], select_dimensions=[".*"])`

  Debugger collects the start and end times of all the GetNext calls. You can find the amount of time spent by the training script on one batch of data. Within the specified time window, you can identify the calls that are not directly contributing to the training. These calls can be from the following operations: computing the accuracy, adding the losses for debugging or logging purposes, and printing the debugging information. Operations like these can be compute intensive or time consuming. We can identify such operations by correlating the Python profiler, system metrics, and framework metrics.

  The following list shows what analysis is available from this class method:

  - Profile time spent on each data batch, `BatchTime_in_seconds`, by finding the difference between start times of current and subsequent GetNext calls.
  - Find the outliers in `BatchTime_in_seconds` and start and end time for those outliers.
  - Obtain the system and framework metrics during those `BatchTime_in_seconds` timestamps. This indicates where the time was spent.
- `pt_analysis.plot_the_window()`

  Plots a timeline charts between a start timestamp and the end timestamp.

Release notes for profiling capabilities of Amazon SageMaker AI

See the following release notes to track the latest updates for profiling capabilities of

> **Note**
>
> End of support notice: On June 30, 2027, Amazon will end support for Amazon SageMaker Profiler. After June 30, 2027, you will no longer be able to access the Profiler console or Profiler resources. For more information, see Profiler availability change.

Amazon SageMaker AI.

March 21, 2024

Currency updates

SageMaker Profiler has added support for PyTorch v2.2.0, v2.1.0, and v2.0.1.

Amazon Deep Learning Containers pre-installed with SageMaker Profiler

SageMaker Profiler is packaged in the following Amazon Deep Learning Containers.

- SageMaker AI Framework Container for PyTorch v2.2.0
- SageMaker AI Framework Container for PyTorch v2.1.0
- SageMaker AI Framework Container for PyTorch v2.0.1

December 14, 2023

Currency updates

SageMaker Profiler has added support for TensorFlow v2.13.0.

Breaking changes

This release involves a breaking change. The SageMaker Profiler Python package name is changed from `smppy` to `smprof`. If you have been using the previous version of the package while you have started using the latest SageMaker AI Framework Containers for TensorFlow listed in the following section, make sure that you update the package name from `smppy` to `smprof` in the import statement in your training script.

Amazon Deep Learning Containers pre-installed with SageMaker Profiler

SageMaker Profiler is packaged in the following Amazon Deep Learning Containers.

- SageMaker AI Framework Container for TensorFlow v2.13.0
- SageMaker AI Framework Container for TensorFlow v2.12.0

If you use the previous versions of the framework containers such TensorFlow v2.11.0, the SageMaker Profiler Python package is still available as `smppy`. If you are uncertain which version or the package name you should use, replace the import statement of the SageMaker Profiler package with the following code snippet.

```
try:
    import smprof
```

```
except ImportError:
    # backward-compatability for TF 2.11 and PT 1.13.1 images
    import smppy as smprof
```

August 24, 2023

New features

Released Amazon SageMaker Profiler, a profiling and visualization capability of SageMaker AI to deep dive into compute resources provisioned while training deep learning models and gain visibility into operation-level details. SageMaker Profiler provides Python modules (`smppy`) for adding annotations throughout PyTorch or TensorFlow training scripts and activating SageMaker Profiler. You can access the modules through the SageMaker AI Python SDK and Amazon Deep Learning Containers. For any jobs run with the SageMaker Profiler Python modules, you can load the profile data in the SageMaker Profiler UI application that provides a summary dashboard and a detailed timeline. To learn more, see Amazon SageMaker Profiler.

This release of the SageMaker Profiler Python package is integrated into the following SageMaker AI Framework Containers for PyTorch and TensorFlow.

- PyTorch v2.0.0
- PyTorch v1.13.1
- TensorFlow v2.12.0
- TensorFlow v2.11.0

Distributed training in Amazon SageMaker AI

SageMaker AI provides distributed training libraries and supports various distributed training options for deep learning tasks such as computer vision (CV) and natural language processing (NLP). With SageMaker AI's distributed training libraries, you can run highly scalable and cost-effective custom data parallel and model parallel deep learning training jobs. You can also use other distributed training frameworks and packages such as PyTorch DistributedDataParallel (DDP), `torchrun`, MPI (`mpirun`), and parameter server. The following section gives information about fundamental distributed training concepts. Throughout the documentation, instructions and examples focus on how to set up the distributed training options for deep learning tasks using the SageMaker Python SDK.

Tip

To learn best practices for distributed computing of machine learning (ML) training and processing jobs in general, see Distributed computing with SageMaker AI best practices.

Distributed training concepts

SageMaker AI's distributed training libraries use the following distributed training terms and features.

Datasets and Batches

- **Training Dataset**: All of the data you use to train the model.
- **Global batch size**: The number of records selected from the training dataset in each iteration to send to the GPUs in the cluster. This is the number of records over which the gradient is computed at each iteration. If data parallelism is used, it is equal to the total number of model replicas multiplied by the per-replica batch size: `global batch size = (the number of model replicas) * (per-replica batch size)`. A single batch of global batch size is often referred to as the *mini-batch* in machine learning literature.
- **Per-replica batch size:** When data parallelism is used, this is the number of records sent to each model replica. Each model replica performs a forward and backward pass with this batch to calculate weight updates. The resulting weight updates are synchronized (averaged) across all replicas before the next set of per-replica batches are processed.
- **Micro-batch**: A subset of the mini-batch or, if hybrid model and data parallelism is used , it is a subset of the per-replica sized batch . When you use SageMaker AI's distributed model parallelism library, each micro-batch is fed into the training pipeline one-by-one and follows an execution schedule defined by the library's runtime.

Training

- **Epoch**: One training cycle through the entire dataset. It is common to have multiple iterations per an epoch. The number of epochs you use in training is unique on your model and use case.
- **Iteration**: A single forward and backward pass performed using a global batch sized batch (a mini-batch) of training data. The number of iterations performed during training is determined by the global batch size and the number of epochs used for training. For example, if a dataset

includes 5,000 samples, and you use a global batch size of 500, it will take 10 iterations to complete a single epoch.

- **Learning rate**: A variable that influences the amount that weights are changed in response to the calculated error of the model. The learning rate plays an important role in the model's ability to converge as well as the speed and optimality of convergence.

Instances and GPUs

- **Instances**: An Amazon machine learning compute instance. These are also referred to as *nodes*.
- **Cluster size**: When using SageMaker AI's distributed training library, this is the number of instances multiplied by the number of GPUs in each instance. For example, if you use two ml.p3.8xlarge instances in a training job, which have 4 GPUs each, the cluster size is 8. While increasing cluster size can lead to faster training times, communication between instances must be optimized; Otherwise, communication between the nodes can add overhead and lead to slower training times. The SageMaker AI distributed training library is designed to optimize communication between Amazon EC2 ML compute instances, leading to higher device utilization and faster training times.

Distributed Training Solutions

- **Data parallelism**: A strategy in distributed training where a training dataset is split up across multiple GPUs in a compute cluster, which consists of multiple Amazon EC2 ML Instances. Each GPU contains a *replica* of the model, receives different batches of training data, performs a forward and backward pass, and shares weight updates with the other nodes for synchronization before moving on to the next batch and ultimately another epoch.
- **Model parallelism**: A strategy in distributed training where the model partitioned across multiple GPUs in a compute cluster, which consists of multiple Amazon EC2 ML Instances. The model might be complex and have a large number of hidden layers and weights, making it unable to fit in the memory of a single instance. Each GPU carries a subset of the model, through which the data flows and the transformations are shared and compiled. The efficiency of model parallelism, in terms of GPU utilization and training time, is heavily dependent on how the model is partitioned and the execution schedule used to perform forward and backward passes.
- **Pipeline Execution Schedule** (**Pipelining**): The pipeline execution schedule determines the order in which computations (micro-batches) are made and data is processed across devices during model training. Pipelining is a technique to achieve true parallelization in model parallelism and

overcome the performance loss due to sequential computation by having the GPUs compute simultaneously on different data samples. To learn more, see Pipeline Execution Schedule.

Advanced concepts

Machine Learning (ML) practitioners commonly face two scaling challenges when training models: *scaling model size* and *scaling training data*. While model size and complexity can result in better accuracy, there is a limit to the model size you can fit into a single CPU or GPU. Furthermore, scaling model size may result in more computations and longer training times.

Not all models handle training data scaling equally well because they need to ingest all the training data *in memory* for training. They only scale vertically, and to bigger and bigger instance types. In most cases, scaling training data results in longer training times.

Deep Learning (DL) is a specific family of ML algorithms consisting of several layers of artificial neural networks. The most common training method is with mini-batch Stochastic Gradient Descent (SGD). In mini-batch SGD, the model is trained by conducting small iterative changes of its coefficients in the direction that reduces its error. Those iterations are conducted on equally sized subsamples of the training dataset called *mini-batches*. For each mini-batch, the model is run in each record of the mini-batch, its error measured and the gradient of the error estimated. Then the average gradient is measured across all the records of the mini-batch and provides an update direction for each model coefficient. One full pass over the training dataset is called an *epoch*. Model trainings commonly consist of dozens to hundreds of epochs. Mini-batch SGD has several benefits: First, its iterative design makes training time theoretically linear of dataset size. Second, in a given mini-batch each record is processed individually by the model without need for inter-record communication other than the final gradient average. The processing of a mini-batch is consequently particularly suitable for parallelization and distribution.

Parallelizing SGD training by distributing the records of a mini-batch over different computing devices is called *data parallel distributed training*, and is the most commonly used DL distribution paradigm. Data parallel training is a relevant distribution strategy to scale the mini-batch size and process each mini-batch faster. However, data parallel training comes with the extra complexity of having to compute the mini-batch gradient average with gradients coming from all the workers and communicating it to all the workers, a step called *allreduce* that can represent a growing overhead, as the training cluster is scaled, and that can also drastically penalize training time if improperly implemented or implemented over improper hardware subtracts.

Data parallel SGD still requires developers to be able to fit at least the model and a single record in a computing device, such as a single CPU or GPU. When training very large models such as large transformers in Natural Language Processing (NLP), or segmentation models over high-resolution images, there may be situations in which this is not feasible. An alternative way to break up the workload is to partition the model over multiple computing devices, an approach called *model-parallel distributed training*.

Get started with distributed training in Amazon SageMaker AI

The following page gives information about the steps needed to get started with distributed training in Amazon SageMaker AI. If you're already familiar with distributed training, choose one of the following options that matches your preferred strategy or framework to get started. If you want to learn about distributed training in general, see the section called "Distributed training concepts".

The SageMaker AI distributed training libraries are optimized for the SageMaker training environment, help adapt your distributed training jobs to SageMaker AI, and improve training speed and throughput. The libraries offer both data parallel and model parallel training strategies. They combine software and hardware technologies to improve inter-GPU and inter-node communications, and extend SageMaker AI's training capabilities with built-in options that require minimal code changes to your training scripts.

Before you get started

SageMaker Training supports distributed training on a single instance as well as multiple instances, so you can run any size of training at scale.

We recommend you to use the ModelTrainer class with PyTorch and TensorFlow in the SageMaker Python SDK, which are the training job launchers with various distributed training options. When you create a ModelTrainer object, the object sets up distributed training infrastructure, runs the `CreateTrainingJob` API in the backend, finds the Region where your current session is running, and pulls one of the pre-built Amazon deep learning container prepackaged with a number of libraries including deep learning frameworks, distributed training frameworks, and the EFA driver. If you want to mount an FSx file system to the training instances, you need to pass your VPC subnet and security group ID to the ModelTrainer.

Before running your distributed training job in SageMaker AI, read the following general guidance on the basic infrastructure setup.

Availability zones and network backplane

When using multiple instances (also called *nodes*), it's important to understand the network that connects the instances, how they read the training data, and how they share information between themselves. For example, when you run a distributed data-parallel training job, a number of factors, such as communication between the nodes of a compute cluster for running the `AllReduce` operation and data transfer between the nodes and data storage in Amazon Simple Storage Service or Amazon FSx for Lustre, play a crucial role to achieve an optimal use of compute resources and a faster training speed. To reduce communication overhead, make sure that you configure instances, VPC subnet, and data storage in the same Amazon Web Services Region and Availability Zone.

GPU instances with faster network and high-throughput storage

You can technically use any instances for distributed training. For cases where you need to run multi-node distributed training jobs for training large models, such as large language models (LLMs) and diffusion models, which require faster inter-node commutation, we recommend EFA-enabled GPU instances supported by SageMaker AI. Especially, to achieve the most performant distributed training job in SageMaker AI, we recommend P4d and P4de instances equipped with NVIDIA A100 GPUs. These are also equipped with high-throughput low-latency local instance storage and faster intra-node network. For data storage, we recommend Amazon FSx for Lustre that provides high throughput for storing training datasets and model checkpoints.

Use the SageMaker AI distributed data parallelism (SMDDP) library

The SMDDP library improves communication between nodes with implementations of `AllReduce` and `AllGather` collective communication operations that are optimized for Amazon network infrastructure and Amazon SageMaker AI ML instance topology. You can use the SMDDP library as the backend of PyTorch-based distributed training packages: PyTorch distributed data parallel (DDP), PyTorch fully sharded data parallelism (FSDP), DeepSpeed, and Megatron-DeepSpeed. The following code example shows how to set a `PyTorch` estimator for launching a distributed training job on two `ml.p4d.24xlarge` instances.

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Compute
from sagemaker.train.distributed import Torchrun

model_trainer = ModelTrainer(
    ...,
    compute=Compute(instance_count=2, instance_type="ml.p4d.24xlarge"),
```

```
    # Activate distributed training with SMDDP
    distributed=Torchrun()
)
```

To learn how to prepare your training script and launch a distributed data-parallel training job on SageMaker AI, see the section called "SageMaker AI distributed data parallelism library".

Use the SageMaker AI model parallelism library (SMP)

SageMaker AI provides the SMP library and supports various distributed training techniques, such as sharded data parallelism, pipelining, tensor parallelism, optimizer state sharding, and more. To learn more about what the SMP library offers, see the section called "Core Features".

To use SageMaker AI's model parallelism library, configure the `distribution` parameter of the SageMaker AI framework estimators.

The ModelTrainer class supports PyTorch and TensorFlow. The following code example shows how to construct a ModelTrainer for distributed training with the model parallelism library on two `ml.p4d.24xlarge` instances.

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Compute
from sagemaker.train.distributed import Torchrun

model_trainer = ModelTrainer(
    ...,
    compute=Compute(instance_count=2, instance_type="ml.p4d.24xlarge"),
    distributed=Torchrun()
)
```

To learn how to adapt your training script, configure distribution parameters in the `estimator` class, and launch a distributed training job, see SageMaker AI's model parallelism library (see also Distributed Training APIs in the *SageMaker Python SDK documentation*).

Use open source distributed training frameworks

SageMaker AI also supports the following options to operate `mpirun` and `torchrun` in the backend.

- To use PyTorch DistributedDataParallel (DDP) in SageMaker AI with the `mpirun` backend, add `distribution={"pytorchddp": {"enabled": True}}` to your PyTorch estimator. For

more information, see also PyTorch Distributed Training and SageMaker AI PyTorch Estimator's `distribution` argument in the *SageMaker Python SDK documentation*.

> **Note**
>
> This option is available for PyTorch 1.12.0 and later.

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Compute
from sagemaker.train.distributed import Torchrun

model_trainer = ModelTrainer(
    ...,
    compute=Compute(instance_count=2, instance_type="ml.p4d.24xlarge"),
    distributed=Torchrun()  # runs torchrun in the backend
)
```

- SageMaker AI supports the PyTorch `torchrun` launcher for distributed training on GPU-based Amazon EC2 instances, such as P3 and P4, as well as Trn1 powered by the Amazon Trainium device.

  To use PyTorch DistributedDataParallel (DDP) in SageMaker AI with the `torchrun` backend, add `distribution={"torch_distributed": {"enabled": True}}` to the PyTorch estimator.

  > **Note**
  >
  > This option is available for PyTorch 1.13.0 and later.

  The following code snippet shows an example of constructing a SageMaker AI PyTorch estimator to run distributed training on two `ml.p4d.24xlarge` instances with the `torch_distributed` distribution option.

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Compute
from sagemaker.train.distributed import Torchrun

model_trainer = ModelTrainer(
    ...,
```

```
    compute=Compute(instance_count=2, instance_type="ml.p4d.24xlarge"),
    distributed=Torchrun()  # runs torchrun in the backend
)
```

For more information, see Distributed PyTorch Training and SageMaker AI PyTorch Estimator's `distribution` argument in the *SageMaker Python SDK documentation*.

Notes for distributed training on Trn1

A Trn1 instance consists of up to 16 Trainium devices, and each Trainium device consists of two NeuronCores. For specs of the Amazon Trainium devices, see Trainium Architecture in the *Amazon Neuron Documentation*.

To train on the Trainium-powered instances, you only need to specify the Trn1 instance code, `ml.trn1.*`, in string to the `instance_type` argument of the SageMaker AI PyTorch estimator class. To find available Trn1 instance types, see Amazon Trn1 Architecture in the *Amazon Neuron documentation*.

> **Note**
>
> SageMaker Training on Amazon EC2 Trn1 instances is currently available only for the PyTorch framework in the Amazon Deep Learning Containers for PyTorch Neuron starting v1.11.0. To find a complete list of supported versions of PyTorch Neuron, see Neuron Containers in the *Amazon Deep Learning Containers GitHub repository*.

When you launch a training job on Trn1 instances using the SageMaker Python SDK, SageMaker AI automatically picks up and runs the right container from Neuron Containers provided by Amazon Deep Learning Containers. The Neuron Containers are prepackaged with training environment settings and dependencies for easier adaptation of your training job to the SageMaker Training platform and Amazon EC2 Trn1 instances.

> **Note**
>
> To run your PyTorch training job on Trn1 instances with SageMaker AI, you should modify your training script to initialize process groups with the `xla` backend and use PyTorch/XLA. To support the XLA adoption process, the Amazon Neuron SDK provides PyTorch Neuron that uses XLA to make conversion of PyTorch operations to Trainium instructions.

To learn how to modify your training script, see Developer Guide for Training with PyTorch Neuron (`torch-neuronx`) in the *Amazon Neuron Documentation*.

For more information, see Distributed Training with PyTorch Neuron on Trn1 instances and SageMaker AI PyTorch Estimator's `distribution` argument in the *SageMaker Python SDK documentation*.

- To use MPI in SageMaker AI, add `distribution={"mpi": {"enabled": True}}` to your estimator. The MPI distribution option is available for the following frameworks: MXNet, PyTorch, and TensorFlow.
- To use a parameter server in SageMaker AI, add `distribution={"parameter_server": {"enabled": True}}` to your estimator. The parameter server option is available for the following frameworks: MXNet, PyTorch, and TensorFlow.

Tip

For more information about using the MPI and parameter server options per framework, use the following links to the *SageMaker Python SDK documentation*.

Strategies for distributed training

Distributed training is usually split by two approaches: data parallel and model parallel. *Data parallel* is the most common approach to distributed training: You have a lot of data, batch it up, and send blocks of data to multiple CPUs or GPUs (nodes) to be processed by the neural network or ML algorithm, then combine the results. The neural network is the same on each node. A *model parallel* approach is used with large models that won't fit in a node's memory in one piece; it breaks up the model and places different parts on different nodes. In this situation, you need to send your batches of data out to each node so that the data is processed on all parts of the model.

The terms *network* and *model* are often used interchangeably: A large model is really a large network with many layers and parameters. Training with a large network produces a large model, and loading the model back onto the network with all your pre-trained parameters and their weights loads a large model into memory. When you break apart a model to split it across nodes, you're also breaking apart the underlying network. A network consists of layers, and to split up the network, you put layers on different compute devices.

A common pitfall of naively splitting layers across devices is severe GPU under-utilization. Training is inherently sequential in both forward and backward passes, and at a given time, only one GPU can actively compute, while the others wait on the activations to be sent. Modern model parallel libraries solve this problem by using pipeline execution schedules to improve device utilization. However, only the Amazon SageMaker AI's distributed model parallel library includes automatic model splitting. The two core features of the library, automatic model splitting and pipeline execution scheduling, simplifies the process of implementing model parallelism by making automated decisions that lead to efficient device utilization.

Train with data parallel and model parallel

If you are training with a large dataset, start with a data parallel approach. If you run out of memory during training, you may want to switch to a model parallel approach, or try hybrid model and data parallelism. You can also try the following to improve performance with data parallel:

- Change your model's hyperparameters.
- Reduce the batch size.
- Keep reducing the batch size until it fits. If you reduce batch size to 1, and still run out of memory, then you should try model-parallel training.

Try gradient compression (FP16, INT8):

- On NVIDIA TensorCore-equipped hardware, using mixed precision training creates both speed-up and memory consumption reduction.
- SageMaker AI's distributed data parallelism library supports Automatic Mixed Precision (AMP) out of the box. No extra action is needed to enable AMP other than the framework-level modifications to your training script. If gradients are in FP16, the SageMaker AI data parallelism library runs its `AllReduce` operation in FP16. For more information about implementing AMP APIs to your training script, see the following resources:
  - Frameworks - PyTorch in the *NVIDIA Deep Learning Performance documentation*
  - Frameworks - TensorFlow in the *NVIDIA Deep Learning Performance documentation*

- Automatic Mixed Precision for Deep Learning in the *NVIDIA Developer Docs*
- Introducing native PyTorch automatic mixed precision for faster training on NVIDIA GPUs in the *PyTorch Blog*
- TensorFlow mixed precision APIs in the *TensorFlow documentation*

Try reducing the input size:

- Reduce the NLP sequence length if you increase the sequence link, need to adjust the batch size down, or adjust the GPUs up to spread the batch.
- Reduce image resolution.

Check if you use batch normalization, since this can impact convergence. When you use distributed training, your batch is split across GPUs and the effect of a much lower batch size can be a higher error rate thereby disrupting the model from converging. For example, if you prototyped your network on a single GPU with a batch size of 64, then scaled up to using four p3dn.24xlarge, you now have 32 GPUs and your per-GPU batch size drops from 64 to 2. This will likely break the convergence you saw with a single node.

Start with model-parallel training when:

- Your model does not fit on a single device.
- Due to your model size, you're facing limitations in choosing larger batch sizes, such as if your model weights take up most of your GPU memory and you are forced to choose a smaller, suboptimal batch size.

- TensorFlow distributed training

Batch Size

SageMaker AI distributed toolkits generally allow you to train on bigger batches. For example, if a model fits within a single device but can only be trained with a small batch size, using either model-parallel training or data parallel training enables you to experiment with larger batch sizes.

Be aware that batch size directly influences model accuracy by controlling the amount of noise in the model update at each iteration. Increasing batch size reduces the amount of noise in the gradient estimation, which can be beneficial when increasing from very small batches sizes, but can result in degraded model accuracy as the batch size increases to large values.

> **Tip**
>
> Adjust your hyperparameters to ensure that your model trains to a satisfying convergence as you increase its batch size.

A number of techniques have been developed to maintain good model convergence when batch is increased.

Mini-batch size

In SGD, the mini-batch size quantifies the amount of noise present in the gradient estimation. A small mini-batch results in a very noisy mini-batch gradient, which is not representative of the true gradient over the dataset. A large mini-batch results in a mini-batch gradient close to the true gradient over the dataset and potentially not noisy enough—likely to stay locked in irrelevant minima.

To learn more about these techniques, see the following papers:

- Accelerated Large Batch Optimization of BERT Pretraining in 54 minutes, Zheng et al.
- Deep Gradient Compression, Lin et al.

Scaling training

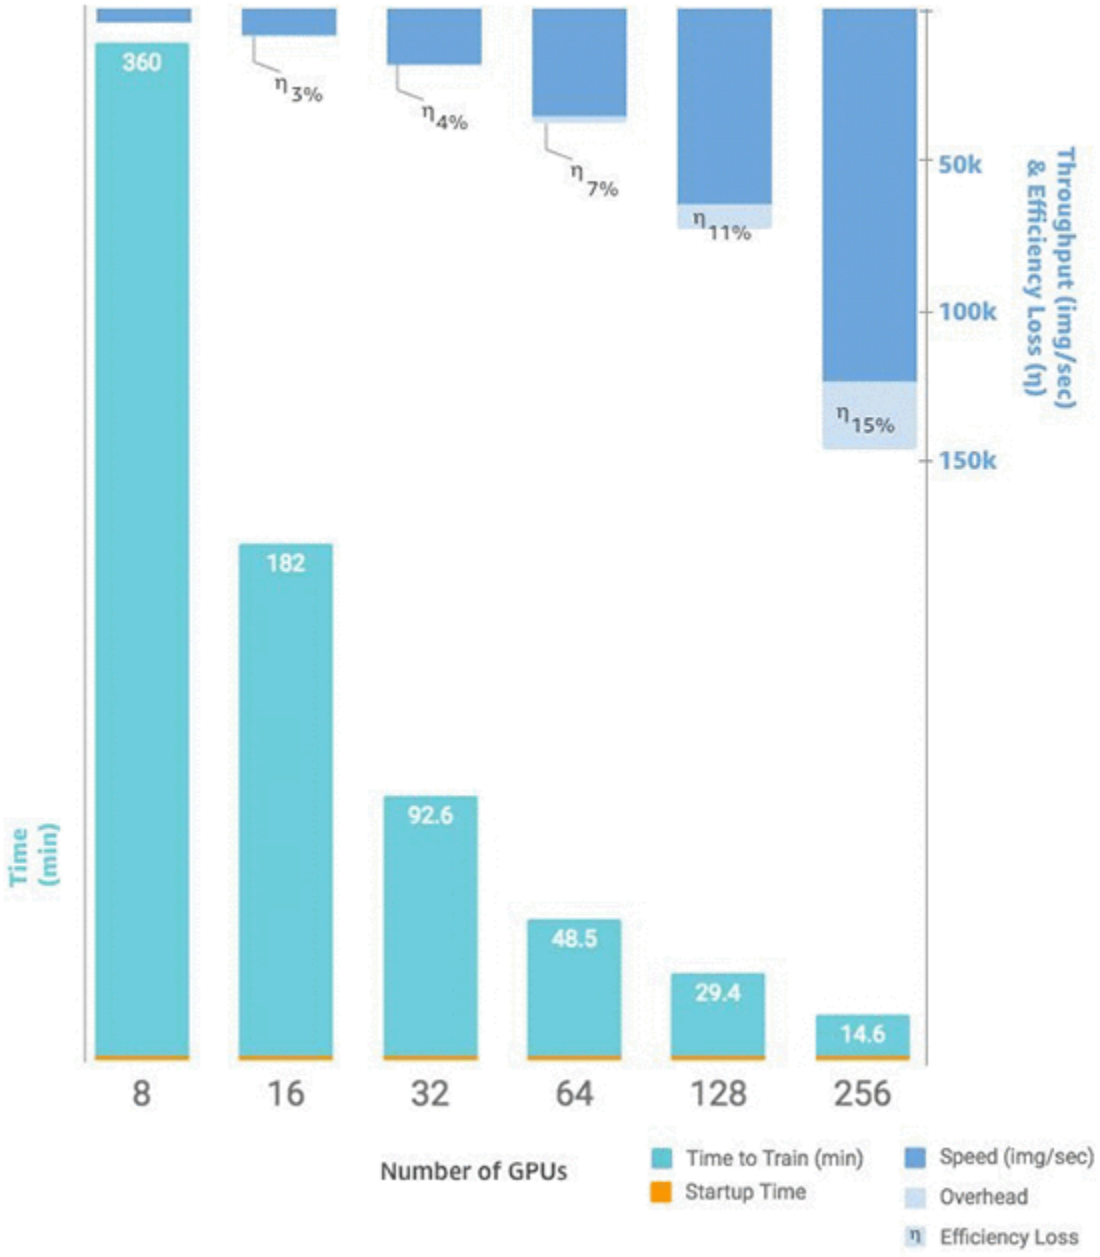
The following sections cover scenarios in which you may want to scale up training, and how you can do so using Amazon resources. You may want to scale training in one of the following situations:

- Scaling from a single GPU to many GPUs
- Scaling from a single instance to multiple instances
- Using custom training scripts

Scaling from a single GPU to many GPUs

The amount of data or the size of the model used in machine learning can create situations in which the time to train a model is longer that you are willing to wait. Sometimes, the training doesn't work at all because the model or the training data is too large. One solution is to increase the number of GPUs you use for training. On an instance with multiple GPUs, like a `p3.16xlarge` that has eight GPUs, the data and processing is split across the eight GPUs. When you use distributed training libraries, this can result in a near-linear speedup in the time it takes to train your model. It takes slightly over 1/8 the time it would have taken on `p3.2xlarge` with one GPU.

Instance type	GPUs
p3.2xlarge	1
p3.8xlarge	4
p3.16xlarge	8
p3dn.24xlarge	8



> **Note**
>
> The ml instance types used by SageMaker training have the same number of GPUs as the corresponding p3 instance types. For example, `ml.p3.8xlarge` has the same number of GPUs as `p3.8xlarge` - 4.

Scaling from a single instance to multiple instances

If you want to scale your training even further, you can use more instances. However, you should choose a larger instance type before you add more instances. Review the previous table to see how many GPUs are in each p3 instance type.

If you have made the jump from a single GPU on a `p3.2xlarge` to four GPUs on a `p3.8xlarge`, but decide that you require more processing power, you may see better performance and incur lower costs if you choose a `p3.16xlarge` before trying to increase instance count. Depending on the libraries you use, when you keep your training on a single instance, performance is better and costs are lower than a scenario where you use multiple instances.

When you are ready to scale the number of instances, you can do this with SageMaker AI Python SDK `estimator` function by setting your `instance_count`. For example, you can set `instance_type = p3.16xlarge` and `instance_count = 2`. Instead of the eight GPUs on a single `p3.16xlarge`, you have 16 GPUs across two identical instances. The following chart shows scaling and throughput starting with eight GPUs on a single instance and increasing to 64 instances for a total of 256 GPUs.

Custom training scripts

While SageMaker AI makes it simple to deploy and scale the number of instances and GPUs, depending on your framework of choice, managing the data and results can be very challenging, which is why external supporting libraries are often used. This most basic form of distributed training requires modification of your training script to manage the data distribution.

SageMaker AI also supports Horovod and implementations of distributed training native to each major deep learning framework. If you choose to use examples from these frameworks, you can follow SageMaker AI's container guide for Deep Learning Containers, and various example notebooks that demonstrate implementations.

Run distributed training with the SageMaker AI distributed data parallelism library

The SageMaker AI distributed data parallelism (SMDDP) library extends SageMaker training capabilities on deep learning models with near-linear scaling efficiency by providing implementations of collective communication operations optimized for Amazon infrastructure.

When training large machine learning (ML) models, such as large language models (LLM) and diffusion models, on a huge training dataset, ML practitioners use clusters of accelerators and distributed training techniques to reduce the time to train or resolve memory constraints for models that cannot fit in each GPU memory. ML practitioners often start with multiple accelerators on a single instance and then scale to clusters of instances as their workload requirements increase. As the cluster size increases, so does the communication overhead between multiple nodes, which leads to drop in overall computational performance.

To address such overhead and memory problems, the SMDDP library offers the following.

- The SMDDP library optimizes training jobs for Amazon network infrastructure and Amazon SageMaker AI ML instance topology.
- The SMDDP library improves communication between nodes with implementations of `AllReduce` and `AllGather` collective communication operations that are optimized for Amazon infrastructure.

To learn more about the details of the SMDDP library offerings, proceed to the section called "Introduction to the SMDDP library".

For more information about training with the model-parallel strategy offered by SageMaker AI, see also (Archived) SageMaker model parallelism library v1.x.

Introduction to the SageMaker AI distributed data parallelism library

The SageMaker AI distributed data parallelism (SMDDP) library is a collective communication library that improves compute performance of distributed data parallel training. The SMDDP library addresses communications overhead of the key collective communication operations by offering the following.

1. The library offers `AllReduce` optimized for Amazon. `AllReduce` is a key operation used for synchronizing gradients across GPUs at the end of each training iteration during distributed data training.
2. The library offers `AllGather` optimized for Amazon. `AllGather` is another key operation used in sharded data parallel training, which is a memory-efficient data parallelism technique offered by popular libraries such as the SageMaker AI model parallelism (SMP) library, DeepSpeed Zero Redundancy Optimizer (ZeRO), and PyTorch Fully Sharded Data Parallelism (FSDP).
3. The library performs optimized node-to-node communication by fully utilizing Amazon network infrastructure and the Amazon EC2 instance topology.

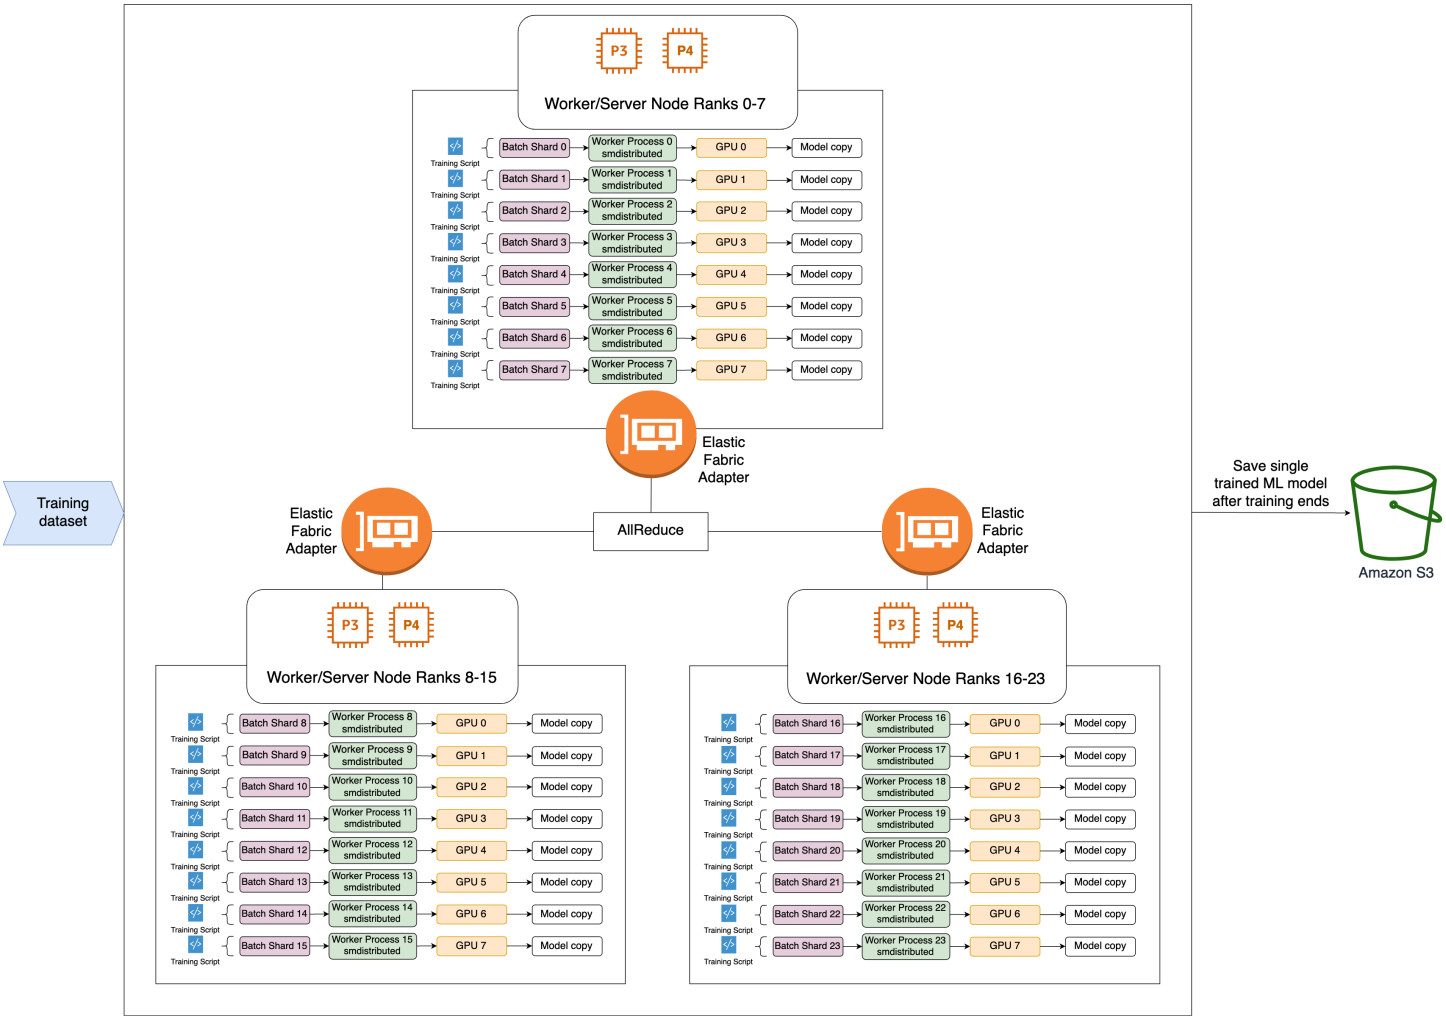
The SMDDP library can increase training speed by offering performance improvement as you scale your training cluster, with near-linear scaling efficiency.

> **Note**
>
> The SageMaker AI distributed training libraries are available through the Amazon deep learning containers for PyTorch and Hugging Face within the SageMaker Training platform. To use the libraries, you must use the SageMaker Python SDK or the SageMaker APIs through SDK for Python (Boto3) or Amazon Command Line Interface. Throughout the documentation, instructions and examples focus on how to use the distributed training libraries with the SageMaker Python SDK.

SMDDP collective communication operations optimized for Amazon compute resources and network infrastructure

The SMDDP library provides implementations of the `AllReduce` and `AllGather` collective operations that are optimized for Amazon compute resources and network infrastructure.

SMDDP `AllReduce` collective operation



The SMDDP library achieves optimal overlapping of the `AllReduce` operation with the backward pass, significantly improving GPU utilization. It achieves near-linear scaling efficiency and faster training speed by optimizing kernel operations between CPUs and GPUs. The library performs `AllReduce` in parallel while GPU is computing gradients without taking away additional GPU cycles, which makes the library to achieve faster training.

- *Leverages CPUs*: The library uses CPUs to `AllReduce` gradients, offloading this task from the GPUs.
- *Improved GPU usage*: The cluster's GPUs focus on computing gradients, improving their utilization throughout training.

The following is the high-level workflow of the SMDDP `AllReduce` operation.

1. The library assigns ranks to GPUs (workers).
2. At each iteration, the library divides each global batch by the total number of workers (world size) and assigns small batches (batch shards) to the workers.
   - The size of the global batch is `(number of nodes in a cluster) * (number of GPUs per node) * (per batch shard)`.
   - A batch shard (small batch) is a subset of dataset assigned to each GPU (worker) per iteration.
3. The library launches a training script on each worker.
4. The library manages copies of model weights and gradients from the workers at the end of every iteration.
5. The library synchronizes model weights and gradients across the workers to aggregate a single trained model.

The following architecture diagram shows an example of how the library sets up data parallelism for a cluster of 3 nodes.

SMDDP `AllGather` collective operation

`AllGather` is a collective operation where each worker starts with an input buffer, and then concatenates or *gathers* the input buffers from all other workers into an output buffer.

> **Note**
>
> The SMDDP `AllGather` collective operation is available in `smdistributed-dataparallel>=2.0.1` and Amazon Deep Learning Containers (DLC) for PyTorch v2.0.1 and later.

`AllGather` is heavily used in distributed training techniques such as sharded data parallelism where each individual worker holds a fraction of a model, or a sharded layer. The workers call `AllGather` before forward and backward passes to reconstruct the sharded layers. The forward

and backward passes continue onward after the parameters are *all gathered*. During the backward pass, each worker also calls `ReduceScatter` to collect (reduce) gradients and break (scatter) them into gradient shards to update the corresponding sharded layer. For more details on the role of these collective operations in sharded data parallelism, see the SMP library's implementati on of sharded data parallelism, ZeRO in the DeepSpeed documentation, and the blog about PyTorch Fully Sharded Data Parallelism.

Because collective operations like AllGather are called in every iteration, they are the main contributors to GPU communication overhead. Faster computation of these collective operations directly translates to a shorter training time with no side effects on convergence. To achieve this, the SMDDP library offers `AllGather` optimized for P4d instances.

SMDDP `AllGather` uses the following techniques to improve computational performance on P4d instances.

1. It transfers data between instances (inter-node) through the Elastic Fabric Adapter (EFA) network with a mesh topology. EFA is the Amazon low-latency and high-throughput network solution. A mesh topology for inter-node network communication is more tailored to the characteristics of EFA and Amazon network infrastructure. Compared to the NCCL ring or tree topology that involves multiple packet hops, SMDDP avoids accumulating latency from multiple hops as it only needs one hop. SMDDP implements a network rate control algorithm that balances the workload to each communication peer in a mesh topology and achieves a higher global network throughput.
2. It adopts low-latency GPU memory copy library based on NVIDIA GPUDirect RDMA technology (GDRCopy) to coordinate local NVLink and EFA network traffic. GDRCopy, a low-latency GPU memory copy library offered by NVIDIA, provides low-latency communication between CPU processes and GPU CUDA kernels. With this technology, the SMDDP library is able to pipeline the intra-node and inter-node data movement.
3. It reduces the usage of GPU streaming multiprocessors to increase compute power for running model kernels. P4d and P4de instances are equipped with NVIDIA A100 GPUs, which each have 108 streaming multiprocessors. While NCCL takes up to 24 streaming multiprocessors to run collective operations, SMDDP uses fewer than 9 streaming multiprocessors. Model compute kernels pick up the saved streaming multiprocessors for faster computation.

Supported frameworks, Amazon Web Services Regions, and instances types

Before using the SageMaker AI distributed data parallelism (SMDDP) library, check what are the supported ML frameworks and instance types and if there are enough quotas in your Amazon account and Amazon Web Services Region.

Supported frameworks

The following tables show the deep learning frameworks and their versions that SageMaker AI and SMDDP support. The SMDDP library is available in SageMaker AI Framework Containers, integrated in Docker containers distributed by the SageMaker model parallelism (SMP) library v2, or downloadable as a binary file.

> **Note**
>
> To check the latest updates and release notes of the SMDDP library, see the the section called "SMDDP release notes".

** The URLs of the binary files are for installing the SMDDP library in custom containers. For more information, see Create your own Docker container with the SageMaker AI distributed data parallel library.

> **Note**
>
> The SMDDP library is available in Amazon Web Services Regions where the SageMaker AI Framework Containers and the SMP Docker images are in service.

Note

The SMDDP library v1.4.0 and later works as a backend of PyTorch distributed (torch.distributed) data parallelism (torch.parallel.DistributedDataParallel). In accordance with the change, the following smdistributed APIs for the PyTorch distributed package have been deprecated.

- `smdistributed.dataparallel.torch.distributed` is deprecated. Use the torch.distributed package instead.
- `smdistributed.dataparallel.torch.parallel.DistributedDataParallel` is deprecated. Use the torch.nn.parallel.DistributedDataParallel API instead.

If you need to use the previous versions of the library (v1.3.0 or before), see the archived SageMaker AI distributed data parallelism documentation in the *SageMaker AI Python SDK documentation*.

PyTorch Lightning

The SMDDP library is available for PyTorch Lightning in the following SageMaker AI Framework Containers for PyTorch and the SMP Docker containers.

PyTorch Lightning v2

PyTorch Lightning version	PyTorch version	SMDDP library version	SageMaker AI Framework Container images pre-installed with SMDDP	SMP Docker images pre-installed with SMDDP	URL of the binary file**

** The URLs of the binary files are for installing the SMDDP library in custom containers. For more information, see Create your own Docker container with the SageMaker AI distributed data parallel library.

Note

PyTorch Lightning and its utility libraries such as Lightning Bolts are not preinstalled in the PyTorch DLCs. When you construct a SageMaker AI PyTorch ModelTrainer and submit a training job request in Step 2, you need to provide `requirements.txt` to install `pytorch-lightning` and `lightning-bolts` in the SageMaker AI PyTorch training container.

```
# requirements.txt
pytorch-lightning
lightning-bolts
```

For more information about specifying the source directory to place the `requirements.txt` file along with your training script and a job submission, see Using third-party libraries in the *Amazon SageMaker AI Python SDK documentation*.

Hugging Face Transformers

The Amazon Deep Learning Containers for Hugging Face use the SageMaker Training Containers for PyTorch and TensorFlow as their base images. To look up the Hugging Face Transformers library versions and paired PyTorch and TensorFlow versions, see the latest Hugging Face Containers and the Prior Hugging Face Container Versions.

TensorFlow (deprecated)

Important

The SMDDP library discontinued support for TensorFlow and is no longer available in DLCs for TensorFlow later than v2.11.0. The following table lists previous DLCs for TensorFlow with the SMDDP library installed.

TensorFlow version	SMDDP library version
2.9.1, 2.10.1, 2.11.0	`smdistributed-dataparallel==v1.4.1`
2.8.3	`smdistributed-dataparallel==v1.3.0`

Amazon Web Services Regions

The SMDDP library is available in all of the Amazon Web Services Regions where the Amazon Deep Learning Containers for SageMaker AI and the SMP Docker images are in service.

Supported instance types

The SMDDP library requires one of the following instance types.

Instance type		
ml.p3dn.24xlarge *		
ml.p4d.24xlarge		
ml.p4de.24xlarge		

Tip

To properly run distributed training on the EFA-enabled instance types, you should enable traffic between the instances by setting up the security group of your VPC to allow all inbound and outbound traffic to and from the security group itself. To learn how to set up the security group rules, see Step 1: Prepare an EFA-enabled security group in the *Amazon EC2 User Guide*.

Important

* The SMDDP library has discontinued support for optimizing its collective communication operations on P3 instances. While you can still utilize the SMDDP optimized `AllReduce` collective on `ml.p3dn.24xlarge` instances, there will be no further development support to enhance performance on this instance type. Note that the SMDDP optimized `AllGather` collective is only available for P4 instances.

For specs of the instance types, see the **Accelerated Computing** section in the Amazon EC2 Instance Types page. For information about instance pricing, see Amazon SageMaker Pricing.

If you encountered an error message similar to the following, follow the instructions at Request a service quota increase for SageMaker AI resources.

```
ResourceLimitExceeded: An error occurred (ResourceLimitExceeded) when calling
the CreateTrainingJob operation: The account-level service limit 'ml.p3dn.24xlarge
for training job usage' is 0 Instances, with current utilization of 0 Instances
and a request delta of 1 Instances.
Please contact AWS support to request an increase for this limit.
```

Distributed training with the SageMaker AI distributed data parallelism library

The SageMaker AI distributed data parallelism (SMDDP) library is designed for ease of use and to provide seamless integration with PyTorch.

When training a deep learning model with the SMDDP library on SageMaker AI, you can focus on writing your training script and model training.

To get started, import the SMDDP library to use its collective operations optimized for Amazon. The following topics provide instructions on what to add to your training script depending on which collective operation you want to optimize.

Topics

- Adapting your training script to use the SMDDP collective operations
- Launching distributed training jobs with SMDDP using the SageMaker Python SDK

Adapting your training script to use the SMDDP collective operations

The training script examples provided in this section are simplified and highlight only the required changes to enable the SageMaker AI distributed data parallelism (SMDDP) library in your training script. For end-to-end Jupyter notebook examples that demonstrate how to run a distributed training job with the SMDDP library, see Amazon SageMaker AI data parallelism library examples.

Topics

- Use the SMDDP library in your PyTorch training script
- Use the SMDDP library in your PyTorch Lightning training script
- Use the SMDDP library in your TensorFlow training script (deprecated)

Use the SMDDP library in your PyTorch training script

Starting from the SageMaker AI distributed data parallelism (SMDDP) library v1.4.0, you can use the library as a backend option for the PyTorch distributed package. To use the SMDDP `AllReduce` and `AllGather` collective operations, you only need to import the SMDDP library at the beginning of your training script and set SMDDP as the the backend of PyTorch distributed modules during process group initialization. With the single line of backend specification, you can keep all the native PyTorch distributed modules and the entire training script unchanged. The following code snippets show how to use the SMDDP library as the backend of PyTorch-based distributed training

packages: PyTorch distributed data parallel (DDP), PyTorch fully sharded data parallelism (FSDP), DeepSpeed, and Megatron-DeepSpeed.

For PyTorch DDP or FSDP

Initialize the process group as follows.

```
import torch.distributed as dist
import smdistributed.dataparallel.torch.torch_smddp

dist.init_process_group(backend="smddp")
```

> **Note**
>
> (For PyTorch DDP jobs only) The `smddp` backend currently does not support creating subprocess groups with the `torch.distributed.new_group()` API. You also cannot use the `smddp` backend concurrently with other process group backends such as `NCCL` and `Gloo`.

For DeepSpeed or Megatron-DeepSpeed

Initialize the process group as follows.

```
import deepspeed
import smdistributed.dataparallel.torch.torch_smddp

deepspeed.init_distributed(dist_backend="smddp")
```

> **Note**
>
> To use SMDDP `AllGather` with the `mpirun`-based launchers (`smdistributed` and `pytorchddp`) in the section called "Launching distributed training jobs with SMDDP", you also need to set the following environment variable in your training script.
>
> ```
> export SMDATAPARALLEL_OPTIMIZE_SDP=true
> ```

For general guidance on writing a PyTorch FSDP training script, see Advanced Model Training with Fully Sharded Data Parallel (FSDP) in the PyTorch documentation.

For general guidance on writing a PyTorch DDP training script, see Getting started with distributed data parallel in the PyTorch documentation.

After you have completed adapting your training script, proceed to Launching distributed training jobs with SMDDP using the SageMaker Python SDK.

Use the SMDDP library in your PyTorch Lightning training script

If you want to bring your PyTorch Lightning training script and run a distributed data parallel training job in SageMaker AI, you can run the training job with minimal changes in your training script. The necessary changes include the following: import the `smdistributed.dataparallel` library's PyTorch modules, set up the environment variables for PyTorch Lightning to accept the SageMaker AI environment variables that are preset by the SageMaker training toolkit, and activate the SMDDP library by setting the process group backend to `"smddp"`. To learn more, walk through the following instructions that break down the steps with code examples.

> **Note**
>
> The PyTorch Lightning support is available in the SageMaker AI data parallel library v1.5.0 and later.

PyTorch Lightning == v2.1.0 and PyTorch == 2.0.1

1. Import the `pytorch_lightning` library and the `smdistributed.dataparallel.torch` modules.

```
import lightning as pl
import smdistributed.dataparallel.torch.torch_smddp
```

2. Instantiate the LightningEnvironment.

```
from lightning.fabric.plugins.environments.lightning import LightningEnvironment

env = LightningEnvironment()
env.world_size = lambda: int(os.environ["WORLD_SIZE"])
env.global_rank = lambda: int(os.environ["RANK"])
```

3. **For PyTorch DDP** – Create an object of the DDPStrategy class with `"smddp"` for `process_group_backend` and `"gpu"` for `accelerator`, and pass that to the Trainer class.

```
import lightning as pl
from lightning.pytorch.strategies import DDPStrategy

ddp = DDPStrategy(
    cluster_environment=env,
    process_group_backend="smddp",
    accelerator="gpu"
)

trainer = pl.Trainer(
    max_epochs=200,
    strategy=ddp,
    devices=num_gpus,
    num_nodes=num_nodes
)
```

For PyTorch FSDP – Create an object of the FSDPStrategy class (with wrapping policy of choice) with `"smddp"` for `process_group_backend` and `"gpu"` for `accelerator`, and pass that to the Trainer class.

```
import lightning as pl
from lightning.pytorch.strategies import FSDPStrategy

from functools import partial
from torch.distributed.fsdp.wrap import size_based_auto_wrap_policy

policy = partial(
    size_based_auto_wrap_policy,
    min_num_params=10000
)

fsdp = FSDPStrategy(
    auto_wrap_policy=policy,
    process_group_backend="smddp",
    cluster_environment=env
)

trainer = pl.Trainer(
    max_epochs=200,
```

```
    strategy=fsdp,
    devices=num_gpus,
    num_nodes=num_nodes
)
```

After you have completed adapting your training script, proceed to Launching distributed training jobs with SMDDP using the SageMaker Python SDK.

Note

When you construct a SageMaker AI PyTorch ModelTrainer and submit a training job request in the section called "Launching distributed training jobs with SMDDP", you need to provide `requirements.txt` to install `pytorch-lightning` and `lightning-bolts` in the SageMaker AI PyTorch training container.

```
# requirements.txt
pytorch-lightning
lightning-bolts
```

For more information about specifying the source directory to place the `requirements.txt` file along with your training script and a job submission, see Using third-party libraries in the *Amazon SageMaker AI Python SDK documentation*.

Use the SMDDP library in your TensorFlow training script (deprecated)

Important

The SMDDP library discontinued support for TensorFlow and is no longer available in DLCs for TensorFlow later than v2.11.0. To find previous TensorFlow DLCs with the SMDDP library installed, see the section called "Supported frameworks".

The following steps show you how to modify a TensorFlow training script to utilize SageMaker AI's distributed data parallel library.

The library APIs are designed to be similar to Horovod APIs. For additional details on each API that the library offers for TensorFlow, see the SageMaker AI distributed data parallel TensorFlow API documentation.

> **Note**
>
> SageMaker AI distributed data parallel is adaptable to TensorFlow training scripts composed of `tf` core modules except `tf.keras` modules. SageMaker AI distributed data parallel does not support TensorFlow with Keras implementation.

> **Note**
>
> The SageMaker AI distributed data parallelism library supports Automatic Mixed Precision (AMP) out of the box. No extra action is needed to enable AMP other than the framework-level modifications to your training script. If gradients are in FP16, the SageMaker AI data parallelism library runs its `AllReduce` operation in FP16. For more information about implementing AMP APIs to your training script, see the following resources:
>
> - Frameworks - TensorFlow in the *NVIDIA Deep Learning Performance documentation*
> - Automatic Mixed Precision for Deep Learning in the *NVIDIA Developer Docs*
> - TensorFlow mixed precision APIs in the *TensorFlow documentation*

1. Import the library's TensorFlow client and initialize it.

```
import smdistributed.dataparallel.tensorflow as sdp
sdp.init()
```

2. Pin each GPU to a single `smdistributed.dataparallel` process with `local_rank`—this refers to the relative rank of the process within a given node. The `sdp.tensorflow.local_rank()` API provides you with the local rank of the device. The leader node is rank 0, and the worker nodes are rank 1, 2, 3, and so on. This is invoked in the following code block as `sdp.local_rank()`. `set_memory_growth` is not directly related to SageMaker AI distributed, but must be set for distributed training with TensorFlow.

```
gpus = tf.config.experimental.list_physical_devices('GPU')
for gpu in gpus:
    tf.config.experimental.set_memory_growth(gpu, True)
```

```
if gpus:
    tf.config.experimental.set_visible_devices(gpus[sdp.local_rank()], 'GPU')
```

3. Scale the learning rate by the number of workers. The `sdp.tensorflow.size()` API provides you the number of workers in the cluster. This is invoked in the following code block as `sdp.size()`.

```
learning_rate = learning_rate * sdp.size()
```

4. Use the library's `DistributedGradientTape` to optimize `AllReduce` operations during training. This wraps `tf.GradientTape`.

```
with tf.GradientTape() as tape:
      output = model(input)
      loss_value = loss(label, output)

# SageMaker AI data parallel: Wrap tf.GradientTape with the library's
 DistributedGradientTape
tape = sdp.DistributedGradientTape(tape)
```

5. Broadcast the initial model variables from the leader node (rank 0) to all the worker nodes (ranks 1 through n). This is needed to ensure a consistent initialization across all the worker ranks. Use the `sdp.tensorflow.broadcast_variables` API after the model and optimizer variables are initialized. This is invoked in the following code block as `sdp.broadcast_variables()`.

```
sdp.broadcast_variables(model.variables, root_rank=0)
sdp.broadcast_variables(opt.variables(), root_rank=0)
```

6. Finally, modify your script to save checkpoints only on the leader node. The leader node has a synchronized model. This also avoids worker nodes overwriting the checkpoints and possibly corrupting the checkpoints.

```
if sdp.rank() == 0:
    checkpoint.save(checkpoint_dir)
```

The following is an example TensorFlow training script for distributed training with the library.

```
import tensorflow as tf
```

```
# SageMaker AI data parallel: Import the library TF API
import smdistributed.dataparallel.tensorflow as sdp

# SageMaker AI data parallel: Initialize the library
sdp.init()

gpus = tf.config.experimental.list_physical_devices('GPU')
for gpu in gpus:
    tf.config.experimental.set_memory_growth(gpu, True)
if gpus:
    # SageMaker AI data parallel: Pin GPUs to a single library process
    tf.config.experimental.set_visible_devices(gpus[sdp.local_rank()], 'GPU')

# Prepare Dataset
dataset = tf.data.Dataset.from_tensor_slices(...)

# Define Model
mnist_model = tf.keras.Sequential(...)
loss = tf.losses.SparseCategoricalCrossentropy()

# SageMaker AI data parallel: Scale Learning Rate
# LR for 8 node run : 0.000125
# LR for single node run : 0.001
opt = tf.optimizers.Adam(0.000125 * sdp.size())

@tf.function
def training_step(images, labels, first_batch):
    with tf.GradientTape() as tape:
        probs = mnist_model(images, training=True)
        loss_value = loss(labels, probs)

    # SageMaker AI data parallel: Wrap tf.GradientTape with the library's
 DistributedGradientTape
    tape = sdp.DistributedGradientTape(tape)

    grads = tape.gradient(loss_value, mnist_model.trainable_variables)
    opt.apply_gradients(zip(grads, mnist_model.trainable_variables))

    if first_batch:
       # SageMaker AI data parallel: Broadcast model and optimizer variables
       sdp.broadcast_variables(mnist_model.variables, root_rank=0)
       sdp.broadcast_variables(opt.variables(), root_rank=0)

    return loss_value
```

```
...

# SageMaker AI data parallel: Save checkpoints only from master node.
if sdp.rank() == 0:
    checkpoint.save(checkpoint_dir)
```

After you have completed adapting your training script, move on to Launching distributed training jobs with SMDDP using the SageMaker Python SDK.

Launching distributed training jobs with SMDDP using the SageMaker Python SDK

To run a distributed training job with your adapted script from the section called "Adapting your training script to use the SMDDP collective operations", use the SageMaker Python SDK's framework or generic estimators by specifying the prepared training script as an entry point script and the distributed training configuration.

This page walks you through how to use the SageMaker AI Python SDK in two ways.

- If you want to achieve a quick adoption of your distributed training job in SageMaker AI, configure a SageMaker AI PyTorch or TensorFlow framework estimator class. The framework estimator picks up your training script and automatically matches the right image URI of the pre-built PyTorch or TensorFlow Deep Learning Containers (DLC), given the value specified to the `framework_version` parameter.
- If you want to extend one of the pre-built containers or build a custom container to create your own ML environment with SageMaker AI, use the SageMaker AI generic `Estimator` class and specify the image URI of the custom Docker container hosted in your Amazon Elastic Container Registry (Amazon ECR).

Your training datasets should be stored in Amazon S3 or Amazon FSx for Lustre in the Amazon Web Services Region in which you are launching your training job. If you use Jupyter notebooks, you should have a SageMaker notebook instance or a SageMaker Studio Classic app running in the same Amazon Web Services Region. For more information about storing your training data, see the SageMaker Python SDK data inputs documentation.

Tip

We recommend that you use Amazon FSx for Lustre instead of Amazon S3 to improve training performance. Amazon FSx has higher throughput and lower latency than Amazon S3.

Tip

To properly run distributed training on the EFA-enabled instance types, you should enables traffic between the instances by setting up the security group of your VPC to allow all inbound and outbound traffic to and from the security group itself. To learn how to set up the security group rules, see Step 1: Prepare an EFA-enabled security group in the *Amazon EC2 User Guide*.

Choose one of the following topics for instructions on how to run a distributed training job of your training script. After you launch a training job, you can monitor system utilization and model performance using Amazon SageMaker Debugger or Amazon CloudWatch.

While you follow instructions in the following topics to learn more about technical details, we also recommend that you try the Amazon SageMaker AI data parallelism library examples to get started.

Topics

- Use the PyTorch framework estimators in the SageMaker Python SDK
- Use the SageMaker AI generic estimator to extend pre-built DLC containers
- Create your own Docker container with the SageMaker AI distributed data parallel library

Use the PyTorch framework estimators in the SageMaker Python SDK

You can launch distributed training by adding the `distribution` argument to the SageMaker AI `PyTorch` framework estimator. The SageMaker AI distributed data parallelism (SMDDP) library supports PyTorch distributed training.

> **Note**
>
> SMDDP discontinued TensorFlow support after v2.11.0. For distributed training with TensorFlow, use alternative distribution strategies.

The following launcher options are available for launching PyTorch distributed training.

- `pytorchddp` – This option runs `mpirun` and sets up environment variables needed for running PyTorch distributed training on SageMaker AI. To use this option, pass the following dictionary to the `distribution` parameter.

```
{ "pytorchddp": { "enabled": True } }
```

- `torch_distributed` – This option runs `torchrun` and sets up environment variables needed for running PyTorch distributed training on SageMaker AI. To use this option, pass the following dictionary to the `distribution` parameter.

```
{ "torch_distributed": { "enabled": True } }
```

- `smdistributed` – This option also runs `mpirun` but with `smddprun` that sets up environment variables needed for running PyTorch distributed training on SageMaker AI.

```
{ "smdistributed": { "dataparallel": { "enabled": True } } }
```

If you chose to replace NCCL `AllGather` to SMDDP `AllGather`, you can use all three options. Choose one option that fits with your use case.

If you chose to replace NCCL `AllReduce` with SMDDP `AllReduce`, you should choose one of the `mpirun`-based options: `smdistributed` or `pytorchddp`. You can also add additional MPI options as follows.

```
{
    "pytorchddp": {
        "enabled": True,
        "custom_mpi_options": "-verbose -x NCCL_DEBUG=VERSION"
    }
}
```

```
{
    "smdistributed": {
        "dataparallel": {
            "enabled": True,
            "custom_mpi_options": "-verbose -x NCCL_DEBUG=VERSION"
        }
    }
}
```

The following code sample shows the basic structure of a ModelTrainer with distributed training options.

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import SourceCode, Compute, InputData
from sagemaker.core import image_uris

# Retrieve the training image for the desired PyTorch version
training_image = image_uris.retrieve(
    framework="pytorch",
    region="us-west-2",
    version="2.0.1",
    py_version="py310",
    instance_type="ml.p4d.24xlarge",
    image_scope="training"
)

source_code = SourceCode(
    source_dir="subdirectory-to-your-code",
    entry_script="adapted-training-script.py"
)

compute = Compute(
    # For running a multi-node distributed training job, specify a value greater than 1
    # Example: 2,3,4,..8
    instance_count=2,

    # Instance types supported by the SageMaker AI data parallel library:
    # ml.p4d.24xlarge, ml.p4de.24xlarge
    instance_type="ml.p4d.24xlarge"
)

pt_model_trainer = ModelTrainer(
    training_image=training_image,
```

```
    base_job_name="training_job_name_prefix",
    source_code=source_code,
    role="SageMakerRole",
    compute=compute,

    # Activate distributed training with SMDDP
    distribution={ "pytorchddp": { "enabled": True } }  # mpirun, activates SMDDP
 AllReduce OR AllGather
    # distribution={ "torch_distributed": { "enabled": True } }  # torchrun, activates
 SMDDP AllGather
    # distribution={ "smdistributed": { "dataparallel": { "enabled": True } } }  #
 mpirun, activates SMDDP AllReduce OR AllGather
)

pt_model_trainer.train(input_data_config=[
    InputData(channel_name="training", data_source="s3://bucket/path/to/training/data")
])
```

Note

PyTorch Lightning and its utility libraries such as Lightning Bolts are not preinstalled in the SageMaker AI PyTorch DLCs. Create the following `requirements.txt` file and save in the source directory where you save the training script.

```
# requirements.txt
pytorch-lightning
lightning-bolts
```

For example, the tree-structured directory should look like the following.

```
### pytorch_training_launcher_jupyter_notebook.ipynb
### sub-folder-for-your-code
    ###  adapted-training-script.py
    ###  requirements.txt
```

For more information about specifying the source directory to place the `requirements.txt` file along with your training script and a job submission, see Using third-party libraries in the *Amazon SageMaker AI Python SDK documentation*.

Considerations for activating SMDDP collective operations and using the right distributed training launcher options

- SMDDP `AllReduce` and SMDDP `AllGather` are not mutually compatible at present.
- SMDDP `AllReduce` is activated by default when using `smdistributed` or `pytorchddp`, which are `mpirun`-based launchers, and NCCL `AllGather` is used.
- SMDDP `AllGather` is activated by default when using `torch_distributed` launcher, and `AllReduce` falls back to NCCL.
- SMDDP `AllGather` can also be activated when using the `mpirun`-based launchers with an additional environment variable set as follows.

```
export SMDATAPARALLEL_OPTIMIZE_SDP=true
```

Use the SageMaker AI generic estimator to extend pre-built DLC containers

You can customize SageMaker AI prebuilt containers or extend them to handle any additional functional requirements for your algorithm or model that the prebuilt SageMaker AI Docker image doesn't support. For an example of how you can extend a pre-built container, see Extend a Prebuilt Container.

To extend a prebuilt container or adapt your own container to use the library, you must use one of the images listed in Supported frameworks.

> **Note**
>
> From TensorFlow 2.4.1 and PyTorch 1.8.1, SageMaker AI framework DLCs supports EFA-enabled instance types. We recommend that you use the DLC images that contain TensorFlow 2.4.1 or later and PyTorch 1.8.1 or later.

For example, if you use PyTorch, your Dockerfile should contain a `FROM` statement similar to the following:

```
# SageMaker AI PyTorch image
FROM 763104351884.dkr.ecr.<aws-region>.amazonaws.com/pytorch-training:<image-tag>

ENV PATH="/opt/ml/code:${PATH}"
```

```
# this environment variable is used by the SageMaker AI PyTorch container to determine
 our user code directory.
ENV SAGEMAKER_SUBMIT_DIRECTORY /opt/ml/code

# /opt/ml and all subdirectories are utilized by SageMaker AI, use the /code
 subdirectory to store your user code.
COPY train.py /opt/ml/code/train.py

# Defines cifar10.py as script entrypoint
ENV SAGEMAKER_PROGRAM train.py
```

You can further customize your own Docker container to work with SageMaker AI using the SageMaker Training toolkit and the binary file of the SageMaker AI distributed data parallel library. To learn more, see the instructions in the following section.

Create your own Docker container with the SageMaker AI distributed data parallel library

To build your own Docker container for training and use the SageMaker AI data parallel library, you must include the correct dependencies and the binary files of the SageMaker AI distributed parallel libraries in your Dockerfile. This section provides instructions on how to create a complete Dockerfile with the minimum set of dependencies for distributed training in SageMaker AI using the data parallel library.

> **Note**
>
> This custom Docker option with the SageMaker AI data parallel library as a binary is available only for PyTorch.

To create a Dockerfile with the SageMaker training toolkit and the data parallel library

1. Start with a Docker image from NVIDIA CUDA. Use the cuDNN developer versions that contain CUDA runtime and development tools (headers and libraries) to build from the PyTorch source code.

   ```
   FROM nvidia/cuda:11.3.1-cudnn8-devel-ubuntu20.04
   ```

> **Tip**
>
> The official Amazon Deep Learning Container (DLC) images are built from the NVIDIA CUDA base images. If you want to use the prebuilt DLC images as references while following the rest of the instructions, see the Amazon Deep Learning Containers for PyTorch Dockerfiles.

2. Add the following arguments to specify versions of PyTorch and other packages. Also, indicate the Amazon S3 bucket paths to the SageMaker AI data parallel library and other software to use Amazon resources, such as the Amazon S3 plug-in.

   To use versions of the third party libraries other than the ones provided in the following code example, we recommend you look into the official Dockerfiles of Amazon Deep Learning Container for PyTorch to find versions that are tested, compatible, and suitable for your application.

   To find URLs for the `SMDATAPARALLEL_BINARY` argument, see the lookup tables at Supported frameworks.

   ```
   ARG PYTORCH_VERSION=1.10.2
   ARG PYTHON_SHORT_VERSION=3.8
   ARG EFA_VERSION=1.14.1
   ARG SMDATAPARALLEL_BINARY=https://smdataparallel.s3.amazonaws.com/binary/pytorch/
   ${PYTORCH_VERSION}/cu113/2022-02-18/smdistributed_dataparallel-1.4.0-cp38-cp38-
   linux_x86_64.whl
   ARG PT_S3_WHL_GPU=https://aws-s3-plugin.s3.us-west-2.amazonaws.com/
   binaries/0.0.1/1c3e69e/awsio-0.0.1-cp38-cp38-manylinux1_x86_64.whl
   ARG CONDA_PREFIX="/opt/conda"
   ARG BRANCH_OFI=1.1.3-aws
   ```

3. Set the following environment variables to properly build SageMaker training components and run the data parallel library. You use these variables for the components in the subsequent steps.

   ```
   # Set ENV variables required to build PyTorch
   ENV TORCH_CUDA_ARCH_LIST="7.0+PTX 8.0"
   ENV TORCH_NVCC_FLAGS="-Xfatbin -compress-all"
   ENV NCCL_VERSION=2.10.3

   # Add OpenMPI to the path.
   ```

```
ENV PATH /opt/amazon/openmpi/bin:$PATH

# Add Conda to path
ENV PATH $CONDA_PREFIX/bin:$PATH

# Set this enviroment variable for SageMaker AI to launch SMDDP correctly.
ENV SAGEMAKER_TRAINING_MODULE=sagemaker_pytorch_container.training:main

# Add enviroment variable for processes to be able to call fork()
ENV RDMAV_FORK_SAFE=1

# Indicate the container type
ENV DLC_CONTAINER_TYPE=training

# Add EFA and SMDDP to LD library path
ENV LD_LIBRARY_PATH="/opt/conda/lib/python${PYTHON_SHORT_VERSION}/site-packages/
smdistributed/dataparallel/lib:$LD_LIBRARY_PATH"
ENV LD_LIBRARY_PATH=/opt/amazon/efa/lib/:$LD_LIBRARY_PATH
```

4. Install or update `curl`, `wget`, and `git` to download and build packages in the subsequent steps.

```
RUN --mount=type=cache,id=apt-final,target=/var/cache/apt \
    apt-get update && apt-get install -y  --no-install-recommends \
        curl \
        wget \
        git \
    && rm -rf /var/lib/apt/lists/*
```

5. Install Elastic Fabric Adapter (EFA) software for Amazon EC2 network communication.

```
RUN DEBIAN_FRONTEND=noninteractive apt-get update
RUN mkdir /tmp/efa \
    && cd /tmp/efa \
    && curl --silent -O https://efa-installer.amazonaws.com/aws-efa-installer-
${EFA_VERSION}.tar.gz \
    && tar -xf aws-efa-installer-${EFA_VERSION}.tar.gz \
    && cd aws-efa-installer \
    && ./efa_installer.sh -y --skip-kmod -g \
    && rm -rf /tmp/efa
```

6. Install Conda to handle package management.

```
RUN curl -fsSL -v -o ~/miniconda.sh -O  https://repo.anaconda.com/miniconda/
Miniconda3-latest-Linux-x86_64.sh  && \
    chmod +x ~/miniconda.sh && \
    ~/miniconda.sh -b -p $CONDA_PREFIX && \
    rm ~/miniconda.sh && \
    $CONDA_PREFIX/bin/conda install -y python=${PYTHON_SHORT_VERSION} conda-build
 pyyaml numpy ipython && \
    $CONDA_PREFIX/bin/conda clean -ya
```

7. Get, build, and install PyTorch and its dependencies. We build PyTorch from the source code because we need to have control of the NCCL version to guarantee compatibility with the Amazon OFI NCCL plug-in.

   a. Following the steps in the PyTorch official dockerfile, install build dependencies and set up ccache to speed up recompilation.

   ```
   RUN DEBIAN_FRONTEND=noninteractive \
       apt-get install -y --no-install-recommends \
           build-essential \
           ca-certificates \
           ccache \
           cmake \
           git \
           libjpeg-dev \
           libpng-dev \
       && rm -rf /var/lib/apt/lists/*

   # Setup ccache
   RUN /usr/sbin/update-ccache-symlinks
   RUN mkdir /opt/ccache && ccache --set-config=cache_dir=/opt/ccache
   ```

   b. Install PyTorch's common and Linux dependencies.

   ```
   # Common dependencies for PyTorch
   RUN conda install astunparse numpy ninja pyyaml mkl mkl-include setuptools cmake
    cffi typing_extensions future six requests dataclasses

   # Linux specific dependency for PyTorch
   RUN conda install -c pytorch magma-cuda113
   ```

   c. Clone the PyTorch GitHub repository.

```
RUN --mount=type=cache,target=/opt/ccache \
    cd / \
    && git clone --recursive https://github.com/pytorch/pytorch -b v
${PYTORCH_VERSION}
```

d. Install and build a specific NCCL version. To do this, replace the content in the PyTorch's default NCCL folder (`/pytorch/third_party/nccl`) with the specific NCCL version from the NVIDIA repository. The NCCL version was set in the step 3 of this guide.

```
RUN cd /pytorch/third_party/nccl \
    && rm -rf nccl \
    && git clone https://github.com/NVIDIA/nccl.git -b v${NCCL_VERSION}-1 \
    && cd nccl \
    && make -j64 src.build CUDA_HOME=/usr/local/cuda NVCC_GENCODE="-
gencode=arch=compute_70,code=sm_70 -gencode=arch=compute_80,code=sm_80" \
    && make pkg.txz.build \
    && tar -xvf build/pkg/txz/nccl_*.txz -C $CONDA_PREFIX --strip-components=1
```

e. Build and install PyTorch. This process usually takes slightly more than 1 hour to complete. It is built using the NCCL version downloaded in a previous step.

```
RUN cd /pytorch \
    && CMAKE_PREFIX_PATH="$(dirname $(which conda))/../" \
    python setup.py install \
    && rm -rf /pytorch
```

8. Build and install Amazon OFI NCCL plugin. This enables libfabric support for the SageMaker AI data parallel library.

```
RUN DEBIAN_FRONTEND=noninteractive apt-get update \
    && apt-get install -y --no-install-recommends \
        autoconf \
        automake \
        libtool
RUN mkdir /tmp/efa-ofi-nccl \
    && cd /tmp/efa-ofi-nccl \
    && git clone https://github.com/aws/aws-ofi-nccl.git -b v${BRANCH_OFI} \
    && cd aws-ofi-nccl \
    && ./autogen.sh \
    && ./configure --with-libfabric=/opt/amazon/efa \
    --with-mpi=/opt/amazon/openmpi \
```

```
    --with-cuda=/usr/local/cuda \
    --with-nccl=$CONDA_PREFIX \
    && make \
    && make install \
    && rm -rf /tmp/efa-ofi-nccl
```

9. Build and install TorchVision.

```
RUN pip install --no-cache-dir -U \
    packaging \
    mpi4py==3.0.3
RUN cd /tmp \
    && git clone https://github.com/pytorch/vision.git -b v0.9.1 \
    && cd vision \
    && BUILD_VERSION="0.9.1+cu111" python setup.py install \
    && cd /tmp \
    && rm -rf vision
```

10. Install and configure OpenSSH. OpenSSH is required for MPI to communicate between containers. Allow OpenSSH to talk to containers without asking for confirmation.

```
RUN apt-get update \
    && apt-get install -y  --allow-downgrades --allow-change-held-packages --no-
install-recommends \
    && apt-get install -y --no-install-recommends openssh-client openssh-server \
    && mkdir -p /var/run/sshd \
    && cat /etc/ssh/ssh_config | grep -v StrictHostKeyChecking > /etc/ssh/
ssh_config.new \
    && echo "    StrictHostKeyChecking no" >> /etc/ssh/ssh_config.new \
    && mv /etc/ssh/ssh_config.new /etc/ssh/ssh_config \
    && rm -rf /var/lib/apt/lists/*

# Configure OpenSSH so that nodes can communicate with each other
RUN mkdir -p /var/run/sshd && \
 sed 's@session\s*required\s*pam_loginuid.so@session optional pam_loginuid.so@g' -i /
etc/pam.d/sshd
RUN rm -rf /root/.ssh/ && \
 mkdir -p /root/.ssh/ && \
 ssh-keygen -q -t rsa -N '' -f /root/.ssh/id_rsa && \
 cp /root/.ssh/id_rsa.pub /root/.ssh/authorized_keys \
 && printf "Host *\n StrictHostKeyChecking no\n" >> /root/.ssh/config
```

11. Install the PT S3 plug-in to efficiently access datasets in Amazon S3.

```
RUN pip install --no-cache-dir -U ${PT_S3_WHL_GPU}
RUN mkdir -p /etc/pki/tls/certs && cp /etc/ssl/certs/ca-certificates.crt /etc/pki/
tls/certs/ca-bundle.crt
```

12 Install the libboost library. This package is needed for networking the asynchronous IO functionality of the SageMaker AI data parallel library.

```
WORKDIR /
RUN wget https://sourceforge.net/projects/boost/files/boost/1.73.0/
boost_1_73_0.tar.gz/download -O boost_1_73_0.tar.gz \
    && tar -xzf boost_1_73_0.tar.gz \
    && cd boost_1_73_0 \
    && ./bootstrap.sh \
    && ./b2 threading=multi --prefix=${CONDA_PREFIX} -j 64 cxxflags=-fPIC cflags=-
fPIC install || true \
    && cd .. \
    && rm -rf boost_1_73_0.tar.gz \
    && rm -rf boost_1_73_0 \
    && cd ${CONDA_PREFIX}/include/boost
```

13 Install the following SageMaker AI tools for PyTorch training.

```
WORKDIR /root
RUN pip install --no-cache-dir -U \
    smclarify \
    "sagemaker>=2,<3" \
    sagemaker-experiments==0.* \
    sagemaker-pytorch-training
```

14 Finally, install the SageMaker AI data parallel binary and the remaining dependencies.

```
RUN --mount=type=cache,id=apt-final,target=/var/cache/apt \
  apt-get update && apt-get install -y  --no-install-recommends \
  jq \
  libhwloc-dev \
  libnuma1 \
  libnuma-dev \
  libssl1.1 \
  libtool \
  hwloc \
  && rm -rf /var/lib/apt/lists/*
```

```
RUN SMDATAPARALLEL_PT=1 pip install --no-cache-dir ${SMDATAPARALLEL_BINARY}
```

15 After you finish creating the Dockerfile, see Adapting Your Own Training Container to learn how to build the Docker container, host it in Amazon ECR, and run a training job using the SageMaker Python SDK.

The following example code shows a complete Dockerfile after combining all the previous code blocks.

```
# This file creates a docker image with minimum dependencies to run SageMaker AI data
 parallel training
FROM nvidia/cuda:11.3.1-cudnn8-devel-ubuntu20.04

# Set appropiate versions and location for components
ARG PYTORCH_VERSION=1.10.2
ARG PYTHON_SHORT_VERSION=3.8
ARG EFA_VERSION=1.14.1
ARG SMDATAPARALLEL_BINARY=https://smdataparallel.s3.amazonaws.com/binary/pytorch/
${PYTORCH_VERSION}/cu113/2022-02-18/smdistributed_dataparallel-1.4.0-cp38-cp38-

```

Tip

For more general information about creating a custom Dockerfile for training in SageMaker AI, see Use Your Own Training Algorithms.

Tip

If you want to extend the custom Dockerfile to incorporate the SageMaker AI model parallel library, see Create Your Own Docker Container with the SageMaker Distributed Model Parallel Library.

Amazon SageMaker AI data parallelism library examples

This page provides Jupyter notebooks that present examples of implementing the SageMaker AI distributed data parallelism (SMDDP) library to run distributed training jobs on SageMaker AI.

Blogs and Case Studies

The following blogs discuss case studies about using the SMDDP library.

SMDDP v2 blogs

- Enable faster training with Amazon SageMaker AI data parallel library, *Amazon Machine Learning Blog* (December 05, 2023)

SMDDP v1 blogs

- How I trained 10TB for Stable Diffusion on SageMaker AI in *Medium* (November 29, 2022)
- Run PyTorch Lightning and native PyTorch DDP on Amazon SageMaker Training, featuring Amazon Search , *Amazon Machine Learning Blog* (August 18, 2022)
- Training YOLOv5 on Amazon with PyTorch and the SageMaker AI distributed data parallel library, *Medium* (May 6, 2022)
- Speed up EfficientNet model training on SageMaker AI with PyTorch and the SageMaker AI distributed data parallel library, *Medium* (March 21, 2022)
- Speed up EfficientNet training on Amazon with the SageMaker AI distributed data parallel library, *Towards Data Science* (January 12, 2022)

Configuration tips for the SageMaker AI distributed data parallelism library

Review the following tips before using the SageMaker AI distributed data parallelism (SMDDP) library. This list includes tips that are applicable across frameworks.

Topics

- Data preprocessing
- Single versus multiple nodes
- Debug scaling efficiency with Debugger
- Batch size
- Custom MPI options
- Use Amazon FSx and set up an optimal storage and throughput capacity

Data preprocessing

If you preprocess data during training using an external library that utilizes the CPU, you may run into a CPU bottleneck because SageMaker AI distributed data parallel uses the CPU for `AllReduce`

operations. You may be able to improve training time by moving preprocessing steps to a library that uses GPUs or by completing all preprocessing before training.

Single versus multiple nodes

We recommend that you use this library with multiple nodes. The library can be used with a single-host, multi-device setup (for example, a single ML compute instance with multiple GPUs); however, when you use two or more nodes, the library's `AllReduce` operation gives you significant performance improvement. Also, on a single host, NVLink already contributes to in-node `AllReduce` efficiency.

Debug scaling efficiency with Debugger

You can use Amazon SageMaker Debugger to monitor and visualize CPU and GPU utilization and other metrics of interest during training. You can use Debugger built-in rules to monitor computational performance issues, such as `CPUBottleneck`, `LoadBalancing`, and `LowGPUUtilization`. You can specify these rules with Debugger configurations when you define an Amazon SageMaker Python SDK ModelTrainer. If you use Amazon CLI and Amazon SDK for Python (Boto3) for training on SageMaker AI, you can enable Debugger as shown in Configure SageMaker Debugger Using Amazon SageMaker API.

To see an example using Debugger in a SageMaker training job, you can reference one of the notebook examples in the SageMaker Notebook Examples GitHub repository. To learn more about Debugger, see Amazon SageMaker Debugger.

Batch size

In distributed training, as more nodes are added, batch sizes should increase proportionally. To improve convergence speed as you add more nodes to your training job and increase the global batch size, increase the learning rate.

One way to achieve this is by using a gradual learning rate warmup where the learning rate is ramped up from a small to a large value as the training job progresses. This ramp avoids a sudden increase of the learning rate, allowing healthy convergence at the start of training. For example, you can use a *Linear Scaling Rule* where each time the mini-batch size is multiplied by k, the learning rate is also multiplied by k. To learn more about this technique, see the research paper, Accurate, Large Minibatch SGD: Training ImageNet in 1 Hour, Sections 2 and 3.

Custom MPI options

The SageMaker AI distributed data parallel library employs Message Passing Interface (MPI), a popular standard for managing communication between nodes in a high-performance cluster, and uses NVIDIA's NCCL library for GPU-level communication. When you use the data parallel library with a TensorFlow or Pytorch `ModelTrainer`, the respective container sets up the MPI environment and executes the `mpirun` command to start jobs on the cluster nodes.

You can set custom MPI operations using the `custom_mpi_options` parameter in the `ModelTrainer`. Any `mpirun` flags passed in this field are added to the `mpirun` command and executed by SageMaker AI for training. For example, you may define the `distribution` parameter of an `ModelTrainer` using the following to use the NCCL_DEBUG variable to print the NCCL version at the start of the program:

```
distribution = {'smdistributed':{'dataparallel':{'enabled': True, "custom_mpi_options":
 "-verbose -x NCCL_DEBUG=VERSION"}}}
```

Use Amazon FSx and set up an optimal storage and throughput capacity

When training a model on multiple nodes with distributed data parallelism, it is highly recommended to use FSx for Lustre. Amazon FSx is a scalable and high-performance storage service that supports shared file storage with a faster throughput. Using Amazon FSx storage at scale, you can achieve a faster data loading speed across the compute nodes.

Typically, with distributed data parallelism, you would expect that the total training throughput scales near-linearly with the number of GPUs. However, if you use suboptimal Amazon FSx storage, the training performance might slow down due to a low Amazon FSx throughput.

For example, if you use the **SCRATCH_2** deployment type of Amazon FSx file system with the minimum 1.2 TiB storage capacity, the I/O throughput capacity is 240 MB/s. Amazon FSx storage works in a way that you can assign physical storage devices, and the more devices assigned, the larger throughput you get. The smallest storage increment for the SRATCH_2 type is 1.2 TiB, and the corresponding throughput gain is 240 MB/s.

Assume that you have a model to train on a 4-node cluster over a 100 GB data set. With a given batch size that's optimized to the cluster, assume that the model can complete one epoch in about 30 seconds. In this case, the minimum required I/O speed is approximately 3 GB/s (100 GB / 30 s). This is apparently a much higher throughput requirement than 240 MB/s. With such a limited Amazon FSx capacity, scaling your distributed training job up to larger clusters might aggravate I/O

bottleneck problems; model training throughput might improve in later epochs as cache builds up, but Amazon FSx throughput can still be a bottleneck.

To alleviate such I/O bottleneck problems, you should increase the Amazon FSx storage size to obtain a higher throughput capacity. Typically, to find an optimal I/O throughput, you may experiment with different Amazon FSx throughput capacities, assigning an equal to or slightly lower throughput than your estimate, until you find that it is sufficient to resolve the I/O bottleneck problems. In case of the aforementioned example, Amazon FSx storage with 2.4 GB/s throughput and 67 GB RAM cache would be sufficient. If the file system has an optimal throughput, the model training throughput should reach maximum either immediately or after the first epoch as cache has built up.

To learn more about how to increase Amazon FSx storage and deployment types, see the following pages in the *Amazon FSx for Lustre documentation*:

- How to increase storage capacity
- Aggregate file system performance

Amazon SageMaker AI distributed data parallelism library FAQ

Use the following to find answers to commonly asked questions about the SMDDP library.

Q: When using the library, how are the `allreduce`-supporting CPU instances managed? Do I have to create heterogeneous CPU-GPU clusters, or does the SageMaker AI service create extra C5s for jobs that use the SMDDP library?

The SMDDP library only supports GPU instances, more specificcally, P4d and P4de instances with NVIDIA A100 GPUs and EFA. No additional C5 or CPU instances are launched; if your SageMaker AI training job is on an 8-node P4d cluster, only 8 `ml.p4d.24xlarge` instances are used. No additional instances are provisioned.

Q: I have a training job taking 5 days on a single `ml.p3.24xlarge` instance with a set of hyperparameters H1 (learning rate, batch size, optimizer, etc). Is using SageMaker AI's data parallelism library and a five-time bigger cluster enough to achieve an approximate five-time speedup? Or do I have to revisit its training hyperparameters after activating the SMDDP library?

The library changes the overall batch size. The new overall batch size is scaled linearly with the number of training instances used. As a result of this, hyperparameters, such as learning rate, have to be changed to ensure convergence.

Q: Does the SMDDP library support Spot?

Yes. You can use managed spot training. You specify the path to the checkpoint file in the SageMaker training job. You save and restore checkpoints in their training script as mentioned in the last steps of the section called "TensorFlow (deprecated)" and the section called "PyTorch".

Q: Is the SMDDP library relevant in a single-host, multi-device setup?

The library can be used in single-host multi-device training but the library offers performance improvements only in multi-host training.

Q: Where should the training dataset be stored?

The training dataset can be stored in an Amazon S3 bucket or on an Amazon FSx drive. See this document for various supported input file systems for a training job.

Q: When using the SMDDP library, is it mandatory to have training data in FSx for Lustre? Can Amazon EFS and Amazon S3 be used?

We generally recommend you use Amazon FSx because of its lower latency and higher throughput. If you prefer, you can use Amazon EFS or Amazon S3.

Q: Can the library be used with CPU nodes?

No. To find instance types supported by the SMDDP library, see the section called "Supported instance types".

Q: What frameworks and framework versions are currently supported by the SMDDP library at launch?

the SMDDP library currently supports PyTorch v1.6.0 or later and TensorFlow v2.3.0 or later. It doesn't support TensorFlow 1.x. For more information about which version of the SMDDP library is packaged within Amazon deep learning containers, see Release Notes for Deep Learning Containers.

Q: Does the library support AMP?

Yes, the SMDDP library supports Automatic Mixed Precision (AMP) out of the box. No extra action is needed to use AMP other than the framework-level modifications to your training script. If gradients are in FP16, the SageMaker AI data parallelism library runs its `AllReduce` operation in FP16. For more information about implementing AMP APIs to your training script, see the following resources:

- Frameworks - PyTorch in the *NVIDIA Deep Learning Performace documentation*
- Frameworks - TensorFlow in the *NVIDIA Deep Learning Performace documentation*
- Automatic Mixed Precision for Deep Learning in the *NVIDIA Developer Docs*
- Introducing native PyTorch automatic mixed precision for faster training on NVIDIA GPUs in the *PyTorch Blog*
- TensorFlow mixed precision APIs in the *TensorFlow documentation*

Q: How do I identify if my distributed training job is slowed down due to I/O bottleneck?

With a larger cluster, the training job requires more I/O throughput, and therefore the training throughput might take longer (more epochs) to ramp up to the maximum performance. This indicates that I/O is being bottlenecked and cache is harder to build up as you scale nodes up (higher throughput requirement and more complex network topology). For more information about monitoring the Amazon FSx throughput on CloudWatch, see Monitoring FSx for Lustre in the *FSx for Lustre User Guide*.

Q: How do I resolve I/O bottlenecks when running a distributed training job with data parallelism?

We highly recommend that you use Amazon FSx as your data channel if you are using Amazon S3. If you are already using Amazon FSx but still having I/O bottleneck problems, you might have set up your Amazon FSx file system with a low I/O throughput and a small storage capacity. For more information about how to estimate and choose the right size of I/O throughput capacity, see Use Amazon FSx and set up an optimal storage and throughput capacity.

Q: (For the library v1.4.0 or later) How do I resolve the `Invalid backend` error while initializing process group.

If you encounter the error message `ValueError: Invalid backend: 'smddp'` when calling `init_process_group`, this is due to the breaking change in the SMDDP library v1.4.0 and later. You must import the PyTorch client of the library, `smdistributed.dataparallel.torch.torch_smddp`, which registers `smddp` as a backend for PyTorch. To learn more, see the section called “PyTorch”.

Q: (For the SMDDP library v1.4.0 or later) I would like to call the collective primitives of the `torch.distributed` interface. Which primitives does the `smddp` backend support?

In v1.4.0, the SMDDP library supports `all_reduce`, `broadcast`, `reduce`, `all_gather`, and `barrier` of of the `torch.distributed` interface.

Q: (For the SMDDP library v1.4.0 or later) Does this new API work with other custom DDP classes or libraries like Apex DDP?

The SMDDP library is tested with other third-party distributed data parallel libraries and framework implementations that use the `torch.distribtued` modules. Using the SMDDP library with custom DDP classes works as long as the collective operations used by the custom DDP classes are supported by the SMDDP library. See the preceding question for a list of supported collectives. If you have these use cases and need further support, reach out to the SageMaker AI team through the Amazon Support Center or Amazon Developer Forums for Amazon SageMaker AI.

Q: Does the SMDDP library support the bring-your-own-container (BYOC) option? If so, how do I install the library and run a distributed training job by writing a custom Dockerfile?

If you want to integrate the SMDDP library and its minimum dependencies into your own Docker container, BYOC is the right approach. You can build your own container using the binary file of the library. The recommended process is to write a custom Dockerfile with the library and its dependencies, build the Docker container, host it in Amazon ECR, and use the ECR image URI to launch a training job using the SageMaker AI generic ModelTrainer class. For more instructions on how to prepare a custom Dockerfile for distributed training in SageMaker AI with the SMDDP library, see Create your own Docker container with the SageMaker AI distributed data parallel library.

Troubleshooting for distributed training in Amazon SageMaker AI

If you have problems in running a training job when you use the library, use the following list to try to troubleshoot. If you need further support, reach out to the SageMaker AI team through Amazon Support Center or Amazon Developer Forums for Amazon Amazon SageMaker AI.

Topics

- Using SageMaker AI distributed data parallel with Amazon SageMaker Debugger and checkpoints
- An unexpected prefix attached to model parameter keys
- SageMaker AI distributed training job stalling during initialization
- SageMaker AI distributed training job stalling at the end of training

- Observing scaling efficiency degradation due to Amazon FSx throughput bottlenecks
- SageMaker AI distributed training job with PyTorch returns deprecation warnings

Using SageMaker AI distributed data parallel with Amazon SageMaker Debugger and checkpoints

To monitor system bottlenecks, profile framework operations, and debug model output tensors for training jobs with SageMaker AI distributed data parallel, use Amazon SageMaker Debugger.

However, when you use SageMaker Debugger, SageMaker AI distributed data parallel, and SageMaker AI checkpoints, you might see an error that looks like the following example.

```
SMDebug Does Not Currently Support Distributed Training Jobs With Checkpointing Enabled
```

This is due to an internal error between Debugger and checkpoints, which occurs when you enable SageMaker AI distributed data parallel.

- If you enable all three features, SageMaker Python SDK automatically turns off Debugger by passing `debugger_hook_config=False`, which is equivalent to the following framework `ModelTrainer` example.

```
bucket=Session().default_bucket()
base_job_name="sagemaker-checkpoint-test"
checkpoint_in_bucket="checkpoints"

# The S3 URI to store the checkpoints
checkpoint_s3_bucket="s3://{}/{}/{}".format(bucket, base_job_name,
 checkpoint_in_bucket)

model_trainer = ModelTrainer(
    ...

    distribution={"smdistributed": {"dataparallel": { "enabled": True }}},
    checkpoint_s3_uri=checkpoint_s3_bucket,
    checkpoint_local_path="/opt/ml/checkpoints",
    debugger_hook_config=False
)
```

- If you want to keep using both SageMaker AI distributed data parallel and SageMaker Debugger, a workaround is manually adding checkpointing functions to your training script instead of

specifying the `checkpoint_s3_uri` and `checkpoint_local_path` parameters from the ModelTrainer. For more information about setting up manual checkpointing in a training script, see Saving Checkpoints.

An unexpected prefix attached to model parameter keys

For PyTorch distributed training jobs, an unexpected prefix (`model` for example) might be attached to `state_dict` keys (model parameters). The SageMaker AI data parallel library does not directly alter or prepend any model parameter names when PyTorch training jobs save model artifacts. The PyTorch's distributed training changes the names in the `state_dict` to go over the network, prepending the prefix. If you encounter any model failure problem due to different parameter names while you are using the SageMaker AI data parallel library and checkpointing for PyTorch training, adapt the following example code to remove the prefix at the step you load checkpoints in your training script.

```
state_dict = {k.partition('model.')[2]:state_dict[k] for k in state_dict.keys()}
```

This takes each `state_dict` key as a string value, separates the string at the first occurrence of `'model.'`, and takes the third list item (with index 2) of the partitioned string.

For more information about the prefix issue, see a discussion thread at Prefix parameter names in saved model if trained by multi-GPU? in the *PyTorch discussion forum*.

For more information about the PyTorch methods for saving and loading models, see Saving & Loading Model Across Devices in the *PyTorch documentation*.

SageMaker AI distributed training job stalling during initialization

If your SageMaker AI distributed data parallel training job stalls during initialization when using EFA-enabled instances, this might be due to a misconfiguration in the security group of the VPC subnet that's used for the training job. EFA requires a proper security group configuration to enable traffic between the nodes.

To configure inbound and outbound rules for the security group

1. Sign in to the Amazon Web Services Management Console and open the Amazon VPC console at https://console.amazonaws.cn/vpc/.
2. Choose **Security Groups** in the left navigation pane.
3. Select the security group that's tied to the VPC subnet you use for training.

4. In the **Details** section, copy the **Security group ID**.
5. On the **Inbound rules** tab, choose **Edit inbound rules**.
6. On the **Edit inbound rules** page, do the following:
   a. Choose **Add rule**.
   b. For **Type**, choose **All traffic**.
   c. For **Source**, choose **Custom**, paste the security group ID into the search box, and select the security group that pops up.
7. Choose **Save rules** to finish configuring the inbound rule for the security group.
8. On the **Outbound rules** tab, choose **Edit outbound rules**.
9. Repeat the step 6 and 7 to add the same rule as an outbound rule.

After you complete the preceding steps for configuring the security group with the inbound and outbound rules, re-run the training job and verify if the stalling issue is resolved.

For more information about configuring security groups for VPC and EFA, see Security groups for your VPC and Elastic Fabric Adapter.

SageMaker AI distributed training job stalling at the end of training

One of the root causes of stalling issues at the end of training is a mismatch in the number of batches that are processed per epoch across different ranks. All workers (GPUs) synchronize their local gradients in the backward pass to ensure they all have the same copy of the model at the end of the batch iteration. If the batch sizes are unevenly assigned to different worker groups during the final epoch of training, the training job stalls. For example, while a group of workers (group A) finishes processing all batches and exits the training loop, another group of workers (group B) starts processing another batch and still expects communication from group A to synchronize the gradients. This causes group B to wait for group A, which already completed training and does not have any gradients to synchronize.

Therefore, when setting up your training dataset, it is important that each worker gets the same number of data samples so that each worker goes through the same number of batches while training. Make sure each rank gets the same number of batches to avoid this stalling issue.

Observing scaling efficiency degradation due to Amazon FSx throughput bottlenecks

One potential cause of lowered scaling efficiency is the FSx throughput limit. If you observe a sudden drop in scaling efficiency when you switch to a larger training cluster, try using a larger

FSx for Lustre file system with a higher throughput limit. For more information, see Aggregate file system performance and Managing storage and throughput capacity in the *Amazon FSx for Lustre User Guide*.

SageMaker AI distributed training job with PyTorch returns deprecation warnings

Since v1.4.0, the SageMaker AI distributed data parallelism library works as a backend of PyTorch distributed. Because of the breaking change of using the library with PyTorch, you might encounter a warning message that the `smdistributed` APIs for the PyTorch distributed package are deprecated. The warning message should be similar to the following:

```
smdistributed.dataparallel.torch.dist is deprecated in the SageMaker AI distributed
 data parallel library v1.4.0+.
Please use torch.distributed and specify 'smddp' as a backend when initializing process
 group as follows:
torch.distributed.init_process_group(backend='smddp')
For more information, see the library's API documentation at
https://docs.aws.amazon.com/sagemaker/latest/dg/data-parallel-modify-sdp-pt.html
```

In v1.4.0 and later, the library only needs to be imported once at the top of your training script and set as the backend during the PyTorch distributed initialization. With the single line of backend specification, you can keep your PyTorch training script unchanged and directly use the PyTorch distributed modules. See Use the SMDDP library in your PyTorch training script to learn about the breaking changes and the new way to use the library with PyTorch.

SageMaker AI data parallelism library release notes

See the following release notes to track the latest updates for the SageMaker AI distributed data parallelism (SMDDP) library.

The SageMaker AI distributed data parallelism library v2.5.0

Date: October 17, 2024

New features

- Added support for PyTorch v2.4.1 with CUDA v12.1.

Integration into Docker containers distributed by the SageMaker AI model parallelism (SMP) library

This version of the SMDDP library is migrated to the section called "SMP v2.6.0".

```
658645717510.dkr.ecr.<us-west-2>.amazonaws.com/smdistributed-modelparallel:2.4.1-gpu-
py311-cu121
```

For Regions where the SMP Docker images are available, see the section called "Amazon Web Services Regions".

Binary file of this release

You can download or install the library using the following URL.

```
https://smdataparallel.s3.amazonaws.com/binary/pytorch/2.4.1/cu121/2024-10-09/
smdistributed_dataparallel-2.5.0-cp311-cp311-linux_x86_64.whl
```

The SageMaker AI distributed data parallelism library v2.3.0

Date: June 11, 2024

New features

- Added support for PyTorch v2.3.0 with CUDA v12.1 and Python v3.11.
- Added support for PyTorch Lightning v2.2.5. This is integrated into the SageMaker AI framework container for PyTorch v2.3.0.
- Added instance type validation during import to prevent loading the SMDDP library on unsupported instance types. For a list of instance types compatible with the SMDDP library, see the section called "Supported frameworks, Amazon Web Services Regions, and instances types".

Integration into SageMaker AI Framework Containers

This version of the SMDDP library is migrated to the following SageMaker AI Framework Container.

- PyTorch v2.3.0

  ```
  763104351884.dkr.ecr.<region>.amazonaws.com/pytorch-training:2.3.0-gpu-py311-cu121-
  ubuntu20.04-sagemaker
  ```

For a complete list of versions of the SMDDP library and the pre-built containers, see the section called "Supported frameworks, Amazon Web Services Regions, and instances types".

Binary file of this release

You can download or install the library using the following URL.

```
https://smdataparallel.s3.amazonaws.com/binary/pytorch/2.3.0/cu121/2024-05-23/
smdistributed_dataparallel-2.3.0-cp311-cp311-linux_x86_64.whl
```

Other changes

- The SMDDP library v2.2.0 is integrated into the SageMaker AI framework container for PyTorch v2.2.0.

The SageMaker AI distributed data parallelism library v2.2.0

Date: March 4, 2024

New features

- Added support for PyTorch v2.2.0 with CUDA v12.1.

Integration into Docker containers distributed by the SageMaker AI model parallelism (SMP) library

This version of the SMDDP library is migrated to the section called "SMP v2.2.0".

```
658645717510.dkr.ecr.<region>.amazonaws.com/smdistributed-modelparallel:2.2.0-gpu-
py310-cu121
```

For Regions where the SMP Docker images are available, see the section called "Amazon Web Services Regions".

Binary file of this release

You can download or install the library using the following URL.

```
https://smdataparallel.s3.amazonaws.com/binary/pytorch/2.2.0/cu121/2024-03-04/
smdistributed_dataparallel-2.2.0-cp310-cp310-linux_x86_64.whl
```

The SageMaker AI distributed data parallelism library v2.1.0

Date: March 1, 2024

New features

- Added support for PyTorch v2.1.0 with CUDA v12.1.

Bug fixes

- Fixed the CPU memory leak issue in SMDDP v2.0.1.

Integration into SageMaker AI Framework Containers

This version of the SMDDP library passed benchmark testing and is migrated to the following SageMaker AI Framework Container.

- PyTorch v2.1.0

```
763104351884.dkr.ecr.<region>.amazonaws.com/pytorch-training:2.1.0-gpu-py310-cu121-
ubuntu20.04-sagemaker
```

Integration into Docker containers distributed by the SageMaker AI model parallelism (SMP) library

This version of the SMDDP library is migrated to the section called "SMP v2.1.0".

```
658645717510.dkr.ecr.<region>.amazonaws.com/smdistributed-modelparallel:2.1.2-gpu-
py310-cu121
```

For Regions where the SMP Docker images are available, see the section called "Amazon Web Services Regions".

Binary file of this release

You can download or install the library using the following URL.

```
https://smdataparallel.s3.amazonaws.com/binary/pytorch/2.1.0/cu121/2024-02-04/
smdistributed_dataparallel-2.1.0-cp310-cp310-linux_x86_64.whl
```

The SageMaker AI distributed data parallelism library v2.0.1

Date: December 7, 2023

New features

- Added a new SMDDP-implementation of `AllGather` collective operation optimized for Amazon compute resources and network infrastructure. To learn more, see the section called "SMDDP `AllGather` collective operation".
- The SMDDP `AllGather` collective operation is compatible with PyTorch FSDP and DeepSpeed. To learn more, see the section called "PyTorch".
- Added support for PyTorch v2.0.1

Known issues

- There's a CPU memory leak issue from a gradual CPU memory increase while training with SMDDP `AllReduce` in DDP mode.

Integration into SageMaker AI Framework Containers

This version of the SMDDP library passed benchmark testing and is migrated to the following SageMaker AI Framework Container.

- PyTorch v2.0.1

```
763104351884.dkr.ecr.<region>.amazonaws.com/pytorch-training:2.0.1-gpu-py310-cu118-
ubuntu20.04-sagemaker
```

Binary file of this release

You can download or install the library using the following URL.

```
https://smdataparallel.s3.amazonaws.com/binary/pytorch/2.0.1/cu118/2023-12-07/
smdistributed_dataparallel-2.0.2-cp310-cp310-linux_x86_64.whl
```

Other changes

- Starting from this release, documentation for the SMDDP library is fully available in this *Amazon SageMaker AI Developer Guide*. In favor of the complete developer guide for SMDDP v2 housed in the *Amazon SageMaker AI Developer Guide*, documentation for the additional reference for SMDDP v1.x in the *SageMaker AI Python SDK documentation* is no longer supported. If you still

need SMP v1.x documentation, see the following snapshot of the documentation at SageMaker Python SDK v2.212.0 documentation.

SageMaker model parallelism library v2

> **Note**
>
> Since the release of the SageMaker model parallelism (SMP) library v2.0.0 on December 19, 2023, this documentation is renewed for the SMP library v2. For previous versions of the SMP library, see the section called "(Archived) SageMaker model parallelism library v1.x".

The Amazon SageMaker AI model parallelism library is a capability of SageMaker AI that enables high performance and optimized large scale training on SageMaker AI accelerate compute instances. The the section called "Core features of SMP v2" include techniques and optimizations to accelerate and simplify large model training, such as hybrid sharded data parallelism, tensor parallelism, activation checkpointing, and activation offloading. You can use the SMP library to accelerate the training and fine-tuning of large language models (LLMs), large vision models (LVMs), and foundation models (FMs) with hundreds of billions of parameters.

The SageMaker model parallelism library v2 (SMP v2) aligns the library's APIs and methods with open source PyTorch Fully Sharded Data Parallelism (FSDP), which gives you the benefit of SMP performance optimizations with minimal code changes. With SMP v2, you can improve the computational performance of training a state-of-the-art large model on SageMaker AI by bringing your PyTorch FSDP training scripts to SageMaker AI.

You can use SMP v2 for the general SageMaker Training jobs and distributed training workloads on the section called "HyperPod" clusters.

Model parallelism concepts

Model parallelism is a distributed training method in which the deep learning (DL) model is partitioned across multiple GPUs and instances. The SageMaker model parallel library v2 (SMP v2) is compatible with the native PyTorch APIs and capabilities. This makes it convenient for you to adapt your PyTorch Fully Sharded Data Parallel (FSDP) training script to the SageMaker Training platform and take advantage of the performance improvement that SMP v2 provides. This introduction page provides a high-level overview about model parallelism and a description of how it can help overcome issues that arise when training deep learning (DL) models that are typically very large in size. It also provides examples of what the SageMaker model parallel library offers to help manage model parallel strategies and memory consumption.

What is model parallelism?

Increasing the size of deep learning models (layers and parameters) yields better accuracy for complex tasks such as computer vision and natural language processing. However, there is a limit to the maximum model size you can fit in the memory of a single GPU. When training DL models, GPU memory limitations can be bottlenecks in the following ways:

- They limit the size of the model that you can train, because the memory footprint of a model scales proportionally to the number of parameters.
- They limit the per-GPU batch size during training, driving down GPU utilization and training efficiency.

To overcome the limitations associated with training a model on a single GPU, SageMaker AI provides the model parallel library to help distribute and train DL models efficiently on multiple compute nodes. Furthermore, with the library, you can achieve optimized distributed training using EFA-supported devices, which enhance the performance of inter-node communication with low latency, high throughput, and OS bypass.

Estimate memory requirements before using model parallelism

Before you use the SageMaker model parallel library, consider the following to get a sense of the memory requirements of training large DL models.

For a training job that uses automatic mixed precision such as `float16` (FP16) or `bfloat16` (BF16) and Adam optimizers, the required GPU memory per parameter is about 20 bytes, which we can break down as follows:

- An FP16 or BF16 parameter ~ 2 bytes
- An FP16 or BF16 gradient ~ 2 bytes
- An FP32 optimizer state ~ 8 bytes based on the Adam optimizers
- An FP32 copy of parameter ~ 4 bytes (needed for the `optimizer apply` (OA) operation)
- An FP32 copy of gradient ~ 4 bytes (needed for the OA operation)

Even for a relatively small DL model with 10 billion parameters, it can require at least 200GB of memory, which is much larger than the typical GPU memory (for example, NVIDIA A100 with 40GB/80GB memory) available on a single GPU. On top of the memory requirements for model and optimizer states, there are other memory consumers such as activations generated in the forward pass. The memory required can be a lot greater than 200GB.

For distributed training, we recommend that you use Amazon EC2 P4 and P5 instances that have NVIDIA A100 and H100 Tensor Core GPUs respectively. For more details about specifications such as CPU cores, RAM, attached storage volume, and network bandwidth, see the *Accelerated Computing* section in the Amazon EC2 Instance Types page. For instance types that SMP v2 supports, see the section called "Supported instance types".

Even with the accelerated computing instances, models with about 10 billion parameters such as Megatron-LM and T5, and even larger models with hundreds of billions of parameters such as GPT-3, cannot fit model replicas in each GPU device.

How the library employs model parallelism and memory saving techniques

The library consists of various types of model parallelism features and memory-saving features such as optimizer state sharding, activation checkpointing, and activation offloading. All these techniques can be combined to efficiently train large models that consist of hundreds of billions of parameters.

Topics

- Sharded data parallelism
- Expert parallelism
- Tensor parallelism

- Activation checkpointing and offloading
- Choosing the right techniques for your model

Sharded data parallelism

Sharded data parallelism is a memory-saving distributed training technique that splits the state of a model (model parameters, gradients, and optimizer states) across GPUs within a data-parallel group.

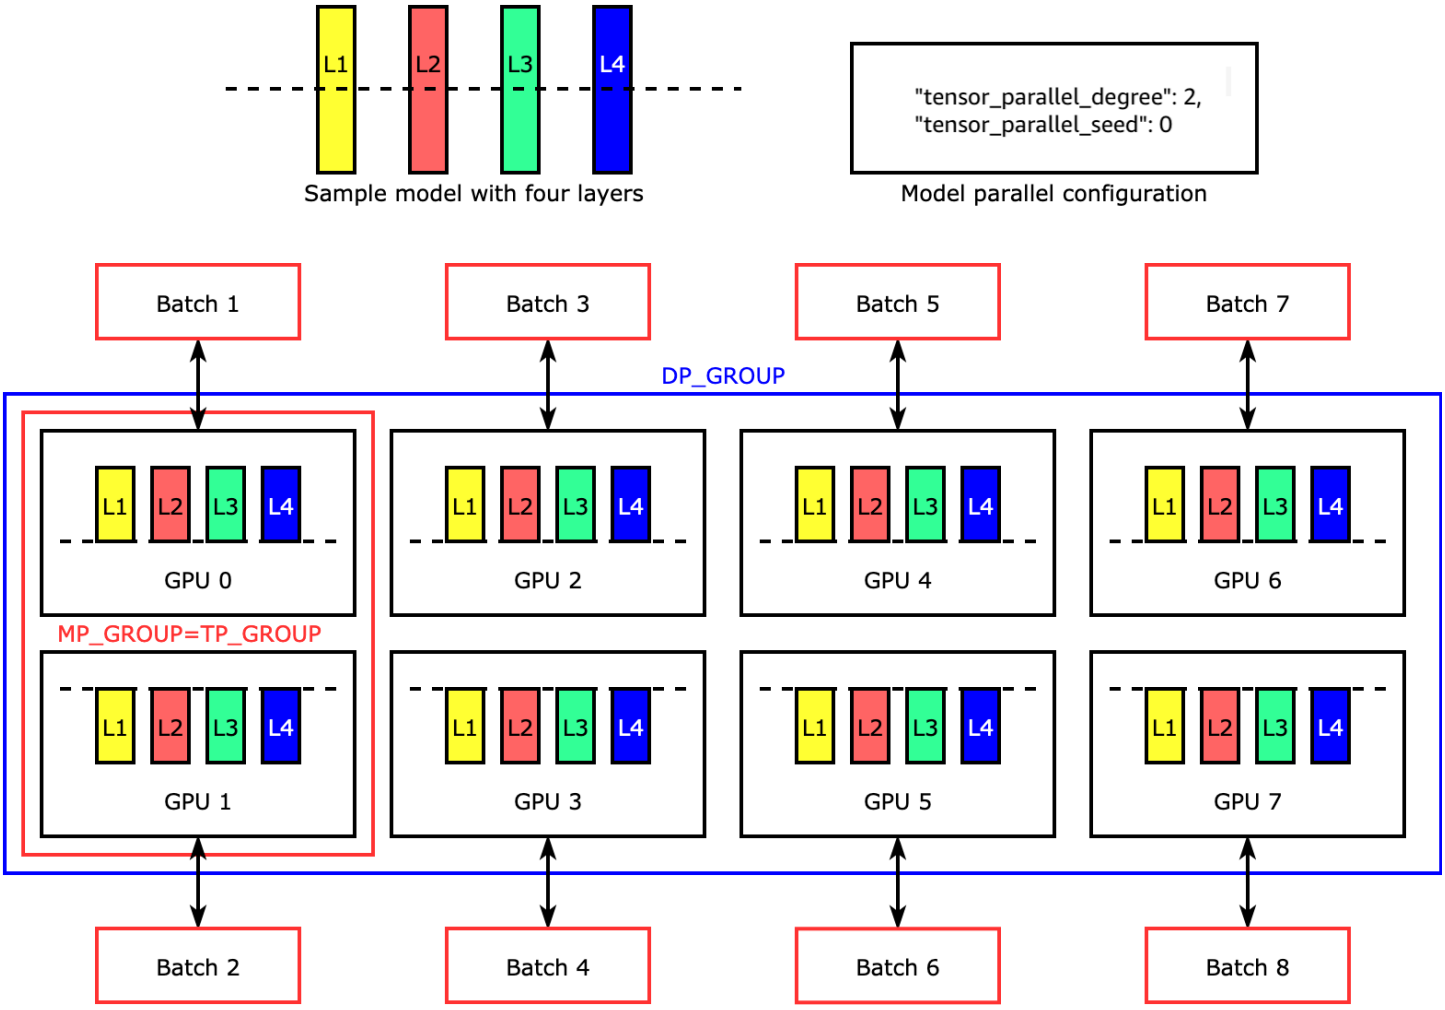
SMP v2 implements sharded data parallelism through FSDP, and extends it to implement the scale aware hybrid sharding strategy discussed in the blog post Near-linear scaling of gigantic-model training on Amazon.

You can apply sharded data parallelism to your model as a standalone strategy. Furthermore, if you are using the most performant GPU instances equipped with NVIDIA A100 Tensor Core GPUs, `ml.p4d.24xlarge` and `ml.p4de.24xlarge`, you can take the advantage of improved training speed from the `AllGather` operation offered by the SageMaker data parallelism (SMDDP) library.

To dive deep into sharded data parallelism and learn how to set it up or use a combination of sharded data parallelism with other techniques like tensor parallelism and mixed precision training, see the section called "Hybrid sharded data parallelism".

Expert parallelism

SMP v2 integrates with NVIDIA Megatron for implementing *expert parallelism* on top of its support for the native PyTorch FSDP APIs. You can keep your PyTorch FSDP training code as is and apply SMP expert parallelism for training *Mixture of Experts* (MoE) models within SageMaker AI.



An MoE model is a type of transformer model that consists of multiple *experts*, each consisting of a neural network, typically a feed-forward network (FFN). A gate network called *router* determines which tokens are sent to which expert. These experts specialize in processing specific aspects of the input data, enabling the model to train faster, reduce compute cost, while achieving the same performance quality as its counterpart dense model. And *expert parallelism* is a parallelism technique that handles splitting experts of an MoE model across GPU devices.

To learn how to train MoE models with SMP v2, see the section called "Expert parallelism".

Tensor parallelism

Tensor parallelism splits individual layers, or `nn.Modules`, across devices to run in parallel. The following figure shows the simplest example of how the SMP library splits a model with four layers

to achieve two-way tensor parallelism (`"tensor_parallel_degree": 2`). In the following figure, the notations for model parallel group, tensor parallel group, and data parallel group are `MP_GROUP`, `TP_GROUP`, and `DP_GROUP` respectively. The layers of each model replica are bisected and distributed into two GPUs. The library manages communication across the tensor-distributed model replicas.

To dive deep into tensor parallelism and other memory-saving features for PyTorch, and to learn how to set a combination of the core features, see the section called “Tensor parallelism”.

Activation checkpointing and offloading

To save GPU memory, the library supports activation checkpointing to avoid storing internal activations in the GPU memory for user-specified modules during the forward pass. The library recomputes these activations during the backward pass. In addition, with activation offloading, it offloads the stored activations to CPU memory and fetches them back to GPU during the backward pass to further reduce the activation memory footprint. For more information about how to use

these features, see the section called "Activation checkpointing" and the section called "Activation offloading".

Choosing the right techniques for your model

For more information about choosing the right techniques and configurations, see the section called "Best practices".

Supported frameworks and Amazon Web Services Regions

Before using the SageMaker model parallelism library v2 (SMP v2), check the supported frameworks and instance types and determine if there are enough quotas in your Amazon account and Amazon Web Services Region.

> **Note**
>
> To check the latest updates and release notes of the library, see the section called "SMP release notes".

Supported frameworks

SMP v2 supports the following deep learning frameworks and available through SMP Docker containers and an SMP Conda channel. When you use the ModelTrainer class in the SageMaker Python SDK and specify distribution configuration to use SMP v2, SageMaker AI automatically picks up the SMP Docker containers. To use SMP v2, we recommend that you always keep the SageMaker Python SDK up to date in your development environment.

PyTorch versions that the SageMaker model parallelism library supports

PyTorch version	SageMaker model parallelism library version	SMP Docker image URI	SMP Enroot image URI
v2.5.1	`smdistributed-modelparallel==v2.8.0`	`658645717510.dkr.ecr.<us-west-2>.amazonaws.com/smd`	`https://sagemaker-distributed-model-parallel.s3.<us-west-`

PyTorch version	SageMaker model parallelism library version	SMP Docker image URI	SMP Enroot image URI
		istributed-modelparallel:2.5.1-gpu-py311-cu124	*2>* .amazonaws.com/enroot/2.5.1-gpu-py311-cu124.sqsh
v2.4.1	smdistributed-modelparallel==v2.7.0	658645717510.dkr.ecr. *<us-west-2>* .amazonaws.com/smdistributed-modelparallel:2.4.1-gpu-py311-cu121	https://sagemaker-distributed-model-parallel.s3. *<us-west-2>* .amazonaws.com/enroot/2.4.1-gpu-py311-cu121.sqsh

SMP Conda channel

The following Amazon S3 bucket is a public Conda channel hosted by the SMP service team. If you want to install the SMP v2 library in an environment such as SageMaker HyperPod clusters, use this Conda channel to properly install the SMP library.

```
https://sagemaker-distributed-model-parallel.s3.us-west-2.amazonaws.com/smp-v2/
```

For more information about Conda channels in general, see Channels in the *Conda documentation*.

> **Note**
>
> To find previous versions of the SMP library v1.x and pre-packaged DLCs, see the section called "Supported Frameworks" in the *SMP v1 documentation*.

Use SMP v2 with open source libraries

The SMP v2 library works with other PyTorch-based open source libraries such as PyTorch Lightning, Hugging Face Transformers, and Hugging Face Accelerate, because SMP v2 is compatible with the PyTorch FSDP APIs. If you have further questions on using the SMP library with other third party libraries, contact the SMP service team at `sm-model-parallel-feedback@amazon.com`.

Amazon Web Services Regions

SMP v2 is available in the following Amazon Web Services Regions. If you'd like to use the SMP Docker image URIs or the SMP Conda channel, check the following list and choose the Amazon Web Services Region matching with yours, and update the image URI or the channel URL accordingly.

- ap-northeast-1
- ap-northeast-2
- ap-northeast-3
- ap-south-1
- ap-southeast-1
- ap-southeast-2
- ca-central-1
- eu-central-1
- eu-north-1
- eu-west-1
- eu-west-2
- eu-west-3
- sa-east-1
- us-east-1
- us-east-2
- us-west-1
- us-west-2

Supported instance types

SMP v2 requires one of the following ML instance types.

Instance type
`ml.p4d.24xlarge`
`ml.p4de.24xlarge`

Instance type
ml.p5.48xlarge
ml.p5e.48xlarge

> **Tip**
>
> Starting from SMP v2.2.0 supporting PyTorch v2.2.0 and later, the section called "Mixed precision training with FP8 on P5 instances using Transformer Engine" is available.

For specs of the SageMaker machine learning instance types in general, see the **Accelerated Computing** section in the Amazon EC2 Instance Types page. For information about instance pricing, see Amazon SageMaker AI Pricing.

If you encountered an error message similar to the following, follow the instructions at Requesting a quota increase in the *Amazon Service Quotas User Guide*.

```
ResourceLimitExceeded: An error occurred (ResourceLimitExceeded) when calling
    the CreateTrainingJob operation: The account-level service limit 'ml.p3dn.24xlarge
    for training job usage' is 0 Instances, with current utilization of 0 Instances
    and a request delta of 1 Instances.
    Please contact Amazon support to request an increase for this limit.
```

Use the SageMaker model parallelism library v2

On this page, you'll learn how to use the SageMaker model parallelism library v2 APIs and get started with running a PyTorch Fully Sharded Data Parallel (FSDP) training job in the SageMaker Training platform or on a SageMaker HyperPod cluster.

There are various scenarios for running a PyTorch training job with SMP v2.

1. For SageMaker training, use one of the pre-built SageMaker Framework Containers for PyTorch v2.0.1 and later, which are pre-packaged with SMP v2.
2. Use the SMP v2 binary file to set up a Conda environment for running a distributed training workload on a SageMaker HyperPod cluster.

3. Extend the pre-built SageMaker Framework Containers for PyTorch v2.0.1 and later to install any additional functional requirements for your use case. To learn how to extend a pre-built container, see Extend a Pre-built Container.
4. You can also bring your own Docker container and manually set up all SageMaker Training environment using the SageMaker Training toolkit and install the SMP v2 binary file. This is the least recommended option due to the complexity of dependencies. To learn how to run your own Docker container, see Adapting Your Own Training Container.

This getting started guide covers the first two scenarios.

Topics

- Step 1: Adapt your PyTorch FSDP training script
- Step 2: Launch a training job

Step 1: Adapt your PyTorch FSDP training script

To activate and configure the SMP v2 library, start with importing and adding the `torch.sagemaker.init()` module at the top of the script. This module takes in the SMP configuration dictionary of the section called "SMP v2 core feature configuration parameters" that you'll prepare in the section called "Step 2: Launch a training job". Also, for using the various core features offered by SMP v2, you might need to make few more changes to adapt your training script. More detailed instructions on adapting your training script for using the SMP v2 core features are provided at the section called "Core features of SMP v2".

SageMaker Training

In your training script, add the following two lines of code, which is the minimal requirement to start training with SMP v2. In the section called "Step 2: Launch a training job", you'll set up an object of the SageMaker `PyTorch` estimator class with an SMP configuration dictionary through the `distribution` argument of the estimator class.

```
import torch.sagemaker as tsm
tsm.init()
```

> **Note**
>
> You can also directly pass a configuration dictionary of the the section called "SMP v2 core feature configuration parameters" to the `torch.sagemaker.init()` module. However, the parameters passed to the PyTorch estimator in the section called "Step 2: Launch a training job" take priority and override the ones specified to the `torch.sagemaker.init()` module.

SageMaker HyperPod

In your training script, add the following two lines of code. In the section called "Step 2: Launch a training job", you'll set up a `smp_config.json` file for setting up SMP configurations in JSON format, and upload it to a storage or a file system mapped with your SageMaker HyperPod cluster. We recommend that you keep the configuration file under the same directory where you upload your training script.

```
import torch.sagemaker as tsm
tsm.init("/dir_to_training_files/smp_config.json")
```

> **Note**
>
> You can also directly pass a configuration dictionary of the the section called "SMP v2 core feature configuration parameters" into the `torch.sagemaker.init()` module.

Step 2: Launch a training job

Learn how to configure SMP distribution options for launching a PyTorch FSDP training job with SMP core features.

SageMaker Training

When you set up a training job launcher object of the PyTorch framework estimator class in the SageMaker Python SDK, configure the section called "SMP v2 core feature configuration parameters" through `distribution` argument as follows.

Note

The `distribution` configuration for SMP v2 is integrated in the SageMaker Python SDK starting from v2.200. Make sure that you use the SageMaker Python SDK v2.200 or later.

Note

In SMP v2, you should configure `smdistributed` with `torch_distributed` for the `distribution` argument of the SageMaker `PyTorch` estimator. With `torch_distributed`, SageMaker AI runs `torchrun`, which is the default multi-node job launcher of PyTorch Distributed.

```
from sagemaker.pytorch import PyTorch

estimator = PyTorch(
    framework_version=2.2.0,
    py_version="310"
    # image_uri="<smp-docker-image-uri>" # For using prior versions, specify the SMP
 image URI directly.
    entry_point="your-training-script.py", # Pass the training script you adapted
 with SMP from Step 1.
    ... # Configure other required and optional parameters
    distribution={
        "torch_distributed": { "enabled": True },
        "smdistributed": {
            "modelparallel": {
                "enabled": True,
                "parameters": {
                    "hybrid_shard_degree": Integer,
                    "sm_activation_offloading": Boolean,
                    "activation_loading_horizon": Integer,
                    "fsdp_cache_flush_warnings": Boolean,
                    "allow_empty_shards": Boolean,
                    "tensor_parallel_degree": Integer,
                    "expert_parallel_degree": Integer,
                    "random_seed": Integer
                }
            }
```

```
        }
    }
)
```

Important

For using one of the prior versions of PyTorch or SMP instead of the latest, you need to specify the SMP Docker image directly using the `image_uri` argument instead of the `framework_version` and `py_version` pair. The following is an example of

```
estimator = PyTorch(
    ...,
    image_uri="658645717510.dkr.ecr.us-west-2.amazonaws.com/smdistributed-
modelparallel:2.2.0-gpu-py310-cu121"
)
```

To find SMP Docker image URIs, see the section called "Supported frameworks".

SageMaker HyperPod

Before you start, make sure if the following prerequisites are met.

- An Amazon FSx shared directory mounted (`/fsx`) to your HyperPod cluster.
- Conda installed in the FSx shared directory. To learn how to install Conda, use the instructions at Installing on Linux in the *Conda User Guide*.
- `cuda11.8` or `cuda12.1` installed on the head and compute nodes of your HyperPod cluster.

If the prerequisites are all met, proceed to the following instructions on launching a workload with SMP v2 on a HyperPod cluster.

1. Prepare an `smp_config.json` file that contains a dictionary of the section called "SMP v2 core feature configuration parameters". Make sure that you upload this JSON file to where you store your training script, or the path you specified to the `torch.sagemaker.init()` module in Step 1. If you've already passed the configuration dictionary to the `torch.sagemaker.init()` module in the training script in Step 1, you can skip this step.

```
// smp_config.json
{
    "hybrid_shard_degree": Integer,
    "sm_activation_offloading": Boolean,
    "activation_loading_horizon": Integer,
    "fsdp_cache_flush_warnings": Boolean,
    "allow_empty_shards": Boolean,
    "tensor_parallel_degree": Integer,
    "expert_parallel_degree": Integer,
    "random_seed": Integer
}
```

2. Upload the `smp_config.json` file to a directory in your file system. The directory path must match with the path you specified in Step 1. If you've already passed the configuration dictionary to the `torch.sagemaker.init()` module in the training script, you can skip this step.
3. On the compute nodes of your cluster, start a terminal session with the following command.

```
sudo su -l ubuntu
```

4. Create a Conda environment on the compute nodes. The following code is an example script of creating a Conda environment and installing SMP, SMDDP, CUDA, and other dependencies.

```
# Run on compute nodes
SMP_CUDA_VER=<11.8 or 12.1>

source /fsx/<path_to_miniconda>/miniconda3/bin/activate

export ENV_PATH=/fsx/<path to miniconda>/miniconda3/envs/<ENV_NAME>
conda create -p ${ENV_PATH} python=3.10

conda activate ${ENV_PATH}

# Verify aws-cli is installed: Expect something like "aws-cli/2.15.0*"
aws --version
# Install aws-cli if not already installed
# https://docs.aws.amazon.com/cli/latest/userguide/getting-started-
install.html#cliv2-linux-install

# Install the SMP library
```

```
conda install pytorch="2.0.1=sm_py3.10_cuda${SMP_CUDA_VER}*" packaging --override-
channels \
  -c https://sagemaker-distributed-model-parallel.s3.us-west-2.amazonaws.com/

export LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/usr/local/cuda-$SMP_CUDA_VER/lib

python -m pip install --no-build-isolation git+https://github.com/NVIDIA/
TransformerEngine.git@v1.0
```

5. Run a test training job.

   a. In the shared file system (`/fsx`), clone the Awsome Distributed Training GitHub repository, and go to the `3.test_cases/11.modelparallel` folder.

   ```
   git clone https://github.com/aws-samples/awsome-distributed-training/
   cd awsome-distributed-training/3.test_cases/11.modelparallel
   ```

   b. Submit a job using `sbatch` as follows.

   ```
   conda activate <ENV_PATH>
   sbatch -N 16 conda_launch.sh
   ```

   If the job submission is successful, the output message of this `sbatch` command should be similar to `Submitted batch job ABCDEF`.

   c. Check the log file in the current directory under `logs/`.

   ```
   tail -f ./logs/fsdp_smp_ABCDEF.out
   ```

Core features of the SageMaker model parallelism library v2

The Amazon SageMaker AI model parallelism library v2 (SMP v2) offers distribution strategies and memory-saving techniques, such as sharded data parallelism, tensor parallelism, and checkpointing. The model parallelism strategies and techniques offered by SMP v2 help distribute

large models across multiple devices while optimizing training speed and memory consumption. SMP v2 also provides a Python package `torch.sagemaker` to help adapt your training script with few lines of code change.

This guide follows the basic two-step flow introduced in the section called "Use the SMP v2". To dive deep into the core features of SMP v2 and how to use them, see the following topics.

> **Note**
>
> These core features are available in SMP v2.0.0 and later and the SageMaker Python SDK v2.200.0 and later, and works for PyTorch v2.0.1 and later. To check the versions of the packages, see the section called "Supported frameworks and Amazon Web Services Regions".

Topics

- Hybrid sharded data parallelism
- Expert parallelism
- Context parallelism
- Compatibility with the SMDDP library optimized for Amazon infrastructure
- Mixed precision training
- Delayed parameter initialization
- Activation checkpointing
- Activation offloading
- Tensor parallelism
- Fine-tuning
- FlashAttention
- Checkpointing using SMP

Hybrid sharded data parallelism

Sharded data parallelism is a memory-saving distributed training technique that splits the state of a model (model parameters, gradients, and optimizer states) across devices. This helps you fit a larger model or increase the batch size using the freed-up GPU memory. The SMP library offers a capability of running sharded data parallelism with PyTorch Fully Sharded Data Parallel (FSDP).

PyTorch FSDP by default shards across the whole set of GPUs being used. In SMP v2, the library offers this sharded data parallelism on top of PyTorch FSDP by extending PyTorch hybrid sharding (`HYBRID_SHARD`), which is one of the sharding strategies provided by PyTorch FSDP: `FULL_SHARD`, `SHARD_GRAD_OP`, `HYBRID_SHARD`, `_HYBRID_SHARD_ZERO2`. Extending hybrid sharding in this manner helps implement scale-aware-sharding as described in the blog Near-linear scaling of gigantic-model training on Amazon for PyTorch FSDP.

The SMP library makes it easy to use `HYBRID_SHARD` and `_HYBRID_SHARD_ZERO2` across any configurable number of GPUs, extending the native PyTorch FSDP that supports sharding across a single node (`HYBRID_SHARD`) or all GPUs (`FULL_SHARD`). PyTorch FSDP calls can stay as is, and you only need to add the `hybrid_shard_degree` argument to the SMP configuration, as shown in the following code example. You don't need to change the value of the `sharding_strategy` argument in the PyTorch FSDP wrapper around your PyTorch model. You can pass `ShardingStrategy.HYBRID_SHARD` as the value. Alternatively, the SMP library overrides the strategy in the script and sets it to `ShardingStrategy.HYBRID_SHARD` if you specify a value equal to or greater than 2 to the `hybrid_shard_degree` parameter.

The following code snippets show how to add the SMP initialization module `torch.sagemaker.init()` to your training script and set up the SMP configuration dictionary in JSON format for training job launcher while following the two-step process introduced in the section called "Use the SMP v2". You don't need to make any changes to your PyTorch model or PyTorch FSDP configuration. For more information about the `hybrid_shard_degree` parameter, see the section called "SMP v2 core feature configuration parameters".

SMP configuration dictionary

```
{ "hybrid_shard_degree": 16 }
```

In training script

```
import torch.sagemaker as tsm
tsm.init()

# Set up a PyTorch model
model = ...

# Wrap the PyTorch model using the PyTorch FSDP module
model = FSDP(
    model,
```

```
    ...
)

# Optimizer needs to be created after FSDP wrapper
optimizer = ...
```

Expert parallelism

A *Mixture of Experts* (MoE) model is a type of transformer model that employs a *sparse* approach, making it lighter for training compared to training traditional dense models. In this MoE neural network architecture, only a subset of the model's components called *experts* are utilized for each input. This approach offers several advantages, including more efficient training and faster inference, even with a larger model size. In other words, with the same compute budget for training a full dense model, you can fit a larger model or dataset when using MoE.

An MoE model consists of multiple *experts*, each consisting of a neural network, typically a feed-forward network (FFN). A gate network called *router* determines which tokens are sent to which expert. These experts specialize in processing specific aspects of the input data, enabling the model to train faster, reduce compute cost, while achieving the same performance quality as its counterpart dense model. To learn more about Mixture of Experts in general, refer to the blog Applying Mixture of Experts in LLM Architectures in the *NVIDIA developer website*.

Expert parallelism is a type of parallelism that handles splitting experts of an MoE model across GPU devices.

SMP v2 integrates with NVIDIA Megatron for implementing expert parallelism to support training MoE models, and runs on top of PyTorch FSDP APIs. You keep using your PyTorch FSDP training code as is and activate SMP expert parallelism for training MoE models.

Hugging Face Transformer models compatible with SMP expert parallelism

SMP v2 currently offers expert parallelism support for the following Hugging Face transformer models.

- Mixtral

Configure expert parallelism

For `expert_parallel_degree`, you select a value for the degree of expert parallelism. The value must evenly divide the number of GPUs in your cluster. For example, to shard your model

while using an instance with 8 GPUs, choose 2, 4, or 8. We recommend that you start with a small number, and gradually increase it until the model fits in the GPU memory.

The following code snippets show how to add the SMP initialization module `torch.sagemaker.init()` to your training script and set up the SMP configuration dictionary in JSON format for training job launcher while following the two-step process introduced in the section called "Use the SMP v2". You don't need to make any changes to your PyTorch model or PyTorch FSDP configuration. For more information about the `expert_parallel_degree` parameter, see the section called "SMP v2 core feature configuration parameters".

> **Note**
>
> You can use expert parallelism with the section called "Hybrid sharded data parallelism". Note that expert parallelism is currently not compatible with tensor parallelism.

> **Note**
>
> This expert parallelism training feature is available in the following combination of libraries of SageMaker and the PyTorch library:
>
> - SMP v2.3.0 and later
> - The SageMaker Python SDK v2.214.4 and later
> - PyTorch v2.2.0 and later

In your training script

As part of Step 1, initialize your script with `torch.sagemaker.init()` to activate SMP v2 and wrap your model with the the section called "`torch.sagemaker.transform`" API, adding the `config` parameter to the API to activate MoE. The following code snippet shows how to activate SMP MoE for the generic model class `AutoModelForCausalLM` pulling an MoE transformer model configuration using the `from_config` method for training from scratch, or the `from_pretrained` method for fine-tuning. To learn more about the SMP `MoEConfig` class, see the section called "`torch.sagemaker.moe.moe_config.MoEConfig`".

```
# Import the torch.sagemaker.transform API and initialize.
import torch.sagemaker as tsm
```

```
tsm.init()

# Import transformers AutoModelForCausalLM class.
from transformers import AutoModelForCausalLM

# Import the SMP-implementation of MoE configuration class.
from torch.sagemaker.moe.moe_config import MoEConfig

# Define a transformer model with an MoE model configuration
model = AutoModelForCausalLM.from_config(MoEModelConfig)

# Wrap it by torch.sagemaker.transform with the SMP MoE configuration.
model = tsm.transform(
    model,
    config=MoEConfig(
        smp_moe=True,
        random_seed=12345,
        moe_load_balancing="sinkhorn",
        global_token_shuffle=False,
        moe_all_to_all_dispatcher=True,
        moe_aux_loss_coeff=0.001,
        moe_z_loss_coeff=0.001
    )
)
```

SMP configuration

As part of Step 2, add the following parameter to the SMP configuration dictionary for the SageMaker PyTorch ModelTrainer.

```
{
    ..., # other SMP config parameters
    "expert_parallel_degree": 8
}
```

Context parallelism

Context parallelism is a type of model parallelism that partitions the model activations along the sequence dimension. Unlike other sequence parallelism techniques, which only partition the `LayerNorm` and `RMSNorm`, context parallelism partitions the network inputs and all intermediate activations along the sequence dimension.

SMP v2 integrates with Transformer Engine for context parallelism and can be used in conjunction with PyTorch FSDP and SMP the section called "Tensor parallelism". You can enable all three parallelisms simultaneously for model training. Context parallelism is beneficial for training models with large activation sizes and long sequence lengths. It accelerates the computation of attention scores and attention outputs, by allowing each device to computes only a part of the scores and outputs along the sequence dimension. While tensor parallelism also accelerates computation through partitioning along the hidden dimension, the advantage of context parallelism is more substantial since computational requirements increase quadratically with sequence dimension.

Hugging Face Transformer models compatible with SMP context parallelism

SMP v2 currently offers context parallelism support for the following Hugging Face transformer models.

- GPT-NeoX
- Llama 2 and Llama 3
- Mistral 7B

Configure context parallelism

Set an integer value to the `context_parallel_degree` parameter that evenly divides the number of GPUs in your cluster. For example, if you have an 8-GPU instance, use 2, 4, or 8 for `context_parallel_degree`. We recommend starting with a small `context_parallel_degree` value and gradually increasing it until the model fits in the GPU memory with the required input sequence length.

The following code snippets show how to add the SMP initialization module `torch.sagemaker.init()` to your training script and set up the SMP configuration dictionary in JSON format for training job launcher while following the two-step process introduced in the section called "Use the SMP v2". You don't need to make any changes to your PyTorch model or PyTorch FSDP configuration. For more information about the `context_parallel_degree` parameter, see the section called "SMP v2 core feature configuration parameters".

In your training script

As part of Step 1, initialize your script with `torch.sagemaker.init()` to activate SMP v2 and wrap your model with the the section called "`torch.sagemaker.transform`" API.

Starting from SMP v2.6.0, you can use the argument `cp_comm_type` to determine which context parallelism implementation to use. The SMP library currently supports two implementations: `p2p` and `all_gather`. The `p2p` implementation uses peer-to-peer send-receive calls for key-value accumulation during the attention implementation and runs asynchronously, allowing overlaps with compute. `all_gather` implementation, instead, uses the `AllGather` collective operation and runs synchronously.

```
import torch.sagemaker as tsm
tsm.init()

from transformers import AutoModelForCausalLM
model = AutoModelForCausalLM.from_config(..)
model = tsm.transform(model, cp_comm_type="p2p")
```

SMP configuration

As part of Step 2, add the following parameter to the SMP configuration dictionary for the SageMaker PyTorch ModelTrainer.

```
{
    ..., # other SMP config parameters
    "context_parallel_degree": 2
}
```

Compatibility with the SMDDP library optimized for Amazon infrastructure

You can use the SageMaker model parallelism library v2 (SMP v2) in conjunction with the SageMaker distributed data parallelism (SMDDP) library that offers the `AllGather` collective communication operation optimized for Amazon infrastructure. In distributed training, collective communication operations are designed for synchronizing multiple GPU workers and exchange information between them. `AllGather` is one of the core collective communication operations typically used in sharded data parallelism. To learn more about the SMDDP `AllGather` operation, see the section called "SMDDP `AllGather` collective operation" Optimizing such collective communication operations would directly contribute to a faster end-to-end training without side effects on convergence.

> **Note**
>
> The SMDDP library supports P4 and P4de instances (see also the section called "Supported frameworks, Amazon Web Services Regions, and instances types" by the SMDDP library).

The SMDDP library integrates natively with PyTorch through the process group layer. To use the SMDDP library, you only need to add two lines of code to your training script. It supports any training frameworks such as SageMaker Model Parallelism Library, PyTorch FSDP, and DeepSpeed.

To activate SMDDP and use its `AllGather` operation, you need to add two lines of code to your training script as part of the section called "Step 1: Adapt your PyTorch FSDP training script". Note that you need to initialize PyTorch Distributed with the SMDDP backend first, and then run the SMP initialization.

```
import torch.distributed as dist

# Initialize with SMDDP
import smdistributed.dataparallel.torch.torch_smddp
dist.init_process_group(backend="smddp") # Replacing "nccl"

 # Initialize with SMP
import torch.sagemaker as tsm
tsm.init()
```

SageMaker Framework Containers for PyTorch (see also the section called "Supported frameworks and Amazon Web Services Regions" by SMP v2 and the section called "Supported frameworks, Amazon Web Services Regions, and instances types" by the SMDDP library) are pre-packaged with the SMP binary and the SMDDP binary. To learn more about the SMDDP library, see the section called "SageMaker AI distributed data parallelism library".

Mixed precision training

The SageMaker model parallelism (SMP) library v2 supports mixed precision training out of the box by integrating with open source frameworks such as PyTorch FSDP and Transformer Engine. To learn more, see the following topics.

Topics

- Mixed precision training with FP8 on P5 instances using Transformer Engine

- Mixed precision training with half-precision data types using PyTorch FSDP

Mixed precision training with FP8 on P5 instances using Transformer Engine

Starting from the SageMaker model parallelism (SMP) library v2.2.0, the SMP library integrates with Transformer Engine and supports FP8 mixed precision training out of the box, keeping compatibility with PyTorch FSDP `MixedPrecision`. This means that you can use both PyTorch FSDP for mixed precision training and Transformer Engine for FP8 training. For model layers not supported by Transformer Engine's FP8 training feature, those layers fall back to PyTorch FSDP mixed precision.

> **Note**
>
> SMP v2 offers FP8 support for the following Hugging Face Transformer models:
>
> - GPT-NeoX (available in SMP v2.2.0 and later)
> - Llama 2 (available in SMP v2.2.0 and later)
> - Mixtral 8x7b and Mixtral 8x22b (available in SMP v2.5.0 and later)

> **Note**
>
> This FP8 training on the P5 feature is available in the following combination of libraries of SageMaker and the PyTorch library:
>
> - The SageMaker Python SDK v2.212.0 and later
> - PyTorch v2.2.0 and later

FP8 (8-bit floating point precision) is a data type that has emerged as another paradigm to accelerate deep learning training of LLM models. With the release of NVIDIA H100 GPUs supporting FP8 data types, you can benefit from the advantages from the performance improvements on P5 instances equipped with the H100 GPUs, while accelerating distributed training with FP8 mixed precision training.

The FP8 data type further branches down to E4M3 and E5M2 formats. *E4M3* offers a better precision, has a limited dynamic range, and is ideal for the forward pass in model training. *E5M2* has a broader dynamic range, but reduced precision, and is better suited for the backward

pass, where precision is less critical and a wider dynamic range becomes beneficial. Hence, we recommend that you use the hybrid FP8 strategy recipe to leverage these characteristics effectively.

For half-precision data types (FP16 and BF16), global loss-scaling techniques such as static loss-scaling or dynamic loss-scaling handle convergence issues that arise from information loss due to rounding gradients in half-precision. However, the dynamic range of FP8 is even narrower, and the global loss scaling techniques are not sufficient. At this point, we need a finer-grained per-tensor scaling technique. *Delayed scaling* is a strategy that selects a scaling factor based on the maximum absolute values observed in a number of tensors form previous iterations. There's a trade-off in this strategy; it uses the full performance benefits of FP8 computation but requires memory for keeping the maximum value history of tensors. To learn more about the delayed scaling strategy in general, see the paper *FP8 Formats for Deep Learning*.

In practice, using FP8 is helpful in all training scenarios on P5 instances. We strongly recommend enabling FP8 whenever possible for enhancing training performance.

SMP v2 supports Transformer Engine out of the box. Therefore, when running FP8 training with SMP v2 on P5 instances of SageMaker AI (`ml.p5.48xlarge`), the only thing you need to do is to import `torch.sagemaker` in your training script and keep using the native Transformer Engine Python package. To learn more about using Transformer Engine for FP8 training in general, see Using FP8 with Transformer Engine in the *NVIDIA Transformer Engine documentation*. The following code snippet shows how the code lines for importing the SMP library and setting up FP8 in your training script should look.

```
import torch.sagemaker as tsm
import transformer_engine.pytorch as te
from transformer_engine.common.recipe import DelayedScaling, Format

# Initialize the SMP torch.sagemaker API.
tsm.init()

# Define a transformer model and wrap it with the torch.sagemaker.transform API.
from transformers import AutoModelForCausalLM
model = AutoModelForCausalLM.from_config(ModelConfig)
model = tsm.transform(model)

# Enable E4M3 during forward pass, E5M2 during backward pass.
fp8_format = Format.HYBRID

# Create an FP8 recipe.
```

```
fp8_recipe = DelayedScaling(fp8_format=fp8_format, amax_history_len=32,
 amax_compute_algo="max")

# Enable FP8 autocasting.
with te.fp8_autocast(enabled=True, fp8_recipe=fp8_recipe,
 fp8_group=tsm.state.world_process_group):
    out = model(inp)

loss = out.sum()
loss.backward()
```

To find a practical example of FP8 training with SMP v2 on P5 instances, see the example notebook at Accelerate SageMaker PyTorch FSDP Training of Llama-v2 (or GPT-NeoX) with FP8 on P5 instances.

Mixed precision training with half-precision data types using PyTorch FSDP

SMP v2 supports PyTorch FSDP `MixedPrecision` for training jobs on P4 and P5 instances. PyTorch FSDP provides various configurations for mixed precision for both performance improvement and memory reduction.

> **Note**
>
> This mixed precision training with the PyTorch FSDP feature is available in the following combination of libraries of SageMaker and the PyTorch library.
>
> - SMP v2.0.0 and later
> - the SageMaker Python SDK v2.200.0 and later
> - PyTorch v2.0.1 and later

The standard way to configure a model for mixed precision is to create the model in `float32`, and then allow FSDP to cast the parameters to `float16` or `bfloat16` on the fly by passing a `MixedPrecision` policy, as shown in the following code snippet. For more information about options to change the `dtype` for parameters, reduction, or buffers for mixed precision in PyTorch, see PyTorch FSDP `MixedPrecision` API in the *PyTorch documentation*.

```
# Native PyTorch API
from torch.distributed.fsdp import MixedPrecision
```

```
dtype = torch.bfloat16
mixed_precision_policy = MixedPrecision(
    param_dtype=dtype, reduce_dtype=dtype, buffer_dtype=dtype
)

model = FSDP(
    model,
    ...,
    mixed_precision=mixed_precision_policy
)
```

Note that certain models (such as the Hugging Face Transformers Llama model) expect buffers as `float32`. To use `float32`, replace `torch.bfloat16` with `torch.float32` in the line defining the `dtype` object.

Delayed parameter initialization

Initialization of a large model for training is not always possible with the limited GPU memory. To resolve this problem of insufficient GPU memory, you can initialize the model on CPU memory. However, for larger models with more than 20 or 40 billion parameters, even CPU memory might not be enough. For such case, we recommend that you initialize the model on what PyTorch calls a *meta device*, which allows the creation of tensors without any data attached to them. A tensor on a meta device only needs the shape information, and this allows to create a large model with its parameters on meta devices. Hugging Face Accelerate provides the context manager `init_empty_weights` to help create such model on meta devices while initializing the buffers on a regular device. Before training starts, PyTorch FSDP initializes the model parameters. This delayed parameter initialization feature of SMP v2 delays this creation of model parameters to happen after PyTorch FSDP performs parameter sharding. PyTorch FSDP accepts a parameter initialization function (`param_init_fn`) when sharding the modules, and it calls `param_init_fn` for each module. The `param_init_fn` API takes a module as an argument and initializes all the parameters in it, not including the parameters of any child module. Note that this behavior *differs* from the native PyTorch v2.0.1 which has a bug causing the parameters to be initialized multiple times.

SMP v2 provides the the section called “`torch.sagemaker.delayed_param.DelayedParamIniter`” API for applying delayed parameter initialization.

The following code snippets show how to apply the `torch.sagemaker.delayed_param.DelayedParamIniter` API to your training script.

Assume that you have a PyTorch FSDP training script as follows.

```
# Creation of model on meta device
from accelerate import init_empty_weights
with init_empty_weights():
    model = create_model()

# Define a param init fn, below is an example for Hugging Face GPTNeoX.
def init_weights(module):
    d = torch.cuda.current_device()
    # Note that below doesn't work if you have buffers in the model
    # buffers will need to reinitialized after this call
    module.to_empty(device=d, recurse=False)
    if isinstance(module, (nn.Linear, Conv1D)):
        module.weight.data.normal_(mean=0.0, std=args.initializer_range)
        if module.bias:
            module.bias.data.zero_()
    elif isinstance(module, nn.Embedding):
        module.weight.data.normal_(mean=0.0, std=args.initializer_range)
        if module.padding_idx:
            module.weight.data[module.padding_idx].zero_()
    elif isinstance(module, nn.LayerNorm):
        module.bias.data.zero_()
        module.weight.data.fill_(1.0)

# Changes to FSDP wrapper.
model = FSDP(
    model,
    ...,
    param_init_fn=init_weights
)

# At this point model is initialized and sharded for sharded data parallelism.
```

Note that the delayed parameter initialization approach is not model agnostic. To resolve this issue, you need to write an `init_weights` function as shown in the preceding example to match the initialization in the original model definition, and it should cover all the parameters of the model. To simplify this process of preparing such `init_weights` function, SMP v2 implements this initialization function for the following models: GPT-2, GPT-J, GPT-NeoX, and Llama from Hugging Face Transformers. The `torch.sagemaker.delayed_param.DelayedParamIniter` API also works with the SMP tensor parallel implementation,

`torch.sagemaker.tensor_parallel.transformer.TransformerLMHead` model, that you can call after the the section called "`torch.sagemaker.transform`" API call.

Using the `torch.sagemaker.delayed_param.DelayedParamIniter` API, you can adapt your PyTorch FSDP script as follows. After creating a model with empty weights, register the `torch.sagemaker.delayed_param.DelayedParamIniter` API to the model, and define an object of it. Pass the object to the `param_init_fn` of the PyTorch FSDP class.

```
from torch.sagemaker.delayed_param import DelayedParamIniter
from accelerate import init_empty_weights

with init_empty_weights():
    model = create_model()

delayed_initer = DelayedParamIniter(model)

with delayed_initer.validate_params_and_buffers_inited():
    model = FSDP(
        model,
        ...,
        param_init_fn=delayed_initer.get_param_init_fn()
    )
```

Notes on tied weights

When training models with tied weights, we need to take special care to tie the weights after initializing the weights with delayed parameter initialization. PyTorch FSDP does not have a mechanism to tie the weights after initializing them using `param_init_fn` as above. To address such cases we added API to allow a `post_init_hook_fn`, which can be used to tie the weights. You can pass any function in there which accepts the module as argument, but we also have a predefined `post_param_init_fn` defined in `DelayedParamIniter` which calls `tie_weights` method of the module if it exists. Note that it's safe to always pass in `post_param_init_fn` even if there's no `tie_weights` method for the module.

```
with delayed_initer.validate_params_and_buffers_inited():
    model = FSDP(
        model,
        ...,
        param_init_fn=delayed_initer.get_param_init_fn(),
        post_param_init_fn=delayed_initer.get_post_param_init_fn()
    )
```

Activation checkpointing

Activation checkpointing is a technique to reduce memory usage by clearing activations of certain layers and recomputing them during the backward pass. Effectively, this trades extra computation time for reducing memory usage. If a module is checkpointed, at the end of a forward pass, only the initial inputs to the module and final outputs from the module stay in memory. PyTorch releases any intermediate tensors that are part of the computation inside that module during the forward pass. During the backward pass of the checkpointed modules, PyTorch recomputes these tensors. At this point, the layers beyond this checkpointed module have finished their backward pass, so the peak memory usage with checkpointing becomes lower.

SMP v2 supports the PyTorch activation checkpointing module, `apply_activation_checkpointing`. The following are examples of activation checkpointing of the Hugging Face GPT-NeoX model.

Checkpointing Transformer layers of the Hugging Face GPT-NeoX model

```
from transformers.models.gpt_neox import GPTNeoXLayer
from torch.distributed.algorithms._checkpoint.checkpoint_wrapper import (
    apply_activation_checkpointing
)

# check_fn receives a module as the arg,
# and it needs to return whether the module is to be checkpointed
def is_transformer_layer(module):
    from transformers.models.gpt_neox import GPTNeoXLayer
    return isinstance(submodule, GPTNeoXLayer)

apply_activation_checkpointing(model, check_fn=is_transformer_layer)
```

Checkpointing every other Transformer layer of the Hugging Face GPT-NeoX model

```
# check_fn receives a module as arg,
# and it needs to return whether the module is to be checkpointed
# here we define that function based on global variable (transformer_layers)
from transformers.models.gpt_neox import GPTNeoXLayer
from torch.distributed.algorithms._checkpoint.checkpoint_wrapper import (
    apply_activation_checkpointing
)

transformer_layers = [
```

```
    m for m model.modules() if isinstance(m, GPTNeoXLayer)
]

def is_odd_transformer_layer(module):
    return transformer_layers.index(module) % 2 == 0

apply_activation_checkpointing(model, check_fn=is_odd_transformer_layer)
```

Alternatively, PyTorch also has the `torch.utils.checkpoint` module for checkpointing, which is used by a subset of Hugging Face Transformers models. This module also works with SMP v2. However, it requires you to have access to the model definition for adding the checkpoint wrapper. Therefore, we recommend you to use the `apply_activation_checkpointing` method.

Activation offloading

> **Important**
>
> In SMP v2.2.0, the activation offloading functionality of the SMP library doesn't work. Use the native PyTorch activation offloading instead.

Typically, the forward pass computes activations at each layer and keeps them in GPU memory until the backward pass for the corresponding layer finishes. Offloading these tensors to CPU memory after forward pass and fetching them back to GPU when they are needed can save substantial GPU memory usage. PyTorch supports offloading activations, but the implementation causes GPUs to be idle while activations are fetched back from CPU during backward pass. This causes a major performance degradation when using activation offloading.

SMP v2 improves this activation offloading. It pre-fetches activations ahead of time before the activations are needed for the GPU to start backward pass on those activations. The pre-fetching feature helps training progresses be run more efficiently without idle GPUs. This results in offering benefits from lower memory usage without a performance degradation.

You can keep the native PyTorch modules for offloading activations in your training script. The following is an example structure of applying the SMP activation offloading feature in your script. Note that activation offloading is applicable *only* when used together with the section called "Activation checkpointing". To learn more about the native PyTorch checkpoint tools for activation offloading, see:

- checkpoint_wrapper.py in the *PyTorch GitHub repository*

- Activation Checkpointing in the PyTorch blog *Scaling Multi-modal Foundation Models in TorchMultimodal with PyTorch Distributed*.

You can apply the SMP activation offloading feature on PyTorch activation checkpointing. This is done by adding the `sm_activation_offloading` and `activation_loading_horizon` parameters to the SMP configuration dictionary during the section called "Step 2: Launch a training job".

The following code snippets show how to add the SMP initialization module `torch.sagemaker.init()` to your training script and set up the SMP configuration dictionary in JSON format for training job launcher while following the two-step process introduced in the section called "Use the SMP v2". You don't need to make any changes to your PyTorch model or PyTorch FSDP configuration. For more information about the `sm_activation_offloading` and `activation_loading_horizon` parameters, see the section called "SMP v2 core feature configuration parameters".

SMP configuration

```
{
    "activation_loading_horizon": 2,
    "sm_activation_offloading": True
}
```

In training script

> **Note**
>
> While activating the SMP activation offloading feature, make sure that you also use the PyTorch `offload_wrapper` function and apply it to the root module. The SMP activation offloading feature uses the root module to determine when forward pass is done to start pre-fetching.

```
import torch.sagemaker as tsm
tsm.init()

# Native PyTorch module for activation offloading
from torch.distributed.algorithms._checkpoint.checkpoint_wrapper import (
    apply_activation_checkpointing,
```

```
    offload_wrapper,
)

model = FSDP(...)

# Activation offloading requires activation checkpointing.
apply_activation_checkpointing(
    model,
    check_fn=checkpoint_transformer_layers_policy,
)

model = offload_wrapper(model)
```

Tensor parallelism

Tensor parallelism is a type of model parallelism in which specific model weights, gradients, and optimizer states are split across devices. In contrast to pipeline parallelism, which keeps individual weights intact but partitions the *set* of weights, gradients, or optimizer across devices, tensor parallelism shards *individual* weights. This typically involves distributed computation of specific operations, modules, or layers of the model.

Tensor parallelism is required in cases in which a single parameter consumes most of the GPU memory (such as large embedding tables with a large vocabulary size or a large softmax layer with a large number of classes). In this case, treating this large tensor or operation as an atomic unit is inefficient and impedes balance of the memory load.

SMP v2 integrates with Transformer Engine for the implementation for tensor parallelism, and runs on top of PyTorch FSDP APIs. You can enable PyTorch FSDP and SMP tensor parallelism simultaneously, and determine the best model parallelism for best performance.

In practice, tensor parallelism is especially helpful in the following scenarios.

- When training with long context lengths as that leads to high activation memory with FSDP alone.
- When training with really large clusters on which the global batch size exceeds desired limits.

Hugging Face Transformer models compatible with the SMP tensor parallelism

SMP v2 currently offers tensor parallelism support for the following Hugging Face transformer models.

- GPT-NeoX
- Llama 2
- Llama 3
- Mistral 7B
- Mixtral 8x7B
- Mixtral 8x22B

For reference configuration for applying tensor parallelism on these models, see the section called "Configuration tips".

Configure tensor parallelism

For `tensor_parallel_degree`, you select a value for the degree of tensor parallelism. The value must evenly divide the number of GPUs in your cluster. For example, to shard your model while using an instance with 8 GPUs, choose 2, 4, or 8. We recommend that you start with a small number, and gradually increase it until the model fits in the GPU memory.

The following code snippets show how to add the SMP initialization module `torch.sagemaker.init()` to your training script and set up the SMP configuration dictionary in JSON format for training job launcher while following the two-step process introduced in the section called "Use the SMP v2". You don't need to make any changes to your PyTorch model or PyTorch FSDP configuration. For more information about the `tensor_parallel_degree` and `random_seed` parameters, see the section called "SMP v2 core feature configuration parameters".

SMP configuration

```
{
    "tensor_parallel_degree": 8,
    "random_seed": 0
}
```

In your training script

Initialize with `torch.sagemaker.init()` to activate SMP v2 and wrap your model with the the section called "`torch.sagemaker.transform`" API.

```
import torch.sagemaker as tsm
tsm.init()
```

```
from transformers import AutoModelForCausalLM
model = AutoModelForCausalLM.from_config(..)
model = tsm.transform(model)
```

Saving and loading Hugging Face Transformer checkpoints

After the SMP library transforms a model, it changes the state dictionary (`state_dict`) of the model. This means that the model becomes incompatible with the original Hugging Face Transformer checkpointing functionalities. To handle this, the SMP library provides APIs to save checkpoints from a transformed model in Hugging Face Transformer representation, and the `torch.sagemaker.transform` API to load a Hugging Face Transformer model checkpoint for fine-tuning.

For more information about saving checkpoints while using the tensor parallelism feature of SMP v2, see the section called “Checkpointing using SMP”.

For more information about fine-tuning a model applying the tensor parallelism feature of SMP v2, see the section called “Fine-tuning”.

Fine-tuning

Fine-tuning is a process of continuously training pre-trained models to improve performance for specific use cases.

Fine-tuning small models that fit fully on a single GPU, or those that fit 8 copies of model fully on CPUs is straightforward. It requires no special change to regular FSDP training. In the realm of models larger than this, you need to consider using the delayed parameter initialization functionality, which can be tricky.

To address this, the SMP library loads the full model on one of the ranks while the rest of the ranks create models with empty weights on a meta device. Then, PyTorch FSDP initializes the weights on non-zero ranks using the `init_weights` function, and synchronizes the weights on all ranks to the weights on the 0th rank with `sync_module_states` set to `True`. The following code snippet shows how you should set it up in your training script.

```
import torch.distributed as dist
from transformers import AutoModelForCasalLM
from accelerate import init_empty_weights
from torch.sagemaker.delayed_param import DelayedParamIniter
```

```
if dist.get_rank() == 0:
    model = AutoModelForCasalLM.from_pretrained(..., low_cpu_mem_usage=True)
else:
    with init_empty_weights():
        model = AutoModelForCasalLM.from_config(AutoConfig.from_pretrained(...))
    delayed_initer = DelayedParamIniter(model)

model = FSDP(
    model,
    ...,
    sync_module_states=True,
    param_init_fn=delayed_initer.get_param_init_fn() if dist.get_rank() > 0 else None
)
```

Fine-tuning a pre-trained Hugging Face Transformer model with SMP tensor parallelism

This section discusses loading Transformer models for two use cases: fine-tuning small Transformer models and fine-tuning large Transformer models. For smaller models without delayed parameter initialization, wrap the model with the `torch.sagemaker.transform` API before wrapping it with PyTorch FSDP.

```
import functools
from transformers import AutoModelForCausalLM
from torch.distributed.fsdp import FullyShardedDataParallel as FSDP
from torch.distributed.fsdp.wrap import transformer_auto_wrap_policy
from torch.sagemaker import transform

model = AutoModelForCausalLM.from_pretrained("meta-llama/Llama-2-7b-hf",
 low_cpu_mem_usage=True)

# Transform model while loading state dictionary from rank 0.
tp_model = transform(model, load_state_dict_from_rank0=True)

# Wrap with FSDP.
model = FSDP(
    tp_model,
    ...
    sync_module_states=True,
)
```

For larger models, the preceding approach causes to run out of CPU memory. We recommend that you use delayed parameter initialization to avoid such CPU memory

issues. In this case, you can apply the `torch.sagemaker.transform` API and the `torch.sagemaker.delayed_param.DelayedParamIniter` API as shown in the following code example.

```
from transformers import AutoModelForCausalLM
from torch.sagemaker import transform
from torch.sagemaker.delayed_param import DelayedParamIniter

# Create one instance of model without delayed param
# on CPU, on one rank.
if dist.get_rank() == 0:
    model = AutoModelForCasalLM.from_pretrained(...,low_cpu_mem_usage=True)
else:
    with init_empty_weights():
        model = AutoModelForCasalLM.from_config(AutoConfig.from_pretrained(...))

# Transform model while loading state dictionary from rank 0
model = transform(model, load_state_dict_from_rank0=True)

if dist.get_rank() != 0: # For fine-tuning, delayed parameter on non-zero ranks
    delayed_initer = DelayedParamIniter(model)
else:
    delayed_initer = None

with (
    delayed_initer.validate_params_and_buffers_inited() if delayed_initer else
 nullcontext()
):
    # Wrap the model with FSDP
    model = FSDP(
        model,
        ...,
        sync_module_states=True,
        param_init_fn=delayed_initer.get_param_init_fn() if delayed_initer else None
    )
```

FlashAttention

SMP v2 supports FlashAttention kernels and makes it easy to apply them to various scenarios for Hugging Face Transformer models. Note that if you use FlashAttention package v2.0 or later, SMP uses FlashAttention v2; however, the Triton flash attention defaults to the flash attention kernel in FlashAttention v1.x, making it exclusively supported in FlashAttention v1.

The module (`nn.Module`) is a low level API that defines the attention layers of a model. It should be applied right after model creation, from the `AutoModelForCausalLM.from_config()` API for example, and before the model is being transformed or wrapped with FSDP.

Use FlashAttention kernels for self attention

The following code snippet shows how to use the the section called "`torch.sagemaker.nn.attn.FlashSelfAttention`" API provided by SMP v2.

```
def new_attn(self, q, k, v, attention_mask=None, head_mask=None):
    return (
        self.flashmod((q, k, v), causal=True, cast_dtype=torch.bfloat16, layout="b h s
 d"),
        None,
    )

for layer in model.gpt_neox.layers:
    layer.attention.flash_mod = torch.sagemaker.nn.attn.FlashSelfAttention()
    layer.attention._attn = functools.partial(new_attn, layer.attention)
```

Use FlashAttention kernels for grouped-query attention

SMP v2 also supports FlashAttention kernels for grouped-query attention (GQA) and makes it easy to apply them to various scenarios for Hugging Face Transformer models. Different from original attention architecture, GQA equally partitions query heads into groups, and query heads in the same group share the same key and value heads. Therefore, q and kv heads are passed into forward call separately. Note: The number of q heads needs to be divisible by the number of kv heads.

Example of using FlashGroupedQueryAttention

The following code snippet shows how to use the the section called "`torch.sagemaker.nn.attn.FlashGroupedQueryAttention`" API provided by SMP v2.

```
from transformers.models.llama.modeling_llama import LlamaAttention
from torch.sagemaker.nn.attn import FlashGroupedQueryAttention

class LlamaFlashAttention(LlamaAttention):
    def __init__(self, config: LlamaConfig):
        super().__init__(config)
```

```
        self.flash_attn = FlashGroupedQueryAttention(
            attention_dropout_prob=0.0,
        )

    def forward(
        self,
        hidden_states: torch.Tensor,
        attention_mask: Optional[torch.Tensor] = None,
        position_ids: Optional[torch.LongTensor] = None,
        ...
    ):
        query_states = self.q_proj(hidden_states)
        key_states = self.k_proj(hidden_states)
        value_states = self.v_proj(hidden_states)
        ...
        kv = (key_states, value_states)
        attn_output = self.flash_attn(
            query_states,
            kv,
            attn_mask=attention_mask,
            causal=True,
            layout="b h s d",
        )
        ...
        attn_output = self.o_proj(attn_output)
        ...
        return attn_output
```

The SMP library also provides the section called "`torch.sagemaker.nn.huggingface.llama_flashattn.LlamaFlashAttention`", which uses the the section called "`torch.sagemaker.nn.attn.FlashGroupedQueryAttention`" API at low level. Hugging Face Transformers has a similar implementation called `LlamaFlashAttention2` from v4.36.0. The following code snippet shows how to use the SMP v2 `LlamaFlashAttention` API or the Transformers `LlamaFlashAttention2` API to replace the attention layers of an existing Llama model.

```
from torch.sagemaker.nn.huggingface.llama_flashattn import LlamaFlashAttention
from transformers.models.llama.modeling_llama import LlamaFlashAttention2

flash_attn_class = LlamaFlashAttention # or flash_attn_class = LlamaFlashAttention2

attn_name = "self_attn"
```

```
for layer in model.model.layers:
    prev_layer = getattr(layer, attn_name)
    setattr(layer, attn_name, flash_attn_class(model.config))
```

Checkpointing using SMP

The SageMaker model parallelism (SMP) library supports PyTorch APIs for checkpoints, and provides APIs that help checkpoint properly while using the SMP library.

PyTorch FSDP (Fully Sharded Data Parallelism) supports three types of checkpoints: full, sharded, and local, each serving different purposes. Full checkpoints are used when exporting the model after training is completed, as generating a full checkpoint is a computationally expensive process. Sharded checkpoints help save and load the state of a model sharded for each individual rank. With sharded checkpoints, you can resume training with different hardware configurations, such as a different number of GPUs. However, loading sharded checkpoints can be slow due to the communication involved among multiple devices. The SMP library provides local checkpointing functionalities, which allow faster retrieval of the model's state without additional communication overhead. Note that checkpoints created by FSDP require writing to a shared network file system such as Amazon FSx.

Async local checkpoints

When training machine learning models, there is no need for subsequent iterations to wait for the checkpoint files to be saved to disk. With the release of SMP v2.5, the library supports saving checkpoint files asynchronously. This means that the subsequent training iteration can run simultaneously with the input and output (I/O) operations for creating checkpoints, without being slowed down or held back by those I/O operations. Also, the process of retrieving sharded model and optimizer parememeters in PyTorch can be time-consuming due to the additional collective communication required to exchange distributed tensor metadata across ranks. Even when using `StateDictType.LOCAL_STATE_DICT` to save local checkpoints for each rank, PyTorch still invokes hooks that perform collective communication. To mitigate this issue and reduce the time required for checkpoint retrieval, SMP introduces `SMStateDictType.SM_LOCAL_STATE_DICT`, which allows for faster retrieval of model and optimizer checkpoints by bypassing the collective communication overhead.

> **Note**
>
> Maintaining consistency in the FSDP `SHARD_DEGREE` is a requirement for utilizing the `SMStateDictType.SM_LOCAL_STATE_DICT`. Ensure that the `SHARD_DEGREE` remains

unchanged. While the number of model replications can vary, the model shard degree needs to be identical to the previous training setup when resuming from a checkpoint.

```
import os
import torch.distributed as dist
import torch.sagemaker as tsm
from torch.sagemaker import state
from torch.distributed.fsdp import FullyShardedDataParallel as FSDP
from torch.sagemaker.distributed.checkpoint.state_dict_saver import (
    async_save,
    maybe_finalize_async_calls,
)
from torch.sagemaker.distributed.checkpoint.state_dict_utils import (
    sm_state_dict_type,
    SMStateDictType,
)

global_rank = dist.get_rank()
save_dir = "/opt/ml/checkpoints"
sub_dir = f"tp{state.tp_rank}_ep{state.ep_rank}_fsdp{model.rank}"

# 1. Get replication ranks and group
current_replication_group = None
current_replication_ranks = None
for replication_ranks in state.ranker.get_rep_groups():
    rep_group = dist.new_group(replication_ranks)
    if global_rank in replication_ranks:
        current_replication_group = rep_group
        current_replication_ranks = replication_ranks

coordinator_rank = min(current_replication_ranks)

# 2. Wait for the previous checkpointing done
maybe_finalize_async_calls(
    blocking=True, process_group=current_replication_group
)

# 3. Get model local checkpoint
with sm_state_dict_type(model, SMStateDictType.SM_LOCAL_STATE_DICT):
    state_dict = {
       "model": model.state_dict(),
       "optimizer": optimizer.state_dict(),
```

```
        # Potentially add more customized state dicts.
    }

# 4. Save a local checkpoint
async_save(
    state_dict,
    checkpoint_id=os.path.join(save_dir, sub_dir),
    process_group=current_replication_group,
    coordinator_rank=coordinator_rank,
)
```

The following code snippet demonstrates how to load a checkpoint utilizing `SMStateDictType.SM_LOCAL_STATE_DICT`.

```
import os
import torch.sagemaker as tsm
from torch.sagemaker import state
from torch.sagemaker.distributed.checkpoint.state_dict_loader import load
from torch.sagemaker.distributed.checkpoint.state_dict_utils import (
    sm_state_dict_type,
    SMStateDictType,
    init_optim_state
)
from torch.sagemaker.distributed.checkpoint.filesystem import (
    DistributedFileSystemReader,
)

load_dir = "/opt/ml/checkpoints"
sub_dir = f"tp{state.tp_rank}_ep{state.ep_rank}_fsdp{model.rank}"
global_rank = dist.get_rank()
checkpoint_id = os.path.join(load_dir, sub_dir)
storage_reader = DistributedFileSystemReader(checkpoint_id)

# 1. Get replication ranks and group
current_replication_group = None
current_replication_ranks = None
for replication_ranks in state.ranker.get_rep_groups():
    rep_group = dist.new_group(replication_ranks)
    if global_rank in replication_ranks:
        current_replication_group = rep_group
        current_replication_ranks = replication_ranks

coordinator_rank = min(current_replication_ranks)
```

```
# 2. Create local state_dict
with sm_state_dict_type(model, SMStateDictType.SM_LOCAL_STATE_DICT):
    state_dict = {
        "model": model.state_dict(),
        # Potentially add more customized state dicts.
    }

    # Init optimizer state_dict states by setting zero grads and step.
    init_optim_state(optimizer, skip_empty_param=True)
    state_dict["optimizer"] = optimizer.state_dict()

# 3. Load a checkpoint
load(
    state_dict=state_dict,
    process_group=current_replication_group,
    coordinator_rank=coordinator_rank,
    storage_reader=storage_reader,
)
```

Storing checkpoints for large language models (LLMs) can be expensive as it often requires creating a large filesystem volume. To reduce costs, you have the option to save checkpoints directly to Amazon S3 without the need for additional filesystem services such as Amazon FSx. You can leverage the previous example with the following code snippet to save checkpoints to S3 by specifying an S3 URL as the destination.

```
key = os.path.join(checkpoint_dir, sub_dir)
checkpoint_id= f"s3://{your_s3_bucket}/{key}"
async_save(state_dict, checkpoint_id=checkpoint_id, **kw)
load(state_dict, checkpoint_id=checkpoint_id, **kw)
```

Async sharded checkpoints

There may be situations where you need to continue training with different hardware configurations, such as changing the number of GPUs. In these cases, your training processes must load checkpoints while resharding, which means resuming subsequent training with a different number of `SHARD_DEGREE`. In order to address the scenario where you need to resume training with a different number of `SHARD_DEGREE`, you must save your model checkpoints using the sharded state dictionary type, which is represented by `StateDictType.SHARDED_STATE_DICT`. Saving checkpoints in this format allows you to properly handle the resharding process when continuing the training with a modified hardware configuration. The provided code snippet

illustrates how to use the `tsm` API to asynchronously save sharded checkpoints, enabling a more efficient and streamlined training process.

```
import os
import torch.sagemaker as tsm
from torch.sagemaker import state
from torch.distributed.fsdp import FullyShardedDataParallel as FSDP
from torch.distributed.fsdp import StateDictType
from torch.sagemaker.utils.process_group_utils import get_global_ranks
from torch.sagemaker.distributed.checkpoint.state_dict_saver import (
    async_save,
    maybe_finalize_async_calls,
)

save_dir = "/opt/ml/checkpoints"
sub_dir = f"tp{state.tp_rank}_ep{state.ep_rank}"
checkpoint_id = os.path.join(save_dir, sub_dir)

# To determine whether curreto take part in checkpointing.
global_rank = dist.get_rank()
action_rank = state.ranker.get_rep_rank(global_rank) == 0
process_group = model.process_group
coordinator_rank = min(get_global_ranks(process_group))

# 1. wait for the previous checkpointing done
maybe_finalize_async_calls(blocking=True, process_group=process_group)

# 2. retrieve model & optimizer sharded state_dict
with FSDP.state_dict_type(model, StateDictType.SHARDED_STATE_DICT):
    state_dict = {
        "model": model.state_dict(),
        "optimizer": FSDP.optim_state_dict(model, optimizer),
        # Potentially add more customized state dicts.
    }

# 3. save checkpoints asynchronously using async_save
if action_rank:
    async_save(
        state_dict,
        checkpoint_id=checkpoint_id,
        process_group=process_group,
        coordinator_rank=coordinator_rank,
    )
```

The process of loading shared checkpoints is similar to the previous section, but it involves using the `torch.sagemaker.distributed.checkpoint.filesystem.DistributedFileSystemReader` and its `load` method. The `load` method of this class allows you to load the shared checkpoint data, following a process analogous to the one described earlier.

```
import os
from torch.distributed.fsdp import FullyShardedDataParallel as FSDP
from torch.distributed.fsdp import StateDictType
from torch.distributed.checkpoint.optimizer import load_sharded_optimizer_state_dict
from torch.sagemaker.distributed.checkpoint.state_dict_loader import load
from torch.sagemaker.utils.process_group_utils import get_global_ranks
from torch.sagemaker.distributed.checkpoint.filesystem import (
    DistributedFileSystemReader,
)

 load_dir = "/opt/ml/checkpoints"
sub_dir = f"tp{state.tp_rank}_ep{state.ep_rank}"
checkpoint_id = os.path.join(load_dir, sub_dir)
reader = DistributedFileSystemReader(checkpoint_id)

process_group = model.process_group
coordinator_rank = min(get_global_ranks(process_group))

with FSDP.state_dict_type(model, StateDictType.SHARDED_STATE_DICT):
   # 1. Load model and everything else except the optimizer.
   state_dict = {
        "model": model.state_dict()
        # Potentially more customized state dicts.
   }
   load(
        state_dict,
        storage_reader=reader,
        process_group=process_group,
        coordinator_rank=coordinator_rank,
   )
   model.load_state_dict(state_dict["model"])

   # 2. Load optimizer.
   optim_state = load_sharded_optimizer_state_dict(
        model_state_dict=state_dict["model"],
        optimizer_key="optimizer",
        storage_reader=reader,
```

```
        process_group=process_group,
    )
   flattened_optimizer_state = FSDP.optim_state_dict_to_load(
        optim_state["optimizer"], model, optimizer,
         group=model.process_group
   )
   optimizer.load_state_dict(flattened_optimizer_state)
```

Full model checkpoints

At the end of training, you can save a full checkpoint that combines all shards of a model into a single model checkpoint file. The SMP library fully supports the PyTorch full model checkpoints API, so you don't need to make any changes.

Note that if you use the SMP the section called “Tensor parallelism”, the SMP library transforms the model. When checkpointing the full model in this case, the SMP library translates the model back to the Hugging Face Transformers checkpoint format by default.

In cases where you train with the SMP tensor parallelism and turn off the SMP translation process, you can use the `translate_on_save` argument of the PyTorch `FullStateDictConfig` API to switch the SMP auto-translation on or off as needed. For example, if you are focusing on training a model, you don’t need to add the translation process which adds overhead. In that case, we recommend you to set `translate_on_save=False`. Also, if you plan to keep using the SMP translation of the model for further training in future, you can switch it off to save the SMP translation of the model for later use. Translating the model back to the Hugging Face Transformers model checkpoint format is needed when you wrap up the training of your model and use that for inference.

```
from torch.distributed.fsdp import FullyShardedDataParallel as FSDP
from torch.distributed.fsdp import FullStateDictConfig
import torch.sagemaker as tsm

# Save checkpoints.
with FSDP.state_dict_type(
    model,
    StateDictType.FULL_STATE_DICT,
    FullStateDictConfig(
        rank0_only=True, offload_to_cpu=True,
        # Default value is to translate back to Hugging Face Transformers format,
        # when saving full checkpoints for models trained with SMP tensor parallelism.
        # translate_on_save=True
```

```
    ),
):
    state_dict = model.state_dict()
    if dist.get_rank() == 0:
        logger.info("Processed state dict to save. Starting write to disk now.")
        os.makedirs(save_dir, exist_ok=True)
        # This name is needed for HF from_pretrained API to work.
        torch.save(state_dict, os.path.join(save_dir, "pytorch_model.bin"))
        hf_model_config.save_pretrained(save_dir)
    dist.barrier()
```

Note that the option `FullStateDictConfig(rank0_only=True, offload_to_cpu=True)` is to gather the model on the CPU of the 0th rank device to save memory when training large models.

To load the model back for inference, you do so as shown in the following code example. Note that the class `AutoModelForCausalLM` might change to other factor builder classes in Hugging Face Transformers, such as `AutoModelForSeq2SeqLM`, depending on your model. For more information, see Hugging Face Transformers documentation.

```
from transformers import AutoModelForCausalLM
model = AutoModelForCausalLM.from_pretrained(save_dir)
```

Amazon SageMaker AI model parallelism library v2 examples

This page provides a list of blogs and Jupyter notebooks that present practical examples of implementing the SageMaker model parallelism (SMP) library v2 to run distributed training jobs on SageMaker AI.

Blogs and Case Studies

The following blogs discuss case studies about using SMP v2.

- Amazon SageMaker AI model parallel library now accelerates PyTorch FSDP workloads by up to 20%

PyTorch example notebooks

Example notebooks are provided in the SageMaker AI examples GitHub repository. To download the examples, run the following command to clone the repository and go to `training/distributed_training/pytorch/model_parallel_v2`.

Note

Clone and run the example notebooks in the following SageMaker AI ML IDEs.

- SageMaker JupyterLab (available in Studio created after December 2023)
- SageMaker Code Editor (available in Studio created after December 2023)
- Studio Classic (available as an application in Studio created after December 2023)
- SageMaker Notebook Instances

```
git clone https://github.com/aws/amazon-sagemaker-examples.git
cd amazon-sagemaker-examples/training/distributed_training/pytorch/model_parallel_v2
```

SMP v2 example notebooks

- Accelerate training of Llama v2 with SMP v2, PyTorch FSDP, and Transformer Engine by running FP8 training on P5 instances
- Fine-tune Llama v2 with SMP v2 and PyTorch FSDP at large-scale using tensor parallelism, hybrid sharding, and activation offloading
- Train GPT-NeoX with SMP v2 and PyTorch FSDP at large scale
- Fine-tune GPT-NeoX with SMP v2 and PyTorch FSDP at large-scale using tensor parallelism, hybrid sharding, and activation offloading

SageMaker distributed model parallelism best practices

Use the following guidelines when you run a distributed training job with the SageMaker model parallel library v2 (SMP v2).

Setting up the right configuration for distributed training

To estimate and find the best starting point to apply distributed training techniques that SMP v2 provides, review the following list. Each list item discusses the advantage of using the the section called “Core features of SMP v2” along with potential tradeoffs.

Configuration tips

This section provides guidelines on how to decide on the best model configurations for optimal throughput with global batch size requirements.

First, we recommend the following setups regardless of the size of your model.

1. Use the most powerful instance type that you can use.
2. Turn on mixed precision all the time, as it provides substantial benefits for performance and memory reduction. We recommend you to use `bfloat16` as it's more precise than `float16`.
3. Turn on the SageMaker distributed data parallelism library (instead of using NCCL) whenever it's applicable, as shown in the section called "Compatibility with the SMDDP library". One exception is for tensor-parallelism-only use cases (`hybrid_shard_degree = 1` and `tensor_paralle_degree > 1`).
4. If your model has more than about 60 billion parameters, we recommend using the section called "Delayed parameter initialization". You can also use delayed parameter initialization to speed up the initialization for any model.
5. We recommend you to enable the section called "Activation checkpointing".

Depending on the size of you model, we recommend that you start with the following guidance.

1. Use sharded data parallelism.
   a. Depending on the batch size you intend to fit in the GPU memory, choose the appropriate sharded data parallel degree. Normally, you should start with the lowest degree to fit your model in the GPU memory while minimizing overhead from network communication. If you see a warning that cache flushes are happening, we recommend that you increase the sharding degree.
   b. Determine `world_size` based on the maximum local batch size and required global batch size, if any.
   c. You can experiment with activation offloading. Depending on scenarios, it can address your memory needs without having to increase the sharding degree, which means less communication.
2. Use sharded data parallelism of PyTorch FSDP and tensor parallelism of SMP v2 simultaneously, as introduced in the section called "Tensor parallelism".
   a. When training on large clusters, with FSDP alone the global batch size can become too large, causing convergence issues for the model. Typically, most research work keeps the batch size under 4 million tokens. In this case, you can resolve the problem by composing PyTorch FSDP with tensor parallelism of SMP v2 to reduce the batch size.

For example, if you have 256 nodes and sequence length 4096, even a batch size of 1 per GPU leads to global batch size of 8M tokens. However, when you use tensor parallelism with degree 2 and batch size of 1 per tensor parallel group, this becomes 1/2 batch size per GPU, which translates to 4 million tokens.

b. When training with long context lengths such as 8k, 16k activation memory can become very high. FSDP doesn't shard activations, and activations can cause GPUs to go out of memory. In such scenarios, you can train efficiently by composing PyTorch FSDP with tensor parallelism of SMP v2.

Reference configurations

The SageMaker model parallelism training team provides the following reference points based on experiments with the Llama 2 model transformed to the SMP transformer model using the section called "`torch.sagemaker.transform`", and trained on `ml.p4d.24xlarge` instance(s) with sequence length 4096 and mixed precision (FP16 or BF16).

Model	Model size (the number of model parameters)	The number of instances	Sharded data parallel degree	Tensor parallel degree	Activation checkpointing	Activation offloading	Batch size
Llama 2	7B	1	8	1	TRUE	FALSE	4
	70B	32	256	1	TRUE	FALSE	2
	175B	64	128	4	TRUE	TRUE	6

You can extrapolate from the preceding configurations to estimate GPU memory usage for your model configuration. For example, if you increase the sequence length for a 10-billion-parameter model or increase the size of the model to 20 billion, you might want to lower batch size first. If the model still doesn't fit, try increasing the degree of tensor parallelism.

Monitoring and logging a training job using the SageMaker AI console and Amazon CloudWatch

To monitor system-level metrics such as CPU memory utilization, GPU memory utilization, and GPU utilization, use visualization provided through the SageMaker AI console.

1. In the left navigation pane, choose **Training**.
2. Choose **Training jobs**.
3. In the main pane, choose the training job name for which you want to see more details.
4. Browse the main pane and find the **Monitor** section to see the automated visualization.
5. To see training job logs, choose **View logs** in the **Monitor** section. You can access the distributed training job logs of the training job in CloudWatch. If you launched multi-node distributed training, you should see multiple log streams with tags in the format of **algo-n-1234567890**. The **algo-1** log stream tracks training logs from the main (0th) node.

For more information, see Amazon CloudWatch Metrics for Monitoring and Analyzing Training Jobs.

Permissions

To run a SageMaker training job with model parallelism, make sure you have the right permissions in your IAM role, such as the following:

- To use FSx for Lustre, add `AmazonFSxFullAccess`.
- To use Amazon S3 as a data channel, add `AmazonS3FullAccess`.
- To use Docker, build your own container, and push it to Amazon ECR, add `AmazonEC2ContainerRegistryFullAccess`.
- To have a full access to use the entire suite of SageMaker AI features, add `AmazonSageMakerFullAccess`.

The SageMaker model parallel library v2 reference

The following are references for the SageMaker model parallel library v2 (SMP v2).

Topics

- SMP v2 core feature configuration parameters
- Reference for the SMP v2 torch.sagemaker package

- Upgrade from SMP v1 to SMP v2

SMP v2 core feature configuration parameters

The following is a complete list of parameters to activate and configure the the section called "Core features of SMP v2". These must be written in JSON format and passed to the PyTorch ModelTrainer in the SageMaker Python SDK or saved as a JSON file for SageMaker HyperPod.

```
{
    "hybrid_shard_degree": Integer,
    "sm_activation_offloading": Boolean,
    "activation_loading_horizon": Integer,
    "fsdp_cache_flush_warnings": Boolean,
    "allow_empty_shards": Boolean,
    "tensor_parallel_degree": Integer,
    "context_parallel_degree": Integer,
    "expert_parallel_degree": Integer,
    "random_seed": Integer
}
```

- `hybrid_shard_degree` (Integer) – Specifies a sharded parallelism degree. The value must be an integer between `0` and `world_size`. The default value is `0`.
  - If set to `0`, it falls back to the native PyTorch implementation and API in the script when `tensor_parallel_degree` is 1. Otherwise, it computes the largest possible `hybrid_shard_degree` based on `tensor_parallel_degree` and `world_size`. When falling back to the native PyTorch FSDP use cases, if `FULL_SHARD` is the strategy you use, it shards across the whole cluster of GPUs. If `HYBRID_SHARD` or `_HYBRID_SHARD_ZERO2` was the strategy, it is equivalent to `hybrid_shard_degree` of 8. When tensor parallelism is enabled, it shards based on the revised `hybrid_shard_degree`.
  - If set to `1`, it falls back to the native PyTorch implementation and API for `NO_SHARD` in the script when `tensor_parallel_degree` is 1. Otherwise, it's equivalent to `NO_SHARD` within any given tensor parallel groups.
  - If set to an integer between 2 and `world_size`, sharding happens across the specified number of GPUs. If you don't set up `sharding_strategy` in the FSDP script, it gets overridden to `HYBRID_SHARD`. If you set `_HYBRID_SHARD_ZERO2`, the `sharding_strategy` you specify is used.

- `sm_activation_offloading` (Boolean) – Specifies whether to enable the SMP activation offloading implementation. If `False`, offloading uses the native PyTorch implementation. If `True`, it uses the SMP activation offloading implementation. You also need to use the PyTorch activation offload wrapper (`torch.distributed.algorithms._checkpoint.checkpoint_wrapper.offload_wrapper`) in your script. To learn more, see the section called "Activation offloading". The default value is `True`.
- `activation_loading_horizon` (Integer) – An integer specifying the activation offloading horizon type for FSDP. This is the maximum number of checkpointed or offloaded layers whose inputs can be in the GPU memory simultaneously. To learn more, see the section called "Activation offloading". The input value must be a positive integer. The default value is 2.
- `fsdp_cache_flush_warnings` (Boolean) – Detects and warns if cache flushes happen in the PyTorch memory manager, because they can degrade computational performance. The default value is `True`.
- `allow_empty_shards` (Boolean) – Whether to allow empty shards when sharding tensors if tensor is not divisible. This is an experimental fix for crash during checkpointing in certain scenarios. Disabling this falls back to the original PyTorch behavior. The default value is `False`.
- `tensor_parallel_degree` (Integer) – Specifies a tensor parallelism degree. The value must be between 1 and `world_size`. The default value is 1. Note that passing a value greater than 1 does not enable context parallelism automatically; you also need to use the the section called "`torch.sagemaker.transform`" API to wrap the model in your training script. To learn more, see the section called "Tensor parallelism".
- `context_parallel_degree` (Integer) – Specifies the context parallelism degree. The value must be between 1 and `world_size` , and must be `<= hybrid_shard_degree`. The default value is 1. Note that passing a value greater than 1 does not enable context parallelism automatically; you also need to use the the section called "`torch.sagemaker.transform`" API to wrap the model in your training script. To learn more, see the section called "Context parallelism".
- `expert_parallel_degree` (Integer) – Specifies a expert parallelism degree. The value must be between 1 and `world_size`. The default value is 1. Note that passing a value greater than 1 does not enable context parallelism automatically; you also need to use the the section called "`torch.sagemaker.transform`" API to wrap the model in your training script. To learn more, see the section called "Expert parallelism".
- `random_seed` (Integer) – A seed number for the random operations in distributed modules by SMP tensor parallelism or expert parallelism. This seed is added to tensor-parallel or expert-

parallel ranks to set the actual seed for each rank. It is unique for each tensor-parallel and expert-parallel rank. SMP v2 makes sure that the random number generated across tensor-parallel and expert-parallel ranks matches the non-tensor-parallelism and non-expert-parallelism cases respectively.

`torch.sagemaker.delayed_param.DelayedParamIniter`

An API for applying the section called “Delayed parameter initialization” to a PyTorch model.

```
class torch.sagemaker.delayed_param.DelayedParamIniter(
    model: nn.Module,
    init_method_using_config : Callable = None,
    verbose: bool = False,
)
```

Parameters

- `model` (`nn.Module`) – A PyTorch model to wrap and apply the delayed parameter initialization functionality of SMP v2.

- `init_method_using_config` (Callable) – If you use the tensor parallel implementation of SMP v2 or supported the section called "Hugging Face Transformer models compatible with the SMP tensor parallelism", keep this parameter at the default value, which is `None`. By default, the `DelayedParamIniter` API finds out how to initialize the given model correctly. For any other models, you need to create a custom parameter initialization function and add it to your script. The following code snippet is the default `init_method_using_config` function that SMP v2 implemented for the the section called "Hugging Face Transformer models compatible with the SMP tensor parallelism". Use the following code snippet as a reference for creating your own initialization configuration function, adding it to your script, and passing it to the `init_method_using_config` parameter of the SMP `DelayedParamIniter` API.

```
from torch.sagemaker.utils.module_utils import empty_module_params,
 move_buffers_to_device

# Define a custom init config function.
def custom_init_method_using_config(module):
    d = torch.cuda.current_device()
    empty_module_params(module, device=d)
    if isinstance(module, (nn.Linear, Conv1D)):
        module.weight.data.normal_(mean=0.0, std=config.initializer_range)
        if module.bias is not None:
            module.bias.data.zero_()
    elif isinstance(module, nn.Embedding):
        module.weight.data.normal_(mean=0.0, std=config.initializer_range)
        if module.padding_idx is not None:
            module.weight.data[module.padding_idx].zero_()
    elif isinstance(module, nn.LayerNorm):
        module.weight.data.fill_(1.0)
        module.bias.data.zero_()
    elif isinstance(module, LlamaRMSNorm):
        module.weight.data.fill_(1.0)
    move_buffers_to_device(module, device=d)

delayed_initer = DelayedParamIniter(model,
 init_method_using_config=custom_init_method_using_config)
```

  For more information about the `torch.sagemaker.module_util` functions in the preceding code snippet, see the section called "`torch.sagemaker` util functions and properties".

- `verbose` (Boolean) – Whether to enable more detailed logging during initialization and validation. The default value is `False`.

Methods

- `get_param_init_fn()` – Returns the parameter initialization function that you can pass to the `param_init_fn` argument of the PyTorch FSDP wrapper class.
- `get_post_param_init_fn()` – Returns the parameter initialization function that you can pass to the `post_param_init_fn` argument of the PyTorch FSDP wrapper class. This is needed when you have tied weights in the model. The model must implement the method `tie_weights`. For more information, see the **Notes on tied weight** in the section called "Delayed parameter initialization".
- `count_num_params` (`module: nn.Module, *args: Tuple[nn.Parameter]`) – Tracks how many parameters are being initialized by the parameter initialization function. This helps implement the following `validate_params_and_buffers_inited` method. You usually don't need to call this function explicitly, because the `validate_params_and_buffers_inited` method implicitly calls this method in the backend.
- `validate_params_and_buffers_inited` (`enabled: bool=True`) – This is a context manager that helps validate that the number of parameters initialized matches the total number of parameters in the model. It also validates that all parameters and buffers are now on GPU devices instead of meta devices. It raises `AssertionErrors` if these conditions are not met. This context manager is only optional and you're not required to use this context manager to initialize parameters.

`torch.sagemaker.distributed.checkpoint.state_dict_saver.async_save`

Entry API for asynchronous save. Use this method to save a `state_dict` asynchronously to a specified `checkpoint_id`.

```
def async_save(
    state_dict: STATE_DICT_TYPE,
    *,
    checkpoint_id: Union[str, os.PathLike, None] = None,
    storage_writer: Optional[StorageWriter] = None,
    planner: Optional[SavePlanner] = None,
    process_group: Optional[dist.ProcessGroup] = None,
    coordinator_rank: int = 0,
    queue : AsyncCallsQueue = None,
    sharded_strategy: Union[SaveShardedStrategy, Tuple[str, int], None] = None,
    wait_error_handling: bool = True,
    force_check_all_plans: bool = True,
```

```
    s3_region: Optional[str] = None,
    s3client_config: Optional[S3ClientConfig] = None
) -> None:
```

Parameters

- `state_dict` (dict) - Required. The state dict to save.
- `checkpoint_id` (str) - Required. The storage path to save checkpoints to.
- `storage_writer` (StorageWriter) - Optional. An instance of `StorageWriter` in PyTorch to perform write operations. If this is not specificed, the default configuration of `StorageWriter` is used.
- `planner` (SavePlanner) - Optional. An instance of `SavePlanner` in PyTorch. If this is not specificed, the default configuration of `SavePlanner` is used.
- `process_group` (ProcessGroup) - Optional. The process group to work on. If `None`, the default (global) process group is used.
- `coordinator_rank` (int) - Optional. The rank of the coordinator when performing collective communication operators such as `AllReduce`.
- queue (AsyncRequestQueue) - Optional. The async scheduler to use. By default, it takes the global parameter `DEFAULT_ASYNC_REQUEST_QUEUE`.
- `sharded_strategy` (PyTorchDistSaveShardedStrategy) - Optional. The sharded strategy to use for saving checkpoints. If this is is not specified, `torch.sagemaker.distributed.checkpoint.state_dict_saver.PyTorchDistSaveShardedS` is used by default.
- `wait_error_handling` (bool) - Optional. A flag specifying whether to wait for all ranks to finish error handling. The default value is `True`.
- `force_check_all_plans` (bool) - Optional. A flag that determines whether to forcibly synchronize plans across ranks, even in the case of a cache hit. The default value is `True`.
- `s3_region` (str) - Optional. The region where the S3 bucket is located. If not specified, the region is inferred from the `checkpoint_id`.
- `s3client_config` (S3ClientConfig) - Optional. The dataclass exposing configurable parameters for the S3 client. If not provided, the default configuration of S3ClientConfig is used. The `part_size` parameter is set to 64MB by default.

`torch.sagemaker.distributed.checkpoint.state_dict_saver.maybe_finalize_async_cal`

This function allows a training process to monitor multiple asynchronous requests to be done.

```
def maybe_finalize_async_calls(
    blocking=True,
    process_group=None
) -> List[int]:
```

Parameters

- `blocking` (bool) - Optional. If `True`, it will wait until all active requests are completed. Otherwise, it finalizes only the asynchronous requests that have already finished. The default value is `True`.
- `process_group` (ProcessGroup) - Optional. The process group to operate on. If set to None, the default (global) process group is utilized.

Returns

- A list containing the indices of asynchronous calls are successfully finalized.

`torch.sagemaker.distributed.checkpoint.state_dict_saver.save`

Use this method to save a `state_dict` synchronously to a specified `checkpoint_id`.

```
def save(
    state_dict: STATE_DICT_TYPE,
    *,
    checkpoint_id: Union[str, os.PathLike, None] = None,
    storage_writer: Optional[StorageWriter] = None,
    planner: Optional[SavePlanner] = None,
    process_group: Optional[dist.ProcessGroup] = None,
    coordinator_rank: int = 0,
    wait_error_handling: bool = True,
    force_check_all_plans: bool = True,
    s3_region: Optional[str] = None,
    s3client_config: Optional[S3ClientConfig] = None
) -> None:
```

Parameters

- `state_dict` (dict) - Required. The state dict to save.
- `checkpoint_id` (str) - Required. The storage path to save checkpoints to.
- `storage_writer` (StorageWriter) - Optional. An instance of `StorageWriter` in PyTorch to perform write operations. If this is not specificed, the default configuration of `StorageWriter` is used.
- `planner` (SavePlanner) - Optional. An instance of `SavePlanner` in PyTorch. If this is not specificed, the default configuration of `SavePlanner` is used.
- `process_group` (ProcessGroup) - Optional. The process group to work on. If None, the default (global) process group is used.
- `coordinator_rank` (int) - Optional. The rank of the coordinator when performing collective communication operators such as `AllReduce`.
- `wait_error_handling` (bool) - Optional. A flag specifying whether to wait for all ranks to finish error handling. The default value is `True`.
- `force_check_all_plans` (bool) - Optional. A flag that determines whether to forcibly synchronize plans across ranks, even in the case of a cache hit. The default value is `True`.
- `s3_region` (str) - Optional. The region where the S3 bucket is located. If not specified, the region is inferred from the `checkpoint_id`.
- `s3client_config` (S3ClientConfig) - Optional. The dataclass exposing configurable parameters for the S3 client. If not provided, the default configuration of S3ClientConfig is used. The `part_size` parameter is set to 64MB by default.

`torch.sagemaker.distributed.checkpoint.state_dict_loader.load`

Load the state dictionary of a distributed model (`state_dict`).

```
def load(
    state_dict: Dict[str, Any],
    *,
    checkpoint_id: Union[str, os.PathLike, None] = None,
    storage_reader: Optional[StorageReader] = None,
    planner: Optional[LoadPlanner] = None,
    process_group: Optional[dist.ProcessGroup] = None,
    check_keys_matched: bool = True,
    coordinator_rank: int = 0,
    s3_region: Optional[str] = None,
    s3client_config: Optional[S3ClientConfig] = None
```

```
) -> None:
```

Parameters

- `state_dict` (dict) - Required. The `state_dict` to load.
- `checkpoint_id` (str) - Required. The ID of a checkpoint. The meaning of the `checkpoint_id` depends on the storage. It can be a path to a folder or to a file. It can also be a key if the storage is a key-value store.
- `storage_reader` (StorageReader) - Optional. An instance of `StorageReader` in PyTorch to perform read operations. If not specified, distributed checkpointing will automatically infer the reader based on the `checkpoint_id`. If `checkpoint_id` is also None, an exception error is raised.
- `planner` (StorageReader) - Optional. An instance of `LoadPlanner` in PyTorch. If not specificed, the default configuration of `LoadPlanner` is used.
- `check_keys_matched` (bool) - Optional. If enabled, checks whether the `state_dict` keys of all ranks are matched using `AllGather`.
- `s3_region` (str) - Optional. The region where the S3 bucket is located. If not specified, the region is inferred from the `checkpoint_id`.
- `s3client_config` (S3ClientConfig) - Optional. The dataclass exposing configurable parameters for the S3 client. If not provided, the default configuration of S3ClientConfig is used. The `part_size` parameter is set to 64MB by default.

`torch.sagemaker.moe.moe_config.MoEConfig`

A configuration class for setting up the SMP-implementation of Mixture-of-Experts (MoE). You can specify MoE configuration values through this class and pass it to the `torch.sagemaker.transform` API call. To learn more about the usage of this class for training MoE models, see the section called “Expert parallelism”.

```
class torch.sagemaker.moe.moe_config.MoEConfig(
    smp_moe=True,
    random_seed=12345,
    moe_load_balancing="sinkhorn",
    global_token_shuffle=False,
    moe_all_to_all_dispatcher=True,
    moe_aux_loss_coeff=0.001,
    moe_z_loss_coeff=0.001
```

```
)
```

Parameters

- `smp_moe` (Boolean) - Whether to use the SMP-implementation of MoE. The default value is `True`.
- `random_seed` (Integer) - A seed number for the random operations in expert-parallel distributed modules. This seed is added to the expert parallel rank to set the actual seed for each rank. It is unique for each expert parallel rank. The default value is `12345`.
- `moe_load_balancing` (String) - Specify the load balancing type of the MoE router. Valid options are `aux_loss`, `sinkhorn`, `balanced`, and `none`. The default value is `sinkhorn`.
- `global_token_shuffle` (Boolean) - Whether to shuffle tokens across EP ranks within the same EP group. The default value is `False`.
- `moe_all_to_all_dispatcher` (Boolean) - Whether to use all-to-all dispatcher for the communications in MoE. The default value is `True`.
- `moe_aux_loss_coeff` (Float) - A coefficient for auxiliary load balancing loss. The default value is `0.001`.
- `moe_z_loss_coeff` (Float) - Coefficient for z-loss. The default value is `0.001`.

`torch.sagemaker.nn.attn.FlashSelfAttention`

An API for using the section called “FlashAttention” with SMP v2.

```
class torch.sagemaker.nn.attn.FlashSelfAttention(
   attention_dropout_prob: float = 0.0,
   scale: Optional[float] = None,
   triton_flash_attention: bool = False,
   use_alibi: bool = False,
)
```

Parameters

- `attention_dropout_prob` (float) – The dropout probability to apply to attention. The default value is `0.0`.
- `scale` (float) – If passed, this scale factor is applied for softmax. If set to `None` (which is also the default value), the scale factor is `1 / sqrt(attention_head_size)`. The default value is None.

- `triton_flash_attention` (bool) – If passed, Triton implementation of flash attention is used. This is necessary to supports Attention with Linear Biases (ALiBi) (see the following `use_alibi` parameter). This version of the kernel doesn't support dropout. The default value is `False`.
- `use_alibi` (bool) – If passed, it enables Attention with Linear Biases (ALiBi) using the mask provided. When using ALiBi, it needs an attention mask prepared as follows. The default value is `False`.

```
def generate_alibi_attn_mask(attention_mask, batch_size, seq_length,
    num_attention_heads, alibi_bias_max=8):
    device, dtype = attention_mask.device, attention_mask.dtype
    alibi_attention_mask = torch.zeros(
        1, num_attention_heads, 1, seq_length, dtype=dtype, device=device
    )

    alibi_bias = torch.arange(1 - seq_length, 1, dtype=dtype, device=device).view(
        1, 1, 1, seq_length
    )
    m = torch.arange(1, num_attention_heads + 1, dtype=dtype, device=device)
    m.mul_(alibi_bias_max / num_attention_heads)
    alibi_bias = alibi_bias * (1.0 / (2 ** m.view(1, num_attention_heads, 1, 1)))

    alibi_attention_mask.add_(alibi_bias)
    alibi_attention_mask = alibi_attention_mask[..., :seq_length, :seq_length]
    if attention_mask is not None and attention_mask.bool().any():
        alibi_attention_mask.masked_fill(
            attention_mask.bool().view(batch_size, 1, 1, seq_length), float("-inf")
        )

    return alibi_attention_mask
```

Methods

- `forward(self, qkv, attn_mask=None, causal=False, cast_dtype=None, layout="b h s d")` – A regular PyTorch module function. When a `module(x)` is called, SMP runs this function automatically.
  - `qkv` – `torch.Tensor` of the following form: `(batch_size x seqlen x (3 x num_heads) x head_size)` or `(batch_size, (3 x num_heads) x seqlen x head_size)`, a tuple of `torch.Tensors` each of which might be of shape `(batch_size`

`x seqlen x num_heads x head_size`), or (`batch_size x num_heads x seqlen x head_size`). An appropriate layout arg must be passed based on the shape.

- `attn_mask` – `torch.Tensor` of the following form (`batch_size x 1 x 1 x seqlen`). To enable this attention mask parameter, it requires `triton_flash_attention=True` and `use_alibi=True`. To learn how to generate an attention mask using this method, see the code examples at the section called "FlashAttention". The default value is None.
- `causal` – When set to `False`, which is the default value of the argument, no mask is applied. When set to `True`, the `forward` method uses the standard lower triangular mask. The default value is `False`.
- `cast_dtype` – When set to a particular `dtype`, it casts the `qkv` tensors to that `dtype` before `attn`. This is useful for implementations such as the Hugging Face Transformer GPT-NeoX model, which has `q` and `k` with `fp32` after rotary embeddings. If set to None, no cast is applied. The default value is None.
- `layout` (string) – Available values are `b h s d` or `b s h d`. This should be set to the layout of `qkv` tensors passed, so appropriate transformations can be applied for `attn`. The default value is `b h s d`.

Returns

A single `torch.Tensor` with shape (`batch_size x num_heads x seq_len x head_size`).

`torch.sagemaker.nn.attn.FlashGroupedQueryAttention`

An API for using `FlashGroupedQueryAttention` with SMP v2. To learn more about the usage of this API, see the section called "Use FlashAttention kernels for grouped-query attention".

```
class torch.sagemaker.nn.attn.FlashGroupedQueryAttention(
    attention_dropout_prob: float = 0.0,
    scale: Optional[float] = None,
)
```

Parameters

- `attention_dropout_prob` (float) – The dropout probability to apply to attention. The default value is `0.0`.
- `scale` (float) – If passed, this scale factor is applied for softmax. If set to None, `1 / sqrt(attention_head_size)` is used as the scale factor. The default value is None.

Methods

- `forward(self, q, kv, causal=False, cast_dtype=None, layout="b s h d")` – A regular PyTorch module function. When a `module(x)` is called, SMP runs this function automatically.
  - `q` – `torch.Tensor` of the following form `(batch_size x seqlen x num_heads x head_size)` or `(batch_size x num_heads x seqlen x head_size)`. Appropriate layout arg must be passed based on the shape.
  - `kv` – `torch.Tensor` of the following form `(batch_size x seqlen x (2 x num_heads) x head_size)` or `(batch_size, (2 x num_heads) x seqlen x head_size)`, or a tuple of two `torch.Tensors`, each of which might be of shape `(batch_size x seqlen x num_heads x head_size)` or `(batch_size x num_heads x seqlen x head_size)`. Appropriate `layout` argument must also be passed based on the shape.
  - `causal` – When set to `False`, which is the default value of the argument, no mask is applied. When set to `True`, the `forward` method uses the standard lower triangular mask. The default value is `False`.
  - `cast_dtype` – When set to a particular dtype, it casts the `qkv` tensors to that dtype before `attn`. This is useful for implementations such as Hugging Face Transformers GPT-NeoX, which has `q,k` with `fp32` after rotary embeddings. If set to None, no cast is applied. The default value is None.
  - layout (string) – Available values are `"b h s d"` or `"b s h d"`. This should be set to the layout of `qkv` tensors passed, so appropriate transformations can be applied for `attn`. The default value is `"b h s d"`.

Returns

Returns a single `torch.Tensor (batch_size x num_heads x seq_len x head_size)` that represents the output of attention computation.

`torch.sagemaker.nn.huggingface.llama_flashattn.LlamaFlashAttention`

An API that supports FlashAttention for the Llama model. This API uses the the section called "`torch.sagemaker.nn.attn.FlashGroupedQueryAttention`" API at low level. To learn how to use this, see the section called "Use FlashAttention kernels for grouped-query attention".

```
class torch.sagemaker.nn.huggingface.llama_flashattn.LlamaFlashAttention(
    config: LlamaConfig
```

```
)
```

Parameters

- `config` – A FlashAttention configuration for the Llama model.

Methods

- `forward(self, hidden_states, attention_mask, position_ids, past_key_value, output_attentions, use_cache)`
  - `hidden_states` (`torch.Tensor`) – Hidden states of a tensor in form of `(batch_size x seq_len x num_heads x head_size)`.
  - `attention_mask` (`torch.LongTensor`) – Mask to avoid performing attention on padding token indices in form of `(batch_size x seqlen)`. The default value is None.
  - `position_ids` (`torch.LongTensor`) – When not being None, it is in form of `(batch_size x seqlen)`, indicating the indices of positions of each input sequence token in the position embeddings. The default value is None.
  - `past_key_value` (Cache) – Pre-computed hidden-states (key and values in the self-attention blocks and in the cross-attention blocks). The default value is None.
  - `output_attentions` (bool) – Indicates whether to return the attentions tensors of all attention layers. The default value is `False`.
  - `use_cache` (bool) – Indicates whether to return `past_key_values` key value states. The default value is `False`.

Returns

Returns a single `torch.Tensor (batch_size x num_heads x seq_len x head_size)` that represents the output of attention computation.

`torch.sagemaker.transform`

SMP v2 provides this `torch.sagemaker.transform()` API for transforming Hugging Face Transformer models to SMP model implementations and enabling the SMP tensor parallelism.

```
torch.sagemaker.transform(
    model: nn.Module,
    device: Optional[torch.device] = None,
```

```
    dtype: Optional[torch.dtype] = None,
    config: Optional[Dict] = None,
    load_state_dict_from_rank0: bool = False,
    cp_comm_type: str = "p2p"
)
```

SMP v2 maintains transformation policies for the the section called "Hugging Face Transformer models compatible with the SMP tensor parallelism" by converting the configuration of the Hugging Face Transformer models to the SMP transformer configuration.

Parameters

- `model` (`torch.nn.Module`) – A model from the section called "Hugging Face Transformer models compatible with the SMP tensor parallelism" to transform and apply the tensor parallelism feature of the SMP library.
- `device` (`torch.device`) – If passed, a new model is created on this device. If the original module has any parameter on meta device (see the section called "Delayed parameter initialization"), then the transformed module will also be created on meta device, ignoring the argument passed here. The default value is `None`.
- `dtype` (`torch.dtype`) – If passed, sets this as the dtype context manager for the creation of the model and creates a model with this dtype. This is typically unnecessary, as we want to create the model with `fp32` when using `MixedPrecision`, and `fp32` is the default dtype in PyTorch. The default value is `None`.
- `config` (dict) – This is a dictionary for configuring the SMP transformer. The default value is `None`.
- `load_state_dict_from_rank0` (Boolean) – By default, this module creates a new instance of the model with new weights. When this argument is set to `True`, SMP tries to load the state dictionary of the original PyTorch model from the 0th rank into transformed model for the tensor parallel group that the 0th rank is part of. When this is set to `True`, rank 0 can't have any parameters on meta device. Only the first tensor parallel group populates the weights from the 0th rank after this transform call. You need to set `sync_module_states` to `True` in the FSDP wrapper to get these weights from the first tensor parallel group to all other processes. With this activated, the SMP library loads the state dictionary from the original model. The SMP library takes the `state_dict` of the model before transform, converts it to match the structure of the transformed model, shards it for each tensor parallel rank, communicates this state from the 0th rank to other ranks in the tensor parallel group that the 0th rank is part of, and loads it. The default value is `False`.

- `cp_comm_type` (str) – Determines the context parallelism implementation and is only applicable when the `context_parallel_degree` is greater than 1. Available values for this parameter are `p2p` and `all_gather`. The `p2p` implementation utilizes peer-to-peer send-receive calls for key-and-value (KV) tensor accumulation during the attention computation, running asynchronously and allowing communication to overlap with computation. On the other hand, the `all_gather` implementation employs the `AllGather` communication collective operation for KV tensor accumulation. The default value is `"p2p"`.

Returns

Returns a transformed model that you can wrap with PyTorch FSDP. When `load_state_dict_from_rank0` is set to `True`, the tensor parallel group that involves rank 0 has weights loaded from the original state dictionary on rank 0. When using the section called "Delayed parameter initialization" on the original model, only these ranks have the actual tensors on CPUs for the parameters and buffers of the transformed model. The rest of the ranks continue to have the parameters and buffers on the meta device to save memory.

`torch.sagemaker` util functions and properties

torch.sagemaker util functions

- `torch.sagemaker.init(config: Optional[Union[str, Dict[str, Any]]] = None) -> None` – Initializes the PyTorch training job with SMP.
- `torch.sagemaker.is_initialized() -> bool` – Checks whether the training job is initialized with SMP. When falling back to the native PyTorch while the job is initialized with SMP, some of the properties are not relevant and become `None`, as indicated in the following **Properties** list.
- `torch.sagemaker.utils.module_utils.empty_module_params(module: nn.Module, device: Optional[torch.device] = None, recurse: bool = False) -> nn.Module` – Creates empty parameters on the given `device` if any, and it can be recursive for all nested modules if specified.
- `torch.sagemaker.utils.module_utils.move_buffers_to_device(module: nn.Module, device: torch.device, recurse: bool = False) -> nn.Module` – Moves module buffers to the given `device`, and it can be recursive for all nested modules if specified.

Properties

`torch.sagemaker.state` holds multiple useful properties after the initialization of SMP with `torch.sagemaker.init`.

- `torch.sagemaker.state.hybrid_shard_degree` (int) – The sharded data parallelism degree, a copy from user input in the SMP configuration passed to `torch.sagemaker.init()`. To learn more, see the section called "Use the SMP v2".
- `torch.sagemaker.state.rank` (int) – The global rank for the device, in the range of `[0, world_size)`.
- `torch.sagemaker.state.rep_rank_process_group` (`torch.distributed.ProcessGroup`) – The process group including all devices with the same replication rank. Note the subtle but fundamental difference with `torch.sagemaker.state.tp_process_group`. When falling back to native PyTorch, it returns None.
- `torch.sagemaker.state.tensor_parallel_degree` (int) – The tensor parallelism degree, a copy from user input in the SMP configuration passed to `torch.sagemaker.init()`. To learn more, see the section called "Use the SMP v2".
- `torch.sagemaker.state.tp_size` (int) – An alias to `torch.sagemaker.state.tensor_parallel_degree`.
- `torch.sagemaker.state.tp_rank` (int) – The tensor parallelism rank for the device in the range of `[0, tp_size)`, determined by the tensor parallelism degree and the ranking mechanism.
- `torch.sagemaker.state.tp_process_group` (`torch.distributed.ProcessGroup`) – The tensor parallel process group including all devices with the same rank in other dimensions (for example, sharded data parallelism and replication) but unique tensor parallel ranks. When falling back to native PyTorch, it returns None.
- `torch.sagemaker.state.world_size` (int) – The total number of devices used in training.

Upgrade from SMP v1 to SMP v2

To move from SMP v1 to SMP v2, you must make script changes to remove the SMP v1 APIs and apply the SMP v2 APIs. Instead of starting from your SMP v1 script, we recommend you start from a PyTorch FSDP script, and follow the instructions at the section called "Use the SMP v2".

To bring SMP v1 *models* to SMP v2, in SMP v1 you must collect the full model state dictionary and apply the translation functions on the model state dictionary to convert it into the Hugging Face Transformers model checkpoint format. Then in SMP v2, as discussed in the section called "Checkpointing using SMP", you can load the Hugging Face Transformers model checkpoints, and then continue with using the PyTorch checkpoint APIs with SMP v2. To use SMP with your PyTorch FSDP model, make sure that you move to SMP v2 and make changes to your training script to use PyTorch FSDP and other latest features.

```
import smdistributed.modelparallel.torch as smp

# Create model
model = ...
model = smp.DistributedModel(model)

# Run training
...

# Save v1 full checkpoint
if smp.rdp_rank() == 0:
    model_dict = model.state_dict(gather_to_rank0=True) # save the full model
    # Get the corresponding translation function in smp v1 and translate
    if model_type == "gpt_neox":
        from smdistributed.modelparallel.torch.nn.huggingface.gptneox import
 translate_state_dict_to_hf_gptneox
        translated_state_dict = translate_state_dict_to_hf_gptneox(state_dict,
 max_seq_len=None)

    # Save the checkpoint
    checkpoint_path = "checkpoint.pt"
    if smp.rank() == 0:
        smp.save(
            {"model_state_dict": translated_state_dict},
            checkpoint_path,
            partial=False,
        )
```

To find available translation functions in SMP v1, see the section called "Support for Hugging Face Transformer Models".

For instruction on model checkpoints saving and loading in SMP v2, see the section called "Checkpointing using SMP".

Release notes for the SageMaker model parallelism library

See the following release notes to track the latest updates for the SageMaker model parallelism (SMP) library. If you have further questions about the SMP library, contact the SMP service team at `sm-model-parallel-feedback@amazon.com`.

The SageMaker model parallelism library v2.8.0

Date: April 01, 2025

SMP library updates

Bug fixes

- SMP gradient norm clipping now supports activation offloading.

SMP Docker and Enroot containers

The SMP library team distributes Docker containers in replacement of the SageMaker PyTorch framework containers. If you use the PyTorch ModelTrainer class in the SageMaker Python SDK and specify distribution configuration to use SMP v2, SageMaker AI automatically picks up the SMP Docker containers. To use this release of SMP v2, upgrade your SageMaker Python SDK to `v2.243.0` or later.

Currency updates

- Added support for PyTorch v2.5.1
- Upgraded CUDA support to v12.4
- Upgraded NCCL support to v2.23.4
- Upgraded SMDDP library to 2.6.0

Container details

- SMP Docker container for PyTorch v2.5.1 with CUDA v12.4

```
658645717510.dkr.ecr.<us-west-2>.amazonaws.com/smdistributed-modelparallel:2.5.1-gpu-py311-cu124
```

- SMP Enroot container for PyTorch v2.5.1 with CUDA v12.4

```
https://sagemaker-distributed-model-parallel.s3.<us-west-2>.amazonaws.com/
enroot/2.5.1-gpu-py311-cu124.sqsh
```

- Pre-installed packages
  - The SMP library v2.8.0
  - The SMDDP library v2.6.0
  - CUDNN v9.4.0
  - FlashAttention v2.5.8
  - TransformerEngine v1.10
  - Megatron v0.8.0
  - Hugging Face Transformers v4.44.2
  - Hugging Face Datasets library v2.19.0
  - EFA v1.36.0
  - NCCL v2.23.4
  - AWS-OFI-NCCL v1.13.2

SMP Conda channel

The following S3 bucket is the public Conda channel of the SMP library hosted by the SMP service team. If you want to install the SMP v2 library in an environment such as SageMaker HyperPod clusters, use this Conda channel to properly install the SMP library.

- `https://sagemaker-distributed-model-parallel.s3.us-west-2.amazonaws.com/smp-v2/`

For more information about Conda channels in general, see Channels in the *Conda documentation*.

The SageMaker model parallelism library v2.7.0

Date: December 04, 2024

SMP library updates

New features

- Added support for the section called "HyperPod recipes".

SMP Docker and Enroot containers

The SMP library team distributes Docker and Enroot containers in replacement of the SageMaker PyTorch framework containers. If you use the PyTorch ModelTrainer class in the SageMaker Python SDK and specify distribution configuration to use SMP v2, SageMaker automatically picks up the SMP Docker containers. To use this release of SMP v2, upgrade your SageMaker Python SDK to `v2.237.0` or later.

Container details

- SMP Docker container for PyTorch v2.4.1 with CUDA v12.1

```
658645717510.dkr.ecr.<us-west-2>.smdistributed-modelparallel:2.4.1-gpu-py311-cu121
```

- SMP Enroot container for PyTorch v2.4.1 with CUDA v12.1

```
https://sagemaker-distributed-model-parallel.s3.<us-west-2>.amazonaws.com/
enroot/2.4.1-gpu-py311-cu121.sqsh
```

- Pre-installed packages
  - The SMP library v2.7.0
  - The SMDDP library v2.5.0
  - CUDNN v9.4.0
  - FlashAttention v2.5.8
  - TransformerEngine v1.10
  - Megatron v0.8.0
  - Hugging Face Transformers v4.44.2
  - Hugging Face Datasets library v2.19.0
  - EFA v1.32.0
  - NCCL v2.21.5

SMP Conda channel

The following S3 bucket is the public Conda channel of the SMP library hosted by the SMP service team. If you want to install the SMP v2 library in a Conda environment such as SageMaker HyperPod clusters, use this Conda channel to properly install the SMP library.

- `https://sagemaker-distributed-model-parallel.s3.us-west-2.amazonaws.com/smp-v2/`

For more information about Conda channels in general, see Channels in the *Conda documentation*.

The SageMaker model parallelism library v2.6.1

Date: October 31, 2024

SMP library updates

Bug fixes

- Fixed an `ImportError` issue that occurred when using older training scripts with SMP v2.6.0. This fixes the backward incompatibility with SMP v2.6.0.
- Added a `DeprecationWarning` for `torch.sagemaker.distributed.fsdp.checkpoint`. This module will be deprecated and removed in SMP v2.7.0. If you're currently using `torch.sagemaker.distributed.fsdp.checkpoint` in your code, you should plan to update your scripts before the release of SMP v2.7.0 to avoid issues in the future.
- Fixed a backward compatibility issue identified in SMP v2.6.0. This issue was related to the deprecation of the `USE_PG_WITH_UTIL` checkpoint method in SMP v2.6.0, which broke backward compatibility with previous versions of training scripts. To resolve this issue, re-run your PyTorch training jobs to pick up the latest SMP container packaged with SMP v2.6.1.

SMP Docker container

The SMP library team distributes Docker containers in replacement of the SageMaker PyTorch framework containers. If you use the PyTorch ModelTrainer class in the SageMaker Python SDK and specify distribution configuration to use SMP v2, SageMaker AI automatically picks up the SMP Docker containers.

Container details

- SMP Docker container for PyTorch v2.4.1 with CUDA v12.1

```
658645717510.dkr.ecr.<us-west-2>.amazonaws.com/smdistributed-modelparallel:2.4.1-gpu-py311-cu121
```

- Pre-installed packages

- The SMP library v2.6.1
- The SMDDP library v2.5.0
- CUDNN v9.4.0
- FlashAttention v2.5.8
- TransformerEngine v1.10
- Megatron v0.8.0
- Hugging Face Transformers v4.44.2
- Hugging Face Datasets library v2.19.0
- EFA v1.32.0
- NCCL v2.21.5

SMP Conda channel

The following S3 bucket is the public Conda channel of the SMP library hosted by the SMP service team. If you want to install the SMP v2 library in an environment of highly customizable compute resources such as SageMaker HyperPod clusters, use this Conda channel to properly install the SMP library.

- `https://sagemaker-distributed-model-parallel.s3.us-west-2.amazonaws.com/smp-v2/`

For more information about Conda channels in general, see Channels in the *Conda documentation*.

The SageMaker model parallelism library v2.6.0

Date: October 17, 2024

SMP library updates

New features

- Added support for the following LLM model configurations. You can start using the section called "Context parallelism" and the section called "Tensor parallelism".
  - Llama3.1 8B
  - Llama3.1 70B
  - Mistral 7B

- Added the section called "Tensor parallelism" support for the following Mixtral model configurations.
  - Mixtral 8x7B
  - Mixtral 8x22B
- Added support for an AllGather-based context parallelism implementation that utilizes the AllGather communication collective to obtain the full sequence of key-and-value tensors. Available implementations are `p2p` and `all_gather`. The `p2p` implementation utilizes peer-to-peer send-receive calls for key-and-value (KV) tensor accumulation during the attention computation, running asynchronously and allowing communication to overlap with computation. On the other hand, the `all_gather` implementation employs the `AllGather` communication collective operation for KV tensor accumulation. To learn how to apply these context parallelism implementation, see the section called "Context parallelism".
- Added support for tuning the Rotary Position Embedding (RoPE) theta value.

Bug fixes

- Fixed a bug where Rotary Position Embedding (RoPE) isn't properly initialized during pre-training when delayed parameter is enabled.

Known issues

- Transformer Engine does not currently support context parallelism or FP8 with sliding window attention enabled. Thus, the SMP version of Mistral transformers don't support context parallelism or FP8 training when sliding window configuration is set to a non-null value.

SMP Docker container

The SMP library team distributes Docker containers in replacement of the SageMaker PyTorch framework containers. If you use the PyTorch ModelTrainer class in the SageMaker Python SDK and specify distribution configuration to use SMP v2, SageMaker AI automatically picks up the SMP Docker containers.

Currency updates

- Upgraded PyTorch to v2.4.1
- Upgraded Megatron to v0.8.0

- Upgraded the TransformerEngine library to v1.10
- Upgraded Transformers to v4.44.2
- Upgraded cuDNN to v9.4.0.58

Container details

- SMP Docker container for PyTorch v2.4.1 with CUDA v12.1

```
658645717510.dkr.ecr.<us-west-2>.amazonaws.com/smdistributed-modelparallel:2.4.1-gpu-py311-cu121
```

- Pre-installed packages
  - The SMP library v2.6.0
  - The SMDDP library v2.5.0
  - CUDNN v9.4.0
  - FlashAttention v2.5.8
  - TransformerEngine v1.10
  - Megatron v0.8.0
  - Hugging Face Transformers v4.44.2
  - Hugging Face Datasets library v2.19.0
  - EFA v1.32.0
  - NCCL v2.21.5

SMP Conda channel

The following S3 bucket is the public Conda channel of the SMP library hosted by the SMP service team. If you want to install the SMP v2 library in an environment of highly customizable compute resources such as SageMaker HyperPod clusters, use this Conda channel to properly install the SMP library.

- `https://sagemaker-distributed-model-parallel.s3.us-west-2.amazonaws.com/smp-v2/`

For more information about Conda channels in general, see Channels in the *Conda documentation*.

The SageMaker model parallelism library v2.5.0

Date: August 28, 2024

SMP library updates

New features

- Added support for mixed-precision training using FP8 data format on P5 instances for the Mixtral model.
  - Supported Mixtral configurations are 8x7B and 8x22B. To learn more, see the section called "Mixed precision training with FP8 on P5 instances using Transformer Engine".
- Added support for the section called "Context parallelism" for the following model configurations.
  - Llama-v2: 7B and 70B
  - Llama-v3: 8B and 70B
  - GPT-NeoX: 20B
- Added support for saving checkpoints asynchronously. To learn more, see the section called "Checkpointing using SMP".
  - Support for saving checkpoints to S3 directly without using Amazon EBS or file servers.

Bug fixes

- Resolved an issue that caused unexpectedly high initial loss during Llama fine-tuning when loading a pre-trained model checkpoint and utilizing tensor parallelism.

Notes

- To use activation checkpointing for Mixtral with FP8 mixed precision, you will need to checkpoint the attention and expert layers separately. For an example of setting it up properly, see the example training script in the *Amazon SageMaker AI Examples repository*.

Known issues

- The balanced load balancing type in the MoE configuration (the section called "`torch.sagemaker.moe.moe_config.MoEConfig`") is currently incompatible with activation checkpointing.

- With context parallelism, GPT-NeoX shows performance regression in both pre-training and fine-tuning.
- For GPT-NeoX on P4 instances, directly loading weights from a delayed parameter initialized transformed model into a Hugging Face transformer model leads to a loss mismatch on the first step.

SMP Docker container

The SMP library team distributes Docker containers in replacement of the SageMaker PyTorch framework containers. If you use the PyTorch ModelTrainer class in the SageMaker Python SDK and specify distribution configuration to use SMP v2, SageMaker AI automatically picks up the SMP Docker containers. To use this release of SMP v2, upgrade your SageMaker Python SDK to v2.224.0 or later.

Currency updates

- Upgraded the FlashAttention library to v2.5.8
- Upgraded the Transformer Engine library to v1.8
  - If you want to install Transformer Engine in a Conda environment, you need to build from the source and cherry-pick the specific upstream fixes (744624d, 27c6342, 7669bf3).

Container details

- SMP Docker container for PyTorch v2.3.1 with CUDA v12.1

  ```
  658645717510.dkr.ecr.<region>.amazonaws.com/smdistributed-modelparallel:2.3.1-gpu-py311-cu121
  ```

  For a complete list of supported regions, see the section called “Amazon Web Services Regions”.
- Pre-installed packages
  - The SMP library v2.5.0
  - The SMDDP library v2.3.0
  - CUDNN v8.9.7.29
  - FlashAttention v2.5.8
  - TransformerEngine v1.8
  - Megatron v0.7.0

- Hugging Face Transformers v4.40.1
- Hugging Face Datasets library v2.19.0
- EFA v1.32.0
- NCCL v2.21.5

SMP Conda channel

The following S3 bucket is the public Conda channel of the SMP library hosted by the SMP service team. If you want to install the SMP v2 library in an environment of highly customizable compute resources such as SageMaker HyperPod clusters, use this Conda channel to properly install the SMP library.

- `https://sagemaker-distributed-model-parallel.s3.us-west-2.amazonaws.com/smp-v2/`

For more information about Conda channels in general, see Channels in the *Conda documentation*.

The SageMaker model parallelism library v2.4.0

Date: June 20, 2024

SMP library updates

Bug fixes

- Fixed a bug that causes incorrect logit shapes when labels are not passed in the forward pass while using the SMP Transformer.

Currency updates

- Added support for PyTorch v2.3.1.
- Added support for Python v3.11.
- Added support for the Hugging Face Transformers library v4.40.1.

Deprecations

- Discontinued support for Python v3.10.

- Discontinued support for the Hugging Face Transformers library versions before v4.40.1.

Other changes

- Included a patch to toggle saving de-duplicated tensors on different ranks. To learn more, see the discussion threadin the PyTorch GitHub repository.

Known issues

- There is a known issue that the loss might spike and then resume at a higher loss value while fine-tuning Llama-3 70B with tensor parallelism.

SMP Docker container

The SMP library team distributes Docker containers in replacement of the SageMaker PyTorch framework containers. If you use the PyTorch ModelTrainer class in the SageMaker Python SDK and specify distribution configuration to use SMP v2, SageMaker AI automatically picks up the SMP Docker containers. To use this release of SMP v2, upgrade your SageMaker Python SDK to v2.224.0 or later.

Currency updates

- Upgraded the SMDDP library to v2.3.0.
- Upgraded the NCCL library to v2.21.5.
- Upgraded the EFA software to v1.32.0.

Deprecations

- Discontinued the installation of the Torch Distributed Experimental (torchdistX) library.

Container details

- SMP Docker container for PyTorch v2.3.1 with CUDA v12.1

```
658645717510.dkr.ecr.us-west-2.amazonaws.com/smdistributed-modelparallel:2.3.1-gpu-
py311-cu121
```

- Pre-installed packages

- The SMP library v2.4.0
- The SMDDP library v2.3.0
- CUDNN v8.9.7.29
- FlashAttention v2.3.3
- TransformerEngine v1.2.1
- Hugging Face Transformers v4.40.1
- Hugging Face Datasets library v2.19.0
- EFA v1.32.0
- NCCL v2.21.5

SMP Conda channel

The following S3 bucket is the public Conda channel of the SMP library hosted by the SMP service team. If you want to install the SMP v2 library in an environment of highly customizable compute resources such as SageMaker HyperPod clusters, use this Conda channel to properly install the SMP library.

- `https://sagemaker-distributed-model-parallel.s3.us-west-2.amazonaws.com/smp-v2/`

For more information about Conda channels in general, see Channels in the *Conda documentation*.

The SageMaker model parallelism library v2.3.1

Date: May 9, 2024

Bug fixes

- Fixed an `ImportError` issue when using `moe_load_balancing=balanced` in the section called "`torch.sagemaker.moe.moe_config.MoEConfig`" for expert parallelism.
- Fixed a fine-tuning issue where the the section called "`torch.sagemaker.transform`" call raised `KeyError` when `load_state_dict_from_rank0` is enabled.
- Fixed an out-of-memory (OOM) error raised when loading large Mixture of Experts (MoE) models, such as Mixtral 8x22B, for fine-tuning.

SMP Docker container

The SMP library team distributes Docker containers in replacement of the SageMaker PyTorch framework containers. This release incorporates the aforementioned bug fixes into the following SMP Docker image.

- SMP Docker container for PyTorch v2.2.0 with CUDA v12.1

```
658645717510.dkr.ecr.us-west-2.amazonaws.com/smdistributed-modelparallel:2.2.0-gpu-py310-cu121
```

The SageMaker model parallelism library v2.3.0

Date: April 11, 2024

New features

- Added a new core feature, *expert parallelism*, to support Mixture of Experts transformer models. To learn more, see the section called "Expert parallelism".

SMP Docker container

The SMP library team distributes Docker containers in replacement of the SageMaker PyTorch framework containers. If you use the PyTorch ModelTrainer class in the SageMaker Python SDK and specify distribution configuration to use SMP v2, SageMaker automatically picks up the SMP Docker containers. To use this release of SMP v2, upgrade your SageMaker Python SDK to v2.214.4 or later.

- SMP Docker container for PyTorch v2.2.0 with CUDA v12.1

```
658645717510.dkr.ecr.us-west-2.amazonaws.com/smdistributed-modelparallel:2.2.0-gpu-py310-cu121
```

  - Pre-installed packages in this Docker container
    - The SMDDP library v2.2.0
    - CUDNN v8.9.5.29
    - FlashAttention v2.3.3
    - TransformerEngine v1.2.1
    - Hugging Face Transformers v4.37.1

- Hugging Face Datasets library v2.16.1
- Megatron-core 0.5.0
- EFA v1.30.0
- NCCL v2.19.4

The SageMaker model parallelism library v2.2.0

Date: March 7, 2024

New Features

- Added support for FP8 training of the following Hugging Face transformer models on P5 instances with Transformer Engine integration:
  - GPT-NeoX
  - Llama 2

Bug Fixes

- Fixed a bug where tensors were not guaranteed to be contiguous before the `AllGather` collective call during tensor parallelism training.

Currency Updates

- Added support for PyTorch v2.2.0.
- Upgraded the SMDDP library to v2.2.0.
- Upgraded the FlashAttention library to v2.3.3.
- Upgraded the NCCL library to v2.19.4.

Deprecation

- Discontinued support for Transformer Engine versions before v1.2.0.

Known issues

- The SMP the section called “Activation offloading” feature currently does not work. Use the native PyTorch activation offloading instead.

Other changes

- Included a patch to fix the performance regression discussed in the issue thread at https://github.com/pytorch/pytorch/issues/117748 in the PyTorch GitHub repository.

SMP Docker container

The SMP library team distributes Docker containers in replacement of the SageMaker PyTorch framework containers. If you use the PyTorch ModelTrainer class in the SageMaker Python SDK and specify distribution configuration to use SMP v2, SageMaker AI automatically picks up the SMP Docker containers. To use this release of SMP v2, upgrade your SageMaker Python SDK to v2.212.0 or later.

- SMP Docker container for PyTorch v2.2.0 with CUDA v12.1

```
658645717510.dkr.ecr.us-west-2.amazonaws.com/smdistributed-modelparallel:2.2.0-gpu-py310-cu121
```

  - Available for P4d, P4de, and P5 instances
  - Pre-installed packages in this Docker container
    - The SMDDP library v2.2.0
    - CUDNN v8.9.5.29
    - FlashAttention v2.3.3
    - TransformerEngine v1.2.1
    - Hugging Face Transformers v4.37.1
    - Hugging Face Datasets library v2.16.1
    - EFA v1.30.0
    - NCCL v2.19.4

The SageMaker model parallelism library v2.1.0

Date: February 6, 2024

Currency Updates

- Added support for PyTorch v2.1.2.

Deprecation

- Discontinued support for Hugging Face Transformers v4.31.0.

Known issues

- An issue is discovered that fine-tuning of the Hugging Face Llama 2 model with `attn_implementation=flash_attention_2` and FSDP causes the model to diverge. For reference, see the issue ticket in the *Hugging Face Transformers GitHub repository*. To avoid the divergence issue, use `attn_implementation=sdpa`. Alternatively, use the SMP transformer model implementation by setting up `use_smp_implementation=True`.

SMP Docker container

The SMP library team distributes Docker containers in replacement of the SageMaker PyTorch framework containers. If you use the PyTorch ModelTrainer class in the SageMaker Python SDK and specify distribution configuration to use SMP v2, SageMaker automatically picks up the SMP Docker containers. To use this release of SMP v2, upgrade your SageMaker Python SDK to v2.207.0 or later.

- SMP Docker container for PyTorch v2.1.2 with CUDA v12.1

```
658645717510.dkr.ecr.us-west-2.amazonaws.com/smdistributed-modelparallel:2.1.2-gpu-
py310-cu121
```

  - Available for P4d, P4de, and P5 instances
  - Pre-installed packages in this Docker container
    - The SMDDP library v2.1.0
    - CUDNN v8.9.5.29
    - FlashAttention v2.3.3
    - TransformerEngine v1.2.1
    - Hugging Face Transformers v4.37.1
    - Hugging Face Datasets library v2.16.1
    - EFA v1.30.0

SMP Conda channel

The following S3 bucket is a public Conda channel hosted by the SMP service team. If you want to install the SMP v2 library in an environment of highly customizable compute resources such as SageMaker HyperPod clusters, use this Conda channel to properly install the SMP library.

- `https://sagemaker-distributed-model-parallel.s3.us-west-2.amazonaws.com/smp-v2/`

For more information about Conda channels in general, see Channels in the *Conda documentation*.

The SageMaker model parallelism library v2.0.0

Date: December 19, 2023

New features

Released the SageMaker model parallelism (SMP) library v2.0.0 with the following new offerings.

- A new `torch.sagemaker` package, entirely revamped from the previous `smdistributed.modelparallel.torch` package in SMP v1.x.
- Support for PyTorch 2.0.1.
- Support for PyTorch FSDP.
- Tensor parallelism implementation by integrating with the Transformer Engine library.
- Support for both SageMaker Training and SageMaker HyperPod.

Breaking changes

- SMP v2 revamped the APIs entirely and provides the `torch.sagemaker` package. Mostly, you only need to initialize with the `torch.sagemaker.init()` module and pass model parallel configuration parameters. With this new package, you can significantly simplify code modifications in your training script. To learn more about adapting your training script to use SMP v2, see the section called “Use the SMP v2”.
- If you've used SMP v1 for training Hugging Face Transformer models and want to reuse the models in SMP v2, see the section called “Upgrade from SMP v1 to SMP v2”.
- For PyTorch FSDP training, you should use SMP v2.

Known issues

- Activation checkpointing currently only works with the following wrapping policies with FSDP.
  - `auto_wrap_policy = functools.partial(transformer_auto_wrap_policy, ...)`
- To use the section called "Activation offloading", FSDP activation checkpointing type must be REENTRANT.
- When running with tensor parallel enabled with the sharded data parallel degree set to 1, you must use `backend = nccl`. The `smddp` backend option is not supported in this scenario.
- Transformer Engine is required to use PyTorch with the SMP library even when not using tensor parallelism.

Other changes

- Starting from this release, the documentation for the SageMaker model parallelism library is fully available in this *Amazon SageMaker AI Developer Guide*. In favor of this complete developer guide for SMP v2 in the *Amazon SageMaker AI Developer Guide*, the additional reference for SMP v1.x in the *SageMaker Python SDK documentation* is deprecated. If you still need the documentation for SMP v1.x, the developer guide for SMP v1.x is available at the section called "(Archived) SageMaker model parallelism library v1.x", and the SMP Python library v1.x reference is available in the SageMaker Python SDK v2.199.0 documentation.

Deprecations

- Discontinued support for TensorFlow.
- There is no pipeline parallelism support in SMP v2.
- There is no support for the DeepSpeed library in favor of native PyTorch FSDP.

SMP Docker container

The SMP library team distributes Docker containers in replacement of the SageMaker PyTorch framework containers. If you use the PyTorch ModelTrainer class in the SageMaker Python SDK and specify distribution configuration to use SMP v2, SageMaker AI automatically picks up the SMP Docker containers. To use this release of SMP v2, upgrade your SageMaker Python SDK to v2.207.0 or later.

- SMP Docker container for PyTorch v2.0.1 with CUDA v12.1

```
658645717510.dkr.ecr.us-west-2.amazonaws.com/smdistributed-modelparallel:2.0.1-gpu-
py310-cu121
```

(Archived) SageMaker model parallelism library v1.x

> **Important**
>
> As of December 19, 2023, the SageMaker model parallelism (SMP) library v2 is released. In favor of the SMP library v2, the SMP v1 capabilites are no longer supported in future releases. The following section and topics are archived and specific to using the SMP library v1. For information about using the SMP library v2, see the section called "SageMaker model parallelism library v2".

Use Amazon SageMaker AI's model parallel library to train large deep learning (DL) models that are difficult to train due to GPU memory limitations. The library automatically and efficiently splits a model across multiple GPUs and instances. Using the library, you can achieve a target prediction accuracy faster by efficiently training larger DL models with billions or trillions of parameters.

You can use the library to automatically partition your own TensorFlow and PyTorch models across multiple GPUs and multiple nodes with minimal code changes. You can access the library's API through the SageMaker Python SDK.

Use the following sections to learn more about model parallelism and the SageMaker model parallel library. This library's API documentation is located at Distributed Training APIs in the *SageMaker Python SDK v2.199.0 documentation*.

Introduction to Model Parallelism

Model parallelism is a distributed training method in which the deep learning model is partitioned across multiple devices, within or across instances. This introduction page provides a high-level overview about model parallelism, a description of how it can help overcome issues that arise when training DL models that are typically very large in size, and examples of what the SageMaker model parallel library offers to help manage model parallel strategies as well as memory consumption.

What is Model Parallelism?

Increasing the size of deep learning models (layers and parameters) yields better accuracy for complex tasks such as computer vision and natural language processing. However, there is a limit to the maximum model size you can fit in the memory of a single GPU. When training DL models, GPU memory limitations can be bottlenecks in the following ways:

- They limit the size of the model you can train, since the memory footprint of a model scales proportionally to the number of parameters.
- They limit the per-GPU batch size during training, driving down GPU utilization and training efficiency.

To overcome the limitations associated with training a model on a single GPU, SageMaker provides the model parallel library to help distribute and train DL models efficiently on multiple compute nodes. Furthermore, with the library, you can achieve most optimized distributed training using EFA-supported devices, which enhance the performance of inter-node communication with low latency, high throughput, and OS bypass.

Estimate Memory Requirements Before Using Model Parallelism

Before you use the SageMaker model parallel library, consider the following to get a sense of the memory requirements of training large DL models.

For a training job that uses AMP (FP16) and Adam optimizers, the required GPU memory per parameter is about 20 bytes, which we can break down as follows:

- An FP16 parameter ~ 2 bytes

- An FP16 gradient ~ 2 bytes
- An FP32 optimizer state ~ 8 bytes based on the Adam optimizers
- An FP32 copy of parameter ~ 4 bytes (needed for the `optimizer apply` (OA) operation)
- An FP32 copy of gradient ~ 4 bytes (needed for the OA operation)

Even for a relatively small DL model with 10 billion parameters, it can require at least 200GB of memory, which is much larger than the typical GPU memory (for example, NVIDIA A100 with 40GB/80GB memory and V100 with 16/32 GB) available on a single GPU. Note that on top of the memory requirements for model and optimizer states, there are other memory consumers such as activations generated in the forward pass. The memory required can be a lot greater than 200GB.

For distributed training, we recommend that you use Amazon EC2 P3 and P4 instances that have NVIDIA V100 and A100 Tensor Core GPUs respectively. For more details about specifications such as CPU cores, RAM, attached storage volume, and network bandwidth, see the *Accelerated Computing* section in the Amazon EC2 Instance Types page.

Even with the accelerated computing instances, it is obvious that models with about 10 billion parameters such as Megatron-LM and T5 and even larger models with hundreds of billions of parameters such as GPT-3 cannot fit model replicas in each GPU device.

How the Library Employs Model Parallelism and Memory Saving Techniques

The library consists of various types of model parallelism features and memory-saving features such as optimizer state sharding, activation checkpointing, and activation offloading. All these techniques can be combined to efficiently train large models that consist of hundreds of billions of parameters.

Topics

- Sharded data parallelism (available for PyTorch)
- Pipeline parallelism (available for PyTorch and TensorFlow)
- Tensor parallelism (available for PyTorch)
- Optimizer state sharding (available for PyTorch)
- Activation offloading and checkpointing (available for PyTorch)
- Choosing the right techniques for your model

Sharded data parallelism (available for PyTorch)

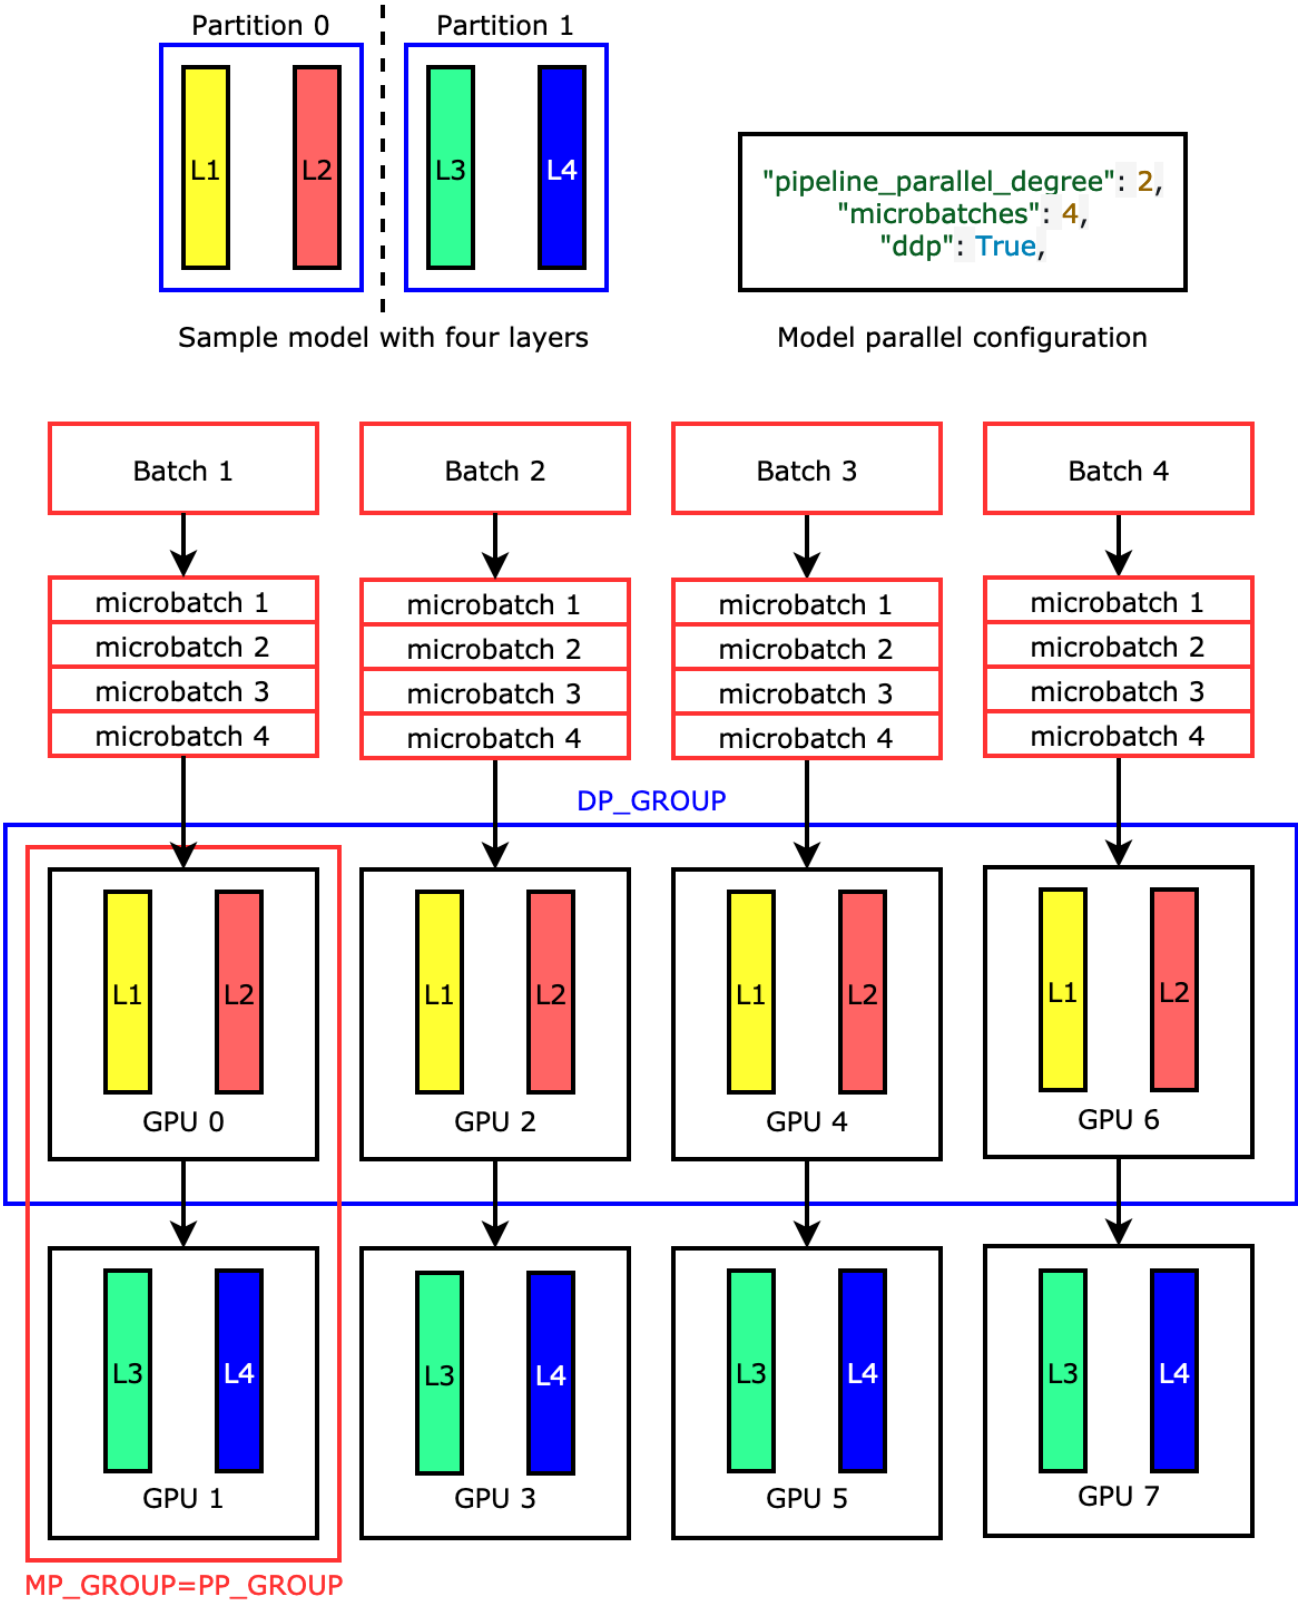
Sharded data parallelism is a memory-saving distributed training technique that splits the state of a model (model parameters, gradients, and optimizer states) across GPUs within a data-parallel group.

SageMaker AI implements sharded data parallelism through the implementation of MiCS, which is a library that **mi**nimizes **c**ommunication **s**cale and discussed in the blog post Near-linear scaling of gigantic-model training on Amazon.

You can apply sharded data parallelism to your model as a stand-alone strategy. Furthermore, if you are using the most performant GPU instances equipped with NVIDIA A100 Tensor Core GPUs, `ml.p4d.24xlarge`, you can take the advantage of improved training speed from the `AllGather` operation offered by SMDDP Collectives.

To dive deep into sharded data parallelism and learn how to set it up or use a combination of sharded data parallelism with other techniques like tensor parallelism and FP16 training, see the section called "Sharded Data Parallelism".

Pipeline parallelism (available for PyTorch and TensorFlow)



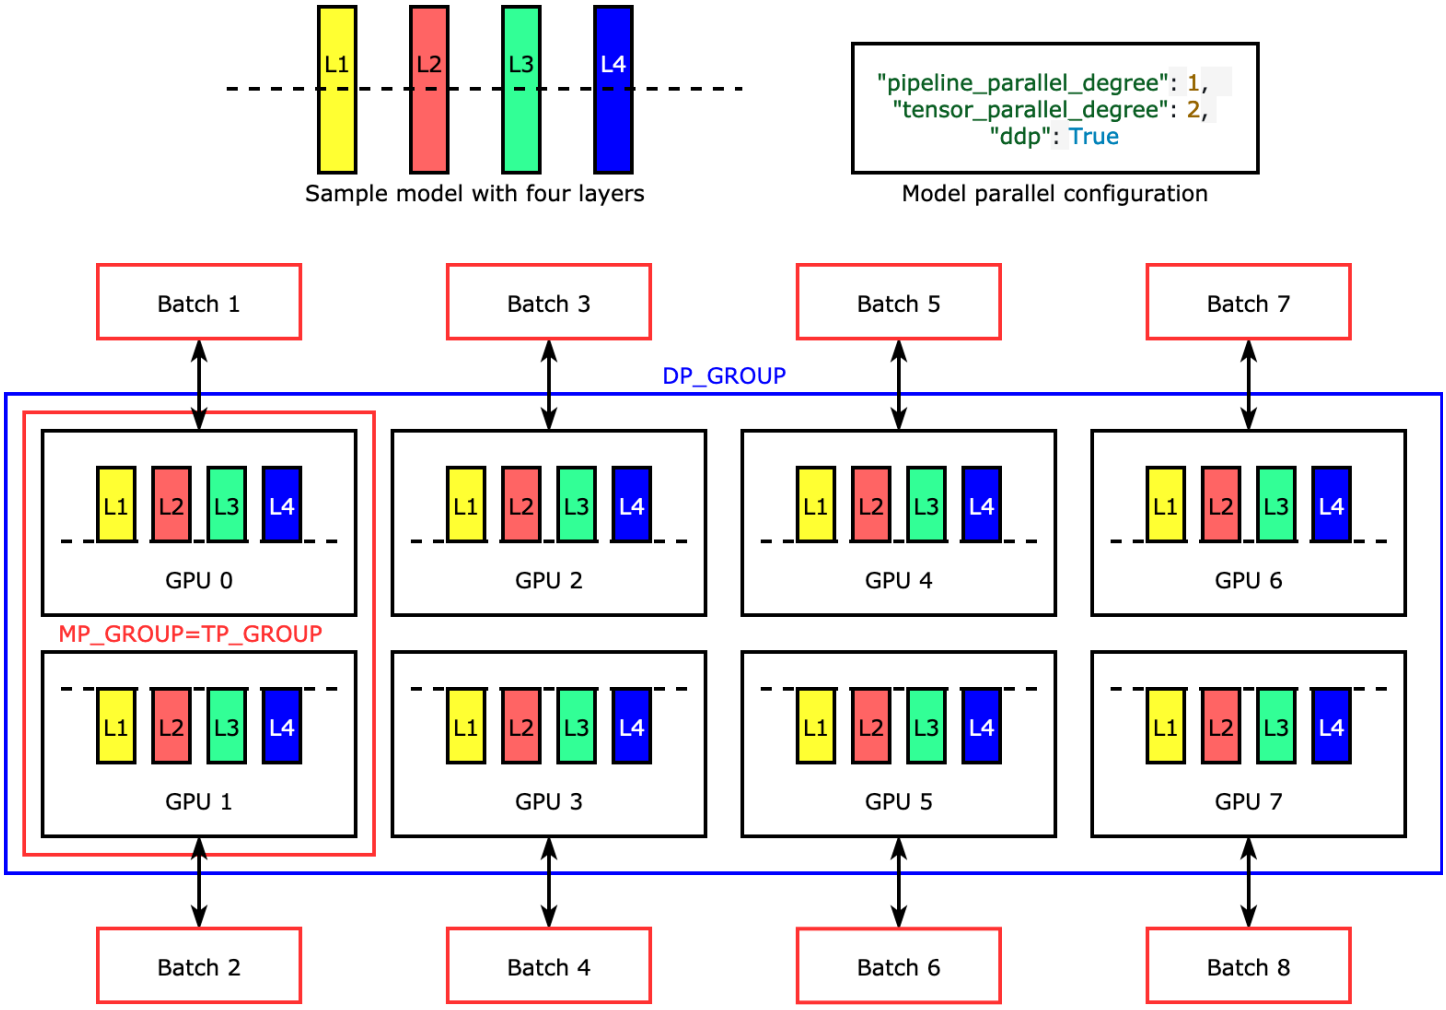
Pipeline parallelism partitions the set of layers or operations across the set of devices, leaving each operation intact. When you specify a value for the number of model partitions (`pipeline_parallel_degree`), the total number of GPUs (`processes_per_host`) must be divisible by the number of the model partitions. To set this up properly, you have to specify the correct values for the `pipeline_parallel_degree` and `processes_per_host` parameters. The simple math is as follows:

```
(pipeline_parallel_degree) x (data_parallel_degree) = processes_per_host
```

The library takes care of calculating the number of model replicas (also called `data_parallel_degree`) given the two input parameters you provide.

For example, if you set `"pipeline_parallel_degree": 2` and `"processes_per_host": 8` to use an ML instance with eight GPU workers such as `ml.p3.16xlarge`, the library automatically sets up the distributed model across the GPUs and four-way data parallelism. The following image illustrates how a model is distributed across the eight GPUs achieving four-way data parallelism and two-way pipeline parallelism. Each model replica, where we define it as a *pipeline parallel group* and label it as PP_GROUP, is partitioned across two GPUs. Each partition of the model is assigned to four GPUs, where the four partition replicas are in a *data parallel group* and labeled as

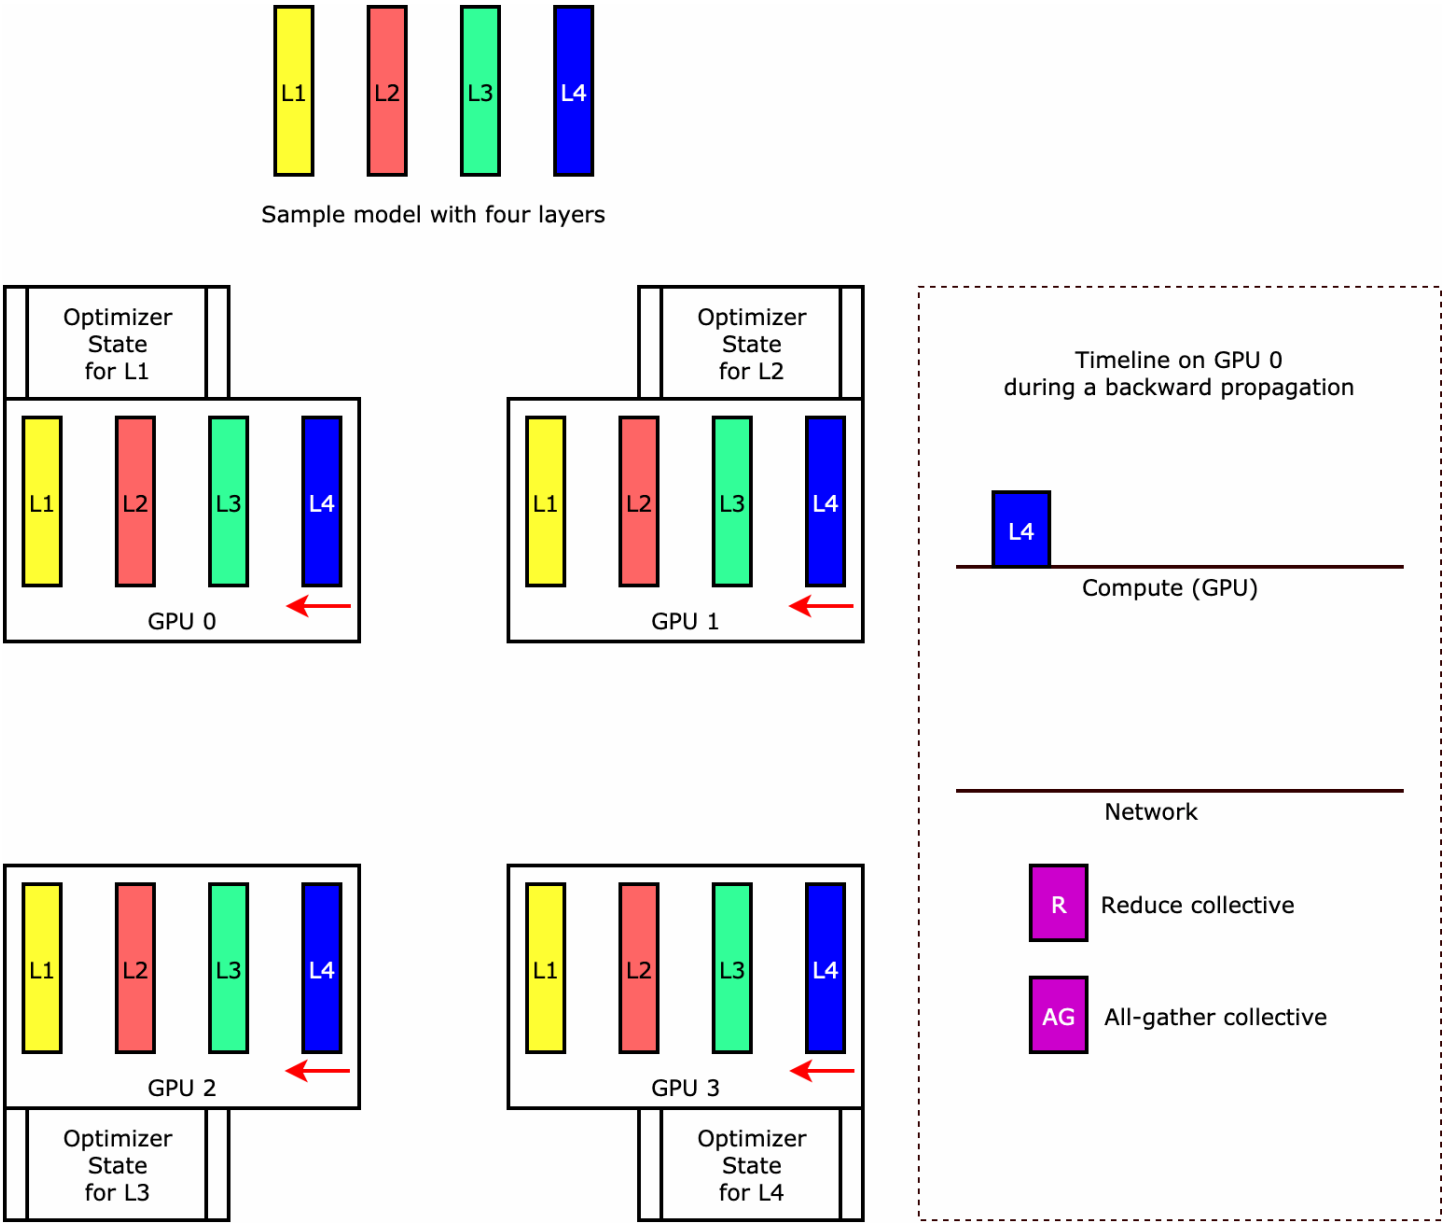
DP_GROUP. Without tensor parallelism, the pipeline parallel group is essentially the model parallel group.



To dive deep into pipeline parallelism, see Core Features of the SageMaker Model Parallelism Library.

To get started with running your model using pipeline parallelism, see Run a SageMaker Distributed Training Job with the SageMaker Model Parallel Library.

Tensor parallelism (available for PyTorch)



Tensor parallelism splits individual layers, or nn.Modules, across devices, to be run in parallel. The following figure shows the simplest example of how the library splits a model with four layers to achieve two-way tensor parallelism (`"tensor_parallel_degree": 2`). The layers of each model replica are bisected and distributed into two GPUs. In this example case, the model parallel configuration also includes `"pipeline_parallel_degree": 1` and `"ddp": True` (uses PyTorch DistributedDataParallel package in the background), so the degree of data parallelism becomes eight. The library manages communication across the tensor-distributed model replicas.

The usefulness of this feature is in the fact that you can select specific layers or a subset of layers to apply tensor parallelism. To dive deep into tensor parallelism and other memory-saving features for PyTorch, and to learn how to set a combination of pipeline and tensor parallelism, see Tensor Parallelism.

Optimizer state sharding (available for PyTorch)

To understand how the library performs *optimizer state sharding*, consider a simple example model with four layers. The key idea in optimizing state sharding is you don't need to replicate your optimizer state in all of your GPUs. Instead, a single replica of the optimizer state is sharded across data-parallel ranks, with no redundancy across devices. For example, GPU 0 holds the optimizer state for layer one, the next GPU 1 holds the optimizer state for L2, and so on. The following animated figure shows a backward propagation with the optimizer state sharding technique. At the end of the backward propagation, there's compute and network time for the `optimizer apply` (OA) operation to update optimizer states and the `all-gather` (AG) operation to update the model parameters for the next iteration. Most importantly, the `reduce` operation can overlap with the compute on GPU 0, resulting in a more memory-efficient and faster backward propagation. In the current implementation, AG and OA operations do not overlap with `compute`. It can result in an extended computation during the AG operation, so there might be a tradeoff.

For more information about how to use this feature, see Optimizer State Sharding.

Activation offloading and checkpointing (available for PyTorch)

To save GPU memory, the library supports activation checkpointing to avoid storing internal activations in the GPU memory for user-specified modules during the forward pass. The library recomputes these activations during the backward pass. In addition, the activation offloading feature offloads the stored activations to CPU memory and fetches back to GPU during the backward pass to further reduce activation memory footprint. For more information about how to use these features, see Activation Checkpointing and Activation Offloading.

Choosing the right techniques for your model

For more information about choosing the right techniques and configurations, see SageMaker Distributed Model Parallel Best Practices and Configuration Tips and Pitfalls.

Supported Frameworks and Amazon Web Services Regions

Before using the SageMaker model parallelism library, check the supported frameworks and instance types, and determine if there are enough quotas in your Amazon account and Amazon Web Services Region.

> **Note**
>
> To check the latest updates and release notes of the library, see the SageMaker Model Parallel Release Notes in the *SageMaker Python SDK documentation*.

Supported Frameworks

The SageMaker model parallelism library supports the following deep learning frameworks and is available in Amazon Deep Learning Containers (DLC) or downloadable as a binary file.

PyTorch versions supported by SageMaker AI and the SageMaker model parallelism library

PyTorch version	SageMaker model parallelism library version	`smdistributed-modelparallel` integrated DLC image URI	URL of the binary file**
v2.0.0	`smdistributed-modelparallel==v1.15.0`	`763104351884.dkr.ecr.<region>.amazonaws.com/pytorch-training:2.0.0-gpu-py310-cu118-ubuntu20.04-sagemaker`	https://sagemaker-distributed-model-parallel.s3.us-west-2.amazonaws.com/pytorch-2.0.0/build-artifacts/2023-04-14-20-14/smdistributed_modelparallel-1.15.0-cp310-cp

Hugging Face Transformers versions supported by SageMaker AI and the SageMaker distributed data parallel library

The Amazon Deep Learning Containers for Hugging Face use the SageMaker Training Containers for PyTorch and TensorFlow as their base images. To look up the Hugging Face Transformers library

versions and paired PyTorch and TensorFlow versions, see the latest Hugging Face Containers and the Prior Hugging Face Container Versions.

Amazon Web Services Regions

The SageMaker data parallel library is available in all of the Amazon Web Services Regions where the Amazon Deep Learning Containers for SageMaker are in service. For more information, see Available Deep Learning Containers Images.

Supported Instance Types

The SageMaker model parallelism library requires one of the following ML instance types.

Instance type
ml.g4dn.12xlarge
ml.p3.16xlarge
ml.p3dn.24xlarge
ml.p4d.24xlarge
ml.p4de.24xlarge

For specs of the instance types, see the **Accelerated Computing** section in the Amazon EC2 Instance Types page. For information about instance pricing, see Amazon SageMaker AI Pricing.

If you encountered an error message similar to the following, follow the instructions at Request a service quota increase for SageMaker AI resources.

```
ResourceLimitExceeded: An error occurred (ResourceLimitExceeded) when calling
    the CreateTrainingJob operation: The account-level service limit 'ml.p3dn.24xlarge
    for training job usage' is 0 Instances, with current utilization of 0 Instances
    and a request delta of 1 Instances.
    Please contact AWS support to request an increase for this limit.
```

Core Features of the SageMaker Model Parallelism Library

Amazon SageMaker AI's model parallelism library offers distribution strategies and memory-saving techniques, such as sharded data parallelism, tensor parallelism, model partitioning by

layers for pipeline scheduling, and checkpointing. The model parallelism strategies and techniques help distribute large models across multiple devices while optimizing training speed and memory consumption. The library also provides Python helper functions, context managers, and wrapper functions to adapt your training script for automated or manual partitioning of your model.

When you implement model parallelism to your training job, you keep the same two-step workflow shown in the Run a SageMaker Distributed Training Job with Model Parallelism section. For adapting your training script, you'll add zero or few additional code lines to your training script. For launching a training job of the adapted training script, you'll need to set the distribution configuration parameters to activate the memory-saving features or to pass values for the degree of parallelism.

To get started with examples, see the following Jupyter notebooks that demonstrate how to use the SageMaker model parallelism library.

- PyTorch example notebooks
- TensorFlow example notebooks

To dive deep into the core features of the library, see the following topics.

Note

The SageMaker distributed training libraries are available through the Amazon deep learning containers for PyTorch, Hugging Face, and TensorFlow within the SageMaker Training platform. To utilize the features of the distributed training libraries, we recommend that you use the SageMaker Python SDK. You can also manually configure in JSON request syntax if you use SageMaker APIs through SDK for Python (Boto3) or Amazon Command Line Interface. Throughout the documentation, instructions and examples focus on how to use the distributed training libraries with the SageMaker Python SDK.

Important

The SageMaker model parallelism library supports all the core features for PyTorch, and supports pipeline parallelism for TensorFlow.

Topics

- Sharded Data Parallelism
- Pipelining a Model
- Tensor Parallelism
- Optimizer State Sharding
- Activation Checkpointing
- Activation Offloading
- FP16 Training with Model Parallelism
- Support for FlashAttention

Sharded Data Parallelism

Sharded data parallelism is a memory-saving distributed training technique that splits the state of a model (model parameters, gradients, and optimizer states) across GPUs in a data parallel group.

> **Note**
>
> Sharded data parallelism is available for PyTorch in the SageMaker model parallelism library v1.11.0 and later.

When scaling up your training job to a large GPU cluster, you can reduce the per-GPU memory footprint of the model by sharding the training state of the model over multiple GPUs. This returns two benefits: you can fit larger models, which would otherwise run out of memory with standard data parallelism, or you can increase the batch size using the freed-up GPU memory.

The standard data parallelism technique replicates the training states across the GPUs in the data parallel group, and performs gradient aggregation based on the `AllReduce` operation. Sharded data parallelism modifies the standard data-parallel distributed training procedure to account for the sharded nature of the optimizer states. A group of ranks over which the model and optimizer states are sharded is called a *sharding group*. The sharded data parallelism technique shards the trainable parameters of a model and corresponding gradients and optimizer states across the GPUs in the *sharding group*.

SageMaker AI achieves sharded data parallelism through the implementation of MiCS, which is discussed in the Amazon blog post Near-linear scaling of gigantic-model training on Amazon.

In this implementation, you can set the sharding degree as a configurable parameter, which must be less than the data parallelism degree. During each forward and backward pass, MiCS temporarily recombines the model parameters in all GPUs through the `AllGather` operation. After the forward or backward pass of each layer, MiCS shards the parameters again to save GPU memory. During the backward pass, MiCS reduces gradients and simultaneously shards them across GPUs through the `ReduceScatter` operation. Finally, MiCS applies the local reduced and sharded gradients to their corresponding local parameter shards, using the local shards of optimizer states. To bring down communication overhead, the SageMaker model parallelism library prefetches the upcoming layers in the forward or backward pass, and overlaps the network communication with the computation.

The training state of the model is replicated across the sharding groups. This means that before gradients are applied to the parameters, the `AllReduce` operation must take place across the sharding groups, in addition to the `ReduceScatter` operation that takes place within the sharding group.

In effect, sharded data parallelism introduces a tradeoff between the communication overhead and GPU memory efficiency. Using sharded data parallelism increases the communication cost, but the memory footprint per GPU (excluding the memory usage due to activations) is divided by the sharded data parallelism degree, thus larger models can be fit in the GPU cluster.

Selecting the degree of sharded data parallelism

When you select a value for the degree of sharded data parallelism, the value must evenly divide the degree of data parallelism. For example, for an 8-way data parallelism job, choose 2, 4, or 8 for the sharded data parallelism degree. While choosing the sharded data parallelism degree, we recommend that you start with a small number, and gradually increase it until the model fits in the memory together with the desired batch size.

Selecting the batch size

After setting up sharded data parallelism, make sure you find the most optimal training configuration that can successfully run on the GPU cluster. For training large language models (LLM), start from the batch size 1, and gradually increase it until you reach the point to receive the out-of-memory (OOM) error. If you encounter the OOM error even with the smallest batch size, apply a higher degree of sharded data parallelism or a combination of sharded data parallelism and tensor parallelism.

Topics

- How to apply sharded data parallelism to your training job
- Reference configurations

- Sharded data parallelism with tensor parallelism
- Tips and considerations for using sharded data parallelism

How to apply sharded data parallelism to your training job

To get started with sharded data parallelism, apply required modifications to your training script, and set up the SageMaker PyTorch ModelTrainer with the sharded-data-parallelism-specific parameters. Also consider to take reference values and example notebooks as a starting point.

Adapt your PyTorch training script

Follow the instructions at Step 1: Modify a PyTorch Training Script to wrap the model and optimizer objects with the `smdistributed.modelparallel.torch` wrappers of the `torch.nn.parallel` and `torch.distributed` modules.

(Optional) Additional modification to register external model parameters

If your model is built with `torch.nn.Module` and uses parameters that is not defined within the module class, you should register them to the module manually for SMP to gather the full parameters while . To register parameters to a module, use `smp.register_parameter(module, parameter)`.

```
class Module(torch.nn.Module):
    def __init__(self, *args):
        super().__init__(self, *args)
        self.layer1 = Layer1()
        self.layer2 = Layer2()
        smp.register_parameter(self, self.layer1.weight)

    def forward(self, input):
        x = self.layer1(input)
        # self.layer1.weight is required by self.layer2.forward
        y = self.layer2(x, self.layer1.weight)
        return y
```

Set up the SageMaker PyTorch ModelTrainer

When configuring a SageMaker PyTorch ModelTrainer in the section called "Step 2: Launch a Training Job", add the parameters for sharded data parallelism.

To turn on sharded data parallelism, add the `sharded_data_parallel_degree` parameter to the SageMaker PyTorch ModelTrainer. This parameter specifies the number of GPUs over which the training state is sharded. The value for `sharded_data_parallel_degree` must be an integer between one and the data parallelism degree and must evenly divide the data parallelism degree. Note that the library automatically detects the number of GPUs so thus the data parallel degree. The following additional parameters are available for configuring sharded data parallelism.

- `"sdp_reduce_bucket_size"` *(int, default: 5e8)* – Specifies the size of PyTorch DDP gradient buckets in number of elements of the default dtype.
- `"sdp_param_persistence_threshold"` *(int, default: 1e6)* – Specifies the size of a parameter tensor in number of elements that can persist at each GPU. Sharded data parallelism splits each parameter tensor across GPUs of a data parallel group. If the number of elements in the parameter tensor is smaller than this threshold, the parameter tensor is not split; this helps reduce communication overhead because the parameter tensor is replicated across data-parallel GPUs.
- `"sdp_max_live_parameters"` *(int, default: 1e9)* – Specifies the maximum number of parameters that can simultaneously be in a recombined training state during the forward and backward pass. Parameter fetching with the `AllGather` operation pauses when the number of active parameters reaches the given threshold. Note that increasing this parameter increases the memory footprint.
- `"sdp_hierarchical_allgather"` *(bool, default: True)* – If set to `True`, the `AllGather` operation runs hierarchically: it runs within each node first, and then runs across nodes. For multi-node distributed training jobs, the hierarchical `AllGather` operation is automatically activated.
- `"sdp_gradient_clipping"` *(float, default: 1.0)* – Specifies a threshold for gradient clipping the L2 norm of the gradients before propagating them backward through the model parameters. When sharded data parallelism is activated, gradient clipping is also activated. The default threshold is `1.0`. Adjust this parameter if you have the exploding gradients problem.

The following code shows an example of how to configure sharded data parallelism.

```
import sagemaker
```

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import SourceCode, Compute, InputData
from sagemaker.core import image_uris
from sagemaker.core.helper.session_helper import get_execution_role

smp_options = {
    "enabled": True,
    "parameters": {
        # "pipeline_parallel_degree": 1,    # Optional, default is 1
        # "tensor_parallel_degree": 1,      # Optional, default is 1
        "ddp": True,
        # parameters for sharded data parallelism
        "sharded_data_parallel_degree": 2,              # Add this to activate sharded
 data parallelism
        "sdp_reduce_bucket_size": int(5e8),             # Optional
        "sdp_param_persistence_threshold": int(1e6),    # Optional
        "sdp_max_live_parameters": int(1e9),            # Optional
        "sdp_hierarchical_allgather": True,             # Optional
        "sdp_gradient_clipping": 1.0                    # Optional
    }
}

mpi_options = {
    "enabled" : True,                      # Required
    "processes_per_host" : 8               # Required
}

# Retrieve the training image for the desired PyTorch version
training_image = image_uris.retrieve(
    framework="pytorch",
    region="us-west-2",
    version='1.13.1',
    py_version='py3',
    instance_type='ml.p3.16xlarge',
    image_scope="training"
)

smp_model_trainer = ModelTrainer(
    training_image=training_image,
    source_code=SourceCode(entry_script="your_training_script.py"),
    role=get_execution_role(),
    compute=Compute(
        instance_type='ml.p3.16xlarge',
        instance_count=1
```

```
    ),
    distribution={
        "smdistributed": {"modelparallel": smp_options},
        "mpi": mpi_options
    },
    base_job_name="sharded-data-parallel-job"
)

smp_model_trainer.train(input_data_config=[
    InputData(channel_name="training", data_source='s3://my_bucket/my_training_data/')
])
```

Reference configurations

The SageMaker distributed training team provides the following reference configurations that you can use as a starting point. You can extrapolate from the following configurations to experiment and estimate the GPU memory usage for your model configuration.

Sharded data parallelism with SMDDP Collectives

Model/the number of parameters	Num instances	Instance type	Sequence length	Global batch size	Mini batch size	Sharded data parallel degree
GPT-NEOX-20B	2	ml.p4d.24xlarge	2048	64	4	16
GPT-NEOX-20B	8	ml.p4d.24xlarge	2048	768	12	32

For example, if you increase the sequence length for a 20-billion-parameter model or increase the size of the model to 65 billion parameters, you need to try reducing the batch size first. If the model still doesn't fit with the smallest batch size (the batch size of 1), try increasing the degree of model parallelism.

Sharded data parallelism with tensor parallelism and NCCL Collectives

Model/ the number of parameters	Num instances	Instance type	Sequence length	Global batch size	Mini batch size	Sharded data parallel degree	Tensor parallel degree	Activation offloading
GPT-NEOX-65B	64	ml.p4d.24xlarge	2048	512	8	16	8	Y
GPT-NEOX-65B	64	ml.p4d.24xlarge	4096	512	2	64	2	Y

The combined usage of sharded data parallelism and tensor parallelism is useful when you want to fit a large language model (LLM) into a large-scale cluster while using text data with a longer sequence length, which leads to use a smaller batch size, and consequently handling the GPU memory usage to train LLMs against longer text sequences. To learn more, see the section called "Sharded data parallelism with tensor parallelism".

For case studies, benchmarks, and more configuration examples, see the blog post New performance improvements in Amazon SageMaker AI model parallel library.

Sharded data parallelism with SMDDP Collectives

The SageMaker data parallelism library offers collective communication primitives (SMDDP collectives) optimized for the Amazon infrastructure. It achieves optimization by adopting an all-to-all-type communication pattern by making use of Elastic Fabric Adapter (EFA), resulting in high-throughput and less latency-sensitive collectives, offloading the communication-related processing to the CPU, and freeing up GPU cycles for computation. On large clusters, SMDDP Collectives can offer improvements in distributed training performance by up to 40% compared to NCCL. For case studies and benchmark results, see the blog New performance improvements in the Amazon SageMaker AI model parallelism library.

> **Note**
>
> Sharded data parallelism with SMDDP Collectives is available in the SageMaker model parallelism library v1.13.0 and later, and the SageMaker data parallelism library v1.6.0 and later. See also Supported configurations to use sharded data parallelism with SMDDP Collectives.

In sharded data parallelism, which is a commonly used technique in large-scale distributed training, the `AllGather` collective is used to reconstitute the sharded layer parameters for forward and backward pass computations, in parallel with GPU computation. For large models, performing the `AllGather` operation efficiently is critical to avoid GPU bottleneck problems and slowing down training speed. When sharded data parallelism is activated, SMDDP Collectives drops into these performance-critical `AllGather` collectives, improving training throughput.

Train with SMDDP Collectives

When your training job has sharded data parallelism activated and meets the Supported configurations, SMDDP Collectives are automatically activated. Internally, SMDDP Collectives optimize the `AllGather` collective to be performant on the Amazon infrastructure and falls back to NCCL for all other collectives. Furthermore, under unsupported configurations, all collectives, including `AllGather`, automatically use the NCCL backend.

Since the SageMaker model parallelism library version 1.13.0, the `"ddp_dist_backend"` parameter is added to the `modelparallel` options. The default value for this configuration parameter is `"auto"`, which uses SMDDP Collectives whenever possible, and falls back to NCCL otherwise. To force the library to always use NCCL, specify `"nccl"` to the `"ddp_dist_backend"` configuration parameter.

The following code example shows how to set up a PyTorch ModelTrainer using the sharded data parallelism with the `"ddp_dist_backend"` parameter, which is set to `"auto"` by default and, therefore, optional to add.

```
import sagemaker
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import SourceCode, Compute, InputData
from sagemaker.core import image_uris
from sagemaker.core.helper.session_helper import get_execution_role

smp_options = {
```

```
    "enabled":True,
    "parameters": {
        "partitions": 1,
        "ddp": True,
        "sharded_data_parallel_degree": 64
        "bf16": True,
        "ddp_dist_backend": "auto"  # Specify "nccl" to force to use NCCL.
    }
}

mpi_options = {
    "enabled" : True,                       # Required
    "processes_per_host" : 8                # Required
}

# Retrieve the training image for the desired PyTorch version
training_image = image_uris.retrieve(
    framework="pytorch",
    region="us-west-2",
    version='1.13.1',
    py_version='py3',
    instance_type='ml.p4d.24xlarge',
    image_scope="training"
)

smd_mp_model_trainer = ModelTrainer(
    training_image=training_image,
    source_code=SourceCode(
        source_dir="location_to_your_script",
        entry_script="your_training_script.py"
    ),
    role=get_execution_role(),
    compute=Compute(
        instance_type='ml.p4d.24xlarge',
        instance_count=8
    ),
    distribution={
        "smdistributed": {"modelparallel": smp_options},
        "mpi": mpi_options
    },
    base_job_name="sharded-data-parallel-demo",
)

smd_mp_model_trainer.train(input_data_config=[
```

```
    InputData(channel_name="training", data_source='s3://my_bucket/my_training_data/')
])
```

Supported configurations

The `AllGather` operation with SMDDP Collectives are activated in training jobs when all the following configuration requirements are met.

- The sharded data parallelism degree greater than 1
- `Instance_count` greater than 1
- `Instance_type` equal to `ml.p4d.24xlarge`
- SageMaker training container for PyTorch v1.12.1 or later
- The SageMaker data parallelism library v1.6.0 or later
- The SageMaker model parallelism library v1.13.0 or later

Performance and memory tuning

SMDDP Collectives utilize additional GPU memory. There are two environment variables to configure the GPU memory usage depending on different model training use cases.

- `SMDDP_AG_SCRATCH_BUFFER_SIZE_BYTES` – During the SMDDP `AllGather` operation, the `AllGather` input buffer is copied into a temporary buffer for inter-node communication. The `SMDDP_AG_SCRATCH_BUFFER_SIZE_BYTES` variable controls the size (in bytes) of this temporary buffer. If the size of the temporary buffer is smaller than the `AllGather` input buffer size, the `AllGather` collective falls back to use NCCL.
  - Default value: 16 * 1024 * 1024 (16 MB)
  - Acceptable values: any multiple of 8192

- `SMDDP_AG_SORT_BUFFER_SIZE_BYTES` – The `SMDDP_AG_SORT_BUFFER_SIZE_BYTES` variable is to size the temporary buffer (in bytes) to hold data gathered from inter-node communication. If the size of this temporary buffer is smaller than `1/8 * sharded_data_parallel_degree * AllGather input size`, the `AllGather` collective falls back to use NCCL.
  - Default value: 128 * 1024 * 1024 (128 MB)
  - Acceptable values: any multiple of 8192

Tuning guidance on the buffer size variables

The default values for the environment variables should work well for most use cases. We recommend tuning these variables only if training runs into the out-of-memory (OOM) error.

The following list discusses some tuning tips to reduce the GPU memory footprint of SMDDP Collectives while retaining the performance gain from them.

- Tuning `SMDDP_AG_SCRATCH_BUFFER_SIZE_BYTES`
  - The `AllGather` input buffer size is smaller for smaller models. Hence, the required size for `SMDDP_AG_SCRATCH_BUFFER_SIZE_BYTES` can be smaller for models with fewer parameters.
  - The `AllGather` input buffer size decreases as `sharded_data_parallel_degree` increases, because the model gets sharded across more GPUs. Hence, the required size for `SMDDP_AG_SCRATCH_BUFFER_SIZE_BYTES` can be smaller for training jobs with large values for `sharded_data_parallel_degree`.
- Tuning `SMDDP_AG_SORT_BUFFER_SIZE_BYTES`
  - The amount of data gathered from inter-node communication is less for models with fewer parameters. Hence, the required size for `SMDDP_AG_SORT_BUFFER_SIZE_BYTES` can be smaller for such models with fewer number of parameters.

Some collectives might fall back to use NCCL; hence, you might not get the performance gain from the optimized SMDDP collectives. If additional GPU memory is available for use, you can consider increasing the values of `SMDDP_AG_SCRATCH_BUFFER_SIZE_BYTES` and `SMDDP_AG_SORT_BUFFER_SIZE_BYTES` to benefit from the performance gain.

The following code shows how you can configure the environment variables by appending them to `mpi_options` in the distribution parameter for the PyTorch ModelTrainer.

```
import sagemaker
from sagemaker.train import ModelTrainer
from sagemaker.core.helper.session_helper import get_execution_role

smp_options = {
    .... # All modelparallel configuration options go here
}

mpi_options = {
    "enabled" : True,                       # Required
```

```
    "processes_per_host" : 8               # Required
}

# Use the following two lines to tune values of the environment variables for buffer
mpioptions += " -x SMDDP_AG_SCRATCH_BUFFER_SIZE_BYTES=8192"
mpioptions += " -x SMDDP_AG_SORT_BUFFER_SIZE_BYTES=8192"

# Retrieve the training image for the desired PyTorch version
training_image = image_uris.retrieve(
    framework="pytorch",
    region="us-west-2",
    version='1.13.1',
    py_version='py3',
    instance_type='ml.p4d.24xlarge',
    image_scope="training"
)

smd_mp_model_trainer = ModelTrainer(
    training_image=training_image,
    source_code=SourceCode(
        source_dir="location_to_your_script",
        entry_script="your_training_script.py"
    ),
    role=get_execution_role(),
    compute=Compute(
        instance_type='ml.p4d.24xlarge',
        instance_count=8
    ),
    distribution={
        "smdistributed": {"modelparallel": smp_options},
        "mpi": mpi_options
    },
    base_job_name="sharded-data-parallel-demo-with-tuning",
)

smd_mp_model_trainer.train(input_data_config=[
    InputData(channel_name="training", data_source='s3://my_bucket/my_training_data/')
])
```

Mixed precision training with sharded data parallelism

To further save GPU memory with half-precision floating point numbers and sharded data parallelism, you can activate 16-bit floating point format (FP16) or Brain floating point format (BF16) by adding one additional parameter to the distributed training configuration.

> **Note**
>
> Mixed precision training with sharded data parallelism is available in the SageMaker model parallelism library v1.11.0 and later.

For FP16 Training with Sharded Data Parallelism

To run FP16 training with sharded data parallelism, add `"fp16": True` to the `smp_options` configuration dictionary. In your training script, you can choose between the static and dynamic loss scaling options through the `smp.DistributedOptimizer` module. For more information, see the section called "FP16 Training with Model Parallelism".

```
smp_options = {
    "enabled": True,
    "parameters": {
        "ddp": True,
        "sharded_data_parallel_degree": 2,
        "fp16": True
    }
}
```

For BF16 Training with Sharded Data Parallelism

The sharded data parallelism feature of SageMaker AI supports training in BF16 data type. The BF16 data type uses 8 bits to represent the exponent of a floating point number, while the FP16 data type uses 5 bits. Preserving the 8 bits for the exponent allows to keep the same representation of the exponent of a 32-bit single precision floating point (FP32) number. This makes the conversion between FP32 and BF16 simpler and significantly less prone to cause overflow and underflow issues that arise often in FP16 training, especially when training larger models. While both data types use 16 bits in total, this increased representation range for the exponent in the BF16 format comes at the expense of reduced precision. For training large models, this reduced precision is often considered an acceptable trade-off for the range and training stability.

> **Note**
>
> Currently, BF16 training works only when sharded data parallelism is activated.

To run BF16 training with sharded data parallelism, add `"bf16": True` to the `smp_options` configuration dictionary.

```
smp_options = {
    "enabled": True,
    "parameters": {
        "ddp": True,
        "sharded_data_parallel_degree": 2,
        "bf16": True
    }
}
```

Sharded data parallelism with tensor parallelism

If you use sharded data parallelism and also need to reduce the global batch size, consider using tensor parallelism with sharded data parallelism. When training a large model with sharded data parallelism on a very large compute cluster (typically 128 nodes or beyond), even a small batch size per GPU results in a very large global batch size. It might lead to convergence issues or low computational performance issues. Reducing the batch size per GPU sometimes is not possible with sharded data parallelism alone when a single batch is already large and cannot be reduced further. In such cases, using sharded data parallelism in combination with tensor parallelism helps reduce the global batch size.

Choosing the optimal sharded data parallel and tensor parallel degrees depends on the scale of the model, the instance type, and the global batch size that is reasonable for the model to converge. We recommend that you start from a low tensor parallel degree to fit the global batch size into the compute cluster to resolve CUDA out-of-memory errors and achieve the best performance. See the following two example cases to learn how the combination of tensor parallelism and sharded data parallelism helps you adjust the global batch size by grouping GPUs for model parallelism, resulting in a lower number of model replicas and a smaller global batch size.

Note

This feature is available from the SageMaker model parallelism library v1.15, and supports PyTorch v1.13.1.

Note

This feature is available for the supported models by the tensor parallelism functionality of the library. To find the list of the supported models, see Support for Hugging Face Transformer Models. Also note that you need to pass `tensor_parallelism=True` to the `smp.model_creation` argument while modifying your training script. To learn more, see the training script `train_gpt_simple.py` in the *SageMaker AI Examples GitHub repository*.

Example 1

Assume that we want to train a model over a cluster of 1536 GPUs (192 nodes with 8 GPUs in each), setting the degree of sharded data parallelism to 32 (`sharded_data_parallel_degree=32`) and the batch size per GPU to 1, where each batch has a sequence length of 4096 tokens. In this case, there are 1536 model replicas, the global batch size becomes 1536, and each global batch contains about 6 million tokens.

```
(1536 GPUs) * (1 batch per GPU) = (1536 global batches)
(1536 batches) * (4096 tokens per batch) = (6,291,456 tokens)
```

Adding tensor parallelism to it can lower the global batch size. One configuration example can be setting the tensor parallel degree to 8 and the batch size per GPU to 4. This forms 192 tensor parallel groups or 192 model replicas, where each model replica is distributed across 8 GPUs. The batch size of 4 is the amount of training data per iteration and per tensor parallel group; that is, each model replica consumes 4 batches per iteration. In this case, the global batch size becomes 768, and each global batch contains about 3 million tokens. Hence, the global batch size is reduced by half compared to the previous case with sharded data parallelism only.

```
(1536 GPUs) / (8 tensor parallel degree) = (192 tensor parallelism groups)
(192 tensor parallelism groups) * (4 batches per tensor parallelism group) = (768
 global batches)
```

```
(768 batches) * (4096 tokens per batch) = (3,145,728 tokens)
```

Example 2

When both sharded data parallelism and tensor parallelism are activated, the library first applies tensor parallelism and shards the model across this dimension. For each tensor parallel rank, the data parallelism is applied as per `sharded_data_parallel_degree`.

For example, assume that we want to set 32 GPUs with a tensor parallel degree of 4 (forming groups of 4 GPUs), a sharded data parallel degree of 4, ending up with a replication degree of 2. The assignment creates eight GPU groups based on the tensor parallel degree as follows: `(0,1,2,3)`, `(4,5,6,7)`, `(8,9,10,11)`, `(12,13,14,15)`, `(16,17,18,19)`, `(20,21,22,23)`, `(24,25,26,27)`, `(28,29,30,31)`. That is, four GPUs form one tensor parallel group. In this case, the reduced data parallel group for the 0th rank GPUs of the tensor parallel groups would be `(0,4,8,12,16,20,24,28)`. The reduced data parallel group is sharded based on the sharded data parallel degree of 4, resulting in two replication groups for data parallelism. GPUs `(0,4,8,12)` form one sharding group, which collectively hold a complete copy of all parameters for the 0th tensor parallel rank, and GPUs `(16,20,24,28)` form another such group. Other tensor parallel ranks also have similar sharding and replication groups.

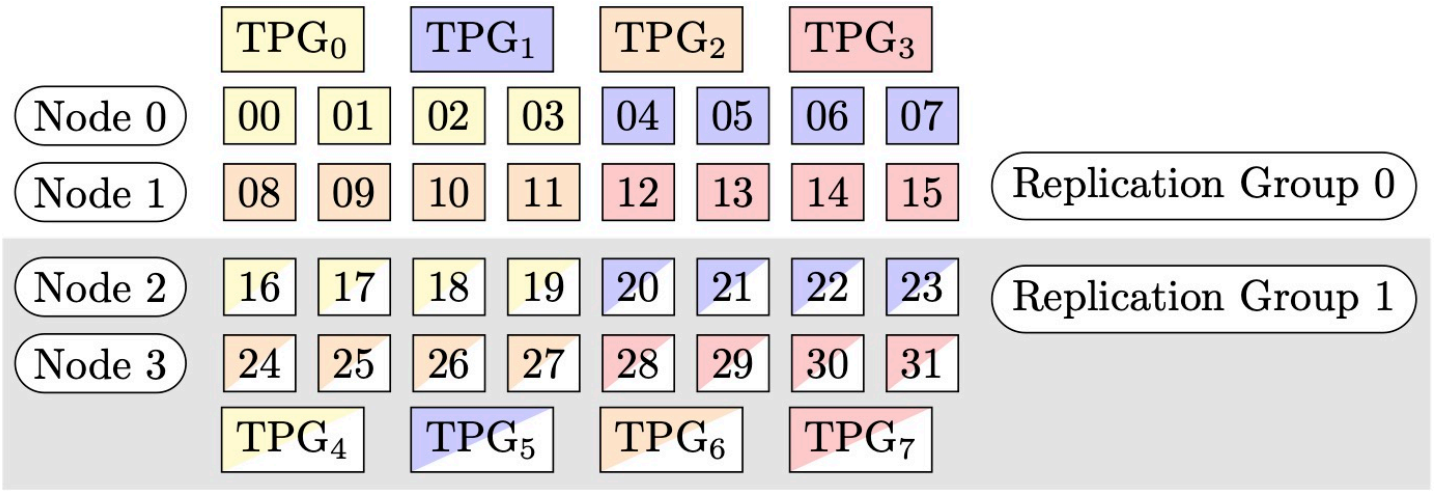

Figure 1: Tensor parallelism groups for (nodes, sharded data parallel degree, tensor parallel degree) = (4, 4, 4), where each rectangle represents a GPU with indices from 0 to 31. The GPUs form tensor parallelism groups from TPG_0 to TPG_7. Replication groups are ({TPG_0, TPG_4}, {TPG_1, TPG_5}, {TPG_2, TPG_6} and {TPG_3, TPG_7}); each replication group pair shares the same color but filled differently.

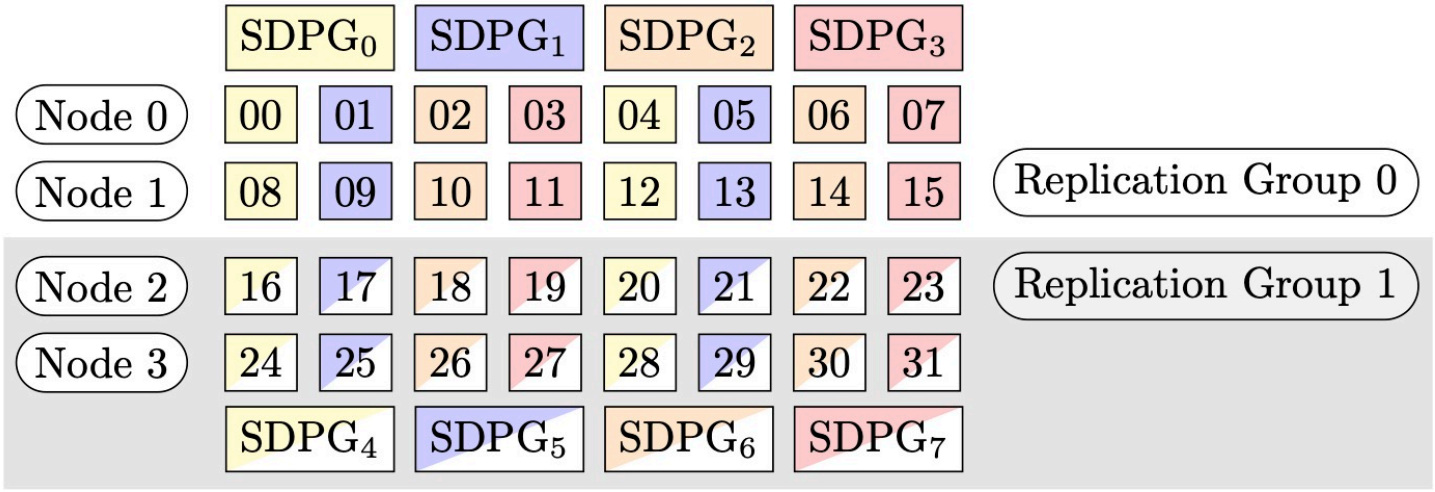

Figure 2: Sharded data parallelism groups for (nodes, sharded data parallel degree, tensor parallel degree) = (4, 4, 4), where each rectangle represents a GPU with indices from 0 to 31. The GPUs form sharded data parallelism groups from $SDPG_0$ to $SDPG_7$. Replication groups are ({$SDPG_0$, $SDPG_4$}, {$SDPG_1$, $SDPG_5$}, {$SDPG_2$, $SDPG_6$} and {$SDPG_3$, $SDPG_7$}); each replication group pair shares the same color but filled differently.

How to activate sharded data parallelism with tensor parallelism

To use sharded data parallelism with tensor parallelism, you need to set both `sharded_data_parallel_degree` and `tensor_parallel_degree` in the configuration for `distribution` while creating an object of the SageMaker PyTorch ModelTrainer class.

You also need to activate `prescaled_batch`. This means that, instead of each GPU reading its own batch of data, each tensor parallel group collectively reads a combined batch of the chosen batch size. Effectively, instead of dividing the dataset into parts equal to the number of GPUs (or data parallel size, `smp.dp_size()`), it divides into parts equal to the number of GPUs divided by `tensor_parallel_degree` (also called reduced data parallel size, `smp.rdp_size()`). For more details on prescaled batch, see Prescaled Batch in the *SageMaker Python SDK documentation*. See also the example training script `train_gpt_simple.py` for GPT-2 in the *SageMaker AI Examples GitHub repository*.

The following code snippet shows an example of creating a PyTorch ModelTrainer object based on the aforementioned scenario in the section called “Example 2”.

```
from sagemaker.train.configs import SourceCode, Compute
from sagemaker.core import image_uris

mpi_options = "-verbose --mca orte_base_help_aggregate 0 "
```

```
smp_parameters = {
    "ddp": True,
    "fp16": True,
    "prescaled_batch": True,
    "sharded_data_parallel_degree": 4,
    "tensor_parallel_degree": 4
}

# Retrieve the training image for the desired PyTorch version
training_image = image_uris.retrieve(
    framework="pytorch",
    region="us-west-2",
    version="1.13.1",
    py_version="py3",
    instance_type="ml.p4d.24xlarge",
    image_scope="training"
)

pytorch_model_trainer = ModelTrainer(
    training_image=training_image,
    source_code=SourceCode(
        source_dir="source_directory_of_your_code",
        entry_script="your_training_script.py"
    ),
    role=role,
    compute=Compute(
        instance_type="ml.p4d.24xlarge",
        instance_count=4,
        volume_size_in_gb=200
    ),
    sagemaker_session=sagemaker_session,
    distribution={
        "smdistributed": {
            "modelparallel": {
                "enabled": True,
                "parameters": smp_parameters,
            }
        },
        "mpi": {
            "enabled": True,
            "processes_per_host": 8,
            "custom_mpi_options": mpi_options,
        },
    },
```

```
    output_path=s3_output_location
)
```

Tips and considerations for using sharded data parallelism

Consider the following when using the SageMaker model parallelism library's sharded data parallelism.

- Sharded data parallelism is compatible with FP16 training. To run FP16 training, see the the section called "FP16 Training with Model Parallelism" section.
- Sharded data parallelism is compatible with tensor parallelism. The following items are what you might need to consider for using sharded data parallelism with tensor parallelism.
  - When using sharded data parallelism with tensor parallelism, the embedding layers are also automatically distributed across the tensor parallel group. In other words, the `distribute_embedding` parameter is automatically set to `True`. For more information about tensor parallelism, see the section called "Tensor Parallelism".
  - Note that sharded data parallelism with tensor parallelism currently uses the NCCL collectives as the backend of the distributed training strategy.

  To learn more, see the the section called "Sharded data parallelism with tensor parallelism" section.
- Sharded data parallelism currently is not compatible with pipeline parallelism or optimizer state sharding. To activate sharded data parallelism, turn off optimizer state sharding and set the pipeline parallel degree to 1.
- The activation checkpointing and activation offloading features are compatible with sharded data parallelism.
- To use sharded data parallelism with gradient accumulation, set the `backward_passes_per_step` argument to the number of accumulation steps while wrapping your model with the `smdistributed.modelparallel.torch.DistributedModel` module. This ensures that the gradient `AllReduce` operation across the model replication groups (sharding groups) takes place at the boundary of gradient accumulation.
- You can checkpoint your models trained with sharded data parallelism using the library's checkpointing APIs, `smp.save_checkpoint` and `smp.resume_from_checkpoint`. For more information, see the section called "Checkpointing a distributed PyTorch model (for the SageMaker model parallelism library v1.10.0 and later)".

- The behavior of the `delayed_parameter_initialization` configuration parameter changes under sharded data parallelism. When these two features are simultaneously turned on, parameters are immediately initialized upon model creation in a sharded manner instead of delaying the parameter initialization, so that each rank initializes and stores its own shard of parameters.
- When sharded data parallelism is activated, the library performs gradient clipping internally when the `optimizer.step()` call runs. You don't need to use utility APIs for gradient clipping, such as `torch.nn.utils.clip_grad_norm_()`. To adjust the threshold value for gradient clipping, you can set it through the `sdp_gradient_clipping` parameter for the distribution parameter configuration when you construct the SageMaker PyTorch ModelTrainer, as shown in the the section called "How to apply sharded data parallelism to your training job" section.

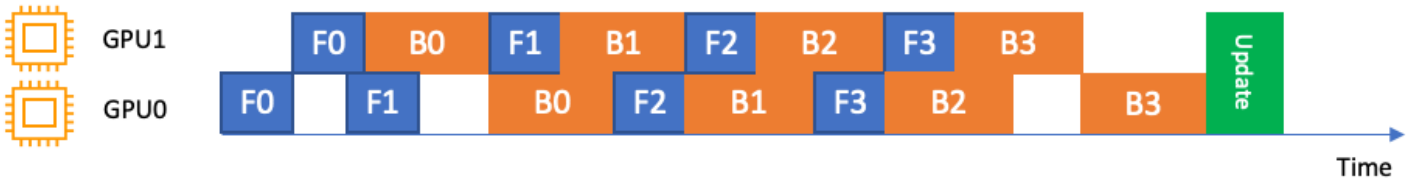
Pipelining a Model

One of the core features of SageMaker's model parallelism library is *pipeline parallelism*, which determines the order in which computations are made and data is processed across devices during model training. Pipelining is a technique to achieve true parallelization in model parallelism, by having the GPUs compute simultaneously on different data samples, and to overcome the performance loss due to sequential computation. When you use pipeline parallelism, training job is executed in a pipelined fashion over microbatches to maximize GPU usage.

> **Note**
>
> Pipeline parallelism, also called model partitioning, is available for both PyTorch and TensorFlow. For supported versions of the frameworks, see the section called "Supported Frameworks and Amazon Web Services Regions".

Pipeline Execution Schedule

Pipelining is based on splitting a mini-batch into microbatches, which are fed into the training pipeline one-by-one and follow an execution schedule defined by the library runtime. A *microbatch* is a smaller subset of a given training mini-batch. The pipeline schedule determines which microbatch is executed by which device for every time slot.

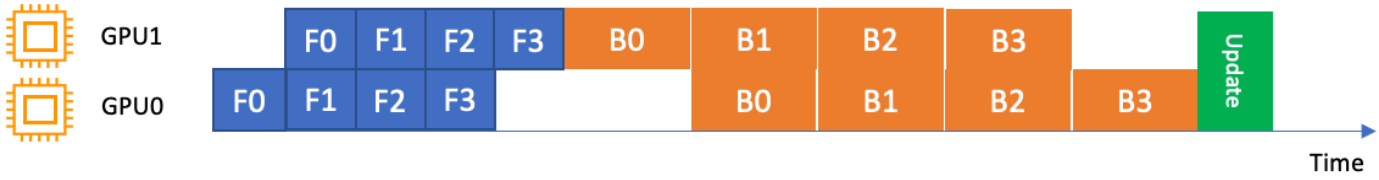


For example, depending on the pipeline schedule and the model partition, GPU `i` might perform (forward or backward) computation on microbatch b while GPU `i+1` performs computation on

microbatch b+1, thereby keeping both GPUs active at the same time. During a single forward or backward pass, execution flow for a single microbatch might visit the same device multiple times, depending on the partitioning decision. For instance, an operation that is at the beginning of the model might be placed on the same device as an operation at the end of the model, while the operations in between are on different devices, which means this device is visited twice.

The library offers two different pipeline schedules, *simple* and *interleaved*, which can be configured using the `pipeline` parameter in the SageMaker Python SDK. In most cases, interleaved pipeline can achieve better performance by utilizing the GPUs more efficiently.

Interleaved Pipeline

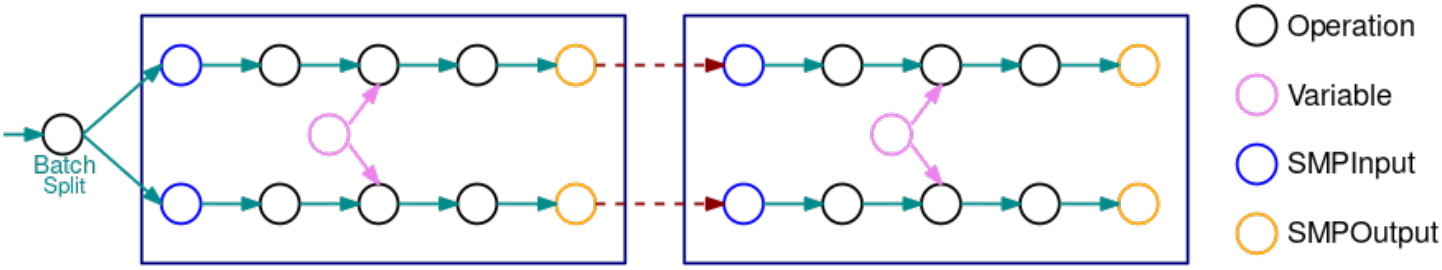


In an interleaved pipeline, backward execution of the microbatches is prioritized whenever possible. This allows quicker release of the memory used for activations, using memory more efficiently. It also allows for scaling the number of microbatches higher, reducing the idle time of the GPUs. At steady-state, each device alternates between running forward and backward passes. This means that the backward pass of one microbatch may run before the forward pass of another microbatch finishes.

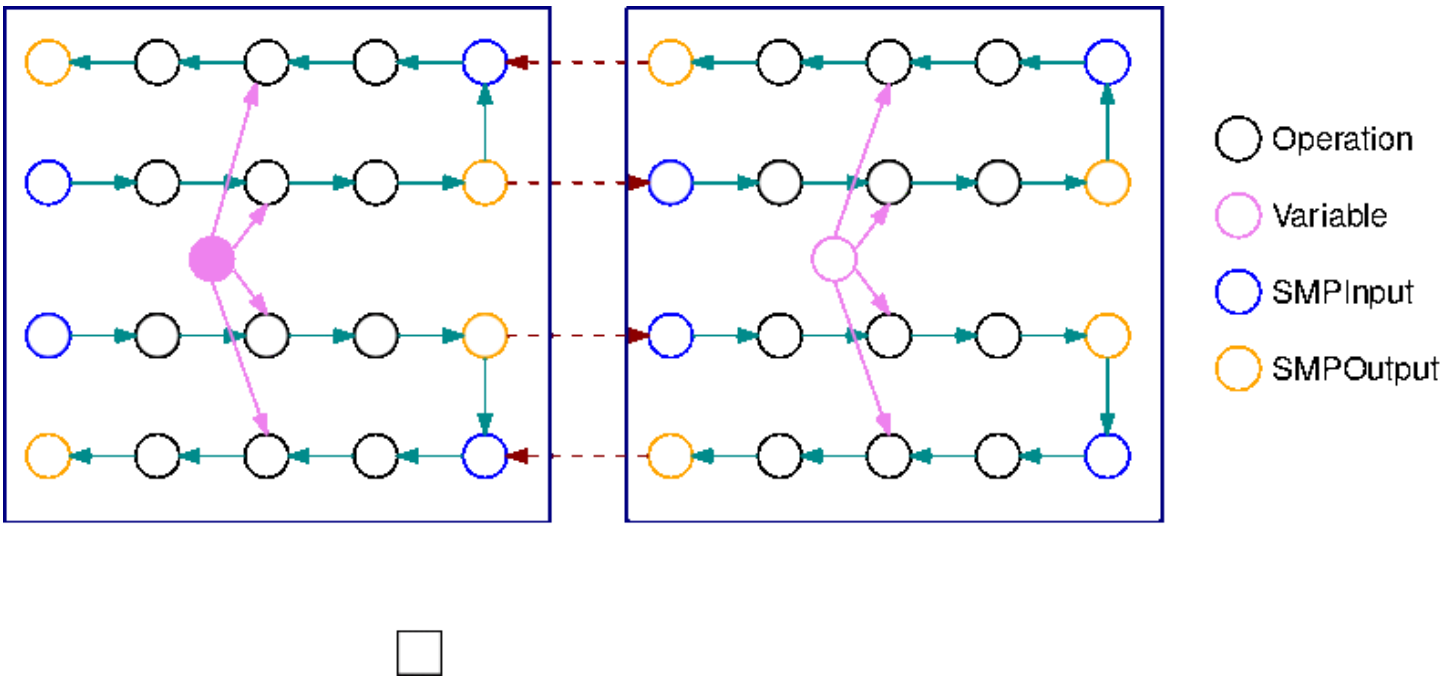
The preceding figure illustrates an example execution schedule for the interleaved pipeline over 2 GPUs. In the figure, F0 represents the forward pass for microbatch 0, and B1 represents the backward pass for microbatch 1. **Update** represents the optimizer update of the parameters. GPU0 always prioritizes backward passes whenever possible (for instance, executes B0 before F2), which allows for clearing of the memory used for activations earlier.

Simple Pipeline

A simple pipeline, by contrast, finishes running the forward pass for each microbatch before starting the backward pass. This means that it only pipelines the forward pass and backward pass stages within themselves. The following figure illustrates an example of how this works, over 2 GPUs.



Pipelining Execution in Specific Frameworks



Use the following sections to learn about the framework-specific pipeline scheduling decisions SageMaker's model parallelism library makes for TensorFlow and PyTorch.

Pipeline Execution with TensorFlow

The following image is an example of a TensorFlow graph partitioned by the model parallelism library, using automated model splitting. When a graph is split, each resulting subgraph is replicated B times (except for the variables), where B is the number of microbatches. In this figure, each subgraph is replicated 2 times (B=2). An `SMPInput` operation is inserted at each input of a subgraph, and an `SMPOutput` operation is inserted at each output. These operations communicate with the library backend to transfer tensors to and from each other.

The following image is an example of 2 subgraphs split with B=2 with gradient operations added. The gradient of a `SMPInput` op is a `SMPOutput` op, and vice versa. This enables the gradients to flow backwards during back-propagation.

This GIF demonstrates an example interleaved pipeline execution schedule with B=2 microbatches and 2 subgraphs. Each device sequentially executes one of the subgraph replicas to improve GPU utilization. As B grows larger, the fraction of idle time slots goes to zero. Whenever it is time to do (forward or backward) computation on a specific subgraph replica, the pipeline layer signals to the corresponding blue `SMPInput` operations to start executing.

Once the gradients from all microbatches in a single mini-batch are computed, the library combines the gradients across microbatches, which can then be applied to the parameters.

Pipeline Execution with PyTorch

Conceptually, pipelining follows a similar idea in PyTorch. However, since PyTorch does not involve static graphs and so the model parallelism library's PyTorch feature uses a more dynamic pipelining paradigm.

As in TensorFlow, each batch is split into a number of microbatches, which are executed one at a time on each device. However, the execution schedule is handled via execution servers launched on each device. Whenever the output of a submodule that is placed on another device is needed on the current device, an execution request is sent to the execution server of the remote device along with the input tensors to the submodule. The server then executes this module with the given inputs and returns the response to the current device.

Since the current device is idle during the remote submodule execution, the local execution for the current microbatch pauses, and the library runtime switches execution to another microbatch

which the current device can actively work on. The prioritization of microbatches is determined by the chosen pipeline schedule. For an interleaved pipeline schedule, microbatches that are in the backward stage of the computation are prioritized whenever possible.

Tensor Parallelism

Tensor parallelism is a type of model parallelism in which specific model weights, gradients, and optimizer states are split across devices. In contrast to pipeline parallelism, which keeps individual weights intact but partitions the *set* of weights, tensor parallelism splits individual weights. This typically involves distributed computation of specific operations, modules, or layers of the model.

Tensor parallelism is required in cases in which a single parameter consumes most of the GPU memory (such as large embedding tables with a large vocabulary size or a large softmax layer with a large number of classes). In this case, treating this large tensor or operation as an atomic unit is inefficient and impedes balance of the memory load.

Tensor parallelism is also useful for extremely large models in which a pure pipelining is simply not enough. For example, with GPT-3-scale models that require partitioning over tens of instances, a pure microbatch pipelining is inefficient because the pipeline depth becomes too high and the overhead becomes prohibitively large.

> **Note**
>
> Tensor parallelism is available for PyTorch in the SageMaker model parallelism library v1.6.0 and later.

- Support for Hugging Face Transformer Models
- Ranking Mechanism when Using a Combination of Pipeline Parallelism and Tensor Parallelism

How Tensor Parallelism Works

Tensor parallelism takes place at the level of `nn.Modules`; it partitions specific modules in the model across tensor parallel ranks. This is in addition to the existing partition of the *set of modules* used in pipeline parallelism.

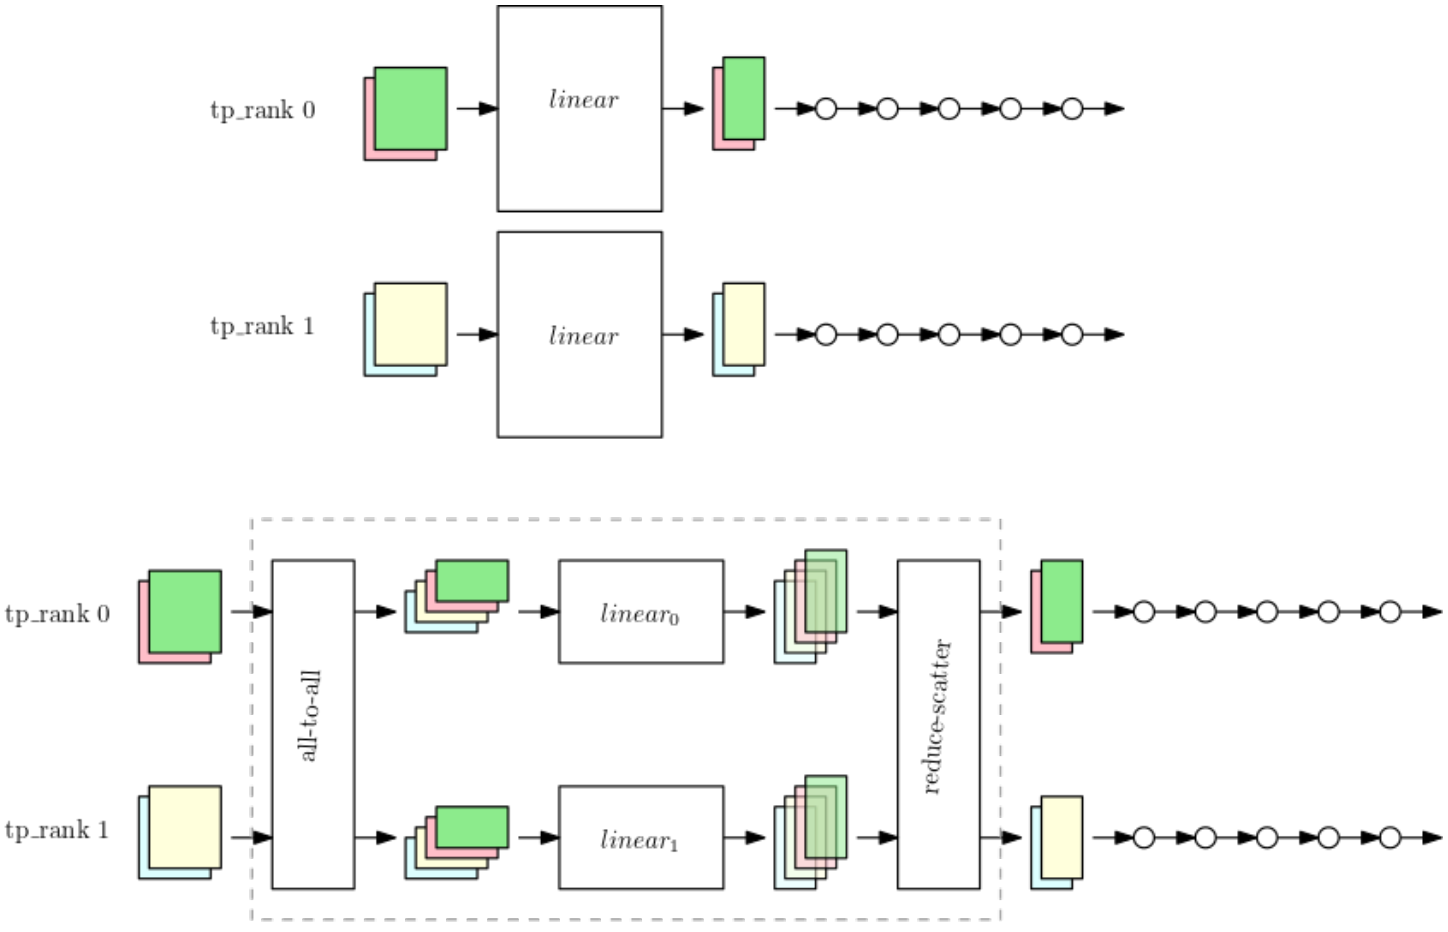
When a module is partitioned through tensor parallelism, its forward and backward propagation are distributed. The library handles the necessary communication across devices to implement the distributed execution of these modules. The modules are partitioned across multiple data parallel ranks. Contrary to the traditional distribution of workloads, each data parallel rank does **not** have the complete model replica when the library's tensor parallelism is used. Instead, each data parallel rank may have only a partition of the distributed modules, in addition to the entirety of the modules that are not distributed.

Example: Consider tensor parallelism across data parallel ranks, where the degree of data parallelism is 4 and the degree of tensor parallelism is 2. Assume that you have a data parallel group that holds the following module tree, after partitioning the set of modules.

```
A
### B
|   ### E
|   ### F
### C
### D
    ### G
    ### H
```

Assume that tensor parallelism is supported for the modules B, G, and H. One possible outcome of tensor parallel partition of this model could be:

```
dp_rank 0 (tensor parallel rank 0): A, B:0, C, D, G:0, H
dp_rank 1 (tensor parallel rank 1): A, B:1, C, D, G:1, H
dp_rank 2 (tensor parallel rank 0): A, B:0, C, D, G:0, H
dp_rank 3 (tensor parallel rank 1): A, B:1, C, D, G:1, H
```



Each line represents the set of modules stored in that dp_rank, and the notation X:y represents the yth fraction of the module X. Note the following:

1. Partitioning takes place across subsets of data parallel ranks, which we call TP_GROUP, not the entire DP_GROUP, so that the exact model partition is replicated across dp_rank 0 and dp_rank 2, and similarly across dp_rank 1 and dp_rank 3.
2. The modules E and F are no longer part of the model, since their parent module B is partitioned, and any execution that is normally a part of E and F takes place within the (partitioned) B module.

3. Even though H is supported for tensor parallelism, in this example it is not partitioned, which highlights that whether to partition a module depends on user input. The fact that a module is supported for tensor parallelism does not necessarily mean it is partitioned.

How the library adapts tensor parallelism to PyTorch `nn.Linear` module

When tensor parallelism is performed over data parallel ranks, a subset of the parameters, gradients, and optimizer states are partitioned across the tensor parallel devices *for the modules that are partitioned*. For the rest of the modules, the tensor parallel devices operate in a regular data parallel manner. To execute the partitioned module, a device first collects the necessary parts of *all data samples* across peer devices in the same tensor parallelism group. The device then runs the local fraction of the module on all these data samples, followed by another round of synchronization which both combines the parts of the output for each data sample and returns the combined data samples to the GPUs from which the data sample first originated. The following figure shows an example of this process over a partitioned `nn.Linear` module.

The first figure shows a small model with a large nn.Linear module with data parallelism over the two tensor parallelism ranks. The nn.Linear module is replicated into the two parallel ranks.

The second figure shows tensor parallelism applied on a larger model while splitting the nn.Linear module. Each tp_rank holds half the linear module, and the entirety of the rest of the operations. While the linear module runs, each tp_rank collects the relevant half of all data samples and passes it through their half of the nn.Linear module. The result needs to be reduce-scattered (with summation as the reduction operation) so that each rank has the final linear output for their own data samples. The rest of the model runs in the typical data parallel manner.

Run a SageMaker Distributed Model Parallel Training Job with Tensor Parallelism

In this section, you learn:

- How to configure a SageMaker PyTorch ModelTrainer and the SageMaker model parallelism option to use tensor parallelism.
- How to adapt your training script using the extended smdistributed.modelparallel modules for tensor parallelism.

To learn more about the smdistributed.modelparallel modules, see the SageMaker model parallel APIs in the *SageMaker Python SDK documentation*.

Topics

- Tensor parallelism alone
- Tensor parallelism combined with pipeline parallelism

Tensor parallelism alone

The following is an example of a distributed training option to activate tensor parallelism alone, without pipeline parallelism. Configure the mpi_options and smp_options dictionaries to specify distributed training options to the SageMaker PyTorch ModelTrainer.

> **Note**
>
> Extended memory-saving features are available through Deep Learning Containers for PyTorch, which implements the SageMaker model parallelism library v1.6.0 or later.

Configure a SageMaker PyTorch ModelTrainer

```
from sagemaker.train.configs import SourceCode, Compute, InputData
from sagemaker.core import image_uris

mpi_options = {
    "enabled" : True,
    "processes_per_host" : 8,               # 8 processes
    "custom_mpi_options" : "--mca btl_vader_single_copy_mechanism none "
}

smp_options = {
    "enabled":True,
    "parameters": {
        "pipeline_parallel_degree": 1,    # alias for "partitions"
        "placement_strategy": "cluster",
        "tensor_parallel_degree": 4,      # tp over 4 devices
        "ddp": True
    }
}

# Retrieve the training image for the desired PyTorch version
training_image = image_uris.retrieve(
    framework="pytorch",
    region="us-west-2",
    version='1.13.1',
    py_version='py36',
    instance_type='ml.p3.16xlarge',
    image_scope="training"
)

smp_model_trainer = ModelTrainer(
    training_image=training_image,
    source_code=SourceCode(entry_script='your_training_script.py'),
    role=role,
    compute=Compute(
        instance_type='ml.p3.16xlarge',
        instance_count=1
    ),
    sagemaker_session=sagemaker_session,
    distribution={
        "smdistributed": {"modelparallel": smp_options},
        "mpi": mpi_options
    },
```

```
    base_job_name="SMD-MP-demo",
)

smp_model_trainer.train(input_data_config=[
    InputData(channel_name="training", data_source='s3://my_bucket/my_training_data/')
])
```

> **Tip**
>
> To find a complete list of parameters for `distribution`, see Configuration Parameters for Model Parallelism in the SageMaker Python SDK documentation.

Adapt your PyTorch training script

The following example training script shows how to adapt the SageMaker model parallelism library to a training script. In this example, it is assumed that the script is named `your_training_script.py`.

```
import torch
import torch.nn as nn
import torch.nn.functional as F
import torch.optim as optim
from torchnet.dataset import SplitDataset
from torchvision import datasets

import smdistributed.modelparallel.torch as smp

class Net(nn.Module):
    def __init__(self):
        super(Net, self).__init__()
        self.conv1 = nn.Conv2d(1, 32, 3, 1)
        self.conv2 = nn.Conv2d(32, 64, 3, 1)
        self.fc1 = nn.Linear(9216, 128)
        self.fc2 = nn.Linear(128, 10)

    def forward(self, x):
        x = self.conv1(x)
        x = F.relu(x)
        x = self.conv2(x)
        x = F.relu(x)
        x = F.max_pool2d(x, 2)
```

```
        x = torch.flatten(x, 1)
        x = self.fc1(x)
        x = F.relu(x)
        x = self.fc2(x)
        return F.log_softmax(x, 1)

def train(model, device, train_loader, optimizer):
    model.train()
    for batch_idx, (data, target) in enumerate(train_loader):
        # smdistributed: Move input tensors to the GPU ID used by
        # the current process, based on the set_device call.
        data, target = data.to(device), target.to(device)
        optimizer.zero_grad()
        output = model(data)
        loss = F.nll_loss(output, target, reduction="mean")
        loss.backward()
        optimizer.step()

# smdistributed: Initialize the backend
smp.init()

# smdistributed: Set the device to the GPU ID used by the current process.
# Input tensors should be transferred to this device.
torch.cuda.set_device(smp.local_rank())
device = torch.device("cuda")

# smdistributed: Download only on a single process per instance.
# When this is not present, the file is corrupted by multiple processes trying
# to download and extract at the same time
if smp.local_rank() == 0:
    dataset = datasets.MNIST("../data", train=True, download=False)
smp.barrier()

# smdistributed: Shard the dataset based on data parallel ranks
if smp.dp_size() > 1:
    partitions_dict = {f"{i}": 1 / smp.dp_size() for i in range(smp.dp_size())}
    dataset = SplitDataset(dataset, partitions=partitions_dict)
    dataset.select(f"{smp.dp_rank()}")

train_loader = torch.utils.data.DataLoader(dataset, batch_size=64)

# smdistributed: Enable tensor parallelism for all supported modules in the model
# i.e., nn.Linear in this case. Alternatively, we can use
# smp.set_tensor_parallelism(model.fc1, True)
```

```
# to enable it only for model.fc1
with smp.tensor_parallelism():
    model = Net()

# smdistributed: Use the DistributedModel wrapper to distribute the
# modules for which tensor parallelism is enabled
model = smp.DistributedModel(model)

optimizer = optim.AdaDelta(model.parameters(), lr=4.0)
optimizer = smp.DistributedOptimizer(optimizer)

train(model, device, train_loader, optimizer)
```

Tensor parallelism combined with pipeline parallelism

The following is an example of a distributed training option that enables tensor parallelism combined with pipeline parallelism. Set up the `mpi_options` and `smp_options` parameters to specify model parallel options with tensor parallelism when you configure a SageMaker `PyTorch` ModelTrainer.

> **Note**
>
> Extended memory-saving features are available through Deep Learning Containers for PyTorch, which implements the SageMaker model parallelism library v1.6.0 or later.

Configure a SageMaker PyTorch ModelTrainer

```
mpi_options = {
    "enabled" : True,
    "processes_per_host" : 8,               # 8 processes
    "custom_mpi_options" : "--mca btl_vader_single_copy_mechanism none "
}

smp_options = {
    "enabled":True,
    "parameters": {
    "microbatches": 4,
        "pipeline_parallel_degree": 2,    # alias for "partitions"
        "placement_strategy": "cluster",
        "tensor_parallel_degree": 2,      # tp over 2 devices
        "ddp": True
```

```
    }
}

# Retrieve the training image for the desired PyTorch version
training_image = image_uris.retrieve(
    framework="pytorch",
    region="us-west-2",
    version='1.13.1',
    py_version='py36',
    instance_type='ml.p3.16xlarge',
    image_scope="training"
)

smp_model_trainer = ModelTrainer(
    training_image=training_image,
    source_code=SourceCode(entry_script='your_training_script.py'),
    role=role,
    compute=Compute(
        instance_type='ml.p3.16xlarge',
        instance_count=1
    ),
    sagemaker_session=sagemaker_session,
    distribution={
        "smdistributed": {"modelparallel": smp_options},
        "mpi": mpi_options
    },
    base_job_name="SMD-MP-demo",
)

smp_model_trainer.train(input_data_config=[
    InputData(channel_name="training", data_source='s3://my_bucket/my_training_data/')
])
```

Adapt your PyTorch training script

The following example training script shows how to adapt the SageMaker model parallelism library to a training script. Note that the training script now includes the `smp.step` decorator:

```
import torch
import torch.nn as nn
import torch.nn.functional as F
import torch.optim as optim
from torchnet.dataset import SplitDataset
```

```
from torchvision import datasets

import smdistributed.modelparallel.torch as smp

class Net(nn.Module):
    def __init__(self):
        super(Net, self).__init__()
        self.conv1 = nn.Conv2d(1, 32, 3, 1)
        self.conv2 = nn.Conv2d(32, 64, 3, 1)
        self.fc1 = nn.Linear(9216, 128)
        self.fc2 = nn.Linear(128, 10)

    def forward(self, x):
        x = self.conv1(x)
        x = F.relu(x)
        x = self.conv2(x)
        x = F.relu(x)
        x = F.max_pool2d(x, 2)
        x = torch.flatten(x, 1)
        x = self.fc1(x)
        x = F.relu(x)
        x = self.fc2(x)
        return F.log_softmax(x, 1)

# smdistributed: Define smp.step. Return any tensors needed outside.
@smp.step
def train_step(model, data, target):
    output = model(data)
    loss = F.nll_loss(output, target, reduction="mean")
    model.backward(loss)
    return output, loss

def train(model, device, train_loader, optimizer):
    model.train()
    for batch_idx, (data, target) in enumerate(train_loader):
        # smdistributed: Move input tensors to the GPU ID used by
        # the current process, based on the set_device call.
        data, target = data.to(device), target.to(device)
        optimizer.zero_grad()
        # Return value, loss_mb is a StepOutput object
        _, loss_mb = train_step(model, data, target)

        # smdistributed: Average the loss across microbatches.
```

```
        loss = loss_mb.reduce_mean()

        optimizer.step()

# smdistributed: Initialize the backend
smp.init()

# smdistributed: Set the device to the GPU ID used by the current process.
# Input tensors should be transferred to this device.
torch.cuda.set_device(smp.local_rank())
device = torch.device("cuda")

# smdistributed: Download only on a single process per instance.
# When this is not present, the file is corrupted by multiple processes trying
# to download and extract at the same time
if smp.local_rank() == 0:
    dataset = datasets.MNIST("../data", train=True, download=False)
smp.barrier()

# smdistributed: Shard the dataset based on data parallel ranks
if smp.dp_size() > 1:
    partitions_dict = {f"{i}": 1 / smp.dp_size() for i in range(smp.dp_size())}
    dataset = SplitDataset(dataset, partitions=partitions_dict)
    dataset.select(f"{smp.dp_rank()}")

# smdistributed: Set drop_last=True to ensure that batch size is always divisible
# by the number of microbatches
train_loader = torch.utils.data.DataLoader(dataset, batch_size=64, drop_last=True)

model = Net()

# smdistributed: enable tensor parallelism only for model.fc1
smp.set_tensor_parallelism(model.fc1, True)

# smdistributed: Use the DistributedModel container to provide the model
# to be partitioned across different ranks. For the rest of the script,
# the returned DistributedModel object should be used in place of
# the model provided for DistributedModel class instantiation.
model = smp.DistributedModel(model)

optimizer = optim.AdaDelta(model.parameters(), lr=4.0)
optimizer = smp.DistributedOptimizer(optimizer)
```

```
train(model, device, train_loader, optimizer)
```

Support for Hugging Face Transformer Models

The SageMaker model parallelism library's tensor parallelism offers out-of-the-box support for the following Hugging Face Transformer models:

- GPT-2, BERT, and RoBERTa (Available in the SageMaker model parallelism library v1.7.0 and later)
- GPT-J (Available in the SageMaker model parallelism library v1.8.0 and later)
- GPT-Neo (Available in the SageMaker model parallelism library v1.10.0 and later)

> **Note**
>
> For any other Transformers models, you need to use the smdistributed.modelparallel.torch.tp_register_with_module() API to apply tensor parallelism.

> **Note**
>
> To use tensor parallelism for training Hugging Face Transformer models, make sure you use Hugging Face Deep Learning Containers for PyTorch that has the SageMaker model parallelism library v1.7.0 and later. For more information, see the SageMaker model parallelism library release notes.

Supported Models Out of the Box

For the Hugging Face transformer models supported by the library out of the box, you don't need to manually implement hooks to translate Transformer APIs to `smdistributed` transformer layers. You can activate tensor parallelism by using the context manager smdistributed.modelparallel.torch.tensor_parallelism() and wrapping the model by smdistributed.modelparallel.torch.DistributedModel(). You don't need to manually register hooks for tensor parallelism using the `smp.tp_register` API.

The `state_dict` translation functions between Hugging Face Transformers and `smdistributed.modelparallel` can be accessed as follows.

- smdistributed.modelparallel.torch.nn.huggingface.gpt2.translate_state_dict_to_h
  max_seq_len=None)
- smdistributed.modelparallel.torch.nn.huggingface.gpt2.translate_hf_state_dict_t
- smdistributed.modelparallel.torch.nn.huggingface.bert.translate_state_dict_to_h
  max_seq_len=None)
- smdistributed.modelparallel.torch.nn.huggingface.bert.translate_hf_state_dict_t
- smdistributed.modelparallel.torch.nn.huggingface.roberta.translate_state_dict_t
  max_seq_len=None)
- smdistributed.modelparallel.torch.nn.huggingface.roberta.translate_hf_state_dic
- smdistributed.modelparallel.torch.nn.huggingface.gptj.translate_state_dict_to_h
  max_seq_len=None) (Available in the SageMaker model parallelism library v1.8.0 and later)
- smdistributed.modelparallel.torch.nn.huggingface.gptj.translate_hf_gptj_state_d
  (Available in the SageMaker model parallelism library v1.8.0 and later)
- smdistributed.modelparallel.torch.nn.huggingface.gptneo.translate_state_dict_to
  max_seq_len=None) (Available in the SageMaker model parallelism library v1.10.0 and later)
- smdistributed.modelparallel.torch.nn.huggingface.gptneo.translate_hf_state_dict
  (Available in the SageMaker model parallelism library v1.10.0 and later)

Example usage of the GPT-2 translation function

Start with wrapping the model as shown in the following code.

```
from transformers import AutoModelForCausalLM

with smp.tensor_parallelism():
    model = AutoModelForCausalLM.from_config(hf_gpt2_config)

model = smp.DistributedModel(model)
```

Given a `state_dict` from the `DistributedModel` object, you can load the weights into the original Hugging Face GPT-2 model using the `translate_state_dict_to_hf_gpt2` function as shown in the following code.

```
from smdistributed.modelparallel.torch.nn.huggingface.gpt2 \
                                        import translate_state_dict_to_hf_gpt2
```

```
max_seq_len = 1024

# [... code block for training ...]

if smp.rdp_rank() == 0:
    state_dict = dist_model.state_dict()
    hf_state_dict = translate_state_dict_to_hf_gpt2(state_dict, max_seq_len)

    # can now call model.load_state_dict(hf_state_dict) to the original HF model
```

Example usage of the RoBERTa translation function

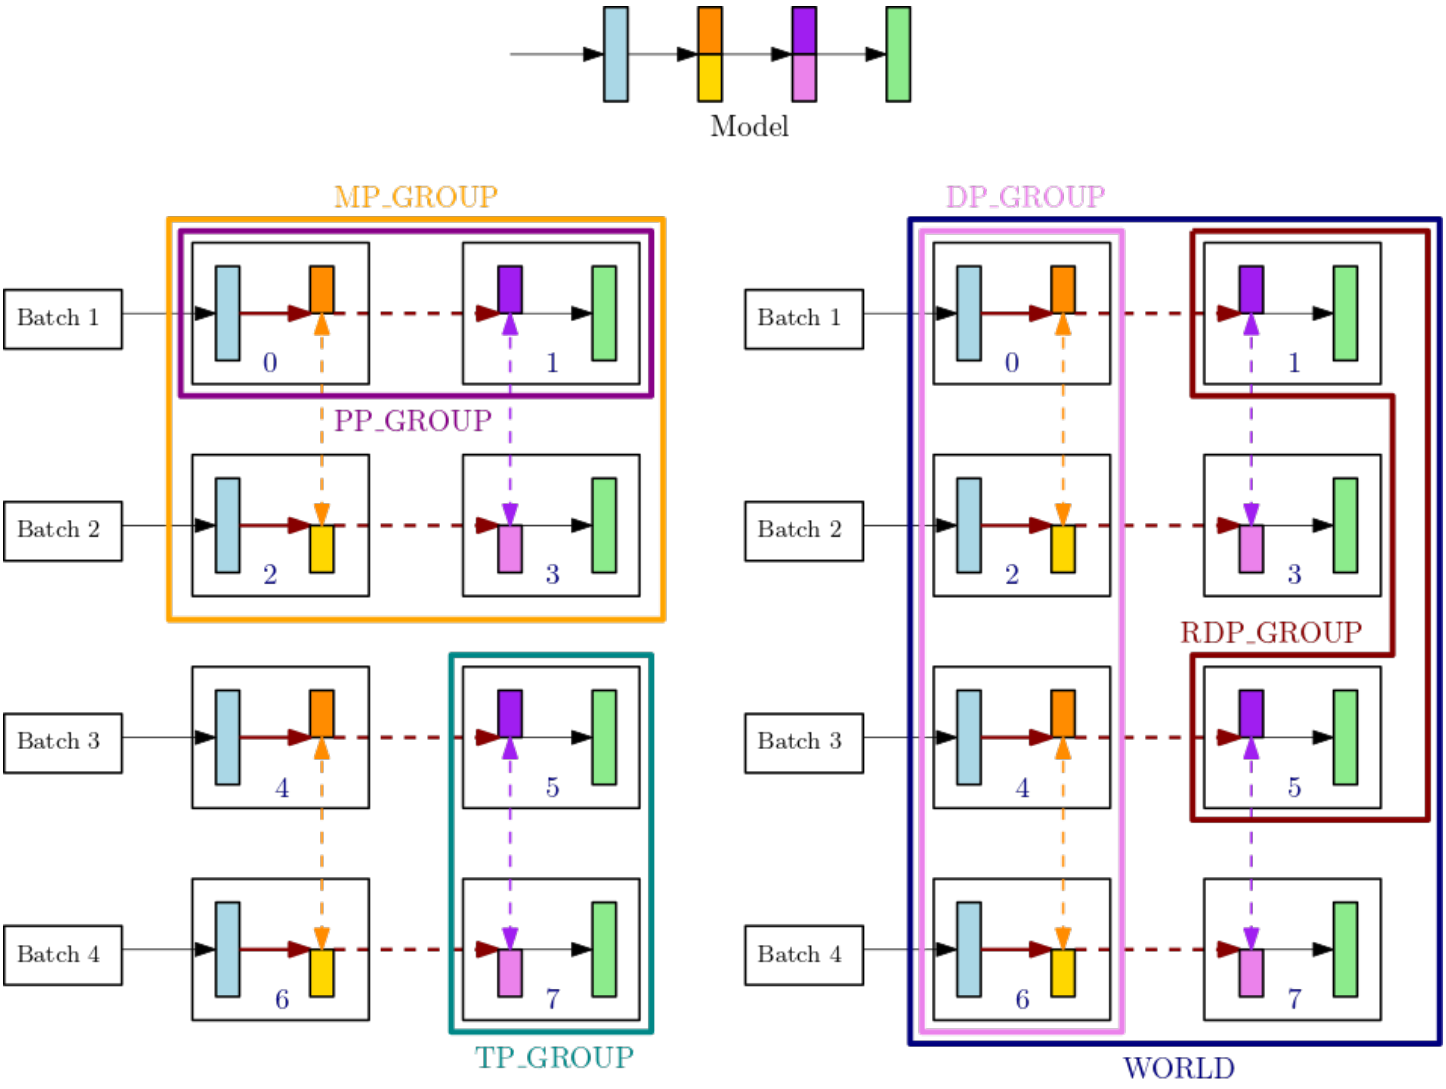
Similarly, given a supported HuggingFace model `state_dict`, you can use the `translate_hf_state_dict_to_smdistributed` function to convert it to a format readable by `smp.DistributedModel`. This can be useful in transfer learning use cases, where a pre-trained model is loaded into a `smp.DistributedModel` for model-parallel fine-tuning:

```
from smdistributed.modelparallel.torch.nn.huggingface.roberta \
                                    import translate_state_dict_to_smdistributed

model = AutoModelForMaskedLM.from_config(roberta_config)
model = smp.DistributedModel(model)

pretrained_model = AutoModelForMaskedLM.from_pretrained("roberta-large")
translated_state_dict =
        translate_state_dict_to_smdistributed(pretrained_model.state_dict())

# load the translated pretrained weights into the smp.DistributedModel
model.load_state_dict(translated_state_dict)



# start fine-tuning...
```

Ranking Mechanism when Using a Combination of Pipeline Parallelism and Tensor Parallelism

This section explains how the ranking mechanism of model parallelism works with tensor parallelism. This is extended from the Ranking Basics for Core Features of the SageMaker Model Parallelism Library. With tensor parallelism, the library introduces three types of ranking and process group APIs: `smp.tp_rank()` for tensor parallel rank, `smp.pp_rank()` for pipeline parallel rank, and `smp.rdp_rank()` for reduced-data parallel rank. The corresponding communication process groups are tensor parallel group (`TP_GROUP`), pipeline parallel group (`PP_GROUP`), and reduced-data parallel group (`RDP_GROUP`). These groups are defined as follows:

- A *tensor parallel group* (TP_GROUP) is an evenly divisible subset of the data parallel group, over which tensor parallel distribution of modules takes place. When the degree of pipeline parallelism is 1, TP_GROUP is the same as *model parallel group* (MP_GROUP).
- A *pipeline parallel group* (PP_GROUP) is the group of processes over which pipeline parallelism takes place. When the tensor parallelism degree is 1, PP_GROUP is the same as MP_GROUP.
- A *reduced-data parallel group* (RDP_GROUP) is a set of processes that hold both the same pipeline parallelism partitions and the same tensor parallel partitions, and perform data parallelism among themselves. This is called the reduced data parallel group because it is a subset of the entire data parallelism group, DP_GROUP. For the model parameters that are distributed within the TP_GROUP , the gradient `allreduce` operation is performed only for reduced-data parallel group, while for the parameters that are not distributed, the gradient `allreduce` takes place over the entire DP_GROUP.
- A model parallel group (MP_GROUP) refers to a group of processes that collectively store the entire model. It consists of the union of the PP_GROUPs of all the ranks that are in the TP_GROUP of the current process. When the degree of tensor parallelism is 1, MP_GROUP is equivalent to PP_GROUP. It is also consistent with the existing definition of MP_GROUP from previous `smdistributed` releases. Note that the current TP_GROUP is a subset of both the current DP_GROUP and the current MP_GROUP.

To learn more about the communication process APIs in the SageMaker model parallelism library, see the Common API and the PyTorch-specific APIs in the *SageMaker Python SDK documentation*.

For example, consider process groups for a single node with 8 GPUs, where the degree of tensor parallelism is 2, the degree of pipeline parallelism is 2, and the degree of data parallelism is 4. The upper center part of the preceding figure shows an example of a model with 4 layers. The lower left and lower right parts of figure illustrate the 4-layer model distributed across 4 GPUs using both pipeline parallelism and tensor parallelism, where tensor parallelism is used for the middle two layers. These two lower figures are simple copies to illustrate different group boundary lines. The partitioned model is replicated for data parallelism across GPUs 0-3 and 4-7. The lower left figure shows the definitions of `MP_GROUP`, `PP_GROUP`, and `TP_GROUP`. The lower right figure shows `RDP_GROUP`, `DP_GROUP`, and `WORLD` over the same set of GPUs. The gradients for the layers and layer slices that have the same color are `allreduced` together for data parallelism. For example, the first layer (light blue) gets the `allreduce` operations across `DP_GROUP`, whereas the dark orange slice in the second layer only gets the `allreduce` operations within the `RDP_GROUP` of its process. The bold dark red arrows represent tensors with the batch of its entire `TP_GROUP`.

```
GPU0: pp_rank 0, tp_rank 0, rdp_rank 0, dp_rank 0, mp_rank 0
GPU1: pp_rank 1, tp_rank 0, rdp_rank 0, dp_rank 0, mp_rank 1
GPU2: pp_rank 0, tp_rank 1, rdp_rank 0, dp_rank 1, mp_rank 2
GPU3: pp_rank 1, tp_rank 1, rdp_rank 0, dp_rank 1, mp_rank 3
GPU4: pp_rank 0, tp_rank 0, rdp_rank 1, dp_rank 2, mp_rank 0
GPU5: pp_rank 1, tp_rank 0, rdp_rank 1, dp_rank 2, mp_rank 1
GPU6: pp_rank 0, tp_rank 1, rdp_rank 1, dp_rank 3, mp_rank 2
GPU7: pp_rank 1, tp_rank 1, rdp_rank 1, dp_rank 3, mp_rank 3
```

In this example, pipeline parallelism occurs across the GPU pairs (0,1); (2,3); (4,5) and (6,7). In addition, data parallelism (`allreduce`) takes place across GPUs 0, 2, 4, 6, and independently over GPUs 1, 3, 5, 7. Tensor parallelism happens over subsets of DP_GROUPs, across the GPU pairs (0,2); (1,3); (4,6) and (5,7).

Optimizer State Sharding

Optimizer state sharding is a useful memory-saving technique that shards the optimizer state (the set of weights that describes the state of optimizer) across data parallel device groups. You can use optimizer state sharding whenever you use a stateful optimizer (such as Adam) or an FP16 optimizer (which stores both FP16 and FP32 copies of the parameters).

> **Note**
>
> Optimizer state sharding is available for PyTorch in the SageMaker model parallelism library v1.6.0 and later.

How to Use Optimizer State Sharding

You can turn on *optimizer state sharding* by setting `"shard_optimizer_state": True` in the `modelparallel` configuration.

When this feature is turned on, the library partitions the set of model parameters based on the data parallelism degree. The gradients corresponding to the `i`th partition get reduced only at the `i`th data parallel rank. At the end of the first call to an `smp.step` decorator function, the optimizer wrapped by `smp.DistributedOptimizer` redefines its parameters to be only limited to those parameters corresponding to the partition of the current data parallel rank. The redefined parameters are called *virtual parameters* and share underlying storage with the original

parameters. During the first call to `optimizer.step`, the optimizer states are created based on these redefined parameters, which are sharded because of the original partition. After the optimizer update, the AllGather operation (as part of the `optimizer.step` call) runs across the data parallel ranks to achieve consistent parameter states.

> **Tip**
>
> Optimizer state sharding can be useful when the degree of data parallelism is greater than 1 and the model has more than a billion parameters.
> The degree of data parallelism is calculated by `(processes_per_host * instance_count / pipeline_parallel_degree)`, and the `smp.dp_size()` function handles the sizing in the background.

Configure a SageMaker PyTorch ModelTrainer

```
mpi_options = {
    "enabled" : True,
    "processes_per_host" : 8,               # 8 processes
    "custom_mpi_options" : "--mca btl_vader_single_copy_mechanism none "
}

smp_options = {
    "enabled":True,
    "parameters": {
        "microbatches": 4,
        "pipeline_parallel_degree": 2,    # alias for "partitions"
        "placement_strategy": "cluster",
        "tensor_parallel_degree": 2,      # tp over 2 devices
        "ddp": True,
        "shard_optimizer_state": True
    }
}
```

Adapt your PyTorch training script

See Adapt your PyTorch training script in the *Tensor parallelism combined with pipeline parallelism* section. There's no additional modification required for the script.

Activation Checkpointing

Activation checkpointing (or *gradient checkpointing*) is a technique to reduce memory usage by clearing activations of certain layers and recomputing them during a backward pass. Effectively, this trades extra computation time for reduced memory usage. If a module is checkpointed, at the end of a forward pass, the inputs to and outputs from the module stay in memory. Any intermediate tensors that would have been part of the computation inside that module are freed up during the forward pass. During the backward pass of checkpointed modules, these tensors are recomputed. At this point, the layers beyond this checkpointed module have finished their backward pass, so the peak memory usage with checkpointing can be lower.

> **Note**
>
> This feature is available for PyTorch in the SageMaker model parallelism library v1.6.0 and later.

How to Use Activation Checkpointing

With `smdistributed.modelparallel`, you can use activation checkpointing at the granularity of a module. For all `torch.nn` modules except `torch.nn.Sequential`, you can only checkpoint a module tree if it lies within one partition from the perspective of pipeline parallelism. In case of the `torch.nn.Sequential` module, each module tree inside the sequential module must lie completely within one partition for activation checkpointing to work. When you use manual partitioning, be aware of these restrictions.

When you use automated model partitioning, you can find the partitioning assignment logs starting with `Partition assignments:` in the training job logs. If a module is partitioned across multiple ranks (for example, with one descendant on one rank and another descendant on a different rank), the library ignores the attempt to checkpoint the module and raises a warning message that the module won't be checkpointed.

> **Note**
>
> The SageMaker model parallelism library supports both overlapping and non-overlapping `allreduce` operation in combination with checkpointing.

> **Note**
>
> PyTorch's native checkpointing API is not compatible with `smdistributed.modelparallel`.

Example 1: The following sample code shows how to use activation checkpointing when you have a model definition in your script.

```
import torch.nn as nn
import torch.nn.functional as F

from smdistributed.modelparallel.torch.patches.checkpoint import checkpoint

class Net(nn.Module):
    def __init__(self):
        super(Net, self).__init__()
        self.conv1 = nn.Conv2d(1, 32, 3, 1)
        self.conv2 = nn.Conv2d(32, 64, 3, 1)
        self.fc1 = nn.Linear(9216, 128)
        self.fc2 = nn.Linear(128, 10)

    def forward(self, x):
        x = self.conv1(x)
        x = self.conv2(x)
        x = F.max_pool2d(x, 2)
        x = torch.flatten(x, 1)
        # This call of fc1 will be checkpointed
        x = checkpoint(self.fc1, x)
        x = self.fc2(x)
        return F.log_softmax(x, 1)
```

Example 2: The following sample code shows how to use activation checkpointing when you have a sequential model in your script.

```
import torch.nn as nn
from smdistributed.modelparallel.torch.patches.checkpoint import checkpoint_sequential

class Net(nn.Module):
    def __init__(self):
        super(Net, self).__init__()
```

```
        self.seq = nn.Sequential(
            nn.Conv2d(1,20,5),
            nn.ReLU(),
            nn.Conv2d(20,64,5),
            nn.ReLU()
        )

    def forward(self, x):
        # This call of self.seq will be checkpointed
        x = checkpoint_sequential(self.seq, x)
        return F.log_softmax(x, 1)
```

Example 3: The following sample code shows how to use activation checkpointing when you import a prebuilt model from a library, such as PyTorch and Hugging Face Transformers. Whether you checkpoint sequential modules or not, do the following:

1. Wrap the model by `smp.DistributedModel()`.
2. Define an object for sequential layers.
3. Wrap the sequential layer object by `smp.set_activation_checkpointig()`.

```
import smdistributed.modelparallel.torch as smp
from transformers import AutoModelForCausalLM

smp.init()
model = AutoModelForCausalLM(*args, **kwargs)
model = smp.DistributedModel(model)

# Call set_activation_checkpointing API
transformer_layers = model.module.module.module.transformer.seq_layers
smp.set_activation_checkpointing(
    transformer_layers, pack_args_as_tuple=True, strategy='each')
```

Activation Offloading

When activation checkpointing and pipeline parallelism are turned on and the number of microbatches is greater than one, *activation offloading* is an additional feature that can further reduce memory usage. Activation offloading asynchronously moves the checkpointed activations corresponding to their microbatches that are not currently running in the CPU. Right before the GPU needs the activations for the microbatch's backward pass, this functionality prefetches the offloaded activations back from the CPU.

> **Note**
>
> This feature is available for PyTorch in the SageMaker model parallelism library v1.6.0 and later.

How to Use Activation Offloading

Use activation offloading to reduce memory usage when **the number of microbatches is greater than 1, and activation checkpointing is turned on** (see Activation Checkpointing). When the activation checkpointing is not used, activation offloading has no effect. When it is used with only one microbatch, it does not save memory.

To use activation offloading, set `"offload_activations": True` in the `modelparallel` configuration.

Activation offloading moves the checkpointed activations in `nn.Sequential` modules to CPU asynchronously. The data transfer over the PCIe link overlaps with GPU computation. The offloading happens immediately, as soon as the forward pass for a particular checkpointed layer is computed. The activations are loaded back to the GPU shortly before they are needed for the backward pass of a particular microbatch. The CPU-GPU transfer similarly overlaps with computation.

To adjust how early the activations are loaded back into the GPU, you can use the configuration parameter `"activation_loading_horizon"` (default is set to 4, must be `int` larger than 0). A larger activation loading horizon would cause the activations to be loaded back to the GPU earlier. If the horizon is too large, the memory-saving impact of activation offloading might be diminished. If the horizon is too small, the activations may not be loaded back in time, reducing the amount of overlap and degrading performance.

> **Tip**
>
> Activation offloading can be useful for large models with over a hundred billion parameters.

Configure a SageMaker PyTorch ModelTrainer

```
mpi_options = {
```

```
    "enabled" : True,
    "processes_per_host" : 8,               # 8 processes
    "custom_mpi_options" : "--mca btl_vader_single_copy_mechanism none "
}

smp_options = {
    "enabled":True,
    "parameters": {
        "microbatches": 4,
        "pipeline_parallel_degree": 2,    # alias for "partitions"
        "placement_strategy": "cluster",
        "tensor_parallel_degree": 2,      # tp over 2 devices
        "ddp": True,
        "offload_activations": True,
        "activation_loading_horizon": 4   # optional. default is 4.
    }
}
```

FP16 Training with Model Parallelism

For FP16 training, apply the following modifications to your training script and ModelTrainer.

> **Note**
>
> This feature is available for PyTorch in the SageMaker model parallelism library v1.10.0 and later.

Adapt your PyTorch training script

1. Wrap your model using the smdistributed.modelparallel.torch.model_creation() context manager.

```
# fp16_training_script.py

import torch
import smdistributed.modelparallel.torch as smp

with smp.model_creation(
    dtype=torch.float16 if args.fp16 else torch.get_default_dtype()
):
    model = ...
```

Tip

If you are using tensor parallelism, add `tensor_parallelism=smp.tp_size() > 1` to the `smp.model_creation` context manager. Adding this line also helps automatically detect whether tensor parallelism is activated or not.

```
with smp.model_creation(
    ... ,
    tensor_parallelism=smp.tp_size() > 1
):
    model = ...
```

2. When you wrap the optimizer with `smdistributed.modelparallel.torch.DistributedOptimizer`, set either the `static_loss_scaling` or `dynamic_loss_scaling` argument. By default, `static_loss_scaling` is set to `1.0`, and `dynamic_loss_scaling` is set to `False`. If you set `dynamic_loss_scale=True`, you can feed dynamic loss scaling options as a dictionary through the `dynamic_loss_args` argument. In most cases, we recommend you use dynamic loss scaling with the default options. For more information, options, and examples of the optimizer wrapper function, see the smdistributed.modelparallel.torch.DistributedOptimizer API.

   The following code is an example of wrapping an `Adadelta` optimizer object with dynamic loss scaling for FP16 training.

```
optimizer = torch.optim.Adadelta(...)
optimizer = smp.DistributedOptimizer(
    optimizer,
    static_loss_scale=None,
    dynamic_loss_scale=True,
    dynamic_loss_args={
        "scale_window": 1000,
        "min_scale": 1,
        "delayed_shift": 2
    }
)
```

Configure a SageMaker PyTorch ModelTrainer

Add the FP16 parameter ("fp16") to the distribution configuration for model parallelism when creating a SageMaker PyTorch ModelTrainer object. For a complete list of the configuration parameters for model parallelism, see Parameters for smdistributed.

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import SourceCode

smp_options = {
    "enabled": True,
    "parameters":  {
        "microbatches":  4,
        "pipeline_parallel_degree":  2,
        "tensor_parallel_degree":  2,
        ...,

        "fp16": True
    }
}

fp16_model_trainer = ModelTrainer(
    source_code=SourceCode(entry_script="fp16_training_script.py"),
    ...,

    distribution={
        "smdistributed": {"modelparallel": smp_options},
        "mpi": {...}
    }
)

fp16_model_trainer.train(...)
```

When FP16 training starts, the model and the optimizer are wrapped by FP16_Module and FP16_Optimizer respectively, which are modified smdistributed versions of the Apex utils. FP16_Module converts the model to FP16 dtype and deals with the forward pass in FP16.

Tip

You can apply gradient clipping by calling clip_master_grads before optimizer.step.

```
optimizer.clip_master_grads(max_norm)     # max_norm(float or int): max norm of
 the gradients
```

Tip

When using `torch.optim.lr_scheduler` and FP16 training, you need to pass `optimizer.optimizer` to the LR scheduler rather than the optimizer. See the following example code.

```
from torch.optim.lr_scheduler import StepLR

scheduler = StepLR(
    optimizer.optimizer if smp.state.cfg.fp16 else optimizer,
    step_size=1,
    gamma=args.gamma
)
```

Support for FlashAttention

Support for FlashAttention is a feature of the library only applicable for the *distributed transformer* model, which is a Transformer model wrapped by `smp.DistributedModel()` for model-parallel training. This feature is also compatible with the section called "Tensor Parallelism".

The FlashAttention library only supports models when `attention_head_size` is set to a value that's a multiple of 8 and less than 128. Therefore, when you train a distributed transformer and make sure that FlashAttention works properly, you should adjust parameters to make the attention head size comply the requirements. For more information, see also Installation and features in the *FlashAttention GitHub repository*.

For example, assume that you configure a Transformer model with `hidden_width=864` and `num_heads=48`. The head size of FlashAttention is calculated as `attention_head_size = hidden_width / num_heads = 864 / 48 = 18`. To enable FlashAttention, you need to adjust the `num_heads` parameter to 54, so that `attention_head_size = hidden_width / num_heads = 864 / 54 = 16`, which is a multiple of 8.

Run a SageMaker Distributed Training Job with Model Parallelism

Learn how to run a model-parallel training job of your own training script using the SageMaker Python SDK with the SageMaker model parallelism library.

There are three use-case scenarios for running a SageMaker training job.

1. You can use one of the pre-built Amazon Deep Learning Container for TensorFlow and PyTorch. This option is recommended if it is the first time for you to use the model parallel library. To find a tutorial for how to run a SageMaker model parallel training job, see the example notebooks at PyTorch training with Amazon SageMaker AI's model parallelism library.
2. You can extend the pre-built containers to handle any additional functional requirements for your algorithm or model that the pre-built SageMaker Docker image doesn't support. To find an example of how you can extend a pre-built container, see Extend a Pre-built Container.
3. You can adapt your own Docker container to work with SageMaker AI using the SageMaker Training toolkit. For an example, see Adapting Your Own Training Container.

For options 2 and 3 in the preceding list, refer to Extend a Pre-built Docker Container that Contains SageMaker's Distributed Model Parallel Library to learn how to install the model parallel library in an extended or customized Docker container.

In all cases, you launch your training job configuring a SageMaker `TensorFlow` or `PyTorch` ModelTrainer to activate the library. To learn more, see the following topics.

Topics

- Step 1: Modify Your Own Training Script Using SageMaker's Distributed Model Parallel Library
- Step 2: Launch a Training Job Using the SageMaker Python SDK

Step 1: Modify Your Own Training Script Using SageMaker's Distributed Model Parallel Library

Use this section to learn how to customize your training script to use the core features of the Amazon SageMaker AI model parallelism library. To use the library-specific API functions and parameters, we recommend you use this documentation alongside the SageMaker model parallel library APIs in the *SageMaker Python SDK documentation*.

The training script examples provided in these sections are simplified and designed to highlight the required changes you must make to use the library. For end-to-end, runnable notebook examples

that demonstrate how to use a TensorFlow or PyTorch training script with the SageMaker model parallelism library, see Amazon SageMaker AI model parallelism library v2 examples.

Topics

- Split the model of your training script using the SageMaker model parallelism library
- Modify a TensorFlow training script
- Modify a PyTorch Training Script

Split the model of your training script using the SageMaker model parallelism library

There are two ways to modify your training script to set up model splitting: automated splitting or manual splitting.

Automated model splitting

When you use SageMaker's model parallelism library, you can take advantage of *automated model splitting*, also referred to as *automated model partitioning*. The library uses a partitioning algorithm that balances memory, minimizes communication between devices, and optimizes performance. You can configure the automated partitioning algorithm to optimize for speed or memory.

Alternatively, you can use manual model splitting. We recommend automated model splitting, unless you are very familiar with the model architecture and have a good idea of how to efficiently partition your model.

How it works

Auto-partitioning occurs during the first training step, when the `smp.step`-decorated function is first called. During this call, the library first constructs a version of the model on the CPU RAM (to avoid GPU memory limitations), and then analyzes the model graph and makes a partitioning decision. Based on this decision, each model partition is loaded on a GPU, and only then the first step is executed. Because of these analysis and partitioning steps, the first training step might take longer.

In either framework, the library manages the communication between devices through its own backend, which is optimized for Amazon infrastructure.

The auto-partition design adapts to the characteristics of the framework, and the library does the partitioning at the granularity level that is more natural in each framework. For instance, in

TensorFlow, each specific operation can be assigned to a different device, whereas in PyTorch, the assignment is done at the module level, where each module consists of multiple operations. The follow section reviews the specifics of the design in each framework.

Automated model splitting with PyTorch

During the first training step, the model parallelism library internally runs a tracing step that is meant to construct the model graph and determine the tensor and parameter shapes. After this tracing step, the library constructs a tree, which consists of the nested `nn.Module` objects in the model, as well as additional data gathered from tracing, such as the amount of stored `nn.Parameters`, and execution time for each `nn.Module`.

Next, the library traverses this tree from the root and runs a partitioning algorithm that assigns each `nn.Module` to a device, which balances computational load (measured by module execution time) and memory use (measured by the total stored `nn.Parameter` size and activations). If multiple `nn.Modules` share the same `nn.Parameter`, then these modules are placed on the same device to avoid maintaining multiple versions of the same parameter. Once the partitioning decision is made, the assigned modules and weights are loaded to their devices.

For instructions on how to register the `smp.step` decorator to your PyTorch training script, see the section called “Automated splitting with PyTorch”.

Automated model splitting with TensorFlow

The model parallelism library analyzes the sizes of the trainable variables and the graph structure, and internally uses a graph partitioning algorithm. This algorithm comes up with a device assignment for each operation, with the objective of minimizing the amount of communication needed across devices, subject to two constraints:

- Balancing the number of variables stored in each device
- Balancing the number of operations executed in each device

If you specify `speed` for `optimize` (in the model parallelism parameters in the Python SDK), the library tries to balance the number of operations and `tf.Variable` objects in each device. Otherwise, it tries to balance the total size of `tf.Variables`.

Once the partitioning decision is made, the library creates a serialized representation of the subgraph that each device needs to execute and imports them onto each device. While

partitioning, the library places operations that consume the same `tf.Variable` and operations that are part of the same Keras layer onto the same device. It also respects the colocation constraints imposed by TensorFlow. This means that, for example, if there are two Keras layers that share a `tf.Variable`, then all operations that are part of these layers are placed on a single device.

For instructions on how to register the `smp.step` decorator to your PyTorch training script, see the section called "Automated splitting with TensorFlow".

Comparison of automated model splitting between frameworks

In TensorFlow, the fundamental unit of computation is a `tf.Operation`, and TensorFlow represents the model as a directed acyclic graph (DAG) of `tf.Operations`, and therefore the model parallelism library partitions this DAG so that each node goes to one device. Crucially, `tf.Operation` objects are sufficiently rich with customizable attributes, and they are universal in the sense that every model is guaranteed to consist of a graph of such objects.

PyTorch on the other hand, does not have an equivalent notion of operation that is sufficiently rich and universal. The closest unit of computation in PyTorch that has these characteristics is an `nn.Module`, which is at a much higher granularity level, and this is why the library does partitioning at this level in PyTorch.

Manual Model Splitting

If you want to manually specify how to partition your model across devices, use the `smp.partition` context manager. For instructions on how to set the context manager for manual partitioning, see the following pages.

- the section called "Manual splitting with TensorFlow"
- the section called "Manual splitting with PyTorch"

To use this option after making modifications, in Step 2, you'll need to set `auto_partition` to `False`, and define a `default_partition` in the ModelTrainer class of the SageMaker Python SDK. Any operation that is not explicitly placed on a partition through the `smp.partition` context manager is executed on the `default_partition`. In this case, the automated splitting logic is bypassed, and each operation is placed based on your specification. Based on the resulting graph structure, the model parallelism library creates a pipelined execution schedule automatically.

Modify a TensorFlow training script

In this section, you learn how to modify TensorFlow training scripts to configure the SageMaker model parallelism library for auto-partitioning and manual partitioning. This selection of examples also includes an example integrated with Horovod for hybrid model and data parallelism.

> **Note**
>
> To find which TensorFlow versions are supported by the library, see the section called "Supported Frameworks and Amazon Web Services Regions".

The required modifications you must make to your training script to use the library are listed in Automated splitting with TensorFlow.

To learn how to modify your training script to use hybrid model and data parallelism with Horovod, see Automated splitting with TensorFlow and Horovod for hybrid model and data parallelism.

If you want to use manual partitioning, also review Manual splitting with TensorFlow.

The following topics show examples of training scripts that you can use to configure SageMaker's model parallelism library for auto-partitioning and manual partitioning TensorFlow models.

> **Note**
>
> Auto-partitioning is enabled by default. Unless otherwise specified, the example scripts use auto-partitioning.

Topics

- Automated splitting with TensorFlow
- Automated splitting with TensorFlow and Horovod for hybrid model and data parallelism
- Manual splitting with TensorFlow
- Unsupported framework features

Automated splitting with TensorFlow

The following training script changes are required to run a TensorFlow model with SageMaker's model parallelism library:

1. Import and initialize the library with `smp.init()`.
2. Define a Keras model by inheriting from `smp.DistributedModel` instead of the Keras Model class. Return the model outputs from the call method of the `smp.DistributedModel` object. Be mindful that any tensors returned from the call method will be broadcast across model-parallel devices, incurring communication overhead, so any tensors that are not needed outside the call method (such as intermediate activations) should not be returned.
3. Set `drop_remainder=True` in `tf.Dataset.batch()` method. This is to ensure that the batch size is always divisible by the number of microbatches.
4. Seed the random operations in the data pipeline using `smp.dp_rank()`, e.g., `shuffle(ds, seed=smp.dp_rank())` to ensure consistency of data samples across GPUs that hold different model partitions.
5. Put the forward and backward logic in a step function and decorate it with `smp.step`.
6. Perform post-processing on the outputs across microbatches using `StepOutput` methods such as `reduce_mean`. The `smp.step` function must have a return value that depends on the output of `smp.DistributedModel`.
7. If there is an evaluation step, similarly place the forward logic inside an `smp.step`-decorated function and post-process the outputs using `StepOutput` API.

To learn more about the SageMaker's model parallelism library API, refer to the API documentation.

The following Python script is an example of a training script after the changes are made.

```
import tensorflow as tf

# smdistributed: Import TF2.x API
import smdistributed.modelparallel.tensorflow as smp

# smdistributed: Initialize
smp.init()

# Download and load MNIST dataset.
(x_train, y_train), (x_test, y_test) = tf.keras.datasets.mnist.load_data(
    "MNIST-data-%d" % smp.rank()
)
x_train, x_test = x_train / 255.0, x_test / 255.0

# Add a channels dimension
```

```
x_train = x_train[..., tf.newaxis]
x_test = x_test[..., tf.newaxis]

# smdistributed: If needed, seed the shuffle with smp.dp_rank(), and drop_remainder
# in batching to make sure batch size is always divisible by number of microbatches
train_ds = (
    tf.data.Dataset.from_tensor_slices((x_train, y_train))
    .shuffle(10000, seed=smp.dp_rank())
    .batch(256, drop_remainder=True)
)

# smdistributed: Define smp.DistributedModel the same way as Keras sub-classing API
class MyModel(smp.DistributedModel):
    def __init__(self):
        super(MyModel, self).__init__()
        # define layers

    def call(self, x, training=None):
        # define forward pass and return the model output

model = MyModel()

loss_object = tf.keras.losses.SparseCategoricalCrossentropy(from_logits=True)
optimizer = tf.keras.optimizers.Adam()
train_accuracy = tf.keras.metrics.SparseCategoricalAccuracy(name="train_accuracy")

# smdistributed: Define smp.step. Return any tensors needed outside
@smp.step
def get_grads(images, labels):
    predictions = model(images, training=True)
    loss = loss_object(labels, predictions)

    grads = optimizer.get_gradients(loss, model.trainable_variables)
    return grads, loss, predictions

@tf.function
def train_step(images, labels):
    gradients, loss, predictions = get_grads(images, labels)

    # smdistributed: Accumulate the gradients across microbatches
    gradients = [g.accumulate() for g in gradients]
    optimizer.apply_gradients(zip(gradients, model.trainable_variables))
```

```
    # smdistributed: Merge predictions and average losses across microbatches
    train_accuracy(labels, predictions.merge())
    return loss.reduce_mean()

for epoch in range(5):
    # Reset the metrics at the start of the next epoch
    train_accuracy.reset_states()
    for images, labels in train_ds:
        loss = train_step(images, labels)
    accuracy = train_accuracy.result()
```

If you are done preparing your training script, proceed to Step 2: Launch a Training Job Using the SageMaker Python SDK. If you want to run a hybrid model and data parallel training job, continue to the next section.

Automated splitting with TensorFlow and Horovod for hybrid model and data parallelism

You can use the SageMaker model parallelism library with Horovod for hybrid model and data parallelism. To read more about how the library splits a model for hybrid parallelism, see Pipeline parallelism (available for PyTorch and TensorFlow).

In this step, we focus on how to modify your training script to adapt the SageMaker model parallelism library.

To properly set up your training script to pick up the hybrid parallelism configuration that you'll set in Step 2: Launch a Training Job Using the SageMaker Python SDK, use the library's helper functions, `smp.dp_rank()` and `smp.mp_rank()`, which automatically detect the data parallel rank and model parallel rank respectively.

To find all MPI primitives the library supports, see MPI Basics in the SageMaker Python SDK documentation.

The required changes needed in the script are:

- Adding `hvd.allreduce`
- Broadcasting variables after the first batch, as required by Horovod
- Seeding shuffling and/or sharding operations in the data pipeline with `smp.dp_rank()`.

Note

When you use Horovod, you must not directly call `hvd.init` in your training script. Instead, you'll have to set `"horovod"` to `True` in the SageMaker Python SDK `modelparallel` parameters in Step 2: Launch a Training Job Using the SageMaker Python SDK. This allows the library to internally initialize Horovod based on the device assignments of model partitions. Calling `hvd.init()` directly in your training script can cause problems.

Note

Using the `hvd.DistributedOptimizer` API directly in your training script might result in a poor training performance and speed, because the API implicitly places the `AllReduce` operation inside `smp.step`. We recommend you to use the model parallelism library with Horovod by directly calling `hvd.allreduce` after calling `accumulate()` or `reduce_mean()` on the gradients returned from `smp.step`, as will be shown in the following example.

To learn more about the SageMaker's model parallelism library API, refer to the API documentation.

```
import tensorflow as tf
import horovod.tensorflow as hvd

# smdistributed: Import TF2.x API
import smdistributed.modelparallel.tensorflow as smp

# smdistributed: Initialize
smp.init()

# Download and load MNIST dataset.
(x_train, y_train), (x_test, y_test) = tf.keras.datasets.mnist.load_data(
    "MNIST-data-%d" % smp.rank()
)
x_train, x_test = x_train / 255.0, x_test / 255.0

# Add a channels dimension
x_train = x_train[..., tf.newaxis]
```

```
x_test = x_test[..., tf.newaxis]

# smdistributed: Seed the shuffle with smp.dp_rank(), and drop_remainder
# in batching to make sure batch size is always divisible by number of microbatches
train_ds = (
    tf.data.Dataset.from_tensor_slices((x_train, y_train))
    .shuffle(10000, seed=smp.dp_rank())
    .batch(256, drop_remainder=True)
)

# smdistributed: Define smp.DistributedModel the same way as Keras sub-classing API
class MyModel(smp.DistributedModel):
    def __init__(self):
        super(MyModel, self).__init__()
        # define layers

    def call(self, x, training=None):
        # define forward pass and return model outputs

model = MyModel()

loss_object = tf.keras.losses.SparseCategoricalCrossentropy(from_logits=True)
optimizer = tf.keras.optimizers.Adam()
train_accuracy = tf.keras.metrics.SparseCategoricalAccuracy(name="train_accuracy")

# smdistributed: Define smp.step. Return any tensors needed outside
@smp.step
def get_grads(images, labels):
    predictions = model(images, training=True)
    loss = loss_object(labels, predictions)

    grads = optimizer.get_gradients(loss, model.trainable_variables)
    return grads, loss, predictions

@tf.function
def train_step(images, labels, first_batch):
    gradients, loss, predictions = get_grads(images, labels)

    # smdistributed: Accumulate the gradients across microbatches
    # Horovod: AllReduce the accumulated gradients
    gradients = [hvd.allreduce(g.accumulate()) for g in gradients]
    optimizer.apply_gradients(zip(gradients, model.trainable_variables))
```

```
    # Horovod: Broadcast the variables after first batch
    if first_batch:
        hvd.broadcast_variables(model.variables, root_rank=0)
        hvd.broadcast_variables(optimizer.variables(), root_rank=0)

    # smdistributed: Merge predictions across microbatches
    train_accuracy(labels, predictions.merge())
    return loss.reduce_mean()

for epoch in range(5):
    # Reset the metrics at the start of the next epoch
    train_accuracy.reset_states()

    for batch, (images, labels) in enumerate(train_ds):
        loss = train_step(images, labels, tf.constant(batch == 0))
```

Manual splitting with TensorFlow

Use `smp.partition` context managers to place operations in specific partition. Any operation not placed in any `smp.partition` contexts is placed in the `default_partition`. To learn more about the SageMaker's model parallelism library API, refer to the API documentation.

```
import tensorflow as tf

# smdistributed: Import TF2.x API.
import smdistributed.modelparallel.tensorflow as smp

# smdistributed: Initialize
smp.init()

# Download and load MNIST dataset.
(x_train, y_train), (x_test, y_test) = tf.keras.datasets.mnist.load_data(
    "MNIST-data-%d" % smp.rank()
)
x_train, x_test = x_train / 255.0, x_test / 255.0

# Add a channels dimension
x_train = x_train[..., tf.newaxis]
x_test = x_test[..., tf.newaxis]

# smdistributed: If needed, seed the shuffle with smp.dp_rank(), and drop_remainder
```

```
# in batching to make sure batch size is always divisible by number of microbatches.
train_ds = (
    tf.data.Dataset.from_tensor_slices((x_train, y_train))
    .shuffle(10000, seed=smp.dp_rank())
    .batch(256, drop_remainder=True)
)

# smdistributed: Define smp.DistributedModel the same way as Keras sub-classing API.
class MyModel(smp.DistributedModel):
    def __init__(self):
         # define layers

    def call(self, x):
        with smp.partition(0):
            x = self.layer0(x)
        with smp.partition(1):
            return self.layer1(x)

model = MyModel()

loss_object = tf.keras.losses.SparseCategoricalCrossentropy(from_logits=True)
optimizer = tf.keras.optimizers.Adam()
train_accuracy = tf.keras.metrics.SparseCategoricalAccuracy(name="train_accuracy")

# smdistributed: Define smp.step. Return any tensors needed outside
@smp.step
def get_grads(images, labels):
    predictions = model(images, training=True)
    loss = loss_object(labels, predictions)

    grads = optimizer.get_gradients(loss, model.trainable_variables)
    return grads, loss, predictions

@tf.function
def train_step(images, labels):
    gradients, loss, predictions = get_grads(images, labels)

    # smdistributed: Accumulate the gradients across microbatches
    gradients = [g.accumulate() for g in gradients]
    optimizer.apply_gradients(zip(gradients, model.trainable_variables))

    # smdistributed: Merge predictions and average losses across microbatches
```

```
    train_accuracy(labels, predictions.merge())
    return loss.reduce_mean()

for epoch in range(5):
    # Reset the metrics at the start of the next epoch
    train_accuracy.reset_states()
    for images, labels in train_ds:
        loss = train_step(images, labels)
    accuracy = train_accuracy.result()
```

Unsupported framework features

The following TensorFlow features are not supported by the library:

- `tf.GradientTape()` is currently not supported. You can use `Optimizer.get_gradients()` or `Optimizer.compute_gradients()` instead to compute gradients.
- The `tf.train.Checkpoint.restore()` API is currently not supported. For checkpointing, use `smp.CheckpointManager` instead, which provides the same API and functionality. Note that checkpoint restores with `smp.CheckpointManager` should take place after the first step.

Modify a PyTorch Training Script

In this section, you learn how to modify PyTorch training scripts to configure the SageMaker model parallelism library for auto-partitioning and manual partitioning.

> **Note**
>
> To find which PyTorch versions are supported by the library, see the section called "Supported Frameworks and Amazon Web Services Regions".

> **Tip**
>
> For end-to-end notebook examples that demonstrate how to use a PyTorch training script with the SageMaker model parallelism library, see Amazon SageMaker AI model parallelism library v1 examples.

Note that auto-partitioning is enabled by default. Unless otherwise specified, the following scripts use auto-partitioning.

Topics

- Automated splitting with PyTorch
- Manual splitting with PyTorch
- Considerations
- Unsupported framework features

Automated splitting with PyTorch

The following training script changes are required to run a PyTorch training script with SageMaker's model parallelism library:

1. Import and initialize the library with `smdistributed.modelparallel.torch.init()`.
2. Wrap the model with `smdistributed.modelparallel.torch.DistributedModel`. Be mindful that any tensors returned from the `forward` method of the underlying `nn.Module` object will be broadcast across model-parallel devices, incurring communication overhead, so any tensors that are not needed outside the call method (such as intermediate activations) should not be returned.

   > **Note**
   >
   > For FP16 training, you need to use the smdistributed.modelparallel.torch.model_creation() context manager to wrap the model. For more information, see FP16 Training with Model Parallelism.

3. Wrap the optimizer with `smdistributed.modelparallel.torch.DistributedOptimizer`.

   > **Note**
   >
   > For FP16 training, you need to set up static or dynamic loss scaling. For more information, see FP16 Training with Model Parallelism.

4. Use the returned `DistributedModel` object instead of a user model.

5. Put the forward and backward logic in a step function and decorate it with `smdistributed.modelparallel.torch.step`.
6. Restrict each process to its own device through `torch.cuda.set_device(smp.local_rank())`.
7. Move the input tensors to the GPU using the `.to()` API before the `smp.step` call (see example below).
8. Replace `torch.Tensor.backward` and `torch.autograd.backward` with `DistributedModel.backward`.
9. Perform post-processing on the outputs across microbatches using `StepOutput` methods such as `reduce_mean`.
10. If there is an evaluation step, similarly place the forward logic inside an `smp.step`-decorated function and post-process the outputs using `StepOutput` API.
11. Set `drop_last=True` in `DataLoader`. Alternatively, manually skip a batch in the training loop if the batch size is not divisible by the number of microbatches.

To learn more about the SageMaker's model parallelism library API, refer to the API documentation.

```
import torch
import torch.nn as nn
import torch.nn.functional as F
import torch.optim as optim
from torchnet.dataset import SplitDataset
from torchvision import datasets

import smdistributed.modelparallel.torch as smp

class GroupedNet(nn.Module):
    def __init__(self):
        super(GroupedNet, self).__init__()
        # define layers

    def forward(self, x):
        # define forward pass and return model outputs

# smdistributed: Define smp.step. Return any tensors needed outside.
@smp.step
```

```
def train_step(model, data, target):
    output = model(data)
    loss = F.nll_loss(output, target, reduction="mean")
    model.backward(loss)
    return output, loss

def train(model, device, train_loader, optimizer):
    model.train()
    for batch_idx, (data, target) in enumerate(train_loader):
        # smdistributed: Move input tensors to the GPU ID used by the current process,
        # based on the set_device call.
        data, target = data.to(device), target.to(device)
        optimizer.zero_grad()
        # Return value, loss_mb is a StepOutput object
        _, loss_mb = train_step(model, data, target)

        # smdistributed: Average the loss across microbatches.
        loss = loss_mb.reduce_mean()

        optimizer.step()

# smdistributed: initialize the backend
smp.init()

# smdistributed: Set the device to the GPU ID used by the current process.
# Input tensors should be transferred to this device.
torch.cuda.set_device(smp.local_rank())
device = torch.device("cuda")

# smdistributed: Download only on a single process per instance.
# When this is not present, the file is corrupted by multiple processes trying
# to download and extract at the same time
dataset = datasets.MNIST("../data", train=True, download=False)

# smdistributed: Shard the dataset based on data-parallel ranks
if smp.dp_size() > 1:
    partitions_dict = {f"{i}": 1 / smp.dp_size() for i in range(smp.dp_size())}
    dataset = SplitDataset(dataset, partitions=partitions_dict)
    dataset.select(f"{smp.dp_rank()}")

# smdistributed: Set drop_last=True to ensure that batch size is always divisible
# by the number of microbatches
train_loader = torch.utils.data.DataLoader(dataset, batch_size=64, drop_last=True)
```

```
model = GroupedNet()
optimizer = optim.Adadelta(model.parameters(), lr=4.0)

# smdistributed: Use the DistributedModel container to provide the model
# to be partitioned across different ranks. For the rest of the script,
# the returned DistributedModel object should be used in place of
# the model provided for DistributedModel class instantiation.
model = smp.DistributedModel(model)
optimizer = smp.DistributedOptimizer(optimizer)

train(model, device, train_loader, optimizer)
```

Manual splitting with PyTorch

Use `smp.partition` context managers to place modules in specific devices. Any module not placed in any `smp.partition` contexts is placed in the `default_partition`. The `default_partition` needs to be provided if `auto_partition` is set to `False`. The modules that are created within a specific `smp.partition` context are placed on the corresponding partition.

To learn more about the SageMaker's model parallelism library API, refer to the API documentation.

```
import torch
import torch.nn as nn
import torch.nn.functional as F
import torch.optim as optim
from torchnet.dataset import SplitDataset
from torchvision import datasets

import smdistributed.modelparallel.torch as smp

class GroupedNet(nn.Module):
    def __init__(self):
        super(GroupedNet, self).__init__()
        with smp.partition(0):
            # define child modules on device 0
        with smp.partition(1):
            # define child modules on device 1

    def forward(self, x):
        # define forward pass and return model outputs
```

```
# smdistributed: Define smp.step. Return any tensors needed outside.
@smp.step
def train_step(model, data, target):
    output = model(data)
    loss = F.nll_loss(output, target, reduction="mean")
    model.backward(loss)
    return output, loss

def train(model, device, train_loader, optimizer):
    model.train()
    for batch_idx, (data, target) in enumerate(train_loader):
        # smdistributed: Move input tensors to the GPU ID used by the current process,
        # based on the set_device call.
        data, target = data.to(device), target.to(device)
        optimizer.zero_grad()
        # Return value, loss_mb is a StepOutput object
        _, loss_mb = train_step(model, data, target)

        # smdistributed: Average the loss across microbatches.
        loss = loss_mb.reduce_mean()

        optimizer.step()

# smdistributed: initialize the backend
smp.init()

# smdistributed: Set the device to the GPU ID used by the current process.
# Input tensors should be transferred to this device.
torch.cuda.set_device(smp.local_rank())
device = torch.device("cuda")

# smdistributed: Download only on a single process per instance.
# When this is not present, the file is corrupted by multiple processes trying
# to download and extract at the same time
dataset = datasets.MNIST("../data", train=True, download=False)

# smdistributed: Shard the dataset based on data-parallel ranks
if smp.dp_size() > 1:
    partitions_dict = {f"{i}": 1 / smp.dp_size() for i in range(smp.dp_size())}
    dataset = SplitDataset(dataset, partitions=partitions_dict)
    dataset.select(f"{smp.dp_rank()}")
```

```
# smdistributed: Set drop_last=True to ensure that batch size is always divisible
# by the number of microbatches
train_loader = torch.utils.data.DataLoader(dataset, batch_size=64, drop_last=True)

model = GroupedNet()
optimizer = optim.Adadelta(model.parameters(), lr=4.0)

# smdistributed: Use the DistributedModel container to provide the model
# to be partitioned across different ranks. For the rest of the script,
# the returned DistributedModel object should be used in place of
# the model provided for DistributedModel class instantiation.
model = smp.DistributedModel(model)
optimizer = smp.DistributedOptimizer(optimizer)

train(model, device, train_loader, optimizer)
```

Considerations

When you configure a PyTorch training script using SageMaker's model parallelism library, you should be aware of the following:

- If you are using an optimization technique that relies on global gradient norms, for example gradient norm from the entire model, such as some variants of LAMB optimizer or global gradient clipping, you need to gather all the norms across the model partitions for correctness. You can use the library's communication basic data types to do this.
- All `torch.Tensor` arguments to the forward methods of the `nn.Modules` in your model must be used in the computation of the module output. In other words, the library does not support the case where there is a `torch.Tensor` argument to a module on which the module output does not depend.
- The argument to the `smp.DistributedModel.backward()` call must depend on all model outputs. In other words, there cannot be an output from the `smp.DistributedModel.forward` call that is not used in the computation of the tensor that is fed into the `smp.DistributedModel.backward` call.
- If there are `torch.cuda.synchronize()` calls in your code, you might need to call `torch.cuda.set_device(smp.local_rank())` immediately before the synchronize call. Otherwise unnecessary CUDA contexts might be created in device 0, which will needlessly consume memory.

- Since the library places `nn.Modules` on different devices, the modules in the model must not depend on any global state that is modified inside `smp.step`. Any state that remains fixed throughout training, or that is modified outside `smp.step` in a way that is visible to all processes, is allowed.
- You don't need to move the model to GPU (for example, using `model.to(device)`) when using the library. If you try to move the model to GPU before the model is partitioned (before the first `smp.step` call), the move call is ignored. The library automatically moves the part of the model assigned to a rank to its GPU. Once training with the library starts, don't move the model to CPU and use it, as it won't have correct parameters for modules not assigned to the partition held by the process. If you want to retrain a model or use it for inference without the library after it was trained using the model parallelism library, the recommended way is to save the full model using our checkpointing API and load it back to a regular PyTorch Module.
- If you have a list of modules such that output of one feeds into another, replacing that list with `nn.Sequential` can significantly improve performance.
- The weight update (`optimizer.step()`) needs to happen outside of `smp.step` because that is when the entire backward pass is done and gradients are ready. When using a hybrid model with model and data parallelism, at this point, AllReduce of gradients is also guaranteed to finish.
- When using the library in combination with data parallelism, make sure that the number of batches on all data parallel ranks is the same so that AllReduce does not hang waiting for a rank which is not participating in the step.
- If you launch a training job using an ml.p4d instance type (such as ml.p4d.24xlarge), you must set the data loader variable `num_workers=0`. For example, you may define your `DataLoader` as follows:

```
dataloader = torch.utils.data.DataLoader(
            data,
            batch_size=batch_size,
            num_workers=0,
            pin_memory=True,
            drop_last=True,
            shuffle=shuffle,
        )
```

- The inputs to `smp.step` must be the model inputs generated by `DataLoader`. This is because `smp.step` internally splits the input tensors along the batch dimension and pipelines them. This means that passing `DataLoader` itself to the `smp.step` function to generate the model inputs inside does not work.

For example, if you define a `DataLoader` as follows:

```
train_loader = torch.utils.data.DataLoader(dataset, batch_size=64, drop_last=True)
```

You should access the model inputs generated by `train_loader` and pass those to an `smp.step` decorated function. Do not pass `train_loader` directly to the `smp.step` function.

```
def train(model, device, train_loader, optimizer):
    model.train()
    for batch_idx, (data, target) in enumerate(train_loader):
        ...
        _, loss_mb = train_step(model, data, target)
        ...

@smp.step
def train_step(model, data, target):
    ...
    return output, loss
```

- The input tensors to `smp.step` must be moved to the current device using `.to()` API, which must take place after the `torch.cuda.set_device(local_rank())` call.

  For example, you may define the `train` function as follows. This function adds `data` and `target` to the current device using `.to()` API before using those input tensors to call `train_step`.

```
def train(model, device, train_loader, optimizer):
    model.train()
    for batch_idx, (data, target) in enumerate(train_loader):
        # smdistributed: Move input tensors to the GPU ID used by the current
 process,
        # based on the set_device call.
        data, target = data.to(device), target.to(device)
        optimizer.zero_grad()
        # Return value, loss_mb is a StepOutput object
        _, loss_mb = train_step(model, data, target)

        # smdistributed: Average the loss across microbatches.
        loss = loss_mb.reduce_mean()
```

```
        optimizer.step()
```

The input tensors to this `smp.set` decorated function have been moved to the current device in the `train` function above. The model does *not* need to be moved to the current device. The library automatically moves the part of the model assigned to a rank to its GPU.

```
@smp.step
def train_step(model, data, target):
    output = model(data)
    loss = F.nll_loss(output, target, reduction="mean")
    model.backward(loss)
    return output, loss
```

Unsupported framework features

The following PyTorch features are unsupported by SageMaker's model parallelism library:

- If you use data parallelism with the native PyTorch DDP, the `torch.nn.parallel.DistributedDataParallel` wrapper module is not supported by the library. The library internally manages integrating with PyTorch DDP, including parameter broadcast and gradient AllReduce. When using the library, module buffers are only broadcast once at the start of training. If your model has module buffers that need to be synchronized across data parallel groups at each step, you can do so through the `torch.distributed` API, using the process group that can be obtained via `smp.get_dp_process_group()`.
- For mixed precision training, the `apex.amp` module is not supported. The recommended way to use the library with automatic mixed-precision is to use `torch.cuda.amp`, with the exception of using `smp.amp.GradScaler` instead of the implementation in torch.
- `torch.jit.ScriptModules` or `ScriptFunctions` are not supported by `smp.DistributedModel`.
- `apex` : `FusedLayerNorm`, `FusedAdam`, `FusedLAMB`, and `FusedNovoGrad` from `apex` are not supported. You can use the library implementations of these through `smp.optimizers` and `smp.nn` APIs instead.

Step 2: Launch a Training Job Using the SageMaker Python SDK

The SageMaker Python SDK supports managed training of models with ML frameworks such as TensorFlow and PyTorch. To launch a training job using one of these frameworks, you define

a SageMaker TensorFlow estimator, a SageMaker PyTorch estimator, or a SageMaker generic Estimator to use the modified training script and model parallelism configuration.

- Create Your Own Docker Container with the SageMaker Distributed Model Parallel Library

Using the SageMaker TensorFlow and PyTorch Estimators

The TensorFlow and PyTorch estimator classes contain the `distribution` parameter, which you can use to specify configuration parameters for using distributed training frameworks. The SageMaker model parallel library internally uses MPI for hybrid data and model parallelism, so you must use the MPI option with the library.

The following template of a TensorFlow or PyTorch estimator shows how to configure the `distribution` parameter for using the SageMaker model parallel library with MPI.

```
import sagemaker
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import SourceCode, Compute
from sagemaker.train.distributed import Torchrun
from sagemaker.core.helper.session_helper import get_execution_role
from sagemaker.core import image_uris

training_image = image_uris.retrieve(
    framework="tensorflow", region=region, version='2.6.3',
    py_version='py38', instance_type='ml.p3.16xlarge',
    image_scope="training"
)

smd_mp_model_trainer = ModelTrainer(
    source_code=SourceCode(entry_script="your_training_script.py",
 source_dir="location_to_your_script"),
    role=get_execution_role(),
    compute=Compute(instance_count=1, instance_type='ml.p3.16xlarge'),
    training_image=training_image,
    distributed=Torchrun(),
    base_job_name="SMD-MP-demo",
)
```

```
smd_mp_model_trainer.train('s3://my_bucket/my_training_data/')
```

To enable the library, you need to pass configuration dictionaries to the `"smdistributed"` and `"mpi"` keys through the `distribution` argument of the SageMaker estimator constructors.

Configuration parameters for SageMaker model parallelism

- For the `"smdistributed"` key, pass a dictionary with the `"modelparallel"` key and the following inner dictionaries.

> **Note**
>
> Using `"modelparallel"` and `"dataparallel"` in one training job is not supported.

  - `"enabled"` – Required. To enable model parallelism, set `"enabled": True`.
  - `"parameters"` – Required. Specify a set of parameters for SageMaker model parallelism.
    - For a complete list of common parameters, see Parameters for `smdistributed` in the *SageMaker Python SDK documentation*.

      For TensorFlow, see TensorFlow-specific Parameters.

      For PyTorch, see PyTorch-specific Parameters.
    - `"pipeline_parallel_degree"` (or `"partitions"` in `smdistributed-modelparallel<v1.6.0`) – Required. Among the parameters for `smdistributed`, this parameter is required to specify how many model partitions you want to split into.

> **Important**
>
> There is a breaking change in the parameter name. The `"pipeline_parallel_degree"` parameter replaces the `"partitions"` since `smdistributed-modelparallel` v1.6.0. For more information, see Common Parameters for SageMaker model parallelism configuration and SageMaker Distributed Model Parallel Release Notes in the *SageMaker Python SDK documentation*.

- For the `"mpi"` key, pass a dictionary that contains the following:

- `"enabled"` – Required. Set `True` to launch the distributed training job with MPI.
- `"processes_per_host"` – Required. Specify the number of processes MPI should launch on each host. In SageMaker AI, a host is a single Amazon EC2 ML instance. The SageMaker Python SDK maintains a one-to-one mapping between processes and GPUs across model and data parallelism. This means that SageMaker AI schedules each process on a single, separate GPU and no GPU contains more than one process. If you are using PyTorch, you must restrict each process to its own device through `torch.cuda.set_device(smp.local_rank())`. To learn more, see Automated splitting with PyTorch.

  Important

  `process_per_host` *must* not be greater than the number of GPUs per instance and typically will be equal to the number of GPUs per instance.

- `"custom_mpi_options"` (optional) – Use this key to pass any custom MPI options you might need. If you do not pass any MPI custom options to the key, the MPI option is set by default to the following flag.

```
--mca btl_vader_single_copy_mechanism none
```

  Note

  You do not need to explicitly specify this default flag to the key. If you explicitly specify it, your distributed model parallel training job might fail with the following error:

```
The following MCA parameter has been listed multiple times on the command
 line:
MCA param: btl_vader_single_copy_mechanism MCA parameters can only be listed
 once
on a command line to ensure there is no ambiguity as to its value.
Please correct the situation and try again.
```

> **Tip**
>
> If you launch a training job using an EFA-enabled instance type, such as `ml.p4d.24xlarge` and `ml.p3dn.24xlarge`, use the following flag for best performance:
>
> ```
> -x FI_EFA_USE_DEVICE_RDMA=1 -x FI_PROVIDER=efa -x RDMAV_FORK_SAFE=1
> ```

To launch the training job using the estimator and your SageMaker model parallel configured training script, run the `estimator.fit()` function.

Use the following resources to learn more about using the model parallelism features in the SageMaker Python SDK:

- Use TensorFlow with the SageMaker Python SDK
- Use PyTorch with the SageMaker Python SDK

- We recommend you use a SageMaker notebook instance if you are new users. To see an example of how you can launch a training job using a SageMaker notebook instance, see Amazon SageMaker AI model parallelism library v2 examples.
- You can also submit a distributed training job from your machine using Amazon CLI. To set up Amazon CLI on your machine, see set up your Amazon credentials and Region for development.

Extend a Pre-built Docker Container that Contains SageMaker's Distributed Model Parallel Library

To extend a pre-built container and use SageMaker's model parallelism library, you must use one of the available Amazon Deep Learning Containers (DLC) images for PyTorch or TensorFlow. The SageMaker model parallelism library is included in the TensorFlow (2.3.0 and later) and PyTorch (1.6.0 and later) DLC images with CUDA (`cuxyz`). For a complete list of DLC images, see Available Deep Learning Containers Images in the *Amazon Deep Learning Containers GitHub repository*.

> **Tip**
>
> We recommend that you use the image that contains the latest version of TensorFlow or PyTorch to access the most up-to-date version of the SageMaker model parallelism library.

For example, your Dockerfile should contain a `FROM` statement similar to the following:

```
# Use the SageMaker DLC image URI for TensorFlow or PyTorch
FROM aws-dlc-account-id.dkr.ecr.aws-region.amazonaws.com/framework-training:{framework-version-tag}

# Add your dependencies here
RUN ...

ENV PATH="/opt/ml/code:${PATH}"

# this environment variable is used by the SageMaker AI container to determine our user
 code directory.
ENV SAGEMAKER_SUBMIT_DIRECTORY /opt/ml/code
```

Additionally, when you define a PyTorch or TensorFlow estimator, you must specify that the `entry_point` for your training script. This should be the same path identified with `ENV SAGEMAKER_SUBMIT_DIRECTORY` in your Dockerfile.

> **Tip**
>
> You must push this Docker container to Amazon Elastic Container Registry (Amazon ECR) and use the image URI (`image_uri`) to define a SageMaker estimator for training. For more information, see Extend a Pre-built Container.

After you finish hosting the Docker container and retrieving the image URI of the container, create a SageMaker `PyTorch` estimator object as follows. This example assumes that you have already defined `smp_options` and `mpi_options`.

```
smd_mp_estimator = Estimator(
    entry_point="your_training_script.py",
    role=sagemaker.get_execution_role(),
```

```
    instance_type='ml.p3.16xlarge',
    sagemaker_session=sagemaker_session,
    image_uri='your_aws_account_id.dkr.ecr.region.amazonaws.com/name:tag'
    instance_count=1,
    distribution={
        "smdistributed": smp_options,
        "mpi": mpi_options
    },
    base_job_name="SMD-MP-demo",
)

smd_mp_estimator.fit('s3://my_bucket/my_training_data/')
```

Create Your Own Docker Container with the SageMaker Distributed Model Parallel Library

To build your own Docker container for training and use the SageMaker model parallel library, you must include the correct dependencies and the binary files of the SageMaker distributed parallel libraries in your Dockerfile. This section provides the minimum set of code blocks you must include to properly prepare a SageMaker training environment and the model parallel library in your own Docker container.

> **Note**
>
> This custom Docker option with the SageMaker model parallel library as a binary is available only for PyTorch.

To create a Dockerfile with the SageMaker training toolkit and the model parallel library

1. Start with one of the NVIDIA CUDA base images.

```
FROM <cuda-cudnn-base-image>
```

> **Tip**
>
> The official Amazon Deep Learning Container (DLC) images are built from the NVIDIA CUDA base images. We recommend you look into the official Dockerfiles of Amazon Deep Learning Container for PyTorch to find which versions of the libraries you need to install and how to configure them. The official Dockerfiles are complete, benchmark tested, and managed by the SageMaker and Deep Learning Container service teams. In

the provided link, choose the PyTorch version you use, choose the CUDA (`cuxyz`) folder, and choose the Dockerfile ending with `.gpu` or `.sagemaker.gpu`.

2. To set up a distributed training environment, you need to install software for communication and network devices, such as Elastic Fabric Adapter (EFA), NVIDIA Collective Communications Library (NCCL), and Open MPI. Depending on the PyTorch and CUDA versions you choose, you must install compatible versions of the libraries.

   Important

   Because the SageMaker model parallel library requires the SageMaker data parallel library in the subsequent steps, we highly recommend that you follow the instructions at Create your own Docker container with the SageMaker AI distributed data parallel library to properly set up a SageMaker training environment for distributed training.

   For more information about setting up EFA with NCCL and Open MPI, see Get started with EFA and MPI and Get started with EFA and NCCL.

3. Add the following arguments to specify the URLs of the SageMaker distributed training packages for PyTorch. The SageMaker model parallel library requires the SageMaker data parallel library to use the cross-node Remote Direct Memory Access (RDMA).

```
ARG SMD_MODEL_PARALLEL_URL=https://sagemaker-distributed-model-parallel.s3.us-
west-2.amazonaws.com/pytorch-1.10.0/build-artifacts/2022-02-21-19-26/
smdistributed_modelparallel-1.7.0-cp38-cp38-linux_x86_64.whl
ARG SMDATAPARALLEL_BINARY=https://smdataparallel.s3.amazonaws.com/binary/
pytorch/1.10.2/cu113/2022-02-18/smdistributed_dataparallel-1.4.0-cp38-cp38-
linux_x86_64.whl
```

4. Install dependencies that the SageMaker model parallel library requires.

   a. Install the METIS library.

```
ARG METIS=metis-5.1.0

RUN rm /etc/apt/sources.list.d/* \
  && wget -nv http://glaros.dtc.umn.edu/gkhome/fetch/sw/metis/${METIS}.tar.gz \
  && gunzip -f ${METIS}.tar.gz \
  && tar -xvf ${METIS}.tar \
  && cd ${METIS} \
```

```
  && apt-get update \
  && make config shared=1 \
  && make install \
  && cd .. \
  && rm -rf ${METIS}.tar* \
  && rm -rf ${METIS} \
  && rm -rf /var/lib/apt/lists/* \
  && apt-get clean
```

b. Install the RAPIDS Memory Manager library. This requires CMake 3.14 or later.

```
ARG RMM_VERSION=0.15.0

RUN  wget -nv https://github.com/rapidsai/rmm/archive/v${RMM_VERSION}.tar.gz \
  && tar -xvf v${RMM_VERSION}.tar.gz \
  && cd rmm-${RMM_VERSION} \
  && INSTALL_PREFIX=/usr/local ./build.sh librmm \
  && cd .. \
  && rm -rf v${RMM_VERSION}.tar* \
  && rm -rf rmm-${RMM_VERSION}
```

5. Install the SageMaker model parallel library.

```
RUN pip install --no-cache-dir -U ${SMD_MODEL_PARALLEL_URL}
```

6. Install the SageMaker data parallel library.

```
RUN SMDATAPARALLEL_PT=1 pip install --no-cache-dir ${SMDATAPARALLEL_BINARY}
```

7. Install the sagemaker-training toolkit. The toolkit contains the common functionality that's necessary to create a container compatible with the SageMaker training platform and the SageMaker Python SDK.

```
RUN pip install sagemaker-training
```

8. After you finish creating the Dockerfile, see Adapting Your Own Training Container to learn how to build the Docker container and host it in Amazon ECR.

> **Tip**
>
> For more general information about creating a custom Dockerfile for training in SageMaker AI, see Use Your Own Training Algorithms.

Checkpointing and Fine-Tuning a Model with Model Parallelism

The SageMaker model parallelism library provides checkpointing APIs to save the model state and the optimizer state split by the various model parallelism strategies, and to load checkpoints for continuous training from where you want to restart training and fine-tune. The APIs also support options to save the model and optimizer states partially or fully.

Topics

- Checkpointing a distributed model
- Fine-tuning a distributed model

Checkpointing a distributed model

Choose one of the following topics depending on the framework between PyTorch and TensorFlow and the version of the SageMaker model parallelism library you use.

Topics

- Checkpointing a distributed PyTorch model (for the SageMaker model parallelism library v1.10.0 and later)
- Checkpointing a distributed PyTorch model (for the SageMaker model parallelism library between v1.6.0 and v1.9.0)
- Checkpointing a distributed TensorFlow model

Checkpointing a distributed PyTorch model (for the SageMaker model parallelism library v1.10.0 and later)

The SageMaker model parallelism library provides checkpoint APIs to save and load full or partial checkpoints of the distributed model state and its optimizer state.

> **Note**
>
> This checkpointing method is recommended if you use PyTorch and the SageMaker model parallelism library v1.10.0 or later.

Partial checkpointing

To save checkpoints of a model trained with model parallelism, use the `smdistributed.modelparallel.torch.save_checkpoint` API with the partial checkpointing option set to true (`partial=True`). This saves each model partition individually. In addition to the model and the optimizer state, you can also save any additional custom data through the `user_content` argument. The checkpointed model, optimizer, and user content are saved as separate files. The `save_checkpoint` API call creates checkpoint folders in the following structure.

```
- path
  - ${tag}_partial (folder for partial checkpoints)
    - model_rankinfo.pt
    - optimizer_rankinfo.pt
    - fp16_states_rankinfo.pt
    - user_content.pt
  - $tag (checkpoint file for full checkpoints)
  - user_content_$tag (user_content file for full checkpoints)
  - newest (a file that indicates the newest checkpoint)
```

To resume training from partial checkpoints, use the `smdistributed.modelparallel.torch.resume_from_checkpoint` API with `partial=True`, and specify the checkpoint directory and the tag used while saving the partial checkpoints. Note that the actual loading of model weights happens after model partitioning, during the first run of the `smdistributed.modelparallel.torch.step`-decorated training step function.

When saving a partial checkpoint, the library also saves the model partition decision as files with `.pt` file extension. Conversely, when resuming from the partial checkpoint, the library loads the partition decision files together. Once the partition decision is loaded, you can't change the partition.

The following code snippet shows how to set the checkpoint APIs in a PyTorch training script.

```
import smdistributed.modelparallel.torch as smp

model = ...
model = smp.DistributedModel(model)
optimizer = ...
optimizer = smp.DistributedOptimizer(optimizer)
user_content = ...     # additional custom data
checkpoint_path = "/opt/ml/checkpoint/model_parallel"

# Save a checkpoint.
smp.save_checkpoint(
    path=checkpoint_path,
    tag=f"total_steps{total_steps}",
    partial=True,
    model=model,
    optimizer=optimizer,
    user_content=user_content
    num_kept_partial_checkpoints=5
)

# Load a checkpoint.
# This automatically loads the most recently saved checkpoint.
smp_checkpoint = smp.resume_from_checkpoint(
    path=checkpoint_path,
    partial=True
)
```

Full checkpointing

To save the final model artifact for inference purposes, use the `smdistributed.modelparallel.torch.save_checkpoint` API with `partial=False`, which combines the model partitions to create a single model artifact. Note that this does not combine the optimizer states.

To initialize training with particular weights, given a full model checkpoint, you can use the `smdistributed.modelparallel.torch.resume_from_checkpoint` API with `partial=False`. Note that this does not load optimizer states.

> **Note**
>
> With tensor parallelism, in general, the `state_dict` must be translated between the original model implementation and the `DistributedModel` implementation.

Optionally, you can provide the `state_dict` translation function as an argument to the `smdistributed.modelparallel.torch.resume_from_checkpoint`. However, for the section called "Supported Models Out of the Box", the library takes care of this translation automatically.

The following code shows an example of how to use the checkpoint APIs for fully checkpointing a PyTorch model trained with model parallelism.

```
import smdistributed.modelparallel.torch as smp

model = ...
model = smp.DistributedModel(model)
optimizer = ...
optimizer = smp.DistributedOptimizer(optimizer)
user_content = ...     # additional custom data
checkpoint_path = "/opt/ml/checkpoint/model_parallel"

# Save a checkpoint.
smp.save_checkpoint(
    path=checkpoint_path,
    tag=f"total_steps{total_steps}",
    partial=False,
    model=model,
    optimizer=optimizer,
    user_content=user_content
    num_kept_partial_checkpoints=5
)

# Load a checkpoint.
# This automatically loads the most recently saved checkpoint.
smp_checkpoint = smp.resume_from_checkpoint(
    path=checkpoint_path,
    partial=False
)
```

Checkpointing a distributed PyTorch model (for the SageMaker model parallelism library between v1.6.0 and v1.9.0)

The SageMaker model parallelism library provides Python functions for saving partial or full checkpoints for training jobs with tensor parallelism. The following procedure shows how to use `smp.save()` and `smp.load()` to save and load a checkpoint when you use tensor parallelism.

> **Note**
>
> This checkpointing method is recommended if you use PyTorch, the section called "Tensor Parallelism", and the SageMaker model parallelism library between v1.6.0 and v1.9.0.

1. Prepare a model object and wrap it with the library's wrapper function `smp.DistributedModel()`.

```
model = MyModel(...)
model = smp.DistributedModel(model)
```

2. Prepare an optimizer for the model. A set of model parameters is an iterable argument required by optimizer functions. To prepare a set of model parameters, you must process `model.parameters()` to assign unique IDs to individual model parameters.

   If there are parameters with duplicated IDs in the model parameter iterable, loading the checkpointed optimizer state fails. To create an iterable of model parameters with unique IDs for your optimizer, see the following:

```
unique_params = []
unique_params_set = set()
for p in model.parameters():
  if p not in unique_params_set:
    unique_params.append(p)
    unique_params_set.add(p)
del unique_params_set

optimizer = MyOpt(unique_params, ...)
```

3. Wrap the optimizer using the library's wrapper function `smp.DistributedOptimizer()`.

```
optimizer = smp.DistributedOptimizer(optimizer)
```

4. Save the model and the optimizer state using `smp.save()`. Depending on how you want to save checkpoints, choose one of the following two options:

   - **Option 1:** Save a partial model on each `mp_rank` for a single `MP_GROUP`.

   ```
   model_dict = model.local_state_dict() # save a partial model
   opt_dict = optimizer.local_state_dict() # save a partial optimizer state
   # Save the dictionaries at rdp_rank 0 as a checkpoint
   if smp.rdp_rank() == 0:
       smp.save(
           {"model_state_dict": model_dict, "optimizer_state_dict": opt_dict},
           f"/checkpoint.pt",
           partial=True,
       )
   ```

   With tensor parallelism, the library saves checkpointed files named in the following format: `checkpoint.pt_{pp_rank}_{tp_rank}`.

   > **Note**
   >
   > With tensor parallelism, make sure you set the if statement as `if smp.rdp_rank() == 0` instead of `if smp.dp_rank() == 0`. When the optimizer state is sharded with tensor parallelism, all reduced-data parallel ranks must save their own partition of the optimizer state. Using a wrong *if* statement for checkpointing might result in a stalling training job. For more information about using `if smp.dp_rank() == 0` without tensor parallelism, see General Instruction for Saving and Loading in the *SageMaker Python SDK documentation*.

   - **Option 2:** Save the full model.

   ```
   if smp.rdp_rank() == 0:
       model_dict = model.state_dict(gather_to_rank0=True) # save the full model
       if smp.rank() == 0:
           smp.save(
               {"model_state_dict": model_dict},
               "/checkpoint.pt",
               partial=False,
           )
   ```

> **Note**
>
> Consider the following for full checkpointing:
>
> - If you set `gather_to_rank0=True`, all ranks other than `0` return empty dictionaries.
> - For full checkpointing, you can only checkpoint the model. Full checkpointing of optimizer states is currently not supported.
> - The full model only needs to be saved at `smp.rank() == 0`.

5. Load the checkpoints using `smp.load()`. Depending on how you checkpointed in the previous step, choose one of the following two options:

   - **Option 1:** Load the partial checkpoints.

     ```
     checkpoint = smp.load("/checkpoint.pt", partial=True)
     model.load_state_dict(checkpoint["model_state_dict"], same_partition_load=False)
     optimizer.load_state_dict(checkpoint["optimizer_state_dict"])
     ```

     You can set `same_partition_load=True` in `model.load_state_dict()` for a faster load, if you know that the partition will not change.

   - **Option 2:** Load the full checkpoints.

     ```
     if smp.rdp_rank() == 0:
         checkpoint = smp.load("/checkpoint.pt", partial=False)
         model.load_state_dict(checkpoint["model_state_dict"])
     ```

     The `if smp.rdp_rank() == 0` condition is not required, but it can help avoid redundant loading among different `MP_GROUP`s. Full checkpointing optimizer state dict is currently not supported with tensor parallelism.

Checkpointing a distributed TensorFlow model

To save a TensorFlow model while training with model parallelism, use the following functions provided by the SageMaker model parallelism library.

- `smdistributed.modelparallel.tensorflow.DistributedModel.save_model`
- `smdistributed.modelparallel.tensorflow.CheckpointManager`

Fine-tuning a distributed model

The fine-tuning needs to be configured in your training script. The following code snippet shows an example structure of a training script using the AutoModelForCausalLM class of Hugging Face Transformers with modifications for registering the `smdistributed.model.parallel.torch` modules and settings for fine-tuning.

> **Note**
>
> Fine-tuning a distributed transformer (a Transformer model wrapped by `smp.DistributedModel()`) with the smp.delayed_param_initialization function activated requires the fine-tuning job to be configured with an FSx for Lustre file system. In cases where you want to fine-tune a large-scale model with the delayed parameter initialization option, you should set up an FSx for Lustre file system.

```
import argparse
from transformers import AutoModelForCausalLM
import smdistributed.modelparallel
import smdistributed.modelparallel.torch as smp

def parse_args():

    parser = argparse.ArgumentParser()

    # set an arg group for model
    model_grp = parser.add_argument_group(
        title="model", description="arguments to describe model configuration"
    )

    ... # set up numerous args to parse from the configuration dictionary to the script
 for training

    # add arg for activating fine-tuning
    model_grp.add_argument(
        "--fine_tune",
        type=int,
        default=0,
        help="Fine-tune model from checkpoint or pretrained model",
    )
```

```
def main():
    """Main function to train GPT."""
    args = parse_args()

    ... # parse numerous args

    if args.fine_tune > 0 and args.delayed_param > 0 and smp.rank() == 0:
        pretrained_model = AutoModelForCausalLM.from_pretrained(
            args.model_name or args.model_dir
        )
        model_state_dict = pretrained_model.state_dict()
        path = os.path.join(args.model_dir, "fullmodel.pt")
        torch.save(model_state_dict, path)

    # create a Transformer model and wrap by smp.model_creation()
    # with options to configure model parallelism parameters offered by SageMaker AI
    with smp.model_creation(
        tensor_parallelism=smp.tp_size() > 1 or args.use_distributed_transformer > 0,
        zero_init=args.use_distributed_transformer == 0,
        dtype=dtype,
        distribute_embedding=args.sharded_data_parallel_degree > 1 and smp.tp_size() >
 1,
        use_alibi=args.alibi > 0,
        attention_in_fp32=args.attention_in_fp32 > 0,
        fp32_residual_addition=args.residual_addition_in_fp32 > 0,
        query_key_layer_scaling=args.query_key_layer_scaling > 0 and args.bf16 < 1,
        fused_softmax=args.fused_softmax > 0,
        fused_dropout=args.fused_dropout > 0,
        fused_bias_gelu=args.fused_bias_gelu > 0,
        flash_attention=args.flash_attention > 0,
    ):
        if args.fine_tune > 0 and args.delayed_param == 0:
            model = AutoModelForCausalLM.from_pretrained(
                args.model_name or args.model_dir
            )
        else:
            model = AutoModelForCausalLM.from_config(model_config)

    # wrap the model by smp.DistributedModel() to apply SageMaker model parallelism
    model = smp.DistributedModel(
        model, trace_device="gpu", backward_passes_per_step=args.gradient_accumulation
    )
```

```
    # wrap the optimizer by smp.DistributedOptimizer() to apply SageMaker model
parallelism
    optimizer= ... # define an optimizer
    optimizer = smp.DistributedOptimizer(
        optimizer,
        static_loss_scale=None,
        dynamic_loss_scale=True,
        dynamic_loss_args={"scale_window": 1000, "min_scale": 1, "delayed_shift": 2},
    )

    # for fine-tuning, use smp.resume_from_checkpoint() to load a pre-trained model
    if args.fine_tune > 0 and args.delayed_param > 0:
        smp.resume_from_checkpoint(args.model_dir, tag="fullmodel.pt", partial=False)
```

For a complete example of training scripts and Jupyter notebooks, see the GPT-2 examples for PyTorch in the *SageMaker AI Examples GitHub repository*.

Amazon SageMaker AI model parallelism library v1 examples

This page provides a list of blogs and Jupyter notebooks that present practical examples of implementing the SageMaker model parallelism (SMP) library v1 to run distributed training jobs on SageMaker AI.

Blogs and Case Studies

The following blogs discuss case studies about using SMP v1.

- New performance improvements in the Amazon SageMaker AI model parallelism library, *Amazon Machine Learning Blog* (December 16, 2022)
- Train gigantic models with near-linear scaling using sharded data parallelism on Amazon SageMaker AI, *Amazon Machine Learning Blog* (October 31, 2022)

Example notebooks

Example notebooks are provided in the SageMaker AI examples GitHub repository. To download the examples, run the following command to clone the repository and go to `training/distributed_training/pytorch/model_parallel`.

> **Note**
>
> Clone and run the example notebooks in the following SageMaker AI ML IDEs.

- SageMaker JupyterLab (available in Studio created after December 2023)

SMP v1 example notebooks for PyTorch

- Train GPT-2 with near-linear scaling using the sharded data parallelism technique in the SageMaker model parallelism library
- Fine-tune GPT-2 with near-linear scaling using sharded data parallelism technique in the SageMaker model parallelism library
- Train GPT-NeoX-20B with near-linear scaling using the sharded data parallelism technique in the SageMaker model parallelism library
- Train GPT-J 6B using the sharded data parallelism and tensor parallelism techniques in the SageMaker model parallelism library
- Train FLAN-T5 with near-linear scaling using sharded data parallelism technique in the SageMaker model parallelism library
- Train Falcon with near-linear scaling using sharded data parallelism technique in the SageMaker model parallelism library

SMP v1 example notebooks for TensorFlow

- CNN with TensorFlow 2.3.1 and the SageMaker model parallelism library
- HuggingFace with TensorFlow Distributed model parallelism library Training on SageMaker AI

SageMaker Distributed Model Parallelism Best Practices

Use the following guidelines when you run a distributed training job with the SageMaker model parallel library.

Setting Up the Right Configuration for a Given Model

When scaling up a model, we recommend you to go over the following list in order. Each list item discusses the advantage of using the library's techniques along with the tradeoffs that might arise.

> **Tip**
>
> If a model can fit well using a subset of the library's features, adding more model parallelism or memory saving features does not usually improve performance.

Using large GPU instance types

- In the realm of model parallelism, it is best to use powerful instances with large GPU memories to handle overhead from model parallelism operations such as partitioning models across multiple GPUs. We recommend using `ml.p4d` or `ml.p3dn` instances for training large DL models. These instances are also equipped with Elastic Fabric Adapter (EFA), which provides higher network bandwidth and enables large-scale training with model parallelism.

Sharding optimizer state

- The impact of sharding optimizer state depends on the number of data parallel ranks. Typically, a higher degree of data parallelism (proportional to the size of compute node) can improve the efficiency of memory usage.

  When you want to downsize a cluster, make sure you check the optimizer state sharding configuration. For example, a large DL model with optimizer state sharding that fits on a compute cluster with 16 GPUs (for example, two P4d or P4de instances) might not always fit on a node with 8 GPUs (for example, a single P4d or P4de instance). This is because the combined memory of 8 GPUs is lower than the combined memory of 16 GPUs, and the required memory per GPU for sharding over 8 GPUs is also higher than the memory per GPU for sharding over the 16-GPU scenario. As a result, the increased memory requirement might not fit into the smaller cluster.

  For more information, see Optimizer State Sharding.

Activation checkpointing

- Memory efficiency can be improved by using activation checkpointing for a group of modules. The more you group the modules, the more efficient the memory usage. When checkpointing sequential modules for layers, the `strategy` argument of the `smp.set_activation_checkpointing` function groups the layers together for checkpointing. For example, grouping two or more layers together for checkpointing is more memory efficient than checkpointing one layer at a time, and this trades extra computation time for reduced memory usage.

  For more information, see Activation Checkpointing.

Tensor parallelism

- The degree of tensor parallelism should be a power of two (2, 4, 8, ..., 2^n), where the maximum degree must be equal to the number of GPUs per node. For example, if you use a node with 8 GPUs, possible numbers for the degree of tensor parallelism are 2, 4, and 8. We don't recommend arbitrary numbers (such as 3, 5, 6, and 7) for the degree of tensor parallelism. When you use multiple nodes, misconfiguring the degree of tensor parallelism might result in running tensor parallelism across the nodes; this adds significant overhead from communication of activations across the nodes and can become computationally expensive.

  For more information, see Tensor Parallelism.

Pipeline parallelism across nodes

- You can run pipeline parallelism both within a single node and across multiple nodes. When you use pipeline parallelism in combination with tensor parallelism, we recommend running pipeline parallelism across multiple nodes and keeping tensor parallelism within individual nodes.
- Pipeline parallelism comes with the following three knobs: `microbatches`, `active_microbatches`, and `prescaled_batch`.
  - When you use tensor parallelism with pipeline parallelism, we recommend activating `prescaled_batch` so that the batch size per model parallel group can be increased for efficient pipelining. With `prescaled_batch` activated, the batch size set in the training script becomes `tp_size` times the batch size set for each rank without `prescaled_batch`.
  - Increasing the number of `microbatches` helps achieve efficient pipelining and better performance. Note that the effective microbatch size is the batch size divided by number of

microbatches. If you increase the number of microbatches while keeping batch size constant, each microbatch processes fewer samples.

- The number of `active_microbatches` is the maximum number of microbatches that are simultaneously in process during pipelining. For each active microbatch in process, its activations and gradients take up GPU memory. Therefore, increasing `active_microbatches` takes up more GPU memory.

- If both GPU and GPU memory are underutilized, increase `active_microbatches` for better parallelization during pipelining.
- For more information about how to use tensor parallelism with pipeline parallelism, see Tensor parallelism combined with pipeline parallelism.
- To find descriptions of the aforementioned parameters, see Parameters for `smdistributed` in the *SageMaker Python SDK documentation*.

Offloading activations to CPU

- Make sure that this is used in combination with activation checkpointing and pipeline parallelism. To ensure that the offloading and preloading happen in the background, specify a value greater than 1 to the microbatches parameter.
- When offloading activations, you might be able to increase `active_microbatches` and sometimes match with the total number of microbatches. This depends on which modules are checkpointed and how the model is partitioned.

  For more information, see Activation Offloading.

Reference configurations

The SageMaker model parallelism training team provides the following reference points based on experiments with the GPT-2 model, the sequence length of 512, and the vocabulary size of 50,000.

The number of model parameters	Instance type	Pipeline parallelism	Tensor parallelism	Optimizer state sharding	Activation checkpointing	Prescaled batch	Batch size
10 billion	16 ml.p4d.24xlarge	1	4	True	Each transformer layer	True	batch_size=40
30 billion	16 ml.p4d.24xlarge	1	8	True	Each transformer layer	True	batch_size=32
60 billion	32 ml.p4d.24xlarge	2	8	True	Each transformer layer	True	batch_size=56 , microbatches=4 , active_microbatches=2

You can extrapolate from the preceding configurations to estimate GPU memory usage for your model configuration. For example, if you increase the sequence length for a 10-billion-parameter model or increase the size of the model to 20 billion, you might want to lower batch size first. If the model still doesn't fit, try increasing the degree of tensor parallelism.

Modifying Your Training Script

- Before you use the SageMaker model parallel library's features in your training script, review The SageMaker Distributed Model Parallelism Library Configuration Tips and Pitfalls.
- To launch a training job faster, use the SageMaker AI local mode. This helps you quickly run a training job locally on a SageMaker notebook instance. Depending on the scale of the ML instance on which your SageMaker notebook instance is running, you might need to adjust the size of your model by changing the model configurations, such as the hidden width, number of transformer layers, and attention heads. Validate if the reduced model runs well on the notebook instance before using a large cluster for training the full model.

Monitoring and Logging a Training Job Using the SageMaker AI Console and Amazon CloudWatch

To monitor system-level metrics such as CPU memory utilization, GPU memory utilization, and GPU utilization, use visualization provided through the SageMaker AI console.

1. In the left navigation pane, choose **Training**.
2. Choose **Training jobs**.
3. In the main pane, choose the training job name for which you want to see more details.
4. Browse the main pane and find the **Monitor** section to see the automated visualization.
5. To see training job logs, choose **View logs** in the **Monitor** section. You can access the distributed training job logs of the training job in CloudWatch. If you launched multi-node distributed training, you should see multiple log streams with tags in the format of **algo-n-1234567890**. The **algo-1** log stream tracks training logs from the main (0th) node.

For more information, see Amazon CloudWatch Metrics for Monitoring and Analyzing Training Jobs.

Permissions

To run a SageMaker training job with model parallelism or the SageMaker distributed training example notebooks, make sure you have the right permissions in your IAM role, such as the following:

- To use FSx for Lustre, add `AmazonFSxFullAccess`.
- To use Amazon S3 as a data channel, add `AmazonS3FullAccess`.
- To use Docker, build your own container, and push it to Amazon ECR, add `AmazonEC2ContainerRegistryFullAccess`.
- To have a full access to use the entire suite of SageMaker AI features, add `AmazonSageMakerFullAccess`.

The SageMaker Distributed Model Parallelism Library Configuration Tips and Pitfalls

Review the following tips and pitfalls before using Amazon SageMaker AI's model parallelism library. This list includes tips that are applicable across frameworks. For TensorFlow and PyTorch specific tips, see Modify a TensorFlow training script and Modify a PyTorch Training Script, respectively.

Batch Size and Number of Microbatches

- The library is most efficient when the batch size is increased. For use cases where the model fits within a single device, but can only be trained with a small batch size, batch size can and should be increased after the library is integrated. Model parallelism saves memory for large models, enabling you to train using batch sizes that previously did not fit in memory.
- Choosing a number of microbatches that is too small or too large can lower performance. The library executes each microbatch sequentially in each device, so microbatch size (batch size divided by number of microbatches) must be large enough to fully utilize each GPU. At the same time, pipeline efficiency increases with the number of microbatches, so striking the right balance is important. Typically, a good starting point is to try 2 or 4 microbatches, increasing the batch size to the memory limit, and then experiment with larger batch sizes and numbers of microbatches. As the number of microbatches is increased, larger batch sizes might become feasible if an interleaved pipeline is used.
- Your batch size must be always divisible by the number of microbatches. Note that depending on the size of the dataset, sometimes the last batch of every epoch can be of a smaller size than the rest, and this smaller batch needs to be divisible by the number of microbatches as well. If it is not, you can set `drop_remainder=True` in the `tf.Dataset.batch()` call (in TensorFlow), or set `drop_last=True` in `DataLoader` (in PyTorch), so that this last, small batch is not used. If you are using a different API for the data pipeline, you might need to manually skip the last batch whenever it is not divisible by the number of microbatches.

Manual Partitioning

- If you use manual partitioning, be mindful of the parameters that are consumed by multiple operations and modules in your model, such as the embedding table in transformer architectures. Modules that share the same parameter must be placed in the same device for correctness. When auto-partitioning is used, the library automatically enforces this constraint.

Data Preparation

- If the model takes multiple inputs, make sure you seed the random operations in your data pipeline (e.g., shuffling) with `smp.dp_rank()`. If the dataset is being deterministically sharded across data parallel devices, make sure that the shard is indexed by `smp.dp_rank()`. This is to make sure that the order of the data seen on all ranks that form a model partition is consistent.

Returning Tensors from `smp.DistributedModel`

- Any tensor that is returned from the `smp.DistributedModel.call` (for TensorFlow) or `smp.DistributedModel.forward` (for PyTorch) function is broadcast to all other ranks, from the rank that computed that particular tensor. As a result, any tensor that is not needed outside the call and forward methods (intermediate activations, for example) should not be returned, as this causes needless communication and memory overhead and hurts performance.

The `@smp.step` Decorator

- If an `smp.step`-decorated function has a tensor argument that does not have a batch dimension, the argument name must be provided in the `non_split_inputs` list when calling `smp.step`. This prevents the library from attempting to split the tensor into microbatches. For more information see `smp.step` in the API documentation.

Delaying Parameter Initialization

For very large models over 100 billion parameters, weight initialization through the CPU memory might result in an out-of-memory error. To get around this, the library offers `smp.delay_param_initialization` context manager. This delays the physical allocation of parameters until they move to GPU during the first execution of a `smp.step`-decorated function. This avoids unnecessary memory usage of the CPU during the initialization of training. Use the context manager when you create a model object as shown in the following code.

```
with smp.delay_param_initialization(enabled=True):
    model = MyModel()
```

Tensor Parallelism for PyTorch

- If you are using a seed for deterministic results, set the seed based on `smp.dp_rank()` (for example, `torch.manual_seed(42 + smp.dp_rank())`). If you do not do this, different partitions of an `nn.Parameter` are initialized in the same way, impacting convergence.
- SageMaker's model parallelism library uses NCCL to implement collectives needed for the distribution of the modules. Especially for smaller models, if too many NCCL calls are scheduled on the GPU at the same time, memory usage might increase because of additional space used by NCCL. To counteract this, `smp` throttles the NCCL calls so that the number of ongoing NCCL operations at any given time is less than or equal to a given limit. The default limit is 8, but this

can be adjusted using the environment variable `SMP_NCCL_THROTTLE_LIMIT`. If you observe more memory usage than you expect while using tensor parallelism, you can try reducing this limit. However, choosing a limit that is too small might cause throughput loss. To disable throttling altogether, you can set `SMP_NCCL_THROTTLE_LIMIT=-1`.

- The following identity, which holds when the degree of tensor parallelism is 1, does not hold when the degree of tensor parallelism is greater than 1: `smp.mp_size() * smp.dp_size() == smp.size()`. This is because the tensor parallel group is part of both the model parallelism group and the data parallelism group. If your code has existing references to `mp_rank`, `mp_size`, `MP_GROUP`, and so on, and if you want to work with only the pipeline parallel group, you might need to replace the references with `smp.pp_size()`. The following identities are always true:
  - `smp.mp_size() * smp.rdp_size() == smp.size()`
  - `smp.pp_size() * smp.dp_size() == smp.size()`
  - `smp.pp_size() * smp.tp_size() * smp.rdp_size() == smp.size()`
- Since the `smp.DistributedModel` wrapper modifies the model parameters when tensor parallelism is enabled, the optimizer should be created after calling `smp.DistributedModel`, with the distributed parameters. For example, the following does not work:

```
## WRONG
model = MyModel()
optimizer = SomeOptimizer(model.parameters())
model = smp.DistributedModel(model)  # optimizer now has outdated parameters!
```

  Instead, the optimizer should be created with the parameters of the `smp.DistributedModel` as follows:

```
## CORRECT
model = smp.DistributedModel(MyModel())
optimizer = SomeOptimizer(model.optimizers())
```

- When a module is replaced with its distributed counterpart through tensor parallelism, the distributed module does not inherit its weights from the original module, and initializes new weights. This means that, for instance, if the weights need to be initialized in a particular call (for example, through a `load_state_dict` call), this needs to happen after the `smp.DistributedModel` call, once the module distribution takes place.
- When accessing the parameters of distributed modules directly, note that the weight does not have the same shape as the original module. For instance,

```
with smp.tensor_parallelism():
    linear = nn.Linear(60, 60)

# will pass
assert tuple(linear.weight.shape) == (60, 60)

distributed_linear = smp.DistributedModel(linear)

# will fail. the number of input channels will have been divided by smp.tp_size()
assert tuple(distributed_linear.module.weight.shape) == (60, 60)
```

- Using `torch.utils.data.distributed.DistributedSampler` is strongly recommended for tensor parallelism. This ensures that every data parallel rank receives the same number of data samples, which prevents hangs that might result from different `dp_ranks` taking a different number of steps.
- If you use the `join` API of PyTorch's `DistributedDataParallel` class to handle cases in which different data parallel ranks have different numbers of batches, you still need to make sure that ranks that are in the same `TP_GROUP` have the same number of batches; otherwise the communication collectives used in distributed execution of modules may hang. Ranks that are in different `TP_GROUPs` can have different numbers of batches, as long as `join` API is used.
- If you want to checkpoint your model and use tensor parallelism, consider the following:
  - To avoid stalling and race conditions while saving and loading models when you use tensor parallelism, make sure you call appropriate functions from the following model and optimizer states inside a reduced-data parallelism rank.
  - If you are transitioning an existing pipeline parallel script and enabling tensor parallel for the script, ensure that you modify any `if smp.dp_rank() == 0` block used for saving and loading with `if smp.rdp_rank() == 0` blocks. Otherwise, it might cause your training job to stall.

  For more information about checkpointing a model with tensor parallelism, see the section called “Checkpointing a distributed model”.

Model Parallel Troubleshooting

If you run into an error, you can use the following list to try to troubleshoot your training job. If the problem persists, contact Amazon Support.

Topics

- Considerations for Using SageMaker Debugger with the SageMaker Model Parallelism Library
- Saving Checkpoints
- Convergence Using Model Parallel and TensorFlow
- Stalling or Crashing Distributed Training Jobs
- Receiving NCCL Error for a PyTorch Training Job
- Receiving RecursionError for a PyTorch Training Job

Considerations for Using SageMaker Debugger with the SageMaker Model Parallelism Library

SageMaker Debugger is not available for the SageMaker model parallelism library. Debugger is enabled by default for all SageMaker TensorFlow and PyTorch training jobs, and you might see an error that looks like the following:

```
FileNotFoundError: [Errno 2] No such file or directory: '/opt/ml/checkpoints/
metadata.json.sagemaker-uploading
```

To fix this issue, disable Debugger by passing `debugger_hook_config=False` when creating a framework `ModelTrainer` as shown in the following example.

```
bucket=Session().default_bucket()
base_job_name="sagemaker-checkpoint-test"
checkpoint_in_bucket="checkpoints"

# The S3 URI to store the checkpoints
checkpoint_s3_bucket="s3://{}/{}/{}".format(bucket, base_job_name,
 checkpoint_in_bucket)

model_trainer = ModelTrainer(
    ...

    distribution={"smdistributed": {"modelparallel": { "enabled": True }}},
    checkpoint_s3_uri=checkpoint_s3_bucket,
    checkpoint_local_path="/opt/ml/checkpoints",
    debugger_hook_config=False
)
```

Saving Checkpoints

You might run into the following error when saving checkpoints of a large model on SageMaker AI:

```
InternalServerError: We encountered an internal error. Please try again
```

This could be caused by a SageMaker AI limitation while uploading the local checkpoint to Amazon S3 during training. To disable checkpointing in SageMaker AI, use the following example to explicitly upload the checkpoints.

If you run into the preceding error, do not use `checkpoint_s3_uri` with the SageMaker `ModelTrainer` call. While saving checkpoints for larger models, we recommend saving checkpoints to a custom directory and passing the same to the helper function (as a `local_path` argument).

```
import os

def aws_s3_sync(source, destination):
    """aws s3 sync in quiet mode and time profile"""
    import time, subprocess
    cmd = ["aws", "s3", "sync", "--quiet", source, destination]
    print(f"Syncing files from {source} to {destination}")
    start_time = time.time()
    p = subprocess.Popen(cmd, stdout=subprocess.PIPE, stderr=subprocess.PIPE)
    p.wait()
    end_time = time.time()
    print("Time Taken to Sync: ", (end_time-start_time))
    return

def sync_local_checkpoints_to_s3(local_path="/opt/ml/checkpoints",
 s3_uri=os.path.dirname(os.path.dirname(os.getenv('SM_MODULE_DIR', '')))+'/
checkpoints'):
    """ sample function to sync checkpoints from local path to s3 """

    import boto3
    #check if local path exists
    if not os.path.exists(local_path):
        raise RuntimeError("Provided local path {local_path} does not exist. Please
 check")

    #check if s3 bucket exists
    s3 = boto3.resource('s3')
```

```
    if not s3_uri.startswith("s3://"):
        raise ValueError(f"Provided s3 uri {s3_uri} is not valid.")

    s3_bucket = s3_uri.replace('s3://','').split('/')[0]
    print(f"S3 Bucket: {s3_bucket}")
    try:
        s3.meta.client.head_bucket(Bucket=s3_bucket)
    except Exception as e:
        raise e
    aws_s3_sync(local_path, s3_uri)
    return

def sync_s3_checkpoints_to_local(local_path="/opt/ml/checkpoints",
 s3_uri=os.path.dirname(os.path.dirname(os.getenv('SM_MODULE_DIR', ''))))+'/
checkpoints'):
    """ sample function to sync checkpoints from s3 to local path """

    import boto3
    #try to create local path if it does not exist
    if not os.path.exists(local_path):
        print(f"Provided local path {local_path} does not exist. Creating...")
        try:
            os.makedirs(local_path)
        except Exception as e:
            raise RuntimeError(f"Failed to create {local_path}")

    #check if s3 bucket exists
    s3 = boto3.resource('s3')
    if not s3_uri.startswith("s3://"):
        raise ValueError(f"Provided s3 uri {s3_uri} is not valid.")

    s3_bucket = s3_uri.replace('s3://','').split('/')[0]
    print(f"S3 Bucket: {s3_bucket}")
    try:
        s3.meta.client.head_bucket(Bucket=s3_bucket)
    except Exception as e:
        raise e
    aws_s3_sync(s3_uri, local_path)
    return
```

Usage of helper functions:

```
#base_s3_uri - user input s3 uri or save to model directory (default)
```

```
#curr_host - to save checkpoints of current host
#iteration - current step/epoch during which checkpoint is saved

# save checkpoints on every node using local_rank
if smp.local_rank() == 0:
    base_s3_uri = os.path.dirname(os.path.dirname(os.getenv('SM_MODULE_DIR', '')))
    curr_host = os.environ['SM_CURRENT_HOST']
    full_s3_uri = f'{base_s3_uri}/checkpoints/{curr_host}/{iteration}'
    sync_local_checkpoints_to_s3(local_path=checkpoint_dir, s3_uri=full_s3_uri)
```

Convergence Using Model Parallel and TensorFlow

When you use SageMaker AI multi-node training with TensorFlow and the model parallelism library, the loss may not converge as expected because the order of training input files may be different on each node. This may cause different ranks in the same model parallel group to work on different input files, causing inconsistencies. To prevent this, ensure the input files are ordered the same way in all the ranks before they get converted to TensorFlow datasets. One way to achieve this is to sort the input file names in the training script.

Stalling or Crashing Distributed Training Jobs

If your training job has stalling, crashing, or not responding issues, read the following troubleshooting items to identify what's the cause of the issue. If you need any further support, reach out to the SageMaker distributed training team through Amazon Support.

- If you see **a distributed training job stalling at the NCCL initialization step**, consider the following:
  - If you are using one of the EFA-enabled instances (`ml.p4d` or `ml.p3dn` instances) with a custom VPC and its subnet, ensure that the security group used has inbound and outbound connections for all ports to and from the same SG. You also generally need outbound connections to any IP as a separate rule (for internet access). To find instructions on how to add inbound and outbound rules for EFA communication, refer to SageMaker AI distributed training job stalling during initialization.
- If you see a **distributed training job stalling when checkpointing** the full model, this might be because the `state_dict()` call on the model or optimizer was not made on all ranks with `rdp_rank()==0` (when using tensor parallelism) or `dp_rank()==0` (when using only pipeline parallelism). These ranks need to communicate to construct the checkpoint to be saved. Similar stalling issues can also happen when checkpointing partial optimizer if `shard_optimizer_state` is enabled.

For more information about checkpointing a model with model parallelism, see General Instruction for Saving and Loading and Checkpointing a distributed PyTorch model (for the SageMaker model parallelism library between v1.6.0 and v1.9.0).

- If the training job crashes with a **CUDA Out of Memory error**, this means that the distributed training configuration needs to be adjusted to fit the model on the GPU cluster. For more information and best practices, see Setting Up the Right Configuration for a Given Model.
- If the training job crashes with an **uncorrectable ECC error**, this means that one of the GPUs in the cluster has gone bad. If you need technical support, share the job ARN with the Amazon team and restart your training job from a checkpoint if possible.
- In rare cases, a job configuration that worked previously but is close to the limits of GPU memory might fail later with a different cluster due to a **CUDA Out of Memory error**. This could be because some GPU has lower available memory than usual due to ECC errors.
- **Network timeout crash** might happen when running a multinode job which doesn't use all GPUs in the node. To get around this, use all GPUs on the node by ensuring that the `processes_per_host` parameter is set to the number of GPUs in each instance. For example, this is `processes_per_host=8` for `ml.p3.16xlarge`, `ml.p3dn.24xlarge`, and `ml.p4d.24xlarge` instances.
- If you find that your training job takes a long time during the data downloading stage, make sure the Amazon S3 path you provided to `checkpoint_s3_uri` for the SageMaker `ModelTrainer` class is unique for the current training job. If this path is reused across multiple training jobs running simultaneously, all those checkpoints are uploaded and downloaded to the same Amazon S3 path and might significantly increase checkpoint loading time.
- Use FSx for Lustre when you deal with large data and models.
  - If your dataset is large and fetching it takes a long time, we recommend keeping your dataset in FSx for Lustre.
  - When training models are beyond 10 billion parameters, we recommend using FSx for Lustre for checkpointing.
  - After you create a file system, make sure to wait for the status to become **available** before starting a training job using it.

Receiving NCCL Error for a PyTorch Training Job

If you encountered the following error, it might be due to a process running out of GPU memory.

```
NCCL error in: ../torch/lib/c10d/ProcessGroupNCCL.cpp:825, unhandled system error, NCCL
 version 2.7.8
ncclSystemError: System call (socket, malloc, munmap, etc) failed.
```

You can resolve this by reducing the batch size or `active_microbatches`. If auto partitioning is not resulting in a well-balanced partitioning, you might have to consider manual partitioning. For more information, see Pipeline parallelism across nodes.

Receiving `RecursionError` for a PyTorch Training Job

The library does not support calling `super.forward()` inside a module's forward call. If you use `super.forward()`, you might receive the following error message.

```
RecursionError: maximum recursion depth exceeded
```

To fix the error, instead of calling `super.forward()`, you should call `super()._orig_forward()`.

Distributed computing with SageMaker AI best practices

This best practices page presents various flavors of distributed computing for machine learning (ML) jobs in general. The term *distributed computing* in this page encompasses distributed training for machine learning tasks and parallel computing for data processing, data generation, feature engineering, and reinforcement learning. In this page, we discuss about common challenges in distributed computing, and available options in SageMaker Training and SageMaker Processing. For additional reading materials about distributed computing, see What Is Distributed Computing?.

You can configure ML tasks to run in a distributed manner across multiple nodes (instances), accelerators (NVIDIA GPUs, Amazon Trainium chips), and vCPU cores. By running distributed computation, you can achieve a variety of goals such as computing operations faster, handling large datasets, or training large ML models.

The following list covers common challenges that you might face when you run an ML training job at scale.

- You need to make decisions on how to distribute computation depending on ML tasks, software libraries you want to use, and compute resources.
- Not all ML tasks are straightforward to distribute. Also, not all ML libraries support distributed computation.

- Distributed computation might not always result in a linear increase in compute efficiency. In particular, you need to identify if data I/O and inter-GPU communication have bottlenecks or cause overhead.
- Distributed computation might disturb numerical processes and change model accuracy. Specifically to data-parallel neural network training, when you change the global batch size while scaling up to a larger compute cluster, you also need to adjust the learning rate accordingly.

SageMaker AI provides distributed training solutions to ease such challenges for various use cases. Choose one of the following options that best fits your use case.

Topics

- Option 1: Use a SageMaker AI built-in algorithm that supports distributed training
- Option 2: Run a custom ML code in the SageMaker AI managed training or processing environment
- Option 3: Write your own custom distributed training code
- Option 4: Launch multiple jobs in parallel or sequentially

Option 1: Use a SageMaker AI built-in algorithm that supports distributed training

SageMaker AI provides built-in algorithms that you can use out of the box through the SageMaker AI console or the SageMaker Python SDK. Using the built-in algorithms, you don't need to spend time for code customization, understanding science behind the models, or running Docker on provisioned Amazon EC2 instances.

A subset of the SageMaker AI built-in algorithms support distributed training. To check if the algorithm of your choice supports distributed training, see the **Parallelizable** column in the Common Information About Built-in Algorithms table. Some of the algorithms support multi-instance distributed training, while the rest of the parallelizable algorithms support parallelization across multiple GPUs in a single instance, as indicated in the **Parallelizable** column.

Option 2: Run a custom ML code in the SageMaker AI managed training or processing environment

SageMaker AI jobs can instantiate distributed training environment for specific use cases and frameworks. This environment acts as a ready-to-use whiteboard, where you can bring and run your own ML code.

If your ML code uses a deep learning framework

You can launch distributed training jobs using the Deep Learning Containers (DLC) for SageMaker Training, which you can orchestrate either through the dedicated Python modules in the SageMaker AI Python SDK, or through the SageMaker APIs with Amazon CLI, Amazon SDK for Python (Boto3). SageMaker AI provides training containers for machine learning frameworks, including PyTorch, TensorFlow, Hugging Face Transformers, and Apache MXNet. You have two options to write deep learning code for distributed training.

- **The SageMaker AI distributed training libraries**

  The SageMaker AI distributed training libraries propose Amazon-managed code for neural network data parallelism and model parallelism. SageMaker AI distributed training also comes with launcher clients built into the SageMaker Python SDK, and you don't need to author parallel launch code. To learn more, see SageMaker AI's data parallelism library and SageMaker AI's model parallelism library.

- **Open-source distributed training libraries**

  Open source frameworks have their own distribution mechanisms such as DistributedDataParallelism (DDP) in PyTorch or `tf.distribute` modules in TensorFlow. You can choose to run these distributed training frameworks in the SageMaker AI-managed framework containers. For example, the sample code for training MaskRCNN in SageMaker AI shows how to use both PyTorch DDP in the SageMaker AI PyTorch framework container and Horovod in the SageMaker TensorFlow framework container.

SageMaker AI ML containers also come with MPI preinstalled, so you can parallelize your entry point script using mpi4py. Using the MPI integrated training containers is a great option when you launch a third-party distributed training launcher or write ad-hoc parallel code in the SageMaker AI managed training environment.

Notes for data-parallel neural network training on GPUs

- **Scale to multi-GPU and multi-machine parallelism when appropriate**

  We often run neural network training jobs on multiple-CPU or multiple-GPU instances. Each GPU-based instance usually contains multiple GPU devices. Consequently, distributed GPU computing can happen either within a single GPU instance with multiple GPUs (single-node multi-GPU training), or across multiple GPU instances with multiple GPU cores in each (multi-node multi-GPU training). Single-instance training is easier to write code and debug, and the intra-node GPU-to-GPU throughput is usually faster than the inter-node GPU-to-GPU throughput. Therefore, it is a good idea to scale data parallelism vertically first (use one GPU instance with multiple GPUs) and expand to multiple GPU instances if needed. This might not apply to cases where the CPU budget is high (for example, a massive workload for data pre-processing) and when the CPU-to-GPU ratio of a multi-GPU instance is too low. In all cases, you need to experiment with different combinations of instance types based on your own ML training needs and workload.

- **Monitor the quality of convergence**

  When training a neural network with data parallelism, increasing the number of GPUs while keeping the mini-batch size per GPU constant leads to increasing the size of global mini-batch for the mini-batch stochastic gradient descent (MSGD) process. The size of mini-batches for MSGD is known to impact the descent noise and convergence. For properly scaling while preserving accuracy, you need to adjust other hyperparameters such as the learning rate [Goyal et al. (2017)].

- **Monitor I/O bottlenecks**

  As you increase the number of GPUs, the throughput for reading and writing storage should also increase. Make sure that your data source and pipeline don't become bottlenecks.

- **Modify your training script as needed**

  Training scripts written for single-GPU training must be modified for multi-node multi-GPU training. In most data parallelism libraries, script modification is required to do the following.

  - Assign batches of training data to each GPU.
  - Use an optimizer that can deal with gradient computation and parameter updates across multiple GPUs.
  - Assign responsibility of checkpointing to a specific host and GPU.

If your ML code involves tabular data processing

PySpark is a Python frontend of Apache Spark, which is an open-source distributed computing framework. PySpark has been widely adopted for distributed tabular data processing for large-scale production workloads. If you want to run tabular data processing code, consider using the SageMaker Processing PySpark containers and running parallel jobs. You can also run data processing jobs in parallel using SageMaker Training and SageMaker Processing APIs in Amazon SageMaker Studio Classic, which is integrated with Amazon EMR and Amazon Glue.

Option 3: Write your own custom distributed training code

When you submit a training or processing job to SageMaker AI, SageMaker Training and SageMaker AI Processing APIs launch Amazon EC2 compute instances. You can customize training and processing environment in the instances by running your own Docker container or installing additional libraries in the Amazon managed containers. For more information about Docker with SageMaker Training, see Adapting your own Docker container to work with SageMaker AI and Create a container with your own algorithms and models. For more information about Docker with SageMaker AI Processing, see Use Your Own Processing Code.

Every SageMaker training job environment contains a configuration file at `/opt/ml/input/config/resourceconfig.json`, and every SageMaker Processing job environment contains a similar configuration file at `/opt/ml/config/resourceconfig.json`. Your code can read this file to find `hostnames` and establish inter-node communications. To learn more, including the schema of the JSON file, see Distributed Training Configuration and How Amazon SageMaker Processing Configures Your Processing Container. You can also install and use third-party distributed computing libraries such as Ray or DeepSpeed in SageMaker AI.

You can also use SageMaker Training and SageMaker Processing to run custom distributed computations that do not require inter-worker communication. In the computing literature, those tasks are often described as *embarrassingly parallel* or *share-nothing*. Examples include parallel processing of data files, training models in parallel on different configurations, or running batch inference on a collection of records. You can trivially parallelize such share-nothing use cases with Amazon SageMaker AI. When you launch a SageMaker Training or SageMaker Processing job on a cluster with multiple nodes, SageMaker AI by default replicates and launches your training code (in Python or Docker) on all the nodes. Tasks requiring random spread of input data across such multiple nodes can be facilitated by setting `S3DataDistributionType=ShardedByS3Key` in the data input configuration of the SageMaker AI `InputData` API.

Option 4: Launch multiple jobs in parallel or sequentially

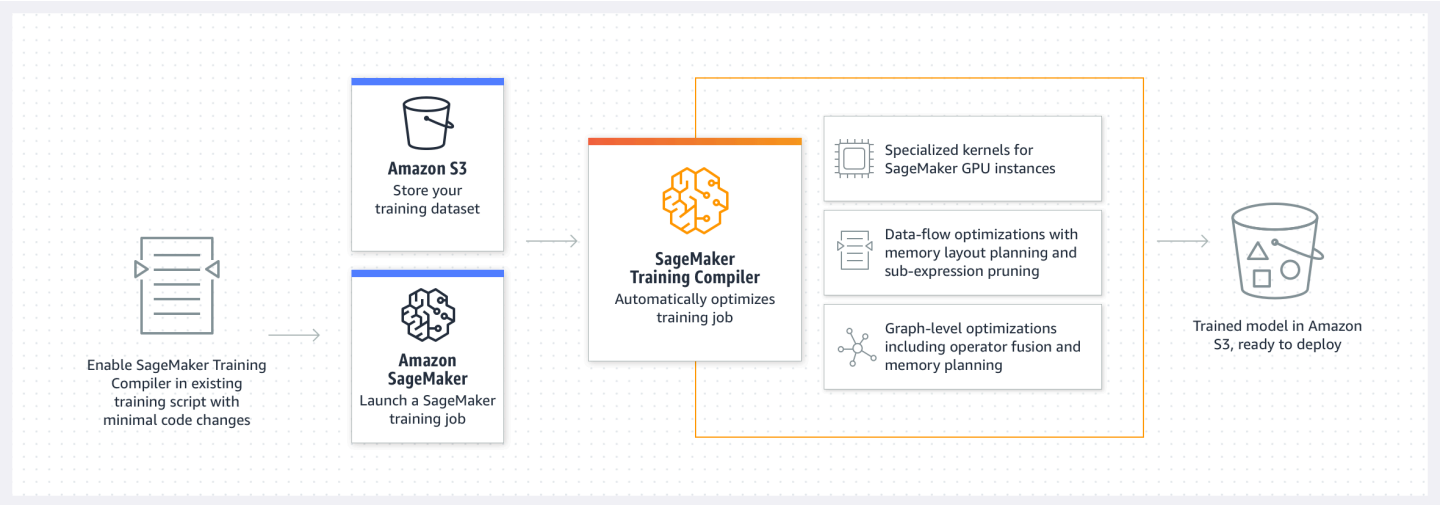
You can also distribute an ML compute workflow into smaller parallel or sequential compute tasks, each represented by its own SageMaker Training or SageMaker Processing job. Splitting a task into multiple jobs can be beneficial for the following situations or tasks:

- When you have specific data channels and metadata entries (such as hyperparameters, model configuration, or instance types) for each sub-tasks.
- When you implement retry steps at a sub-task level.
- When you vary the configuration of the sub-tasks over the course of the workload, such as when training on increasing batch sizes.
- When you need to run an ML task that takes longer than the maximum training time allowed for a single training job (28 days maximum).
- When different steps of a compute workflow require different instance types.

For the specific case of hyperparameter search, use SageMaker AI Automated Model Tuning. SageMaker AI Automated Model Tuning is a serverless parameter search orchestrator that launches multiple training jobs on your behalf, according to a search logic that can be random, Bayesian, or HyperBand.

Additionally, to orchestrate multiple training jobs, you can also consider workflow orchestration tools, such as SageMaker Pipelines, Amazon Step Functions, and Apache Airflow supported by Amazon Managed Workflows for Apache Airflow (MWAA) and SageMaker AI Workflows.

Amazon SageMaker Training Compiler



> **Important**
>
> Amazon Web Services (Amazon) announces that there will be no new releases or versions of SageMaker Training Compiler. You can continue to utilize SageMaker Training Compiler through the existing Amazon Deep Learning Containers (DLCs) for SageMaker Training. It is important to note that while the existing DLCs remain accessible, they will no longer receive patches or updates from Amazon, in accordance with the Amazon Deep Learning Containers Framework Support Policy.

Use Amazon SageMaker Training Compiler to train deep learning (DL) models faster on scalable GPU instances managed by SageMaker AI.

What Is SageMaker Training Compiler?

State-of-the-art deep learning (DL) models consist of complex multi-layered neural networks with billions of parameters that can take thousands of GPU hours to train. Optimizing such models on training infrastructure requires extensive knowledge of DL and systems engineering; this is challenging even for narrow use cases. Although there are open-source implementations of compilers that optimize the DL training process, they can lack the flexibility to integrate DL frameworks with some hardware such as GPU instances.

SageMaker Training Compiler is a capability of SageMaker AI that makes these hard-to-implement optimizations to reduce training time on GPU instances. The compiler optimizes DL models to accelerate training by more efficiently using SageMaker AI machine learning (ML) GPU instances. SageMaker Training Compiler is available at no additional charge within SageMaker AI and can help reduce total billable time as it accelerates training.

SageMaker Training Compiler is integrated into the Amazon Deep Learning Containers (DLCs). Using the SageMaker Training Compiler–enabled Amazon DLCs, you can compile and optimize training jobs on GPU instances with minimal changes to your code. Bring your deep learning models to SageMaker AI and enable SageMaker Training Compiler to accelerate the speed of your training job on SageMaker AI ML instances for accelerated computing.

How It Works

SageMaker Training Compiler converts DL models from their high-level language representation to hardware-optimized instructions. Specifically, SageMaker Training Compiler applies graph-level

optimizations, dataflow-level optimizations, and backend optimizations to produce an optimized model that efficiently uses hardware resources. As a result, you can train your models faster than when you train them without compilation.

It is a two-step process to activate SageMaker Training Compiler for your training job:

1. Bring your own DL script and, if needed, adapt to compile and train with SageMaker Training Compiler. To learn more, see Bring Your Own Deep Learning Model.
2. Create a SageMaker AI ModelTrainer object with the compiler configuration parameter using the SageMaker Python SDK.
   a. Turn on SageMaker Training Compiler by adding `compiler_config=TrainingCompilerConfig()` to the SageMaker AI ModelTrainer class.
   b. Adjust hyperparameters (`batch_size` and `learning_rate`) to maximize the benefit that SageMaker Training Compiler provides.

      Compilation through SageMaker Training Compiler changes the memory footprint of the model. Most commonly, this manifests as a reduction in memory utilization and a consequent increase in the largest batch size that can fit on the GPU. In some cases, the compiler intelligently promotes caching which leads to a decrease in the largest batch size that can fit on the GPU. Note that if you want to change the batch size, you must adjust the learning rate appropriately.

      For a reference for `batch_size` tested for popular models, see Tested Models.

      When you adjust the batch size, you also have to adjust the `learning_rate` appropriately. For best practices for adjusting the learning rate along with the change in batch size, see the section called “Best Practices and Considerations”.
   c. By running the `model_trainer.train()` class method, SageMaker AI compiles your model and starts the training job.

   For instructions on how to launch a training job, see Enable SageMaker Training Compiler.

SageMaker Training Compiler does not alter the final trained model, while allowing you to accelerate the training job by more efficiently using the GPU memory and fitting a larger batch size per iteration. The final trained model from the compiler-accelerated training job is identical to the one from the ordinary training job.

Tip

SageMaker Training Compiler only compiles DL models for training on supported GPU instances managed by SageMaker AI. To compile your model for inference and deploy it to run anywhere in the cloud and at the edge, use SageMaker Neo compiler.

Supported Frameworks, Amazon Web Services Regions, Instance Types, and Tested Models

Important

Amazon Web Services (Amazon) announces that there will be no new releases or versions of SageMaker Training Compiler. You can continue to utilize SageMaker Training Compiler through the existing Amazon Deep Learning Containers (DLCs) for SageMaker Training. It is important to note that while the existing DLCs remain accessible, they will no longer receive patches or updates from Amazon, in accordance with the Amazon Deep Learning Containers Framework Support Policy.

Before using SageMaker Training Compiler, check if your framework of choice is supported, the instance types are available in your Amazon account, and your Amazon account is in one of the supported Amazon Web Services Regions.

> **Note**
>
> SageMaker Training Compiler is available in the SageMaker Python SDK v2.70.0 or later.

Supported Frameworks

SageMaker Training Compiler supports the following deep learning frameworks and is available through Amazon Deep Learning Containers.

Topics

- PyTorch
- TensorFlow

For more information, see Available Images in the *Amazon Deep Learning Containers GitHub repository*.

Amazon Web Services Regions

The SageMaker Training Compiler Containers are available in the Amazon Web Services Regions where Amazon Deep Learning Containers are in service except the China regions.

Supported Instance Types

SageMaker Training Compiler is tested on and supports the following ML instance types.

- P4 instances
- P3 instances
- G4dn instances
- G5 instances

For specs of the instance types, see the **Accelerated Computing** section in the Amazon EC2 Instance Types page. For information about instance pricing, see Amazon SageMaker Pricing.

If you encountered an error message similar to the following, follow the instructions at Request a service quota increase for SageMaker AI resources.

```
ResourceLimitExceeded: An error occurred (ResourceLimitExceeded) when calling
the CreateTrainingJob operation: The account-level service limit 'ml.p3dn.24xlarge
for training job usage' is 0 Instances, with current utilization of 0 Instances
```

```
and a request delta of 1 Instances.
Please contact Amazon support to request an increase for this limit.
```

Tested Models

The following table includes a list of the models that have been tested with SageMaker Training Compiler. For reference, the largest batch size that is able to fit into memory is also included alongside other training parameters. SageMaker Training Compiler can change the memory footprint of the model training process; as a result, a larger batch size can often be used during the training process, further decreasing total training time. In some cases, SageMaker Training Compiler intelligently promotes caching which leads to a decrease in the largest batch size that can fit on the GPU. You must retune your model hyperparameters and find an optimal batch size for your case. To save time, use the following reference tables to look up a batch size that can be a good starting point for your use case.

> **Note**
>
> The batch sizes are local batch size that fit into each individual GPU in the respective instance type. You should also adjust the learning rate when changing the batch size.

PyTorch 1.13.1

Natural language processing (NLP) models

The following models are tested for training jobs for all combinations of single-node and multi-node with single or multi GPU cores and Automatic Mixed Precision (AMP) as indicated.

Single-node/multi-node single-GPU/multi-GPU

Bring Your Own Deep Learning Model

Important

Amazon Web Services (Amazon) announces that there will be no new releases or versions of SageMaker Training Compiler. You can continue to utilize SageMaker Training Compiler through the existing Amazon Deep Learning Containers (DLCs) for SageMaker Training. It is important to note that while the existing DLCs remain accessible, they will no longer receive patches or updates from Amazon, in accordance with the Amazon Deep Learning Containers Framework Support Policy.

This guide walks you through how to adapt your training script for a compiler-accelerated training job. The preparation of your training script depends on the following:

- Training settings such as single-core or distributed training.
- Frameworks and libraries that you use to create the training script.

Choose one of the following topics depending on the framework you use.

Topics

- PyTorch
- TensorFlow

Note

After you finish preparing your training script, you can run a SageMaker training job using the SageMaker AI ModelTrainer class. For more information, see the previous topic at Enable SageMaker Training Compiler.

PyTorch

Bring your own PyTorch model to SageMaker AI, and run the training job with SageMaker Training Compiler.

Topics

- PyTorch Models with Hugging Face Transformers

PyTorch Models with Hugging Face Transformers

PyTorch models with Hugging Face Transformers are based on PyTorch's torch.nn.Module API. Hugging Face Transformers also provides Trainer and pretrained model classes for PyTorch to help reduce the effort for configuring natural language processing (NLP) models. After preparing your training script, you can launch a training job using the SageMaker AI `PyTorch` or `HuggingFace` ModelTrainer with the SageMaker Training Compiler configuration when you'll proceed to the next topic at Enable SageMaker Training Compiler.

> **Tip**
>
> When you create a tokenizer for an NLP model using Transformers in your training script, make sure that you use a static input tensor shape by specifying `padding='max_length'`. Do not use `padding='longest'` because padding to the longest sequence in the batch can change the tensor shape for each training batch. The dynamic input shape can trigger recompilation of the model and might increase total training time. For more information about padding options of the Transformers tokenizers, see Padding and truncation in the *Hugging Face Transformers documentation*.

Topics

- Large Language Models Using the Hugging Face Transformers Trainer Class
- Large Language Models Using PyTorch Directly (without the Hugging Face Transformers Trainer API)

Large Language Models Using the Hugging Face Transformers `Trainer` Class

If you use the transformers library's Trainer class, you don't need to make any additional changes to your training script. SageMaker Training Compiler automatically compiles your Trainer model if you enable it through the ModelTrainer class. The following code shows the basic form of a PyTorch training script with Hugging Face Trainer API.

```
from transformers import Trainer, TrainingArguments

training_args=TrainingArguments(**kwargs)
```

```
trainer=Trainer(args=training_args, **kwargs)
```

Topics

- For single GPU training
- For distributed training
- Best Practices to Use SageMaker Training Compiler with Trainer

For single GPU training

You don't need to change your code when you use the `transformers.Trainer` class.

For distributed training

PyTorch v1.11.0 and later

To run distributed training with SageMaker Training Compiler, you must add the following `_mp_fn()` function in your training script and wrap the `main()` function. It redirects the `_mp_fn(index)` function calls from the SageMaker AI distributed runtime for PyTorch (`pytorchxla`) to the `main()` function of your training script.

```
def _mp_fn(index):
    main()
```

This function accepts the `index` argument to indicate the rank of the current GPU in the cluster for distributed training. To find more example scripts, see the Hugging Face Transformers language modeling example scripts.

For Transformers v4.17 and before with PyTorch v1.10.2 and before

SageMaker Training Compiler uses an alternate mechanism for launching a distributed training job, and you don't need to make any modification in your training script. Instead, SageMaker Training Compiler requires you to pass a SageMaker AI distributed training launcher script to the `entry_point` argument and pass your training script to the `hyperparameters` argument in the SageMaker AI Hugging Face ModelTrainer.

Best Practices to Use SageMaker Training Compiler with `Trainer`

- Make sure that you use SyncFree optimizers by setting the `optim` argument to `adamw_torch_xla` while setting up transformers.TrainingArgument. See also Optimizer in the *Hugging Face Transformers documentation*.

- Ensure that the throughput of the data processing pipeline is higher than the training throughput. You can tweak the `dataloader_num_workers` and `preprocessing_num_workers` arguments of the transformers.TrainingArgument class to achieve this. Typically, these need to be greater than or equal to the number of GPUs but less than the number of CPUs.

After you have completed adapting your training script, proceed to the section called "Run PyTorch Training Jobs with Training Compiler".

Large Language Models Using PyTorch Directly (without the Hugging Face Transformers Trainer API)

If you have a training script that uses PyTorch directly, you need to make additional changes to your PyTorch training script to implement PyTorch/XLA. Follow the instructions to modify your script to properly set up the PyTorch/XLA primatives.

Topics

- For single GPU training
- For distributed training
- Best Practices to Use SageMaker Training Compiler with PyTorch/XLA

For single GPU training

1. Import the optimization libraries.

```
import torch_xla
import torch_xla.core.xla_model as xm
```

2. Change the target device to be XLA instead of `torch.device("cuda")`

```
device=xm.xla_device()
```

3. If you're using PyTorch's Automatic Mixed Precision (AMP), do the following:

   a. Replace `torch.cuda.amp` with the following:

```
import torch_xla.amp
```

   b. Replace `torch.optim.SGD` and `torch.optim.Adam` with the following:

```
import torch_xla.amp.syncfree.Adam as adam
import torch_xla.amp.syncfree.SGD as SGD
```

c. Replace `torch.cuda.amp.GradScaler` with the following:

```
import torch_xla.amp.GradScaler as grad_scaler
```

4. If you're not using AMP, replace `optimizer.step()` with the following:

```
xm.optimizer_step(optimizer)
```

5. If you're using a distributed dataloader, wrap your dataloader in the PyTorch/XLA's `ParallelLoader` class:

```
import torch_xla.distributed.parallel_loader as pl
parallel_loader=pl.ParallelLoader(dataloader, [device]).per_device_loader(device)
```

6. Add `mark_step` at the end of the training loop when you're not using `parallel_loader`:

```
xm.mark_step()
```

7. To checkpoint your training, use the PyTorch/XLA's model checkpoint method:

```
xm.save(model.state_dict(), path_to_save)
```

After you have completed adapting your training script, proceed to the section called “Run PyTorch Training Jobs with Training Compiler”.

For distributed training

In addition to the changes listed in the previous For single GPU training section, add the following changes to properly distribute workload across GPUs.

1. If you're using AMP, add `all_reduce` after `scaler.scale(loss).backward()`:

```
gradients=xm._fetch_gradients(optimizer)
xm.all_reduce('sum', gradients, scale=1.0/xm.xrt_world_size())
```

2. If you need to set variables for `local_ranks` and `world_size`, use similar code to the following:

```
local_rank=xm.get_local_ordinal()
world_size=xm.xrt_world_size()
```

3. For any `world_size` (`num_gpus_per_node*num_nodes`) greater than 1, you must define a train sampler which should look similar to the following:

```
import torch_xla.core.xla_model as xm

if xm.xrt_world_size() > 1:
    train_sampler=torch.utils.data.distributed.DistributedSampler(
        train_dataset,
        num_replicas=xm.xrt_world_size(),
        rank=xm.get_ordinal(),
        shuffle=True
    )

train_loader=torch.utils.data.DataLoader(
    train_dataset,
    batch_size=args.batch_size,
    sampler=train_sampler,
    drop_last=args.drop_last,
    shuffle=False if train_sampler else True,
    num_workers=args.num_workers
)
```

4. Make the following changes to make sure you use the `parallel_loader` provided by the `torch_xla distributed` module.

```
import torch_xla.distributed.parallel_loader as pl
train_device_loader=pl.MpDeviceLoader(train_loader, device)
```

   The `train_device_loader` functions like a regular PyTorch loader as follows:

```
for step, (data, target) in enumerate(train_device_loader):
    optimizer.zero_grad()
    output=model(data)
    loss=torch.nn.NLLLoss(output, target)
    loss.backward()
```

With all of these changes, you should be able to launch distributed training with any PyTorch model without the Transformer Trainer API. Note that these instructions can be used for both single-node multi-GPU and multi-node multi-GPU.

5. **For PyTorch v1.11.0 and later**

   To run distributed training with SageMaker Training Compiler, you must add the following `_mp_fn()` function in your training script and wrap the `main()` function. It redirects the `_mp_fn(index)` function calls from the SageMaker AI distributed runtime for PyTorch (`pytorchxla`) to the `main()` function of your training script.

   ```
   def _mp_fn(index):
       main()
   ```

   This function accepts the `index` argument to indicate the rank of the current GPU in the cluster for distributed training. To find more example scripts, see the Hugging Face Transformers language modeling example scripts.

   For Transformers v4.17 and before with PyTorch v1.10.2 and before

   SageMaker Training Compiler uses an alternate mechanism for launching a distributed training job and requires you to pass a SageMaker AI distributed training launcher script to the `entry_point` argument and pass your training script to the `hyperparameters` argument in the SageMaker AI Hugging Face ModelTrainer.

After you have completed adapting your training script, proceed to the section called "Run PyTorch Training Jobs with Training Compiler".

Best Practices to Use SageMaker Training Compiler with PyTorch/XLA

If you want to leverage the SageMaker Training Compiler on your native PyTorch training script, you may want to first get familiar with PyTorch on XLA devices. The following sections list some best practices to enable XLA for PyTorch.

> **Note**
>
> This section for best practices assumes that you use the following PyTorch/XLA modules:
>
> ```
> import torch_xla.core.xla_model as xm
> ```

```
import torch_xla.distributed.parallel_loader as pl
```

Understand the lazy mode in PyTorch/XLA

One significant difference between PyTorch/XLA and native PyTorch is that the PyTorch/XLA system runs in lazy mode while the native PyTorch runs in eager mode. Tensors in lazy mode are placeholders for building the computational graph until they are materialized after the compilation and evaluation are complete. The PyTorch/XLA system builds the computational graph on the fly when you call PyTorch APIs to build the computation using tensors and operators. The computational graph gets compiled and executed when `xm.mark_step()` is called explicitly or implicitly by `pl.MpDeviceLoader/pl.ParallelLoader`, or when you explicitly request the value of a tensor such as by calling `loss.item()` or `print(loss)`.

Minimize the number of *compilation-and-executions* using `pl.MpDeviceLoader/pl.ParallelLoader` and `xm.step_closure`

For best performance, you should keep in mind the possible ways to initiate *compilation-and-executions* as described in Understand the lazy mode in PyTorch/XLA and should try to minimize the number of compilation-and-executions. Ideally, only one compilation-and-execution is necessary per training iteration and is initiated automatically by `pl.MpDeviceLoader/pl.ParallelLoader`. The `MpDeviceLoader` is optimized for XLA and should always be used if possible for best performance. During training, you might want to examine some intermediate results such as loss values. In such case, the printing of lazy tensors should be wrapped using `xm.add_step_closure()` to avoid unnecessary compilation-and-executions.

Use AMP and `syncfree` optimizers

Training in Automatic Mixed Precision (AMP) mode significantly accelerates your training speed by leveraging the Tensor cores of NVIDIA GPUs. SageMaker Training Compiler provides `syncfree` optimizers that are optimized for XLA to improve AMP performance. Currently, the following three `syncfree` optimizers are available and should be used if possible for best performance.

```
torch_xla.amp.syncfree.SGD
torch_xla.amp.syncfree.Adam
torch_xla.amp.syncfree.AdamW
```

These `syncfree` optimizers should be paired with `torch_xla.amp.GradScaler` for gradient scaling/unscaling.

Tip

Starting PyTorch 1.13.1, SageMaker Training Compiler improves performance by letting PyTorch/XLA to automatically override the optimizers (such as SGD, Adam, AdamW) in `torch.optim` or `transformers.optimization` with the syncfree versions of them in `torch_xla.amp.syncfree` (such as `torch_xla.amp.syncfree.SGD`, `torch_xla.amp.syncfree.Adam`, `torch_xla.amp.syncfree.AdamW`). You don't need to change those code lines where you define optimizers in your training script.

TensorFlow

Bring your own TensorFlow model to SageMaker AI, and run the training job with SageMaker Training Compiler.

TensorFlow Models

SageMaker Training Compiler automatically optimizes model training workloads that are built on top of the native TensorFlow API or the high-level Keras API.

Tip

For preprocessing your input dataset, ensure that you use a static input shape. Dynamic input shape can initiate recompilation of the model and might increase total training time.

Using Keras (Recommended)

For the best compiler acceleration, we recommend using models that are subclasses of TensorFlow Keras (tf.keras.Model).

For single GPU training

There's no additional change you need to make in the training script.

Without Keras

SageMaker Training Compiler does not support eager execution in TensorFlow. Accordingly, you should wrap your model and training loops with the TensorFlow function decorator (`@tf.function`) to leverage compiler acceleration.

SageMaker Training Compiler performs a graph-level optimization, and uses the decorator to make sure your TensorFlow functions are set to run in graph mode.

For single GPU training

TensorFlow 2.0 or later has the eager execution on by default, so you should add the `@tf.function` decorator in front of every function that you use for constructing a TensorFlow model.

TensorFlow Models with Hugging Face Transformers

TensorFlow models with Hugging Face Transformers are based on TensorFlow's tf.keras.Model API. Hugging Face Transformers also provides pretrained model classes for TensorFlow to help reduce the effort for configuring natural language processing (NLP) models. After creating your own training script using the Transformers library, you can run the training script using the SageMaker AI `HuggingFace` ModelTrainer with the SageMaker Training Compiler configuration class as shown in the previous topic at Run TensorFlow Training Jobs with SageMaker Training Compiler.

SageMaker Training Compiler automatically optimizes model training workloads that are built on top of the native TensorFlow API or the high-level Keras API, such as the TensorFlow transformer models.

> **Tip**
>
> When you create a tokenizer for an NLP model using Transformers in your training script, make sure that you use a static input tensor shape by specifying `padding='max_length'`. Do not use `padding='longest'` because padding to the longest sequence in the batch can change the tensor shape for each training batch. The dynamic input shape can initiate recompilation of the model and might increase total training time. For more information about padding options of the Transformers tokenizers, see Padding and truncation in the *Hugging Face Transformers documentation*.

Topics

- Using Keras
- Without Keras

Using Keras

For the best compiler acceleration, we recommend using models that are subclasses of TensorFlow Keras (tf.keras.Model). As noted in the Quick tour page in the *Hugging Face Transformers documentation*, you can use the models as regular TensorFlow Keras models.

For single GPU training

There's no additional change you need to make in the training script.

For distributed training

SageMaker Training Compiler acceleration works transparently for multi-GPU workloads when the model is constructed and trained using Keras APIs within the scope of `tf.distribute.Strategy.scope()` call.

1. Choose the right distributed training strategy.
   a. For single-node multi-GPU, use `tf.distribute.MirroredStrategy` to set the strategy.

```
strategy = tf.distribute.MirroredStrategy()
```

   b. For multi-node multi-GPU, add the following code to properly set the TensorFlow distributed training configuration before creating the strategy.

```
def set_sm_dist_config():
    DEFAULT_PORT = '8890'
    DEFAULT_CONFIG_FILE = '/opt/ml/input/config/resourceconfig.json'
    with open(DEFAULT_CONFIG_FILE) as f:
        config = json.loads(f.read())
        current_host = config['current_host']
    tf_config = {
        'cluster': {
            'worker': []
        },
        'task': {'type': 'worker', 'index': -1}
    }
    for i, host in enumerate(config['hosts']):
        tf_config['cluster']['worker'].append("%s:%s" % (host, DEFAULT_PORT))
        if current_host == host:
            tf_config['task']['index'] = i
    os.environ['TF_CONFIG'] = json.dumps(tf_config)
```

```
set_sm_dist_config()
```

Use `tf.distribute.MultiWorkerMirroredStrategy` to set the strategy.

```
strategy = tf.distribute.MultiWorkerMirroredStrategy()
```

2. Using the strategy of your choice, wrap the model.

```
with strategy.scope():
    # create a model and do fit
```

Without Keras

If you want to bring custom models with custom training loops using TensorFlow without Keras, you should wrap the model and the training loop with the TensorFlow function decorator (`@tf.function`) to leverage compiler acceleration.

SageMaker Training Compiler performs a graph-level optimization, and uses the decorator to make sure your TensorFlow functions are set to run in graph mode.

For single GPU training

TensorFlow 2.0 or later has the eager execution on by default, so you should add the `@tf.function` decorator in front of every function that you use for constructing a TensorFlow model.

For distributed training

In addition to the changes needed for Using Keras for distributed training, you need to ensure that functions to be run on each GPU are annotated with `@tf.function`, while cross-GPU communication functions are not annotated. An example training code should look like the following:

```
@tf.function()
def compiled_step(inputs, outputs):
    with tf.GradientTape() as tape:
        pred=model(inputs, training=True)
        total_loss=loss_object(outputs, pred)/args.batch_size
    gradients=tape.gradient(total_loss, model.trainable_variables)
```

```
    return total_loss, pred, gradients

def train_step(inputs, outputs):
    total_loss, pred, gradients=compiled_step(inputs, outputs)
    if args.weight_decay > 0.:
        gradients=[g+v*args.weight_decay for g,v in zip(gradients,
 model.trainable_variables)]

    optimizer.apply_gradients(zip(gradients, model.trainable_variables))

    train_loss.update_state(total_loss)
    train_accuracy.update_state(outputs, pred)

@tf.function()
def train_step_dist(inputs, outputs):
    strategy.run(train_step, args= (inputs, outputs))
```

Note that this instruction can be used for both single-node multi-GPU and multi-node multi-GPU.

Enable SageMaker Training Compiler

> **Important**
>
> Amazon Web Services (Amazon) announces that there will be no new releases or versions of SageMaker Training Compiler. You can continue to utilize SageMaker Training Compiler through the existing Amazon Deep Learning Containers (DLCs) for SageMaker Training. It is important to note that while the existing DLCs remain accessible, they will no longer receive patches or updates from Amazon, in accordance with the Amazon Deep Learning Containers Framework Support Policy.

SageMaker Training Compiler is built into the SageMaker Python SDK and Amazon Deep Learning Containers so that you don't need to change your workflows to enable Training Compiler. Choose one of the following topics that matches with your use case.

Topics

- Run PyTorch Training Jobs with SageMaker Training Compiler
- Run TensorFlow Training Jobs with SageMaker Training Compiler

Run PyTorch Training Jobs with SageMaker Training Compiler

> **Important**
>
> **Deprecation notice:** SageMaker Training Compiler is not supported in SageMaker Python SDK v3. If you are currently using Training Compiler, continue using SageMaker Python SDK v2. For new projects, consider using the unified `ModelTrainer` class with supported frameworks. See SageMaker Python SDK documentation for migration guidance.

You can use any of the SageMaker AI interfaces to run a training job with SageMaker Training Compiler: Amazon SageMaker Studio Classic, Amazon SageMaker notebook instances, Amazon SDK for Python (Boto3), and Amazon Command Line Interface.

Topics

- Using the SageMaker Python SDK
- Using the SageMaker AI CreateTrainingJob API Operation

Using the SageMaker Python SDK

SageMaker Training Compiler for PyTorch is available through the SageMaker AI `PyTorch` and `HuggingFace` framework estimator classes. To turn on SageMaker Training Compiler, add the `compiler_config` parameter to the SageMaker AI estimators. Import the `TrainingCompilerConfig` class and pass an instance of it to the `compiler_config` parameter. The following code examples show the structure of SageMaker AI estimator classes with SageMaker Training Compiler turned on.

> **Tip**
>
> To get started with prebuilt models provided by PyTorch or Transformers, try using the batch sizes provided in the reference table at Tested Models.

> **Note**
>
> The native PyTorch support is available in the SageMaker Python SDK v2.121.0 and later. Make sure that you update the SageMaker Python SDK accordingly.

> **Note**
>
> Starting PyTorch v1.12.0, SageMaker Training Compiler containers for PyTorch are available. Note that the SageMaker Training Compiler containers for PyTorch are not prepackaged with Hugging Face Transformers. If you need to install the library in the container, make sure that you add the `requirements.txt` file under the source directory when submitting a training job.
> For PyTorch v1.11.0 and before, use the previous versions of the SageMaker Training Compiler containers for Hugging Face and PyTorch.
> For a complete list of framework versions and corresponding container information, see the section called “Supported Frameworks”.

For information that fits your use case, see one of the following options.

For single GPU training

PyTorch v1.12.0 and later

To compile and train a PyTorch model, configure a SageMaker AI PyTorch estimator with SageMaker Training Compiler as shown in the following code example.

> **Note**
>
> This native PyTorch support is available in the SageMaker AI Python SDK v2.120.0 and later. Make sure that you update the SageMaker AI Python SDK.

```
from sagemaker.pytorch import PyTorch, TrainingCompilerConfig

# the original max batch size that can fit into GPU memory without compiler
batch_size_native=12
learning_rate_native=float('5e-5')

# an updated max batch size that can fit into GPU memory with compiler
batch_size=64

# update learning rate
learning_rate=learning_rate_native/batch_size_native*batch_size
```

```
hyperparameters={
    "n_gpus": 1,
    "batch_size": batch_size,
    "learning_rate": learning_rate
}

pytorch_estimator=PyTorch(
    entry_point='train.py',
    source_dir='path-to-requirements-file', # Optional. Add this if need to install
 additional packages.
    instance_count=1,
    instance_type='ml.p3.2xlarge',
    framework_version='1.13.1',
    py_version='py3',
    hyperparameters=hyperparameters,
    compiler_config=TrainingCompilerConfig(),
    disable_profiler=True,
    debugger_hook_config=False
)

pytorch_estimator.fit()
```

Hugging Face Transformers with PyTorch v1.11.0 and before

To compile and train a transformer model with PyTorch, configure a SageMaker AI Hugging Face estimator with SageMaker Training Compiler as shown in the following code example.

```
from sagemaker.huggingface import HuggingFace, TrainingCompilerConfig

# the original max batch size that can fit into GPU memory without compiler
batch_size_native=12
learning_rate_native=float('5e-5')

# an updated max batch size that can fit into GPU memory with compiler
batch_size=64

# update learning rate
learning_rate=learning_rate_native/batch_size_native*batch_size

hyperparameters={
    "n_gpus": 1,
    "batch_size": batch_size,
    "learning_rate": learning_rate
```

```
}

pytorch_huggingface_estimator=HuggingFace(
    entry_point='train.py',
    instance_count=1,
    instance_type='ml.p3.2xlarge',
    transformers_version='4.21.1',
    pytorch_version='1.11.0',
    hyperparameters=hyperparameters,
    compiler_config=TrainingCompilerConfig(),
    disable_profiler=True,
    debugger_hook_config=False
)

pytorch_huggingface_estimator.fit()
```

To prepare your training script, see the following pages.

- For single GPU training of a PyTorch model using Hugging Face Transformers' Trainer API
- For single GPU training of a PyTorch model without Hugging Face Transformers' Trainer API

To find end-to-end examples, see the following notebooks:

- Compile and Train a Hugging Face Transformers Trainer Model for Question and Answering with the SQuAD dataset
- Compile and Train a Hugging Face Transformer BERT Model with the SST Dataset using SageMaker Training Compiler
- Compile and Train a Binary Classification Trainer Model with the SST2 Dataset for Single-Node Single-GPU Training

For distributed training

PyTorch v1.12

For PyTorch v1.12, you can run distributed training with SageMaker Training Compiler by adding the `pytorch_xla` option specified to the `distribution` parameter of the SageMaker AI PyTorch estimator class.

> **Note**
>
> This native PyTorch support is available in the SageMaker AI Python SDK v2.121.0 and later. Make sure that you update the SageMaker AI Python SDK.

```
from sagemaker.pytorch import PyTorch, TrainingCompilerConfig

# choose an instance type, specify the number of instances you want to use,
# and set the num_gpus variable the number of GPUs per instance.
instance_count=1
instance_type='ml.p3.8xlarge'
num_gpus=4

# the original max batch size that can fit to GPU memory without compiler
batch_size_native=16
learning_rate_native=float('5e-5')

# an updated max batch size that can fit to GPU memory with compiler
batch_size=26

# update learning rate
learning_rate=learning_rate_native/
batch_size_native*batch_size*num_gpus*instance_count

hyperparameters={
    "n_gpus": num_gpus,
    "batch_size": batch_size,
    "learning_rate": learning_rate
}

pytorch_estimator=PyTorch(
    entry_point='your_training_script.py',
    source_dir='path-to-requirements-file', # Optional. Add this if need to install
 additional packages.
    instance_count=instance_count,
    instance_type=instance_type,
    framework_version='1.13.1',
    py_version='py3',
    hyperparameters=hyperparameters,
    compiler_config=TrainingCompilerConfig(),
    distribution ={'pytorchxla' : { 'enabled': True }},
```

```
    disable_profiler=True,
    debugger_hook_config=False
)

pytorch_estimator.fit()
```

> **Tip**
>
> To prepare your training script, see PyTorch

Transformers v4.21 with PyTorch v1.11

For PyTorch v1.11 and later, SageMaker Training Compiler is available for distributed training with the `pytorch_xla` option specified to the `distribution` parameter.

```
from sagemaker.huggingface import HuggingFace, TrainingCompilerConfig

# choose an instance type, specify the number of instances you want to use,
# and set the num_gpus variable the number of GPUs per instance.
instance_count=1
instance_type='ml.p3.8xlarge'
num_gpus=4

# the original max batch size that can fit to GPU memory without compiler
batch_size_native=16
learning_rate_native=float('5e-5')

# an updated max batch size that can fit to GPU memory with compiler
batch_size=26

# update learning rate
learning_rate=learning_rate_native/
batch_size_native*batch_size*num_gpus*instance_count

hyperparameters={
    "n_gpus": num_gpus,
    "batch_size": batch_size,
    "learning_rate": learning_rate
}

pytorch_huggingface_estimator=HuggingFace(
```

```
    entry_point='your_training_script.py',
    instance_count=instance_count,
    instance_type=instance_type,
    transformers_version='4.21.1',
    pytorch_version='1.11.0',
    hyperparameters=hyperparameters,
    compiler_config=TrainingCompilerConfig(),
    distribution ={'pytorchxla' : { 'enabled': True }},
    disable_profiler=True,
    debugger_hook_config=False
)

pytorch_huggingface_estimator.fit()
```

Tip

To prepare your training script, see the following pages.

- For distributed training of a PyTorch model using Hugging Face Transformers' Trainer API
- For distributed training of a PyTorch model without Hugging Face Transformers' Trainer API

Transformers v4.17 with PyTorch v1.10.2 and before

For the supported version of PyTorch v1.10.2 and before, SageMaker Training Compiler requires an alternate mechanism for launching a distributed training job. To run distributed training, SageMaker Training Compiler requires you to pass a SageMaker AI distributed training launcher script to the `entry_point` argument, and pass your training script to the `hyperparameters` argument. The following code example shows how to configure a SageMaker AI Hugging Face estimator applying the required changes.

```
from sagemaker.huggingface import HuggingFace, TrainingCompilerConfig

# choose an instance type, specify the number of instances you want to use,
# and set the num_gpus variable the number of GPUs per instance.
instance_count=1
instance_type='ml.p3.8xlarge'
num_gpus=4
```

```
# the original max batch size that can fit to GPU memory without compiler
batch_size_native=16
learning_rate_native=float('5e-5')

# an updated max batch size that can fit to GPU memory with compiler
batch_size=26

# update learning rate
learning_rate=learning_rate_native/
batch_size_native*batch_size*num_gpus*instance_count

training_script="your_training_script.py"

hyperparameters={
    "n_gpus": num_gpus,
    "batch_size": batch_size,
    "learning_rate": learning_rate,
    "training_script": training_script     # Specify the file name of your training
 script.
}

pytorch_huggingface_estimator=HuggingFace(
    entry_point='distributed_training_launcher.py',    # Specify the distributed
 training launcher script.
    instance_count=instance_count,
    instance_type=instance_type,
    transformers_version='4.17.0',
    pytorch_version='1.10.2',
    hyperparameters=hyperparameters,
    compiler_config=TrainingCompilerConfig(),
    disable_profiler=True,
    debugger_hook_config=False
)

pytorch_huggingface_estimator.fit()
```

The launcher script should look like the following. It wraps your training script and configures the distributed training environment depending on the size of the training instance of your choice.

```
# distributed_training_launcher.py

#!/bin/python
```

```
import subprocess
import sys

if __name__ == "__main__":
    arguments_command = " ".join([arg for arg in sys.argv[1:]])
    """
    The following line takes care of setting up an inter-node communication
    as well as managing intra-node workers for each GPU.
    """
    subprocess.check_call("python -m torch_xla.distributed.sm_dist " +
 arguments_command, shell=True)
```

Tip

To prepare your training script, see the following pages.

- For distributed training of a PyTorch model using Hugging Face Transformers' Trainer API
- For distributed training of a PyTorch model without Hugging Face Transformers' Trainer API

Tip

To find end-to-end examples, see the following notebooks:

- Compile and Train the GPT2 Model using the Transformers Trainer API with the SST2 Dataset for Single-Node Multi-GPU Training
- Compile and Train the GPT2 Model using the Transformers Trainer API with the SST2 Dataset for Multi-Node Multi-GPU Training

The following list is the minimal set of parameters required to run a SageMaker training job with the compiler.

> **Note**
>
> When using the SageMaker AI Hugging Face estimator, you must specify the `transformers_version`, `pytorch_version`, `hyperparameters`, and `compiler_config` parameters to enable SageMaker Training Compiler. You cannot use `image_uri` to manually specify the Training Compiler integrated Deep Learning Containers that are listed at Supported Frameworks.

- `entry_point` (str) – Required. Specify the file name of your training script.

  > **Note**
  >
  > To run a distributed training with SageMaker Training Compiler and PyTorch v1.10.2 and before, specify the file name of a launcher script to this parameter. The launcher script should be prepared to wrap your training script and configure the distributed training environment. For more information, see the following example notebooks:
  >
  > - Compile and Train the GPT2 Model using the Transformers Trainer API with the SST2 Dataset for Single-Node Multi-GPU Training
  > - Compile and Train the GPT2 Model using the Transformers Trainer API with the SST2 Dataset for Multi-Node Multi-GPU Training

- `source_dir` (str) – Optional. Add this if need to install additional packages. To install packages, you need to prapare a `requirements.txt` file under this directory.
- `instance_count` (int) – Required. Specify the number of instances.
- `instance_type` (str) – Required. Specify the instance type.
- `transformers_version` (str) – Required only when using the SageMaker AI Hugging Face estimator. Specify the Hugging Face Transformers library version supported by SageMaker Training Compiler. To find available versions, see Supported Frameworks.
- `framework_version` or `pytorch_version` (str) – Required. Specify the PyTorch version supported by SageMaker Training Compiler. To find available versions, see Supported Frameworks.

> **Note**
>
> When using the SageMaker AI Hugging Face estimator, you must specify both `transformers_version` and `pytorch_version`.

- `hyperparameters` (dict) – Optional. Specify hyperparameters for the training job, such as `n_gpus`, `batch_size`, and `learning_rate`. When you enable SageMaker Training Compiler, try larger batch sizes and adjust the learning rate accordingly. To find case studies of using the compiler and adjusted batch sizes to improve training speed, see the section called "Tested Models" and SageMaker Training Compiler Example Notebooks and Blogs.

  > **Note**
  >
  > To run a distributed training with SageMaker Training Compiler and PyTorch v1.10.2 and before, you need to add an additional parameter, `"training_script"`, to specify your training script, as shown in the preceding code example.

- `compiler_config` (TrainingCompilerConfig object) – Required to activate SageMaker Training Compiler. Include this parameter to turn on SageMaker Training Compiler. The following are parameters for the `TrainingCompilerConfig` class.
  - `enabled` (bool) – Optional. Specify `True` or `False` to turn on or turn off SageMaker Training Compiler. The default value is `True`.
  - `debug` (bool) – Optional. To receive more detailed training logs from your compiler-accelerated training jobs, change it to `True`. However, the additional logging might add overhead and slow down the compiled training job. The default value is `False`.
- `distribution` (dict) – Optional. To run a distributed training job with SageMaker Training Compiler, add `distribution = { 'pytorchxla' : { 'enabled': True }}`.

> **Warning**
>
> If you turn on SageMaker Debugger, it might impact the performance of SageMaker Training Compiler. We recommend that you turn off Debugger when running SageMaker Training Compiler to make sure there's no impact on performance. For more information, see the section called "Considerations". To turn the Debugger functionalities off, add the following two arguments to the estimator:

```
    disable_profiler=True,
    debugger_hook_config=False
```

If the training job with the compiler is launched successfully, you receive the following logs during the job initialization phase:

- With `TrainingCompilerConfig(debug=False)`

```
Found configuration for Training Compiler
Configuring SM Training Compiler...
```

- With `TrainingCompilerConfig(debug=True)`

```
Found configuration for Training Compiler
Configuring SM Training Compiler...
Training Compiler set to debug mode
```

Using the SageMaker AI `CreateTrainingJob` API Operation

SageMaker Training Compiler configuration options must be specified through the `AlgorithmSpecification` and `HyperParameters` field in the request syntax for the `CreateTrainingJob` API operation.

```
"AlgorithmSpecification": {
    "TrainingImage": "<sagemaker-training-compiler-enabled-dlc-image>"
},

"HyperParameters": {
    "sagemaker_training_compiler_enabled": "true",
    "sagemaker_training_compiler_debug_mode": "false",
    "sagemaker_pytorch_xla_multi_worker_enabled": "false"    // set to "true" for
 distributed training
}
```

To find a complete list of deep learning container image URIs that have SageMaker Training Compiler implemented, see Supported Frameworks.

Run TensorFlow Training Jobs with SageMaker Training Compiler

> **Important**
>
> **Deprecation notice:** SageMaker Training Compiler is not supported in SageMaker Python SDK v3. If you are currently using Training Compiler, continue using SageMaker Python SDK v2. For new projects, consider using the unified `ModelTrainer` class with supported frameworks. See SageMaker Python SDK documentation for migration guidance.

You can use any of the SageMaker AI interfaces to run a training job with SageMaker Training Compiler: Amazon SageMaker Studio Classic, Amazon SageMaker notebook instances, Amazon SDK for Python (Boto3), and Amazon Command Line Interface.

Topics

- Using the SageMaker Python SDK
- Using the SageMaker AI Python SDK and Extending SageMaker AI Framework Deep Learning Containers
- Enable SageMaker Training Compiler Using the SageMaker AI CreateTrainingJob API Operation

Using the SageMaker Python SDK

To turn on SageMaker Training Compiler, add the `compiler_config` parameter to the SageMaker AI TensorFlow or Hugging Face estimator. Import the `TrainingCompilerConfig` class and pass an instance of it to the `compiler_config` parameter. The following code examples show the structure of the SageMaker AI estimator classes with SageMaker Training Compiler turned on.

> **Tip**
>
> To get started with prebuilt models provided by the TensorFlow and Transformers libraries, try using the batch sizes provided in the reference table at Tested Models.

> **Note**
>
> SageMaker Training Compiler for TensorFlow is available through the SageMaker AI TensorFlow and Hugging Face framework estimators.

For information that fits your use case, see one of the following options.

For single GPU training

TensorFlow

```
from sagemaker.tensorflow import TensorFlow, TrainingCompilerConfig

# the original max batch size that can fit into GPU memory without compiler
batch_size_native=12
learning_rate_native=float('5e-5')

# an updated max batch size that can fit into GPU memory with compiler
batch_size=64

# update the global learning rate
learning_rate=learning_rate_native/batch_size_native*batch_size

hyperparameters={
    "n_gpus": 1,
    "batch_size": batch_size,
    "learning_rate": learning_rate
}

tensorflow_estimator=TensorFlow(
    entry_point='train.py',
    instance_count=1,
    instance_type='ml.p3.2xlarge',
    framework_version='2.9.1',
    hyperparameters=hyperparameters,
    compiler_config=TrainingCompilerConfig(),
    disable_profiler=True,
    debugger_hook_config=False
)

tensorflow_estimator.fit()
```

To prepare your training script, see the following pages.

- For single GPU training of a model constructed using TensorFlow Keras (`tf.keras.*`).
- For single GPU training of a model constructed using TensorFlow modules (`tf.*` excluding the TensorFlow Keras modules).

Hugging Face Estimator with TensorFlow

```
from sagemaker.huggingface import HuggingFace, TrainingCompilerConfig

# the original max batch size that can fit into GPU memory without compiler
batch_size_native=12
learning_rate_native=float('5e-5')

# an updated max batch size that can fit into GPU memory with compiler
batch_size=64

# update the global learning rate
learning_rate=learning_rate_native/batch_size_native*batch_size

hyperparameters={
    "n_gpus": 1,
    "batch_size": batch_size,
    "learning_rate": learning_rate
}

tensorflow_huggingface_estimator=HuggingFace(
    entry_point='train.py',
    instance_count=1,
    instance_type='ml.p3.2xlarge',
    transformers_version='4.21.1',
    tensorflow_version='2.6.3',
    hyperparameters=hyperparameters,
    compiler_config=TrainingCompilerConfig(),
    disable_profiler=True,
    debugger_hook_config=False
)

tensorflow_huggingface_estimator.fit()
```

To prepare your training script, see the following pages.

- For single GPU training of a TensorFlow Keras model with Hugging Face Transformers
- For single GPU training of a TensorFlow model with Hugging Face Transformers

For distributed training

Hugging Face Estimator with TensorFlow

```
from sagemaker.huggingface import HuggingFace, TrainingCompilerConfig

# choose an instance type, specify the number of instances you want to use,
# and set the num_gpus variable the number of GPUs per instance.
instance_count=1
instance_type='ml.p3.8xlarge'
num_gpus=4

# the original max batch size that can fit to GPU memory without compiler
batch_size_native=16
learning_rate_native=float('5e-5')

# an updated max batch size that can fit to GPU memory with compiler
batch_size=26

# update learning rate
learning_rate=learning_rate_native/
batch_size_native*batch_size*num_gpus*instance_count

hyperparameters={
    "n_gpus": num_gpus,
    "batch_size": batch_size,
    "learning_rate": learning_rate
}

tensorflow_huggingface_estimator=HuggingFace(
    entry_point='train.py',
    instance_count=instance_count,
    instance_type=instance_type,
    transformers_version='4.21.1',
    tensorflow_version='2.6.3',
    hyperparameters=hyperparameters,
    compiler_config=TrainingCompilerConfig(),
    disable_profiler=True,
    debugger_hook_config=False
)

tensorflow_huggingface_estimator.fit()
```

> **Tip**
>
> To prepare your training script, see the following pages.
>
> - For distributed training of a TensorFlow Keras model with Hugging Face Transformers
> - For distributed training of a TensorFlow model with Hugging Face Transformers

The following list is the minimal set of parameters required to run a SageMaker training job with the compiler.

> **Note**
>
> When using the SageMaker AI Hugging Face estimator, you must specify the `transformers_version`, `tensorflow_version`, `hyperparameters`, and `compiler_config` parameters to enable SageMaker Training Compiler. You cannot use `image_uri` to manually specify the Training Compiler integrated Deep Learning Containers that are listed at Supported Frameworks.

- `entry_point` (str) – Required. Specify the file name of your training script.
- `instance_count` (int) – Required. Specify the number of instances.
- `instance_type` (str) – Required. Specify the instance type.
- `transformers_version` (str) – Required only when using the SageMaker AI Hugging Face estimator. Specify the Hugging Face Transformers library version supported by SageMaker Training Compiler. To find available versions, see Supported Frameworks.
- `framework_version` or `tensorflow_version` (str) – Required. Specify the TensorFlow version supported by SageMaker Training Compiler. To find available versions, see Supported Frameworks.

  > **Note**
  >
  > When using the SageMaker AI TensorFlow estimator, you must specify `framework_version`.
  > When using the SageMaker AI Hugging Face estimator, you must specify both `transformers_version` and `tensorflow_version`.

- `hyperparameters` (dict) – Optional. Specify hyperparameters for the training job, such as `n_gpus`, `batch_size`, and `learning_rate`. When you enable SageMaker Training Compiler, try larger batch sizes and adjust the learning rate accordingly. To find case studies of using the compiler and adjusted batch sizes to improve training speed, see the section called "Tested Models" and SageMaker Training Compiler Example Notebooks and Blogs.
- `compiler_config` (TrainingCompilerConfig object) – Required. Include this parameter to turn on SageMaker Training Compiler. The following are parameters for the `TrainingCompilerConfig` class.
  - `enabled` (bool) – Optional. Specify `True` or `False` to turn on or turn off SageMaker Training Compiler. The default value is `True`.
  - `debug` (bool) – Optional. To receive more detailed training logs from your compiler-accelerated training jobs, change it to `True`. However, the additional logging might add overhead and slow down the compiled training job. The default value is `False`.

> **Warning**
>
> If you turn on SageMaker Debugger, it might impact the performance of SageMaker Training Compiler. We recommend that you turn off Debugger when running SageMaker Training Compiler to make sure there's no impact on performance. For more information, see the section called "Considerations". To turn the Debugger functionalities off, add the following two arguments to the estimator:
>
> ```
> disable_profiler=True,
> debugger_hook_config=False
> ```

If the training job with the compiler is launched successfully, you receive the following logs during the job initialization phase:

- With `TrainingCompilerConfig(debug=False)`

```
Found configuration for Training Compiler
Configuring SM Training Compiler...
```

- With `TrainingCompilerConfig(debug=True)`

```
Found configuration for Training Compiler
```

```
Configuring SM Training Compiler...
Training Compiler set to debug mode
```

Using the SageMaker AI Python SDK and Extending SageMaker AI Framework Deep Learning Containers

Amazon Deep Learning Containers (DLC) for TensorFlow use adapted versions of TensorFlow that include changes on top of the open-source TensorFlow framework. The SageMaker AI Framework Deep Learning Containers are optimized for the underlying Amazon infrastructure and Amazon SageMaker AI. With the advantage of using the DLCs, SageMaker Training Compiler integration adds more performance improvements over the native TensorFlow. Furthermore, you can create a custom training container by extending the DLC image.

> **Note**
>
> This Docker customization feature is currently available only for TensorFlow.

To extend and customize the SageMaker AI TensorFlow DLCs for your use-case, use the following instructions.

Create a Dockerfile

Use the following Dockerfile template to extend the SageMaker AI TensorFlow DLC. You must use the SageMaker AI TensorFlow DLC image as the base image of your Docker container. To find the SageMaker AI TensorFlow DLC image URIs, see Supported Frameworks.

```
# SageMaker AI TensorFlow Deep Learning Container image
FROM 763104351884.dkr.ecr.<aws-region>.amazonaws.com/tensorflow-training:<image-tag>

ENV PATH="/opt/ml/code:${PATH}"

# This environment variable is used by the SageMaker AI container
# to determine user code directory.
ENV SAGEMAKER_SUBMIT_DIRECTORY /opt/ml/code

# Add more code lines to customize for your use-case
...
```

For more information, see Step 2: Create and upload the Dockerfile and Python training scripts.

Consider the following pitfalls when extending SageMaker AI Framework DLCs:

- Do not explicitly uninstall or change the version of TensorFlow packages in SageMaker AI containers. Doing so causes the Amazon optimized TensorFlow packages to be overwritten by open-source TensorFlow packages, which might result in performance degradation.
- Watch out for packages that have a particular TensorFlow version or flavor as a dependency. These packages might implicitly uninstall the Amazon optimized TensorFlow and install open-source TensorFlow packages.

For example, there's a known issue that the tensorflow/models and tensorflow/text libraries always attempt to reinstall open source TensorFlow. If you need to install these libraries to choose a specific version for your use case, we recommend that you look into the SageMaker AI TensorFlow DLC Dockerfiles for v2.9 or later. The paths to the Dockerfiles are typically in the following format: `tensorflow/training/docker/<tensorflow-version>/py3/<cuda-version>/Dockerfile.gpu`. In the Dockerfiles, you should find the code lines to reinstall Amazon managed TensorFlow binary (specified to the `TF_URL` environment variable) and other dependencies in order. The reinstallation section should look like the following example:

```
# tf-models does not respect existing installations of TensorFlow
# and always installs open source TensorFlow

RUN pip3 install --no-cache-dir -U \
    tf-models-official==x.y.z

RUN pip3 uninstall -y tensorflow tensorflow-gpu \
  ; pip3 install --no-cache-dir -U \
    ${TF_URL} \
    tensorflow-io==x.y.z \
    tensorflow-datasets==x.y.z
```

Build and push to ECR

To build and push your Docker container to Amazon ECR, follow the instructions in the following links:

- Step 3: Build the container
- Step 4: Test the container
- Step 5: Push the container to Amazon ECR

Run using the SageMaker Python SDK Estimator

Use the SageMaker AI TensorFlow framework estimator as usual. You must specify `image_uri` to use the new container you hosted in Amazon ECR.

```
import sagemaker, boto3
from sagemaker import get_execution_role
from sagemaker.tensorflow import TensorFlow, TrainingCompilerConfig

account_id = boto3.client('sts').get_caller_identity().get('Account')
ecr_repository = 'tf-custom-container-test'
tag = ':latest'

region = boto3.session.Session().region_name

uri_suffix = 'amazonaws.com'

byoc_image_uri = '{}.dkr.ecr.{}.{}/{}'.format(
    account_id, region, uri_suffix, ecr_repository + tag
)

byoc_image_uri
# This should return something like
# 111122223333.dkr.ecr.us-east-2.amazonaws.com/tf-custom-container-test:latest

estimator = TensorFlow(
    image_uri=image_uri,
    role=get_execution_role(),
    base_job_name='tf-custom-container-test-job',
    instance_count=1,
    instance_type='ml.p3.8xlarge'
    compiler_config=TrainingCompilerConfig(),
    disable_profiler=True,
    debugger_hook_config=False
)

# Start training
estimator.fit()
```

Enable SageMaker Training Compiler Using the SageMaker AI `CreateTrainingJob` API Operation

SageMaker Training Compiler configuration options must be specified through the `AlgorithmSpecification` and `HyperParameters` field in the request syntax for the `CreateTrainingJob` API operation.

```
"AlgorithmSpecification": {
    "TrainingImage": "<sagemaker-training-compiler-enabled-dlc-image>"
},

"HyperParameters": {
    "sagemaker_training_compiler_enabled": "true",
    "sagemaker_training_compiler_debug_mode": "false"
}
```

To find a complete list of deep learning container image URIs that have SageMaker Training Compiler implemented, see Supported Frameworks.

SageMaker Training Compiler Example Notebooks and Blogs

> **Important**
>
> Amazon Web Services (Amazon) announces that there will be no new releases or versions of SageMaker Training Compiler. You can continue to utilize SageMaker Training Compiler through the existing Amazon Deep Learning Containers (DLCs) for SageMaker Training. It is important to note that while the existing DLCs remain accessible, they will no longer receive patches or updates from Amazon, in accordance with the Amazon Deep Learning Containers Framework Support Policy.

The following blogs, case studies, and notebooks provide examples of how to implement SageMaker Training Compiler.

Example notebooks are provided in the SageMaker AI examples GitHub repository, and you can also browse them on the SageMaker AI examples website.

Blogs and Case Studies

The following blogs discuss case studies about using SageMaker Training Compiler.

- New – Introducing SageMaker Training Compiler
- Hugging Face Transformers BERT fine-tuning using Amazon SageMaker Training Compiler
- Speed up Hugging Face Training Jobs on Amazon by Up to 50% with SageMaker Training Compiler

Examples Notebooks

To find examples of using SageMaker Training Compiler, see the Training Compiler page in the *Amazon SageMaker AI Example Read the Docs website*.

SageMaker Training Compiler Best Practices and Considerations

> **Important**
>
> Amazon Web Services (Amazon) announces that there will be no new releases or versions of SageMaker Training Compiler. You can continue to utilize SageMaker Training Compiler through the existing Amazon Deep Learning Containers (DLCs) for SageMaker Training. It is important to note that while the existing DLCs remain accessible, they will no longer receive patches or updates from Amazon, in accordance with the Amazon Deep Learning Containers Framework Support Policy.

Review the following best practices and considerations when using SageMaker Training Compiler.

Best Practices

Use the following guidelines to achieve the best results when you run training jobs with SageMaker Training Compiler.

General Best Practices

- Make sure that you use one of the Supported Instance Types and Tested Models.
- When you create a tokenizer for an NLP model using the Hugging Face Transformers library in your training script, make sure that you use a static input tensor shape by specifying `padding='max_length'`. Do not use `padding='longest'` because padding to the longest sequence in the batch can change the tensor shape for each training batch. The dynamic input shape can initiate recompilation of the model and might increase total training time. For more

information about padding options of the Transformers tokenizers, see Padding and truncation in the *Hugging Face Transformers documentation*.

- Measure GPU memory utilization to make sure that you use the maximum batch size that can fit into the GPU memory. Amazon SageMaker Training Compiler reduces the memory footprint of your model during training, which typically allows you to fit a larger `batch_size` in the GPU memory. Using a larger `batch_size` results in a better GPU utilization and reduces the total training time.

  When you adjust the batch size, you also have to adjust the `learning_rate` appropriately. For example, if you increased the batch size by a factor of k, you need to adjust `learning_rate` linearly (simple multiplication by k) or multiply by the square root of k. This is to achieve the same or similar convergence behavior in the reduced training time. For reference of `batch_size` tested for popular models, see Tested Models.

- To debug the compiler-accelerated training job, enable the `debug` flag in the `compiler_config` parameter. This enables SageMaker AI to put the debugging logs into SageMaker training job logs.

```
from sagemaker.core.training_compiler import TrainingCompilerConfig
from sagemaker.train import ModelTrainer
from sagemaker.core import image_uris

training_image = image_uris.retrieve(
    framework="huggingface",
    region=region,
    version="4.21.1",
    py_version="py38",
    instance_type="ml.p3.2xlarge",
    image_scope="training",
    training_compiler_config=TrainingCompilerConfig(debug=True)
)

model_trainer=ModelTrainer(
    training_image=training_image,
    ...
)
```

  Note that if you enable full debugging of the training job with the compiler, this might add some overhead.

Best Practices for PyTorch

- If you bring a PyTorch model and want to checkpoint it, make sure you use PyTorch/XLA's model save function to properly checkpoint your model. For more information about the function, see `torch_xla.core.xla_model.save` in the *PyTorch on XLA Devices documentation*.

  To learn how to add the modifications to your PyTorch script, see Large Language Models Using PyTorch Directly (without the Hugging Face Transformers Trainer API).

  For more information about the actual application of using the model save function, see Checkpoint Writing and Loading in the *Hugging Face on PyTorch/XLA TPUs: Faster and cheaper training blog*.
- To achieve the most optimal training time for distributed training, consider the following.
  - Use instances with multiple GPUs instead of using single-gpu instances. For example, a single `ml.p3dn.24xlarge` instance has faster training time compared to 8 x `ml.p3.2xlarge` instances.
  - Use instances with EFA support such as `ml.p3dn.24xlarge` and `ml.p4d.24xlarge`. These instance types have accelerated networking speed and reduce training time.
  - Tune the `preprocessing_num_workers` parameter for datasets, so that model training is not delayed by slow preprocessing.

Considerations

Consider the following when using SageMaker Training Compiler.

Performance degradation due to logging, checkpointing, and profiling

- Avoid logging, checkpointing, and profiling model tensors that lead to explicit evaluations. To understand what an explicit evaluation is, consider the following code compiling example.

```
a = b+c
e = a+d
```

  A compiler interprets the code as follows and reduces the memory footprint for the variable `a`:

```
e = b+c+d
```

Now consider the following case in which the code is changed to add a print function for the variable a.

```
a = b+c
e = a+d
print(a)
```

The compiler makes an explicit evaluation of the variable a as follows.

```
e = b+c+d
a = b+c    # Explicit evaluation
print(a)
```

In PyTorch, for example, avoid using torch.tensor.items(), which might introduce explicit evaluations. In deep learning, such explicit evaluations can cause overhead because they break fused operations in a compilation graph of a model and lead to recomputation of the tensors.

If you still want to periodically evaluate the model during training while using SageMaker Training Compiler, we recommend logging and checkpointing at a lower frequency to reduce overhead due to explicit evaluations. For example, log every 10 epochs instead of every epoch.

- Graph compilation runs during the first few steps of training. As a result, the first few steps are expected to be exceptionally slow. However, this is a one-time compilation cost and can be amortized by training for a longer duration because compilation makes future steps much faster. The initial compilation overhead depends on the size of the model, the size of the input tensors, and the distribution of input tensor shapes.

Incorrect use of the PyTorch/XLA APIs when using PyTorch directly

PyTorch/XLA defines a set of APIs to replace some of the existing PyTorch training APIs. Failing to use them properly leads PyTorch training to fail.

- One of the most typical errors when compiling a PyTorch model is due to a wrong device type for operators and tensors. To properly compile a PyTorch model, make sure you use XLA devices (`xm.xla_device()`) instead of using CUDA or mixing CUDA devices and XLA devices.
- `mark_step()` is a barrier just for XLA. Failing to set it correctly causes a training job to stall.
- PyTorch/XLA provides additional distributed training APIs. Failing to program the APIs properly causes gradients to be collected incorrectly, which causes a training convergence failure.

To properly set up your PyTorch script and avoid the aforementioned incorrect API uses, see Large Language Models Using PyTorch Directly (without the Hugging Face Transformers Trainer API).

SageMaker Training Compiler FAQ

> **Important**
>
> Amazon Web Services (Amazon) announces that there will be no new releases or versions of SageMaker Training Compiler. You can continue to utilize SageMaker Training Compiler through the existing Amazon Deep Learning Containers (DLCs) for SageMaker Training. It is important to note that while the existing DLCs remain accessible, they will no longer receive patches or updates from Amazon, in accordance with the Amazon Deep Learning Containers Framework Support Policy.

Use the following FAQ items to find answers to commonly asked questions about SageMaker Training Compiler.

Q. How do I know SageMaker Training Compiler is working?

If you successfully launched your training job with SageMaker Training Compiler, you receive the following log messages:

- With `TrainingCompilerConfig(debug=False)`

```
Found configuration for Training Compiler
Configuring SM Training Compiler...
```

- With `TrainingCompilerConfig(debug=True)`

```
Found configuration for Training Compiler
Configuring SM Training Compiler...
Training Compiler set to debug mode
```

Q. Which models does SageMaker Training Compiler accelerate?

SageMaker Training Compiler supports the most popular deep learning models from the Hugging Face transformers library. With most of the operators that the compiler supports, these models can be trained faster with SageMaker Training Compiler. Compilable models include but are not

limited to the following: `bert-base-cased`, `bert-base-chinese`, `bert-base-uncased`, `distilbert-base-uncased`, `distilbert-base-uncased-finetuned-sst-2-english`, `gpt2`, `roberta-base`, `roberta-large`, `t5-base`, and `xlm-roberta-base`. The compiler works with most DL operators and data structures and can accelerate many other DL models beyond those that have been tested.

Q. What happens if I enable SageMaker Training Compiler with a model that isn't tested?

For an untested model, you might need to first modify the training script to be compatible with SageMaker Training Compiler. For more information, see Bring Your Own Deep Learning Model and follow the instructions on how to prepare your training script.

Once you have updated your training script, you can start the training job. The compiler proceeds to compile the model. However, training speed may not increase and might even decrease relative to the baseline with an untested model. You might need to retune training parameters such as `batch_size` and `learning_rate` to achieve any speedup benefits.

If compilation of the untested model fails, the compiler returns an error. See SageMaker Training Compiler Troubleshooting for detailed information about the failure types and error messages.

Q. Will I always get a faster training job with SageMaker Training Compiler?

No, not necessarily. First, SageMaker Training Compiler adds some compilation overhead before the ongoing training process can be accelerated. The optimized training job must run sufficiently long to amortize and make up for this incremental compilation overhead at the beginning of the training job.

Additionally, as with any model training process, training with suboptimal parameters can increase training time. SageMaker Training Compiler can change the characteristics of the training job by, for example, changing the memory footprint of the job. Because of these differences, you might need to retune your training job parameters to speed up training. A reference table specifying the best performing parameters for training jobs with different instance types and models can be found at Tested Models.

Finally, some code in a training script might add additional overhead or disrupt the compiled computation graph and slow training. If working with a customized or untested model, see the instructions at Best Practices to Use SageMaker Training Compiler with PyTorch/XLA.

Q. Can I always use a larger batch size with SageMaker Training Compiler?

Batch size increases in most, but not all, cases. The optimizations made by SageMaker Training Compiler can change the characteristics of your training job, such as the memory footprint. Typically, a Training Compiler job occupies less memory than an uncompiled training job with the native framework, which allows for a larger batch size during training. A larger batch size, and a corresponding adjustment to the learning rate, increases training throughput and can decrease total training time.

However, there could be cases where SageMaker Training Compiler might actually increase memory footprint based on its optimization scheme. The compiler uses an analytical cost model to predict the execution schedule with the lowest cost of execution for any compute-intensive operator. This model could find an optimal schedule that increases memory use. In this case, you won't be able to increase batch sizes, but your sample throughput is still higher.

Q. Does SageMaker Training Compiler work with other SageMaker training features, such as the SageMaker AI distributed training libraries and SageMaker Debugger?

SageMaker Training Compiler is currently not compatible with SageMaker AI's distributed training libraries.

SageMaker Training Compiler is compatible with SageMaker Debugger, but Debugger might degrade computational performance by adding overhead.

Q. Does SageMaker Training Compiler support custom containers (bring your own container)?

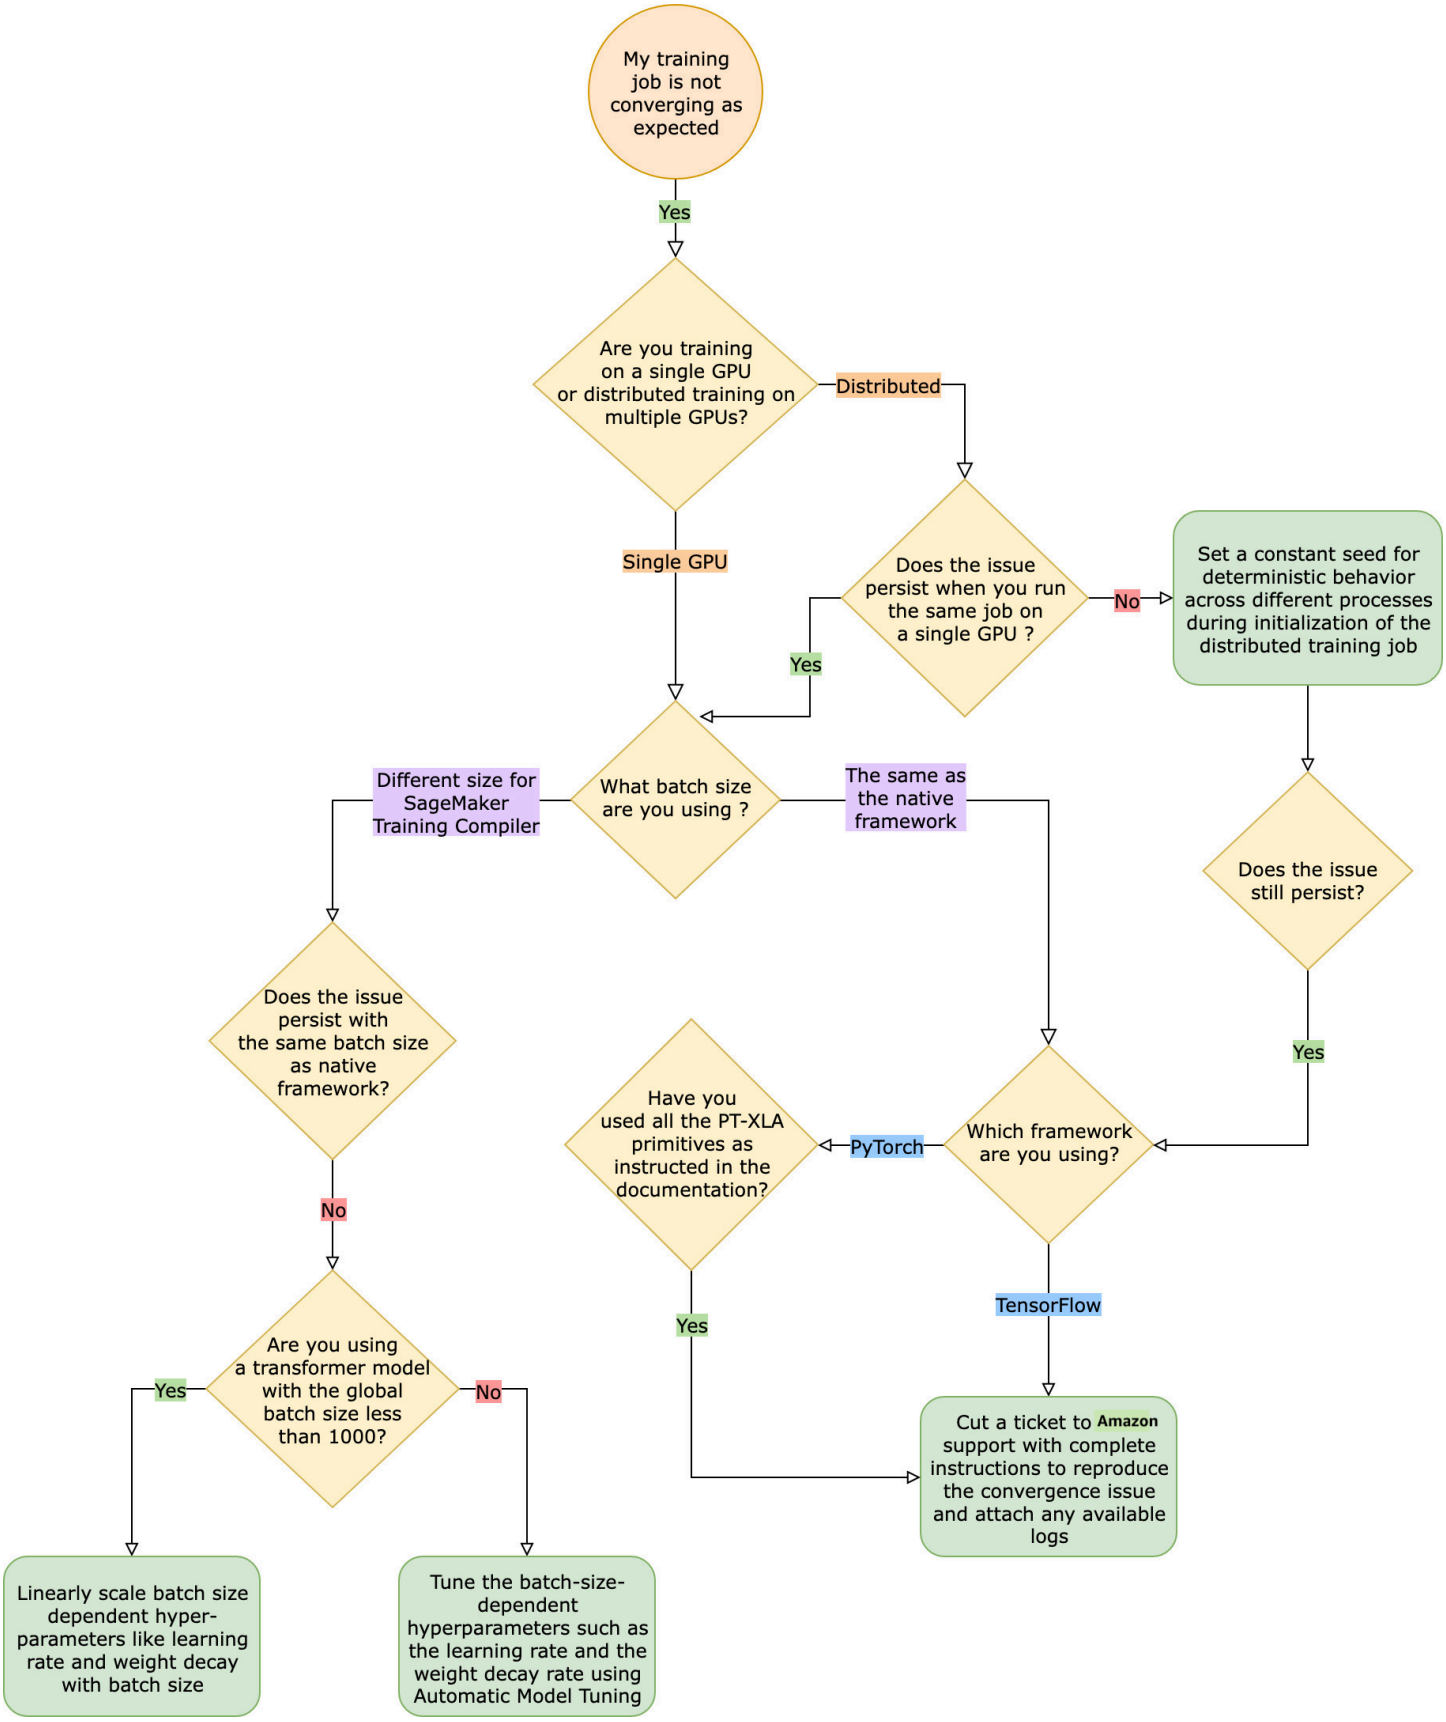
SageMaker Training Compiler is provided through Amazon Deep Learning Containers, and you can extend a subset of the containers to customize for your use-case. Containers that are extended from Amazon DLCs are supported by SageMaker Training Compiler. For more information, see Supported Frameworks and Using the SageMaker AI Python SDK and Extending SageMaker AI Framework Deep Learning Containers. If you need further support, reach out to the SageMaker AI team through Amazon Support or Amazon Developer Forums for Amazon SageMaker AI.

SageMaker Training Compiler Troubleshooting

> **Important**
>
> Amazon Web Services (Amazon) announces that there will be no new releases or versions of SageMaker Training Compiler. It is important to note that while the existing DLCs remain accessible, they will no longer

receive patches or updates from Amazon, in accordance with the Amazon Deep Learning Containers Framework Support Policy.

If you run into an error, you can use the following list to try to troubleshoot your training job. If you need further support, reach out to the SageMaker AI team through Amazon Support or Amazon Developer Forums for Amazon SageMaker AI.



Training job is not converging as expected when compared to the native framework training job

Convergence issues range from “the model is not learning when SageMaker Training Compiler is turned on” to “the model is learning but slower than the native framework”. In this troubleshooting guide, we assume your convergence is fine without SageMaker Training Compiler (in the native framework) and consider this the baseline.

When faced with such convergence issues, the first step is to identify if the issue is limited to distributed training or stems from single-GPU training. Distributed training with SageMaker Training Compiler is an extension of single-GPU training with additional steps.

1. Set up a cluster with multiple instances or GPUs.
2. Distribute input data to all workers.
3. Synchronize the model updates from all workers.

Therefore, any convergence issue in single-GPU training propagates to distributed training with multiple workers.

My training job is not converging as expected
Yes
Are you training on a single GPU or distributed training on multiple GPUs?
Distributed
Single GPU
Does the issue persist when you run the same job on a single GPU ?
No
Yes
Set a constant seed for deterministic behavior across different processes during initialization of the distributed training job
What batch size are you using ?
Different size for SageMaker Training Compiler
The same as the native framework
Does the issue still persist?
Does the issue persist with the same batch size as native framework?
Yes
Which framework are you using?
PyTorch
Have you used all the PT-XLA primitives as instructed in the documentation?
TensorFlow
No
Yes
Are you using a transformer model with the global batch size less than 1000?
Yes
No
Cut a ticket to Amazon support with complete instructions to reproduce the convergence issue and attach any available logs
Linearly scale batch size dependent hyper-parameters like learning rate and weight decay with batch size
Tune the batch-size-dependent hyperparameters such as the learning rate and the weight decay rate using Automatic Model Tuning

Convergence issues occurring in single-GPU training

If your convergence issue stems from single-GPU training, this is likely due to improper settings for hyperparameters or the `torch_xla` APIs.

Check the hyperparameters

Training with SageMaker Training Compiler leads to change in the memory footprint of a model. The compiler intelligently arbitrates between re-use and re-compute leading to a corresponding increase or decrease in memory consumption. To leverage this, it is essential to re-tune the batch size and associated hyperparameters when migrating a training job to SageMaker Training Compiler. However, incorrect hyperparameter settings often cause oscillation in training loss and possibly a slower convergence as a result. In rare cases, aggressive hyperparameters might result in the model not learning (the training loss metric doesn't decrease or returns `NaN`). To identify if the convergence issue is due to the hyperparameters, do a side-by-side test of two training jobs with and without SageMaker Training Compiler while keeping all the hyperparameters the same.

Check if the `torch_xla` APIs are properly set up for single-GPU training

If the convergence issue persists with the baseline hyperparameters, you need to check if there's any improper usage of the `torch_xla` APIs, specifically the ones for updating the model. Fundamentally, `torch_xla` continues to accumulate instructions (deferring execution) in the form of graph until it is explicitly instructed to run the accumulated graph. The `torch_xla.core.xla_model.mark_step()` function facilitates the execution of the accumulated graph. The graph execution should be synchronized using this function ***after each model update*** and ***before printing and logging any variables***. If it lacks the synchronization step, the model might use stale values from memory during prints, logs, and the subsequent forward passes, instead of using the most recent values that have to be synchronized after every iteration and model update.

It can be more complicated when using SageMaker Training Compiler with gradient scaling (possibly from the use of AMP) or gradient clipping techniques. The appropriate order of gradient computation with AMP is as follows.

1. Gradient computation with scaling
2. Gradient un-scaling, gradient clipping, and then scaling
3. Model update
4. Synchronizing the graph execution with `mark_step()`

To find the right APIs for the operations mentioned in the list, see the guide for migrating your training script to SageMaker Training Compiler.

Consider using Automatic Model Tuning

If the convergence issue arises when re-tuning the batch size and associated hyperparameters such as the learning rate while using SageMaker Training Compiler, consider using Automatic Model Tuning to tune your hyperparameters. You can refer to the example notebook on tuning hyperparameters with SageMaker Training Compiler.

Convergence issues occurring in distributed training

If your convergence issue persists in distributed training, this is likely due to improper settings for weight initialization or the `torch_xla` APIs.

Check weight initialization across the workers

If the convergence issue arises when running a distributed training job with multiple workers, ensure there is a uniform deterministic behavior across all workers by setting a constant seed where applicable. Beware of techniques such as weight initialization, which involves randomization. Each worker might end up training a different model in the absence of a constant seed.

Check if the `torch_xla` APIs are properly set up for distributed training

If the issue still persists, this is likely due to improper use of the `torch_xla` APIs for distributed training. Make sure that you add the following in your ModelTrainer to set up a cluster for distributed training with SageMaker Training Compiler.

```
distribution={'torchxla': {'enabled': True}}
```

This should be accompanied by a function `_mp_fn(index)` in your training script, which is invoked once per worker. Without the `mp_fn(index)` function, you might end up letting each of the workers train the model independently without sharing model updates.

Next, make sure that you use the `torch_xla.distributed.parallel_loader.MpDeviceLoader` API along with the distributed data sampler, as guided in the documentation about migrating your training script to SageMaker Training Compiler, as in the following example.

```
torch.utils.data.distributed.DistributedSampler()
```

This ensures that the input data is properly distributed across all workers.

Finally, to synchronize model updates from all workers, use `torch_xla.core.xla_model._fetch_gradients` to gather gradients from all workers and `torch_xla.core.xla_model.all_reduce` to combine all the gathered gradients into a single update.

It can be more complicated when using SageMaker Training Compiler with gradient scaling (possibly from use of AMP) or gradient clipping techniques. The appropriate order of gradient computation with AMP is as follows.

1. Gradient computation with scaling
2. Gradient synchronization across all workers
3. Gradient un-scaling, gradient clipping, and then gradient scaling
4. Model update
5. Synchronizing the graph execution with `mark_step()`

Note that this checklist has an additional item for synchronizing all workers, compared to the checklist for single-GPU training.

Training job fails due to missing PyTorch/XLA configuration

If a training job fails with the `Missing XLA configuration` error message, it might be due to a misconfiguration in the number of GPUs per instance that you use.

XLA requires additional environment variables to compile the training job. The most common missing environment variable is `GPU_NUM_DEVICES`. For the compiler to work properly, you must set this environment variable equal to the number of GPUs per instance.

There are three approaches to set the `GPU_NUM_DEVICES` environment variable:

- **Approach 1** – Use the `environment` argument of the SageMaker AI ModelTrainer class. For example, if you use an `ml.p3.8xlarge` instance that has four GPUs, do the following:

```
# Using the SageMaker Python SDK's ModelTrainer

model_trainer=ModelTrainer(
    ...
    compute=Compute(instance_type="ml.p3.8xlarge", instance_count=1),
```

```
    hyperparameters={...},
    environment={
        ...
        "GPU_NUM_DEVICES": "4" # corresponds to number of GPUs on the specified
 instance
    },
)
```

- **Approach 2** – Use the `hyperparameters` argument of the SageMaker AI ModelTrainer class and parse it in your training script.

  1. To specify the number of GPUs, add a key-value pair to the `hyperparameters` argument.

     For example, if you use an `ml.p3.8xlarge` instance that has four GPUs, do the following:

     ```
     # Using the SageMaker Python SDK's ModelTrainer

     model_trainer=ModelTrainer(
         ...
         source_code=SourceCode(entry_script="train.py"),
         compute=Compute(instance_type="ml.p3.8xlarge", instance_count=1),
         hyperparameters = {
             ...
             "n_gpus": 4 # corresponds to number of GPUs on specified instance
         }
     )
     model_trainer.train()
     ```

  2. In your training script, parse the `n_gpus` hyperparameter and specify it as an input for the `GPU_NUM_DEVICES` environment variable.

     ```
     # train.py
     import os, argparse

     if __name__ == "__main__":
         parser = argparse.ArgumentParser()
         ...
         # Data, model, and output directories
         parser.add_argument("--output_data_dir", type=str,
      default=os.environ["SM_OUTPUT_DATA_DIR"])
         parser.add_argument("--model_dir", type=str,
      default=os.environ["SM_MODEL_DIR"])
         parser.add_argument("--training_dir", type=str,
      default=os.environ["SM_CHANNEL_TRAIN"])
     ```

```
    parser.add_argument("--test_dir", type=str,
default=os.environ["SM_CHANNEL_TEST"])
    parser.add_argument("--n_gpus", type=str, default=os.environ["SM_NUM_GPUS"])

    args, _ = parser.parse_known_args()

    os.environ["GPU_NUM_DEVICES"] = args.n_gpus
```

- **Approach 3** – Hard-code the `GPU_NUM_DEVICES` environment variable in your training script. For example, add the following to your script if you use an instance that has four GPUs.

```
# train.py

import os
os.environ["GPU_NUM_DEVICES"] = 4
```

> **Tip**
>
> To find the number of GPU devices on machine learning instances that you want to use, see Accelerated Computing in the *Amazon EC2 Instance Types page*.

SageMaker Training Compiler doesn't reduce the total training time

If the total training time does not decrease with SageMaker Training Compiler, we highly recommend you to go over the SageMaker Training Compiler Best Practices and Considerations page to check your training configuration, padding strategy for the input tensor shape, and hyperparameters.

Amazon SageMaker Training Compiler Release Notes

> **Important**
>
> Amazon Web Services (Amazon) announces that there will be no new releases or versions of SageMaker Training Compiler. You can continue to utilize SageMaker Training Compiler through the existing Amazon Deep Learning Containers (DLCs) for SageMaker Training. It is important to note that while the existing DLCs remain accessible, they will no longer

receive patches or updates from Amazon, in accordance with the Amazon Deep Learning Containers Framework Support Policy.

See the following release notes to track the latest updates for Amazon SageMaker Training Compiler.

SageMaker Training Compiler Release Notes: February 13, 2023

Currency Updates

- Added support for PyTorch v1.13.1

Bug Fixes

- Fixed a race condition issue on GPU which was causing NAN loss in some models like vision transformer (ViT) models.

Other Changes

- SageMaker Training Compiler improves performance by letting PyTorch/XLA to automatically override the optimizers (such as SGD, Adam, AdamW) in `torch.optim` or `transformers.optimization` with the syncfree versions of them in `torch_xla.amp.syncfree` (such as `torch_xla.amp.syncfree.SGD`, `torch_xla.amp.syncfree.Adam`, `torch_xla.amp.syncfree.AdamW`). You don't need to change those code lines where you define optimizers in your training script.

Migration to Amazon Deep Learning Containers

This release passed benchmark testing and is migrated to the following Amazon Deep Learning Container:

- PyTorch v1.13.1

```
763104351884.dkr.ecr.us-west-2.amazonaws.com/pytorch-trcomp-training:1.13.1-gpu-py39-cu117-ubuntu20.04-sagemaker
```

To find a complete list of the prebuilt containers with Amazon SageMaker Training Compiler, see Supported Frameworks, Amazon Web Services Regions, Instance Types, and Tested Models.

SageMaker Training Compiler Release Notes: January 9, 2023

Breaking Changes

- `tf.keras.optimizers.Optimizer` points to a new optimizer in TensorFlow 2.11.0 and later. The old optimizers are moved to `tf.keras.optimizers.legacy`. You might encounter job failure due to the breaking change when you do the following.
  - Load checkpoints from an old optimizer. We recommend you to switch to use the legacy optimizers.
  - Use TensorFlow v1. We recommend you to migrate to TensorFlow v2, or switch to the legacy optimizers if you need to continue using TensorFlow v1.

  For more detailed list of breaking changes from the optimizer changes, see the official TensorFlow v2.11.0 release notes in the TensorFlow GitHub repository.

Migration to Amazon Deep Learning Containers

This release passed benchmark testing and is migrated to the following Amazon Deep Learning Container:

- TensorFlow v2.11.0

```
763104351884.dkr.ecr.<region>.amazonaws.com/tensorflow-training:2.11.0-gpu-py39-
cu112-ubuntu20.04-sagemaker
```

To find a complete list of the prebuilt containers with Amazon SageMaker Training Compiler, see Supported Frameworks, Amazon Web Services Regions, Instance Types, and Tested Models.

SageMaker Training Compiler Release Notes: December 8, 2022

Bug Fixes

- Fixed the seed for PyTorch training jobs starting PyTorch v1.12 to ensure that there is no discrepancy in model initialization across different processes. See also PyTorch Reproducibility.

- Fixed the issue causing PyTorch distributed training jobs on G4dn and G5 instances to not default to communication through PCIe.

Known Issues

- Improper use of PyTorch/XLA APIs in Hugging Face's vision transformers might lead to convergence issues.

Other Changes

- When using the Hugging Face Transformers `Trainer` class, make sure that you use SyncFree optimizers by setting the `optim` argument to `adamw_torch_xla`. For more information, see Large Language Models Using the Hugging Face Transformers `Trainer` Class. See also Optimizer in the *Hugging Face Transformers documentation*.

Migration to Amazon Deep Learning Containers

This release passed benchmark testing and is migrated to the following Amazon Deep Learning Container:

- PyTorch v1.12.0

```
763104351884.dkr.ecr.<region>.amazonaws.com/pytorch-trcomp-training:1.12.0-gpu-py38-cu113-ubuntu20.04-sagemaker
```

To find a complete list of the prebuilt containers with Amazon SageMaker Training Compiler, see Supported Frameworks, Amazon Web Services Regions, Instance Types, and Tested Models.

SageMaker Training Compiler Release Notes: October 4, 2022

Currency Updates

- Added support for TensorFlow v2.10.0.

Other Changes

- Added Hugging Face NLP models using the Transformers library to TensorFlow framework tests. To find the tested Transformer models, see the section called "Tested Models".

Migration to Amazon Deep Learning Containers

This release passed benchmark testing and is migrated to the following Amazon Deep Learning Container:

- TensorFlow v2.10.0

```
763104351884.dkr.ecr.<region>.amazonaws.com/tensorflow-training:2.10.0-gpu-py39-cu112-ubuntu20.04-sagemaker
```

To find a complete list of the prebuilt containers with Amazon SageMaker Training Compiler, see Supported Frameworks, Amazon Web Services Regions, Instance Types, and Tested Models.

SageMaker Training Compiler Release Notes: September 1, 2022

Currency Updates

- Added support for Hugging Face Transformers v4.21.1 with PyTorch v1.11.0.

Improvements

- Implemented a new distributed training launcher mechanism to activate SageMaker Training Compiler for Hugging Face Transformer models with PyTorch. To learn more, see Run PyTorch Training Jobs with SageMaker Training Compiler for Distributed Training.
- Integrated with EFA to improve the collective communication in distributed training.
- Added support for G5 instances for PyTorch training jobs. For more information, see the section called "Supported Frameworks, Amazon Web Services Regions, Instance Types, and Tested Models".

Migration to Amazon Deep Learning Containers

This release passed benchmark testing and is migrated to the following Amazon Deep Learning Container:

- HuggingFace v4.21.1 with PyTorch v1.11.0

```
763104351884.dkr.ecr.us-west-2.amazonaws.com/huggingface-pytorch-trcomp-
training:1.11.0-transformers4.21.1-gpu-py38-cu113-ubuntu20.04
```

To find a complete list of the prebuilt containers with Amazon SageMaker Training Compiler, see Supported Frameworks, Amazon Web Services Regions, Instance Types, and Tested Models.

SageMaker Training Compiler Release Notes: June 14, 2022

New Features

- Added support for TensorFlow v2.9.1. SageMaker Training Compiler fully supports compiling TensorFlow modules (`tf.*`) and TensorFlow Keras modules (`tf.keras.*`).
- Added support for custom containers created by extending Amazon Deep Learning Containers for TensorFlow. For more information, see Enable SageMaker Training Compiler Using the SageMaker Python SDK and Extending SageMaker AI Framework Deep Learning Containers.
- Added support for G5 instances for TensorFlow training jobs.

Migration to Amazon Deep Learning Containers

This release passed benchmark testing and is migrated to the following Amazon Deep Learning Container:

- TensorFlow 2.9.1

```
763104351884.dkr.ecr.<region>.amazonaws.com/tensorflow-training:2.9.1-gpu-py39-cu112-
ubuntu20.04-sagemaker
```

To find a complete list of the pre-built containers with Amazon SageMaker Training Compiler, see Supported Frameworks, Amazon Web Services Regions, Instance Types, and Tested Models.

SageMaker Training Compiler Release Notes: April 26, 2022

Improvements

- Added support for all of the Amazon Web Services Regions where Amazon Deep Learning Containers are in service except the China regions.

SageMaker Training Compiler Release Notes: April 12, 2022

Currency Updates

- Added support for Hugging Face Transformers v4.17.0 with TensorFlow v2.6.3 and PyTorch v1.10.2.

SageMaker Training Compiler Release Notes: February 21, 2022

Improvements

- Completed benchmark test and confirmed training speed-ups on the `ml.g4dn` instance types. To find a complete list of tested `ml` instances, see Supported Instance Types.

SageMaker Training Compiler Release Notes: December 01, 2021

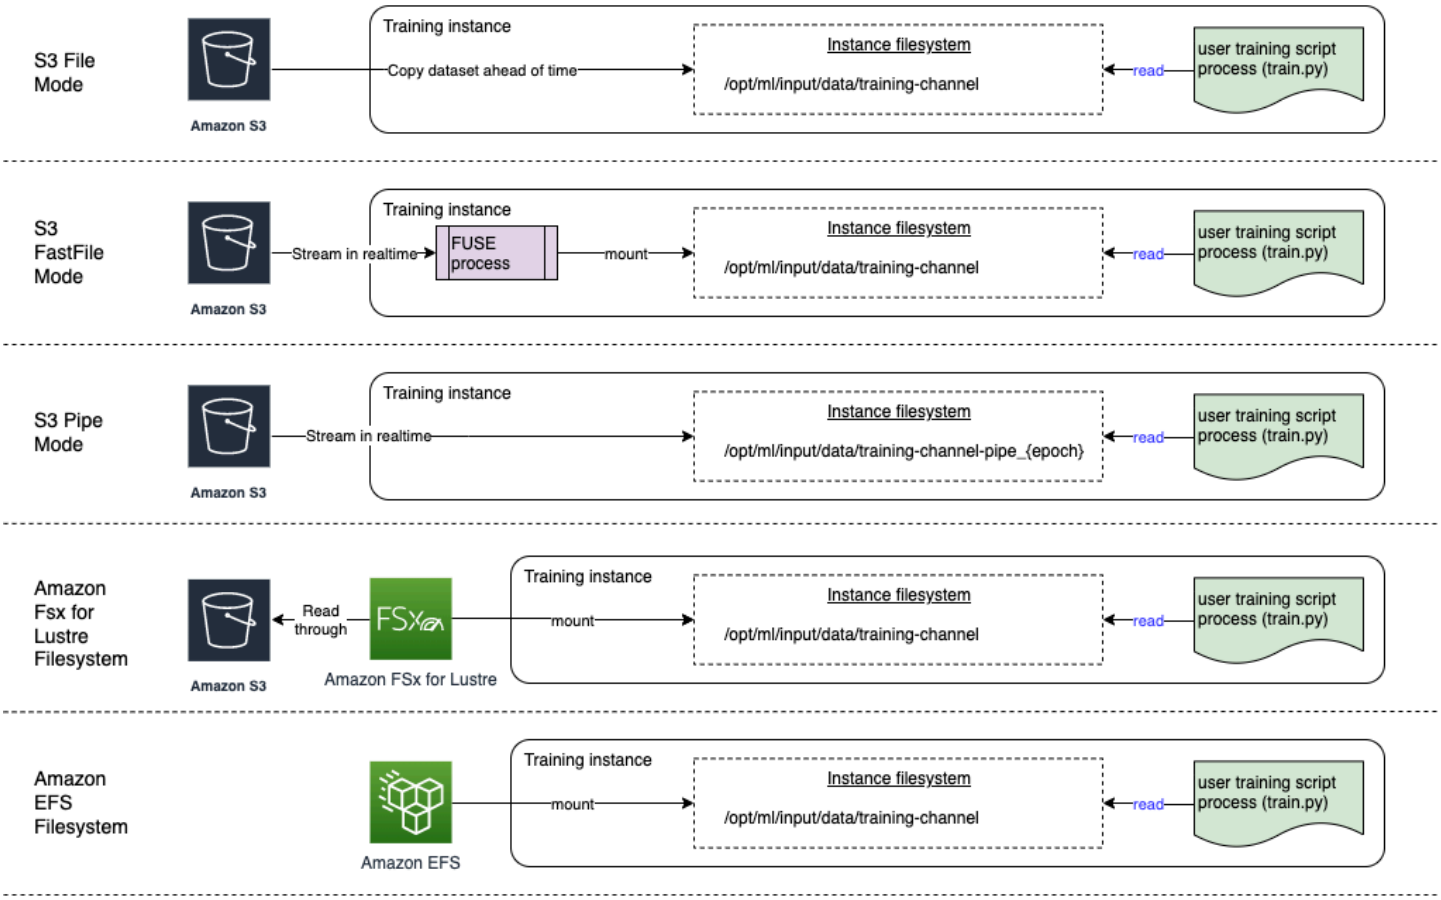
New Features

- Launched Amazon SageMaker Training Compiler at Amazon re:Invent 2021.

Migration to Amazon Deep Learning Containers

- Amazon SageMaker Training Compiler passed benchmark testing and is migrated to Amazon Deep Learning Containers. To find a complete list of the prebuilt containers with Amazon SageMaker Training Compiler, see Supported Frameworks, Amazon Web Services Regions, Instance Types, and Tested Models.

Setting up training jobs to access datasets



When creating a training job, you specify the location of training datasets in a data storage of your choice and the data input mode for the job. Amazon SageMaker AI supports Amazon Simple

Storage Service (Amazon S3), Amazon Elastic File System (Amazon EFS), and Amazon FSx for Lustre. You can choose one of the input modes to stream the dataset in real time or download the whole dataset at the start of the training job.

> **Note**
>
> Your dataset must reside in the same Amazon Web Services Region as the training job.

SageMaker AI input modes and Amazon cloud storage options

This section provides an overview of the file input modes supported by SageMaker for data stored in Amazon EFS and Amazon FSx for Lustre.

- *File mode* presents a file system view of the dataset to the training container. This is the default input mode if you don't explicitly specify one of the other two options. If you use file mode, SageMaker AI downloads the training data from the storage location to a local directory in the Docker container. Training starts after the full dataset has been downloaded. In file mode, the

training instance must have enough storage space to fit the entire dataset. File mode download speed depends on the size of dataset, the average size of files, and the number of files. You can configure the dataset for file mode by providing either an Amazon S3 prefix, manifest file, or augmented manifest file. You should use an S3 prefix when all your dataset files are located within a common S3 prefix. File mode is compatible with SageMaker AI local mode (starting a SageMaker training container interactively in seconds). For distributed training, you can shard the dataset across multiple instances with the `ShardedByS3Key` option.

- *Fast file mode* provides file system access to an Amazon S3 data source while leveraging the performance advantage of pipe mode. At the start of training, fast file mode identifies the data files but does not download them. Training can start without waiting for the entire dataset to download. This means that the training startup takes less time when there are fewer files in the Amazon S3 prefix provided.

  In contrast to pipe mode, fast file mode works with random access to the data. However, it works best when data is read sequentially. Fast file mode doesn't support augmented manifest files.

  Fast file mode exposes S3 objects using a POSIX-compliant file system interface, as if the files are available on the local disk of your training instance. It streams S3 content on demand as your training script consumes data. This means that your dataset no longer needs to fit into the training instance storage space as a whole, and you don't need to wait for the dataset to be downloaded to the training instance before training starts. Fast file currently supports S3 prefixes only (it does not support manifest and augmented manifest). Fast file mode is compatible with SageMaker AI local mode.

  > **Note**
  >
  > Using Fast File mode might lead to increased CloudTrail costs due to additional logging of:
  >
  > - Amazon S3 data events (if enabled in CloudTrail).
  > - Amazon KMS decryption events when accessing Amazon S3 objects encrypted with Amazon KMS keys.
  > - Management events related to Amazon KMS operations.
  >
  > Review your CloudTrail configuration and monitoring costs if you have CloudTrail logging enabled for these event types.

- *Pipe mode* streams data directly from an Amazon S3 data source. Streaming can provide faster start times and better throughput than file mode.

When you stream the data directly, you can reduce the size of the Amazon EBS volumes used by the training instance. Pipe mode needs only enough disk space to store the final model artifacts.

It is another streaming mode that is largely replaced by the newer and simpler-to-use fast file mode. In pipe mode, data is pre-fetched from Amazon S3 at high concurrency and throughput, and streamed into a named pipe, which also known as a First-In-First-Out (FIFO) pipe for its behavior. Each pipe may only be read by a single process. A SageMaker AI specific extension to TensorFlow conveniently integrates Pipe mode into the native TensorFlow data loader for streaming text, TFRecords, or RecordIO file formats. Pipe mode also supports managed sharding and shuffling of data.

- *Amazon S3 Express One Zone* is a high-performance, single Availability Zone storage class that can deliver consistent, single-digit millisecond data access for the most latency-sensitive applications including SageMaker model training. Amazon S3 Express One Zone allows customers to collocate their object storage and compute resources in a single Amazon Availability Zone, optimizing both compute performance and costs with increased data processing speed. To further increase access speed and support hundreds of thousands of requests per second, data is stored in a new bucket type, an Amazon S3 directory bucket.

  SageMaker AI model training supports high-performance Amazon S3 Express One Zone directory buckets as a data input location for file mode, fast file mode, and pipe mode. To use Amazon S3 Express One Zone, input the location of the Amazon S3 Express One Zone directory bucket instead of an Amazon S3 bucket. Provide the ARN for the IAM role with the required access control and permissions policy. Refer to AmazonSageMakerFullAccesspolicy for details. You can only encrypt your SageMaker AI output data in directory buckets with server-side encryption with Amazon S3 managed keys (SSE-S3). Server-side encryption with Amazon KMS keys (SSE-KMS) is not currently supported for storing SageMaker AI output data in directory buckets. For more information, see Amazon S3 Express One Zone.
- Amazon FSx for Lustre – FSx for Lustre can scale to hundreds of gigabytes of throughput and millions of IOPS with low-latency file retrieval. When starting a training job, SageMaker AI mounts the FSx for Lustre file system to the training instance file system, then starts your training script. Mounting itself is a relatively fast operation that doesn't depend on the size of the dataset stored in FSx for Lustre.

  To access FSx for Lustre, your training job must connect to an Amazon Virtual Private Cloud (VPC), which requires DevOps setup and involvement. To avoid data transfer costs, the file

system uses a single Availability Zone, and you need to specify a VPC subnet which maps to this Availability Zone ID when running the training job.

- Amazon EFS – To use Amazon EFS as a data source, the data must already reside in Amazon EFS prior to training. SageMaker AI mounts the specified Amazon EFS file system to the training instance, then starts your training script. Your training job must connect to a VPC to access Amazon EFS.

> **Tip**
>
> To learn more about how to specify your VPC configuration to SageMaker AI ModelTrainers, see Use File Systems as Training Inputs in the *SageMaker AI Python SDK documentation*.

Configure data input mode using the SageMaker Python SDK

SageMaker Python SDK provides the generic ModelTrainer class and its variations for ML frameworks for launching training jobs. You can specify one of the data input modes while configuring the SageMaker AI `ModelTrainer` class or the `ModelTrainer.train` method. The following code templates show the two ways to specify input modes.

To specify the input mode using the ModelTrainer class

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import InputData, OutputDataConfig, CheckpointConfig

model_trainer = ModelTrainer(
    checkpoint_config=CheckpointConfig(s3_uri='s3://amzn-s3-demo-bucket/checkpoint-
destination/'),
    output_data_config=OutputDataConfig(s3_output_path='s3://amzn-s3-demo-bucket/
output-path/'),
    base_job_name='job-name',
    training_input_mode='File'  # Available options: File | Pipe | FastFile
    ...
)

# Run the training job
model_trainer.train(
    input_data_config=[InputData(channel_name="training", data_source="s3://amzn-s3-
demo-bucket/my-data/train")]
```

```
)
```

For more information, see the sagemaker.train.ModelTrainer class in the *SageMaker Python SDK documentation*.

To specify the input mode through the `model_trainer.train()` method

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import InputData, OutputDataConfig, CheckpointConfig
from sagemaker.core.shapes import Channel, DataSource, S3DataSource

model_trainer = ModelTrainer(
    checkpoint_config=CheckpointConfig(s3_uri='s3://amzn-s3-demo-bucket/checkpoint-
destination/'),
    output_data_config=OutputDataConfig(s3_output_path='s3://amzn-s3-demo-bucket/
output-path/'),
    base_job_name='job-name',
    ...
)

# Run the training job with per-channel input mode using Channel
model_trainer.train(
    input_data_config=[Channel(
        channel_name="training",
        data_source=DataSource(
            s3_data_source=S3DataSource(s3_data_type="S3Prefix", s3_uri="s3://amzn-s3-
demo-bucket/my-data/train")
        ),
        input_mode="File",  # Per-channel override: File | Pipe | FastFile
    )]
)
```

For more information, see the sagemaker.train.ModelTrainer.train class method and the sagemaker.train.configs.InputData class in the *SageMaker Python SDK documentation*.

> **Tip**
>
> To learn more about how to configure Amazon FSx for Lustre or Amazon EFS with your VPC configuration using the SageMaker Python SDK ModelTrainers, see Use File Systems as Training Inputs in the *SageMaker AI Python SDK documentation*.

Tip

The data input mode integrations with Amazon S3, Amazon EFS, and FSx for Lustre are recommended ways to optimally configure data source for the best practices. You can strategically improve data loading performance using the SageMaker AI managed storage options and input modes, but it's not strictly constrained. You can write your own data reading logic directly in your training container. For example, you can set to read from a different data source, write your own S3 data loader class, or use third-party frameworks' data loading functions within your training script. However, you must make sure that you specify the right paths that SageMaker AI can recognize.

Tip

If you use a custom training container, make sure you install the SageMaker training toolkit that helps set up the environment for SageMaker training jobs. Otherwise, you must specify the environment variables explicitly in your Dockerfile. For more information, see Create a container with your own algorithms and models.

For more information about how to set the data input modes using the low-level SageMaker APIs, see How Amazon SageMaker AI Provides Training Information, the `CreateTrainingJob` API, and the `TrainingInputMode` in `AlgorithmSpecification`.

Configure data input channel to use Amazon FSx for Lustre

Learn how to use Amazon FSx for Lustre as your data source for higher throughput and faster training by reducing the time for data loading.

Note

When you use EFA-enabled instances such as P4d and P3dn, make sure that you set appropriate inbound and output rules in the security group. Specially, opening up these ports is necessary for SageMaker AI to access the Amazon FSx file system in the training job. To learn more, see File System Access Control with Amazon VPC.

Sync Amazon S3 and Amazon FSx for Lustre

To link your Amazon S3 to Amazon FSx for Lustre and upload your training datasets, do the following.

1. Prepare your dataset and upload to an Amazon S3 bucket. For example, assume that the Amazon S3 paths for a train dataset and a test dataset are in the following format.

   ```
   s3://amzn-s3-demo-bucket/data/train
   s3://amzn-s3-demo-bucket/data/test
   ```

2. To create an FSx for Lustre file system linked with the Amazon S3 bucket with the training data, follow the steps at Linking your file system to an Amazon S3 bucket in the *Amazon FSx for Lustre User Guide*. Make sure that you add an endpoint to your VPC allowing Amazon S3 access. For more information, see the section called "Create an Amazon S3 VPC Endpoint". When you specify **Data repository path**, provide the Amazon S3 bucket URI of the folder that contains your datasets. For example, based on the example S3 paths in step 1, the data repository path should be the following.

   ```
   s3://amzn-s3-demo-bucket/data
   ```

3. After the FSx for Lustre file system is created, check the configuration information by running the following commands.

   ```
   aws fsx describe-file-systems && \
   aws fsx describe-data-repository-association
   ```

   These commands return `FileSystemId`, `MountName`, `FileSystemPath`, and `DataRepositoryPath`. For example, the outputs should look like the following.

   ```
   # Output of aws fsx describe-file-systems
   "FileSystemId": "fs-0123456789abcdef0"
   "MountName": "1234abcd"

   # Output of aws fsx describe-data-repository-association
   "FileSystemPath": "/ns1",
   "DataRepositoryPath": "s3://amzn-s3-demo-bucket/data/"
   ```

After the sync between Amazon S3 and Amazon FSx has completed, your datasets are saved in Amazon FSx in the following directories.

```
/ns1/train  # synced with s3://amzn-s3-demo-bucket/data/train
/ns1/test   # synced with s3://amzn-s3-demo-bucket/data/test
```

Set the Amazon FSx file system path as the data input channel for SageMaker training

The following procedures walk you through the process of setting the Amazon FSx file system as the data source for SageMaker training jobs.

Using the SageMaker Python SDK

To properly set the Amazon FSx file system as the data source, configure the SageMaker AI ModelTrainer classes and `FileSystemInput` using the following instruction.

1. Configure a FileSystemInput class object.

```
from sagemaker.core.inputs import FileSystemInput

train_fs = FileSystemInput(
    file_system_id="fs-0123456789abcdef0",
    file_system_type="FSxLustre",
    directory_path="/1234abcd/ns1/",
    file_system_access_mode="ro",
)
```

> **Tip**
>
> When you specify `directory_path`, make sure that you provide the Amazon FSx file system path starting with `MountName`.

2. Configure a SageMaker AI ModelTrainer with the VPC configuration used for the Amazon FSx file system.

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Networking
```

```
model_trainer = ModelTrainer(
    ...
    role="your-iam-role-with-access-to-your-fsx",
    networking=Networking(
        subnets=["subnet-id"],  # Should be the same as the subnet used for Amazon
 FSx
        security_group_ids=["security-group-id"]
    )
)
```

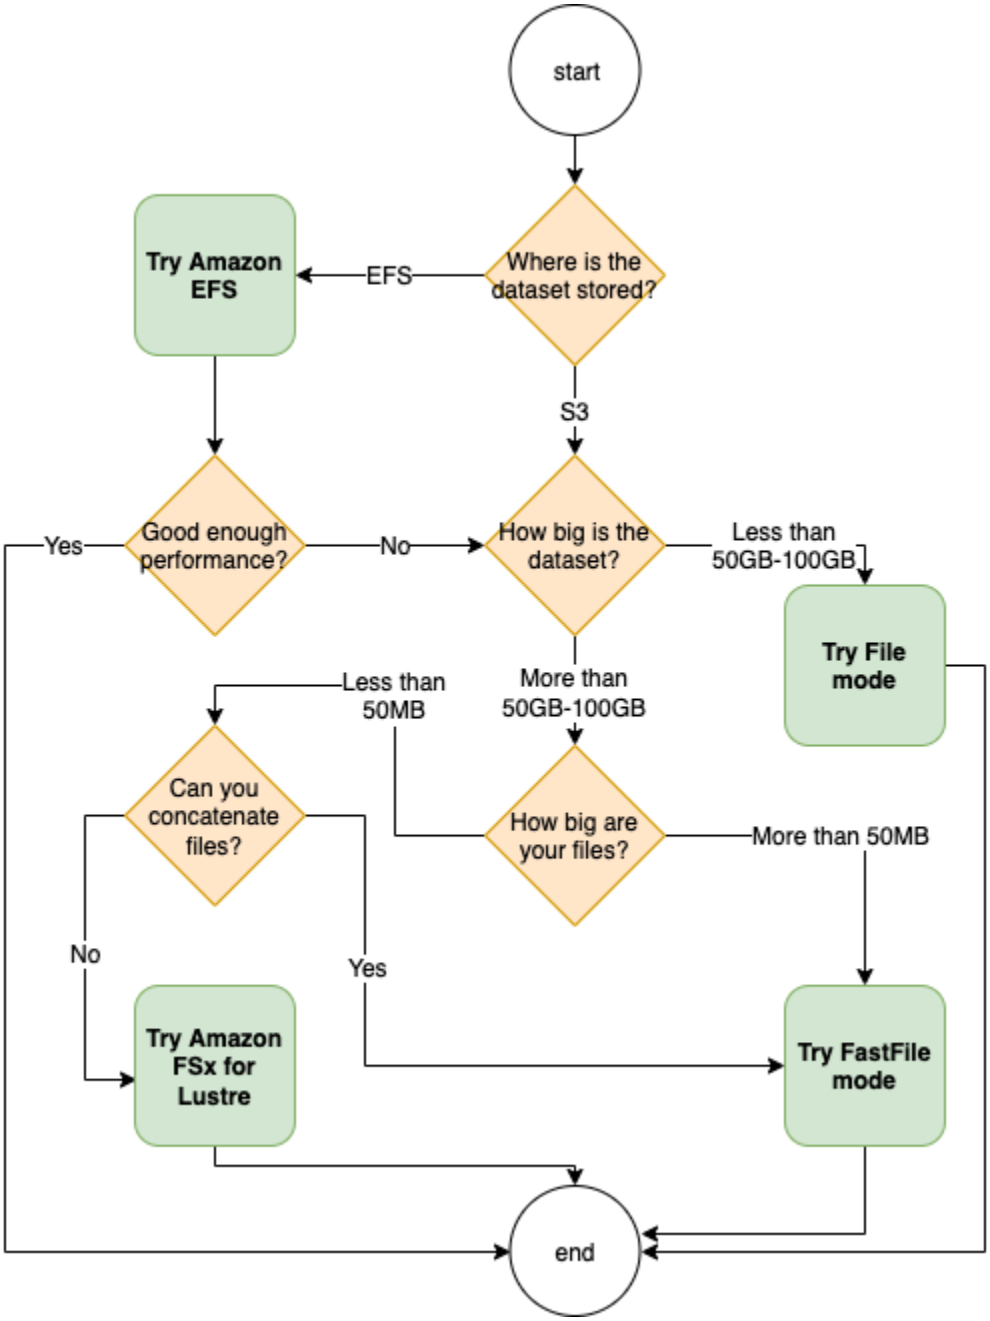
Make sure that the IAM role for the SageMaker training job has the permissions to access and read from Amazon FSx.

3. Launch the training job by running the ModelTrainer.train method with the Amazon FSx file system.

```
model_trainer.train(train_fs)
```

To find more code examples, see Use File Systems as Training Inputs in the *SageMaker Python SDK documentation*.

Using the SageMaker AI CreateTrainingJob API



As part of the CreateTrainingJob request JSON, configure `InputDataConfig` as follows.

```
"InputDataConfig": [
    {
        "ChannelName": "string",
        "DataSource": {
            "FileSystemDataSource": {
                "DirectoryPath": "/1234abcd/ns1/",
                "FileSystemAccessMode": "ro",
                "FileSystemId": "fs-0123456789abcdef0",
                "FileSystemType": "FSxLustre"
            }
        }
    }
],
```

> **Tip**
>
> When you specify `DirectoryPath`, make sure that you provide the Amazon FSx file system path starting with `MountName`.

Choosing an input mode and a storage unit

The best data source for your training job depends on workload characteristics such as the size of the dataset, the file format, the average size of files, the training duration, a sequential or random data loader read pattern, and how fast your model can consume the training data. The following best practices provide guidelines to get started with the most suitable input mode and data storage service for your use case.

When to use Amazon EFS

If your dataset is stored in Amazon Elastic File System, you might have a preprocessing or annotations application that uses Amazon EFS for storage. You can run a training job configured with a data channel that points to the Amazon EFS file system. For more information, see Speed up training on Amazon SageMaker AI using Amazon FSx for Lustre and Amazon EFS file systems. If you cannot achieve better performance, check your optimization options following the Amazon Elastic File System performance guide or consider using different input modes or data storage.

Use file mode for small datasets

If the dataset is stored in Amazon Simple Storage Service and its overall volume is relatively small (for example, less than 50-100 GB), try using file mode. The overhead of downloading a 50 GB dataset can vary based on the total number of files. For example, it takes about 5 minutes if a dataset is chunked into 100 MB shards. Whether this startup overhead is acceptable primarily depends on the overall duration of your training job, because a longer training phase means a proportionally smaller download phase.

Serializing many small files

If your dataset size is small (less than 50-100 GB), but is made up of many small files (less than 50 MB per file), the file mode download overhead grows, because each file needs to be downloaded individually from Amazon Simple Storage Service to the training instance volume. To reduce this overhead and data traversal time in general, consider serializing groups of such small files into fewer larger file containers (such as 150 MB per file) by using file formats, such as TFRecord for TensorFlow, WebDataset for PyTorch, and RecordIO for MXNet.

When to use fast file mode

For larger datasets with larger files (more than 50 MB per file), the first option is to try fast file mode, which is more straightforward to use than FSx for Lustre because it doesn't require creating a file system, or connecting to a VPC. Fast file mode is ideal for large file containers (more than 150 MB), and might also do well with files more than 50 MB. Because fast file mode provides a POSIX interface, it supports random reads (reading non-sequential byte-ranges). However, this is not the ideal use case, and your throughput might be lower than with the sequential reads. However, if you have a relatively large and computationally intensive ML model, fast file mode might still be able to saturate the effective bandwidth of the training pipeline and not result in an IO bottleneck. You'll need to experiment and see. To switch from file mode to fast file mode (and back), just add (or remove) the `input_mode='FastFile'` parameter while defining your input channel using the SageMaker Python SDK:

```
from sagemaker.train.configs import InputData, OutputDataConfig, CheckpointConfig
from sagemaker.core.shapes import Channel, DataSource, S3DataSource
Channel(
    channel_name="training",
    data_source=DataSource(
        s3_data_source=S3DataSource(s3_data_type="S3Prefix", s3_uri=S3_INPUT_FOLDER)
    ),
```

```
    input_mode='FastFile',
)
```

When to use Amazon FSx for Lustre

If your dataset is too large for file mode, has many small files that you can't serialize easily, or uses a random read access pattern, FSx for Lustre is a good option to consider. Its file system scales to hundreds of gigabytes per second (GB/s) of throughput and millions of IOPS, which is ideal when you have many small files. However, note that there might be the cold start issue due to lazy loading and the overhead of setting up and initializing the FSx for Lustre file system.

> **Tip**
>
> To learn more, see Choose the best data source for your Amazon SageMaker training job. This Amazon machine learning blog further discusses case studies and performance benchmark of data sources and input modes.

Use attribute-based access control (ABAC) for multi-tenancy training

In a multi-tenant environment, it is crucial to ensure that each tenant's data is isolated and accessible only to authorized entities. SageMaker AI supports the use of attribute-based access control (ABAC) to achieve this isolation for training jobs. Instead of creating multiple IAM roles for each tenant, you can use the same IAM role for all tenants by configuring a session chaining configuration that uses Amazon Security Token Service (Amazon STS) session tags to request temporary, limited-privilege credentials for your training job to access specific tenants. For more information about session tags, see Passing session tags in Amazon STS.

When creating a training job, your session chaining configuration uses Amazon STS to request temporary security credentials. This request generates a session, which is tagged. Each SageMaker training job can only access a specific tenant using a single role shared by all training jobs. By implementing ABAC with session chaining, you can ensure that each training job has access only to the tenant specified by the session tag, effectively isolating and securing each tenant. The following section guides you through the steps to set up and use ABAC for multi-tenant training job isolation using the SageMaker Python SDK.

Prerequisites

To get started with ABAC for multi-tenant training job isolation, you must have the following:

- Tenants with consistent naming across locations. For example, if an input data Amazon S3 URI for a tenant is `s3://your-input-s3-bucket/example-tenant`, the Amazon FSx directory for that same tenant should be `/fsx-train/train/example-tenant` and the output data Amazon S3 URI should be `s3://your-output-s3-bucket/example-tenant`.
- A SageMaker AI job creation role. You can create a SageMaker AI job creation role using Amazon SageMaker AI Role Manager. For information, see Using the role manager.
- A SageMaker AI execution role that has `sts:AssumeRole`, and `sts:TagSession` permissions in its trust policy. For more information on SageMaker AI execution roles, see SageMaker AI Roles.

  The execution role should also have a policy that allows tenants in any attribute-based multi-tenancy architecture to read from the prefix attached to a principal tag. The following is an example policy that limits the SageMaker AI execution role to have access to the value associated with the `tenant-id` key. For more information on naming tag keys, see Rules for tagging in IAM and STS.

  JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Action": [
                "s3:GetObject",
                "s3:PutObject"
            ],
            "Resource": [
                "arn:aws-cn:s3:::your-input-s3-bucket/
${aws:PrincipalTag/tenant-id}/*"
            ],
            "Effect": "Allow"
        },
        {
            "Action": [
                "s3:PutObject"
            ],
            "Resource": "arn:aws-cn:s3:::your-output-s3-bucket/
${aws:PrincipalTag/tenant-id}/*",
            "Effect": "Allow"
        },
        {
            "Action": "s3:ListBucket",
```

```
            "Resource": "*",
            "Effect": "Allow"
        }
    ]
}
```

Create a training job with session tag chaining enabled

The following procedure shows you how to create a training job with session tag chaining using the SageMaker Python SDK for ABAC-enabled multi-tenancy training.

> **Note**
>
> In addition to multi-tenancy data storage, you can also use the ABAC workflow to pass session tags to your execution role for Amazon VPC, Amazon Key Management Service, and any other services you allow SageMaker AI to call

Enable session tag chaining for ABAC

1. Import `boto3` and the SageMaker Python SDK. ABAC-enabled training job isolation is only available in version 2.217 or later of the SageMaker AI Python SDK.

```
import boto3

from sagemaker.train import ModelTrainer
from sagemaker.train.configs import InputData, CheckpointConfig
from sagemaker.core.helper.session_helper import Session
from sagemaker.core.shapes import OutputDataConfig
from sagemaker.train.configs import Compute
```

2. Set up an Amazon STS and SageMaker AI client to use the tenant-labeled session tags. You can change the tag value to specify a different tenant.

```
# Start an AWS STS client
sts_client = boto3.client('sts')

# Define your tenants using tags
# The session tag key must match the principal tag key in your execution role
 policy
```

```
tags = []
tag = {}
tag['Key'] = "tenant-id"
tag['Value'] = "example-tenant"
tags.append(tag)

# Have AWS STS assume your ABAC-enabled job creation role
response = sts_client.assume_role(
    RoleArn="arn:aws:iam::<account-id>:role/<your-training-job-creation-role>",
    RoleSessionName="SessionName",
    Tags=tags)
credentials = response['Credentials']

# Create a client with your job creation role (which was assumed with tags)
sagemaker_client = boto3.client(
    'sagemaker',
    aws_access_key_id=credentials['AccessKeyId'],
    aws_secret_access_key=credentials['SecretAccessKey'],
    aws_session_token=credentials['SessionToken']
)
sagemaker_session = Session(sagemaker_client=sagemaker_client)
```

When appending the tags `"tenant-id=example-tenant"` to the job creation role, these tags are extracted by the execution role to use the following policy:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Action": [
                "s3:GetObject",
                "s3:PutObject"
            ],
            "Resource": [
                "arn:aws-cn:s3:::your-input-s3-bucket/example-tenant/*"
            ],
            "Effect": "Allow"
        },
        {
            "Action": [
```

```
                "s3:PutObject"
            ],
            "Resource": "arn:aws-cn:s3:::your-output-s3-bucket/example-
tenant/*",
            "Effect": "Allow"
        },
        {
            "Action": "s3:ListBucket",
            "Resource": "*",
            "Effect": "Allow"
        }
    ]
}
```

3. Define a ModelTrainer to create a training job using the SageMaker Python SDK. Set `enable_session_tag_chaining` to `True` to allow your SageMaker AI training execution role to retrieve the tags from your job creation role.

```
# Specify your training input
trainingInput = InputData(
    channel_name='training',
    data_source='s3://<your-input-bucket>/example-tenant'
)

# Specify your training job execution role
execution_role_arn = "arn:aws:iam::<account-id>:role/<your-training-job-execution-
role>"

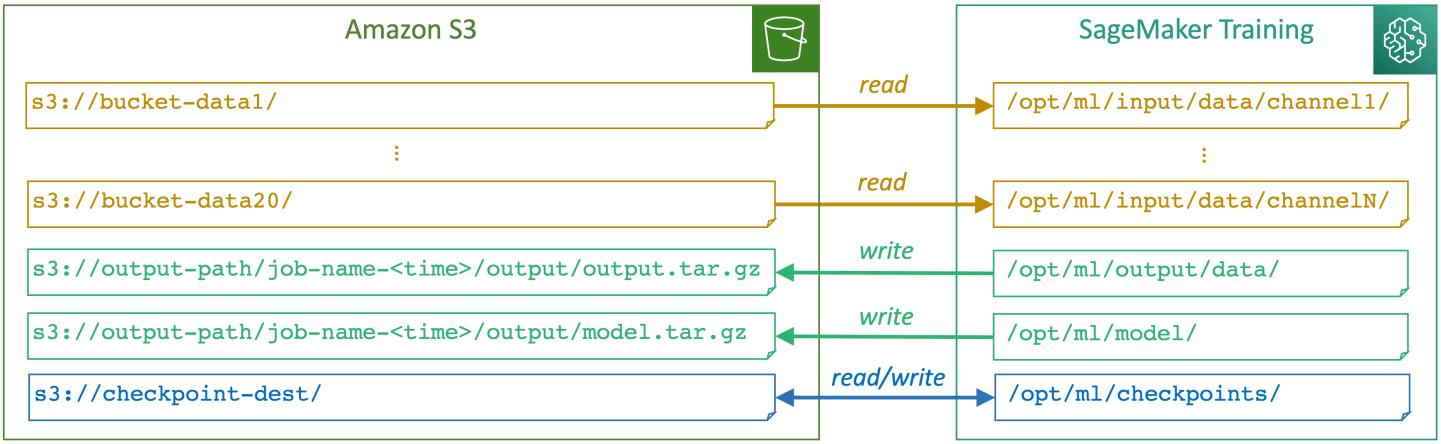
# Define your model trainer with session tag chaining enabled
model_trainer = ModelTrainer(
    training_image="<your-training-image-uri>",
    role=execution_role_arn,
    compute=Compute(
        instance_type='ml.m4.xlarge',
        instance_count=1,
        volume_size_in_gb=20
    ),
    sagemaker_session=sagemaker_session,
    output_data_config=OutputDataConfig(s3_output_path="s3://<your-output-bucket>/
example-tenant"),
    tags=[{"Key": "sagemaker:EnableSessionTagChaining", "Value": "true"}]
)
```

```
model_trainer.train(input_data_config=[trainingInput])
```

SageMaker AI can only read tags provided in the training job request and does not add any tags to resources on your behalf.

ABAC for SageMaker training is compatible with SageMaker AI managed warm pools. To use ABAC with warm pools, matching training jobs must have identical session tags. For more information, see the section called “Matching training jobs”.

Mapping of training storage paths managed by Amazon SageMaker AI



This page provides a high-level summary of how the SageMaker training platform manages storage paths for training datasets, model artifacts, checkpoints, and outputs between Amazon cloud storage and training jobs in SageMaker AI. Throughout this guide, you learn to identify the default paths set by the SageMaker AI platform and how the data channels can be streamlined with your data sources in Amazon Simple Storage Service (Amazon S3), FSx for Lustre, and Amazon EFS. For more information about various data channel input modes and storage options, see Setting up training jobs to access datasets.

Overview of how SageMaker AI maps storage paths

The following diagram shows an example of how SageMaker AI maps input and output paths when you run a training job using the SageMaker Python SDK ModelTrainer class.

```
estimator = Estimator(
    checkpoint_s3_uri='s3://checkpoint-dest/',
    output_path='s3://output-path/',
    base_job_name='job-name',
    input_mode='File'
    ...
)

estimator.fit(inputs={
    'channel1' : 's3://bucket-data1/',
    ...
    'channel20': 's3://bucket-data20/'})
```

SageMaker AI maps storage paths between a storage (such as Amazon S3, Amazon FSx, and Amazon EFS) and the SageMaker training container based on the paths and input mode specified through a SageMaker AI ModelTrainer object. More information about how SageMaker AI reads from or writes to the paths and the purpose of the paths, see the section called "SageMaker AI environment variables and the default paths for training storage locations".

You can use `OutputDataConfig` in the CreateTrainingJob API to save the results of model training to an S3 bucket. Use the ModelArtifacts API to find the S3 bucket that contains your model artifacts. See the abalone_build_train_deploy notebook for an example of output paths and how they are used in API calls.

For more information and examples of how SageMaker AI manages data source, input modes, and local paths in SageMaker training instances, see Access Training Data.

Topics

- Uncompressed model output
- Managing storage paths for different types of instance local storage
- SageMaker AI environment variables and the default paths for training storage locations

Uncompressed model output

SageMaker AI stores your model in `/opt/ml/model` and your data in `/opt/ml/output/data`. After the model and data are written to those locations, they're uploaded to your Amazon S3 bucket as compressed files by default.

You can save time on large data file compression by uploading model and data outputs to your S3 bucket as uncompressed files. To do this, create a training job in uncompressed upload mode by using either the Amazon Command Line Interface (Amazon CLI) or the SageMaker Python SDK.

The following code example shows how to create a training job in uncompressed upload mode when using the Amazon CLI. To enable uncompressed upload mode, set `CompressionType` field in the `OutputDataConfig` API to **`NONE`**.

```
{
   "TrainingJobName": "uncompressed_model_upload",
   ...
   "OutputDataConfig": {
      "S3OutputPath": "s3://amzn-s3-demo-bucket/uncompressed_upload/output",
      "CompressionType": "NONE"
   },
   ...
}
```

The following code example shows you how to create a training job in uncompressed upload mode using the SageMaker Python SDK.

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Compute
from sagemaker.core.helper.session_helper import Session, get_execution_role
from sagemaker.core.shapes import OutputDataConfig

model_trainer = ModelTrainer(
    training_image="your-own-image-uri",
    role=get_execution_role(),
    compute=Compute(
        instance_count=1,
        instance_type='ml.c4.xlarge',
    ),
    output_data_config=OutputDataConfig(compression_type="NONE")
)
```

Managing storage paths for different types of instance local storage

Consider the following when setting up storage paths for training jobs in SageMaker AI.

- If you want to store training artifacts for distributed training in the `/opt/ml/output/data` directory, you must properly append subdirectories or use unique file names for the artifacts through your model definition or training script. If the subdirectories and file names are not properly configured, all of the distributed training workers might write outputs to the same file name in the same output path in Amazon S3.
- If you use a custom training container, make sure you install the SageMaker Training Toolkit that helps set up the environment for SageMaker training jobs. Otherwise, you must specify the environment variables explicitly in your Dockerfile. For more information, see Create a container with your own algorithms and models.
- When using an ML instance with NVMe SSD volumes, SageMaker AI doesn't provision Amazon EBS gp2 storage. Available storage is fixed to the NVMe-type instance's storage capacity. SageMaker AI configures storage paths for training datasets, checkpoints, model artifacts, and outputs to use the entire capacity of the instance storage. For example, ML instance families with the NVMe-type instance storage include `ml.p4d`, `ml.g4dn`, and `ml.g5`. When using an ML instance with the EBS-only storage option and without instance storage, you must define the size of EBS volume through the `volume_size` parameter in the SageMaker AI ModelTrainer class (or `VolumeSizeInGB` if you are using the `ResourceConfig` API). For example, ML instance families that use EBS volumes include `ml.c5` and `ml.p2`. To look up instance types and their instance storage types and volumes, see Amazon EC2 Instance Types.
- The default paths for SageMaker training jobs are mounted to Amazon EBS volumes or NVMe SSD volumes of the ML instance. When you adapt your training script to SageMaker AI, make sure that you use the default paths listed in the previous topic about the section called "SageMaker AI environment variables and the default paths for training storage locations". We recommend that you use the `/tmp` directory as a scratch space for temporarily storing any large objects during training. This means that you must not use directories that are mounted to small disk space allocated for system, such as `/user` and `/home`, to avoid out-of-space errors.

To learn more, see the Amazon machine learning blog Choose the best data source for your Amazon SageMaker training job that further discusses case studies and performance benchmarks of data sources and input modes.

SageMaker AI environment variables and the default paths for training storage locations

The following table summarizes the input and output paths for training datasets, checkpoints, model artifacts, and outputs, managed by the SageMaker training platform.

Local path in SageMaker training instance	SageMaker AI environment variable	Purpose	Read from S3 during start	Read from S3 during Spot-restart	Writes to S3 during training	Writes to S3 when job is terminated
`/opt/ml/input/data/` *channel_name* [1]	SM_CHANNEL_*CHANNEL_NAME*	Reading training data from the input channels specified through the SageMaker AI Python SDK ModelTrainer class or the CreateTrainingJob API operation. For more information about how to specify it in your training script using the SageMaker Python SDK, see Prepare a Training script.	Yes	Yes	No	No
`/opt/ml/output/data` [2]	SM_OUTPUT_DIR	Saving outputs such as loss, accuracy, intermediate layers, weights, gradients, bias, and TensorBoard-compatible outputs. You can also save any arbitrary	No	No	No	Yes

Local path in SageMaker training instance	SageMaker AI environment variable	Purpose	Read from S3 during start	Read from S3 during Spot-restart	Writes to S3 during training	Writes to S3 when job is terminated
		output you'd like using this path. Note that this is a different path from the one for storing the final model artifact `/opt/ml/model/` .				
`/opt/ml/model` [3]	SM_MODEL_DIR	Storing the final model artifact. This is also the path from where the model artifact is deployed for Real-time inference in SageMaker AI Hosting.	No	No	No	Yes
`/opt/ml/checkpoints` [4]	-	Saving model checkpoints (the state of model) to resume training from a certain point, and recover from unexpected or Managed Spot Training interruptions.	Yes	Yes	Yes	No

Local path in SageMaker training instance	SageMaker AI environment variable	Purpose	Read from S3 during start	Read from S3 during Spot-restart	Writes to S3 during training	Writes to S3 when job is terminated
`/opt/ml/code`	SAGEMAKER_SUBMIT_DIRECTORY	Copying training scripts, additional libraries, and dependencies.	Yes	Yes	No	No
`/tmp`	-	Reading or writing to `/tmp` as a scratch space.	No	No	No	No

[1] `channel_name` is the place to specify user-defined channel names for training data inputs. Each training job can contain several data input channels. You can specify up to 20 training input channels per training job. Note that the data downloading time from the data channels is counted to the billable time. For more information about data input paths, see How Amazon SageMaker AI Provides Training Information. Also, there are three types of data input modes that SageMaker AI supports: file, FastFile, and pipe mode. To learn more about the data input modes for training in SageMaker AI, see Access Training Data.

[2] SageMaker AI compresses and writes training artifacts to TAR files (`tar.gz`). Compression and uploading time is counted to the billable time. For more information, see How Amazon SageMaker AI Processes Training Output.

[3] SageMaker AI compresses and writes the final model artifact to a TAR file (`tar.gz`). Compression and uploading time is counted to the billable time. For more information, see How Amazon SageMaker AI Processes Training Output.

[4] Sync with Amazon S3 during training. Write as is without compressing to TAR files. For more information, see Use Checkpoints in Amazon SageMaker AI.

Running training jobs on a heterogeneous cluster

Using the heterogeneous cluster feature of SageMaker Training, you can run a training job with multiple types of ML instances for a better resource scaling and utilization for different ML training

tasks and purposes. For example, if your training job on a cluster with GPU instances suffers low GPU utilization and CPU bottleneck problems due to CPU-intensive tasks, using a heterogeneous cluster can help offload CPU-intensive tasks by adding more cost-efficient CPU instance groups, resolve such bottleneck problems, and achieve a better GPU utilization.

> **Note**
>
> This feature is available in the SageMaker Python SDK v2.98.0 and later.

> **Note**
>
> This feature is available through the SageMaker AI ModelTrainer class. Supported frameworks are PyTorch v1.10 or later and TensorFlow v2.6 or later.

See also the blog Improve price performance of your model training using Amazon SageMaker AI heterogeneous clusters.

Topics

- Configure a training job with a heterogeneous cluster in Amazon SageMaker AI
- Run distributed training on a heterogeneous cluster in Amazon SageMaker AI
- Modify your training script to assign instance groups

Configure a training job with a heterogeneous cluster in Amazon SageMaker AI

This section provides instructions on how to run a training job using a heterogeneous cluster that consists of multiple instance types.

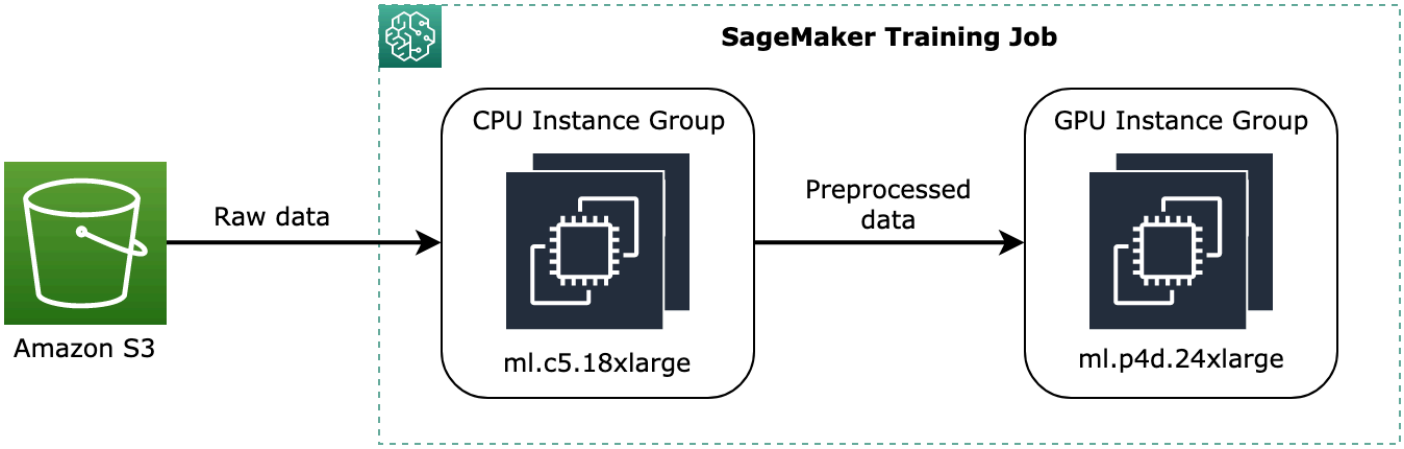
Note the following before you start.

- All instance groups share the same Docker image and training script. Therefore, your training script should be modified to detect which instance group it belongs to and fork execution accordingly.
- The heterogeneous cluster feature is not compatable with SageMaker AI local mode.

- The Amazon CloudWatch log streams of a heterogeneous cluster training job are not grouped by instance groups. You need to figure out from the logs which nodes are in which group.

Topics

- Option 1: Using the SageMaker Python SDK
- Option 2: Using the low-level SageMaker APIs



Option 1: Using the SageMaker Python SDK

Follow instructions on how to configure instance groups for a heterogeneous cluster using the SageMaker Python SDK.

1. To configure instance groups of a heterogeneous cluster for a training job, use the `sagemaker.instance_group.InstanceGroup` class. You can specify a custom name for each instance group, the instance type, and the number of instances for each instance group. For more information, see sagemaker.instance_group.InstanceGroup in the *SageMaker AI Python SDK documentation*.

   > **Note**
   >
   > For more information about available instance types and the maximum number of instance groups that you can configure in a heterogeneous cluster, see the InstanceGroup API reference.

   The following code example shows how to set up two instance groups that consists of two `ml.c5.18xlarge` CPU-only instances named `instance_group_1` and one `ml.p3dn.24xlarge` GPU instance named `instance_group_2`, as shown in the following diagram.

The preceding diagram shows a conceptual example of how pre-training processes, such as data preprocessing, can be assigned to the CPU instance group and stream the preprocessed data to the GPU instance group.

```
from sagemaker.instance_group import InstanceGroup

instance_group_1 = InstanceGroup(
    "instance_group_1", "ml.c5.18xlarge", 2
)
instance_group_2 = InstanceGroup(
    "instance_group_2", "ml.p3dn.24xlarge", 1
)
```

2. Using the instance group objects, set up training input channels and assign instance groups to the channels through the `instance_group_names` argument. The `instance_group_names` argument accepts a list of strings of instance group names.

   The following example shows how to set two training input channels and assign the instance groups created in the example of the previous step. You can also specify Amazon S3 bucket paths for the instance groups to process data for your usage purposes.

```
from sagemaker.train.configs import InputData
from sagemaker.core.shapes import Channel, DataSource, S3DataSource

training_input_channel_1 = Channel(
    channel_name='training',
    data_source=DataSource(
        s3_data_source=S3DataSource(
            s3_data_type='S3Prefix',
            s3_uri='s3://your-training-data-storage/folder1',
```

```
            s3_data_distribution_type='FullyReplicated', # Available Options:
 FullyReplicated | ShardedByS3Key
            instance_group_names=["instance_group_1"],
        )
    ),
    input_mode='File', # Available Options: File | Pipe | FastFile
)

training_input_channel_2 = Channel(
    channel_name='dummy-input-channel',
    data_source=DataSource(
        s3_data_source=S3DataSource(
            s3_data_type='S3Prefix',
            s3_uri='s3://your-training-data-storage/folder2',
            s3_data_distribution_type='FullyReplicated',
            instance_group_names=["instance_group_2"],
        )
    ),
    input_mode='File',
)
```

For more information about the arguments of `InputData`, see the following links.

- The sagemaker.train.configs.InputData class in the *SageMaker Python SDK documentation*
- The S3DataSource API in the *SageMaker AI API Reference*

3. Configure a SageMaker AI training object with the `instance_groups` argument as shown in the following code example. The `instance_groups` argument accepts a list of `InstanceGroup` objects.

> **Note**
>
> The heterogeneous cluster feature is available through the SageMaker AI PyTorch and TensorFlow ModelTrainer classes. Supported frameworks are PyTorch v1.10 or later and TensorFlow v2.6 or later. To find a complete list of available framework containers, framework versions, and Python versions, see SageMaker AI Framework Containers in the Amazon Deep Learning Container GitHub repository.

PyTorch

```
from sagemaker.train import ModelTrainer
```

```
from sagemaker.train.configs import SourceCode
from sagemaker.core import image_uris

training_image = image_uris.retrieve(
    framework="pytorch", region=region, version='x.y.z',    # 1.10.0 or later
    py_version='pyxy', instance_type='ml.p3dn.24xlarge',
    image_scope="training"
)

model_trainer = ModelTrainer(
    ...
    source_code=SourceCode(entry_script='my-training-script.py'),
    training_image=training_image,
    job_name='my-training-job-with-heterogeneous-cluster',
    instance_groups=[instance_group_1, instance_group_2]
)
```

TensorFlow

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import SourceCode
from sagemaker.core import image_uris

training_image = image_uris.retrieve(
    framework="tensorflow", region=region, version='x.y.z', # 2.6.0 or later
    py_version='pyxy', instance_type='ml.p3dn.24xlarge',
    image_scope="training"
)

model_trainer = ModelTrainer(
    ...
    source_code=SourceCode(entry_script='my-training-script.py'),
    training_image=training_image,
    job_name='my-training-job-with-heterogeneous-cluster',
    instance_groups=[instance_group_1, instance_group_2]
)
```

> **Note**
>
> The `instance_type` and `instance_count` argument pair and the `instance_groups` argument of the SageMaker AI ModelTrainer class are mutually exclusive. For

homogeneous cluster training, use the `instance_type` and `instance_count` argument pair. For heterogeneous cluster training, use `instance_groups`.

> **Note**
>
> To find a complete list of available framework containers, framework versions, and Python versions, see SageMaker AI Framework Containers in the Amazon Deep Learning Container GitHub repository.

4. Start the training job with the training input channels configured with the instance groups.

```
model_trainer.train(
    inputs={
        'training': training_input_channel_1,
        'dummy-input-channel': training_input_channel_2
    }
)
```

Option 2: Using the low-level SageMaker APIs

If you use the Amazon Command Line Interface or Amazon SDK for Python (Boto3) and want to use low-level SageMaker APIs for submitting a training job request with a heterogeneous cluster, see the following API references.

- CreateTrainingJob
- ResourceConfig
- InstanceGroup
- S3DataSource

Run distributed training on a heterogeneous cluster in Amazon SageMaker AI

Through the `distribution` argument of the SageMaker AI ModelTrainer class, you can assign a specific instance group to run distributed training. For example, assume that you have the following two instance groups and want to run multi-GPU training on one of them.

```
from sagemaker.instance_group import InstanceGroup

instance_group_1 = InstanceGroup("instance_group_1", "ml.c5.18xlarge", 1)
instance_group_2 = InstanceGroup("instance_group_2", "ml.p3dn.24xlarge", 2)
```

You can set the distributed training configuration for one of the instance groups. For example, the following code examples show how to assign `training_group_2` with two `ml.p3dn.24xlarge` instances to the distributed training configuration.

> **Note**
>
> Currently, only one instance group of a heterogeneous cluster can be specified to the distribution configuration. In the SageMaker AI Python SDK v3, the `Torchrun` distributed configuration does not accept an instance group parameter and applies to all instances in the training job.

With MPI

PyTorch

```
from sagemaker.train import ModelTrainer
from sagemaker.train.distributed import Torchrun

# Note: In v3, Torchrun does not support scoping to a specific instance group.
# It applies to all instances in the training job. Use instance_groups with
# Channel/S3DataSource to control which group receives training data.
model_trainer = ModelTrainer(
    ...
    instance_groups=[instance_group_1, instance_group_2],
    distributed=Torchrun()
)
```

TensorFlow

```
from sagemaker.train import ModelTrainer
from sagemaker.train.distributed import Torchrun

# Note: In v3, Torchrun does not support scoping to a specific instance group.
# It applies to all instances in the training job. Use instance_groups with
# Channel/S3DataSource to control which group receives training data.
```

```
model_trainer = ModelTrainer(
    ...
    instance_groups=[instance_group_1, instance_group_2],
    distributed=Torchrun()
)
```

With the SageMaker AI data parallel library

PyTorch

```
from sagemaker.train import ModelTrainer
from sagemaker.train.distributed import Torchrun

model_trainer = ModelTrainer(
    ...
    instance_groups=[instance_group_1, instance_group_2],
    distributed=Torchrun()
)
```

TensorFlow

```
from sagemaker.train import ModelTrainer
from sagemaker.train.distributed import Torchrun

model_trainer = ModelTrainer(
    ...
    instance_groups=[instance_group_1, instance_group_2],
    distributed=Torchrun()
)
```

> **Note**
>
> When using the SageMaker AI data parallel library, make sure the instance group consists of the supported instance types by the library.

For more information about the SageMaker AI data parallel library, see SageMaker AI Data Parallel Training.

With the SageMaker AI model parallel library

PyTorch

```
from sagemaker.train import ModelTrainer
from sagemaker.train.distributed import Torchrun

model_trainer = ModelTrainer(
    ...
    instance_groups=[instance_group_1, instance_group_2],
    distributed=Torchrun()
)
```

TensorFlow

```
from sagemaker.train import ModelTrainer
from sagemaker.train.distributed import Torchrun

model_trainer = ModelTrainer(
    ...
    instance_groups=[instance_group_1, instance_group_2],
    distributed=Torchrun()
)
```

For more information about the SageMaker AI model parallel library, see SageMaker AI Model Parallel Training.

Modify your training script to assign instance groups

With the heterogeneous cluster configuration in the previous sections, you have prepared the SageMaker training environment and instances for your training job. To further assign the instance groups to certain training and data processing tasks, the next step is to modify your training script. By default, the training job simply makes training script replicas for all nodes regardless the size of the instance, and this might lead to performance loss.

For example, if you mix CPU instances and GPU instances in a heterogeneous cluster while passing a deep neural network training script to the `entry_point` argument of the SageMaker AI ModelTrainer, the `entry_point` script is replicated to each instance. This means that, without proper task assignments, CPU instances also run the entire script and start the training job that's designed for distributed training on GPU instances. Therefore, you must make changes in specific processing functions that you want to offload and run on the CPU instances. You can use the SageMaker AI environment variables to retrieve the information of the heterogeneous cluster and let specific processes to run accordingly.

When your training job starts, your training script reads SageMaker training environment information that includes heterogeneous cluster configuration. The configuration contains information such as the current instance groups, the current hosts in each group, and in which group the current host resides.

You can query instance group information during the initialization phase of a SageMaker AI training job in the following ways.

(Recommended) Reading instance group information with the SageMaker training toolkit

Use the environment Python module that the SageMaker training toolkit library provides. The toolkit library is preinstalled in the SageMaker framework containers for TensorFlow and PyTorch, so you don't need an additional installation step when using the prebuilt containers. This is the recommended way to retrieve the SageMaker AI environment variables with fewer code changes in your training script.

```
from sagemaker_training import environment

env = environment.Environment()
```

Environment variables related to general SageMaker training and heterogeneous clusters:

- `env.is_hetero` – Returns a Boolean result whether a heterogeneous cluster is configured or not.
- `env.current_host` – Returns the current host.
- `env.current_instance_type` – Returns the type of instance of the current host.
- `env.current_instance_group` – Returns the name of the current instance group.
- `env.current_instance_group_hosts` – Returns a list of hosts in current instance group.
- `env.instance_groups` – Returns a list of instance group names used for training.
- `env.instance_groups_dict` – Returns the entire heterogeneous cluster configuration of the training job.
- `env.distribution_instance_groups` – Returns a list of instance groups assigned to the `distribution` parameter of the SageMaker AI ModelTrainer class.
- `env.distribution_hosts` – Returns a list of hosts belonging to the instance groups assigned to the `distribution` parameter of the SageMaker AI ModelTrainer class.

For example, consider the following example of a heterogeneous cluster that consists of two instance groups.

```
from sagemaker.instance_group import InstanceGroup

instance_group_1 = InstanceGroup(
    "instance_group_1", "ml.c5.18xlarge", 1)
instance_group_2 = InstanceGroup(
    "instance_group_2", "ml.p3dn.24xlarge", 2)
```

The output of `env.instance_groups_dict` of the example heterogeneous cluster should be similar to the following.

```
{
    "instance_group_1": {
        "hosts": [
            "algo-2"
        ],
        "instance_group_name": "instance_group_1",
        "instance_type": "ml.c5.18xlarge"
    },
    "instance_group_2": {
        "hosts": [
            "algo-3",
            "algo-1"
        ],
        "instance_group_name": "instance_group_2",
        "instance_type": "ml.p3dn.24xlarge"
    }
}
```

(Optional) Reading instance group information from the resource configuration JSON file

If you prefer to retrieve the environment variables in JSON format, you can directly use the resource configuration JSON file. The JSON file in a SageMaker training instance is located at `/opt/ml/input/config/resourceconfig.json` by default.

```
file_path = '/opt/ml/input/config/resourceconfig.json'
config = read_file_as_json(file_path)
print(json.dumps(config, indent=4, sort_keys=True))
```

Use Incremental Training in Amazon SageMaker AI

Over time, you might find that a model generates inference that are not as good as they were in the past. With incremental training, you can use the artifacts from an existing model and use an expanded dataset to train a new model. Incremental training saves both time and resources.

Use incremental training to:

- Train a new model using an expanded dataset that contains an underlying pattern that was not accounted for in the previous training and which resulted in poor model performance.
- Use the model artifacts or a portion of the model artifacts from a popular publicly available model in a training job. You don't need to train a new model from scratch.
- Resume a training job that was stopped.
- Train several variants of a model, either with different hyperparameter settings or using different datasets.

For more information about training jobs, see Train a Model with Amazon SageMaker.

You can train incrementally using the SageMaker AI console or the Amazon SageMaker Python SDK.

> **Important**
>
> Only three built-in algorithms currently support incremental training: Object Detection - MXNet, Image Classification - MXNet, and Semantic Segmentation Algorithm.

Topics

- Perform Incremental Training (Console)
- Perform Incremental Training (API)

Perform Incremental Training (Console)

To complete this procedure, you need:

- The Amazon Simple Storage Service (Amazon S3) bucket URI where you've stored the training data.

- The S3 bucket URI where you want to store the output of the job.
- The Amazon Elastic Container Registry path where the training code is stored. For more information, see Docker Registry Paths and Example Code.
- The URL of the S3 bucket where you've stored the model artifacts that you want to use in incremental training. To find the URL for the model artifacts, see the details page of the training job used to create the model. To find the details page, in the SageMaker AI console, choose **Inference**, choose **Models**, and then choose the model.

To restart a stopped training job, use the URL to the model artifacts that are stored in the details page as you would with a model or a completed training job.

To perform incremental training (console)

1. Open the Amazon SageMaker AI console at https://console.amazonaws.cn/sagemaker/.
2. In the navigation pane, choose **Training**, then choose **Training jobs**.
3. Choose **Create training job**.
4. Provide a name for the training job. The name must be unique within an Amazon Region in an Amazon account. The training job name must have 1 to 63 characters. Valid characters: a-z, A-Z, 0-9, and . : + = @ _ % - (hyphen).
5. Choose the algorithm that you want to use. For information about algorithms, see Built-in algorithms and pretrained models in Amazon SageMaker.
6. (Optional) For **Resource configuration**, either leave the default values or increase the resource consumption to reduce computation time.
    a. (Optional) For **Instance type**, choose the ML compute instance type that you want to use. In most cases, **ml.m4.xlarge** is sufficient.
    b. For **Instance count**, use the default, 1.
    c. (Optional) For **Additional volume per instance (GB)**, choose the size of the ML storage volume that you want to provision. In most cases, you can use the default, 1. If you are using a large dataset, use a larger size.
7. Provide information about the input data for the training dataset.
    a. For **Channel name**, either leave the default (**`train`**) or enter a more meaningful name for the training dataset, such as **`expanded-training-dataset`**.
    b. For **InputMode**, choose **File**. For incremental training, you need to use file input mode.

c. For **S3 data distribution type**, choose **FullyReplicated**. This causes each ML compute instance to use a full replicate of the expanded dataset when training incrementally.

d. If the expanded dataset is uncompressed, set the **Compression type** to **None**. If the expanded dataset is compressed using Gzip, set it to **Gzip**.

e. (Optional) If you are using File input mode, leave **Content type** empty. For Pipe input mode, specify the appropriate MIME type. *Content type* is the multipurpose internet mail extension (MIME) type of the data.

f. For **Record wrapper**, if the dataset is saved in RecordIO format, choose **RecordIO**. If your dataset is not saved as a RecordIO formatted file, choose **None**.

g. For **S3 data type**, if the dataset is stored as a single file, choose **S3Prefix**. If the dataset is stored as several files in a folder, choose **Manifest**.

h. For **S3 location**, provide the URL to the path where you stored the expanded dataset.

i. Choose **Done**.

8. To use model artifacts in a training job, you need to add a new channel and provide the needed information about the model artifacts.

a. For **Input data configuration**, choose **Add channel**.

b. For **Channel name**, enter **`model`** to identify this channel as the source of the model artifacts.

c. For **InputMode**, choose **File**. Model artifacts are stored as files.

d. For **S3 data distribution type**, choose **FullyReplicated**. This indicates that each ML compute instance should use all of the model artifacts for training.

e. For **Compression type**, choose **None** because we are using a model for the channel.

f. Leave **Content type** empty. Content type is the multipurpose internet mail extension (MIME) type of the data. For model artifacts, we leave it empty.

g. Set **Record wrapper** to **None** because model artifacts are not stored in RecordIO format.

h. For **S3 data type**, if you are using a built-in algorithm or an algorithm that stores the model as a single file, choose **S3Prefix**. If you are using an algorithm that stores the model as several files, choose **Manifest**.

i. For **S3 location**, provide the URL to the path where you stored the model artifacts. Typically, the model is stored with the name `model.tar.gz`. To find the URL for the model artifacts, in the navigation pane, choose **Inference**, then choose **Models**. From the list of models, choose a model to display its details page. The URL for the model artifacts is listed under **Primary container** .

j. Choose **Done**.

9. For **Output data configuration**, provide the following information:

   a. For **S3 location**, type the path to the S3 bucket where you want to store the output data.

   b. (Optional) For **Encryption key**, you can add your Amazon Key Management Service (Amazon KMS) encryption key to encrypt the output data at rest. Provide the key ID or its Amazon Resource Number (ARN). For more information, see KMS-Managed Encryption Keys.

10. (Optional) For **Tags**, add one or more tags to the training job. A *tag* is metadata that you can define and assign to Amazon resources. In this case, you can use tags to help you manage your training jobs. A tag consists of a key and a value, which you define. For example, you might want to create a tag with **`Project`** as a key and a value referring to a project that is related to the training job, such as **`Home value forecasts`**.

11. Choose **Create training job**. SageMaker AI creates and runs training job.

After the training job has completed, the newly trained model artifacts are stored under the **S3 output path** that you provided in the **Output data configuration** field. To deploy the model to get predictions, see Deploy the model to Amazon EC2.

Perform Incremental Training (API)

This example shows how to use SageMaker AI APIs to train a model using the SageMaker AI image classification algorithm and the Caltech 256 Image Dataset, then train a new model using the first one. It uses Amazon S3 for input and output sources. Please see the incremental training sample notebook for more details on using incremental training.

> **Note**
>
> In this example we used the original datasets in the incremental training, however you can use different datasets, such as ones that contain newly added samples. Upload the new datasets to S3 and make adjustments to the `data_channels` variable used to train the new model.

Get an Amazon Identity and Access Management (IAM) role that grants required permissions and initialize environment variables:

```
import sagemaker
from sagemaker.core.helper.session_helper import Session, get_execution_role
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Compute

role = get_execution_role()
print(role)

sess = Session()

bucket=sess.default_bucket()
print(bucket)
prefix = 'ic-incr-training'
```

Get the training image for the image classification algorithm:

```
from sagemaker.amazon.amazon_estimator import get_image_uri

training_image = get_image_uri(sess.boto_region_name, 'image-classification',
 repo_version="latest")
#Display the training image
print (training_image)
```

Download the training and validation datasets, then upload them to Amazon Simple Storage Service (Amazon S3):

```
import os
import urllib.request
import boto3

# Define a download function
def download(url):
    filename = url.split("/")[-1]
    if not os.path.exists(filename):
        urllib.request.urlretrieve(url, filename)

# Download the caltech-256 training and validation datasets
download('http://data.mxnet.io/data/caltech-256/caltech-256-60-train.rec')
download('http://data.mxnet.io/data/caltech-256/caltech-256-60-val.rec')

# Create four channels: train, validation, train_lst, and validation_lst
s3train = 's3://{}/{}/train/'.format(bucket, prefix)
```

```
s3validation = 's3://{}/{}/validation/'.format(bucket, prefix)

# Upload the first files to the train and validation channels
!aws s3 cp caltech-256-60-train.rec $s3train --quiet
!aws s3 cp caltech-256-60-val.rec $s3validation --quiet
```

Define the training hyperparameters:

```
# Define hyperparameters for the estimator
hyperparams = { "num_layers": "18",
                "resize": "32",
                "num_training_samples": "50000",
                "num_classes": "10",
                "image_shape": "3,28,28",
                "mini_batch_size": "128",
                "epochs": "3",
                "learning_rate": "0.1",
                "lr_scheduler_step": "2,3",
                "lr_scheduler_factor": "0.1",
                "augmentation_type": "crop_color",
                "optimizer": "sgd",
                "momentum": "0.9",
                "weight_decay": "0.0001",
                "beta_1": "0.9",
                "beta_2": "0.999",
                "gamma": "0.9",
                "eps": "1e-8",
                "top_k": "5",
                "checkpoint_frequency": "1",
                "use_pretrained_model": "0",
                "model_prefix": "" }
```

Create an estimator object and train the first model using the training and validation datasets:

```
from sagemaker.train.configs import InputData, StoppingCondition
from sagemaker.core.shapes import OutputDataConfig, Channel, DataSource, S3DataSource

# Train the base ModelTrainer
s3_output_location = 's3://{}/{}/output'.format(bucket, prefix)
ic = ModelTrainer(training_image=training_image,
                                  role=role,
                                  compute=Compute(
                                      instance_count=1,
```

```
                                        instance_type='ml.p2.xlarge',
                                        volume_size_in_gb=50,
                                    ),

 stopping_condition=StoppingCondition(max_runtime_in_seconds=360000),
                                    training_input_mode='File',

 output_data_config=OutputDataConfig(s3_output_path=s3_output_location),
                                    hyperparameters=hyperparams)

train_data = Channel(
    channel_name="train",
    data_source=DataSource(
        s3_data_source=S3DataSource(
            s3_data_type='S3Prefix',
            s3_uri=s3train,
            s3_data_distribution_type='FullyReplicated',
        )
    ),
    content_type='application/x-recordio',
)
validation_data = Channel(
    channel_name="validation",
    data_source=DataSource(
        s3_data_source=S3DataSource(
            s3_data_type='S3Prefix',
            s3_uri=s3validation,
            s3_data_distribution_type='FullyReplicated',
        )
    ),
    content_type='application/x-recordio',
)

data_channels = {'train': train_data, 'validation': validation_data}

ic.train(input_data_config=[train_data, validation_data])
```

To use the model to incrementally train another model, create a new estimator object and use the model artifacts (`ic.model_data`, in this example) for the `model_uri` input argument:

```
# Given the base ModelTrainer, create a new one for incremental training
incr_ic = ModelTrainer(training_image=training_image,
                                        role=role,
```

```
                                        compute=Compute(
                                            instance_count=1,
                                            instance_type='ml.p2.xlarge',
                                            volume_size_in_gb=50,
                                        ),

    stopping_condition=StoppingCondition(max_runtime_in_seconds=360000),
                                        training_input_mode='File',

    output_data_config=OutputDataConfig(s3_output_path=s3_output_location),
                                        hyperparameters=hyperparams,
                                        # Pass the previous model artifacts as an input
    data channel
                                        input_data_config=[
                                            InputData(channel_name="model",
    data_source=ic.model_data),
                                        ])
incr_ic.train(input_data_config=[train_data, validation_data])
```

After the training job has completed, the newly trained model artifacts are stored under the S3 `output path` that you provided in `Output_path`. To deploy the model to get predictions, see Deploy the model to Amazon EC2.

Managed Spot Training in Amazon SageMaker AI

Amazon SageMaker AI makes it easy to train machine learning models using managed Amazon EC2 Spot instances. Managed spot training can optimize the cost of training models up to 90% over on-demand instances. SageMaker AI manages the Spot interruptions on your behalf.

Managed Spot Training uses Amazon EC2 Spot instance to run training jobs instead of on-demand instances. You can specify which training jobs use spot instances and a stopping condition that specifies how long SageMaker AI waits for a job to run using Amazon EC2 Spot instances. Metrics and logs generated during training runs are available in CloudWatch.

Amazon SageMaker AI automatic model tuning, also known as hyperparameter tuning, can use managed spot training. For more information on automatic model tuning, see Automatic model tuning with SageMaker AI.

Spot instances can be interrupted, causing jobs to take longer to start or finish. You can configure your managed spot training job to use checkpoints. SageMaker AI copies checkpoint data from a local path to Amazon S3. When the job is restarted, SageMaker AI copies the data from Amazon

S3 back into the local path. The training job can then resume from the last checkpoint instead of restarting. For more information about checkpointing, see Checkpoints in Amazon SageMaker AI.

> **Note**
>
> Unless your training job will complete quickly, we recommend you use checkpointing with managed spot training. SageMaker AI built-in algorithms and marketplace algorithms that do not checkpoint are currently limited to a `MaxWaitTimeInSeconds` of 3600 seconds (60 minutes).

To use managed spot training, create a training job. Set `EnableManagedSpotTraining` to `True` and specify the `MaxWaitTimeInSeconds`. `MaxWaitTimeInSeconds` must be larger than `MaxRuntimeInSeconds`. For more information about creating a training job, see DescribeTrainingJob.

You can calculate the savings from using managed spot training using the formula `(1 - (BillableTimeInSeconds / TrainingTimeInSeconds)) * 100`. For example, if `BillableTimeInSeconds` is 100 and `TrainingTimeInSeconds` is 500, this means that your training job ran for 500 seconds, but you were billed for only 100 seconds. Your savings is (1 - (100 / 500)) * 100 = 80%.

`TrainingTimeInSeconds` is the compute time that was retained as productive training time. It includes the first image download and each training interval, but excludes intervals that were lost to a Spot interruption within their first hour of runtime, as well as time spent re-provisioning instances or waiting for Spot capacity after an interruption. `BillableTimeInSeconds` is the amount of time that you are billed for. For managed spot training, it is the Spot cost of those productive intervals expressed as the equivalent number of seconds at the Amazon SageMaker AI on-demand price for the instance. Because the Amazon SageMaker AI Spot price is a discount off the Amazon SageMaker AI on-demand price, `BillableTimeInSeconds` is lower than `TrainingTimeInSeconds`, and the formula gives your Spot discount relative to the Amazon SageMaker AI on-demand price.

> **Note**
>
> - The savings percentage compares the Amazon SageMaker AI Spot price to the Amazon SageMaker AI on-demand price. It is not comparable to the Amazon EC2 Spot price history shown in the Amazon EC2 console, which reflects the raw Amazon EC2 Spot

market price for the underlying instance and does not include the Amazon SageMaker AI managed-service rate.

- Managed spot training does not fall back to on-demand instances. When `EnableManagedSpotTraining` is set to `True`, the training job runs only on Spot capacity. If Spot capacity is unavailable, the job waits until `MaxWaitTimeInSeconds` is reached and then stops, rather than switching to on-demand instances.
- The wall-clock duration of the job (`TrainingEndTime` minus `TrainingStartTime`) includes all interruptions, restarts, and Spot capacity waits, and is not the amount you are billed for. Only `BillableTimeInSeconds` is billed.

To learn how to run training jobs on Amazon SageMaker AI spot instances and how managed spot training works and reduces the billable time, see the following example notebooks:

- Managed Spot Training with TensorFlow
- Managed Spot Training with PyTorch
- Managed Spot Training with XGBoost
- Managed Spot Training with MXNet
- Amazon SageMaker AI Managed Spot Training Examples GitHub repository

Managed Spot Training Lifecycle

You can monitor a training job using `TrainingJobStatus` and `SecondaryStatus` returned by DescribeTrainingJob. The list below shows how `TrainingJobStatus` and `SecondaryStatus` values change depending on the training scenario:

- **Spot instances acquired with no interruption during training**
  1. `InProgress`: `Starting` → `Downloading` → `Training` → `Uploading`
- **Spot instances interrupted once. Later, enough spot instances were acquired to finish the training job.**
  1. `InProgress`: `Starting` → `Downloading` → `Training` → `Interrupted` → `Starting` → `Downloading` → `Training` → `Uploading`
- **Spot instances interrupted twice and `MaxWaitTimeInSeconds` exceeded.**
  1. `InProgress`: `Starting` → `Downloading` → `Training` → `Interrupted` → `Starting` → `Downloading` → `Training` → `Interrupted` → `Downloading` → `Training`

2. `Stopping`: `Stopping`
3. `Stopped`: `MaxWaitTimeExceeded`

- **Spot instances were never launched.**

1. `InProgress`: `Starting`
2. `Stopping`: `Stopping`
3. `Stopped`: `MaxWaitTimeExceeded`

SageMaker AI Managed Warm Pools

SageMaker AI managed warm pools let you retain and reuse provisioned infrastructure after the completion of a training job to reduce latency for repetitive workloads, such as iterative experimentation or running many jobs consecutively. Subsequent training jobs that match specified parameters run on the retained warm pool infrastructure, which speeds up start times by reducing the time spent provisioning resources.

> **Important**
>
> SageMaker AI managed warm pools are a billable resource. For more information, see Billing.

Topics

- How it works
- Considerations
- Request a warm pool quota increase
- Use SageMaker AI managed warm pools

How it works

To use SageMaker AI managed warm pools and reduce latency between similar consecutive training jobs, create a training job that specifies a `KeepAlivePeriodInSeconds` value in its `ResourceConfig`. This value represents the duration of time in seconds to retain configured resources in a warm pool for subsequent training jobs. If you need to run several training jobs

using similar configurations, you can further reduce latency and billable time by using a dedicated persistent cache directory to store and re-use your information in a different job.

Topics

- Warm pool lifecycle
- Warm pool creation
- Matching training jobs
- Maximum warm pool duration
- Using persistent cache
- Billing

Warm pool lifecycle

1. Create an initial training job with a `KeepAlivePeriodInSeconds` value greater than 0. When you run this first training job, this “cold-starts” a cluster with typical startup times.
2. When the first training job completes, the provisioned resources are kept alive in a warm pool for the period specified in the `KeepAlivePeriodInSeconds` value. As long as the cluster is healthy and the warm pool is within the specified `KeepAlivePeriodInSeconds`, then the warm pool status is `Available`.
3. The warm pool stays `Available` until it either identifies a matching training job for reuse or it exceeds the specified `KeepAlivePeriodInSeconds` and is terminated. The maximum length of time allowed for the `KeepAlivePeriodInSeconds` is 3600 seconds (60 minutes). If the warm pool status is `Terminated`, then this is the end of the warm pool lifecycle.
4. If the warm pool identifies a second training job with matching specifications such as instance count or instance type, then the warm pool moves from the first training job to the second training job for reuse. The status of the first training job warm pool becomes `Reused`. This is the end of the warm pool lifecycle for the first training job.
5. The status of the second training job that reused the warm pool becomes `InUse`.
   After the second training job completes, the warm pool is `Available` for the `KeepAlivePeriodInSeconds` duration specified in the second training job. A warm pool can continue moving to subsequent matching training jobs for a maximum of 28 days.
6. If the warm pool is no longer available to reuse, the warm pool status is `Terminated`. Warm pools are no longer available if they are terminated by a user, for a patch update, or for exceeding the specified `KeepAlivePeriodInSeconds`.

For more information on warm pool status options, see WarmPoolStatus in the *Amazon SageMaker API Reference*.

Warm pool creation

If an initial training job successfully completes and has a `KeepAlivePeriodInSeconds` value greater than 0, this creates a warm pool. If you stop a training job after a cluster is already launched, a warm pool is still retained. If the training job fails due to an algorithm or client error, a warm pool is still retained. If the training job fails for any other reason that might compromise the health of the cluster, then the warm pool is not created.

To verify successful warm pool creation, check the warm pool status of your training job. If a warm pool successfully provisions, the warm pool status is `Available`. If a warm pool fails to provision, the warm pool status is `Terminated`.

Matching training jobs

For a warm pool to persist, it must find a matching training job within the time specified in the `KeepAlivePeriodInSeconds` value. The next training job is a match if the following values are identical:

- `RoleArn`
- `ResourceConfig` values:
  - `InstanceCount`
  - `InstanceType`
  - `VolumeKmsKeyId`
  - `VolumeSizeInGB`
- `VpcConfig` values:
  - `SecurityGroupIds`
  - `Subnets`
- `EnableInterContainerTrafficEncryption`
- `EnableNetworkIsolation`
- If you passed session tags for your training job with `EnableSessionTagChaining` set to `True` in the training job's `SessionChainingConfig`, then a matching training job must also set `EnableSessionTagChaining` to `True` and have identical session keys. For more information, see Use attribute-based access control (ABAC) for multi-tenancy training.

All of these values must be the same for a warm pool to move to a subsequent training job for reuse.

Maximum warm pool duration

The maximum `KeepAlivePeriodInSeconds` for a single training job is 3600 seconds (60 minutes) and the maximum length of time that a warm pool cluster can continue running consecutive training jobs is 28 days.

Each subsequent training job must also specify a `KeepAlivePeriodInSeconds` value. When the warm pool moves to the next training job, it inherits the new `KeepAlivePeriodInSeconds` value specified in that training job's `ResourceConfig`. In this way, you can keep a warm pool moving from training job to training job for a maximum of 28 days.

If no `KeepAlivePeriodInSeconds` is specified, then the warm pool spins down after the training job completes.

Using persistent cache

When you create a warm pool, SageMaker AI mounts a special directory on the volume that will persist throughout the lifecycle of the warm pool. This directory can also be used to store information that you want to re-use in another job.

Using persistent cache can reduce latency and billable time over using warm pools alone for jobs that require the following:

- multiple interactions with similar configurations
- incremental training jobs
- hyperparameter optimization

For example, you can avoid downloading the same Python dependencies on repeated runs by setting up a pip cache directory inside the persistent cache directory. You are fully responsible for managing the contents of this directory. The following are examples of types of information that you can put in your persistent cache to help reduce your latency and billable time.

- Dependencies managed by pip.
- Dependencies managed by conda.
- Checkpoint information.
- Any additional information generated during training.

The location of the persistent cache is `/opt/ml/sagemaker/warmpoolcache`. The environment variable `SAGEMAKER_MANAGED_WARMPOOL_CACHE_DIRECTORY` points to the location of the persistent cache directory.

The following code example shows you how to set up a warm pool and use persistent cache to store your pip dependencies for use in a subsequent job. The subsequent job must run within the time frame given by the parameter `keep_alive_period_in_seconds`.

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Compute, SourceCode
from sagemaker.core.helper.session_helper import Session, get_execution_role
from sagemaker.core import image_uris

# Creates a SageMaker session and gets execution role
session = Session()
role = get_execution_role()

# Retrieve the TensorFlow training image
training_image = image_uris.retrieve(
    framework="tensorflow", region=session.boto_region_name,
    version="2.2", py_version="py37",
    instance_type="ml.g4dn.xlarge", image_scope="training"
)

# Creates an example ModelTrainer with warm pool enabled
model_trainer = ModelTrainer(
    training_image=training_image,
    source_code=SourceCode(source_dir='code', entry_script='my-training-script.py'),
    role=role,
    compute=Compute(
        instance_type='ml.g4dn.xlarge',
        instance_count=1,
        volume_size_in_gb=250,
        keep_alive_period_in_seconds=1800,
    ),
    hyperparameters={
        "batch-size": "512",
        "epochs": "1",
        "learning-rate": "1e-3",
        "beta_1": "0.9",
        "beta_2": "0.999",
    },
    environment={"PIP_CACHE_DIR": "/opt/ml/sagemaker/warmpoolcache/pip"}
```

```
)
```

In the previous code example, using the environment parameter exports the environment variable `PIP_CACHE_DIRECTORY` to point to the directory `/opt/ml/sagemaker/warmpoolcache/pip`. Exporting this environment variable will change where pip stores its cache to the new location. Any directory, including nested directories, that you create inside the persistent cache directory will be available for re-use during a subsequent training run. In the previous code example, a directory called `pip` is changed to be the default location to cache any dependencies installed using pip.

The persistent cache location may also be accessed from within your Python training script using the environment variable as shown in the following code example.

```
import os
import shutil
if __name__ == '__main__':
    PERSISTED_DIR = os.environ["SAGEMAKER_MANAGED_WARMPOOL_CACHE_DIRECTORY"]

    # create a file to be persisted
    open(os.path.join(PERSISTED_DIR, "test.txt"), 'a').close()
    # create a directory to be persisted
    os.mkdir(os.path.join(PERSISTED_DIR, "test_dir"))

    # Move a file to be persisted
    shutil.move("path/of/your/file.txt", PERSISTED_DIR)
```

Billing

SageMaker AI managed warm pools are a billable resource. Retrieve the warm pool status for your training job to check the billable time for your warm pools. You can check the warm pool status either through the Using the Amazon SageMaker AI console or directly through the DescribeTrainingJob API command. For more information, see WarmPoolStatus in the *Amazon SageMaker API Reference*.

> **Note**
>
> After the time specified by the parameter `KeepAlivePeriodInSeconds` has ended, both the warm pool and persistent cache will shut down, and the contents will be deleted.

Considerations

Consider the following items when using SageMaker AI managed warm pools.

- SageMaker AI managed warm pools cannot be used with heterogeneous cluster training.
- SageMaker AI managed warm pools cannot be used with spot instances.
- SageMaker AI managed warm pools are limited to a `KeepAlivePeriodInSeconds` value of 3600 seconds (60 minutes).
- If a warm pool continues to successfully match training jobs within the specified `KeepAlivePeriodInSeconds` value, the cluster can only continue running for a maximum of 28 days.

Request a warm pool quota increase

To get started, you must first request a service limit increase for SageMaker AI managed warm pools. The default resource limit for warm pools is 0.

If a training job is created with `KeepAlivePeriodInSeconds` specified, but you did not request a warm pool limit increase, then a warm pool is not retained after the completion of the training job. A warm pool is only created if your warm pool limit has sufficient resources. After a warm pool is created, the resources are released when they move to a matching training job or if the `KeepAlivePeriodInSeconds` expires (if the warm pool status is `Reused` or `Terminated`).

Request a warm pool quota increase using the Amazon Service Quotas console.

> **Note**
>
> All warm pool instance usage counts toward your SageMaker training resource limit. Increasing your warm pool resource limit does not increase your instance limit, but allocates a subset of your resource limit to warm pool training.

1. Open the Amazon Service Quotas console.
2. On the left-hand navigation panel, choose **Amazon services**.
3. Search for and choose **Amazon SageMaker AI**.
4. Search for the keyword **`warm pool`** to see all available warm pool service quotas.

5. Find the instance type for which you want to increase your warm pool quota, select the warm pool service quota for that instance type, and choose **Request quota increase**.
6. Enter your requested instance limit number under **Change quota value**. The new value must be greater than the current **Applied quota value**.
7. Choose **Request**.

There is a limit on the number of instances that you can retain for each account, which is determined by instance type. You can check your resource limits in the Amazon Service Quotas console or directly using the list-service-quotas Amazon CLI command. For more information on Amazon Service Quotas, see Requesting a quota increase in the *Service Quotas User Guide*.

You can also use Amazon Support Center to request a warm pool quota increase. For a list of available instance types according to Region, see Amazon SageMaker Pricing and choose **Training** in the **On-Demand Pricing** table.

Use SageMaker AI managed warm pools

You can use SageMaker AI managed warm pools through the SageMaker Python SDK, the Amazon SageMaker AI console, or through the low-level APIs. Administrators can optionally use the `sagemaker:KeepAlivePeriod` condition key to further restrict the `KeepAlivePeriodInSeconds` limits for certain users or groups.

Topics

Using the SageMaker AI Python SDK

Create, update, or terminate warm pools using the SageMaker Python SDK.

> **Note**
>
> This feature is available in the SageMaker AI Python SDK v2.110.0 and later.

Topics

- Create a warm pool
- Update a warm pool
- Terminate a warm pool

Create a warm pool

To create a warm pool, use the SageMaker Python SDK to create a training job with a `keep_alive_period_in_seconds` value greater than 0 and start training. When the training job completes, a warm pool is retained. If your script does not create a warm pool, see Warm pool creation for possible explanations.

Use the SageMaker Python SDK to create a `ModelTrainer` with a `keep_alive_period_in_seconds` value greater than 0 in the `Compute` configuration and call `train()`. For more information on training with the SageMaker Python SDK, see Train a Model with the SageMaker Python SDK.

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Compute, SourceCode
from sagemaker.core.helper.session_helper import Session, get_execution_role
from sagemaker.core import image_uris
from sagemaker.train.configs import InputData

# Creates a SageMaker AI session and gets execution role
session = Session()
role = get_execution_role()

# Retrieve the TensorFlow training image
training_image = image_uris.retrieve(
    framework="tensorflow", region=session.boto_region_name,
    version="2.2", py_version="py37",
    instance_type="ml.g4dn.xlarge", image_scope="training"
)

# Creates an example ModelTrainer with warm pool enabled
model_trainer = ModelTrainer(
    training_image=training_image,
    source_code=SourceCode(source_dir='code', entry_script='my-training-script.py'),
    role=role,
    compute=Compute(
```

```
        instance_type='ml.g4dn.xlarge',
        instance_count=1,
        volume_size_in_gb=250,
        keep_alive_period_in_seconds=1800,
    ),
    hyperparameters={
        "batch-size": "512",
        "epochs": "1",
        "learning-rate": "1e-3",
        "beta_1": "0.9",
        "beta_2": "0.999",
    },
)

# Starts a SageMaker training job and waits until completion
train_data = InputData(channel_name="training", data_source='s3://my_bucket/
my_training_data/')
model_trainer.train(input_data_config=[train_data])
```

Next, create a second matching training job. In this example, we create `my-training-job-2`, which has all of the necessary attributes to match with `my-training-job-1`, but has a different hyperparameter for experimentation. The second training job reuses the warm pool and starts up faster than the first training job. The following code example uses a Tensorflow estimator. The warm pool feature can be used with any training algorithm that runs on Amazon SageMaker AI. For more information on which attributes need to match, see Matching training jobs.

```
# Creates a second ModelTrainer that reuses the warm pool
model_trainer_2 = ModelTrainer(
    training_image=training_image,
    source_code=SourceCode(source_dir='code', entry_script='my-training-script.py'),
    role=role,
    compute=Compute(
        instance_type='ml.g4dn.xlarge',
        instance_count=1,
        volume_size_in_gb=250,
        keep_alive_period_in_seconds=1800,
    ),
    hyperparameters={
        "batch-size": "512",
        "epochs": "2",
        "learning-rate": "1e-3",
        "beta_1": "0.9",
```

```
        "beta_2": "0.999",
    },
)

# Starts a SageMaker training job and waits until completion
train_data = InputData(channel_name="training", data_source='s3://my_bucket/
my_training_data/')
model_trainer_2.train(input_data_config=[train_data])
```

Check the warm pool status of both training jobs to confirm that the warm pool is `Reused` for `my-training-job-1` and `InUse` for `my-training-job-2`.

> **Note**
>
> Training job names have date/time suffixes. The example training job names `my-training-job-1` and `my-training-job-2` should be replaced with actual training job names. You can use the `estimator.latest_training_job.job_name` command to fetch the actual training job name.

```
session.describe_training_job('my-training-job-1')
session.describe_training_job('my-training-job-2')
```

The result of `describe_training_job` provides all details about a given training job. Find the `WarmPoolStatus` attribute to check information about a training job's warm pool. Your output should look similar to the following example:

```
# Warm pool status for training-job-1
...
'WarmPoolStatus': {'Status': 'Reused',
  'ResourceRetainedBillableTimeInSeconds': 1000,
  'ReusedByName': my-training-job-2}
...

# Warm pool status for training-job-2
...
'WarmPoolStatus': {'Status': 'InUse'}
...
```

Update a warm pool

When the training job is complete and the warm pool status is `Available`, then you can update the `KeepAlivePeriodInSeconds` value.

```
session.update_training_job(job_name,
 resource_config={"KeepAlivePeriodInSeconds":3600})
```

Terminate a warm pool

To manually terminate a warm pool, set the `KeepAlivePeriodInSeconds` value to 0.

```
session.update_training_job(job_name, resource_config={"KeepAlivePeriodInSeconds":0})
```

The warm pool automatically terminates when it exceeds the designated `KeepAlivePeriodInSeconds` value or if there is a patch update for the cluster.

Using the Amazon SageMaker AI console

Through the console, you can create a warm pool, release a warm pool, or check the warm pool status and billable time of specific training jobs. You can also see which matching training job reused a warm pool.

1. Open the Amazon SageMaker AI console and choose **Training jobs** from the navigation pane. If applicable, the warm pool status of each training job is visible in the **Warm pool status** column and the time left for an active warm pool is visible in the **Time left** column.
2. To create a training job that uses a warm pool from the console, choose **Create training job**. Then, be sure to specify a value for the **Keep alive period** field when configuring your training job resources. This value must be an integer between 1 and 3600, which represents duration of time in seconds.
3. To release a warm pool from the console, select a specific training job and choose **Release cluster** from the **Actions** dropdown menu.
4. To see more information about a warm pool, choose a training job name. In the job details page, scroll down to the **Warm pool status** section to find the warm pool status, the time left if the warm pool status is `Available`, the warm pool billable seconds, and the name of the training job that reused the warm pool if the warm pool status is `Reused`.

Using the low-level SageMaker APIs

Use SageMaker AI managed warm pools with either the SageMaker API or the Amazon CLI.

SageMaker AI API

Set up SageMaker AI managed warm pools using the SageMaker API with the following commands:

- CreateTrainingJob
- UpdateTrainingJob
- ListTrainingJobs
- DescribeTrainingJob

Amazon CLI

Set up SageMaker AI managed warm pools using the Amazon CLI with the following commands:

- create-training-job
- update-training-job
- list-training-jobs
- describe-training-job

IAM condition key

Administrators can optionally use the `sagemaker:KeepAlivePeriod` condition key to further restrict the `KeepAlivePeriodInSeconds` limits for certain users or groups. SageMaker AI managed warm pools are limited to a `KeepAlivePeriodInSeconds` value of 3600 seconds (60 minutes), but administrators can lower this limit if needed.

JSON

                }
            }
        }
    ]
}
```

For more information, see Condition keys for Amazon SageMaker AI in the *Service Authorization Reference*.

Amazon CloudWatch Metrics for Monitoring and Analyzing Training Jobs

An Amazon SageMaker training job is an iterative process that teaches a model to make predictions by presenting examples from a training dataset. Typically, a training algorithm computes several metrics, such as training error and prediction accuracy. These metrics help diagnose whether the model is learning well and will generalize well for making predictions on unseen data. The training algorithm writes the values of these metrics to logs, which SageMaker AI monitors and sends to Amazon CloudWatch in real time. To analyze the performance of your training job, you can view graphs of these metrics in CloudWatch. When a training job has completed, you can also get a list of the metric values that it computes in its final iteration by calling the `DescribeTrainingJob` operation.

> **Note**
>
> Amazon CloudWatch supports high-resolution custom metrics, and its finest resolution is 1 second. However, the finer the resolution, the shorter the lifespan of the CloudWatch metrics. For the 1-second frequency resolution, the CloudWatch metrics are available for 3 hours. For more information about the resolution and the lifespan of the CloudWatch metrics, see GetMetricStatistics in the *Amazon CloudWatch API Reference*.

Tip

If you want to profile your training job with a finer resolution down to 100-millisecond (0.1 second) granularity and store the training metrics indefinitely in Amazon S3 for custom analysis at any time, consider using Amazon SageMaker Debugger. SageMaker Debugger provides built-in rules to automatically detect common training issues; it detects hardware resource utilization issues (such as CPU, GPU, and I/O bottlenecks) and non-converging model issues (such as overfit, vanishing gradients, and exploding tensors). SageMaker Debugger also provides visualizations through Studio Classic and its profiling report. To explore the Debugger visualizations, see SageMaker Debugger Insights Dashboard Walkthrough, Debugger Profiling Report Walkthrough, and Analyze Data Using the SMDebug Client Library.

Topics

- Define Training Metrics
- View training job metrics
- Example: Viewing a Training and Validation Curve

Define Training Metrics

SageMaker AI automatically parses training job logs and sends training metrics to CloudWatch. By default, SageMaker AI sends system resource utilization metrics listed in SageMaker AI Jobs and Endpoint Metrics. If you want SageMaker AI to parse logs and send custom metrics from a training job of your own algorithm to CloudWatch, you need to specify metrics definitions by passing the name of metrics and regular expressions when you configure a SageMaker AI training job request.

You can specify the metrics that you want to track using the SageMaker AI console, the SageMaker AI Python SDK, or the low-level SageMaker AI API.

If you are using your own algorithm, do the following:

- Make sure that the algorithm writes the metrics that you want to capture to logs.
- Define a regular expression that accurately searches the logs to capture the values of the metrics that you want to send to CloudWatch.

For example, suppose your algorithm emits the following metrics for training error and validation error:

```
Train_error=0.138318;  Valid_error=0.324557;
```

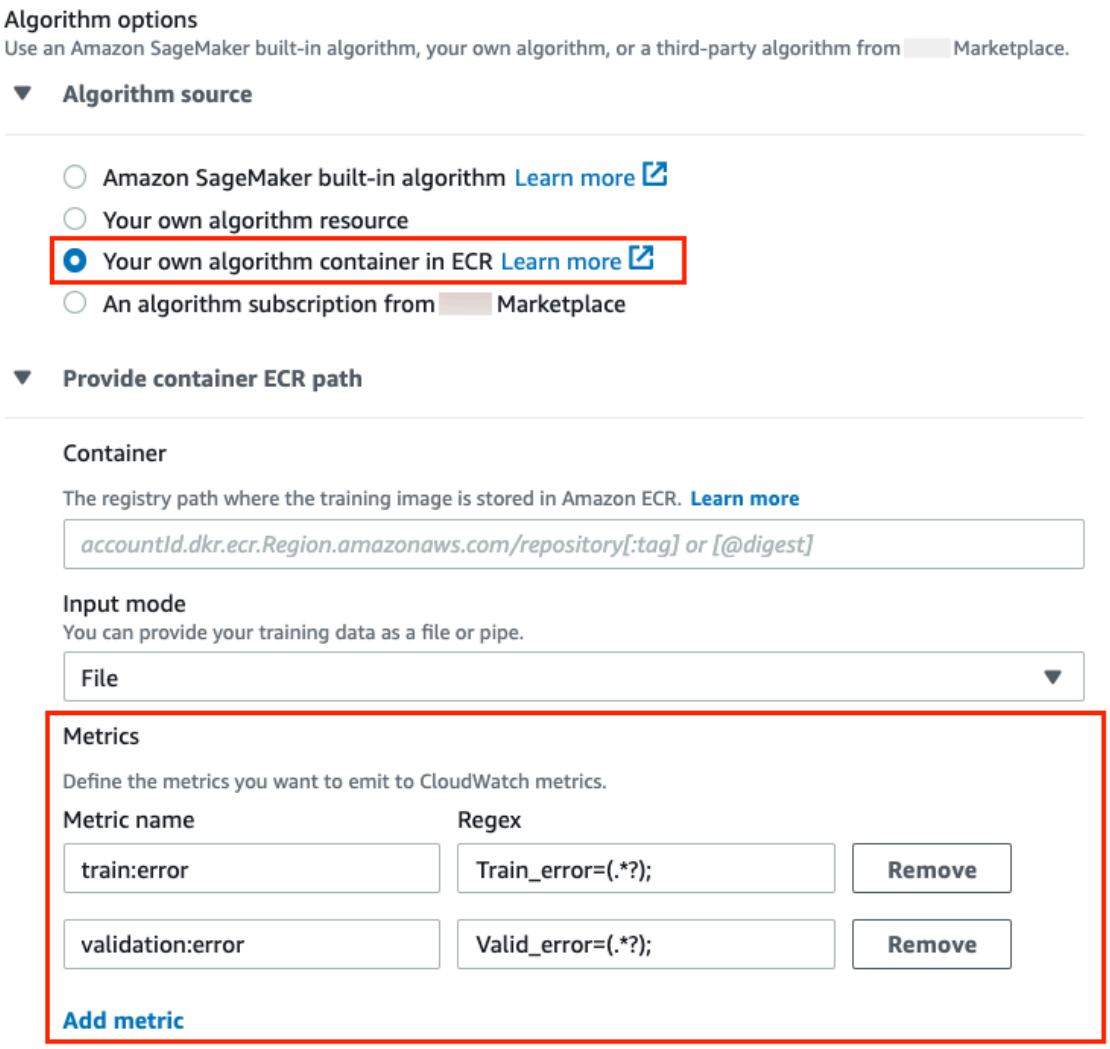
If you want to monitor both of those metrics in CloudWatch, the dictionary for the metric definitions should look like the following example:

```
[
    {
        "Name": "train:error",
        "Regex": "Train_error=(.*?);"
    },
    {
        "Name": "validation:error",
        "Regex": "Valid_error=(.*?);"
    }
]
```

In the regex for the `train:error` metric defined in the preceding example, the first part of the regex finds the exact text "Train_error=", and the expression `(.*?);` captures any characters until the first semicolon character appears. In this expression, the parenthesis tell the regex to capture what is inside them, `.` means any character, `*` means zero or more, and `?` means capture only until the first instance of the `;` character.

Define Metrics Using the SageMaker AI Python SDK

Define the metrics that you want to send to CloudWatch by specifying a list of metric definitions in the `AlgorithmSpecification` when you create a `TrainingJob` using `sagemaker-core`. For example, if you want to monitor both the `train:error` and `validation:error` metrics in CloudWatch, your `TrainingJob.create()` call would look like the following example:



```
from sagemaker.core.resources import TrainingJob
from sagemaker.core.shapes import (
    AlgorithmSpecification,
    MetricDefinition,
    ResourceConfig,
    OutputDataConfig,
    StoppingCondition,
)
```

```
TrainingJob.create(
    training_job_name="my-training-job",
    role_arn="arn:aws:iam::123456789012:role/SageMakerRole",
    algorithm_specification=AlgorithmSpecification(
        training_image="your-own-image-uri",
        training_input_mode="File",
        metric_definitions=[
            MetricDefinition(name="train:error", regex="Train_error=(.*?);"),
            MetricDefinition(name="validation:error", regex="Valid_error=(.*?);"),
        ],
    ),
    resource_config=ResourceConfig(
        instance_type="ml.c4.xlarge",
        instance_count=1,
        volume_size_in_gb=30,
    ),
    output_data_config=OutputDataConfig(s3_output_path="s3://bucket/output"),
    stopping_condition=StoppingCondition(max_runtime_in_seconds=3600),
)
```

For more information about training by using Amazon SageMaker Python SDK ModelTrainers, see Sagemaker Python SDK on GitHub.

Define Metrics Using the SageMaker AI Console

If you choose the **Your own algorithm container in ECR** option as your algorithm source in the SageMaker AI console when you create a training job, add the metric definitions in the **Metrics** section. The following screenshot shows how it should look after you add the example metric names and the corresponding regular expressions.

Define Metrics Using the Low-level SageMaker AI API

Define the metrics that you want to send to CloudWatch by specifying a list of metric names and regular expressions in the `MetricDefinitions` field of the [AlgorithmSpecification](#) input parameter that you pass to the [CreateTrainingJob](#) operation. For example, if you want to monitor both the `train:error` and `validation:error` metrics in CloudWatch, your `AlgorithmSpecification` would look like the following example:

```
"AlgorithmSpecification": {
    "TrainingImage": your-own-image-uri,
    "TrainingInputMode": "File",
    "MetricDefinitions" : [
        {
            "Name": "train:error",
            "Regex": "Train_error=(.*?);"
```

```
        },
        {
            "Name": "validation:error",
            "Regex": "Valid_error=(.*?);"
        }
    ]
}
```

For more information about defining and running a training job by using the low-level SageMaker AI API, see `CreateTrainingJob`.

View training job metrics

You can view the metrics emitted from your Amazon SageMaker training jobs in either the Amazon CloudWatch or SageMaker AI console.

Monitor training job metrics (CloudWatch console)

You can monitor the metrics that a training job emits in real time in the CloudWatch console.

To monitor training job metrics (CloudWatch console)

1. Open the CloudWatch console at https://console.amazonaws.cn/cloudwatch.
2. Choose **Metrics**, then choose **/aws/sagemaker/TrainingJobs**.
3. Choose **TrainingJobName**.
4. On the **All metrics** tab, choose the names of the training metrics that you want to monitor.
5. On the **Graphed metrics** tab, configure the graph options. For more information about using CloudWatch graphs, see Graph Metrics in the *Amazon CloudWatch User Guide*.

Monitor training job metrics (SageMaker AI console)

You can monitor the metrics that a training job emits in real time by using the SageMaker AI console.

To monitor training job metrics (SageMaker AI console)

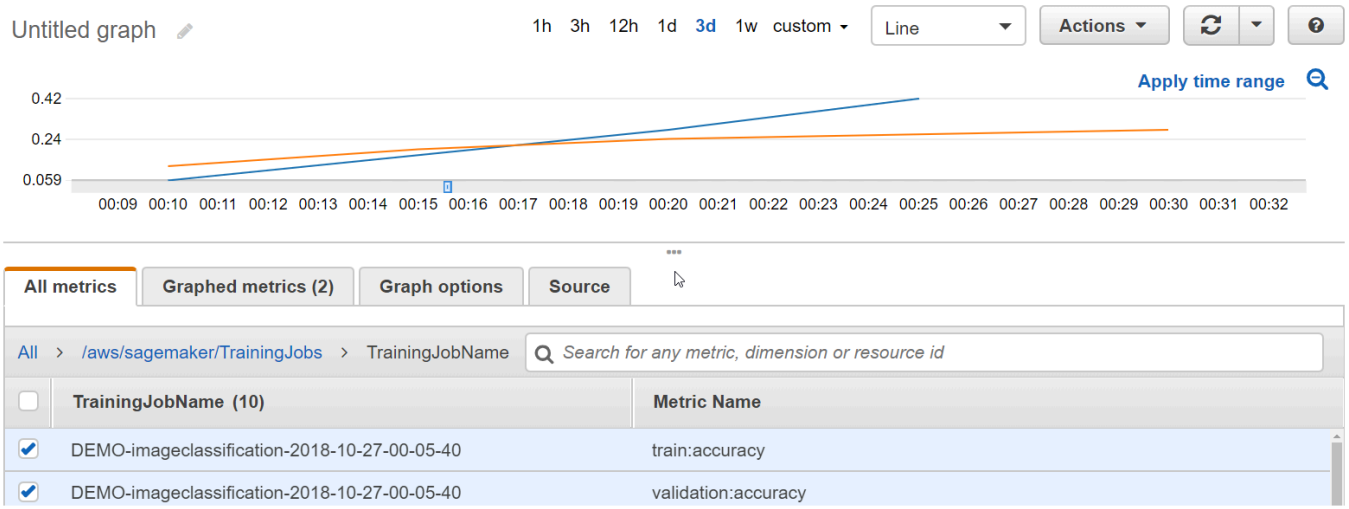
1. Open the SageMaker AI console at https://console.amazonaws.cn/sagemaker.
2. Choose **Training jobs**, then choose the training job whose metrics you want to see.

3. Choose **TrainingJobName**.

4. In the **Monitor** section, you can review the graphs of instance utilization and algorithm metrics.

Example: Viewing a Training and Validation Curve

Typically, you split the data on which you train your model into training and validation datasets. You use the training set to train the model parameters that are used to make predictions on the training dataset. Then you test how well the model makes predictions by calculating predictions for the validation set. To analyze the performance of a training job, you commonly plot a training curve against a validation curve.



Viewing a graph that shows the accuracy for both the training and validation sets over time can help you to improve the performance of your model. For example, if training accuracy continues to increase over time, but, at some point, validation accuracy starts to decrease, you are likely overfitting your model. To address this, you can make adjustments to your model, such as increasing regularization.

For this example, you can use the **Image-classification-full-training** example in the **Example notebooks** section of your SageMaker AI notebook instance. If you don't have a SageMaker notebook instance, create one by following the instructions at Create an Amazon SageMaker Notebook Instance for the tutorial. If you prefer, you can follow along with the End-to-End Multiclass Image Classification Example in the example notebook on GitHub. You also need an Amazon S3 bucket to store the training data and for the model output.

To view training and validation error curves

1. Open the SageMaker AI console at https://console.amazonaws.cn/sagemaker.
2. Choose **Notebooks**, and then choose **Notebook instances**.
3. Choose the notebook instance that you want to use, and then choose **Open**.
4. On the dashboard for your notebook instance, choose **SageMaker AI Examples**.
5. Expand the **Introduction to Amazon Algorithms** section, and then choose **Use** next to **Image-classification-fulltraining.ipynb**.
6. Choose **Create copy**. SageMaker AI creates an editable copy of the **Image-classification-fulltraining.ipynb** notebook in your notebook instance.
7. Run all of the cells in the notebook up to the **Inference** section. You don't need to deploy an endpoint or get inference for this example.
8. After the training job starts, open the CloudWatch console at https://console.amazonaws.cn/cloudwatch.
9. Choose **Metrics**, then choose **/aws/sagemaker/TrainingJobs**.

10. Choose **TrainingJobName**.
11. On the **All metrics** tab, choose the **train:accuracy** and **validation:accuracy** metrics for the training job that you created in the notebook.
12. On the graph, choose an area that the metric's values to zoom in. You should see something like the following example.

Augmented Manifest Files for Training Jobs

To include metadata with your dataset in a training job, use an augmented manifest file. When using an augmented manifest file, your dataset must be stored in Amazon Simple Storage Service (Amazon S3), and you must configure your training job to use the dataset stored there. You specify the location and format of this dataset for one or more `Channel`. Augmented manifests can only support Pipe input mode. See the section, **InputMode** in `Channel` to learn more about pipe input mode.

When specifying a channel's parameters, you specify a path to the file, called a `S3Uri`. Amazon SageMaker AI interprets this URI based on the specified `S3DataType` in `S3DataSource`. The `AugmentedManifestFile` option defines a manifest format that includes metadata with the input data. Using an augmented manifest file is an alternative to preprocessing when you have labeled data. For training jobs using labeled data, you typically need to preprocess the dataset to combine input data with metadata before training. If your training dataset is large, preprocessing can be time consuming and expensive.

Augmented Manifest File Format

An augmented manifest file must be formatted in JSON Lines format. In JSON Lines format, each line in the file is a complete JSON object followed by a newline separator.

During training, SageMaker AI parses each JSON line and sends some or all of its attributes on to the training algorithm. You specify which attribute contents to pass and the order in which to pass them with the `AttributeNames` parameter of the `CreateTrainingJob` API. The `AttributeNames` parameter is an ordered list of attribute names that SageMaker AI looks for in the JSON object to use as training input.

For example, if you list `["line", "book"]` for `AttributeNames`, the input data must include the attribute names of `line` and book in the specified order. For this example, the following augmented manifest file content is valid:

```
{"author": "Herman Melville", "line": "Call me Ishmael", "book": "Moby Dick"}
{"line": "It was love at first sight.", "author": "Joseph Heller", "book": "Catch-22"}
```

SageMaker AI ignores unlisted attribute names even if they precede, follow, or are in between listed attributes.

When using augmented manifest files, observe the following guidelines:

- The order of the attributes listed in the `AttributeNames` parameter determines the order of the attributes passed to the algorithm in the training job.
- The listed `AttributeNames` can be a subset of all of the attributes in the JSON line. SageMaker AI ignores unlisted attributes in the file.
- You can specify any type of data allowed by the JSON format in `AttributeNames`, including text, numerical, data arrays, or objects.
- To include an S3 URI as an attribute name, add the suffix `-ref` to it.

If an attribute name contains the suffix `-ref`, the attribute's value must be an S3 URI to a data file that is accessible to the training job. For example, if `AttributeNames` contains `["image-ref", "is-a-cat"]`, the following example shows a valid augmented manifest file:

```
{"image-ref": "s3://amzn-s3-demo-bucket/sample01/image1.jpg", "is-a-cat": 1}
{"image-ref": "s3://amzn-s3-demo-bucket/sample02/image2.jpg", "is-a-cat": 0}
```

In case of the first JSON line of this manifest file, SageMaker AI retrieves the `image1.jpg` file from `s3://amzn-s3-demo-bucket/sample01/` and the string representation of the `is-a-cat` attribute `"1"` for image classification.

> **Tip**
>
> To create an augmented manifest file, use Amazon SageMaker Ground Truth and create a labeling job. For more information about the output from a labeling job, see Labeling job output data.

Augmented Manifest File Format for Pipe Mode Training

Augmented manifest format enables you to do training in Pipe mode using files without needing to create RecordIO files. You need to specify both train and validation channels as values for the `InputDataConfig` parameter of the `CreateTrainingJob` request. Augmented manifest files are supported only for channels using Pipe input mode. For each channel, the data is extracted from its augmented manifest file and streamed (in order) to the algorithm through the channel's named pipe. Pipe mode uses the first in first out (FIFO) method, so records are processed in the order in which they are queued. For information about Pipe input mode, see `Input Mode`.

Attribute names with a `"-ref"` suffix point to preformatted binary data. In some cases, the algorithm knows how to parse the data. In other cases, you might need to wrap the data so that records are delimited for the algorithm. If the algorithm is compatible with RecordIO-formatted data, specifying `RecordIO` for `RecordWrapperType` solves this issue. If the algorithm is not compatible with `RecordIO` format, specify `None` for `RecordWrapperType` and make sure that your data is parsed correctly for your algorithm.

Using the `["image-ref", "is-a-cat"]` example, if you use RecordIO wrapping, the following stream of data is sent to the queue:

```
recordio_formatted(s3://amzn-s3-demo-bucket/foo/
image1.jpg)recordio_formatted("1")recordio_formatted(s3://amzn-s3-demo-
bucket/bar/image2.jpg)recordio_formatted("0")
```

Images that are not wrapped with RecordIO format, are streamed with the corresponding `is-a-cat` attribute value as one record. This can cause a problem because the algorithm might not delimit the images and attributes correctly. For more information about using augmented manifest files for image classification, see Train with Augmented Manifest Image Format.

With augmented manifest files and Pipe mode in general, size limits of the EBS volume do not apply. This includes settings that otherwise must be within the EBS volume size limit such as `S3DataDistributionType` . For more information about Pipe mode and how to use it, see Using Your Own Training Algorithms - Input Data Configuration.

Use an Augmented Manifest File

The following sections show you how to use augmented manifest files in your Amazon SageMaker training jobs, either with the SageMaker AI console or programmatically using the SageMaker Python SDK.

Use an Augmented Manifest File (Console)

To complete this procedure, you need:

- The URL of the S3 bucket where you've stored the augmented manifest file.
- To store the data that is listed in the augmented manifest file in an S3 bucket.
- The URL of the S3 bucket where you want to store the output of the job.

To use an augmented manifest file in a training job (console)

1. Open the Amazon SageMaker AI console at https://console.amazonaws.cn/sagemaker/.
2. In the navigation pane, choose **Training**, then choose **Training jobs**.
3. Choose **Create training job**.
4. Provide a name for the training job. The name must be unique within an Amazon Region in an Amazon account. It can have 1 to 63 characters. Valid characters: a-z, A-Z, 0-9, and . : + = @ _ % - (hyphen).
5. Choose the algorithm that you want to use. For information about supported built-in algorithms, see Built-in algorithms and pretrained models in Amazon SageMaker. If you want to use a custom algorithm, make sure that it is compatible with Pipe mode.
6. (Optional) For **Resource configuration**, either accept the default values or, to reduce computation time, increase the resource consumption.
    a. (Optional) For **Instance type**, choose the ML compute instance type that you want to use. In most cases, **ml.m4.xlarge** is sufficient.
    b. For **Instance count**, use the default, 1.

c. (Optional) For **Additional volume per instance (GB)**, choose the size of the ML storage volume that you want to provision. In most cases, you can use the default, 1. If you are using a large dataset, use a larger size.

7. Provide information about the input data for the training dataset.

   a. For **Channel name**, either accept the default (**`train`**) or enter a more meaningful name, such as **`training-augmented-manifest-file`**.

   b. For **InputMode**, choose **Pipe**.

   c. For **S3 data distribution type**, choose **FullyReplicated**. When training incrementally, fully replicating causes each ML compute instance to use a complete copy of the expanded dataset. For neural-based algorithms, such as Neural Topic Model (NTM) Algorithm, choose `ShardedByS3Key`.

   d. If the data specified in the augmented manifest file is uncompressed, set the **Compression type** to **None**. If the data is compressed using gzip, set it to **Gzip**.

   e. (Optional) For **Content type**, specify the appropriate MIME type. Content type is the multipurpose internet mail extension (MIME) type of the data.

   f. For **Record wrapper**, if the dataset specified in the augmented manifest file is saved in RecordIO format, choose **RecordIO**. If your dataset is not saved as a RecordIO-formatted file, choose **None**.

   g. For **S3 data type**, choose **AugmentedManifestFile**.

   h. For **S3 location**, provide the path to the bucket where you stored the augmented manifest file.

   i. For **AugmentedManifestFile attribute names**, specify the name of an attribute that you want to use. The attribute name must be present within the augmented manifest file, and is case-sensitive.

   j. (Optional) To add more attribute names, choose **Add row** and specify another attribute name for each attribute.

   k. (Optional) To adjust the order of attribute names, choose the up or down buttons next to the names. When using an augmented manifest file, the order of the specified attribute names is important.

   l. Choose **Done**.

8. For **Output data configuration**, provide the following information:

   a. For **S3 location**, type the path to the S3 bucket where you want to store the output data.

   b. (Optional) You can use your Amazon Key Management Service (Amazon KMS) encryption key to encrypt the output data at rest. For **Encryption key**, provide the key ID or its Amazon Resource Number (ARN). For more information, see KMS-Managed Encryption Keys.

9. (Optional) For **Tags**, add one or more tags to the training job. A *tag* is metadata that you can define and assign to Amazon resources. In this case, you can use tags to help you manage your training jobs. A tag consists of a key and a value, which you define. For example, you might want to create a tag with **`Project`** as a key and a value that refers to a project that is related to the training job, such as **`Home value forecasts`**.
10. Choose **Create training job**. SageMaker AI creates and runs the training job.

After the training job has finished, SageMaker AI stores the model artifacts in the bucket whose path you provided for **S3 output path** in the **Output data configuration** field. To deploy the model to get predictions, see Deploy the model to Amazon EC2.

Use an Augmented Manifest File (API)

The following shows how to train a model with an augmented manifest file using the SageMaker AI high-level Python library:

```
import sagemaker
from sagemaker.train import ModelTrainer
from sagemaker.core.shapes import Channel, DataSource, S3DataSource
from sagemaker.train.configs import Compute, StoppingCondition, OutputDataConfig

# Create a model object set to using "Pipe" mode.
compute = Compute(
    instance_type='ml.p3.2xlarge',
    instance_count=1,
    volume_size_in_gb=50
)

model_trainer = ModelTrainer(
    training_image=training_image,
    role=role,
    compute=compute,
    stopping_condition=StoppingCondition(max_runtime_in_seconds=360000),
    training_input_mode='Pipe',
    output_data_config=OutputDataConfig(s3_output_path=s3_output_location),
    sagemaker_session=session
```

```
)

# Create a train data channel with S3_data_type as 'AugmentedManifestFile' and
 attribute names.
train_data = Channel(
    channel_name='train',
    data_source=DataSource(
        s3_data_source=S3DataSource(
            s3_data_type='AugmentedManifestFile',
            s3_uri=your_augmented_manifest_file,
            s3_data_distribution_type='FullyReplicated',
            attribute_names=['source-ref', 'annotations'],
        )
    ),
    content_type='application/x-recordio',
    input_mode='Pipe',
    record_wrapper_type='RecordIO'
)

# Train a model.
model_trainer.train(input_data_config=[train_data])
```

After the training job has finished, SageMaker AI stores the model artifacts in the bucket whose path you provided for **S3 output path** in the **Output data configuration** field. To deploy the model to get predictions, see Deploy the model to Amazon EC2.

Checkpoints in Amazon SageMaker AI

Use checkpoints in Amazon SageMaker AI to save the state of machine learning (ML) models during training. Checkpoints are snapshots of the model and can be configured by the callback functions of ML frameworks. You can use the saved checkpoints to restart a training job from the last saved checkpoint.

Using checkpoints, you can do the following:

- Save your model snapshots under training due to an unexpected interruption to the training job or instance.
- Resume training the model in the future from a checkpoint.
- Analyze the model at intermediate stages of training.
- Use checkpoints with S3 Express One Zone for increased access speeds.

- Use checkpoints with SageMaker AI managed spot training to save on training costs.

The SageMaker training mechanism uses training containers on Amazon EC2 instances, and the checkpoint files are saved under a local directory of the containers (the default is `/opt/ml/checkpoints`). SageMaker AI provides the functionality to copy the checkpoints from the local path to Amazon S3 and automatically syncs the checkpoints in that directory with S3. Existing checkpoints in S3 are written to the SageMaker AI container at the start of the job, enabling jobs to resume from a checkpoint. Checkpoints added to the S3 folder after the job has started are not copied to the training container. SageMaker AI also writes new checkpoints from the container to S3 during training. If a checkpoint is deleted in the SageMaker AI container, it will also be deleted in the S3 folder.

You can use checkpoints in Amazon SageMaker AI with the Amazon S3 Express One Zone storage class (S3 Express One Zone) for faster access to checkpoints. When you enable checkpointing and specify the S3 URI for your checkpoint storage destination, you can provide an S3 URI for a folder in either an S3 general purpose bucket or an S3 directory bucket. S3 directory buckets that are integrated with SageMaker AI can only be encrypted with server-side encryption with Amazon S3 managed keys (SSE-S3). Server-side encryption with Amazon KMS keys (SSE-KMS) is not currently supported. For more information on S3 Express One Zone and S3 directory buckets, see What is S3 Express One Zone.

If you are using checkpoints with SageMaker AI managed spot training, SageMaker AI manages checkpointing your model training on a spot instance and resuming the training job on the next spot instance. With SageMaker AI managed spot training, you can significantly reduce the billable time for training ML models. For more information, see Managed Spot Training in Amazon SageMaker AI.

Checkpoints for frameworks and algorithms in SageMaker AI

Use checkpoints to save snapshots of ML models built on your preferred frameworks within SageMaker AI.

SageMaker AI frameworks and algorithms that support checkpointing

SageMaker AI supports checkpointing for Amazon Deep Learning Containers and a subset of built-in algorithms without requiring training script changes. SageMaker AI saves the checkpoints to the default local path `'/opt/ml/checkpoints'` and copies them to Amazon S3.

- Deep Learning Containers: TensorFlow, PyTorch, MXNet, and HuggingFace

> **Note**
>
> If you are using the HuggingFace framework estimator, you need to specify a checkpoint output path through hyperparameters. For more information, see Run training on Amazon SageMaker AI in the *HuggingFace documentation*.

- Built-in algorithms: Image Classification, Object Detection, Semantic Segmentation, and XGBoost (0.90-1 or later)

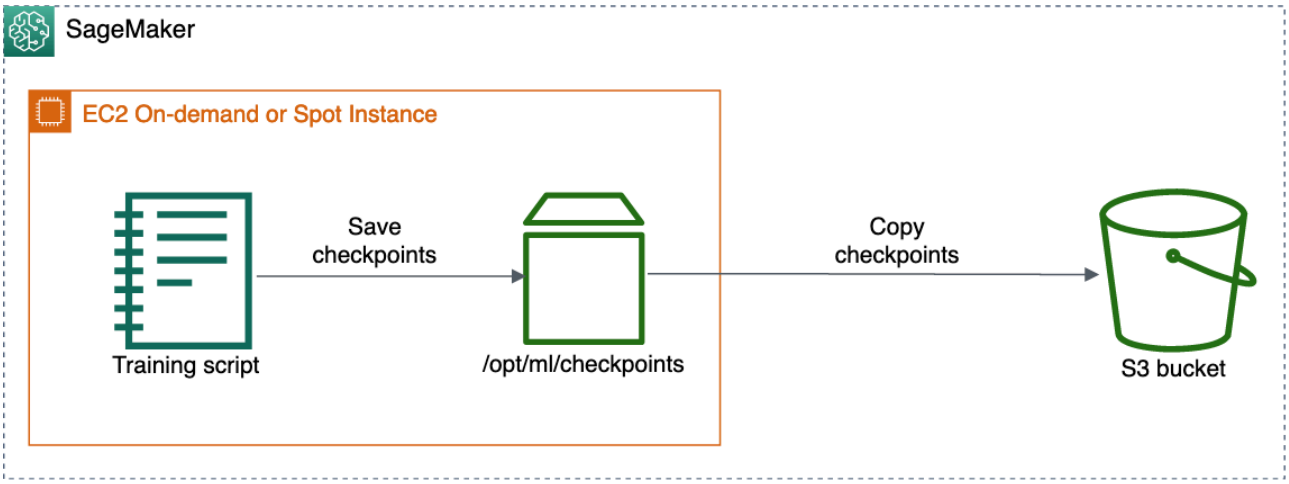
> **Note**
>
> If you are using the XGBoost algorithm in framework mode (script mode), you need to bring an XGBoost training script with checkpointing that's manually configured. For more information about the XGBoost training methods to save model snapshots, see Training XGBoost in *the XGBoost Python SDK documentation*.

If a pre-built algorithm that does not support checkpointing is used in a managed spot training job, SageMaker AI does not allow a maximum wait time greater than an hour for the job in order to limit wasted training time from interrupts.

For custom training containers and other frameworks

If you are using your own training containers, training scripts, or other frameworks not listed in the previous section, you must properly set up your training script using callbacks or training APIs to save checkpoints to the local path (`'/opt/ml/checkpoints'`) and load from the local

path in your training script. SageMaker AI estimators can sync up with the local path and save the checkpoints to Amazon S3.



Considerations for checkpointing

Consider the following when using checkpoints in SageMaker AI.

- To avoid overwrites in distributed training with multiple instances, you must manually configure the checkpoint file names and paths in your training script. The high-level SageMaker AI checkpoint configuration specifies a single Amazon S3 location without additional suffixes or prefixes to tag checkpoints from multiple instances.
- The SageMaker Python SDK does not support high-level configuration for checkpointing frequency. To control the checkpointing frequency, modify your training script using the framework's model save functions or checkpoint callbacks.
- If you use SageMaker AI checkpoints with SageMaker Debugger and SageMaker AI distributed and are facing issues, see the following pages for troubleshooting and considerations.
  - Distributed training supported by Amazon SageMaker Debugger
  - Troubleshooting for distributed training in Amazon SageMaker AI
  - Model Parallel Troubleshooting

Enable checkpointing

After you enable checkpointing, SageMaker AI saves checkpoints to Amazon S3 and syncs your training job with the checkpoint S3 bucket. You can use either S3 general purpose or S3 directory buckets for your checkpoint S3 bucket.

The following example shows how to configure checkpoint paths when you construct a SageMaker AI training object.

To enable checkpointing, add the `checkpoint_config` parameter to your `ModelTrainer`. The following example template shows how to create a SageMaker AI `ModelTrainer` and enable checkpointing. You can use this template for any supported algorithm by specifying the `training_image` parameter. To find Docker image URIs for algorithms with checkpointing supported by SageMaker AI, see Docker Registry Paths and Example Code. In V3, the unified `ModelTrainer` class replaces all framework-specific estimator classes (TensorFlow, PyTorch, HuggingFace, XGBoost, etc.).

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Compute, CheckpointConfig
from sagemaker.core.helper.session_helper import Session

bucket = Session().default_bucket()
base_job_name = "sagemaker-checkpoint-test"
checkpoint_in_bucket = "checkpoints"

# The S3 URI to store the checkpoints
checkpoint_s3_bucket = "s3://{}/{}/{}".format(bucket, base_job_name,
 checkpoint_in_bucket)

model_trainer = ModelTrainer(
    training_image="<ecr_path>/<algorithm-name>:<tag>",
    role=role,
    compute=Compute(instance_type="ml.m5.xlarge", instance_count=1),
    base_job_name=base_job_name,
    checkpoint_config=CheckpointConfig(
        s3_uri=checkpoint_s3_bucket,
        local_path="/opt/ml/checkpoints"
    )
)
```

The `checkpoint_config` parameter accepts a `CheckpointConfig` object with the following fields:

- `local_path` – The local path where the model saves the checkpoints periodically in a training container. The default path is set to `'/opt/ml/checkpoints'`. If you are using other frameworks or bringing your own training container, ensure that your training script's checkpoint configuration specifies the path to `'/opt/ml/checkpoints'`.

> **Note**
>
> We recommend specifying the local paths as `'/opt/ml/checkpoints'` to be consistent with the default SageMaker AI checkpoint settings. If you prefer to specify your own local path, make sure you match the checkpoint saving path in your training script and the `local_path` in your `CheckpointConfig`.

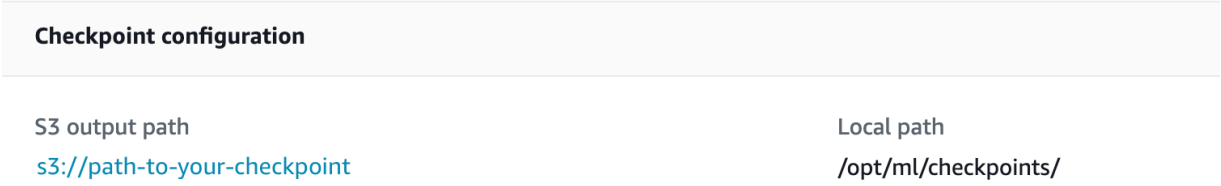
- `s3_uri` – The URI to an S3 bucket where the checkpoints are stored in real time. You can specify either an S3 general purpose or S3 directory bucket to store your checkpoints. For more information on S3 directory buckets, see Directory buckets in the *Amazon Simple Storage Service User Guide*.

To find a complete list of SageMaker AI `ModelTrainer` parameters, see the ModelTrainer API in the *Amazon SageMaker Python SDK documentation*.

Browse checkpoint files

Locate checkpoint files using the SageMaker Python SDK and the Amazon S3 console.

To find the checkpoint files programmatically

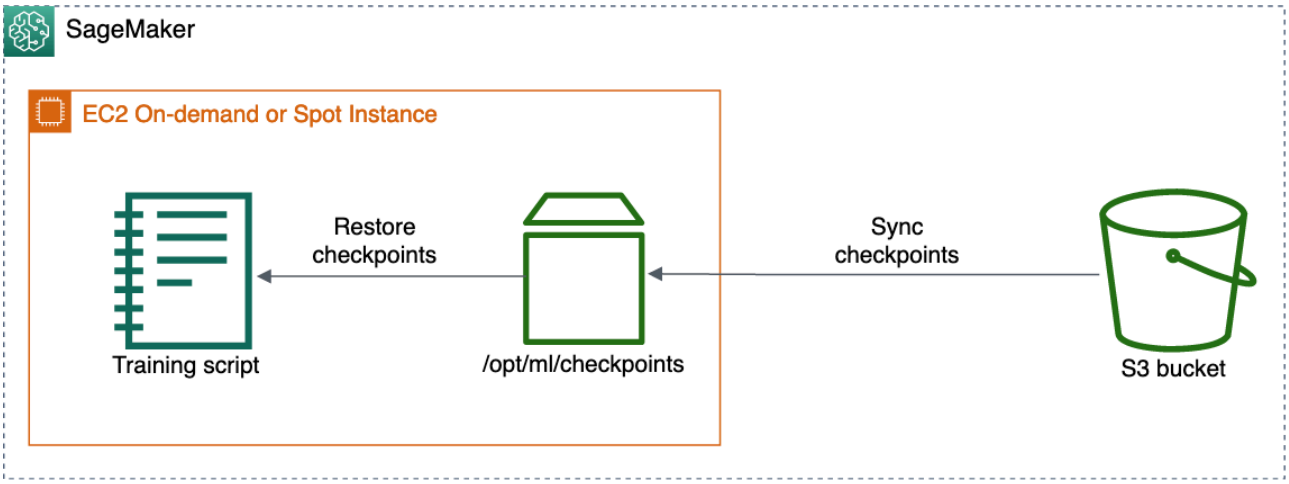


To retrieve the S3 bucket URI where the checkpoints are saved, check the following attribute:

```
model_trainer.checkpoint_config.s3_uri
```

This returns the S3 output path for checkpoints configured while requesting the `CreateTrainingJob` request. To find the saved checkpoint files using the S3 console, use the following procedure.

To find the checkpoint files from the S3 console



1. Sign in to the Amazon Web Services Management Console and open the SageMaker AI console at https://console.amazonaws.cn/sagemaker/.
2. In the left navigation pane, choose **Training jobs**.
3. Choose the link to the training job with checkpointing enabled to open **Job settings**.
4. On the **Job settings** page of the training job, locate the **Checkpoint configuration** section.

5. Use the link to the S3 bucket to access the checkpoint files.

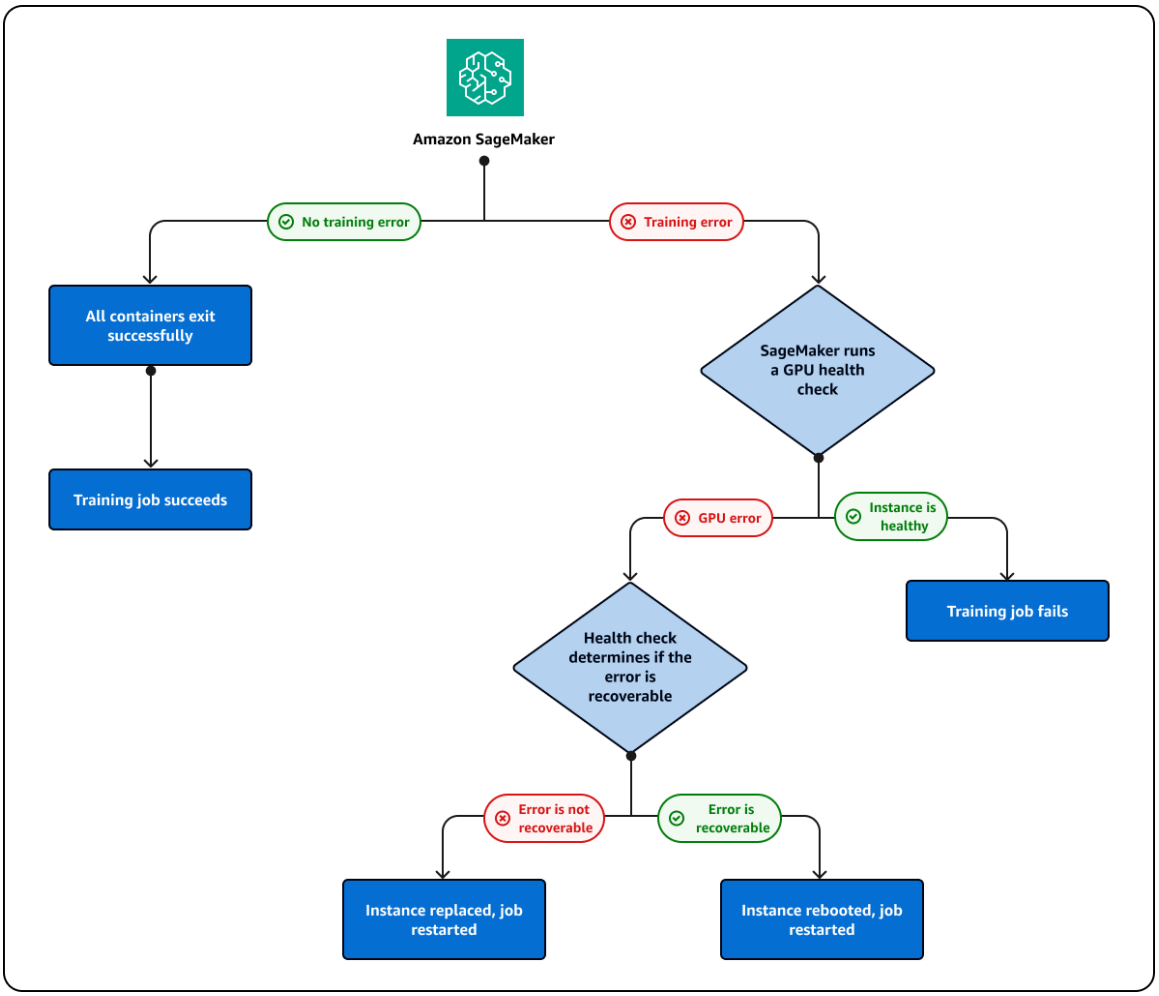
Resume training from a checkpoint

To resume a training job from a checkpoint, run a new estimator with the same `checkpoint_s3_uri` that you created in the Enable checkpointing section. Once the training has resumed, the checkpoints from this S3 bucket are restored to `checkpoint_local_path` in each instance of the new training job. Ensure that the S3 bucket is in the same Region as that of the current SageMaker AI session.

Cluster repairs for GPU errors

If you are running a training job that fails on a GPU, SageMaker AI will run a GPU health check to see whether the failure is related to a GPU issue. SageMaker AI takes the following actions based on the health check results:

- If the error is recoverable, and can be fixed by rebooting the instance or resetting the GPU, SageMaker AI will reboot the instance.



- If the error is not recoverable, and caused by a GPU that needs to be replaced, SageMaker AI will replace the instance.

The instance is either replaced or rebooted as part of a SageMaker AI cluster repair process. During this process, you will see the following message in your training job status:

`Repairing training cluster due to hardware failure`

SageMaker AI will attempt to repair the cluster up to `10` times. If the cluster repair is successful, SageMaker AI will automatically restart the training job from the previous checkpoint. If the cluster repair fails, the training job will also fail. You are not billed for the cluster repair process. Cluster repairs will not initiate unless your training job fails. If a GPU issue is detected for a warmpool cluster, the cluster will enter into repair mode to either reboot or replace the faulty instance. After repair, the cluster can still be used as a warmpool cluster.

The previously described cluster and instance repair process is depicted in the following diagram:

Amazon Nova Forge

This topic has moved. For the latest information, see Amazon Nova Forge in the Amazon Nova 1.0 user guide or the Amazon Nova 2.0 user guide.

Model customization

Amazon SageMaker AI model customization lets you adapt foundation models to your specific use case by training them on your data. You choose a *customization technique* (how the model learns), a *training type* (how much of the model to update), and an *infrastructure option* (where to run the job).

Overview

Customization techniques define *how* your model learns from data:

- **SFT** (Supervised Fine-Tuning) — Train on labeled prompt-response pairs. See the section called "SFT".
- **DPO** (Direct Preference Optimization) — Train on preferred vs rejected response pairs. See the section called "DPO".
- **RFT** (Reinforcement Fine-Tuning) — Optimize via reward signals (RLVR or RLAIF). See the section called "RFT".
- **MTRL** (Multi-Turn Reinforcement Learning) — Train agents for multi-step agentic tasks. See the section called "Multi-turn reinforcement learning".
- **Continuous Customization** — Chain techniques sequentially. See the section called "Continuous customization".
- **Distillation** — Transfer knowledge from a teacher model to a student model. See the section called "Distillation".

Training types determine *how much* of the model to update:

- **LoRA** (Low-Rank Adaptation) — Trains a small set of adapter weights. Lower cost, faster training. See the section called "LoRA".
- **FFT** (Full Fine-Tuning) — Updates all model weights. Higher compute, deeper customization. See the section called "FFT".

Infrastructure options control *where* your training job runs:

- **Serverless** — Fully managed, no instance selection. Best for quick experimentation and production jobs without ops overhead. Serverless model customization also supports training

session APIs, which give you full control over your training loop without managing GPU infrastructure. See the section called “Serverless” and the section called “Training session APIs”.

- **SageMaker AI Training Jobs** — Ephemeral jobs where you select instance type. Uses **Recipes** for pre-configured training. See the section called “SageMaker AI Training Jobs”.
- **HyperPod** — Persistent clusters with advanced fault recovery. Uses **Recipes** for distributed training on Amazon EKS or Slurm. See the section called “HyperPod”.

Choosing your approach

Before customizing, consider whether a simpler approach meets your needs:

Prompt Engineering

: Your model gives acceptable answers but needs better tone, format, or style. No training required — fast iteration. See Prompt engineering for foundation models.

RAG (Retrieval Augmented Generation)

: Your model lacks knowledge about your specific domain. Augment with external knowledge sources without retraining. See Retrieval Augmented Generation.

Fine-tuning

: Your model needs to consistently learn new behaviors, styles, or domain expertise. Train on your data to change model weights. Continue reading this guide.

Prerequisites

Before you start a customization workflow, review the prerequisites for the infrastructure and technique you plan to use:

- For serverless model customization prerequisites and required IAM permissions, see the section called “Prerequisites”.
- For multi-turn reinforcement learning (MTRL), see the section called “Prerequisites”.
- For HyperPod cluster setup, see Prerequisites for using SageMaker AI HyperPod.

Network and encryption considerations

Serverless customization jobs, SageMaker AI Training Jobs, and HyperPod support customer-managed networking and encryption settings, but each infrastructure option is configured differently.

- For serverless customization and SageMaker AI Training Jobs, provide subnets and security groups that can reach your training data, image sources, and logging destinations. If your subnets do not have internet egress, make sure you have routes or VPC endpoints for services such as Amazon S3, Amazon ECR, and CloudWatch Logs.
- For multi-turn RL jobs, see the section called "Configure a VPC".
- For HyperPod in your own VPC, see the section called "IAM role for SageMaker HyperPod" for the additional permissions required to create and manage network interfaces.

If you use customer-managed KMS key encryption for model customization inputs, outputs, or artifacts, make sure the relevant execution role can use that key and that the key policy trusts the role you pass to the job. If your input data in Amazon S3 is encrypted with a customer-managed key, the execution role also needs permission to decrypt that data. For multi-turn RL encryption guidance, see the section called "Encryption at rest". If you do not specify a customer-managed key, SageMaker AI uses its default encryption settings.

For serverless and training job flows, the execution role also needs permission to discover available VPCs, roles, and KMS keys when you configure these advanced settings. The recommended managed policy already covers this; if you manage permissions manually, include the advanced-settings permissions described under the section called "Setting up permissions manually".

Supported models for fine-tuning

The following models are available for customization across serverless, SageMaker AI Training Jobs, and HyperPod infrastructure.

Provider	Model	Model ID	Serverless	Training Jobs	HyperPod
Alibaba	Qwen3.8 27B	`huggingface-vlm-qwen3-8-27b`	✓	✓	✓

For Amazon Nova models, see the Nova walkthrough under the section called "Serverless".

How to access model customization

Amazon SageMaker AI provides multiple interfaces for model customization. The following table summarizes your options — choose the interface that best fits your workflow and level of control.

Interface	Infrastructure	Best for	Control level
Studio UI	Serverless	Quick experimentation, no-code users	Guided — select model, technique, upload data
Python SDK (`SFTTrainer`, etc.)	Serverless	Reproducible pipelines, automation	Programmatic — specify all params in code

Interface	Infrastructure	Best for	Control level
Python SDK (`ModelTrainer`)	SageMaker AI Training Jobs	Custom instances, advanced configs	Full — choose instance type, count, image
Recipes	Training Jobs + HyperPod	Pre-configured best practices	Recipe-driven — modify YAML config
HP-CLI	HyperPod (EKS)	Kubernetes-native teams	Full — Kubernetes job submission
Agent (Model customization skills)	Serverless	Natural language workflow, guided experience	Conversational — describe what you need
Python SDK (`ServiceClient`)	Serverless (Training session APIs)	Custom training loops, multi-turn reinforcement learning (RL), multi-stage pipelines	Operation-level — orchestrate `forward_backward()`, `sample()`, `optim_step()` as API calls

Studio UI

The SageMaker AI Studio console provides visual workflows for model customization without writing code.

Customize with UI

The primary entry point for serverless model customization. Walk through a guided workflow:

1. Select a foundation model from the catalog
2. Choose a customization technique (SFT, DPO, RLVR, RLAIF)
3. Select a training type (LoRA or FFT)
4. Upload or specify your training dataset (S3 path)
5. Configure hyperparameters
6. Launch the training job

Monitor progress in real time with live metrics and logs.

JumpStart model hub

Browse and discover foundation models available for customization. Filter by provider, task, or model size. From a model detail card, you can launch customization directly.

Agent-Guided experience

Use Amazon SageMaker AI Skills for a conversational approach to model customization. Describe what you want to achieve in natural language, and the agent guides you through model selection, dataset preparation, and job configuration. For more information, see Model customization agent skills.

Python SDK V3

Programmatic access for serverless and SageMaker AI Training Jobs workflows using the SageMaker AI Python SDK.

Serverless trainers

Use technique-specific trainer classes for fully managed customization:

```
from sagemaker.train import SFTTrainer, DPOTrainer, RLVRTrainer, RLAIFTrainer

# Example: Serverless SFT
trainer = SFTTrainer(
    model_id="meta-textgeneration-llama-3-1-8b-instruct",
    train_data="s3://my-bucket/train.jsonl",
    hyperparameters={
        "max_epochs": 3,
        "learning_rate": 5e-5,
        "lora_rank": 16,
    }
)
trainer.train()
```

SageMaker AI Training Jobs

Use `ModelTrainer` for full control over instance selection:

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Compute, InputData
```

```
trainer = ModelTrainer(
    training_image="my-training-image",
    role="arn:aws:iam::123456789012:role/SageMakerRole",
    compute=Compute(instance_type="ml.p4d.24xlarge", instance_count=2)
)
trainer.train(input_data_config=[
    InputData(channel_name="training", data_source="s3://my-bucket/train")
])
```

Training session APIs

Use the SageMaker AI Training session APIs when a predefined workflow is too rigid. Instead of submitting a complete training script, you open a stateful session and call training operations — `forward_backward()`, `optim_step()`, `sample()` — as individual API calls, then compose them into whatever procedure your technique requires. The model stays loaded between calls, so you can write custom loss functions, run multi-turn reinforcement learning with elastic rollouts, and chain multiple procedures in one session. SageMaker AI manages the underlying infrastructure and tenant isolation.

```
from sagemaker.train.training_session import ServiceClient, AdamParams

svc = ServiceClient(region="us-west-2", role_arn="arn:aws:iam::111122223333:role/
MyRole")
tc = svc.create_lora_training_client(base_model="openai/gpt-oss-20b", rank=32,
 alpha=64)

for batch in data_loader:
    tc.forward_backward(batch, loss_fn="cross_entropy")
    tc.optim_step(AdamParams(learning_rate=5e-5))

print(tc.save_state().result().model_package_arn)
tc.stop()
```

For more information, see the section called “Training session APIs”.

Recipes (Training Jobs + HyperPod)

Run pre-configured training recipes on SageMaker AI Training Jobs or HyperPod clusters. Recipes handle distributed training configuration, dataset loading, and checkpoint management automatically.

Recipes are available for all supported models and techniques. See SageMaker AI HyperPod recipes for the full catalog.

```
git clone --recursive https://github.com/aws/sagemaker-hyperpod-recipes.git
cd sagemaker-hyperpod-recipes
pip3 install -r requirements.txt

# Launch a fine-tuning recipe
python3 launcher/launch.py --recipe recipes_collection/recipes/fine-tuning/llama/
sft_lora.yaml
```

HP-CLI

Command-line interface for submitting training jobs to HyperPod EKS clusters. HP-CLI integrates with Kubernetes-based workload orchestration for containerized training on persistent clusters.

For setup and usage, see HyperPod with Amazon EKS.

Model customization agent skills

To accelerate model customization workflows, you can use a comprehensive set of Amazon SageMaker AI agent Skills designed to work with AI coding assistants that support skills, such as Kiro and Claude Code. These Skills direct coding assistants, in an IDE or at command line, to orchestrate model customization tasks, such as use case specification and planning, dataset transformation, customization technique selection, fine-tuning, model evaluation, and model deployment with options for Amazon SageMaker AI and Amazon Bedrock, according to Amazon SageMaker AI best practices. You can describe your use case and preferred workflow in natural language to your coding assistant which, guided by Amazon SageMaker AI skills, outputs code constructs that handle the invocation and orchestration of Amazon SageMaker AI APIs and MCP tools.

Amazon SageMaker AI skills are distributed as an open-source agent plugin through the Amazon Agent Plugins GitHub repository, maintained by AWSLabs. By adhering to the standard SKILL.md format defined by the Agent Skills open standard, these skills remain portable across any compatible coding environment.

Getting started

Access the Amazon SageMaker AI agent skills through the AWSLabs Agent Plugins repository on the GitHub website. In Claude Code or Cursor install the `sagemaker-ai` plugin. For coding

assistants that don't support agent plugins directly (for example, Kiro CLI or IDE as of Mar 2026), install the MCP server and Skills separately as detailed in the sagemaker-ai plugin README on the GitHub website.

Infrastructure options

Amazon SageMaker AI offers three infrastructure options for model customization. Choose based on your requirements for control, scale, and capacity access. For example, if you have reserved compute capacity through SageMaker AI Flexible Training Plans, you can use the customization Recipes to run customization jobs on your reserved capacity. The difference is in how compute resources are managed.

Recipes are pre-configured training configurations that work with both SageMaker AI Training Jobs and HyperPod. They automate dataset loading, distributed training, and checkpoint management. See SageMaker Recipes on the GitHub website on GitHub.

Option	What it is	Interfaces	Best for
the section called "Serverless"	**Job APIs:** Fully managed, no instance selection. Infrastructure provisioned and released automatically.	Studio UI, Python SDK (SFTTrainer, DPOTrainer, etc.)	Quick experimentation, production jobs without ops overhead
	the section called "Training session APIs": Interactive, long-lived sessions that expose low-level training primitives as API calls, so you drive the training loop from your own code.	Python SDK (`ServiceClient`), API	Custom training loops, multi-turn reinforcement learning (RL), multi-stage pipelines
the section called "SageMaker AI Training Jobs"	Ephemeral jobs where you select instance type and count. Instances released after training.	Recipes, Python SDK (ModelTrainer)	Custom instance configs, advanced distributed setups
the section called "HyperPod"	Persistent clusters with advanced fault detection and	Recipes, HP-CLI	Large-scale training, long-runn

Option	What it is	Interfaces	Best for
	recovery. Clusters remain available across jobs.		ing jobs, multi-job workflows

Serverless model customization

Amazon SageMaker AI model customization is a capability that transforms the traditionally complex and time-consuming process of customizing AI models from a months-long endeavor into a streamlined workflow that can be completed in days. This feature addresses the critical challenge faced by AI developers who need to customize foundation models with proprietary data to create highly differentiated customer experiences. Detailed customization documentation, including step-by-step guides and advanced configuration options, is provided in this SageMaker AI guide. For a brief overview of Nova model customization, see Customize and fine-tune with SageMaker in the Amazon Nova User Guide.

The capability includes a new guided user interface that understands natural language requirements, with a comprehensive suite of advanced model customization techniques, all powered by serverless infrastructure that eliminates the operational overhead of managing compute resources. Whether you're building legal research applications, enhancing customer service chatbots, or developing domain-specific AI agents, this feature accelerates your path from proof-of-concept to production deployment.

Features in Model Customization powered by Amazon Bedrock Evaluations may securely transmit data across Amazon Web Services Regions within your geography for processing. For more information, access Amazon Bedrock Evaluations documentation.

Key concepts

Serverless training

A fully managed compute infrastructure that abstracts away all infrastructure complexity, allowing you to focus purely on model development. This includes automatic provisioning of GPU instances (P5, P4de, P4d, G5) based on model size and training requirements, pre-optimized training recipes that incorporate best practices for each customization technique, real-time monitoring with live metrics and logs accessible through the UI, and automatic cleanup of resources after training completion to optimize costs.

Model customization techniques

Comprehensive set of advanced methods including supervised fine-tuning (SFT), direct preference optimization (DPO), reinforcement learning with verifiable rewards (RLVR), reinforcement learning with AI feedback (RLAIF), and multi-turn reinforcement learning (multi-turn RL).

Sequence length

The maximum number of tokens in a training example, equal to the prompt length plus the response length. The maximum sequence length that you can set depends on the model, the customization technique, and the training type. For the supported maximums for each open weight model, see the section called “Sequence lengths”.

Custom model

A specialized version of a base foundation model that has been adapted to a specific use case by training it on your own data, resulting in an AI model that retains the general capabilities of the original foundation model while adding domain-specific knowledge, terminology, style, or behavior tailored to your requirements.

AI model customization assets

Resources and artifacts used to train, refine, and evaluate custom models during the model customization process. These assets include **datasets**, which are collections of training examples (prompt-response pairs, domain-specific text, or labeled data) used to fine-tune a foundation model to learn specific behaviors, knowledge, or styles, and **evaluators**, which are mechanisms for assessing and improving model performance through either ***reward functions*** (code-based logic that scores model outputs based on specific criteria, used in RLVR training and custom scorer evaluation) or ***reward prompts*** (natural language instructions that guide an LLM to judge the quality of model responses, used in RLAIF training and LLM-as-a-judge evaluation).

Model package group

A collection container that tracks all logged models from training jobs, providing a centralized location for model versions and their lineage.

Logged model

The output created by SageMaker AI when running serverless training jobs. This can be a fine-tuned model (successful job), a checkpoint (failed job with checkpoint), or associated metadata (failed job without checkpoint).

Registered model

A logged model that has been marked for formal tracking and governance purposes, enabling full lineage and lifecycle management.

Lineage

The automatically captured relationships between training jobs, input datasets, output models, evaluation jobs, and deployments across SageMaker AI and Amazon Bedrock.

Cross-account sharing

The ability to share models, datasets, and evaluators across Amazon accounts using Amazon Resource Access Manager (RAM) while maintaining complete lineage visibility.

User Interfaces

Amazon SageMaker AI provides multiple interfaces for model customization, allowing you to choose the approach that best fits your workflow and expertise level. You can customize models programmatically using APIs available through the SageMaker AI Python SDK, leverage intuitive UI interfaces in Studio for visual model customization workflows, or use agent-guided workflows directly in your IDE and coding assistant of choice for an interactive, conversational approach to model development, leveraging Amazon SageMaker AI Skills.

Pricing

Prerequisites

Before you begin, complete the following prerequisites:

- Onboard to a SageMaker AI domain with Studio access. If you don't have permissions to set Studio as the default experience for your domain, contact your administrator. For more information, see Amazon SageMaker AI domain overview.
- Update the Amazon CLI by following the steps in Installing the current Amazon CLI Version.
- From your local machine, run `aws configure` and provide your Amazon credentials. For information about Amazon credentials, see Understanding and getting your Amazon credentials.

Required IAM permissions

SageMaker AI model customization requires adding appropriate permissions to your SageMaker AI execution role.

Setting up permissions through the console

If you create your SageMaker AI domain through the console, permissions for model customization are handled automatically depending on your setup method:

- **Quick setup** — Model customization permissions are included by default. No additional configuration is needed.
- **Custom setup** — Select the **Model customization** ML activity when configuring your execution role. For more information about ML activities and the permissions they grant, see Configure ML activities for IAM roles.

Setting up permissions manually

If you set up your domain through the Amazon CLI, SDK, or CloudFormation, or if you need to add model customization permissions to an existing execution role, use one of the following options.

Option 1 (Recommended): Attach the Amazon managed policy

Attach the `AmazonSageMakerModelCustomizationCoreAccess` managed policy to your SageMaker AI execution role. This policy covers all permissions needed for basic model customization, including serverless training, custom reward function RL, model evaluation, and deployment to SageMaker AI or Bedrock endpoints. For information about attaching policies, see Adding and removing IAM identity permissions in the *Amazon Identity and Access Management User Guide*.

Option 2: Create an inline policy

If you prefer to manage permissions manually, create an inline policy with the following JSON and attach it to your execution role:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "SageMakerPublicHubPermissions",
            "Effect": "Allow",
            "Action": [
                "sagemaker:ListHubContents"
            ],
            "Resource": [
                "arn:aws:sagemaker:*:aws:hub/SageMakerPublicHub"
            ]
        },
        {
            "Sid": "SageMakerHubPermissions",
            "Effect": "Allow",
            "Action": [
                "sagemaker:ImportHubContent",
                "sagemaker:ListHubs",
                "sagemaker:ListHubContents",
                "sagemaker:ListHubContentVersions",
                "sagemaker:DescribeHubContent",
                "sagemaker:DeleteHubContent"
            ],
```

```
            "Resource": [

            }
        }
    ]
}
```

If you use MLflow tracking during customization or evaluation, see Set up IAM permissions for MLflow for MLflow Tracking Server permissions and Set up IAM permissions for MLflow Apps for MLflow App permissions and setup guidance.

> **Important**
>
> The MLflow App IAM service role must remain valid for the lifetime of the MLflow App. SageMaker AI assumes this role not only when you create the app, but also whenever a customization job, evaluation job, or other client logs runs, experiments, or models to the app. Don't delete this role or remove `sagemaker.amazonaws.com` from its trust policy while the app is in use, or MLflow operations through the app fail.

Roles for Lambda and Bedrock

In addition to the permissions on your SageMaker AI execution role, model customization requires roles for two other services:

- **Lambda** — executes custom reward functions during RL-based training
- **Bedrock** — reads model artifacts from S3 when importing a custom model for deployment

If you previously configured your execution role (legacy approach)

If you previously followed this documentation and updated your SageMaker AI execution role's trust policy to include `lambda.amazonaws.com` and `bedrock.amazonaws.com` as trusted service principals, your existing configuration continues to work. No changes are required.

To use this approach, your execution role's trust policy must include the following service principals:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "sagemaker.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
```

```
        },
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "lambda.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        },
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "bedrock.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

Note

This approach is less secure because Lambda and Bedrock can assume your execution role and inherit all of its permissions — not just the ones each service needs.

Create separate roles (recommended)

For improved security, create two separate scoped-down IAM roles — one for Lambda and one for Bedrock — rather than adding these service principals to your SageMaker AI execution role. Each role trusts only its respective service and contains only the minimum permissions that service requires.

If you set up your domain through the SageMaker AI console quick setup, these roles are created automatically. If you set up your domain through another method, create them manually using the following steps.

Lambda role

This role allows Lambda to execute custom reward functions during RL-based model customization.

Naming convention: `SageMakerForLambda-{domain-id}`

1. Create an IAM role with the following trust policy. Replace <ACCOUNT_ID> with your 12-digit Amazon account ID.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "lambda.amazonaws.com"
      },
      "Action": "sts:AssumeRole",
      "Condition": {
        "StringEquals": {
          "aws:SourceAccount": "<ACCOUNT_ID>"
        },
        "ArnLike": {
          "aws:SourceArn": "arn:aws:lambda:*:<ACCOUNT_ID>:function:*"
        }
      }
    }
  ]
}
```

2. Attach the `AWSLambdaBasicExecutionRole` Amazon managed policy to the role. This grants the permissions needed to write logs to CloudWatch.

> **Note**
>
> This role does not require SageMaker AI or Bedrock permissions. The `aws:SourceAccount` and `aws:SourceArn` conditions restrict role assumption to Lambda functions in your account only, protecting against confused deputy attacks.

Bedrock role

This role allows Bedrock to read model artifacts from your SageMaker AI-managed S3 bucket when importing a custom model.

Naming convention: `SageMakerForBedrock-{domain-id}`

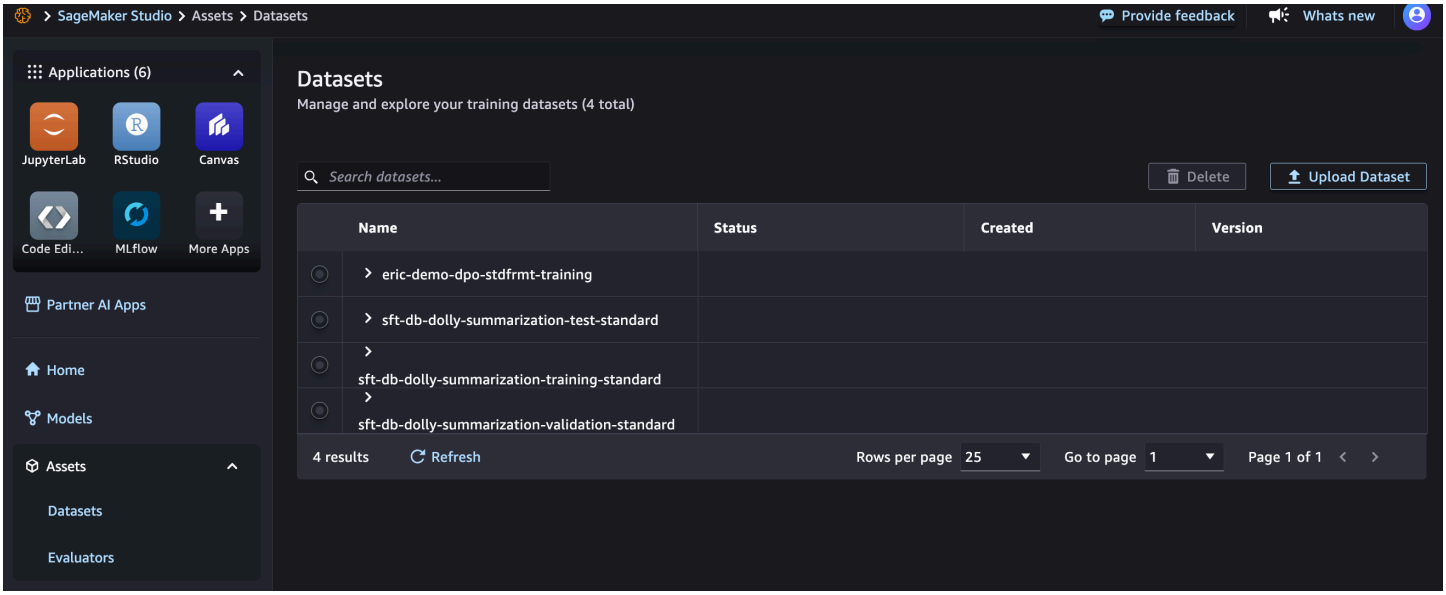
1. Create an IAM role with the following trust policy. Replace <ACCOUNT_ID> with your 12-digit Amazon account ID.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "bedrock.amazonaws.com"
      },
      "Action": "sts:AssumeRole",
      "Condition": {
        "StringEquals": {
          "aws:SourceAccount": "<ACCOUNT_ID>"
        },
        "ArnLike": {
          "aws:SourceArn": "arn:aws:bedrock:*:<ACCOUNT_ID>:*"
        }
      }
    }
  ]
}
```

2. Attach the following inline policy to the role:

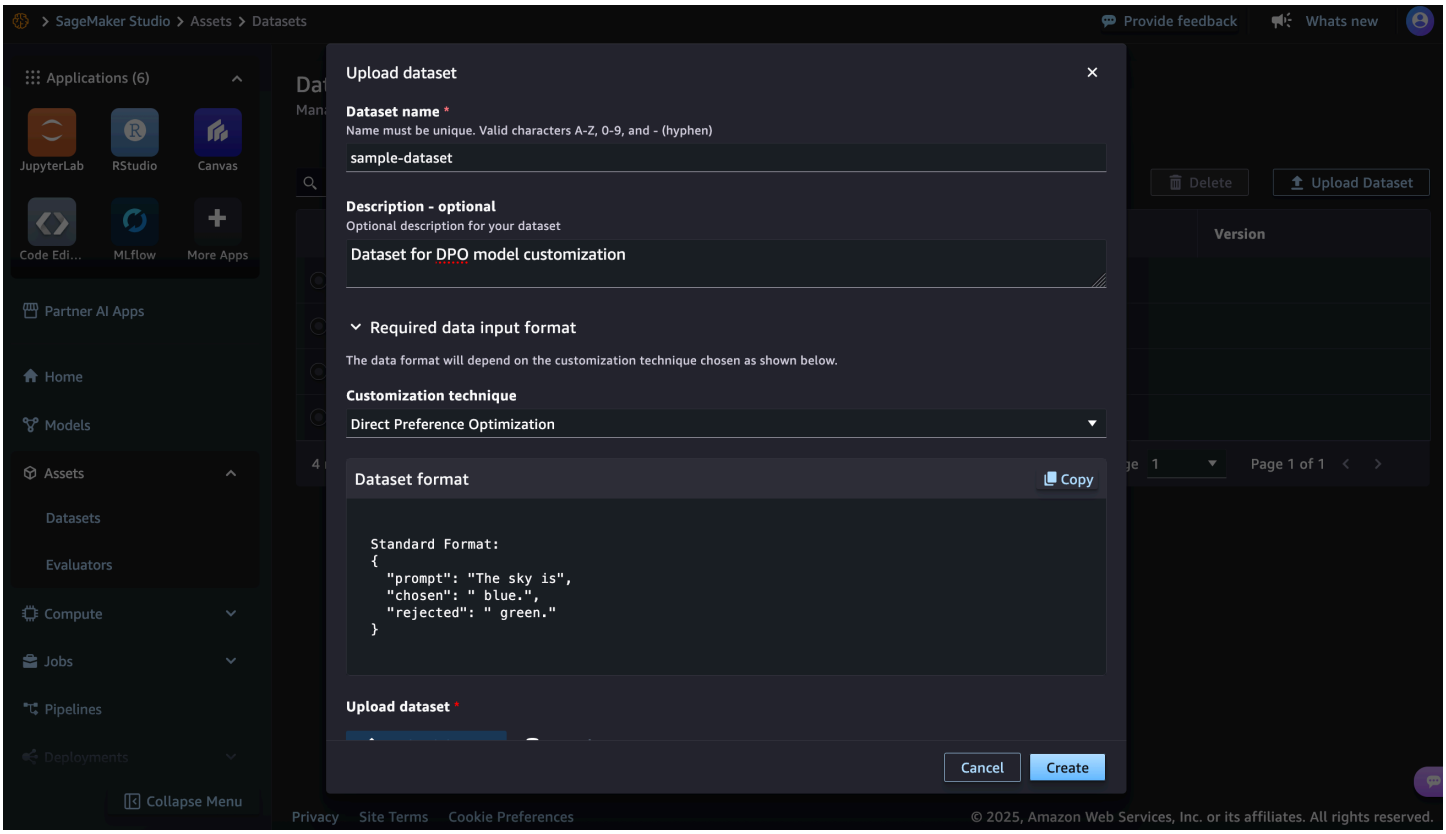
```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "SageMakerBucketReadAccess",
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::sagemaker-*-${aws:PrincipalAccount}",
                "arn:aws:s3:::sagemaker-*-${aws:PrincipalAccount}/*"
            ],
            "Condition": {
                "StringEquals": {
                    "aws:ResourceAccount": "${aws:PrincipalAccount}"
```

```
                }
            }
        },
        {
            "Sid": "AllowSSLRequestsOnly",
            "Action": "s3:*",
            "Effect": "Deny",
            "Resource": [
                "arn:aws:s3:::sagemaker-*-${aws:PrincipalAccount}",
                "arn:aws:s3:::sagemaker-*-${aws:PrincipalAccount}/*"
            ],
            "Condition": {
                "Bool": {
                    "aws:SecureTransport": "false"
                }
            }
        }
    ]
}
```



> **Note**
>
> This role does not require SageMaker AI, Lambda, or Bedrock API permissions. It only provides Bedrock with read access to model artifacts in your SageMaker AI-managed S3 bucket.

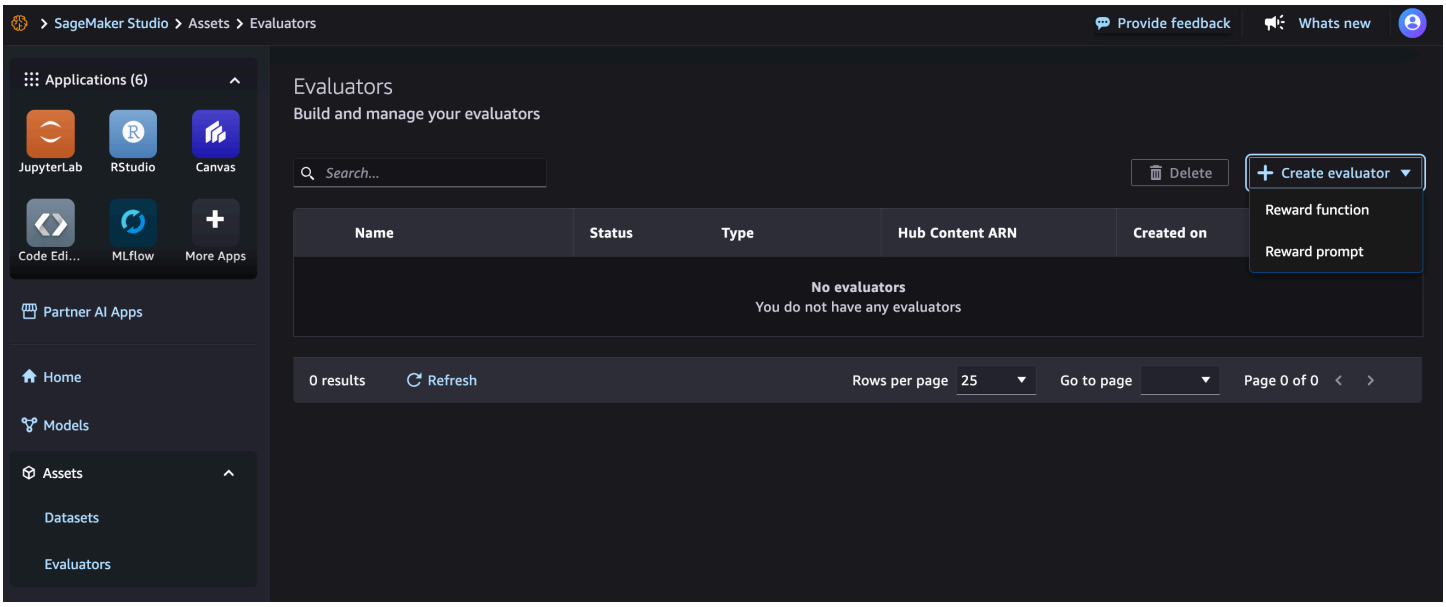
Creating assets for model customization in the UI



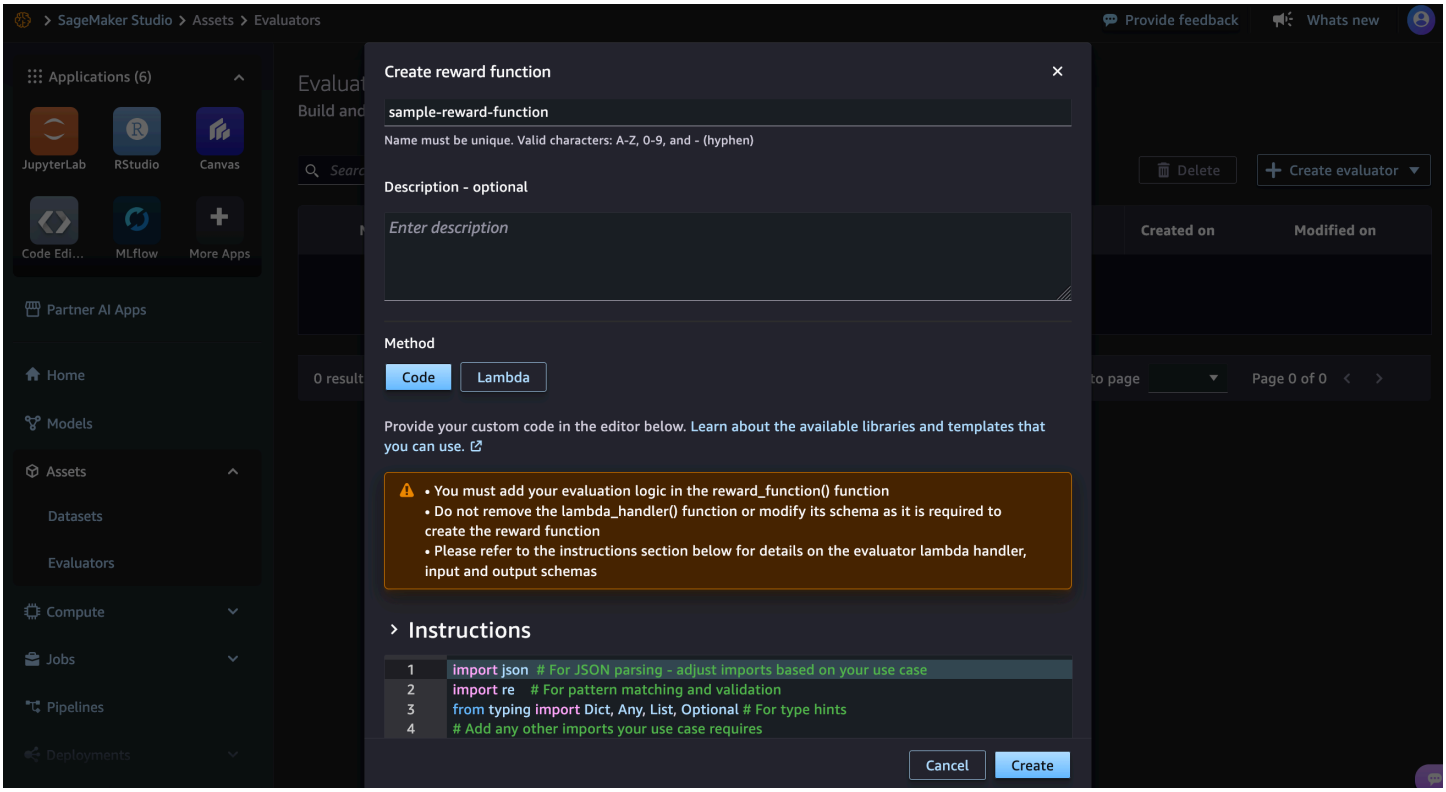
You can create and manage the dataset and evaluator assets that you can use for model customization in the UI.

Assets

Select **Assets** in the left hand panel and the Amazon SageMaker Studio UI and then select **Datasets**.



Choose **Upload Dataset** to add the dataset that you will use in your model customization jobs. By choosing the **Required data input format**, you can access a reference of dataset format to use.



Evaluators

You can also add **Reward Functions** and **Reward Prompts** for your Reinforcement Learning customization jobs.

The UI also provides guidance on the format required for the reward function or reward prompt.

Assets for model customization using Amazon SDK

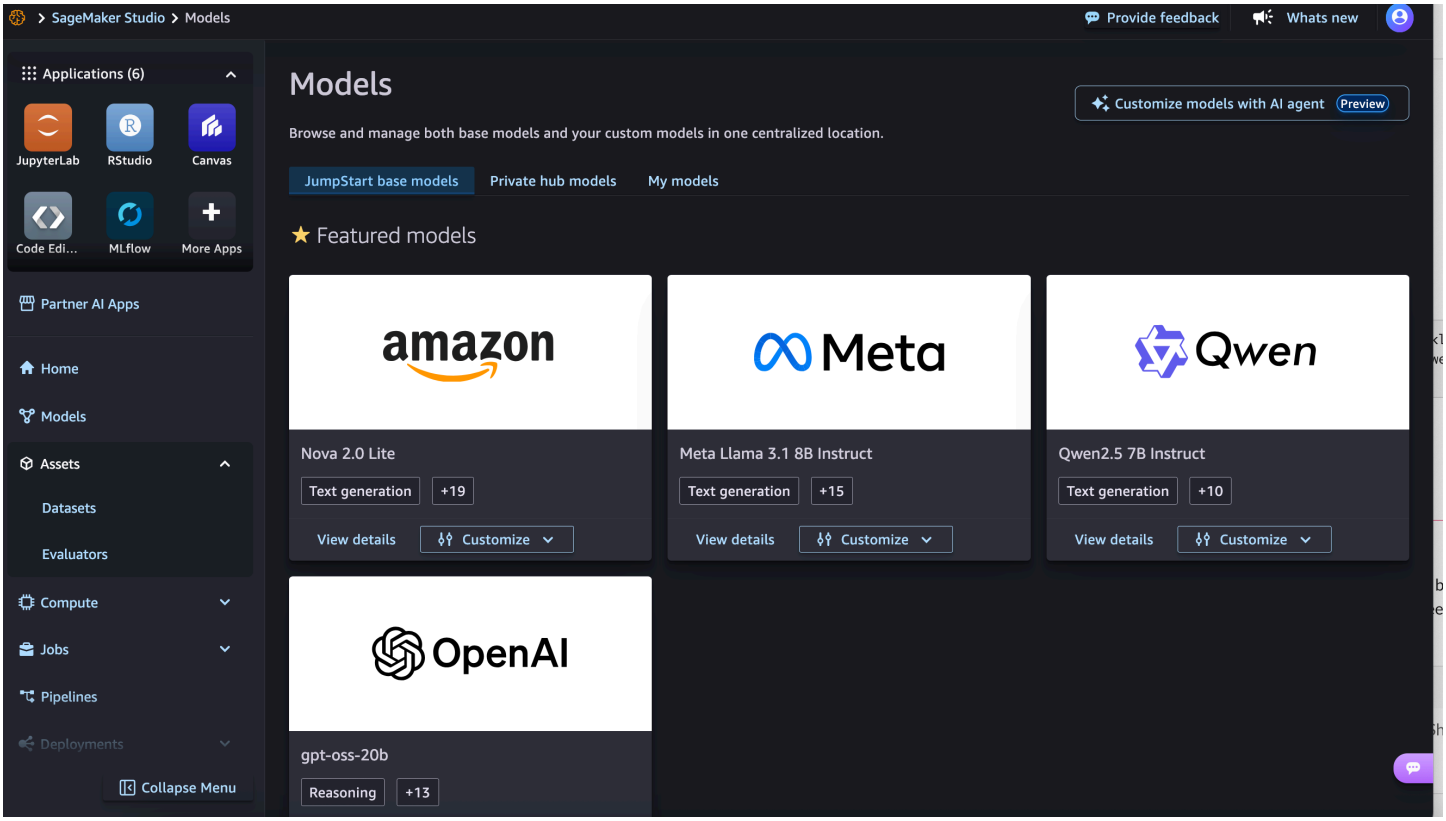
You can also use the SageMaker AI Python SDK to create assets. See sample code snippet below:

```
from sagemaker.ai_registry.air_constants import REWARD_FUNCTION, REWARD_PROMPT
from sagemaker.ai_registry.dataset import DataSet, CustomizationTechnique
from sagemaker.ai_registry.evaluator import Evaluator

# Creating a dataset example
dataset = DataSet.create(
            name="sdkv3-gen-ds2",
            source="s3://sample-test-bucket/datasets/training-data/jamjee-sft-
ds1.jsonl", # or use local filepath as source.
            customization_technique=CustomizationTechnique.SFT
        )

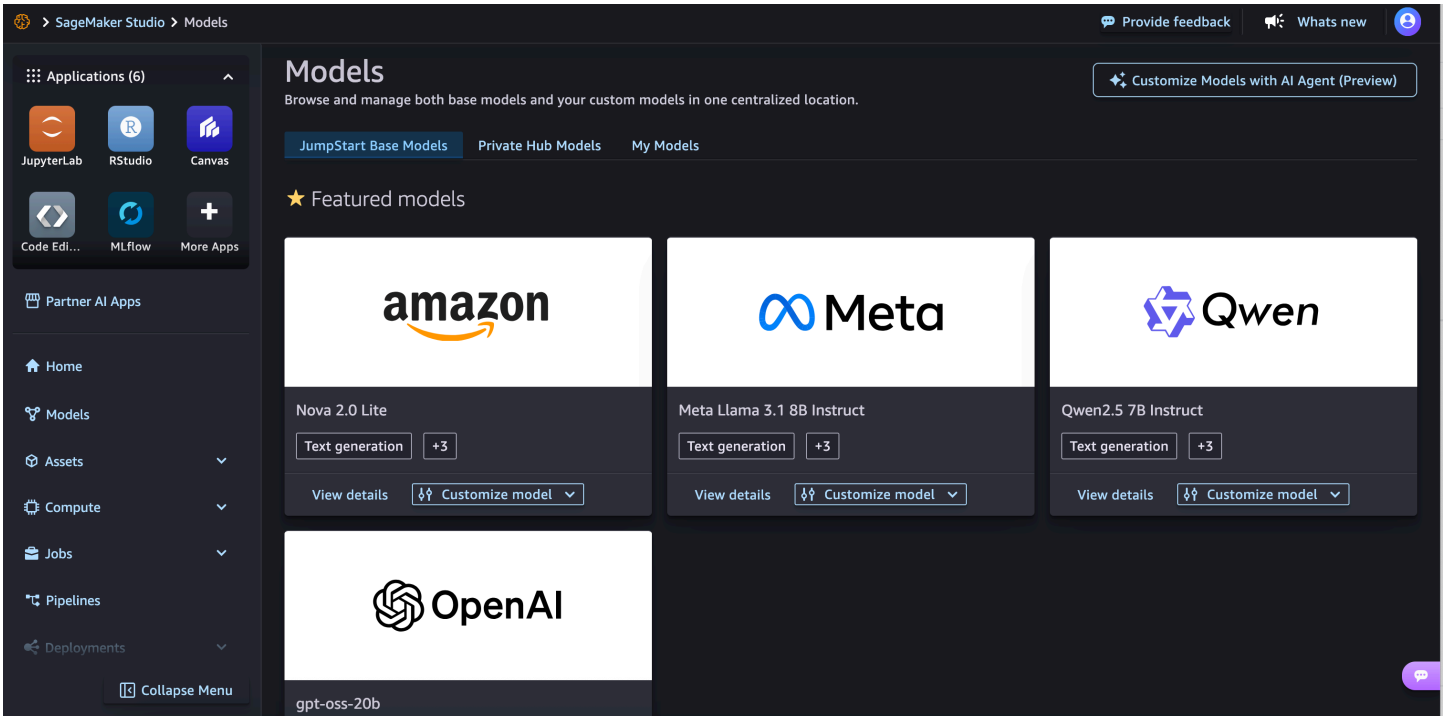
# Refreshes status from hub
dataset.refresh()
pprint(dataset.__dict__)

# Creating an evaluator. Method : Lambda
evaluator = Evaluator.create(
                name = "sdk-new-rf11",
                source="arn:aws:lambda:us-west-2:<>:function:<function-name>8",
                type=REWARD_FUNCTION
        )



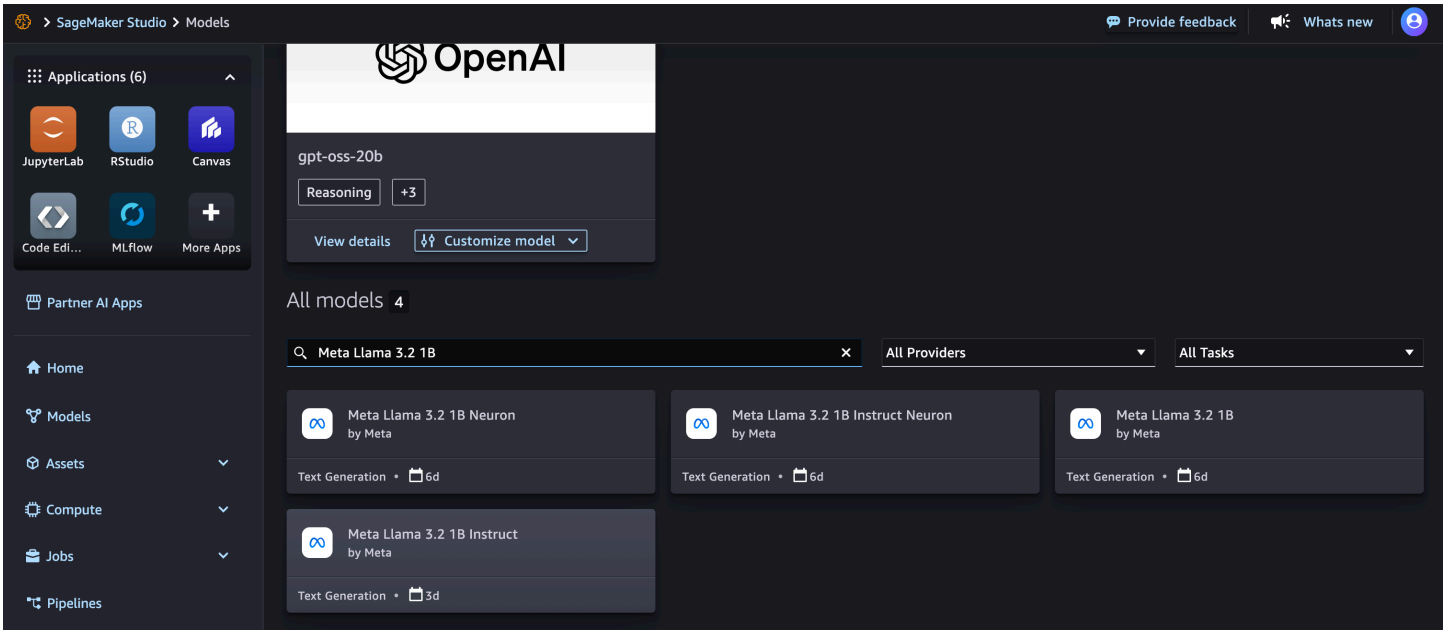
# Creating an evaluator. Method : Bring your own code
evaluator = Evaluator.create(
                name = "eval-lambda-test",
                source="/path_to_local/eval_lambda_1.py",
                type = REWARD_FUNCTION
        )

# Optional wait, by default we have wait = True during create call.
evaluator.wait()

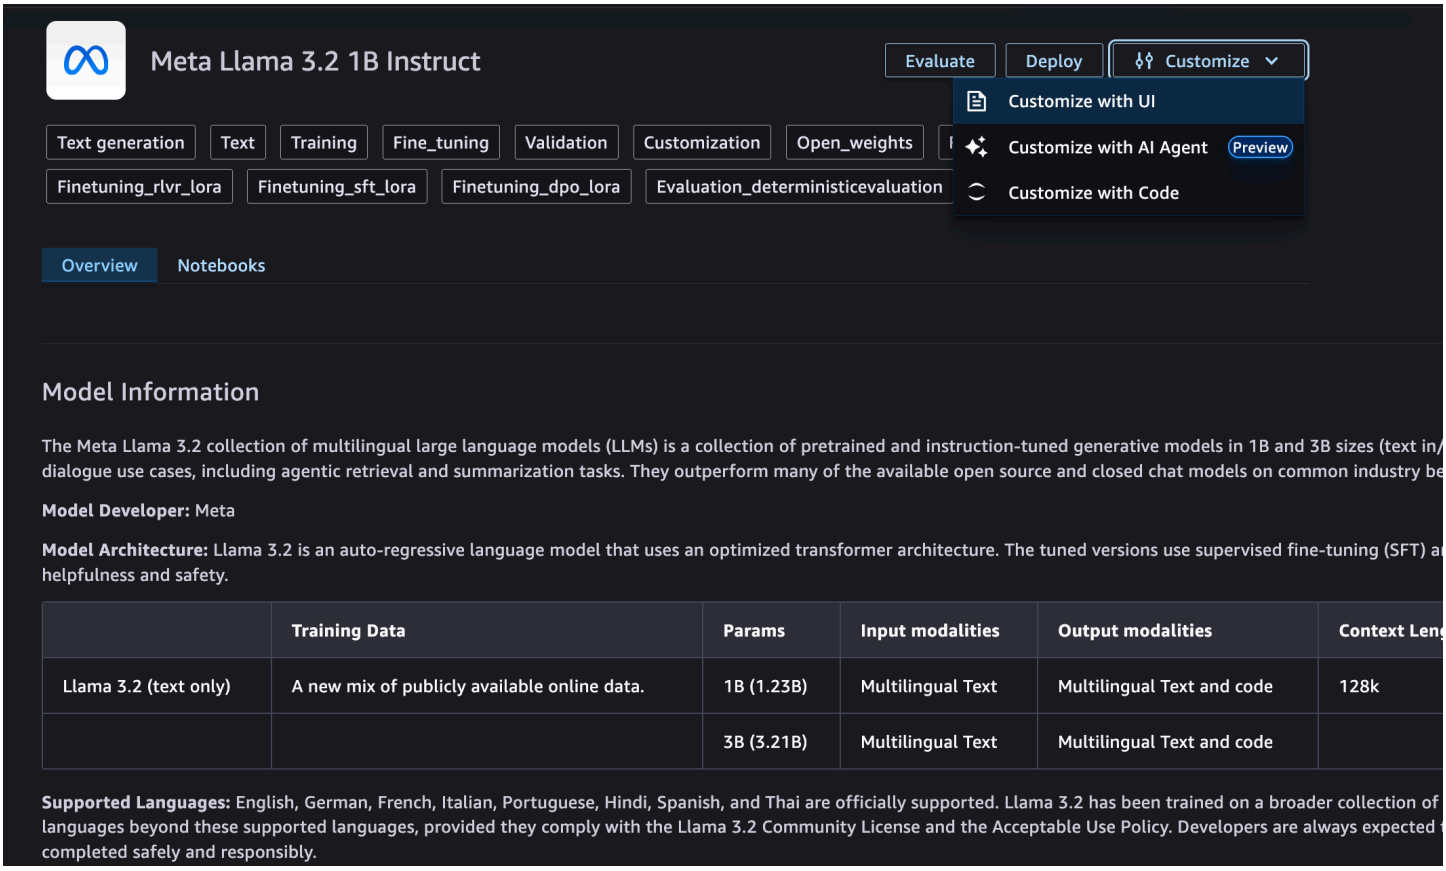


evaluator.refresh()
pprint(evaluator)
```

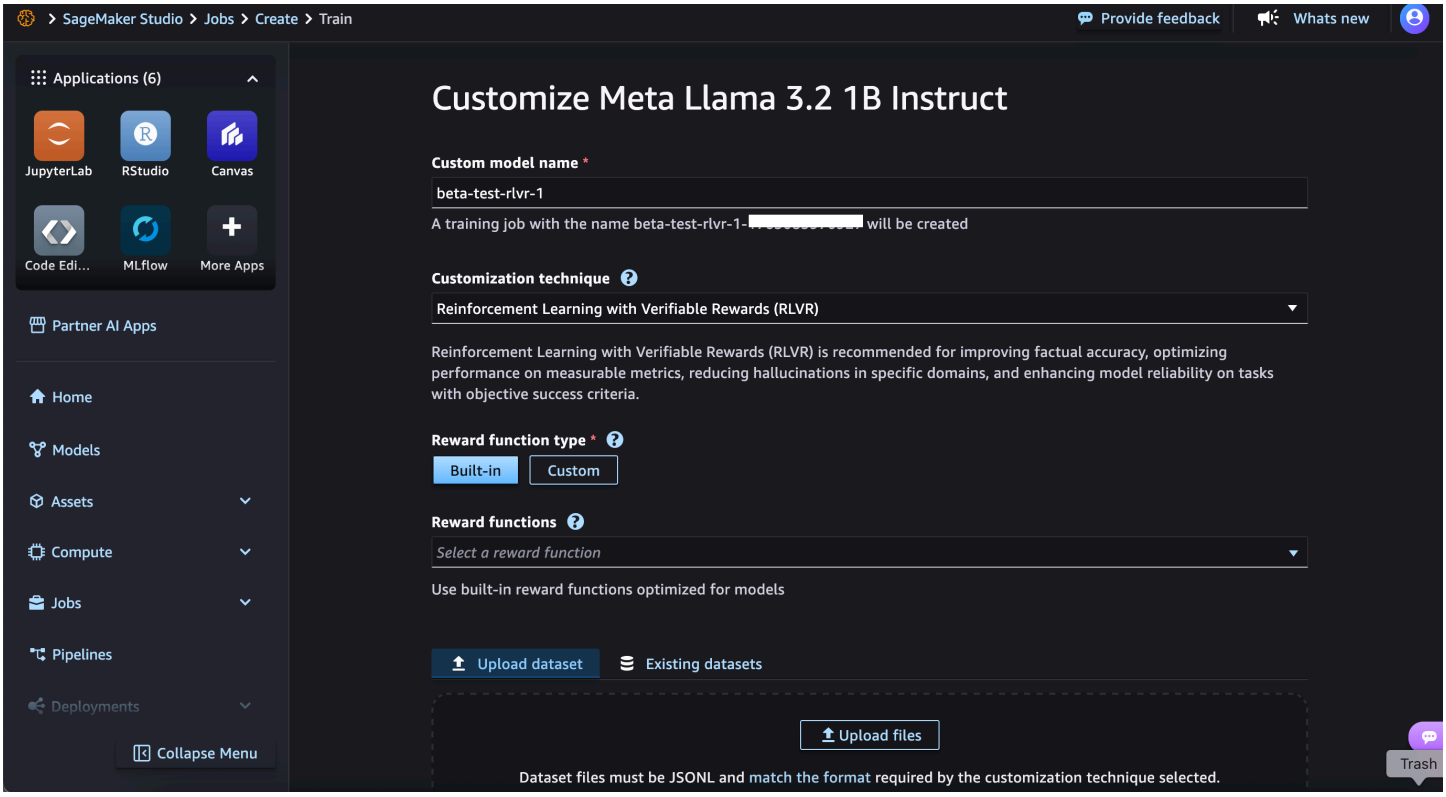
AI model customization job submission



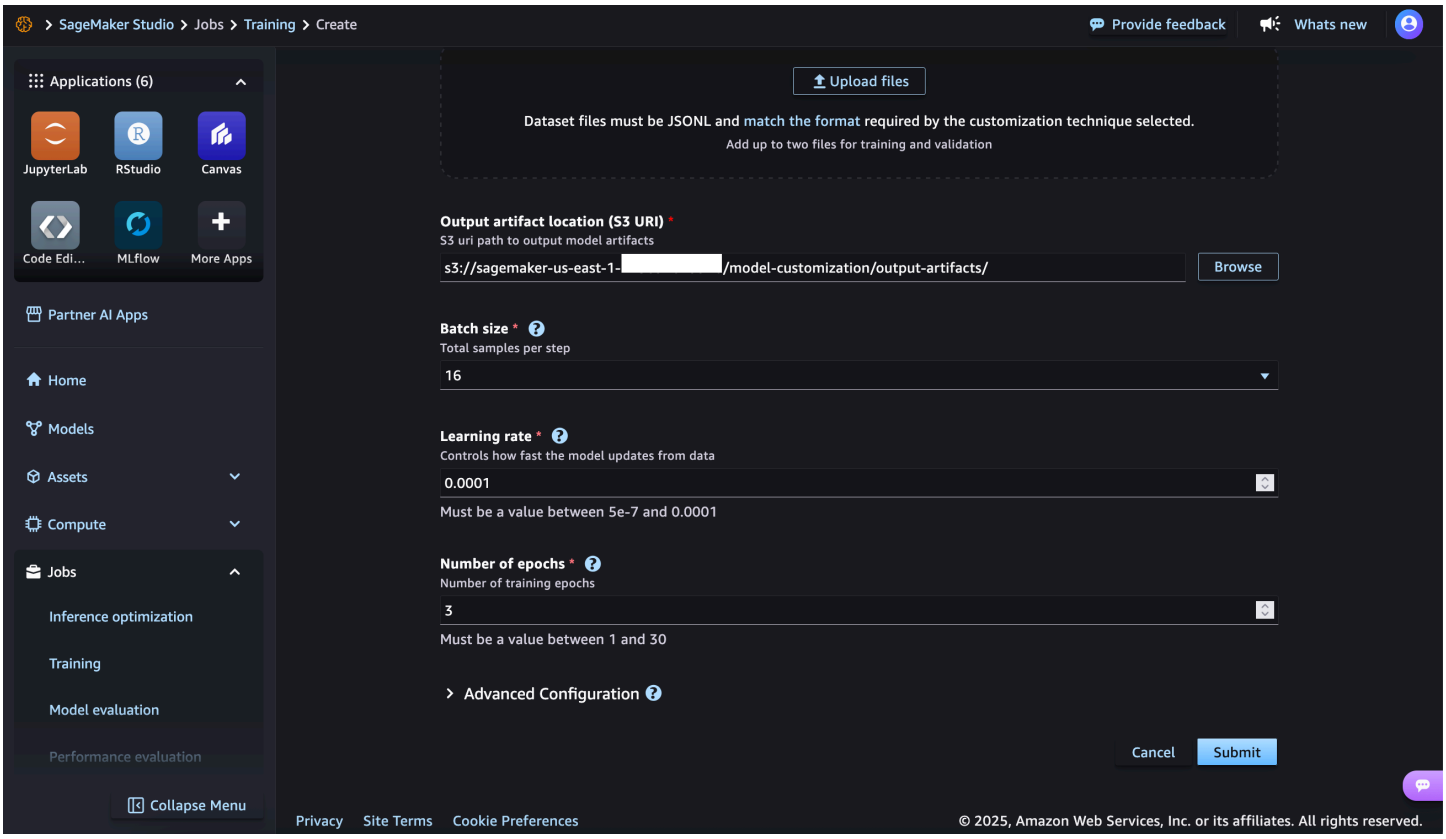
The SageMaker AI model customization capability can be accessed from Amazon SageMaker Studio's Models page in the left hand panel. You can also find the Assets page where you can create and manage your model customization Datasets and Evaluators.



To begin a model customization job submission, select the Models option to access the Jumpstart Base Models tab:



You can directly click Customize model in the model card or you can search for any model from Meta that is the one that your interested to customize.



Upon clicking the model card, you can access the model details page and launch the customization job by clicking Customize model and then selecting Customize with UI to kick-off configuring your RLVR job.

You can then enter your custom model name, select the model customization technique to use and configure your job hyperparameters:

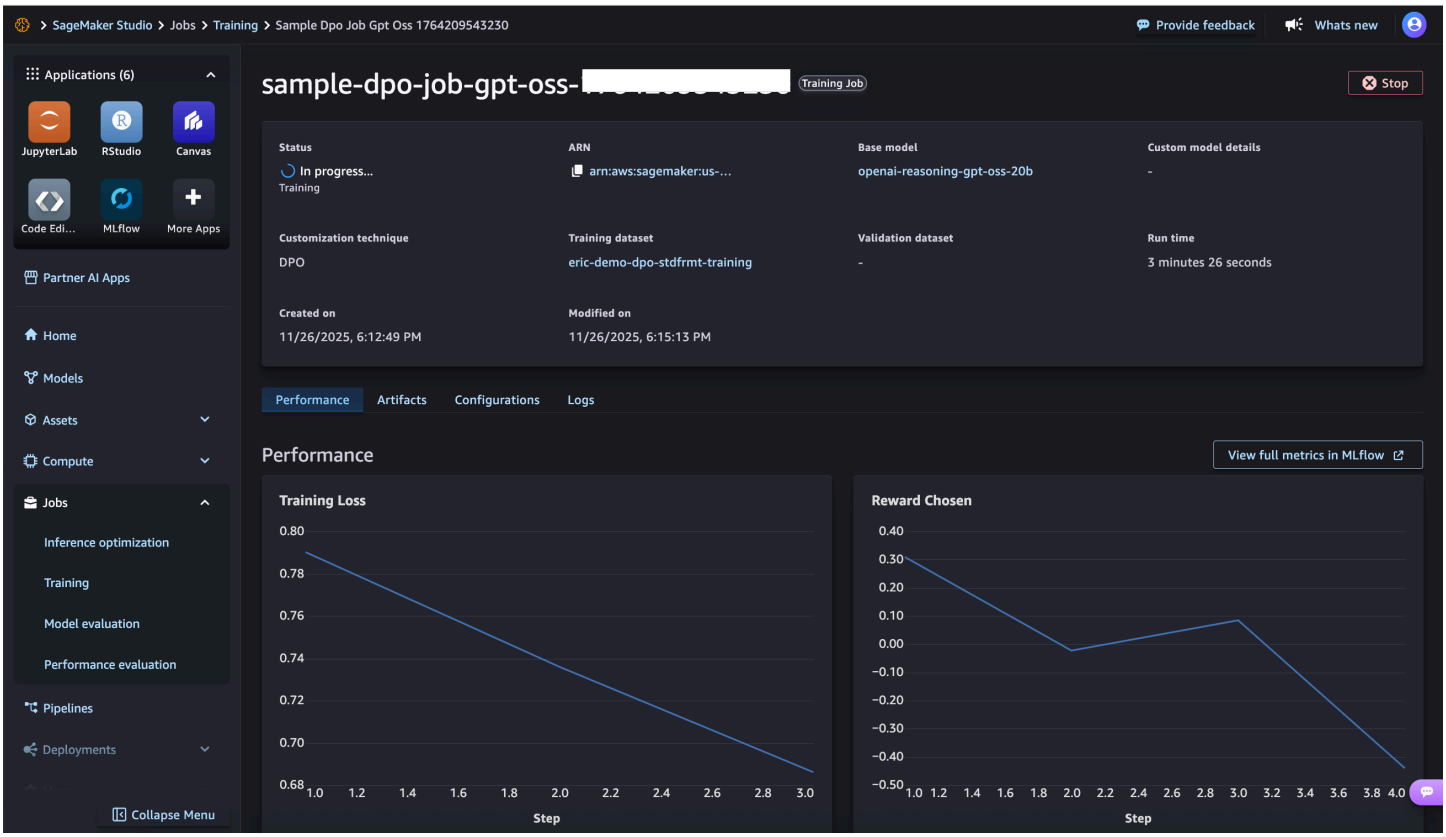
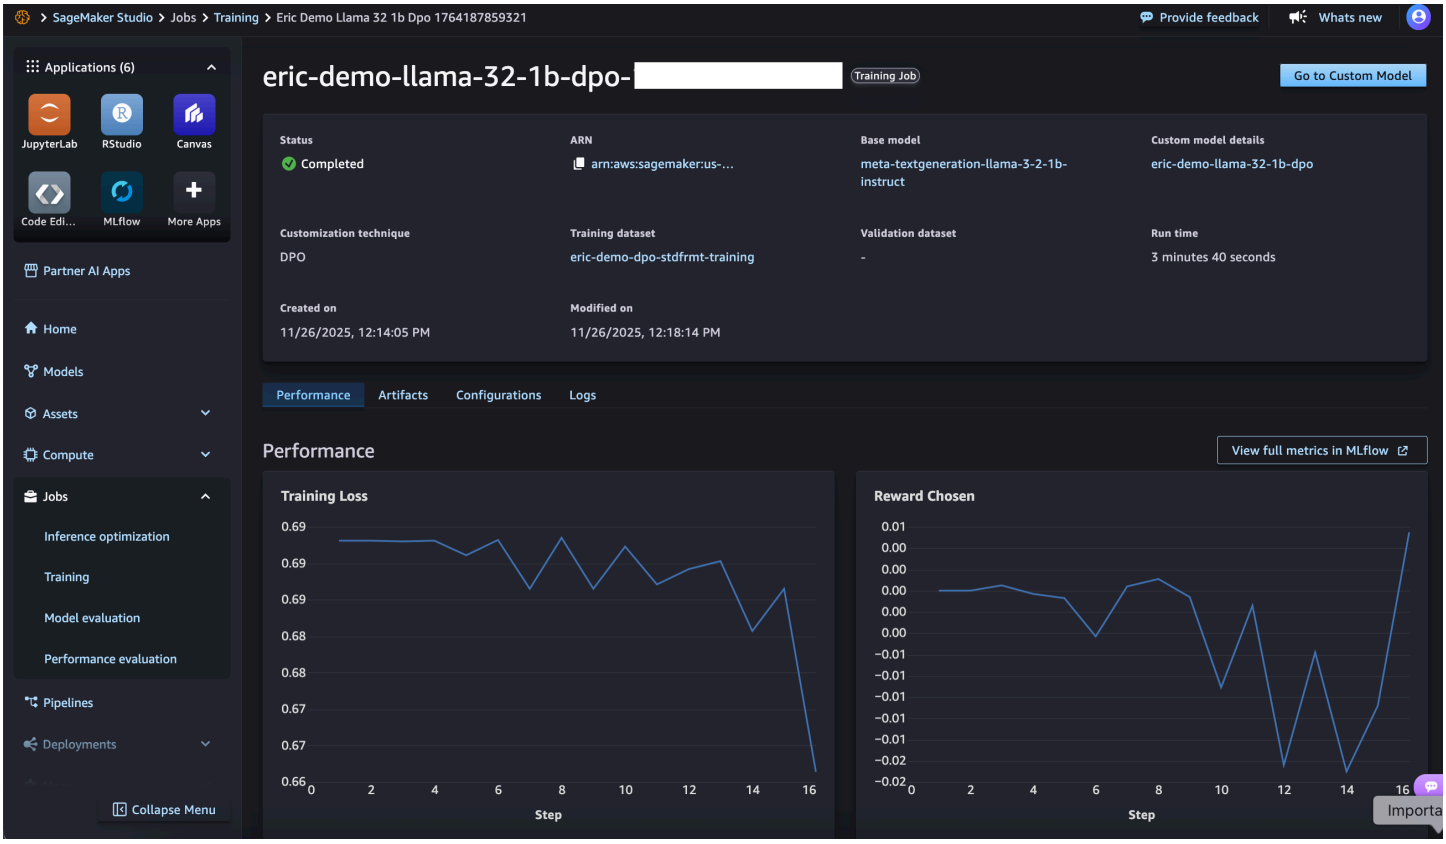
AI model customization job submission using SDK

You can also use the SageMaker AI Python SDK to submit a model customization job:



```
# Submit a DPO model customization job

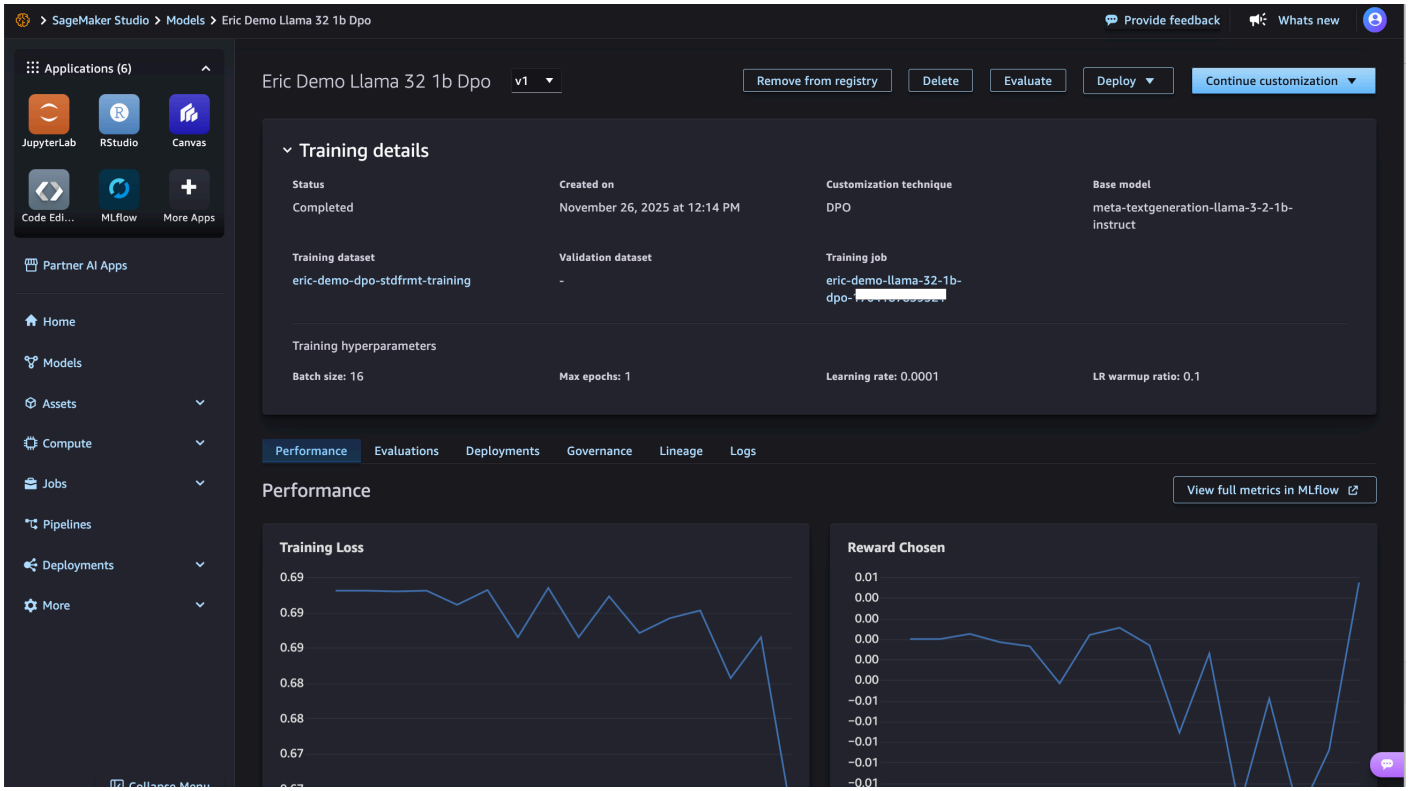
from sagemaker.train import DPOTrainer
from sagemaker.train.common import TrainingType



trainer = DPOTrainer(
    model=BASE_MODEL,
    training_type=TrainingType.LORA,
    model_package_group_name=MODEL_PACKAGE_GROUP_NAME,
    training_dataset=TRAINING_DATASET,
    s3_output_path=S3_OUTPUT_PATH,
    sagemaker_session=sagemaker_session,
    role=ROLE_ARN
)
```

Monitoring your customization job

Immediately after submitting your job, you will be re-directed to your model customization training job page.



Once the job completes you can go to your custom model details page by clicking the Go to **Custom Model** button in the upper right corner.

In the custom model details page you can further work with your custom model by:

1. Checking information about performance, generated artifacts location, training configuration hyper-parameters and training logs.
2. Launch an evaluation job with a different dataset (Continued customization).
3. Deploy the model using SageMaker AI Inference endpoints or Amazon Bedrock Custom Model Import.

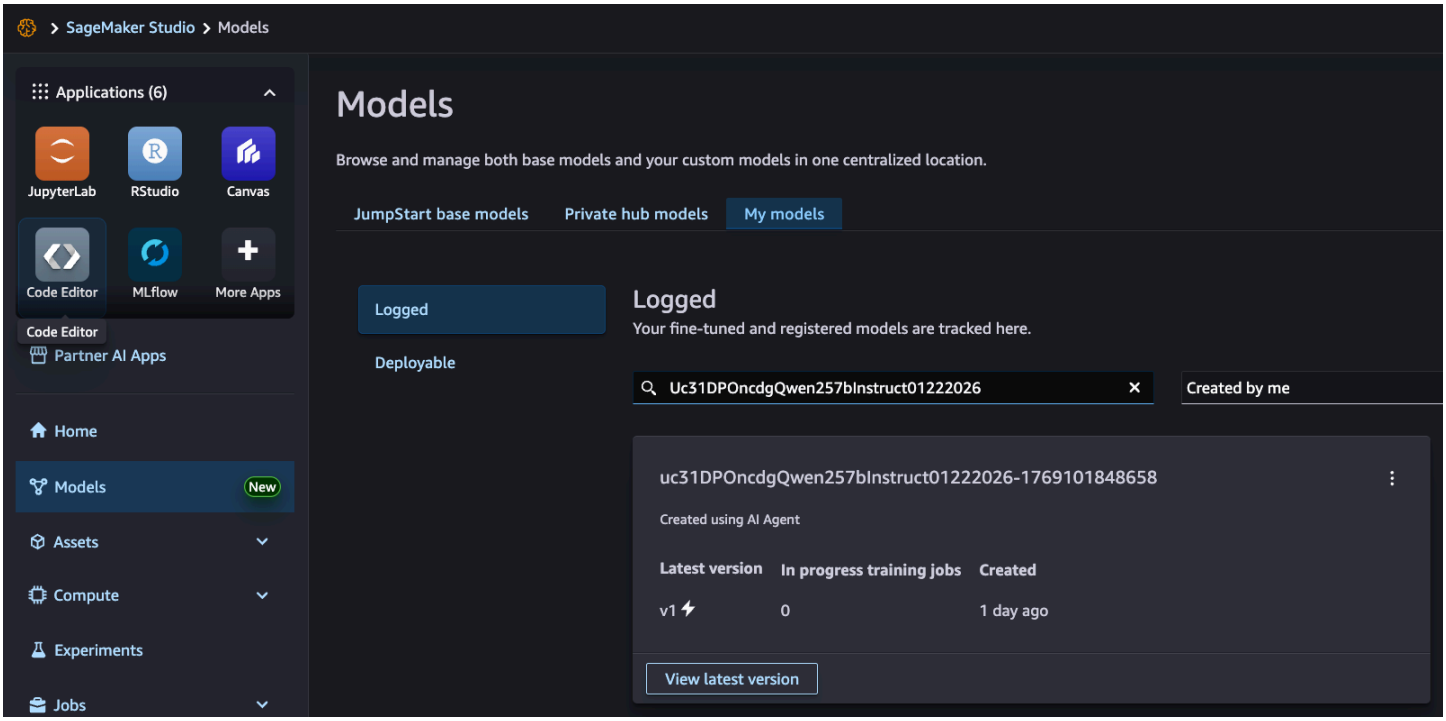
Model evaluation job submission

This section describes open-weight custom model evaluation. It gets you started through a walk through of the evaluation job submission process. Additional resources are provided for more advanced evaluation job submission use cases.

Topics

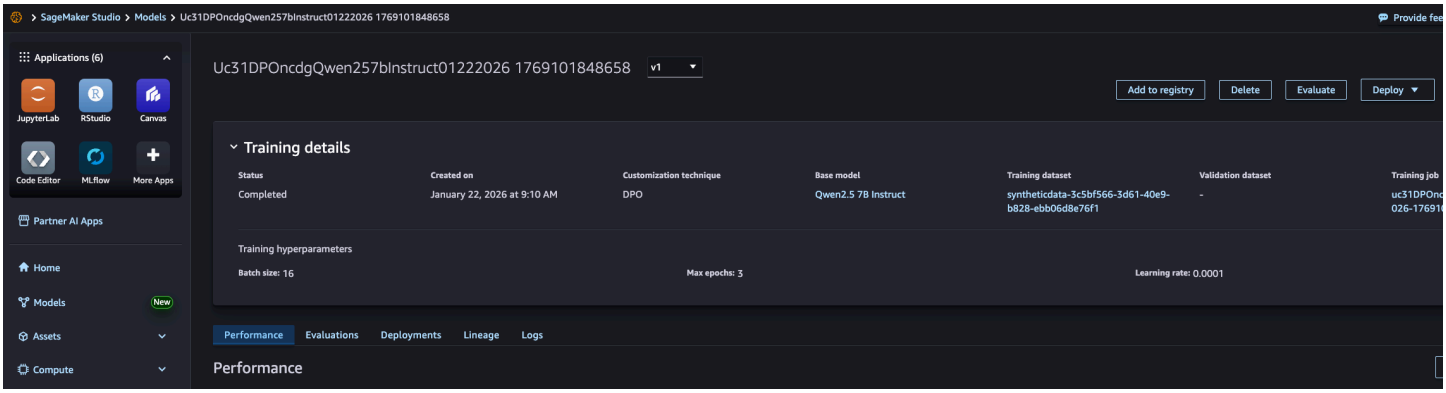
- Getting Started
- Evaluation types and Job Submission
- Evaluation Metrics Formats
- Supported Dataset Formats for Bring-Your-Own-Dataset (BYOD) Tasks
- Evaluate with Preset and Custom Scorers

Getting Started



Submit an Evaluation Job Through SageMaker Studio

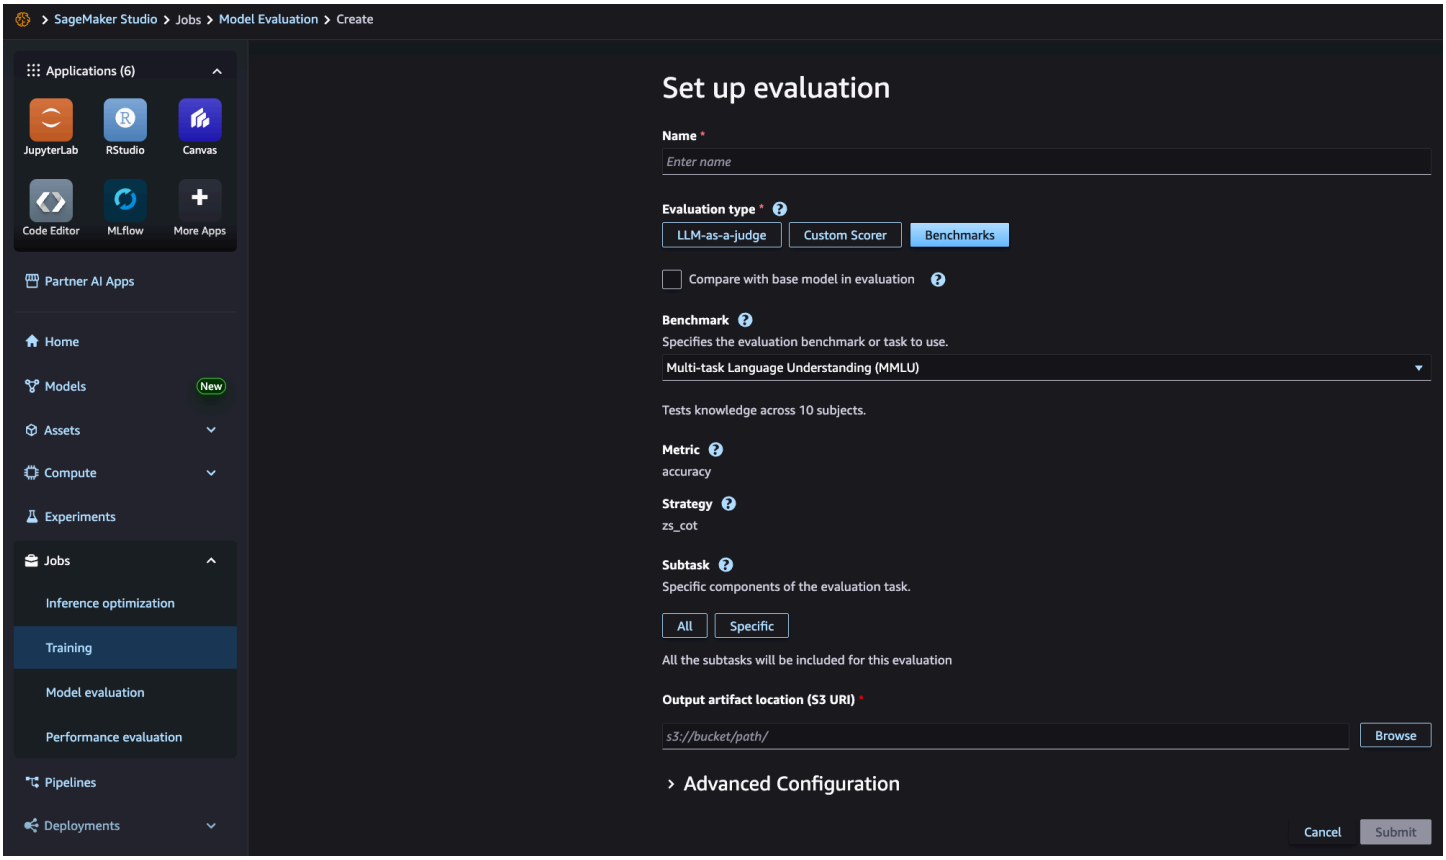
Step 1: Navigate to Evaluation From Your Model Card



After you customize your model, navigate to the evaluation page from your model card.

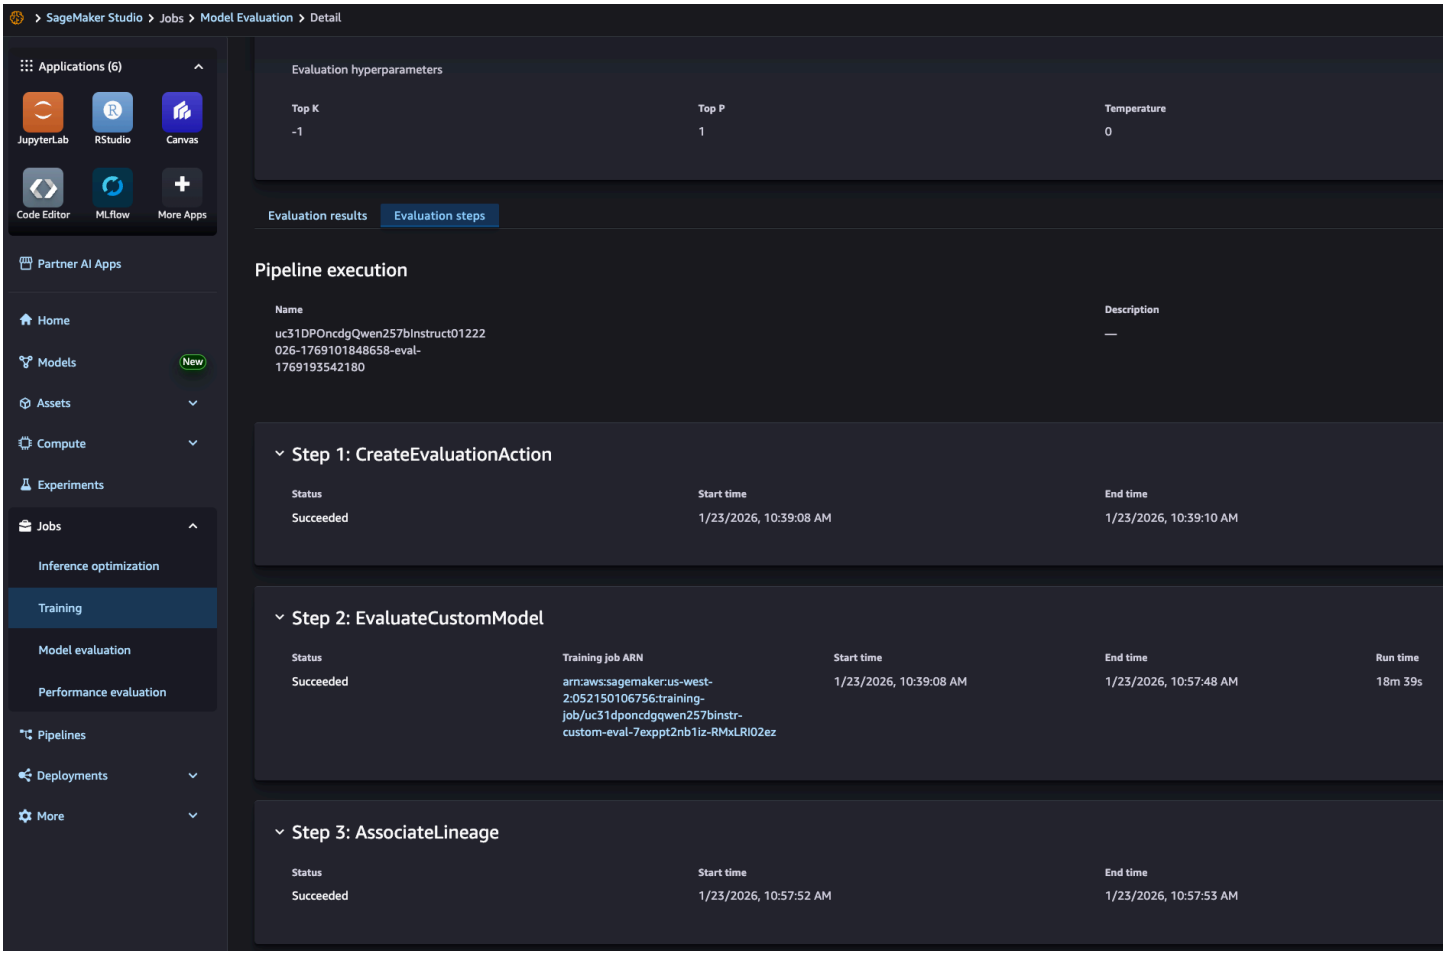
For information on open-weight custom model training: https://docs.aws.amazon.com/sagemaker/latest/dg/model-customize-open-weight-job.html

SageMaker visualizes your customized model on the My Models tab:



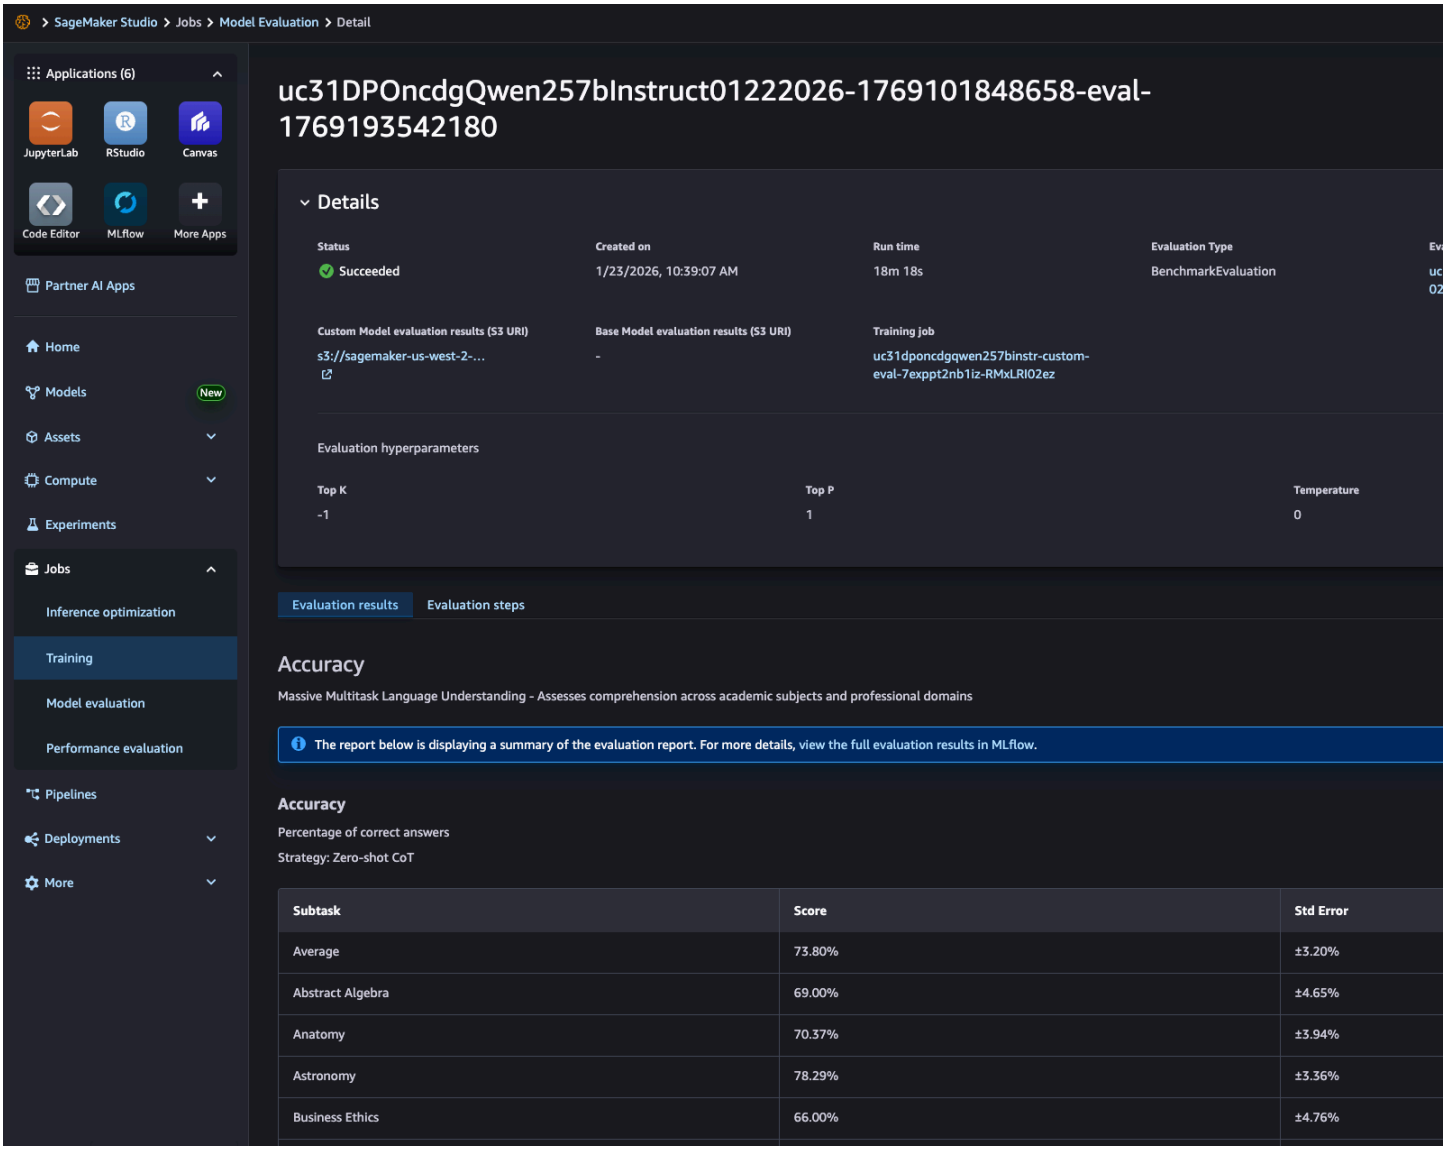
Choose View latest version, then choose Evaluate:

Step 2: Submit Your Evaluation Job



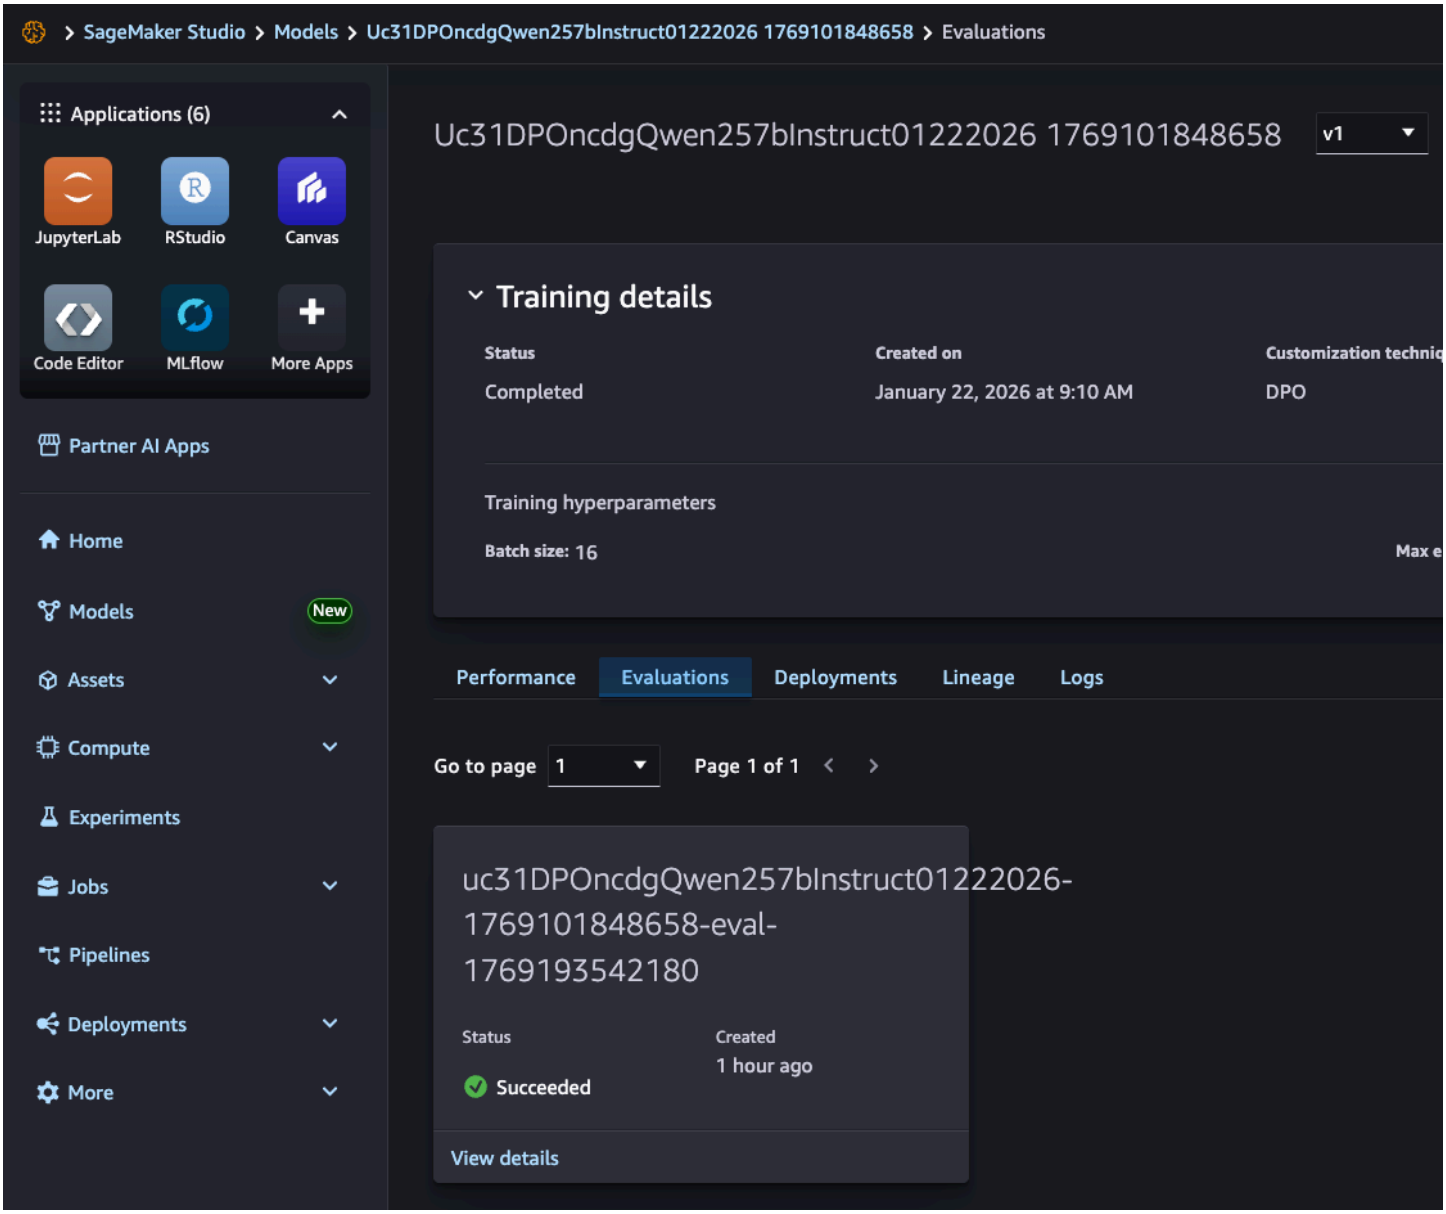
Choose the Submit button and submit your evaluation job. This submits a minimal MMLU benchmark job.

For information on the supported evaluation job types, see the section called “Evaluation types and Job Submission”.



Step 3: Track Your Evaluation Job Progress

Your evaluation job progress is tracked in the Evaluation steps tab:



Step 4: View Your Evaluation Job Results

Your evaluation job results are visualized in the Evaluation results tab:

Step 5: View Your Completed Evaluations

Your completed evaluation job is displayed in Evaluations of your model card:

Submit Your Evaluation Job Through SageMaker Python SDK

Step 1: Create Your BenchMarkEvaluator

Pass your registered trained model, Amazon S3 output location, and MLFlow resource ARN to `BenchMarkEvaluator` and then initialize it.

```
from sagemaker.train.evaluate import BenchMarkEvaluator, Benchmark

evaluator = BenchMarkEvaluator(
    benchmark=Benchmark.MMLU,
```

```
    model="arn:aws:sagemaker:<region>:<account-id>:model-package/<model-package-name>/
<version>",
    s3_output_path="s3://<bucket-name>/<prefix>/eval/",
    mlflow_resource_arn="arn:aws:sagemaker:<region>:<account-id>:mlflow-tracking-
server/<tracking-server-name>",
    evaluate_base_model=False
)
```

Step 2: Submit Your Evaluation Job

Call the `evaluate()` method to submit the evaluation job.

```
execution = evaluator.evaluate()
```

Step 3: Track Your Evaluation Job Progress

Call the `wait()` method of the execution to get a live update of the evaluation job progress.

```
execution.wait(target_status="Succeeded", poll=5, timeout=3600)
```

Step 4: View Your Evaluation Job Results

Call the `show_results()` method to display your evaluation job results.

```
execution.show_results()
```

Evaluation types and Job Submission

Benchmarking with standardized datasets

Use the Benchmark Evaluation type to evaluate the quality of your model across standardized benchmark datasets including popular datasets like MMLU and BBH.

Benchm	Custom Dataset Supported	Modalities	Description	Metrics	Strategy	Subtask available
mmlu	No	Text	Multi-task Langua	accuracy	zs_cot	Yes

Benchm	Custom Dataset Supported	Modalities	Description	Metrics	Strategy	Subtask available
			Understanding – Tests knowle across 57 subject			
mmlu_p	No	Text	MMLU – Professional Subset – Focuses on professional domain such as law, medicin accountg, and enginee ng.	accuracy	zs_cot	No

Benchm	Custom Dataset Supported	Modalities	Description	Metrics	Strategy	Subtask available
bbh	No	Text	Advanc Reasoni Tasks – A collecti n of challen ng problen that test higher- level cognitiv and problen s olving skills.	accuracy	fs_cot	Yes

Benchm	Custom Dataset Supported	Modalities	Description	Metrics	Strategy	Subtask available
gpqa	No	Text	General Physics Question Answering – Assesses comprehension of physics concepts and related problem solving abilities.	accuracy	zs_cot	No

Benchm	Custom Dataset Supported	Modalities	Descrip on	Metrics	Strategy	Subtask available
math	No	Text	Mathem cal Problen Solving – Measur mathen cal reasoni across topics includin algebra calculus and word problen	exact_match	zs_cot	Yes

Benchm	Custom Dataset Supported	Modalities	Description	Metrics	Strategy	Subtask available
strong_ject	No	Text	Quality-Control Task – Tests the model's ability to detect and reject inappropriate, harmful or incorrec content	deflection	zs	Yes

Benchm	Custom Dataset Supported	Modalities	Description	Metrics	Strategy	Subtask available
ifeval	No	Text	Instruction-Following Evaluation – Gauges how accurately a model follows given instructions and complet tasks to specifica tion.	accuracy	zs	No

For more information on BYOD formats, see the section called “Supported Dataset Formats for Bring-Your-Own-Dataset (BYOD) Tasks”.

Available Subtasks

The following lists available subtasks for model evaluation across multiple domains including MMLU (Massive Multitask Language Understanding), BBH (Big Bench Hard), StrongReject, and MATH. These subtasks allow you to assess your model's performance on specific capabilities and knowledge areas.

MMLU Subtasks

```
MMLU_SUBTASKS = [

Submit your benchmark job

SageMaker Studio

SageMaker Python SDK

```
from sagemaker.train.evaluate import get_benchmarks
from sagemaker.train.evaluate import BenchMarkEvaluator

Benchmark = get_benchmarks()

# Create evaluator with MMLU benchmark
evaluator = BenchMarkEvaluator(
benchmark=Benchmark.MMLU,
model="arn:aws:sagemaker:<region>:<account-id>:model-package/<model-package-name>/
<version>",
s3_output_path="s3://<bucket-name>/<prefix>/",
evaluate_base_model=False
)

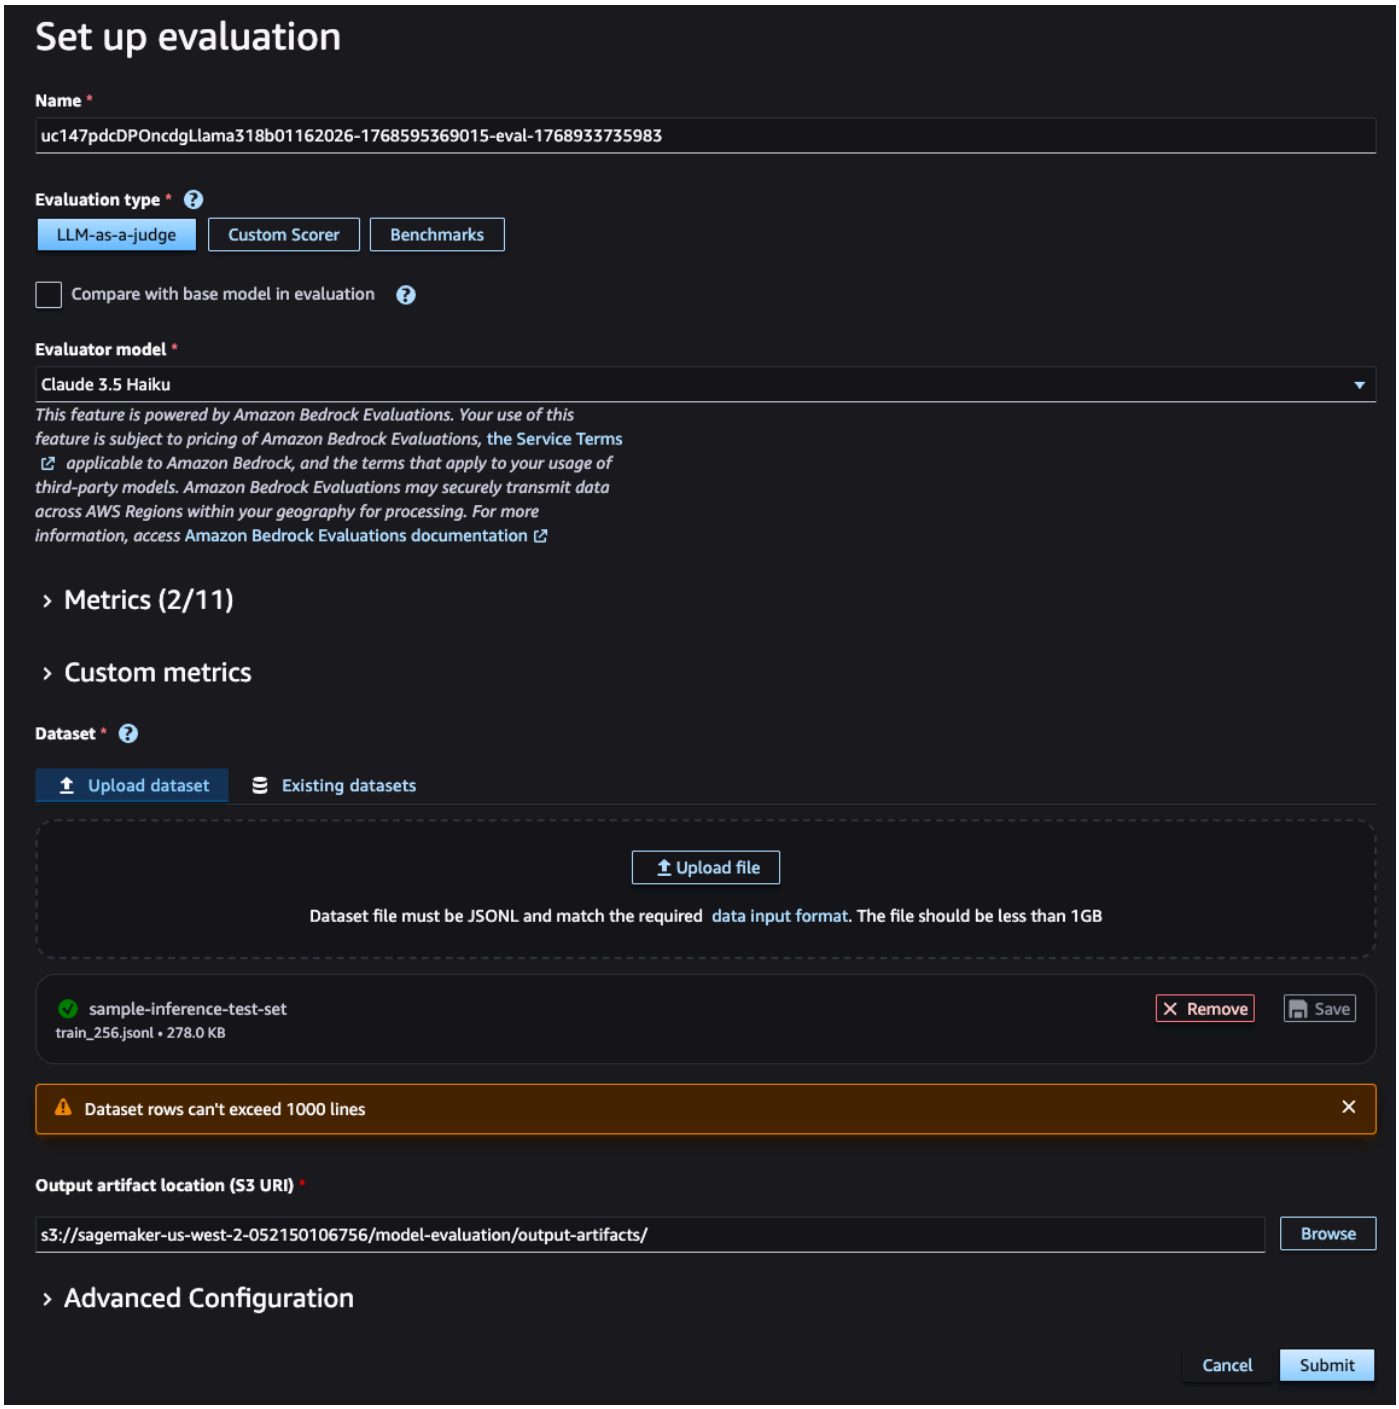
execution = evaluator.evaluate()
```

For more information on evaluation job submission through SageMaker Python SDK, see: https://sagemaker.readthedocs.io/en/stable/model_customization/evaluation.html

Large Language Model as a Judge (LLMAJ) evaluation

Use LLM-as-a-judge (LLMAJ) evaluation to leverage another frontier model to grade your target model responses. You can use Amazon Bedrock models as judges by calling `create_evaluation_job` API to launch the evaluation job.

- **SageMaker LLM as a Judge**: This feature is powered by Amazon Bedrock Evaluations. Your use of this feature is subject to pricing of Amazon Bedrock Evaluations, see the Service Terms applicable to Amazon Bedrock, and the terms that apply to your usage of third-party models. Amazon Bedrock Evaluations may securely transmit data across Amazon Web Services Regions within your geography for processing. For more information, access Amazon Bedrock Evaluations documentation.



For more information on the supported judge models see: https://docs.aws.amazon.com/bedrock/latest/userguide/models-supported.html

You can use 2 different metric formats to define the evaluation:

- **Builtin metrics:** Leverage Amazon Bedrock builtin metrics to analyze the quality of your model's inference responses. For more information, see: https://docs.aws.amazon.com/bedrock/latest/userguide/model-evaluation-type-judge-prompt.html
- **Custom metrics:** Define your own custom metrics in Bedrock Evaluation custom metric format to analyze the quality of your model's inference responses using your own instruction. For more information, see: https://docs.aws.amazon.com/bedrock/latest/userguide/model-evaluation-custom-metrics-prompt-formats.html

Submit a builtin metrics LLMAJ job

SageMaker Studio

SageMaker Python SDK

```
from sagemaker.train.evaluate import LLMAsJudgeEvaluator

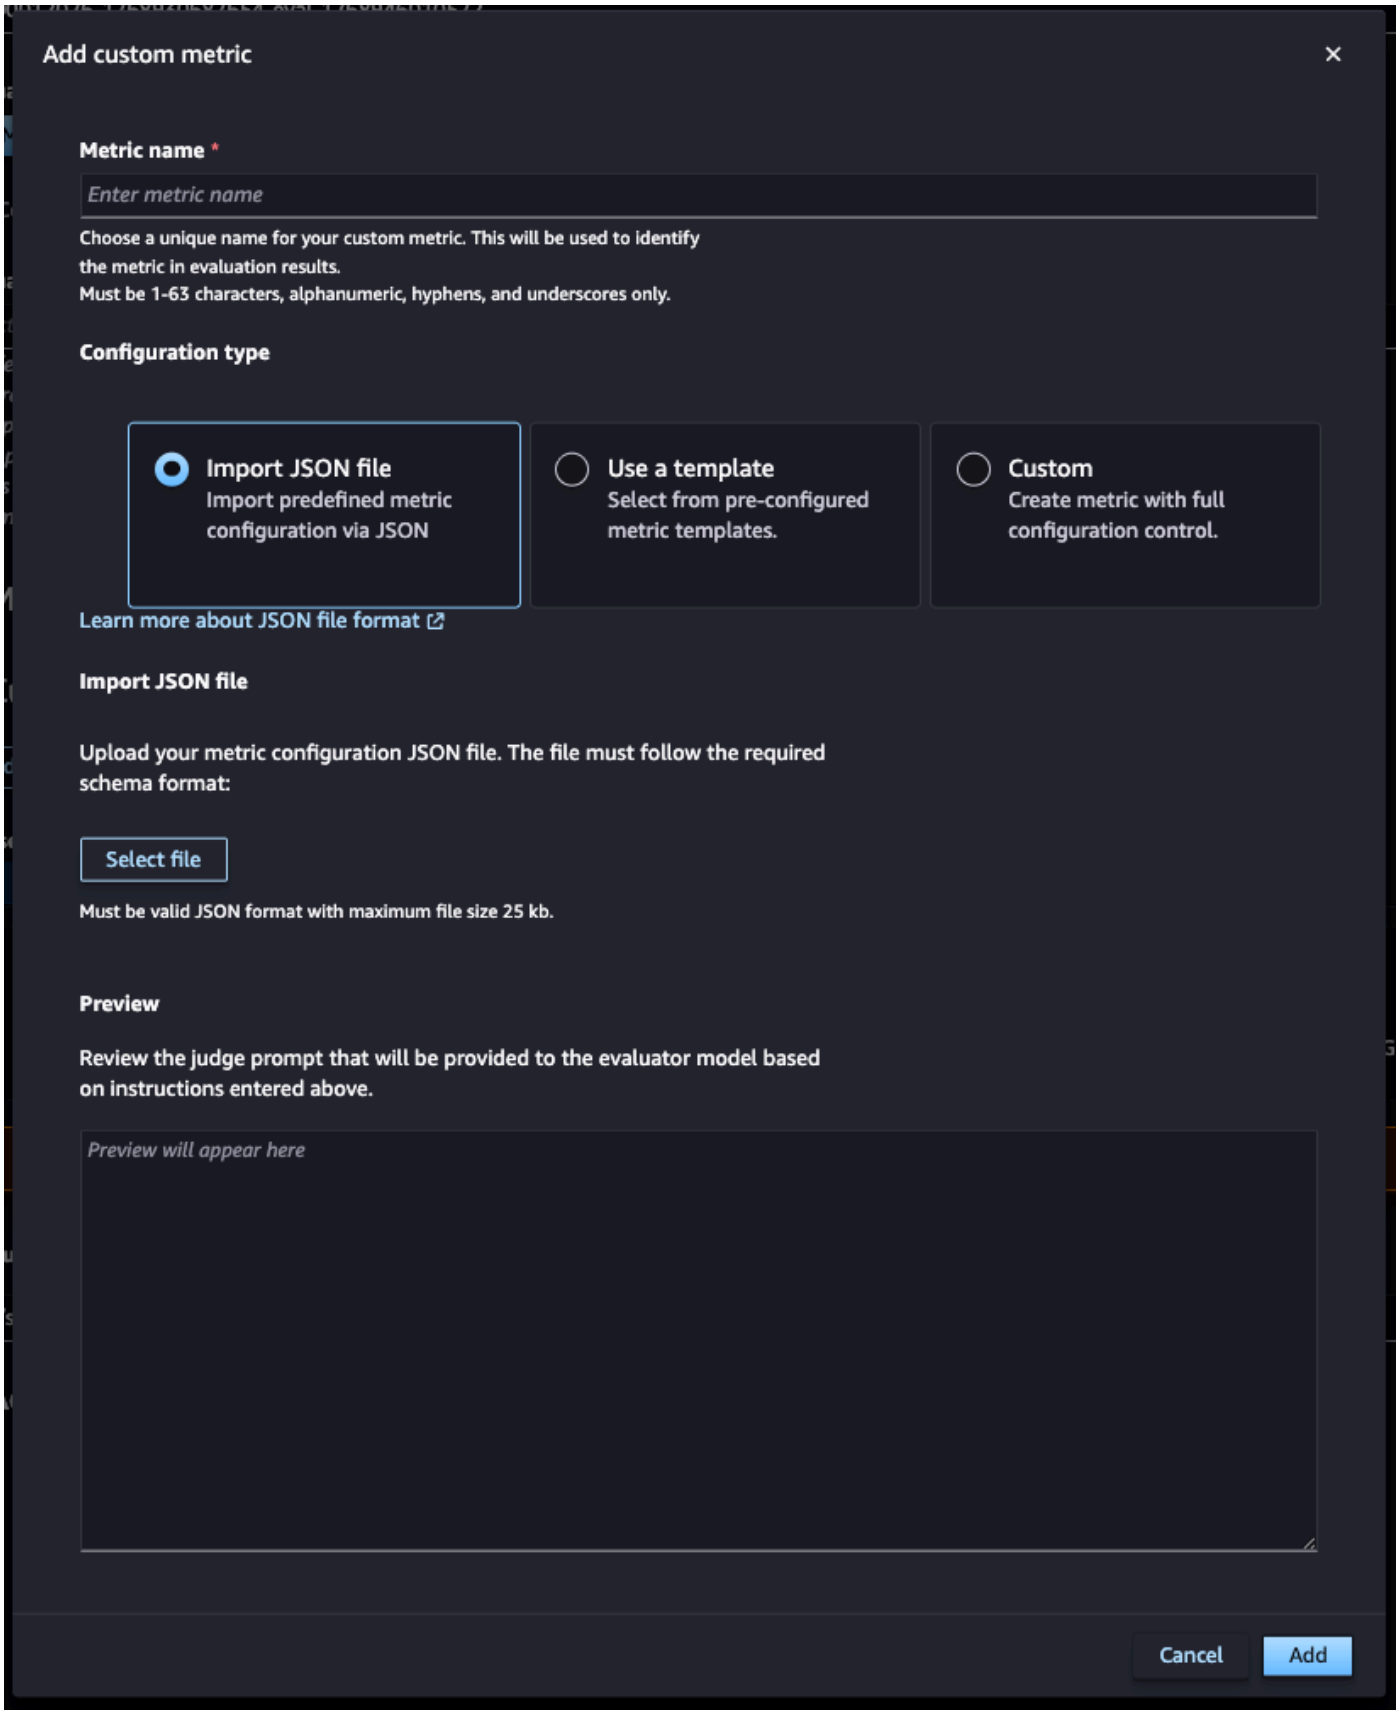
evaluator = LLMAsJudgeEvaluator(
```

```
    model="arn:aws:sagemaker:<region>:<account-id>:model-package/<model-package-
name>/<version>",
    evaluator_model="<bedrock-judge-model-id>",
    dataset="s3://<bucket-name>/<prefix>/<dataset-file>.jsonl",
    builtin_metrics=["<builtin-metric-1>", "<builtin-metric-2>"],
    s3_output_path="s3://<bucket-name>/<prefix>/",
    evaluate_base_model=False
)

execution = evaluator.evaluate()
```

For more information on evaluation job submission through SageMaker Python SDK, see: https://sagemaker.readthedocs.io/en/stable/model_customization/evaluation.html

Submit a custom metrics LLMAJ job



Define your custom metric(s):

```
{
    "customMetricDefinition": {
        "name": "PositiveSentiment",
        "instructions": (
            "You are an expert evaluator. Your task is to assess if the sentiment of
 the response is positive. "
            "Rate the response based on whether it conveys positive sentiment,
 helpfulness, and constructive tone.\n\n"
            "Consider the following:\n"
            "- Does the response have a positive, encouraging tone?\n"
            "- Is the response helpful and constructive?\n"
            "- Does it avoid negative language or criticism?\n\n"
            "Rate on this scale:\n"
            "- Good: Response has positive sentiment\n"
            "- Poor: Response lacks positive sentiment\n\n"
            "Here is the actual task:\n"
            "Prompt: {{prompt}}\n"
            "Response: {{prediction}}"
        ),
        "ratingScale": [
            {"definition": "Good", "value": {"floatValue": 1}},
            {"definition": "Poor", "value": {"floatValue": 0}}
        ]
    }
```

```
}
```

For more information, see: https://docs.aws.amazon.com/bedrock/latest/userguide/model-evaluation-custom-metrics-prompt-formats.html

SageMaker Studio

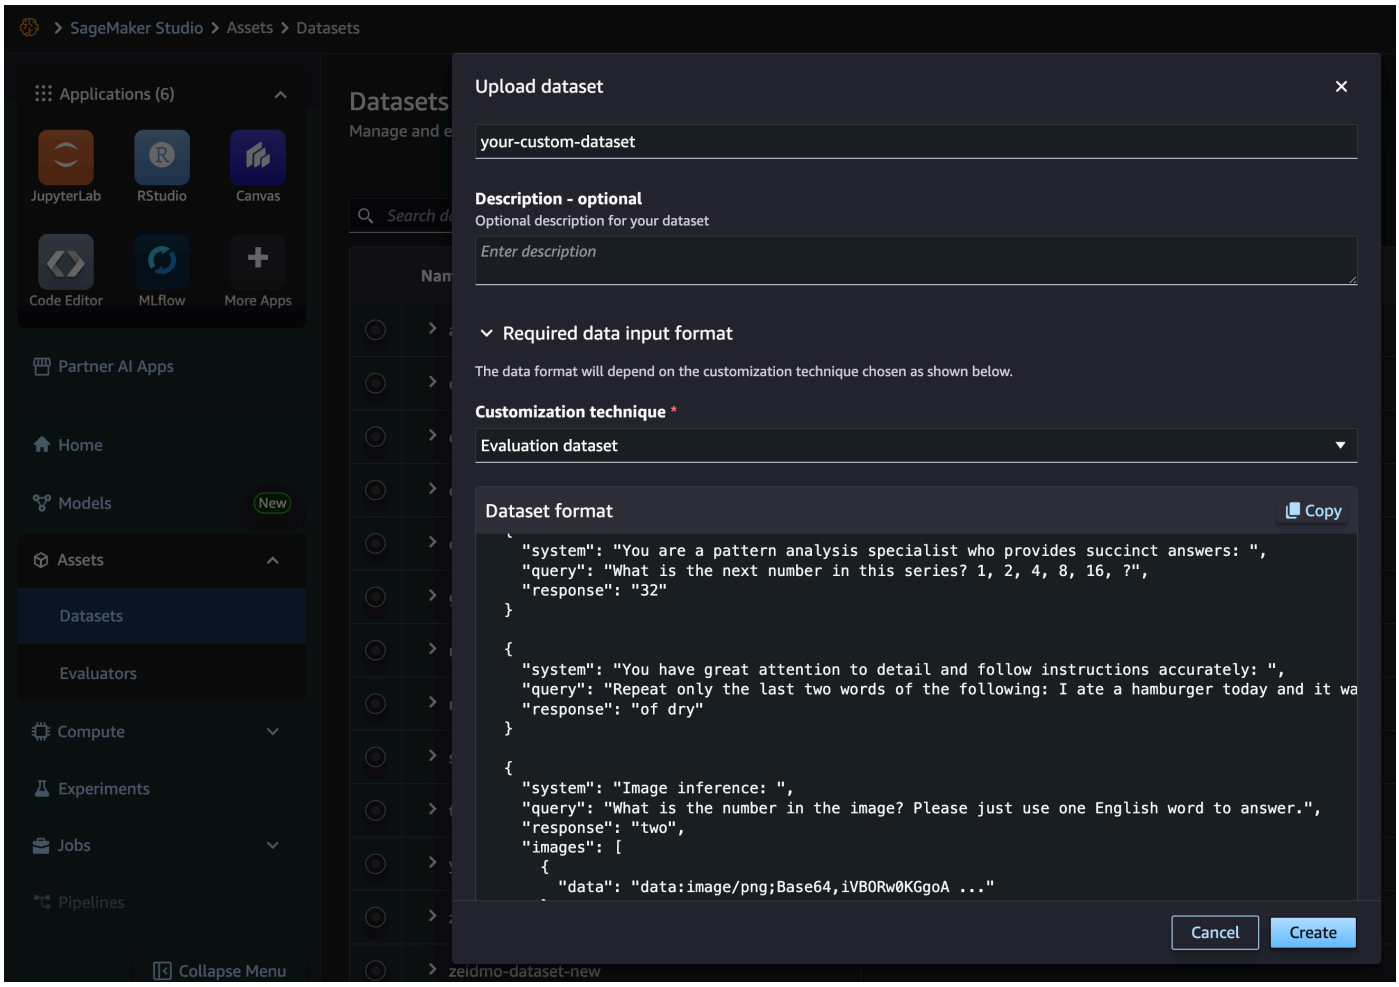
SageMaker Python SDK

```
evaluator = LLMAsJudgeEvaluator(
    model="arn:aws:sagemaker:<region>:<account-id>:model-package/<model-package-
name>/<version>",
    evaluator_model="<bedrock-judge-model-id>",
    dataset="s3://<bucket-name>/<prefix>/<dataset-file>.jsonl",
    custom_metrics=custom_metric_dict = {
        "customMetricDefinition": {
            "name": "PositiveSentiment",
            "instructions": (
                "You are an expert evaluator. Your task is to assess if the
 sentiment of the response is positive. "
                "Rate the response based on whether it conveys positive sentiment,
 helpfulness, and constructive tone.\n\n"
                "Consider the following:\n"
                "- Does the response have a positive, encouraging tone?\n"
                "- Is the response helpful and constructive?\n"
                "- Does it avoid negative language or criticism?\n\n"
                "Rate on this scale:\n"
                "- Good: Response has positive sentiment\n"
                "- Poor: Response lacks positive sentiment\n\n"
                "Here is the actual task:\n"
                "Prompt: {{prompt}}\n"
                "Response: {{prediction}}"
            ),
            "ratingScale": [
                {"definition": "Good", "value": {"floatValue": 1}},
                {"definition": "Poor", "value": {"floatValue": 0}}
            ]
        }
    },
    s3_output_path="s3://<bucket-name>/<prefix>/",
    evaluate_base_model=False
)
```

Custom Scorers

Define your own custom scorer function to launch an evaluation job. The system provides two built-in scorers: Prime math and Prime code. You can also bring your own scorer function. You can copy your scorer function code directly or bring your own Lambda function definition using the

associated ARN. By default, both scorer types produce evaluation results which include standard metrics such as F1 score, ROUGE, and BLEU.



For more information on built-in and custom scorers and their respective requirements/contracts, see the section called “Evaluate with Preset and Custom Scorers”.

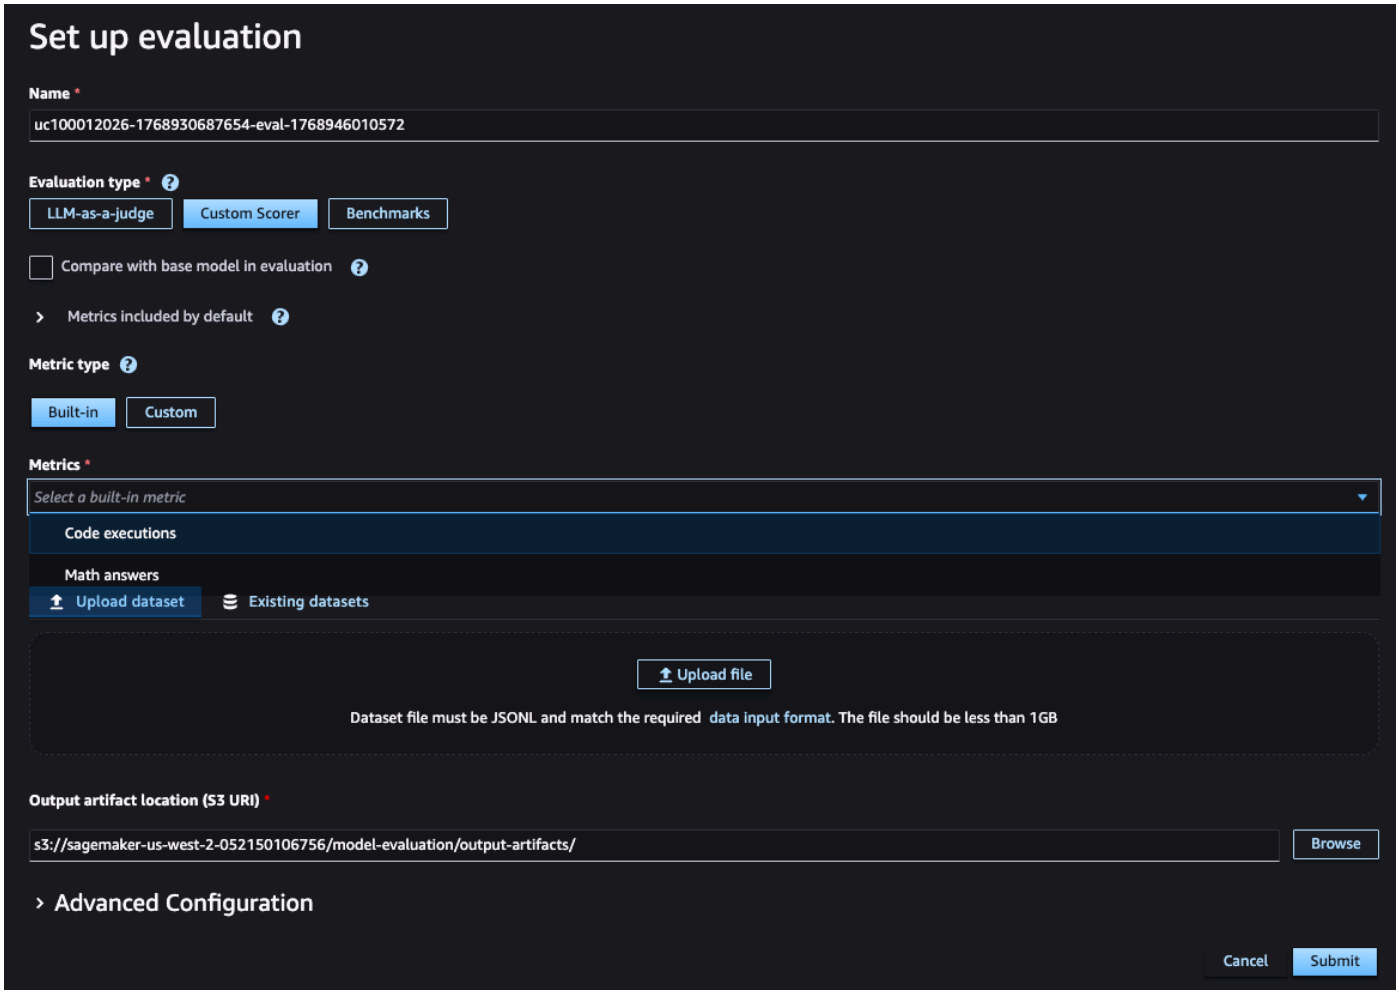
Register your dataset

Bring your own dataset for custom scorer by registering it as a SageMaker Hub Content Dataset.

SageMaker Studio

In Studio, upload your dataset using the dedicated Datasets page..

SageMaker Python SDK



In the SageMaker Python SDK, upload your dataset using the dedicated Datasets page..

```
from sagemaker.ai_registry.dataset import DataSet
```

```
dataset = DataSet.create(
    name="your-bring-your-own-dataset",
    source="s3://<bucket-name>/<prefix>/<dataset-file>.jsonl"
)
dataset.refresh()
```

Submit a built-in scorer job

SageMaker Studio

SageMaker Python SDK

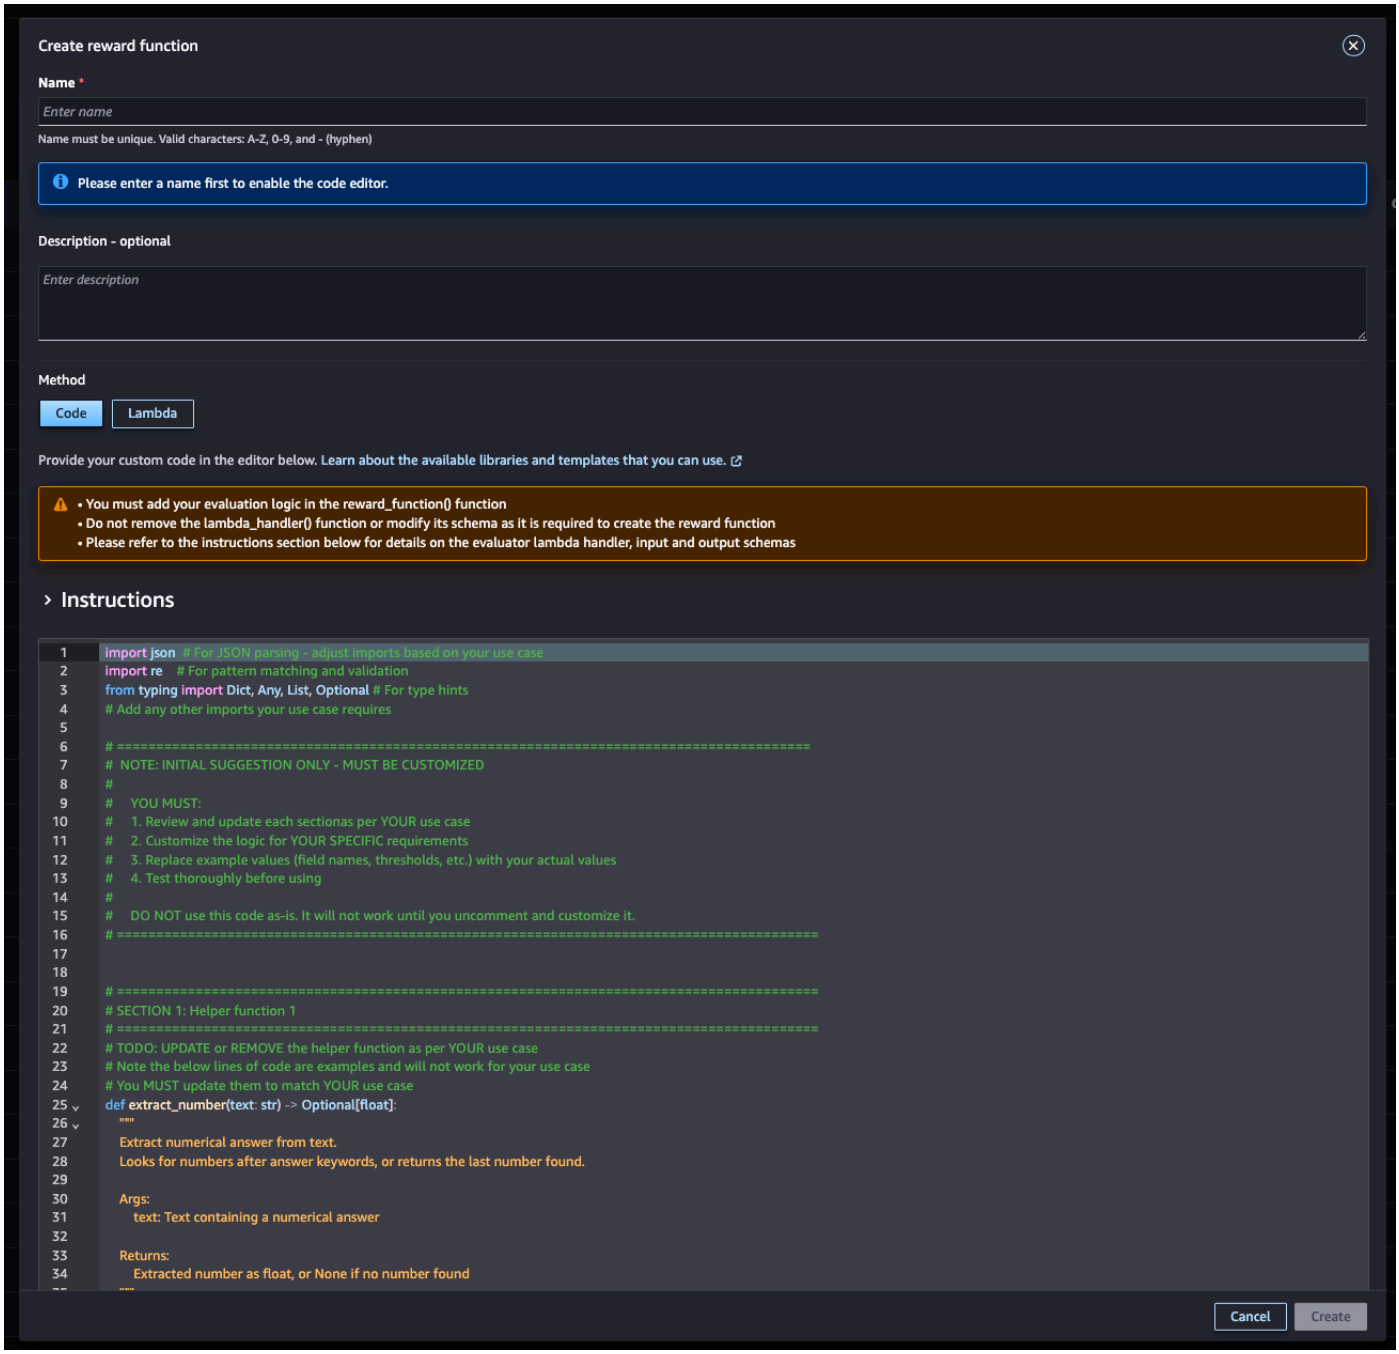
```
from sagemaker.train.evaluate import CustomScorerEvaluator
from sagemaker.train.evaluate import get_builtin_metrics

BuiltInMetric = get_builtin_metrics()

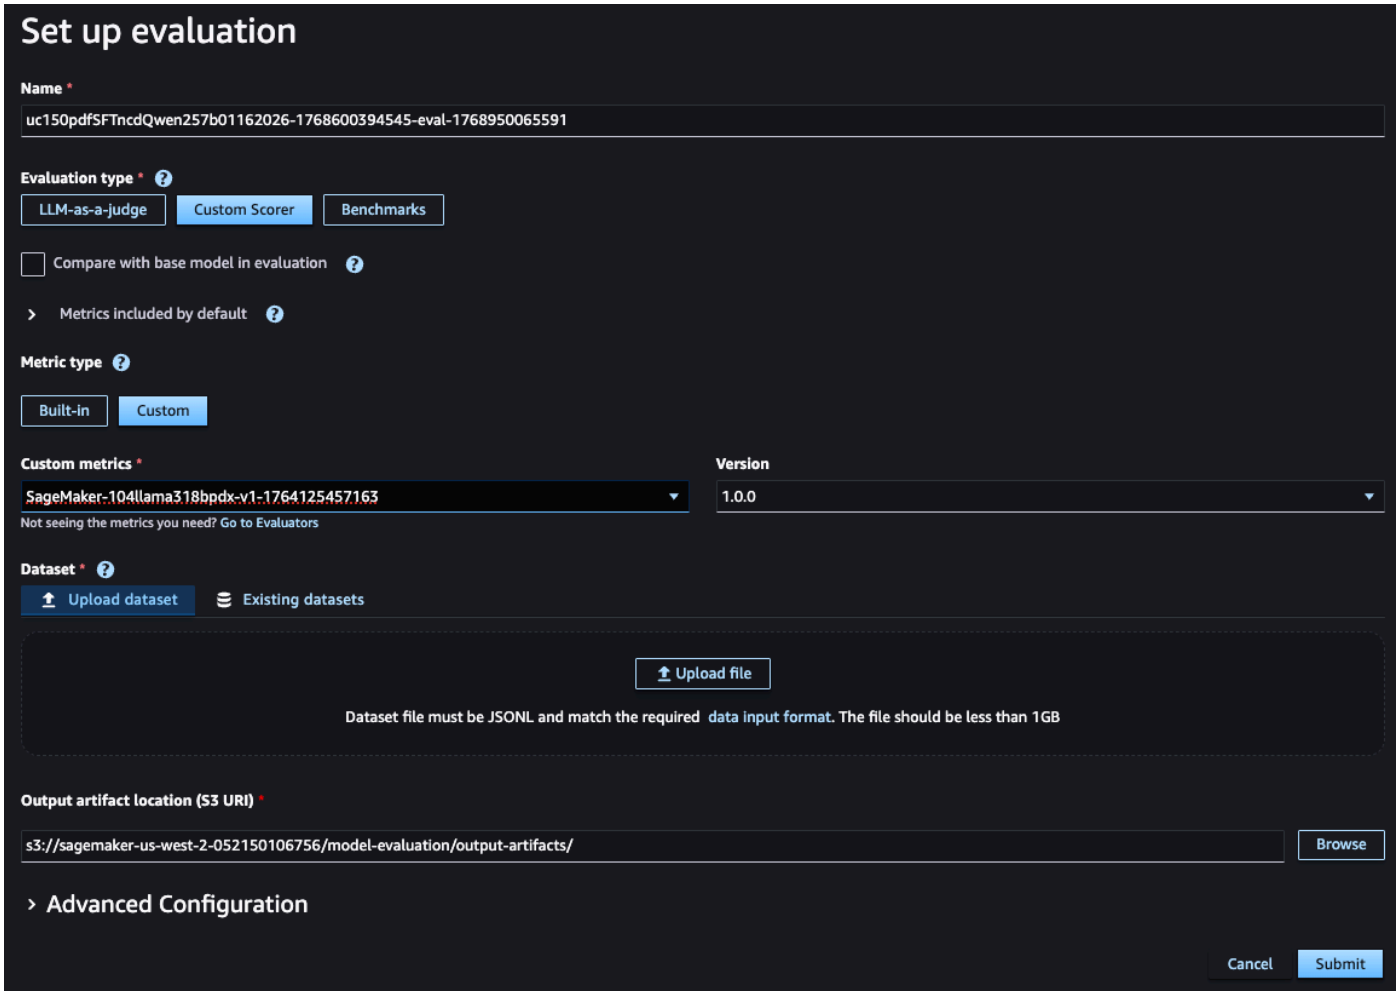
evaluator_builtin = CustomScorerEvaluator(
```

```
    evaluator=BuiltInMetric.PRIME_MATH,
    dataset="arn:aws:sagemaker:<region>:<account-id>:hub-content/<hub-content-id>/
DataSet/your-bring-your-own-dataset/<version>",
    model="arn:aws:sagemaker:<region>:<account-id>:model-package/<model-package-
name>/<version>",
    s3_output_path="s3://<bucket-name>/<prefix>/",
    evaluate_base_model=False
)

execution = evaluator.evaluate()
```



Select from `BuiltInMetric.PRIME_MATH` or `BuiltInMetric.PRIME_CODE` for Built-In Scoring.



Submit a custom scorer job

Define a custom reward function. For more information, see the section called “Custom Scorers (Bring Your Own Metrics)”.

Register the custom reward function

SageMaker Studio

SageMaker Python SDK

```
from sagemaker.ai_registry.evaluator import Evaluator
from sagemaker.ai_registry.air_constants import REWARD_FUNCTION

evaluator = Evaluator.create(
    name = "your-reward-function-name",
    source="/path_to_local/custom_lambda_function.py",
    type = REWARD_FUNCTION
)
```

```
evaluator = CustomScorerEvaluator(
    evaluator=evaluator,
    dataset="s3://<bucket-name>/<prefix>/<dataset-file>.jsonl",
    model="arn:aws:sagemaker:<region>:<account-id>:model-package/<model-package-
name>/<version>",
    s3_output_path="s3://<bucket-name>/<prefix>/",
```

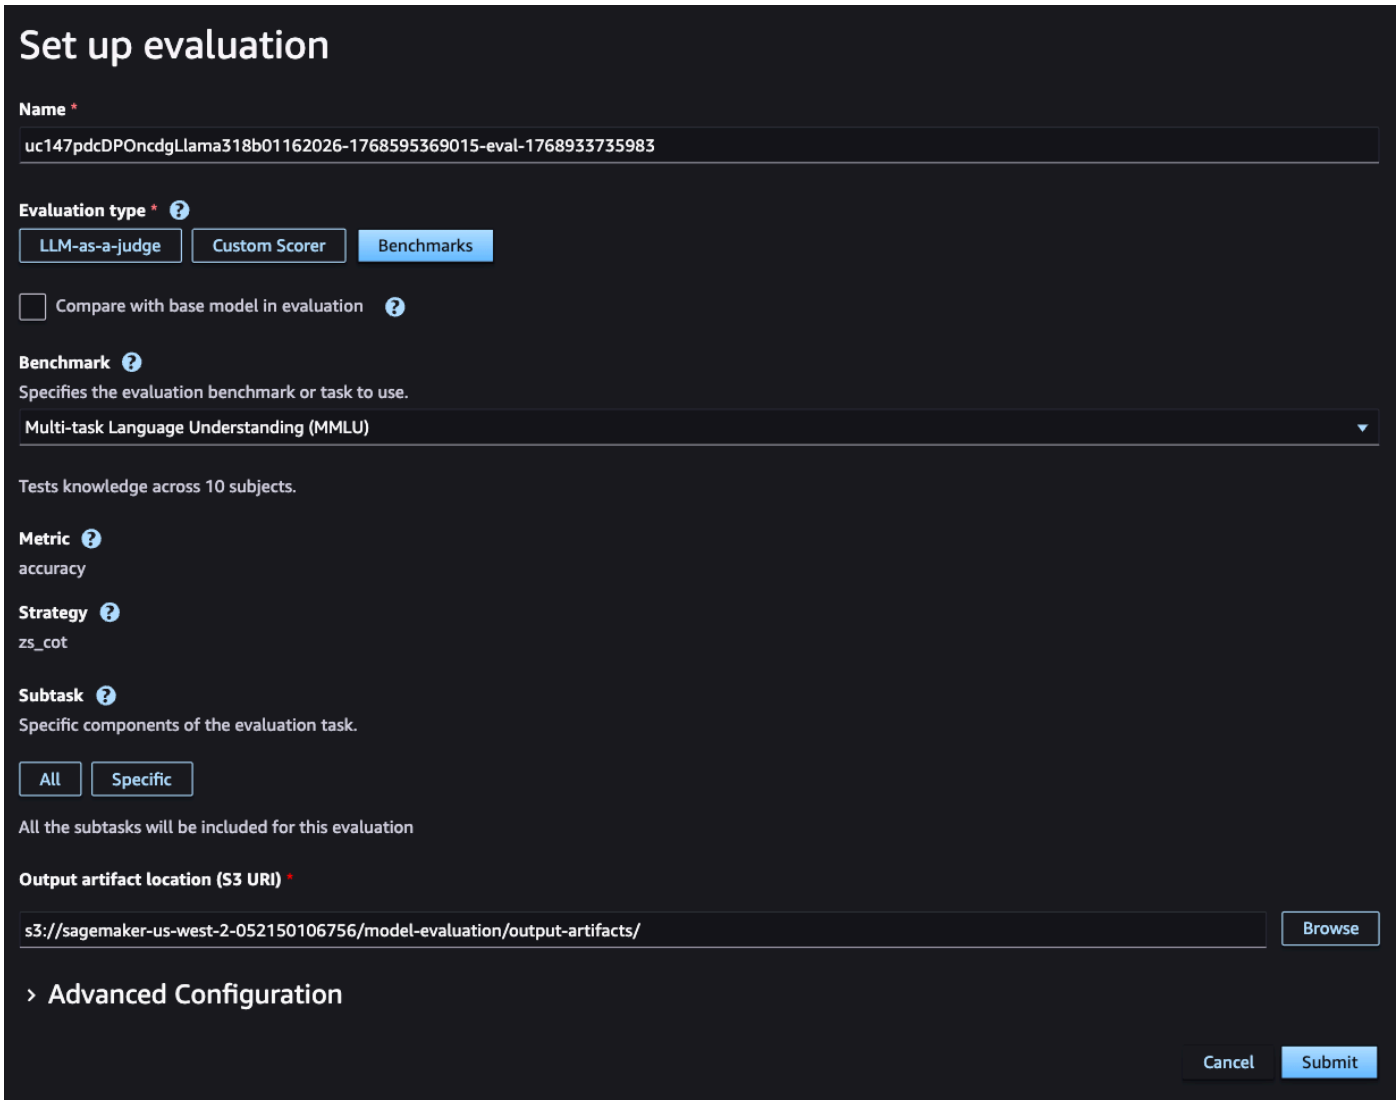
```
    evaluate_base_model=False
)

execution = evaluator.evaluate()
```

Evaluation Metrics Formats

Evaluating the quality of your model across these metric formats:

- Model Evaluation Summary
- MLFlow
- TensorBoard



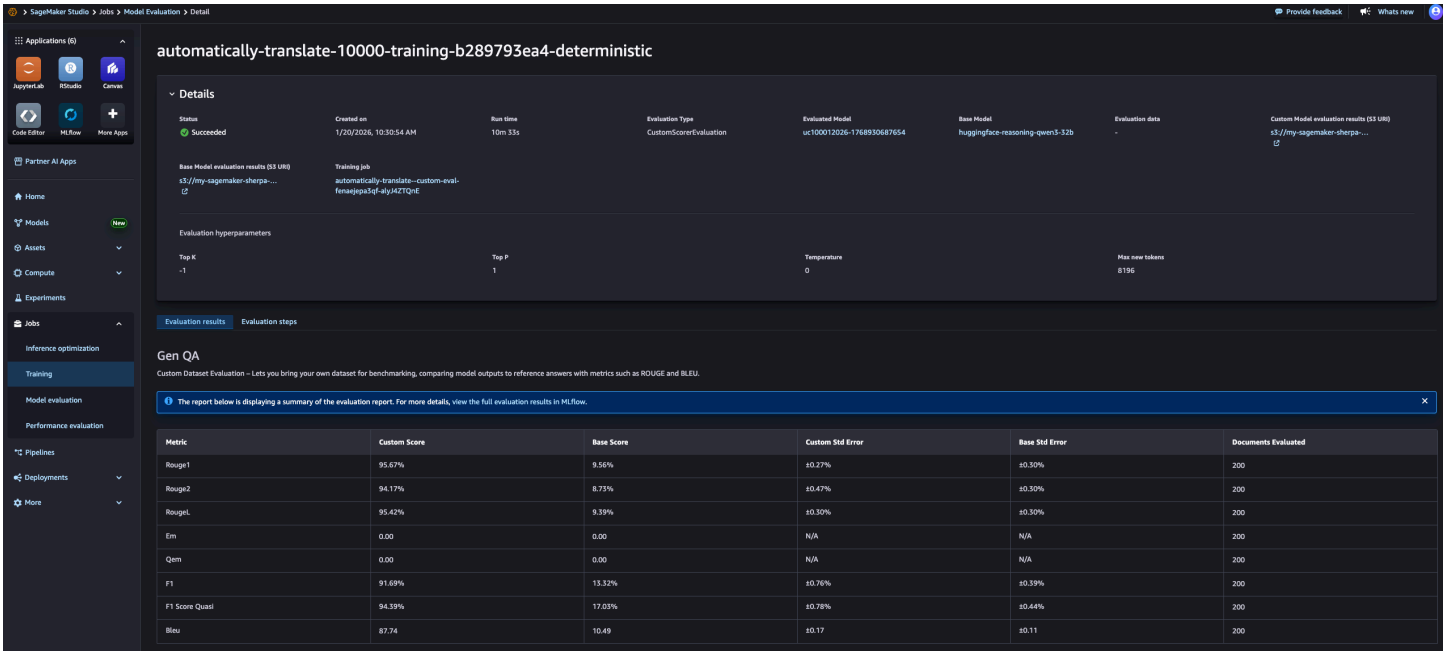
Model Evaluation Summary

When you submit your evaluation job you specify an Amazon S3 output location. SageMaker automatically uploads the evaluation summary .json file to the location. The benchmark summary S3 path is the following:

```
s3://<your-provide-s3-location>/<training-job-name>/output/output/<evaluation-job-name>/eval_results/
```

Pass the Amazon S3 location

SageMaker Studio



SageMaker Python SDK

```
evaluator = BenchMarkEvaluator(
    benchmark=Benchmark.MMLU,
    model="arn:aws:sagemaker:<region>:<account-id>:model-package/<model-package-
name>/<version>",
    s3_output_path="s3://<bucket-name>/<prefix>/eval/",
    evaluate_base_model=False
)

execution = evaluator.evaluate()
```

Read it directly as a `.json` from the Amazon S3 location or visualized automatically in the UI:

```
{
  "results": {
    "custom|gen_qa_gen_qa|0": {
      "rouge1": 0.9152812653966208,
      "rouge1_stderr": 0.003536439199232507,
      "rouge2": 0.774569918517409,
      "rouge2_stderr": 0.006368825746765958,
      "rougeL": 0.9111255645823356,
      "rougeL_stderr": 0.003603841524881021,
      "em": 0.6562150055991042,
      "em_stderr": 0.007948251702846893,
      "qem": 0.7522396416573348,
      "qem_stderr": 0.007224355240883467,
      "f1": 0.8428757602152095,
      "f1_stderr": 0.005186300690881584,
      "f1_score_quasi": 0.9156170336744968,
      "f1_score_quasi_stderr": 0.003667700152375464,
      "bleu": 100.00000000000004,
      "bleu_stderr": 1.464411857851008
    },
    "all": {
      "rouge1": 0.9152812653966208,
      "rouge1_stderr": 0.003536439199232507,
      "rouge2": 0.774569918517409,
      "rouge2_stderr": 0.006368825746765958,
      "rougeL": 0.9111255645823356,
      "rougeL_stderr": 0.003603841524881021,
      "em": 0.6562150055991042,
      "em_stderr": 0.007948251702846893,
      "qem": 0.7522396416573348,
      "qem_stderr": 0.007224355240883467,
      "f1": 0.8428757602152095,
      "f1_stderr": 0.005186300690881584,
      "f1_score_quasi": 0.9156170336744968,
      "f1_score_quasi_stderr": 0.003667700152375464,
      "bleu": 100.00000000000004,
      "bleu_stderr": 1.464411857851008
    }
  }
}
```

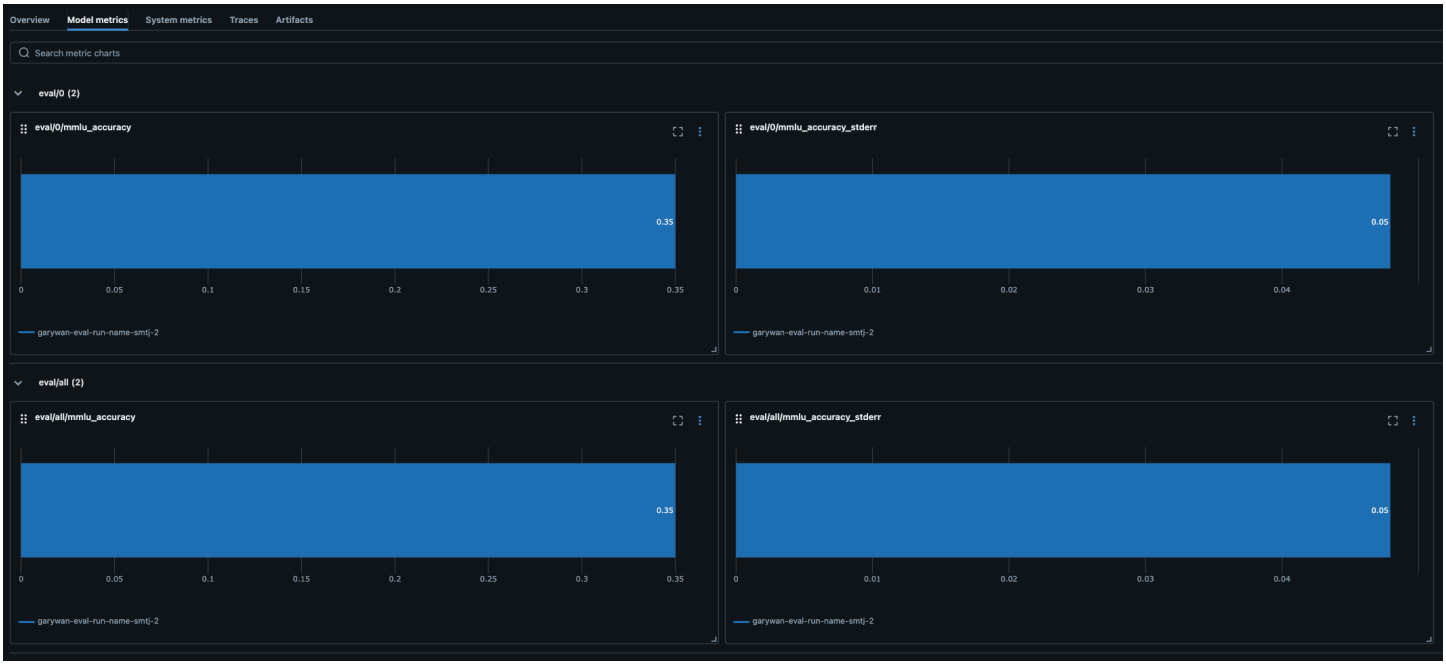
MLflow logging

Provide your SageMaker MLFlow resource ARN

SageMaker Studio uses the default MLFlow app that gets provisioned on each Studio domain when you use the model customization capability for the first time. SageMaker Studio uses the default MLflow app associated ARN in evaluation job submission.

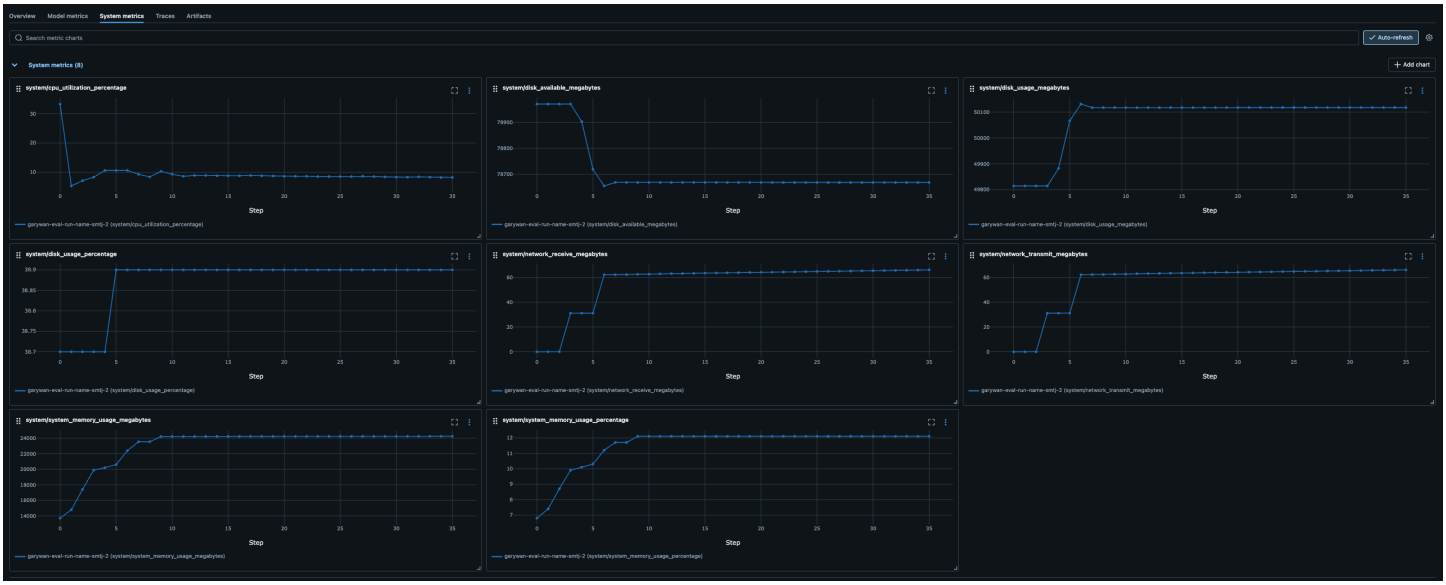
You can also submit your evaluation job and explicitly provide an MLFlow Resource ARN to stream metrics to said associated tracking server/app for real time analysis.

For more information about working with managed MLflow on SageMaker AI, see the section called “Accelerate generative AI development with MLflow”, Set up IAM permissions for MLflow, and Set up IAM permissions for MLflow Apps.



SageMaker Python SDK

```
evaluator = BenchMarkEvaluator(
    benchmark=Benchmark.MMLU,
    model="arn:aws:sagemaker:<region>:<account-id>:model-package/<model-package-name>/
<version>",
    s3_output_path="s3://<bucket-name>/<prefix>/eval/",
    mlflow_resource_arn="arn:aws:sagemaker:<region>:<account-id>:mlflow-tracking-
server/<tracking-server-name>",
    evaluate_base_model=False
```

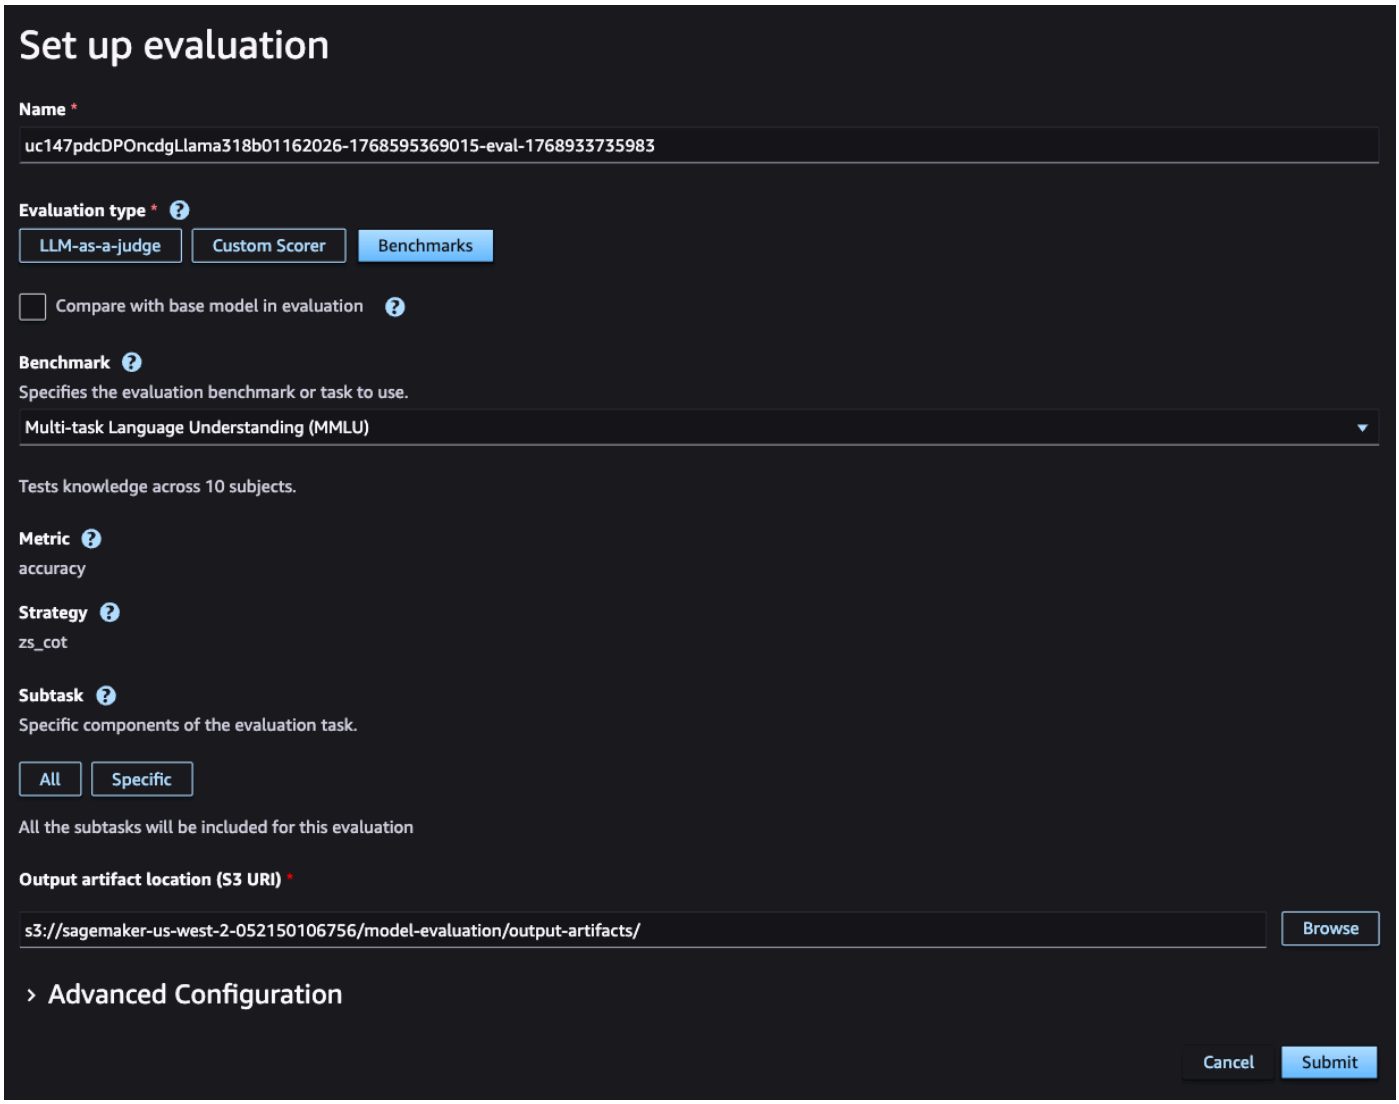


```
)

execution = evaluator.evaluate()
```

Model level and system level metric visualization:

TensorBoard



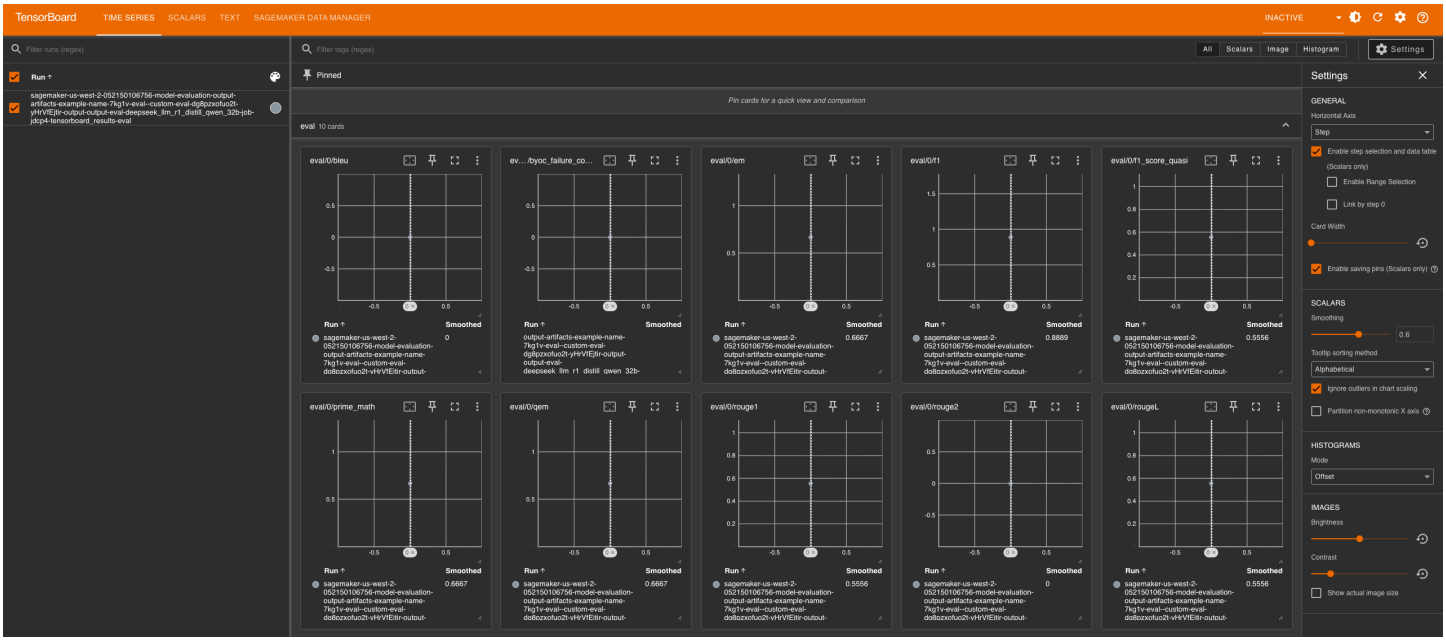
Submit your evaluation job with an Amazon S3 output location. SageMaker automatically uploads a TensorBoard file to the location.

SageMaker uploads the TensorBoard file to Amazon S3 in the following location:

```
s3://<your-provide-s3-location>/<training-job-name>/output/output/<evaluation-job-name>/tensorboard_results/eval/
```

Pass the Amazon S3 location as follows

SageMaker Studio



SageMaker Python SDK

```
evaluator = BenchMarkEvaluator(
    benchmark=Benchmark.MMLU,
    model="arn:aws:sagemaker:<region>:<account-id>:model-package/<model-package-
name>/<version>",
    s3_output_path="s3://<bucket-name>/<prefix>/eval/",
    evaluate_base_model=False
)

execution = evaluator.evaluate()
```

Sample model level metrics

Supported Dataset Formats for Bring-Your-Own-Dataset (BYOD) Tasks

The Custom Scorer and LLM-as-judge evaluation types require a custom dataset JSONL file located in Amazon S3. You must provide the file as a JSON Lines file adhering to one of the following supported formats. The examples in this doc are expanded for clarity.

Each format has its own nuances but at a minimum all require a user prompt.

Required Fields

Field	Required
User Prompt	Yes
System Prompt	No
Ground truth	Only for Custom Scorer
Category	No

1. OpenAI Format

```
{
    "messages": [
        {
```

```
            "role": "system",    # System prompt (looks for system role)
            "content": "You are a helpful assistant."
        },
        {
            "role": "user",       # Query (looks for user role)
            "content": "Hello!"
        },
        {
            "role": "assistant",  # Ground truth (looks for assistant role)
            "content": "Hello to you!"
        }
    ]
}
```

2. SageMaker Evaluation

```
{
   "system":"You are an English major with top marks in class who likes to give minimal
 word responses: ",
   "query":"What is the symbol that ends the sentence as a question",
   "response":"?", # Ground truth
   "category": "Grammar"
}
```

3. HuggingFace Prompt Completion

Both Standard and Conversational formats are supported.

```
# Standard

{
    "prompt" : "What is the symbol that ends the sentence as a question", # Query
    "completion" : "?" # Ground truth
}

# Conversational
{
    "prompt": [
        {
            "role": "user", # Query (looks for user role)
            "content": "What is the symbol that ends the sentence as a question"
        }
    ],
```

```
    "completion": [
        {
            "role": "assistant", # Ground truth (looks for assistant role)
            "content": "?"
        }
    ]
}
```

4. HuggingFace Preference

Support for both standard format (string) and conversational format (messages array).

```
# Standard: {"prompt": "text", "chosen": "text", "rejected": "text"}
{
     "prompt" : "The sky is", # Query
     "chosen" : "blue", # Ground truth
     "rejected" : "green"
}

# Conversational:
{
    "prompt": [
        {
            "role": "user", # Query (looks for user role)
            "content": "What color is the sky?"
        }
    ],
    "chosen": [
        {
            "role": "assistant", # Ground truth (looks for assistant role)
            "content": "It is blue."
        }
    ],
    "rejected": [
        {
            "role": "assistant",
            "content": "It is green."
        }
    ]
}
```

5. Verl Format

The Verl format (both current and legacy formats) is supported for reinforcement learning use cases. Verl docs for reference: https://verl.readthedocs.io/en/latest/preparation/prepare_data.html

Users of the VERL format typically do not provide a ground truth response. If you want to provide one anyways, use either of the fields `extra_info.answer` or `reward_model.ground_truth`; `extra_info` takes precedence.

SageMaker preserves the following VERL-specific fields as metadata if present:

- `id`
- `data_source`
- `ability`
- `reward_model`
- `extra_info`
- `attributes`
- `difficulty`

```
# Newest VERL format where `prompt` is an array of messages.
{
  "data_source": "openai/gsm8k",
  "prompt": [
    {
      "content": "You are a helpful math tutor who explains solutions to questions
 step-by-step.",
      "role": "system"
    },
    {
      "content": "Natalia sold clips to 48 of her friends in April, and then she sold
 half as many clips in May. How many clips did Natalia sell altogether in April and
 May? Let's think step by step and output the final answer after \"####\".",
      "role": "user"
    }
  ],
  "ability": "math",
  "extra_info": {
    "answer": "Natalia sold 48/2 = <<48/2=24>>24 clips in May.\nNatalia sold 48+24 =
 <<48+24=72>>72 clips altogether in April and May.\n#### 72",
    "index": 0,
```

```
    "question": "Natalia sold clips to 48 of her friends in April, and then she sold
 half as many clips in May. How many clips did Natalia sell altogether in April and

 May?",
    "split": "train"
  }
}
```

Evaluate with Preset and Custom Scorers

When using the Custom Scorer evaluation type, SageMaker Evaluation supports two built-in scorers (also referred to as "reward functions") Prime Math and Prime Code taken from the volcengine/verl RL training library, or your own custom scorer implemented as a Lambda Function.

Built-in Scorers

Prime Math

The prime math scorer expects a custom JSONL dataset of entries containing a math question as the prompt/query and the correct answer as ground truth. The dataset can be any of the supported formats mentioned in the section called “Supported Dataset Formats for Bring-Your-Own-Dataset (BYOD) Tasks”.

Example dataset entry (expanded for clarity):

```
{
    "system":"You are a math expert: ",
    "query":"How many vertical asymptotes does the graph of $y=\\frac{2}{x^2+x-6}$
 have?",
    "response":"2" # Ground truth aka correct answer
}
```

Prime Code

The prime code scorer expects a custom JSONL dataset of entries containing a coding problem and test cases specified in the `metadata` field. Structure the test cases with the expected function name for each entry, sample inputs, and expected outputs.

Example dataset entry (expanded for clarity):

```
{
    "system":"\\nWhen tackling complex reasoning tasks, you have access to the
 following actions. Use them as needed to progress through your thought process.\\n\
\n[ASSESS]\\n\\n[ADVANCE]\\n\\n[VERIFY]\\n\\n[SIMPLIFY]\\n\\n[SYNTHESIZE]\\n\\n[PIVOT]\
\n\\n[OUTPUT]\\n\\nYou should strictly follow the format below:\\n\\n[ACTION NAME]\\n\
\n# Your action step 1\\n\\n# Your action step 2\\n\\n# Your action step 3\\n\\n...\\n\
\nNext action: [NEXT ACTION NAME]\\n\\n",
    "query":"A number N is called a factorial number if it is the factorial of a
 positive integer. For example, the first few factorial numbers are 1, 2, 6, 24, 120,
\\nGiven a number N, the task is to return the list/vector of the factorial numbers
 smaller than or equal to N.\\nExample 1:\\nInput: N = 3\\nOutput: 1 2\\nExplanation:
 The first factorial number is \\n1 which is less than equal to N. The second \\nnumber
 is 2 which is less than equal to N,\\nbut the third factorial number is 6 which \\nis
 greater than N. So we print only 1 and 2.\\nExample 2:\\nInput: N = 6\\nOutput: 1 2
 6\\nExplanation: The first three factorial \\nnumbers are less than equal to N but \
\nthe fourth factorial number 24 is \\ngreater than N. So we print only first \\nthree
 factorial numbers.\\nYour Task:  \\nYou don't need to read input or print anything.
 Your task is to complete the function factorialNumbers() which takes an integer N as
 an input parameter and return the list/vector of the factorial numbers smaller than
 or equal to N.\\nExpected Time Complexity: O(K), Where K is the number of factorial
 numbers.\\nExpected Auxiliary Space: O(1)\\nConstraints:\\n1<=N<=10^{18}\\n\\nWrite
 Python code to solve the problem. Present the code in \\n```python\\nYour code\\n```\
\nat the end.",
    "response": "", # Dummy string for ground truth. Provide a value if you want NLP
 metrics like ROUGE, BLEU, and F1.
    ### Define test cases in metadata field
    "metadata": {
        "fn_name": "factorialNumbers",
```

```
        "inputs": ["5"],
        "outputs": ["[1, 2]"]
    }
}
```

Custom Scorers (Bring Your Own Metrics)

Fully customize your model evaluation workflow with custom post-processing logic which allows you to compute custom metrics tailored to your needs. You must implement your custom scorer as an Amazon Lambda function that accepts model responses and returns reward scores.

Sample Lambda Input Payload

The payload your custom scorer Amazon Lambda function receives mirrors the format of your evaluation dataset. SageMaker AI detects your dataset format and sends each sample to your Lambda in the corresponding shape, with the model's generated answer appended. Your Lambda must read the response from the fields that match the dataset format you are using.

The container invokes your Lambda once per sample, passing a list that contains a single sample object. Your Lambda must iterate the list, but currently it contains exactly one item per invocation. The following sections show the payload your Lambda receives for each supported dataset format.

OpenAI Chat format

```
[
  {
    "id": "123",
    "messages": [
      { "role": "system", "content": "You are helpful." },
      { "role": "user", "content": "What is the capital of France?" },
      { "role": "assistant", "content": "Paris" },
      { "role": "assistant", "content": "The capital of France is Paris." }
    ],
    "reference_answer": { "text": "Paris" }
  }
]
```

Notes on the OpenAI payload:

- The model's answer is the last `assistant` message. The container appends the model response as a new assistant turn.

- If your dataset already ends with an assistant message (the ground-truth turn), the payload contains two trailing assistant messages—the original ground-truth turn followed by the model's response.
- The ground truth is also provided at top-level `reference_answer.text` (the runtime-normalized copy).
- `id` is a container-generated identifier (present for this format).

verl format

```
[
  {
    "data_source": "openai/gsm8k",
    "prompt": [
      { "role": "user", "content": "What is the capital of France?" },
      { "role": "assistant", "content": "The capital of France is Paris." }
    ],
    "response": "The capital of France is Paris.",
    "reward_model": { "style": "rule", "ground_truth": "Paris" },
    "extra_info": {
      "reference_answer": { "text": "Paris" },
      "processor_config": { "aggregation": "mean" }
    }
  }
]
```

Notes on the verl payload:

- The model's answer is in `response` (and also appended as the final `assistant` turn in `prompt`).
- Ground truth is always emitted at `extra_info.reference_answer.text`. It is `{"text": ""}` when the dataset provides no ground truth. Read ground truth from this field.
- `data_source` defaults to `"customized"` when the dataset entry doesn't set it.
- `reward_model` and other verl-specific fields (`id`, `ability`, `attributes`, `difficulty`) are passed through only if present in the dataset entry. They are not added by default.

Hugging Face Prompt-Completion format

```
[
  {
```

```
    "id": "123",
    "prompt": "What is the capital of France?",
    "completion": "The capital of France is Paris.",
    "reference_answer": { "text": "Paris" }
  }
]
```

Notes on the Hugging Face Prompt-Completion payload:

- The model's answer is in `completion` (the container overwrites the dataset's original completion with the model response).
- Ground truth is at `reference_answer.text` (the dataset's original completion).

Hugging Face Preference format

```
[
  {
    "id": "123",
    "prompt": "What is the capital of France?",
    "completion": "The capital of France is Paris.",
    "chosen": "Paris",
    "rejected": "London",
    "reference_answer": { "text": "Paris" }
  }
]
```

Notes on the Hugging Face Preference payload:

- The model's answer is in `completion`.
- The original `chosen` and `rejected` preference pair is passed through.
- Ground truth is at `reference_answer.text` (resolved from `chosen`).

SageMaker AI Evaluation format

```
[
  {
    "id": "123",
    "model_response": "The capital of France is Paris.",
    "query": "What is the capital of France?",
```

```
    "response": "Paris",
    "system": "You are a helpful assistant.",
    "reference_answer": { "text": "Paris" }
  }
]
```

Notes on the SageMaker AI Evaluation payload:

- The model's answer is in `model_response`. All original dataset fields are passed through unchanged (`query`, `response`, `system`, `category`, and `metadata`).
- The ground truth appears in two top-level fields with the same value: the original `response`, and `reference_answer.text`. Read either.

> **Note**
>
> These are the payloads your Lambda receives. SageMaker AI takes each entry from your evaluation dataset, appends the model's generated response, and sends it to your scorer. See the section called "Supported Dataset Formats for Bring-Your-Own-Dataset (BYOD) Tasks" for how to author each dataset format. Write your Lambda to parse the fields of the format your dataset uses.

Sample Lambda Output Payload

Your Amazon Lambda function must return one result object per input sample. The SageMaker AI eval container accepts either of two response envelopes:

Option A – Raw list (recommended)

```
[
  {
    "id": "123",
    "aggregate_reward_score": 0.85,
    "metrics_list": [
      { "name": "factual_accuracy", "value": 0.9, "type": "Reward" },
      { "name": "format_compliance", "value": 0.8, "type": "Metric" }
    ]
  }
]
```

Option B – API Gateway-style wrapper

In this format, body is the JSON-encoded string of the result list. This is the format emitted by the Studio "Create Reward Function" template.

```
{
  "statusCode": 200,
  "body": "[{\"id\": \"123\", \"aggregate_reward_score\": 0.85, \"metrics_list\":
 [...]}]"
}
```

The following notes apply to both response envelopes:

- In Option B, body must be a JSON string (not a nested JSON object), and `statusCode` must be `200`. A non-200 status causes the eval container to treat that sample as a failure: it is counted in `byoc_failure_count` and its custom metrics are dropped, but the overall evaluation job still completes.
- `metrics_list` is optional; when present, each entry must include `name`, `value`, and `type` (`"Reward"` or `"Metric"`).
- Each result's `id` must match the input sample's `id`.

> **Note**
>
> If your Lambda returns a payload that does not match one of these two envelopes, SageMaker AI cannot parse the reward response. In RFT workflows this commonly surfaces as `InvalidLambdaResponseException`. Common causes include returning a JSON object instead of a JSON string in body, omitting the sample `id`, returning a different number of results than inputs, or using unsupported field names in `metrics_list`.

Custom Lambda Definition

Find an example of a fully-implemented custom scorer with sample input and expected output at: https://docs.aws.amazon.com/sagemaker/latest/dg/nova-implementing-reward-functions.html#nova-reward-llm-judge-example

Use the following skeleton as a starting point for your own function.

```
def lambda_handler(event, context):
```

```
    return lambda_grader(event)

def lambda_grader(samples: list[dict]) -> list[dict]:
    """
    Args:
        Samples: List of dictionaries; each sample's shape mirrors your evaluation
 dataset format
            (OpenAI, verl, Hugging Face Prompt-Completion, Hugging Face Preference, or
 SageMaker Evaluation).
            See the Sample Lambda Input Payload section above for the per-format shape.

        # Example shown is the OpenAI format; other dataset formats use different
 fields.
        Example input:
        {
            "id": "123",
            "messages": [
                {
                    "role": "user",
                    "content": "Do you have a dedicated security team?"
                },
                {
                    "role": "assistant",
                    "content": "As an AI developed by Company, I do not have a
 dedicated security team..."
                }
            ],
            # reference_answer contents vary by dataset; reference_answer.text holds
 the normalized ground truth
            "reference_answer": {
                "text": "No, as an AI developed by Company, I do not have a dedicated
 security team."
            }
        }

    Returns:
        List of dictionaries with reward scores:
        {
            "id": str,                              # Same id as input sample
            "aggregate_reward_score": float,        # Overall score for the sample
            "metrics_list": [                       # OPTIONAL: Component scores
                {
                    "name": str,                    # Name of the component score
                    "value": float,                 # Value of the component score
```

```
                    "type": str                    # "Reward" or "Metric"
                }
            ]
        }
    """
```

Input and output fields

Input fields

Field	Description	Additional notes
id	Unique identifier for the sample	Echoed back in output. String. Present for the OpenAI, Hugging Face, and SageMaker AI Evaluation formats; for verl it appears only if set in the dataset entry.
referenc _answer ext	Normalized ground truth for the sample	Present in every format (top-level for most; under `extra_info` for verl). Value is `""` when the dataset provides no ground truth. Read ground truth from this field.
messag	Ordered chat history (OpenAI-format datasets only)	Array of message objects. The model's response is the last `assistant` message.
messag].role	Speaker of the message	Common values: "user", "assistant", "system"
messag].conter	Text content of the message	Plain string
prompt	Input prompt (Hugging Face formats: string; verl: chat array)	For verl, the model response is also appended as the final `assistant` turn.
complet n	Model's response (Hugging Face Prompt-Completion and Preference formats)	The container overwrites the dataset's original completion with the model response.

Field	Description	Additional notes
chosen or rejectec	Preferred and rejected responses (Hugging Face Preference format)	Passed through from the dataset. Ground truth resolves from `chosen`.
respons	Model's response (verl) / ground-truth response (SageMaker AI Evaluation)	In SageMaker AI Evaluation this holds the original ground truth (same value as `reference_answer.text`).
model_ ponse	Model's generated response (SageMaker AI Evaluation format)	String
data_so ce, reward_ del, extra_ir o	verl-specific fields	`data_source` defaults to "customized." `reward_model` and other verl fields are passed through only if present in the dataset entry.
metada	Free-form information to aid grading	Object; optional fields passed through from your dataset

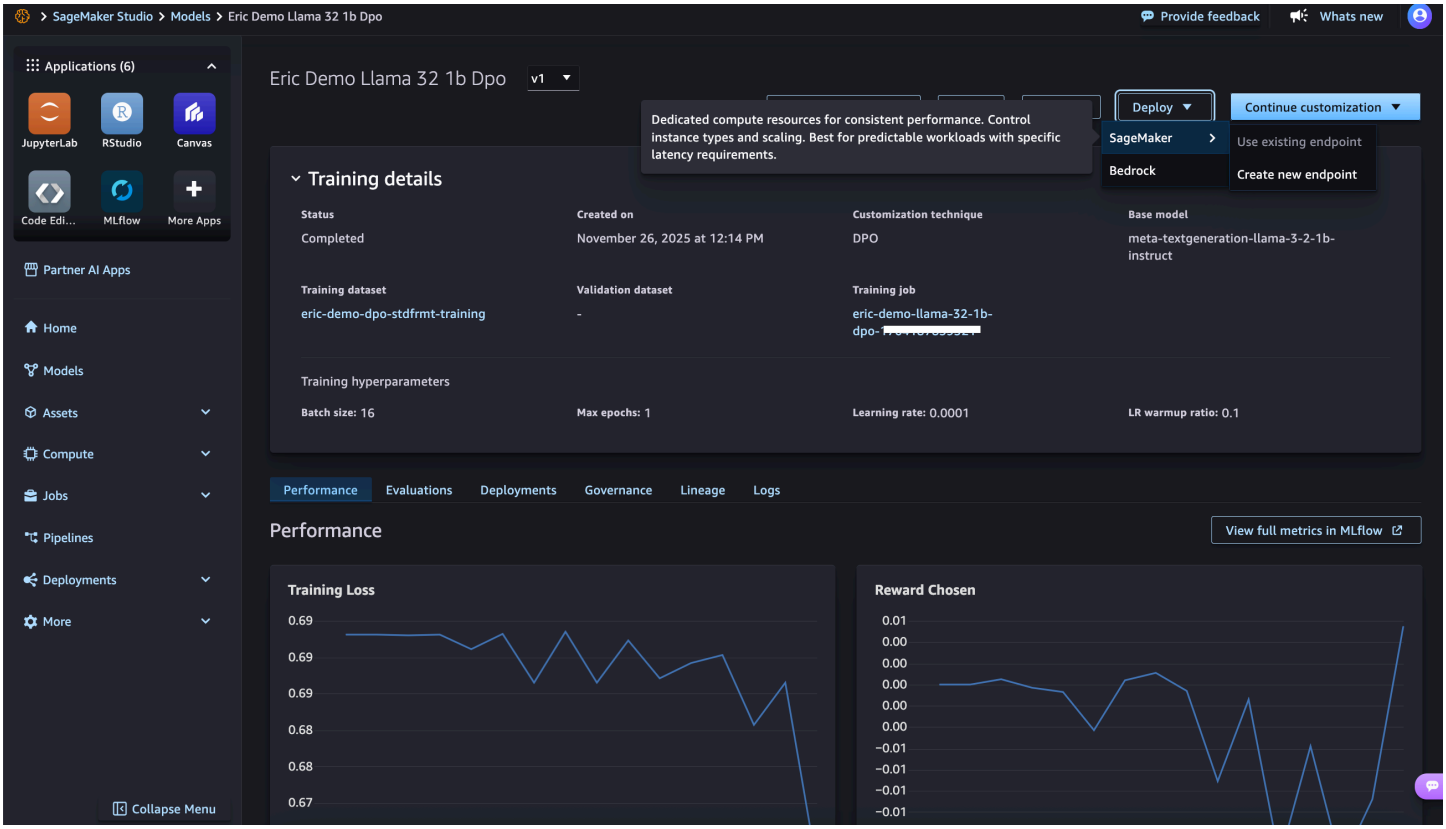
Output fields

Output Fields

Field	Description	Additional notes
id	Same identifier as input sample	Must match input
aggrega _rewarc core	Overall score for the sample	Float (e.g., 0.0–1.0 or task-defined range)
metrics_ ist	Component scores that make up the aggregate	Array of metric objects

Required Permissions

Ensure that the SageMaker execution role you use to run evaluation has Amazon Lambda permissions.



```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "lambda:InvokeFunction"
            ],
            "Resource": "arn:aws:lambda:region:account-id:function:function-name"
        }
    ]
}
```

Ensure your Amazon Lambda Function's execution role has basic Lambda execution permissions, as well as additional permissions you may require for any downstream Amazon calls.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "logs:CreateLogGroup",
        "logs:CreateLogStream",
        "logs:PutLogEvents"
      ],
      "Resource": "arn:aws:logs:*:*:*"
    }
  ]
}
```

Model deployment

From the custom models details page you can also deploy your custom model using either SageMaker AI Inference endpoints or Amazon Bedrock.

\"] = {\"Mediterranean Sea\", \"Adriatic Sea\"};\n    countries[\"Malta\"] =
 {\"Mediterranean Sea\", \"North African Coast\"};\n    countries[\"Spain\"]
 = {\"Mediterranean Sea\", \"Atlantic Ocean\"};\n    countries[\"Tunisia\"] =
 {\"Mediterranean Sea\", \"North African Coast\"};\n\n    string country;\n
 cout << \"Enter the name of a country: \";\n    cin >> country;\n\n    // check
 if country is in the map\n    if (countries.find(country)!= countries.end()) {\n
        // check if country borders the Mediterranean Sea\n        set<string>
 borders = countries.at(country);\n        if (borders.find(\"Mediterranean Sea\")!=
 borders.end()) {\n            cout << country << \" borders the Mediterranean Sea.
\" << endl;\n        } else {\n            cout << country << \" does not border the
 Mediterranean Sea.\" << endl;\n        }\n    } else {\n        cout << country << \"
 is not a recognized country.\" << endl;\n    }\n\n    return 0;\n}\n\nIn this program,
 we first define a map called countries that stores each country's name as a key and a
 set of its surrounding seas as the value. We use a set to store each sea name so that
 we can easily check if a country borders a certain sea.\n\nWe then present the user
 with a prompt to enter the name of a country. We use a while loop to ensure that the
 user enters a valid country name. We check if the country is in the map, and if so,
 we retrieve its bordering seas from the map.\n\nFinally, we check if the Mediterranean
 Sea is among the set of borders. If it is, we inform the user that the country borders
 the Mediterranean Sea. If not, we inform the user that the country does not border the
 Mediterranean Sea.",

RLAIF - Chain of Thought

Input Dataset

Source Data: https://huggingface.co/datasets/thesven/gsm8k-reasoning/tree/main/data

One Sample

```
{
    "data_source": "openai/gsm8k",
    "prompt": [
        {
```

```
            "role": "system",
            "content": "\nYou are an AI assistant that uses a Chain of Thought (CoT)
 approach with reflection to answer queries.\n\nFollow these steps:\n- Think through
 the problem step by step within the ‹thinking> tags.\n- Reflect on your thinking
\n\nto check for any errors or improvements within the ‹reflection› tags.\n- Make
 any necessary adjustments based on your reflection.\n- Provide your final, concise
 answer within the ‹output> tags.\n\nImportant: The <thinking> and ‹reflection›
 sections are for your internal reasoning process only.\nDo not include any part of
 the final answer in these sections.\nThe actual response to the query must be entirely
 contained within the ‹output› tags.\n\nUse the following format for your response:
\n<thinking>\n[Your initial thought process goes here]\n</thinking›\n\n<reasoning>
\n[Your step-by-step reasoning goes here. This is your internal thought process,
 not the final answer. You can create as many reasoning steps as necessary in your
 process.]\n</reasoning>\n\n‹reflection>\n[Your reflection on your reasoning, checking
 for errors or improvements. You can create as many reflection steps as necessary in
 your process.]\n</ reflection>\n\n<adjustment>\n[Any adjustments to your thinking
 based on your reflection]\n</adjustment>\n\n<output>\n[Your final, concise answer to
 the query. This is the only part that will be shown to the user.]\n</output>\n"
        },
        {
            "role": "user",
            "content": "A craft store makes a third of its sales in the fabric section,
 a quarter of its sales in the jewelry section, and the rest in the stationery section.
 They made 36 sales today. How many sales were in the stationery section?"
        }
    ],
    "ability": "chain-of-thought",
    "reward_model": {
        "style": "llmj-cot",
        "ground_truth": "Thus, there were 36 - 12 - 9 = <<36-12-9=15>>15 sales in the
 stationery section."
    },
    "extra_info": {
        "split": "train",
        "index": 0,
        "question": "A craft store makes a third of its sales in the fabric section, a
 quarter of its sales in the jewelry section, and the rest in the stationery section.
 They made 36 sales today. How many sales were in the stationery section?",
        "short_answer": "15",
        "model_output": "<thinking>\nTo find the number of sales in the stationery
 section, I need to first calculate the number of sales in the fabric and jewelry
 sections. The store makes a third of its sales in the fabric section, which is 1/3
 of 36 sales. I can calculate this as 36 * 1/3 = 12 sales in the fabric section. The
 store makes a quarter of its sales in the jewelry section, which is 1/4 of 36 sales.
```

```
 I can calculate this as 36 * 1/4 = 9 sales in the jewelry section. Since the rest of
 the sales are in the stationery section, I can subtract the sales from the other two
 sections from the total number of sales to find the number of sales in the stationery
 section.\n</thinking>\n\n<reasoning>\n1. Calculate the number of sales in the fabric
 section: 36 * 1/3 = 12\n2. Calculate the number of sales in the jewelry section:
 36 * 1/4 = 9\n3. Calculate the number of sales in the stationery section: 36 - 12
 - 9 = 15\n</reasoning>\n\n‹reflection>\nUpon reviewing my reasoning, I noticed that
 my calculations seem correct, but I should ensure that I understand the question
 correctly. The question asks for the number of sales in the stationery section, and
 I believe I have correctly calculated that. However, I should double-check my math to
 make sure it's accurate.\n</reflection>\n\n<adjustment>\nUpon re-examining my math, I
 am confident that my calculations are correct. The fabric section makes up 1/3 of the
 sales, the jewelry section makes up 1/4, and the rest is the stationery section. My
 math checks out, and I am confident in my answer.\n</adjustment>\n\n<output>\n15\n</
output>"

            "content": "Summarize the following article:\n\nLONDON, England (Reuters)
 -- Harry Potter star Daniel Radcliffe gains access to a reported £20 million ($41.1
 million) fortune as he turns 18 on Monday, but he insists the money won't cast a
 spell on him. Daniel Radcliffe as Harry Potter in \"Harry Potter and the Order
 of the Phoenix\" To the disappointment of gossip columnists around the world, the
 young actor says he has no plans to fritter his cash away on fast cars, drink and
 celebrity parties. \"I don't plan to be one of those people who, as soon as they turn
 18, suddenly buy themselves a massive sports car collection or something similar,
\" he told an Australian interviewer earlier this month. \"I don't think I'll be
 particularly extravagant. \"The things I like buying are things that cost about 10
 pounds -- books and CDs and DVDs.\" At 18, Radcliffe will be able to gamble in a
 casino, buy a drink in a pub or see the horror film \"Hostel: Part II,\" currently
 six places below his number one movie on the UK box office chart. Details of how
 he'll mark his landmark birthday are under wraps. His agent and publicist had no
 comment on his plans. \"I'll definitely have some sort of party,\" he said in an
 interview. \"Hopefully none of you will be reading about it.\" Radcliffe's earnings
 from the first five Potter films have been held in a trust fund which he has not
 been able to touch. Despite his growing fame and riches, the actor says he is keeping
 his feet firmly on the ground. \"People are always looking to say 'kid star goes
 off the rails,'\" he told reporters last month. \"But I try very hard not to go that
 way because it would be too easy for them.\" His latest outing as the boy wizard in
 \"Harry Potter and the Order of the Phoenix\" is breaking records on both sides of the
 Atlantic and he will reprise the role in the last two films.  Watch I-Reporter give
 her review of Potter's latest » . There is life beyond Potter, however. The Londoner
 has filmed a TV movie called \"My Boy Jack,\" about author Rudyard Kipling and his
 son, due for release later this year. He will also appear in \"December Boys,\" an
 Australian film about four boys who escape an orphanage. Earlier this year, he made
 his stage debut playing a tortured teenager in Peter Shaffer's \"Equus.\" Meanwhile,
 he is braced for even closer media scrutiny now that he's legally an adult: \"I just
 think I'm going to be more sort of fair game,\" he told Reuters. E-mail to a friend .

RLAIF - Custom Prompt

In this example, we use the section called “RLAIF - Chain of Thought” to discuss how a custom jinja prompt can replace one of the preset prompts.

Below is an example of a custom prompt for CoT:

```
You are an expert logical reasoning evaluator specializing in Chain-of-Thought (CoT)
 analysis.

Given: A problem prompt and a model's reasoning-based response.

Goal: Assess the quality and structure of logical reasoning, especially for specialized
 domains (law, medicine, finance, etc.).

Scoring rubric (start at 0.0, then add or subtract):

Core Components:

Structural Completeness (0.3 max)
- Clear problem statement: +0.05
- Defined variables/terminology: +0.05
- Organized given information: +0.05
- Explicit proof target: +0.05
- Step-by-step reasoning: +0.05
- Clear conclusion: +0.05

Logical Quality (0.4 max)
- Valid logical flow: +0.1
- Proper use of if-then relationships: +0.1
- Correct application of domain principles: +0.1
- No logical fallacies: +0.1

Technical Accuracy (0.3 max)
- Correct use of domain terminology: +0.1
- Accurate application of domain rules: +0.1
- Proper citation of relevant principles: +0.1

Critical Deductions:
A. Invalid logical leap: -0.3
B. Missing critical steps: -0.2
C. Incorrect domain application: -0.2
D. Unclear/ambiguous reasoning: -0.1

Additional Instructions:
- Verify domain-specific terminology and principles
- Check for logical consistency throughout
- Ensure conclusions follow from premises
- Flag potential domain-specific compliance issues
- Consider regulatory/professional standards where applicable
```

```
Return EXACTLY this JSON (no extra text):
{
    "score": <numerical score 0.0-1.0>,

Sample

```
{
  "data_source": "codeforces",
  "prompt": [
    {
      "content": "\nWhen tackling complex reasoning tasks, you have access to the
 following actions. Use them as needed to progress through your thought process.
\n\n[ASSESS]\n\n[ADVANCE]\n\n[VERIFY]\n\n[SIMPLIFY]\n\n[SYNTHESIZE]\n\n[PIVOT]\n
\n[OUTPUT]\n\nYou should strictly follow the format below:\n\n[ACTION NAME]\n\n# Your
 action step 1\n\n# Your action step 2\n\n# Your action step 3\n\n...\n\nNext action:
 [NEXT ACTION NAME]\n\n",
      "role": "system"
    },
    {
```

```
      "content": "Title: Zebras\n\nTime Limit: None seconds\n\nMemory Limit: None
 megabytes\n\nProblem Description:\nOleg writes down the history of the days he lived.
 For each day he decides if it was good or bad. Oleg calls a non-empty sequence of days
 a zebra, if it starts with a bad day, ends with a bad day, and good and bad days are
 alternating in it. Let us denote bad days as 0 and good days as 1. Then, for example,
 sequences of days 0, 010, 01010 are zebras, while sequences 1, 0110, 0101 are not.\n
\nOleg tells you the story of days he lived in chronological order in form of string
 consisting of 0 and 1. Now you are interested if it is possible to divide Oleg's
 life history into several subsequences, each of which is a zebra, and the way it can
 be done. Each day must belong to exactly one of the subsequences. For each of the
 subsequences, days forming it must be ordered chronologically. Note that subsequence
 does not have to be a group of consecutive days.\n\nInput Specification:\nIn the only
 line of input data there is a non-empty string *s* consisting of characters 0 and 1,
 which describes the history of Oleg's life. Its length (denoted as |*s*|) does not
 exceed 200<=000 characters.\n\nOutput Specification:\nIf there is a way to divide
 history into zebra subsequences, in the first line of output you should print an
 integer *k* (1<=\u2264<=*k*<=\u2264<=|*s*|), the resulting number of subsequences. In
 the *i*-th of following *k* lines first print the integer *l**i* (1<=\u2264<=*l**i*<=
\u2264<=|*s*|), which is the length of the *i*-th subsequence, and then *l**i* indices
 of days forming the subsequence. Indices must follow in ascending order. Days
 are numbered starting from 1. Each index from 1 to *n* must belong to exactly one
 subsequence. If there is no way to divide day history into zebra subsequences, print
 -1.\n\nSubsequences may be printed in any order. If there are several solutions, you
 may print any of them. You do not have to minimize nor maximize the value of *k*.\n
\nDemo Input:\n['0010100\\n', '111\\n']\n\nDemo Output:\n['3\\n3 1 3 4\\n3 2 5 6\\n1
 7\\n', '-1\\n']\n\nNote:\nnone\n\nWrite Python code to solve the problem. Present the
 code in \n```python\nYour code\n```\nat the end.",

RLVR - Custom Lambda

Input Dataset

Source: Cleaned gsm8k dataset https://huggingface.co/datasets/thesven/gsm8k-reasoning/tree/main/data

Sample

The following sample input is shown in OpenAI chat format. The reward function below is format-agnostic and also handles the verl, Hugging Face, and SageMaker AI Evaluation payloads. See the section called “Sample Lambda Input Payload” for the shape of each format.

```
[
  {
    "content": "\nYou are an AI assistant that uses a Chain of Thought (CoT) approach
 with reflection to answer queries.\n\nFollow these steps:\n- Think through the problem
 step by step within the ‹thinking› tags.\n- Reflect on your thinking\n\nto check
 for any errors or improvements within the ‹reflection› tags.\n- Make any necessary
```

```
 adjustments based on your reflection.\n- Provide your final, concise answer within
 the ‹output> tags.\n\nImportant: The <thinking> and ‹reflection› sections are for
 your internal reasoning process only.\nDo not include any part of the final answer
 in these sections.\nThe actual response to the query must be entirely contained
 within the ‹output› tags.\n\nUse the following format for your response:\n<thinking>
\n[Your initial thought process goes here]\n</thinking›\n\n<reasoning>\n[Your step-
by-step reasoning goes here. This is your internal thought process, not the final
 answer. You can create as many reasoning steps as necessary in your process.]\n</
reasoning>\n\n‹reflection>\n[Your reflection on your reasoning, checking for errors
 or improvements. You can create as many reflection steps as necessary in your
 process.]\n</ reflection>\n\n<adjustment>\n[Any adjustments to your thinking based on
 your reflection]\n</adjustment>\n\n<output>\n[Your final, concise answer to the query.
 This is the only part that will be shown to the user.]\n</output>\n",
    "role": "system"
  },
  {
    "content": "A craft store makes a third of its sales in the fabric section, a
 quarter of its sales in the jewelry section, and the rest in the stationery section.
 They made 36 sales today. How many sales were in the stationery section?",
    "role": "user"
  },
  {
    "content": "<thinking>\nTo find the number of sales in the stationery section, I
 need to first calculate the number of sales in the fabric and jewelry sections. The
 store makes a third of its sales in the fabric section, which is 1/3 of 36 sales. I
 can calculate this as 36 * 1/3 = 12 sales in the fabric section. The store makes a
 quarter of its sales in the jewelry section, which is 1/4 of 36 sales. I can calculate
 this as 36 * 1/4 = 9 sales in the jewelry section. Since the rest of the sales are
 in the stationery section, I can subtract the sales from the other two sections from
 the total number of sales to find the number of sales in the stationery section.\n</
thinking>\n\n<reasoning>\n1. Calculate the number of sales in the fabric section:
 36 * 1/3 = 12\n2. Calculate the number of sales in the jewelry section: 36 * 1/4 =
 9\n3. Calculate the number of sales in the stationery section: 36 - 12 - 9 = 15\n</
reasoning>\n\n‹reflection>\nUpon reviewing my reasoning, I noticed that my calculations
 seem correct, but I should ensure that I understand the question correctly. The
 question asks for the number of sales in the stationery section, and I believe I have
 correctly calculated that. However, I should double-check my math to make sure it's
 accurate.\n</reflection>\n\n<adjustment>\nUpon re-examining my math, I am confident
 that my calculations are correct. The fabric section makes up 1/3 of the sales, the
 jewelry section makes up 1/4, and the rest is the stationery section. My math checks
 out, and I am confident in my answer.\n</adjustment>\n\n<output>\n15\n</output>",
    "role": "assistant"
  }
]
```

Sample reward prompt

```
You are an expert RAG response evaluator specializing in faithfulness and relevance
 assessment.
Given: Context documents, a question, and response statements.
Goal: Evaluate both statement-level faithfulness and overall response relevance to the
 question.

Scoring rubric (start at 0.0, then add or subtract):

Core Components:

Faithfulness Assessment (0.6 max)
Per statement evaluation:
- Direct support in context: +0.2
- Accurate inference from context: +0.2
- No contradictions with context: +0.2
Deductions:

Release note

The SageMaker AI model customization images

Support plan

- Major versions: 12 months after next major release
- Minor versions: 6 months after next minor release
- Patch versions: No guaranteed support (upgrade to latest patch)

The following table summarizes the distinct container images used by model family for SageMaker AI training jobs and HyperPod recipes. LoRA and full fine-tuning recipes use the same container image unless otherwise noted.

Model family	Distinct container images	Notes
Llama	`hyperpod-recipes:llmft-v1.0.0` ; `hyperpod-recipes:verl-v1.0.0-eks` ; `hyperpod-recipes:verl-v1.0.0-smtj` ; `hyperpod-recipes-verl-0-7-0:verl-v1.1.4-smtj` ; `hyperpod-checkpointless-training:v1.0.0` ; `sagemaker-evaluation:latest`	Covers standard SFT and DPO, GRPO-based recipes, VERL 0.7 recipes, checkpointless training, and open-source evaluation.
Qwen	`hyperpod-recipes:llmft-v1.0.0` ; `hyperpod-recipes:verl-v1.0.0-eks` ; `hyperpod-recipes:verl-v1.0.0-smtj` ; `hyperpod-recipes-verl-0-7-0:verl-v1.1.4-smtj` ; `mtrl-recipes:rft-trainer-v1.0.0` ; `sagemaker-evaluation:latest`	Includes shared open-weight training images and service-only MTRL workflows.
DeepSeek	`hyperpod-recipes:llmft-v1.0.0` ; `hyperpod-recipes:verl-v1.0.0-eks` ; `hyperpod-recipes:verl-v1.0.0-smtj` ; `sagemaker-evaluation:latest`	Uses the shared open-weight training and evaluation images.
GPT-OSS	`hyperpod-recipes:llmft-v1.0.0` ; `hyperpod-recipes:verl-v1.0.0-eks` ; `hyperpod-recipes:verl-v1.0.0-smtj` ; `hyperpod-recipes-verl-0-7-0:verl-v1.1.4-smtj` ; `hyperpod-checkpointless-training:v1.0.0` ; `mtrl-`	Includes checkpointless training and service-only MTRL workflows.

Model family	Distinct container images	Notes
	recipes:rft-trainer-v1.0.0 ; sagemaker-evaluation:latest	
Gemma	hyperpod-recipes-verl-0-7-0 :verl-v1.1.4-smtj-tf58 ;mtrl- recipes:rft-trainer-v1.0.0 ; sagemaker-evaluation:latest	Uses a Gemma-specific VERL image track.
Nemotron	hyperpod-recipes-verl-0-7-0 :verl-v1.1.0-smtj-vllm012 ; hyperpod-recipes-verl-0-7-0 :verl-v1.1.2-smtj-megatron ; sagemaker-evaluation:latest	Uses Nemotron-specific VERL image tracks for Nano and Lightning variants.
Nova	nova-fine-tune-repo:* ;nova- evaluation-repo:* ;nova-dist illation-repo:* ;mtrl-reci pes:rft-trainer-v1.0.0	Uses dedicated Nova repositor ies instead of the shared hyperpod-recipes image family.

Amazon Web Services Regions support

Region	Code	Serverless SMTJ support
Asia Pacific (Mumbai)	ap-south-1	no
Asia Pacific (Singapore)	ap-southeast-1	no
Asia Pacific (Sydney)	ap-southeast-2	no
Asia Pacific (Tokyo)	ap-northeast-1	yes
Europe (Frankfurt)	eu-central-1	no
Europe (Ireland)	eu-west-1	yes
Europe (Stockholm)	eu-north-1	no

Region	Code	Serverless SMTJ support
South America (São Paulo)	sa-east-1	no
US East (N. Virginia)	us-east-1	yes
US East (Ohio)	us-east-2	no
US West (N. California)	us-west-1	no
US West (Oregon)	us-west-2	yes

Training session APIs

The SageMaker AI training session APIs run model customization on stateful, serverless GPU sessions where you orchestrate training operations directly. Existing high-level fine-tuning APIs constrain your training loop to predefined workflows such as supervised fine-tuning (SFT). You cannot write custom loss functions or run frontier reinforcement learning (RL) with elastic rollouts. You are also locked into the infrastructure decisions those APIs make for you.

Teams building production AI systems need to iterate on algorithms, experiment with novel training objectives, and scale RL across Regions without rewriting distributed training code. Training session APIs give you that level of control.

> **Note**
>
> Training session APIs require you to write Python code that drives the training loop. If you want a managed workflow that does not require programming, see the section called "Serverless". If you want to submit a complete training script as a job instead, see the section called "SageMaker AI Training Jobs".

With the training session APIs, instead of submitting a complete training script, you open a session and call operations like `forward_backward()`, `optim_step()`, and `sample()` as API calls, and compose them into whatever training procedure your technique requires. The model stays loaded on GPUs across calls, and the service handles distributed execution, gradient synchronization, and tenant isolation.

```
from sagemaker.train.training_session import ServiceClient, AdamParams
```

```
svc = ServiceClient(region="us-west-2", role_arn="arn:aws:iam::111122223333:role/
MyRole")
tc = svc.create_lora_training_client(base_model="openai/gpt-oss-20b", rank=32,
 alpha=64)

# Custom reinforcement learning loop with on-policy sampling
sc = tc.create_sampling_client()
for step in range(num_steps):
    ops = [sc.sample(p, num_samples=4, sampling_params=params) for p in prompts]
    rollouts = [op.result() for op in ops]
    tc.forward_backward(build_batch(rollouts), loss_fn="ppo").result()
    tc.optim_step(AdamParams(learning_rate=5e-5)).result()
    sc = tc.save_weights_and_get_sampling_client()

tc.stop()
```

Use the training session APIs when you need:

- Full control over a custom training loop (SFT, RL, or novel techniques).
- Multi-stage pipelines that chain multiple procedures in one session.
- Step-by-step debugging of loss divergence or reward hacking.
- Multi-turn RL where rollout generation and policy updates share model state.

Who it is for

- ML researchers experimenting with novel training techniques.
- Advanced ML teams running production RL systems.
- Teams building custom loss functions, such as group relative policy optimization (GRPO), DRO, and DAPO.
- Organizations needing multi-Region training and elastic rollout inference.
- Teams that own their data and want to own their models.

Key differentiators

Capability	What it means
Operation-level API	You orchestrate `forward_backward()` , `sample()`, and `optim_step()` individually rather than submitting a monolithic training script.
Stateful sessions	The model stays loaded on GPUs across calls. No cold starts between rollout generation and policy updates.
Serverless	No instance selection, no cluster management, no capacity planning. The service provisions and manages GPU infrastructure.
Technique-agnostic	Implement SFT, proximal policy optimization (PPO), GRPO, multi-turn RL, or any custom procedure. You choose the algorithm; the service does not limit your technique.

Supported models, pricing, and Regions

Supported models

Model	Region
`openai/gpt-oss-20b`	us-east-1, us-west-2, ap-south-1
`google/gemma-4-E2B-it`	us-west-2
`google/gemma-4-31B-it`	us-east-1, us-west-2, ap-south-1
`Qwen/Qwen3.6-27B`	us-west-2, ap-south-1
`Qwen/Qwen3.8-27B`	us-west-2

Context length limits

Each supported model has a maximum context length. The context length is the total number of tokens in one sequence. For sampling, this is the prompt plus the requested maximum completion length (`maxTokens`). For training, this is the full datum. The limit applies to both sampling and training calls. Requests that exceed the limit fail with the error `The input exceeds the model's maximum context length. Please reduce the length of your prompt or the requested max tokens.` Plan your prompt and response lengths so that each sequence fits within the limit. This matters most for multi-turn rollouts, where the context grows with each turn. For an example of sampling and training calls, see End-to-end examples.

The following table lists the maximum context length for each supported model and whether you can adjust it.

Model	Maximum context length (tokens)	Adjustable
`openai/gpt-oss-20b`	65,536	No
`google/gemma-4-E2B-it`	32,768	No
`google/gemma-4-31B-it`	32,768	No
`Qwen/Qwen3.6-27B`	65,536	No
`Qwen/Qwen3.8-27B`	65,536	No

Pricing

For full pricing details, see the SageMaker AI pricing page. Charges are based on three dimensions:

- **Prefill** – the cost of processing the input tokens fed into the model at the start of each training step. This includes the prompt, conversation history, and any context the model receives before generating a response.
- **Sample** – the cost of the tokens the model generates during the training rollout. This is where the model produces its responses, which are then evaluated and used to compute the reward signal.

- **Train** – the cost of the backward pass, where the model weights are updated based on the reward signal. This is the core learning step in the RL process.

Training session quotas

The following quotas apply to the training session APIs. These quotas are adjustable. To request an increase, open the Service Quotas console. For more information, see Requesting a quota increase.

Name	Default	Adjustable
Maximum number of concurrent fine-tuning training sessions	2	Yes

> **Note**
>
> Some accounts have a default quota of 0 for training sessions. If your account does, request a quota increase in the Service Quotas console.

For a list of all SageMaker AI quotas, see Supported Regions and Quotas.

Topics

- the section called “Prerequisites”
- the section called “Amazon managed policies”
- the section called “Core operations”
- the section called “Getting started”
- the section called “Python SDK reference”
- the section called “API reference”
- the section called “End-to-end examples”
- the section called “Troubleshooting and best practices”
- the section called “Security”

Prerequisites

The training session APIs extend serverless model customization with the SageMaker AI `CreateTrainingSession` API and a set of runtime operations that run training and sampling against an active session. Before you create your first session, configure three things: the IAM identity that calls the API (the *caller identity*), the IAM execution role that the session assumes (the `RoleArn` you pass to `CreateTrainingSession`), and a model package group for your checkpoints.

Managed policies

The training session APIs provide two Amazon managed policies. Attach each to the appropriate identity before you create a session. For the full permission lists, see the section called “Amazon managed policies”.

- **AmazonSageMakerTrainingSessionAccess** – attach to the IAM users and roles that create and interact with training sessions. It grants control-plane actions (create, describe, stop, delete, list), the runtime operations that run training and sampling, model package management for checkpoint publication, `iam:PassRole` to hand the execution role to the service, and the Amazon KMS permissions needed to use a customer managed key through SageMaker AI.
- **AmazonSageMakerTrainingSessionFullAccess** – attach to the IAM role you pass as the session execution role. It grants the session the permissions it needs while running: read and write access to your training data and checkpoints in Amazon S3, Amazon KMS permissions for Amazon S3-side encryption, access to SageMaker AI hub content and model packages, and Amazon EC2 network interface management for sessions that run in Amazon VPC mode.

Pass the execution role

Allow the caller identity to pass the execution role to the Training Sessions service principal. The `AmazonSageMakerTrainingSessionAccess` managed policy already includes this permission, scoped to roles under the `service-role` path whose names contain `SageMaker`. If you use a custom caller policy, include the following statement:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "PassExecutionRolePermissions",
      "Effect": "Allow",
```

```
      "Action": "iam:PassRole",
      "Resource": "arn:aws:iam::*:role/service-role/*SageMaker*",
      "Condition": {
        "StringEquals": {
          "iam:PassedToService": "training-session.sagemaker.amazonaws.com"
        }
      }
    }
  ]
}
```

Execution role trust policy

Add the Training Sessions service principal to the trust policy of your execution role so that the service can assume it:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "training-session.sagemaker.amazonaws.com"
      },
      "Action": ["sts:AssumeRole", "sts:TagSession"]
    }
  ]
}
```

Create a model package group

The service registers each checkpoint you save as a model package in a SageMaker AI model package group. Create a group for your checkpoints and pass its ARN as `model_package_group_arn` when you create the `ServiceClient`:

```
aws sagemaker create-model-package-group \
    --model-package-group-name my-training-session-checkpoints \
    --region us-west-2
```

For more information, see the section called “Create a Model Group”.

Other setup

- If you run sessions inside a customer-managed Amazon VPC, see the section called "Configure a VPC".
- If you use a customer managed KMS key to encrypt session data, the caller identity, execution role, and key policy need additional permissions. See the section called "Encryption at rest".

Amazon managed policies for SageMaker AI training session APIs

Use these Amazon managed policies to create and interact with Amazon SageMaker AI training session APIs. With `AmazonSageMakerTrainingSessionAccess`, you can manage training sessions and run training and sampling operations. With `AmazonSageMakerTrainingSessionFullAccess`, your training session execution role can access data in Amazon S3, use customer managed Amazon Key Management Service (Amazon KMS) keys, publish model packages, and manage Amazon VPC network interfaces.

Topics

- Amazon managed policy: AmazonSageMakerTrainingSessionAccess
- Amazon managed policy: AmazonSageMakerTrainingSessionFullAccess
- Amazon SageMaker AI updates to SageMaker AI training sessions managed policies

Amazon managed policy: AmazonSageMakerTrainingSessionAccess

With this policy, you can create and manage SageMaker AI training sessions and run training and sampling operations against them. Attach this policy to the IAM users and roles that create and interact with training sessions.

Permissions details

This policy includes the following permissions.

- `sagemaker` – Allows creating, describing, stopping, deleting, and tagging training sessions. Restricted to resources in the same account.
- `sagemaker` – Allows running training and sampling operations against a training session, retrieving their results, and invoking sample requests. Restricted to resources in the same account.
- `sagemaker` – Allows listing training sessions. Restricted to resources in the same account.

- `sagemaker` – Allows calling SageMaker AI training session runtime APIs with a bearer token. Restricted to resources in the same account.
- `kms` – Allows the caller identity to use customer managed Amazon KMS keys with training sessions at runtime. The `Decrypt` and `GenerateDataKey` actions are restricted through `kms:ViaService` to SageMaker AI only. Restricted to resources in the same account.
- `iam` – Allows passing an execution role to SageMaker AI. The `iam:PassRole` action is restricted to roles under the `service-role` path whose names contain `SageMaker`, is restricted through `iam:PassedToService` to the SageMaker AI training session service only, and applies only when the role is associated with a SageMaker AI resource. Restricted to resources in the same account.
- `sagemaker` – Allows creating model package groups, deleting model packages, describing model packages and model package groups, and listing model packages, for checkpoint publication workflows. Restricted to resources in the same account.
- `sagemaker` – Allows describing and listing public hub content, such as pre-built models, in the Amazon owned SageMaker AI public hub.
- `s3` – Allows creating the SageMaker AI default Amazon S3 bucket, listing its contents, and deleting output objects in buckets whose names begin with `sagemaker-`. Restricted to resources in the same account.

                }
            }
        }
    ]
}
```

For more information, see AmazonSageMakerTrainingSessionAccess in the Amazon Managed Policy Reference Guide.

Amazon managed policy: AmazonSageMakerTrainingSessionFullAccess

With this policy, your SageMaker AI training session execution roles can access the resources needed to run training sessions. Attach this policy to IAM roles that you use as SageMaker AI training session execution roles.

Permissions details

This policy includes the following permissions.

- `s3` – Allows training sessions to read input data from, write output data to, and list the contents of Amazon S3 buckets. Restricted to resources in the same account.
- `kms` – Allows training sessions to decrypt and generate data keys for server-side encryption of Amazon S3 objects using customer managed Amazon KMS keys. The `Decrypt` and `GenerateDataKey` actions are restricted through `kms:ViaService` to Amazon S3 only. `DescribeKey` is allowed without the `kms:ViaService` restriction. Restricted to resources in the same account.
- `sagemaker` – Allows describing public hub content, such as pre-built models, in the Amazon owned SageMaker AI public hub.
- `sagemaker` – Allows accessing, creating, and describing model packages, and describing model package groups for checkpoint publication workflows. Restricted to resources in the same account.
- `ec2` – Allows managing Amazon VPC network interfaces for training sessions running in Amazon VPC mode, including creating, deleting, and describing network interfaces and related Amazon VPC resources. The `ec2:CreateTags` action is restricted to the `CreateNetworkInterface` action. Restricted to resources in the same account.

Amazon SageMaker AI updates to SageMaker AI training sessions managed policies

View the following table for a history of Amazon managed policies for SageMaker AI training sessions, including each policy version and the date it was added.

Policy	Version	Change	Date
AmazonSageMakerTrainingSessionAccess – New policy	1	Initial policy (version 1).	October 13, 2026
AmazonSageMakerTrainingSessionFullAccess – New policy	1	Initial policy (version 1).	October 13, 2026

Core operations

The training session APIs expose a set of first-class operations that you compose into a training loop. Each operation is an API call against your active session. The model remains loaded on GPUs between calls, and gradient state persists within a training step.

forward_backward

- Compute forward and backward passes in a single call.
- Accumulate gradients across batches.
- Specify your loss function (`cross_entropy`, `importance_sampling`, ppo, `cispo`, or a custom loss).

forward

- Run a forward-only pass (no gradient computation).
- Compute loss and metrics without updating optimizer state.
- Useful for evaluation, importance weighting, and KL divergence calculation.
- Same loss function options as `forward_backward`.

optim_step

- Update weights based on accumulated gradients.
- Configure Adam hyperparameters (`learning_rate`, `beta1`, `beta2`, `eps`, `weight_decay`, `gradient_clip_norm`).
- Full control over Adam optimization and LoRA+ learning rate scaling.

sample

- Generate tokens for evaluation, RL rollouts, or inference.
- Generate multiple sequences per prompt (`num_samples`).
- Optionally return per-token prompt log-probabilities.
- Configurable `temperature`, `top_k`, `top_p`, `seed`, `max_tokens`, and stop sequences.

compute_logprobs

- Score existing token sequences without generating new tokens.
- Returns per-token log probabilities over the prompt.
- Essential for RL reference policies, reranking, and importance sampling.
- Works against the base model or any saved checkpoint.

save_weights

- Save inference-ready model weights as a model package.
- Optionally merge LoRA adapters into full standalone weights.
- Output is deployable directly, with no optimizer state overhead.
- Distinct from `save_state`: export for serving versus checkpoint for resumption.

save_state

- Checkpoint full training state (sharded weights and optimizer state).
- Resume training from any checkpoint via `load_state`.
- Registered as a versioned model package for lifecycle tracking.

load_state

- Resume training from any previously saved checkpoint.
- `load_state` restores weights only; the optimizer starts fresh.
- `load_state_with_optimizer` restores weights and optimizer state, so training resumes exactly where the checkpoint left off.
- Use it to resume after an interruption or to branch a new experiment from a saved point.

Getting started with the training session APIs

This guide walks you through setting up and running your first training session. Start here if you are new to the training session APIs and want to get a working training loop running quickly. Before you begin, make sure you have completed the the section called “Prerequisites”.

For conceptual background, see the section called “Training session APIs”. For the full API, see the section called “Python SDK reference”.

Quickstart: supervised fine-tuning

The following example opens a session, runs one supervised fine-tuning (SFT) step on two prompt and response pairs with the `cross_entropy` loss, saves a checkpoint, and stops the session.

Install the SDK. The `tokenizer` extra provides the `get_tokenizer()` method the example uses.

```
pip install 'sagemaker-train[tokenizer]>=1.25.0'
```

Then run:

```
from sagemaker.train.training_session import ServiceClient, AdamParams
from sagemaker.train.training_session._utils import _serialize_loss_fn_inputs

PAIRS = [
    ("Question: 2+2?\nAnswer:", " 4"),
    ("Capital of France?", " Paris"),
]

svc = ServiceClient(
    region="us-west-2",
    role_arn="arn:aws:iam::111122223333:role/MyRole",
    model_package_group_arn="arn:aws:sagemaker:us-west-2:111122223333:model-package-
group/my-training-session-checkpoints",
    s3_output_path="s3://amzn-s3-demo-bucket/training-sessions/",
)
tc = svc.create_lora_training_client(base_model="<name from list_base_models()>",
 rank=32, alpha=64)
tok = tc.get_tokenizer()

batch = []
for prompt, response in PAIRS:
    prompt_ids = tok.encode(prompt, add_special_tokens=False)
```

```
    ids = tok.encode(prompt + response, add_special_tokens=False)
    prompt_len = len(prompt_ids)
    eos = tok.eos_token_id if tok.eos_token_id is not None else ids[-1]
    target_tokens = ids[1:] + [eos]
    weights = [0.0] * prompt_len + [1.0] * (len(ids) - prompt_len)
    batch.append({
        "modelInput": {"chunks": [{"tokens": ids, "type": "encoded_text"}]},
        "lossFnInputs": _serialize_loss_fn_inputs(
            {"target_tokens": target_tokens, "weights": weights}
        ),
    })

fwd_bwd = tc.forward_backward(batch, loss_fn="cross_entropy")
step = tc.optim_step(AdamParams(learning_rate=5e-5))
print(fwd_bwd.result().metrics, step.result().metrics)

print(tc.save_state().result().model_package_arn)
tc.stop()
```

Each entry in `batch` is one training example: the token IDs of the prompt and response, the next token to predict at each position, and a weight per position. A weight of `0.0` excludes the prompt from the loss, so the model learns only the response. `forward_backward` and `optim_step` each return a future immediately, so the optimizer step is queued behind the forward-backward pass; call `.result()` to wait for the metrics.

Available base models vary by Region — call `list_base_models()` instead of hard-coding a list.

> **Important**
>
> You are charged for the tokens a session processes (prefill, sample, and train). An active session also counts against your concurrent-session quota. Call `tc.stop()` when you finish, including in error paths, so an abandoned session does not hold quota or accept further billable operations. For pricing details, see the section called “Supported models, pricing, and Regions”.

Training sessions cookbook

The training sessions cookbook on GitHub provides complete training loops with logging, evaluation, and helper utilities. For the list of recipes, see the section called “End-to-end examples”.

Python SDK reference

Use the SDK for the training session APIs (`sagemaker.train.training_session`) to drive a training loop from your own Python process. Your code issues each step — a forward and backward pass, an optimizer step, sampling, saving or loading a checkpoint — and SageMaker AI manages the infrastructure and the base model. This page describes the behavior you need to write a correct loop.

```
pip install sagemaker-train
```

At a glance

```
from sagemaker.train.training_session import ServiceClient, AdamParams
from sagemaker.train.training_session._utils import _serialize_loss_fn_inputs

PAIRS = [
    ("Question: 2+2?\nAnswer:", " 4"),
    ("Capital of France?", " Paris"),
]

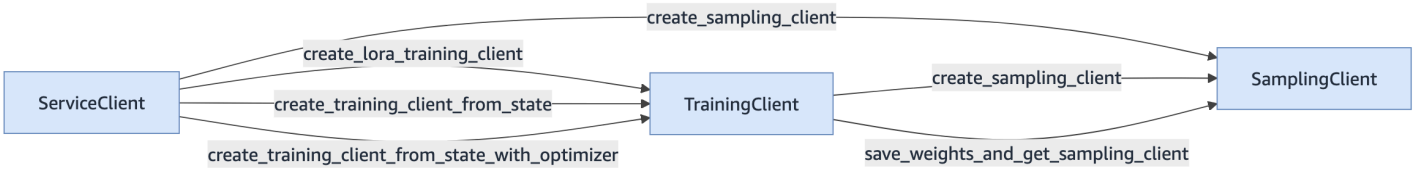
svc = ServiceClient(
    region="us-west-2",
    role_arn="arn:aws:iam::111122223333:role/MyRole",
    model_package_group_arn="arn:aws:sagemaker:us-west-2:111122223333:model-package-
group/my-training-session-checkpoints",
    s3_output_path="s3://amzn-s3-demo-bucket/training-sessions/",
)
print(svc.list_base_models())             # base models you can fine-tune in this
 Region
tc = svc.create_lora_training_client(base_model="<name from list_base_models()>",
 rank=32, alpha=64)
tok = tc.get_tokenizer()                  # the service takes token IDs, so tokenize
 client-side

batch = []
for prompt, response in PAIRS:
    prompt_ids = tok.encode(prompt, add_special_tokens=False)
    ids = tok.encode(prompt + response, add_special_tokens=False)
    prompt_len = len(prompt_ids)
    eos = tok.eos_token_id if tok.eos_token_id is not None else ids[-1]
    target_tokens = ids[1:] + [eos]
    weights = [0.0] * prompt_len + [1.0] * (len(ids) - prompt_len)
```

```
    batch.append({
        "modelInput": {"chunks": [{"tokens": ids, "type": "encoded_text"}]},
        "lossFnInputs": _serialize_loss_fn_inputs(
            {"target_tokens": target_tokens, "weights": weights}
        ),
    })

# Both calls return an APIFuture immediately, so optim_step is queued behind
# forward_backward. Resolve both once they are submitted.
fwd_bwd = tc.forward_backward(batch, loss_fn="cross_entropy")
step = tc.optim_step(AdamParams(learning_rate=5e-5))
print(fwd_bwd.result().metrics, step.result().metrics)

print(tc.save_state().result().model_package_arn)
tc.stop()
```



Each datum in a batch carries the loss inputs its loss function requires — see the section called "Training data". `get_tokenizer()` requires the tokenizer extra (`pip install 'sagemaker-train[tokenizer]'`); pass token IDs directly to skip it. Available base models vary by Region. Call `list_base_models()` instead of hard-coding a list.

Clients

Client	Use it to	Get one from
`ServiceClient`	Create sessions. List sessions, base models, and checkpoints.	Construct it directly.
`TrainingClient`	Drive the training loop.	`ServiceClient.create_lora_training_client` or either restore factory.
`SamplingClient`	Generate tokens from one fixed set of weights.	A `TrainingClient`, or a `ServiceClient` when no session is running.

The following diagram shows which factory method creates each client:

- A `ServiceClient` creates a `TrainingClient` through `create_lora_training_client`, `create_training_client_from_state`, or `create_training_client_from_state_with_optimizer`.
- A `ServiceClient` creates a `SamplingClient` directly through `create_sampling_client`.
- A `TrainingClient` creates a `SamplingClient` through `create_sampling_client` or `save_weights_and_get_sampling_client`.

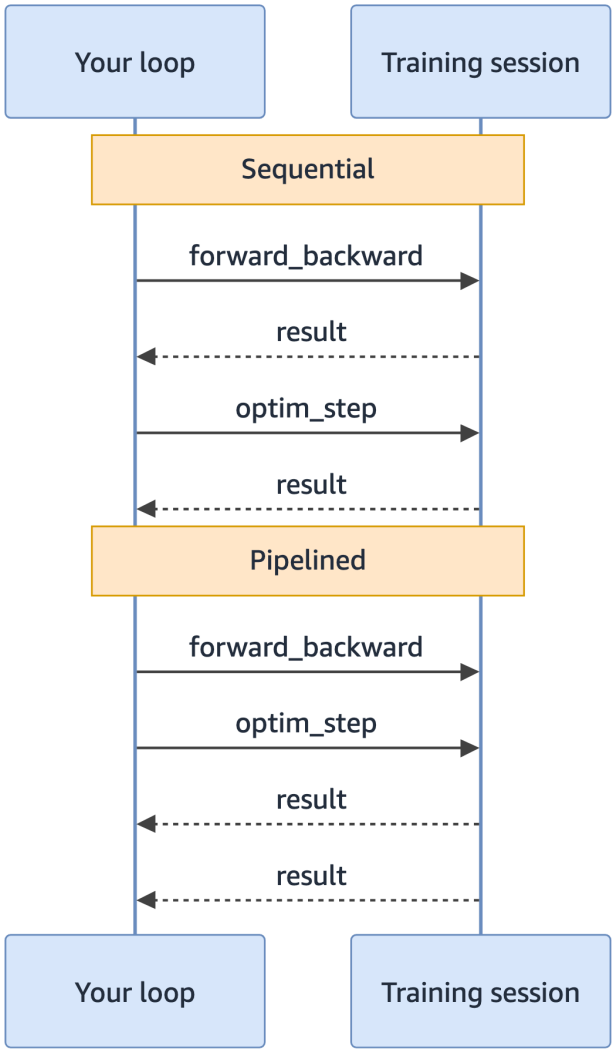
`ServiceClient` requires `role_arn`, the IAM role each session assumes. Set `model_package_group_arn`, `s3_output_path`, `kms_key_arn`, and `vpc_config` on the client to apply them to every session it creates, or pass them per call to override. When you omit them, SageMaker AI supplies account defaults.

Each factory has an `*_async` twin that takes the same arguments and returns the same client. Creating a session waits for it to become ready, which takes from seconds to several minutes depending on the model. The `_async` form performs that wait without blocking the event loop.

```
tc = await svc.create_lora_training_client_async(base_model="...", rank=32)
```

Operations and results

Every operation submits when you call it and returns an `APIFuture`. `future.result()` blocks until the operation finishes, then returns the result or raises `OperationError`. It accepts `timeout` and `poll_interval`. `await future` does the same inside an event loop without blocking it.



Submit successive operations before collecting the earlier one. They pipeline, and both run in the same cycle.

The following diagram compares two ways to run `forward_backward` and `optim_step`:

- *Sequential*: you collect each result before you submit the next operation. Each operation costs one full round trip.
- *Pipelined*: you submit both operations, then collect both results. Both operations are in flight in the same cycle.

The following loop uses the pipelined pattern.

```
for batch in data_loader:
    fwd_bwd = tc.forward_backward(batch, loss_fn="ppo")
    optim = tc.optim_step()
    fwd_bwd.result()
    optim.result()
```

Async variants

What an *_async method returns depends on whether the operation is ordered.

Operations	*_async returns
`forward_backward` , `forward`, `optim_step` , `save_state` , `save_weights_for_sampler` , `load_state` , `load_state_with_optimizer`	An `APIFuture` . Await it again for the result.
`sample`, `compute_logprobs`	The result: `SampleResponse` or `list[float | None]` .

Training operations run in the order you submit them, so the coroutine returns a future and you choose when to wait. Sampling operations are independent, so the coroutine returns the result directly.

```
# Training: two awaits
fwd_bwd = await tc.forward_backward_async(batch, loss_fn="ppo")
result = await fwd_bwd

# Sampling: one await
response = await sc.sample_async(prompt, num_samples=4, sampling_params=params)
```

Concurrent sampling

Each `sample` call takes one prompt. `SamplingParams.max_tokens` defaults to 512, which is also the smallest value the service accepts. Sampling operations are independent, so keep many in flight to raise throughput.

```
results = await asyncio.gather(*(
    sc.sample_async(p, num_samples=4, sampling_params=params)
    for p in prompts
))
```

Synchronous code achieves the same by submitting every call before collecting any:

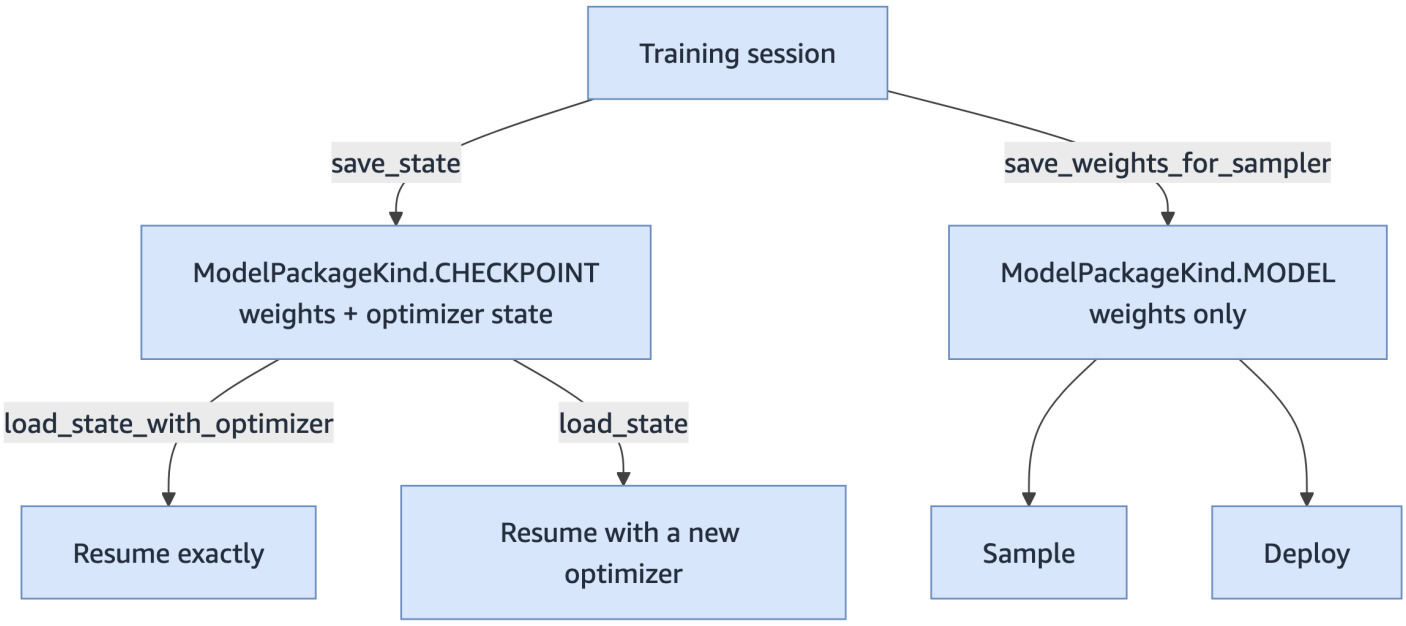
```
ops = [sc.sample(p, num_samples=4, sampling_params=params) for p in prompts]
results = [op.result() for op in ops]
```

Model source

`create_training_client_from_state`, `create_training_client_from_state_with_optimizer`, and `create_sampling_client` accept a base model, saved weights, or both.

You pass	Result
`model_package_arn` only	The base model comes from the package, at the version the weights were trained on.
`base_model` only	Resolved to its latest version.
Both	They must name the same base model, or the call raises `ValueError` . The version still comes from the package.

Because only the model name is compared, a `base_model` that resolves to a newer version than the checkpoint is accepted, and the checkpoint version is used. `base_model` accepts a name from `list_base_models()`, a HuggingFace model ID, or a full hub content ARN to pin an exact version.



Checkpoints

Both checkpoint calls register a versioned SageMaker AI model package. They differ in what they contain.

Call	Contains	Use it to
`save_state()`	Weights and optimizer state	Resume training where it stopped.
`save_weights_for_sampler()`	Weights only	Sample from or deploy a snapshot. Pass `merge_weights=True` to also write a self-contained merged model to the same package version.

The following diagram shows the two save paths and how you use what each one produces. `save_state` writes a `ModelPackageKind.CHECKPOINT` package that contains the weights

and the optimizer state. Restore it with `load_state_with_optimizer` to resume exactly where training stopped, or with `load_state` to resume training with a new optimizer. `save_weights_for_sampler` writes a `ModelPackageKind.MODEL` package that contains the weights only. You can sample from it or deploy it.

The diagram shows the following paths:

- `save_state` writes a `ModelPackageKind.CHECKPOINT` package that contains the weights and the optimizer state.
- `save_weights_for_sampler` writes a `ModelPackageKind.MODEL` package that contains the weights only. You can sample from it or deploy it.
- `load_state_with_optimizer` restores a checkpoint package with its optimizer state, so training resumes exactly where it stopped.
- `load_state` restores the weights from a checkpoint package and resets the optimizer.

Restore with the method that names what you want:

```
tc.load_state(arn).result()                 # weights only; optimizer resets
tc.load_state_with_optimizer(arn).result()  # weights and optimizer
```

Resume a run

A session is compute and cannot be reattached by name. The checkpoint is durable on its own, so checkpoint periodically and resume by starting a new session from the latest one.

```
if step % checkpoint_every == 0:
    tc.save_state(description=f"step {step}").result()

# Later, or in a new process
svc = ServiceClient(region="us-west-2", role_arn=role_arn,
 model_package_group_arn=my_group)
ckpt = svc.get_latest_model_package(ModelPackageKind.CHECKPOINT)
tc =
 svc.create_training_client_from_state_with_optimizer(model_package_arn=ckpt.model_package_arn)
```

Pass your own `model_package_group_arn` for runs you intend to resume. `get_latest_model_package` searches the group set on the client or passed per call, and raises `ValueError` when neither is set. One group per experiment also keeps the result exact, because an unnamed group is shared across your account.

Each saved package consumes Amazon S3 storage until you remove it. `delete_model_package(arn)` removes the package; add `delete_artifacts=True` to remove the stored weights as well. The package holds the only reference to its Amazon S3 location, so deleting the package alone leaves the objects in place.

Training data

`forward_backward` accepts token ID lists or strings. For control over the loss, pass `Datum` objects.

```
from sagemaker.train.training_session import Datum, ModelInput, TensorData, TensorDtype

Datum(
    model_input=ModelInput.from_ints([101, 2023, 3456]),
    loss_fn_inputs={
        "target_tokens": TensorData([2023, 3456, 0], dtype=TensorDtype.INT64,
 shape=[3]),
        "weights": TensorData([0.0, 1.0, 1.0], shape=[3]),
        "logprobs": TensorData(logprobs_tensor),   # torch or numpy
        "advantages": TensorData([0.0, 1.5, 1.5], shape=[3]),
    },
)
```

Each loss function requires specific `loss_fn_inputs` keys. Omitting one fails the operation.

`loss_fn`	Required keys
`cross_entropy`	`target_tokens` , `weights`
`ppo`, `importanc e_sampling` , `cispo`	`target_tokens` , `weights`, `logprobs`, `advantages`

Two requirements apply to every value: the length matches the model input (provide a full-sequence value with the prompt positions zero-padded; a length that disagrees with the token count is rejected), and `weights` masks the prompt (use `0` for prompt tokens and `1` for response tokens so the loss counts only the response).

`TensorData` accepts torch tensors and numpy arrays and converts them when the operation is sent. To pass strings rather than token IDs, call `get_tokenizer()` on a `TrainingClient` or `SamplingClient`. This loads the base model HuggingFace tokenizer and requires the tokenizer extra: `pip install 'sagemaker-train[tokenizer]'`.

On-policy sampling

A `SamplingClient` is bound to the weights that existed when you created it. A later `save_weights_for_sampler` does not change what it samples, and reusing it raises no error — rewards simply stop improving. Rebind after every update:

```
sc = tc.create_sampling_client()
for step in range(num_steps):
    ops = [sc.sample(p, num_samples=4, sampling_params=params) for p in prompts]
    rollouts = [op.result() for op in ops]
    tc.forward_backward(build_batch(rollouts), loss_fn="ppo").result()
    tc.optim_step(AdamParams(learning_rate=1e-5)).result()
    sc = tc.save_weights_and_get_sampling_client()
```

Sessions

Call	Effect
`tc.stop()`	Stop the session. The session record is retained.

Call	Effect
`tc.delete(stop_if_active=False)`	Delete the session. Pass `stop_if_active=True` to stop it first.
`svc.stop_session(name)` , `svc.delete_session(name)`	The same, addressed by name.
`svc.list_sessions(status_equals=...)`	List sessions, paginating automatically.

A session supports one `TrainingClient` at a time. A second client on the same session raises `ConcurrentAccessError`. Call `stop()` when you finish, or scope the client to a `with` block.

API reference

The training session APIs expose two groups of API operations: control-plane operations that manage the session lifecycle, and runtime operations that run training and sampling against an active session. For complete request and response syntax, see the reference pages linked below.

Control plane (session management)

Control-plane operations are part of the SageMaker AI API. Use them to create, inspect, stop, and delete training sessions.

- CreateTrainingSession
- DescribeTrainingSession
- ListTrainingSessions
- StopTrainingSession
- DeleteTrainingSession

Runtime API (training and sampling operations)

Runtime operations are part of the SageMaker AI Training Session Runtime API, a separate service endpoint from the SageMaker AI control plane. You call them against an active session to submit training steps and to generate samples from the in-training model. For the full reference, see the *SageMaker AI Training Session Runtime API Reference*.

Training operations

- ExecuteTrainingOperation
- GetTrainingOperationResult

Sampling operations

- ExecuteSamplingOperation
- GetSamplingOperationResult
- SampleTrainingSession
- SampleTrainingSessionWithResponseStream

Sampling also supports an OpenAI-compatible chat completions endpoint, so you can point existing OpenAI client code at an active training session.

End-to-end examples

The training sessions cookbook on GitHub provides complete, runnable training loops built on the training session APIs. Each recipe covers batching, evaluation, checkpointing with resume, and metrics. Each recipe's README lists the commands, hyperparameters, and expected results.

Recipe	Description
Chat SFT	Supervised fine-tuning on chat datasets with the `cross_entropy` loss.
GSM8K RL	Reinforcement learning on grade-school math problems.
Code RL	Reinforcement learning on competitive-programming problems. Generated solutions run against unit tests in a local sandbox and are rewarded on pass rate.
Preference KTO	Preference alignment from binary desirable and undesirable feedback with Kahneman-Tversky optimization (KTO).

To deploy a saved checkpoint to a SageMaker AI real-time endpoint, see the deployment notebook in the cookbook. For the operation definitions, see the section called “Core operations”. For client behavior, see the section called “Python SDK reference”.

Troubleshooting and best practices

Common errors and solutions

`ConcurrentAccessError`

A session supports one `TrainingClient` at a time. You opened a second client on a session that already has one. Stop the first client, or scope each client to a `with` block.

`OperationError` on `forward_backward`

A required `loss_fn_inputs` key is missing, or a tensor length does not match the model input. Provide full-sequence values with prompt positions zero-padded, and include every key your loss function requires. See the section called “Training data”.

`ValueError` from a restore factory

You passed both `base_model` and `model_package_arn` and they name different base models, or you called `get_latest_model_package` without a `model_package_group_arn`. Pass matching values, or set the group on the client.

Rewards stop improving during RL

You are sampling from stale weights. A `SamplingClient` is bound to the weights that existed when it was created. Rebind after every `optim_step` with `save_weights_and_get_sampling_client()`. See the section called “On-policy sampling”.

Checkpoint operations fail with a Amazon VPC configuration

S3 hostnames are not resolving to private IPs. Enable Private DNS on your S3 interface endpoint and enable DNS support and DNS hostnames on the Amazon VPC. See the section called “Configure a VPC”.

Session inspection and diagnostics

- Use `svc.list_sessions(status_equals=...)` to find active or failed sessions, and `DescribeTrainingSession` for the status and failure reason of a specific session.
- `future.result()` raises `OperationError` with the failure detail for an individual operation. Collect results as you pipeline so a failure surfaces at the step that caused it.

Best practices

- **Checkpoint periodically.** A session is compute and cannot be reattached by name. Call `save_state` on a fixed interval so you can resume from the latest checkpoint after a fault.
- **Stop idle sessions.** An idle session holds the resources. Call `stop()` when you finish, or scope the client to a `with` block.
- **Pipeline operations.** Submit successive training operations before collecting the earlier result, and keep many sampling calls in flight, to raise throughput.
- **Use one model package group per experiment.** An unnamed group is shared across your account, which makes `get_latest_model_package` ambiguous. A dedicated group keeps resume exact.
- **Clean up model packages.** Each saved package consumes Amazon S3 storage until you remove it. Use `delete_model_package(arn, delete_artifacts=True)` to remove both the package and its stored weights.

Security in SageMaker AI Training Sessions

Cloud security at Amazon is the highest priority. As an Amazon customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between Amazon and you. The shared responsibility model describes this as security *of* the cloud and security *in* the cloud:

- **Security of the cloud** – Amazon is responsible for protecting the infrastructure that runs Amazon services in the Amazon Cloud. Amazon also provides you with services that you can use securely. The effectiveness of our security is regularly tested and verified by third-party auditors as part of the Amazon compliance programs.
- **Security in the cloud** – Your responsibility is determined by the Amazon service that you use. You are also responsible for other factors, including the sensitivity of your data, your organization requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using SageMaker AI Training Sessions. The following topics show you how to configure Training Sessions to meet your security and compliance objectives, and how to use other Amazon services that help you monitor and secure your training sessions.

Topics

- the section called “Encryption at rest”
- the section called “Configure a VPC”

Encryption at rest for SageMaker AI Training Sessions

SageMaker AI Training Sessions encrypts all of your data at rest. Your training and sampling operation request and response data, and your training session checkpoints (including LoRA adapter weights), are stored in Amazon S3 using server-side encryption. You do not need to perform any additional configuration to ensure that your data is encrypted at rest.

Options for encryption at rest

SageMaker AI Training Sessions supports the following encryption options:

- **Server-side encryption with an Amazon owned KMS key** – By default, Training Sessions encrypts your data using an Amazon owned KMS key. You do not need to create or manage this key, and no additional configuration is required.
- **Server-side encryption with a customer managed KMS key (SSE-KMS)** – You can optionally specify a customer managed KMS key to encrypt your training session data in Amazon S3. Choose this option if your security requirements call for control over the key lifecycle, key rotation, or key access auditing.

Encrypting data at rest using a customer managed Amazon KMS key

How SageMaker AI Training Sessions uses a customer managed KMS key

When you specify a customer managed KMS key on a training session, Training Sessions uses that key to encrypt the following data in Amazon S3:

- Training session checkpoints, including trained model artifacts (LoRA adapter weights).
- Training and sampling operation request and response data.

When you specify a customer managed key, Training Sessions creates a single grant on the KMS key on your behalf when you create a training session. The grant lets the service call `kms:GenerateDataKey`, `kms:Decrypt`, and `kms:DescribeKey` for that session, and is constrained by an encryption context that binds it to the training session ARN.

Training Sessions retires the grant automatically when the session reaches a terminal state, so the service loses access to the key once the session lifecycle ends. The service does not cache data keys. It retires the grant using the `RetireGrant` privilege carried in the grant itself, so your key policy needs no statement for grant retirement.

During a training session, the following Amazon KMS operations occur:

- `kms:GenerateDataKey` – Called through Amazon S3 when writing encrypted data (checkpoints, model artifacts, and operation data).
- `kms:Decrypt` – Called through Amazon S3 when reading encrypted data.
- `kms:DescribeKey` – Called by the caller identity at session creation time to verify the KMS key configuration and state.
- `kms:CreateGrant` – Called by the caller identity at session creation time to create the session grant described above.

Configuring a customer managed Amazon KMS key

Training Sessions supports symmetric Amazon KMS keys only. Multi-region keys are not supported. The key must be in the same Amazon account and Region as the training session.

Configuring permissions to use a customer managed KMS key

To use a customer managed KMS key, configure permissions in three places: the IAM execution role, the caller identity IAM policy, and the Amazon KMS key policy.

Execution role

The IAM execution role you pass as `RoleArn` to `CreateTrainingSession` must have the following Amazon KMS permissions. These allow the training session to encrypt and decrypt your data through Amazon S3.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "KMSPermissionsForS3Encryption",
      "Effect": "Allow",
      "Action": [
        "kms:Decrypt",
```

```
        "kms:GenerateDataKey"
      ],
      "Resource": "arn:aws:kms:region:account-id:key/key-id",
      "Condition": {
        "StringLike": {
          "kms:ViaService": "s3.*.amazonaws.com"
        }
      }
    }
  ]
}
```

The `kms:ViaService` condition (`s3.*.amazonaws.com`) restricts the execution role use of the key to requests that come through Amazon S3. If your bucket is configured with default encryption under a different KMS key, also grant the execution role `kms:GenerateDataKey` and `kms:Decrypt` on that key so it can read and write objects in your bucket.

Caller identity

At session creation, and before it processes a training or sampling operation, Training Sessions verifies the caller identity is permitted to use the key. The identity that calls `CreateTrainingSession` and invokes these operations must be allowed the following actions, scoped with a `kms:ViaService` of `sagemaker.*.amazonaws.com`.

```
{
  "Sid": "KMSPermissionsForSessionCreation",
  "Effect": "Allow",
  "Action": [
    "kms:CreateGrant",
    "kms:DescribeKey"
  ],
  "Resource": "arn:aws:kms:region:account-id:key/key-id",
  "Condition": {
    "StringLike": {
      "kms:ViaService": "sagemaker.*.amazonaws.com"
    }
  }
}
```

```
{
  "Sid": "KMSPermissionsForTrainingSessionsRuntime",
  "Effect": "Allow",
```

```
  "Action": [
    "kms:Decrypt",
    "kms:GenerateDataKey"
  ],
  "Resource": "arn:aws:kms:region:account-id:key/key-id",
  "Condition": {
    "StringLike": {
      "kms:ViaService": "sagemaker.*.amazonaws.com",
      "kms:EncryptionContext:aws:sagemaker:training-session-arn":
 "arn:aws:sagemaker:region:account-id:training-session/*"
    }
  }
}
```

These permission verifications always include the training session ARN in the encryption context, so you can scope this statement with the `kms:EncryptionContext:aws:sagemaker:training-session-arn` condition shown above.

Key policy

The default KMS key policy already allows IAM roles in the same account to use the key. Add the following statements to your key policy to allow the caller identity — through Training Sessions — to create the session grant and validate the key at `CreateTrainingSession` time. The two statements are separate because `kms:GrantIsForAWSResource` and `kms:GrantOperations` apply only to grant operations, not to `kms:DescribeKey`.

```
{
  "Sid": "AllowDescribeKeyForTrainingSession",
  "Effect": "Allow",
  "Principal": {
    "AWS": "arn:aws:iam::account-id:role/CallerRole"
  },
  "Action": "kms:DescribeKey",
  "Resource": "*",
  "Condition": {
    "StringEquals": {
      "kms:CallerAccount": "account-id"
    },
    "StringLike": {
      "kms:ViaService": "sagemaker.*.amazonaws.com"
    }
  }
```

```
}
```

```
{
  "Sid": "AllowCreateGrantForTrainingSession",
  "Effect": "Allow",
  "Principal": {
    "AWS": "arn:aws:iam::account-id:role/CallerRole"
  },
  "Action": "kms:CreateGrant",
  "Resource": "*",
  "Condition": {
    "StringEquals": {
      "kms:CallerAccount": "account-id"
    },
    "StringLike": {
      "kms:ViaService": "sagemaker.*.amazonaws.com"
    },
    "Bool": {
      "kms:GrantIsForAWSResource": "true"
    },
    "ForAllValues:StringEquals": {
      "kms:GrantOperations": [
        "GenerateDataKey",
        "Decrypt",
        "DescribeKey"
      ]
    }
  }
}
```

If your key policy does not delegate permissions to IAM (a locked-down key policy without the default *Enable IAM User Permissions* statement), also add the following two statements — one so the execution role can perform Amazon S3 SSE-KMS operations, and one so the identity that invokes runtime operations passes the service permission verification:

```
{
  "Sid": "AllowExecutionRoleS3Encryption",
  "Effect": "Allow",
  "Principal": {
    "AWS": "arn:aws:iam::account-id:role/ExecutionRole"
  },
  "Action": [
```

```
    "kms:GenerateDataKey",
    "kms:Decrypt"
  ],
  "Resource": "*",
  "Condition": {
    "StringLike": {
      "kms:ViaService": "s3.*.amazonaws.com"
    }
  }
}
```

```
{
  "Sid": "AllowCallerRuntimeAuthorization",
  "Effect": "Allow",
  "Principal": {
    "AWS": "arn:aws:iam::account-id:role/CallerRole"
  },
  "Action": [
    "kms:Decrypt",
    "kms:GenerateDataKey"
  ],
  "Resource": "*",
  "Condition": {
    "StringLike": {
      "kms:ViaService": "sagemaker.*.amazonaws.com"
    }
  }
}
```

Creating a training session with a customer managed KMS key

To encrypt your data with a customer managed KMS key, specify the key ARN in the `OutputConfig.S3Location.KmsKeyArn` field of your `CreateTrainingSession` request. `KmsKeyArn` accepts a key ID or key ARN; KMS aliases are not supported. For more information, see CreateTrainingSession in the *SageMaker AI API Reference*.

```
{
  "OutputConfig": {
    "S3Location": {
      "Path": "s3://your-bucket/output/",
      "KmsKeyArn": "arn:aws:kms:region:account-id:key/key-id"
    }
```

```
  }
}
```

You cannot change the customer managed key, or switch between an Amazon owned key and a customer managed key, after a training session is created. To use a different key, create a new training session with the desired key configuration. Data encrypted under the original key remains encrypted under that key.

Scoping down access to the customer managed KMS key

You can use the following mechanisms to restrict use of your customer managed KMS key:

- **Encryption context** – The session grant is created with an encryption context constraint that binds every Amazon KMS operation to the training session ARN.
- **kms:ViaService** – The execution role permissions are scoped to `s3.*.amazonaws.com` (Amazon S3 SSE-KMS operations on your output bucket); the caller identity runtime permissions are scoped to `sagemaker.*.amazonaws.com` (service authorization checks).
- **Confused-deputy protection** – Use the `aws:SourceArn` or `aws:SourceAccount` condition keys in your Amazon KMS key policy to prevent the confused deputy problem. This ensures that only requests originating from your specific account or resource can use the key:

  ```
  "Condition": {
    "StringEquals": {
      "aws:SourceAccount": "account-id"
    },
    "ArnLike": {
      "aws:SourceArn": "arn:aws:sagemaker:region:account-id:training-session/*"
    }
  }
  ```

- **kms:GrantIsForAWSResource** – This condition on `kms:CreateGrant` restricts the caller grant-creation permission so it can be used only when an Amazon service creates the grant on your behalf; the caller cannot use it to create arbitrary grants directly.

Encryption context for training sessions

When Training Sessions encrypts data with your customer managed KMS key, it includes an encryption context in every Amazon KMS request. An encryption context is a set of key-value pairs that provide additional authenticated data (AAD) for Amazon KMS operations. The encryption

context is logged in Amazon CloudTrail and can be used in KMS key policies and grant constraints to further restrict access.

Training Sessions uses the following encryption context key-value pair:

```
{
  "aws:sagemaker:training-session-arn": "arn:aws:sagemaker:region:account-id:training-session/session-id"
}
```

The encryption context is enforced automatically through the grant constraint that Training Sessions applies at session creation time; the execution role Amazon S3 operations run within the grant scope, so its policy statement does not need to duplicate the encryption context condition. You do not need to add encryption context conditions to your key policy for encryption to work correctly. When you review CloudTrail logs, the encryption context appears in the `requestParameters` field and identifies the training session that performed each operation.

Monitoring Training Sessions interaction with Amazon KMS

You can use Amazon CloudTrail to monitor the Amazon KMS API calls made on behalf of your training sessions. The `userIdentity.invokedBy` field shows the service that made each call on your behalf. The following CloudTrail event names are relevant for monitoring:

- `CreateGrant` – Logged when the session grant is created at `CreateTrainingSession`; `invokedBy` shows `sagemaker.amazonaws.com`.
- `RetireGrant` – Logged when the grant is retired as the session reaches a terminal state (stopped, failed, or deleted); `invokedBy` shows `training-session.sagemaker.amazonaws.com`.
- `GenerateDataKey` – Logged when the service writes encrypted data to Amazon S3 (`invokedBy` shows the Amazon S3 service), and for authorization checks before runtime operations (`invokedBy` shows `training-session.sagemaker.amazonaws.com`).
- `Decrypt` – Logged when the service reads encrypted data from Amazon S3 (`invokedBy` shows the Amazon S3 service), and for authorization checks before runtime operations (`invokedBy` shows `training-session.sagemaker.amazonaws.com`).
- `DescribeKey` – Logged when the key is validated at session creation.

In the CloudTrail log entries, look for the following values:

- `requestParameters.encryptionContext["aws:sagemaker:training-session-arn"]` – On `GenerateDataKey` and `Decrypt` events for Amazon S3 operations, identifies the training session that performed the operation. This is the authoritative field for attributing Amazon KMS activity to a specific training session.
- `requestParameters.granteePrincipal` – On `CreateGrant` events, shows the service principal that received the grant: `sagemaker.`*`region`*`.amazonaws.com` (for example, `sagemaker.us-west-2.amazonaws.com`). The `retiringPrincipal` shows the same value. On a denied `CreateGrant`, CloudTrail records no `requestParameters`, so this field is absent.

For guidance on searching Amazon KMS CloudTrail events, see Logging Amazon KMS API calls with Amazon CloudTrail in the *Amazon KMS Developer Guide*.

Configure a VPC for SageMaker AI training sessions

When you provide a `VpcConfig` in your `CreateTrainingSession` request, SageMaker AI training sessions place a proxy elastic network interface (ENI) in your VPC. All customer data traffic — including access to your Amazon S3 buckets for checkpoints and model artifacts — flows through this ENI. This keeps data within your VPC network boundary.

Topics

- Required VPC setup
- IAM permissions
- API configuration
- Restrict access to your VPC

Required VPC setup

Subnets

Provide at least two private subnets in different Availability Zones for redundancy. Up to 16 subnets are supported.

Enable DNS support and DNS hostnames on your VPC.

```
aws ec2 modify-vpc-attribute --vpc-id vpc-0abc123 \
    --enable-dns-support '{"Value": true}'
aws ec2 modify-vpc-attribute --vpc-id vpc-0abc123 \
    --enable-dns-hostnames '{"Value": true}'
```

The subnets do not need a NAT gateway or internet gateway because all Amazon service traffic exits through VPC endpoints.

Security group

Create a security group with the following outbound rules. No inbound rules are required for the proxy ENI itself.

Scope the egress rules to your VPC CIDR, or to the private IP addresses or security group of your Amazon S3 interface endpoint ENIs. Don't scope them to the Amazon S3 managed prefix list (`pl-xxxxxxxx`). That list contains only the public IP ranges of Amazon S3, which apply to a gateway endpoint. In this setup, Amazon S3 traffic goes through the interface endpoint and resolves to private ENI IP addresses inside your VPC.

Protocol	Port	Destination	Purpose
TCP	443	Your VPC CIDR, for example `10.0.0.0/16`	HTTPS to the Amazon S3 interface endpoint
UDP	53	Your VPC CIDR, for example `10.0.0.0/16`	DNS resolution via the VPC resolver

Up to 5 security groups are supported.

The following example creates the security group and its egress rules. Replace `10.0.0.0/16` with your VPC CIDR.

```
SG_ID=$(aws ec2 create-security-group \
    --group-name training-session-proxy-sg \
    --description "Proxy ENI for SageMaker Training Sessions" \
    --vpc-id vpc-0abc123 \
    --query 'GroupId' --output text)

# Remove the default allow-all egress rule
aws ec2 revoke-security-group-egress --group-id ${SG_ID} \
    --ip-permissions '[{"IpProtocol": "-1", "IpRanges": [{"CidrIp": "0.0.0.0/0"}]}]'

# Allow HTTPS egress within the VPC
```

```
aws ec2 authorize-security-group-egress --group-id ${SG_ID} \
    --protocol tcp --port 443 --cidr 10.0.0.0/16

# Allow DNS egress within the VPC
aws ec2 authorize-security-group-egress --group-id ${SG_ID} \
    --protocol udp --port 53 --cidr 10.0.0.0/16
```

VPC endpoints

Create an Amazon S3 interface endpoint in your VPC so that the service can reach your Amazon S3 bucket without traversing the public internet. The service routes checkpoint reads and writes through a proxy network interface that uses your VPC's DNS resolver — an interface endpoint with Private DNS enabled is required so that Amazon S3 hostnames resolve to private IPs within your VPC.

Why an interface endpoint (not a gateway endpoint)? The service proxy sends Amazon S3 traffic to whatever IP your VPC's DNS resolver returns for the Amazon S3 hostname. With an interface endpoint and Private DNS enabled, that resolves to private ENI IPs reachable from any subnet, so routing works no matter which of your `VpcConfig.Subnets` the proxy ENI is placed in. A gateway endpoint is a valid, cheaper alternative, but it routes via an Amazon S3 prefix-list entry in the subnet's route table — so you would have to ensure that prefix-list route is present on the route table of every subnet you pass in `VpcConfig.Subnets`, since the service picks the subnet at runtime.

Endpoint	Traffic routed	Service name	Type
Amazon S3 (required)	Checkpoints, model artifacts	`com.amazonaws.` *`region`*`.s3`	Interface

Create a security group for the interface endpoint, then create the Amazon S3 interface endpoint with it. This is a separate security group from the proxy ENI group you created earlier.

> **Important**
>
> Enable Private DNS on the endpoint. The service proxy uses your VPC's DNS resolver to reach Amazon S3. Without Private DNS, Amazon S3 hostnames don't resolve to private IP addresses, and checkpoint operations fail. The following command sets `--private-dns-enabled`.

```
ENDPOINT_SG_ID=$(aws ec2 create-security-group \
    --group-name training-session-endpoint-sg \
    --description "S3 interface endpoint for SageMaker Training Sessions" \
    --vpc-id vpc-0abc123 \
    --query 'GroupId' --output text)

aws ec2 create-vpc-endpoint \
    --vpc-id vpc-0abc123 \
    --service-name com.amazonaws.us-east-1.s3 \
    --vpc-endpoint-type Interface \
    --subnet-ids subnet-0abc123 subnet-0def456 \
    --security-group-ids ${ENDPOINT_SG_ID} \
    --private-dns-enabled
```

Interface endpoint security group

The Amazon S3 interface endpoint must have a security group that allows inbound TCP 443 from your VPC CIDR.

```
aws ec2 authorize-security-group-ingress --group-id ${ENDPOINT_SG_ID} \
    --protocol tcp --port 443 --cidr 10.0.0.0/16
```

IAM permissions

The execution role you pass as `RoleArn` to `CreateTrainingSession` must have Amazon EC2 permissions to manage the proxy ENI on your behalf. The `AmazonSageMakerTrainingSessionFullAccess` managed policy includes these permissions. If you use a custom execution role, add the following three policy statements.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "EC2NetworkPermissions",
            "Effect": "Allow",
            "Action": [
                "ec2:CreateNetworkInterface",
                "ec2:CreateNetworkInterfacePermission",
                "ec2:DescribeNetworkInterfaces",
                "ec2:DescribeVpcs",
                "ec2:DescribeSubnets",
                "ec2:DescribeSecurityGroups",
```

```
                "ec2:DescribeDhcpOptions"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceAccount": "${aws:PrincipalAccount}"
                }
            }
        },
        {
            "Sid": "EC2NetworkInterfaceTagPermissions",
            "Effect": "Allow",
            "Action": [
                "ec2:CreateTags"
            ],
            "Resource": "arn:aws:ec2:*:*:network-interface/*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceAccount": "${aws:PrincipalAccount}",
                    "ec2:CreateAction": "CreateNetworkInterface"
                }
            }
        },
        {
            "Sid": "EC2NetworkInterfaceDeletePermissions",
            "Effect": "Allow",
            "Action": [
                "ec2:DeleteNetworkInterface",
                "ec2:DeleteNetworkInterfacePermission"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "aws:ResourceAccount": "${aws:PrincipalAccount}"
                }
            }
        }
    ]
}
```

API configuration

Include the `VpcConfig` parameter in your `CreateTrainingSession` request. Specify up to 5 security group IDs and up to 16 subnet IDs.

```
{
    "VpcConfig": {
        "SecurityGroupIds": ["sg-0abc123def"],
        "Subnets": ["subnet-0abc123", "subnet-0def456"]
    }
}
```

Using the Amazon CLI:

```
aws sagemaker create-training-session \
    --training-session-name my-session \
    --role-arn arn:aws:iam::111122223333:role/MySageMakerRole \
    --base-model-arn arn:aws:sagemaker:us-east-1:aws:hub-content/SageMakerPublicHub/
Model/openai-reasoning-gpt-oss-20b \
    --vpc-config SecurityGroupIds=sg-0abc123def,Subnets=subnet-0abc123,subnet-0def456
```

You cannot modify `VpcConfig` after a session is created. To change the VPC configuration, create a new training session.

Restrict access to your VPC

You can apply additional controls to harden your VPC configuration.

Amazon S3 bucket policy

To restrict Amazon S3 access to requests originating from your VPC endpoint only, add a deny statement with the `aws:SourceVpce` condition key. This prevents any Amazon S3 access that does not flow through your specific Amazon S3 interface endpoint — including direct access from the public internet or from other VPC endpoints. For more information, see Using Amazon S3 bucket policies.

```
{
    "Sid": "DenyAccessFromOutsideVpcEndpoint",
    "Effect": "Deny",
    "Principal": "*",
```

```
    "Action": "s3:*",
    "Resource": [
        "arn:aws:s3:::amzn-s3-demo-bucket",
        "arn:aws:s3:::amzn-s3-demo-bucket/*"
    ],
    "Condition": {
        "StringNotEquals": {
            "aws:SourceVpce": "vpce-0abc123def456"
        }
    }
}
```

Note

Replace `vpce-0abc123def456` with the VPC endpoint ID of the Amazon S3 interface endpoint you created. To find it, run `aws ec2 describe-vpc-endpoints --filters Name=service-name,Values=com.amazonaws.region.s3 Name=vpc-id,Values=vpc-0abc123`. If you prefer to scope by VPC rather than a specific endpoint, use `aws:SourceVpc` with your VPC ID instead — both condition keys are available for interface endpoints.

VPC endpoint policies

You can attach a resource policy to your Amazon S3 interface endpoint to limit which actions and buckets are accessible through it. The following example restricts the endpoint to the specific Amazon S3 actions that training sessions require on your training bucket.

```
{
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": "*",
            "Action": [
                "s3:GetObject",
                "s3:PutObject",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket",
                "arn:aws:s3:::amzn-s3-demo-bucket/*"
```

```
            ]
        }
    ]
}
```

Any Amazon S3 request through this endpoint that targets a different bucket or uses a different action is denied by the endpoint policy, even if the requester's IAM policy would otherwise allow it.

SageMaker AI Training Jobs

Amazon SageMaker AI Training Jobs is a fully managed service that you can use to efficiently train AI/ML models at scale. With SageMaker AI Training Jobs, you can select and manage compute instances for model customization. You have full control over instance type and configuration. Jobs are ephemeral — instances are provisioned for the duration of training and released when complete. For more information about SageMaker AI Training Jobs, see Train a Model with Amazon SageMaker AI.

For a fully managed experience without instance selection, see the section called “Serverless”.

Overview

Regional availability

SageMaker AI Training Jobs is available in all SageMaker AI regions.

Interfaces

Recipes

Run pre-configured training recipes using SageMaker AI Recipes. Recipes work with both SageMaker AI Training Jobs and HyperPod, automating dataset loading, distributed training, and checkpoint management.

Python SDK V3 (ModelTrainer)

Use the `ModelTrainer` class from the SageMaker AI Python SDK to submit training jobs programmatically with full control over instance selection and configuration.

```
from sagemaker.train import ModelTrainer
from sagemaker.train.configs import Compute, InputData
```

```
trainer = ModelTrainer(
    training_image="my-training-image",
    role="arn:aws:iam::123456789012:role/SageMakerRole",
    compute=Compute(instance_type="ml.p4d.24xlarge", instance_count=2)
)

trainer.train(input_data_config=[
    InputData(channel_name="training", data_source="s3://my-bucket/train")
])
```

Studio (legacy models)

For older models, use the model detail card → Train button in Studio. This flow allows instance selection and hyperparameter configuration.

Supported techniques

- SFT, DPO, RLVR, RLAIF (via Recipes)
- PPO (Amazon Nova models only)
- CPT (Continued Pre-Training)

Supported training types

- LoRA
- FFT (Full Fine-Tuning)

Getting started

To get started with SageMaker AI Training Jobs using Recipes:

1. Clone the recipes repository:

```
git clone --recursive https://github.com/aws/sagemaker-hyperpod-recipes.git
cd sagemaker-hyperpod-recipes
pip3 install -r requirements.txt
```

2. Choose a recipe from `recipes_collection/recipes/fine-tuning/` for your model and technique.

3. Configure your training data path and hyperparameters in the recipe YAML file.
4. Launch the training job using the launcher script.

For detailed tutorials, see SageMaker AI HyperPod recipes documentation.

HyperPod

HyperPod runs model customization on persistent compute clusters that remain available across multiple training jobs. HyperPod provides advanced fault detection and recovery, making it ideal for large-scale and long-running training workloads.

For ephemeral training jobs, see the section called "SageMaker AI Training Jobs". For fully managed serverless training, see the section called "Serverless".

For supported customization techniques and training types, see the section called "Techniques".

Overview

Regional availability

Available in all HyperPod supported regions.

Orchestration options

- **HyperPod with Amazon EKS** — Interfaces: Recipes, HP-CLI. Use Kubernetes-based workload orchestration with dynamic capacity management and containerized training jobs.
- **HyperPod with Slurm** — Interfaces: Recipes. Use Slurm-based job scheduling with head, login, and worker node configuration.

Supported techniques and training types

HyperPod supports all customization techniques and training types. See the section called "Techniques" and the section called "Training types".

Getting started

If this is your first time using HyperPod, see Prerequisites for using SageMaker AI HyperPod to set up your cluster.

To run model customization on an existing HyperPod cluster:

1. Clone the recipes repository:

```
git clone --recursive https://github.com/aws/sagemaker-hyperpod-recipes.git
cd sagemaker-hyperpod-recipes
pip3 install -r requirements.txt
```

2. Choose a recipe from `recipes_collection/recipes/fine-tuning/`.
3. Configure cluster-specific settings (see Cluster-specific configurations).
4. Launch using the appropriate method:
   - **EKS:** Use the launcher script or HP-CLI
   - **Slurm:** Use the launcher script

For detailed tutorials and the full recipe catalog, see SageMaker AI Recipes documentation.

For more information about HyperPod, see Amazon SageMaker AI HyperPod.

Customization techniques

Customization techniques define *how* your model learns from data. Each technique requires a different dataset format and has its own hyperparameters. Choose based on what data you have and what behavior you want to achieve.

For Python SDK examples, see the example section in each technique page and the section called "Serverless trainers".

- **the section called "SFT"** (Supervised Fine-Tuning) — Train on labeled prompt-response pairs. Best for teaching a model specific style, format, or domain knowledge. For the expected training data structure, see the section called "Dataset format".
- **the section called "DPO"** (Direct Preference Optimization) — Train on preferred vs rejected response pairs. Best for aligning with human preferences and avoiding undesirable outputs. For dataset requirements, see the section called "Dataset format".
- **the section called "RFT"** (Reinforcement Fine-Tuning) — Optimize via reward signals: code-based verification (**RLVR**) or an LLM judge (**RLAIF**). Best for improving factual accuracy or subjective quality. For RLVR dataset requirements, see the section called "Dataset format". For RLAIF dataset requirements, see the section called "Dataset format".

- **Sequence lengths** — Maximum sequence lengths supported for each open weight model, technique, and training type in serverless customization.
- **the section called "Multi-turn reinforcement learning"** (Multi-Turn Reinforcement Learning) — Train agents for multi-step agentic tasks with growing context. For setup requirements, see the section called "Prerequisites".
- **the section called "Continuous customization"** (Continuous Customization) — Chain multiple techniques sequentially (for example, SFT → DPO → RLVR). Requires LoRA training type.
- **the section called "Distillation"** — Transfer knowledge from a *teacher* model to a *student* model. Best when you have a specific high-volume task that the student can be trained on. When the student is smaller than the teacher, you also get lower inference latency of the student model.

Each technique can be combined with either LoRA or FFT training type. See the section called "Training types" for details on choosing between them.

Technique	Dataset format	SDK trainer	FFT	Notes
the section called "SFT"	`messages` or `prompt/completion` JSONL	`SFTTrainer`	Yes	LoRA and FFT use the same dataset schema. See the section called "Dataset format".
the section called "DPO"	`chosen/rejected` message pairs or `prompt/chosen/rejecte` JSONL	`DPOTrainer`	Yes	LoRA and FFT use the same dataset schema. See the section called "Dataset format".
RLVR	`prompt` with `reward_model` metadata JSONL	`RLVRTrainer`	Yes	LoRA and FFT use the same dataset schema. See the section called "Dataset format".
RLAIF	`prompt` with LLM-judge `reward_model` metadata JSONL	`RLAIFTrainer`	Yes	LoRA and FFT use the same dataset schema. See the section called "Dataset format".

Technique	Dataset format	SDK trainer	FFT	Notes
the section called "Multi-turn reinforcement learning"	`prompt` column in Parquet, JSONL, JSON, or CSV	`MultiTurnRLTrainer`	No	MTRL training uses prompt datasets and a multi-turn agent environment. See the section called "Prompt dataset format" and the section called "SageMaker AI Python SDK".

SFT

Supervised Fine-Tuning trains a model on labeled input-output pairs to align its behavior with specific examples. The model learns to produce responses that match your training data.

When to use

- You have high-quality prompt-response pairs for your target task
- You want the model to learn a specific style, format, or domain knowledge
- You need consistent behavior on well-defined tasks (summarization, classification, Q&A)

What it achieves

The model learns to mimic the patterns in your training examples, producing outputs that match the style, format, and content of your labeled data.

Dataset format

SFT supports two dataset formats. All datasets must be in JSONL format (one JSON object per line). A `system` message is optional in both formats.

Format 1: `messages`

Represent the conversation as a list of role-tagged messages. If included, the `system` message must be the first element.

```
{
```

```
  "messages": [
    {"role": "system", "content": "..."},
    {"role": "user", "content": "..."},
    {"role": "assistant", "content": "..."}
  ]
}
```

Format 2: `prompt/completion`

Provide the input and expected output as separate fields, with an optional top-level `system` field.

```
{
  "system": "...",
  "prompt": "...",
  "completion": "..."
}
```

> **Note**
>
> The `system` message is optional. Ensure diversity in prompts and response styles.

Python SDK example

Use `SFTTrainer` for serverless SFT customization jobs:

```
from sagemaker.train import SFTTrainer

trainer = SFTTrainer(
    model_id="meta-textgeneration-llama-3-1-8b-instruct",
    train_data="s3://my-bucket/sft-train.jsonl",
    hyperparameters={
        "max_epochs": 3,
        "learning_rate": 5e-5,
        "global_batch_size": 32,
        "lora_rank": 16,
    },
)

trainer.train()
```

To run FFT instead of LoRA, use the same dataset format and remove LoRA-specific hyperparameters such as `lora_rank`, `lora_alpha`, and `lora_dropout`.

Hyperparameters

> **Note**
>
> The tables below show the hyperparameters available when you use serverless model customization. Other hyperparameters are preset by Amazon SageMaker AI using optimized defaults. When you use SageMaker AI Training Jobs or HyperPod, you can access the full list of hyperparameters available in the recipes. See the SageMaker AI Recipes repository to get a recipe and access all hyperparameters.

SFT LoRA

Parameter	Type	Require	Range / Values	Description
`max_epochs`	integer	**Require**	1–100	Number of complete passes through the training dataset.
`global_batch_size`	integer	**Require**	8, 16, 32, 64, 128, 256, 512, 1024	Total samples processed per optimizer step across all instances.
`learning_rate`	float	**Require**	5e-07–1e-04	Step size for weight updates during optimization.
`lr_scheduler`	string	**Require**	cosine, constant	Learning rate decay schedule over training.
`lr_warmup_steps_ratio`	float	**Require**	0–1	Fraction of total steps spent ramping learning rate from 0.
`weight_decay`	float	**Require**	0.0–1.0	L2 regularization coefficient. Helps prevent overfitting.
`gradient_clipping`	boolean	**Require**	true, false	Scale down gradients if norm exceeds threshold.

Parameter	Type	Require	Range / Values	Description
gradient_clipping_threshold	float	**Require**	0.0–5.0	Maximum allowed gradient norm.
dataset_max_len	integer	**Require**	256–131072	Maximum sequence length in tokens. Longer sequences are truncated.
seed	integer	**Require**	0–2147483647	Random seed for reproducibility.
logging_steps	integer	**Require**	1–100	Frequency of metric logging in optimizer steps.
lora_rank	integer	**Require**	8, 16, 32, 64, 128	Dimensionality of low-rank matrices. Lower = fewer trainable parameters.
lora_dropout	float	**Require**	0.0–1.0	Dropout probability for LoRA adapter layers.
lora_alpha	integer	**Require**	16, 32, 64, 128, 256	LoRA scaling factor. Effective LR scales as alpha/rank.
merge_weights	boolean	**Require**	true, false	Merge LoRA weights into base model after training.
train_val_split_ratio	float	Optiona	0.0–1.0	Fraction allocated to training vs validation.
temperature	float	**Require**	0.0–2.0	Sampling temperature for evaluation.

SFT FFT

Parameter	Type	Require	Range / Values	Description
max_epochs	integer	**Require**	1–100	Number of complete passes through the training dataset.
global_batch_size	integer	**Require**	8, 16, 32, 64, 128, 256, 512, 1024	Total samples processed per optimizer step.
learning_rate	float	**Require**	5e-07–1e-04	Step size for weight updates.
lr_scheduler	string	**Require**	cosine, constant	Learning rate decay schedule.
lr_warmup_steps_ratio	float	**Require**	0–1	Fraction of steps for LR warmup.
weight_decay	float	**Require**	0.0–1.0	L2 regularization coefficient.
gradient_clipping	boolean	**Require**	true, false	Scale down gradients if norm exceeds threshold.
gradient_clipping_threshold	float	**Require**	0.0–5.0	Maximum allowed gradient norm.
dataset_max_len	integer	**Require**	256–131072	Maximum sequence length in tokens.
max_response_length	integer	**Require**	100–200000	Maximum tokens for generated response.
seed	integer	**Require**	0–2147483647	Random seed for reproducibility.
logging_steps	integer	**Require**	1–100	Frequency of metric logging.
train_val_split_ratio	float	Optiona	0.0–1.0	Fraction allocated to training vs validation.

Parameter	Type	Require	Range / Values	Description
`temperature`	float	**Require**	0.0–2.0	Sampling temperature for evaluation.

DPO

Description

Direct Preference Optimization (DPO) aligns a model with human preferences by training on pairs of chosen (preferred) and rejected (non-preferred) responses to the same prompt.

When to use

- You have preference data showing which responses are better
- Improve response quality beyond what SFT achieves
- Model needs to avoid specific undesirable behaviors

What it achieves

Model learns to prefer generating responses similar to chosen examples and avoid rejected examples, without requiring a separate reward model.

Dataset format

DPO requires pairs of chosen (preferred) and rejected (non-preferred) responses for the same prompt. DPO supports two dataset formats. All datasets must be in JSONL format (one JSON object per line). A `system` message is optional in both formats.

Format 1: `messages`

Provide `chosen` and `rejected` as full message lists. If included, the `system` message must be the first element and must be the same in both `chosen` and `rejected`.

```
{
  "chosen": [
    {"role": "system", "content": "..."},
    {"role": "user", "content": "..."},
    {"role": "assistant", "content": "..."}
```

```
  ],
  "rejected": [
    {"role": "system", "content": "..."},
    {"role": "user", "content": "..."},
    {"role": "assistant", "content": "..."}
  ]
}
```

Format 2: `prompt/chosen/rejected`

Provide the prompt and both responses as separate string fields, with an optional top-level `system` field.

```
{
  "system": "...",
  "prompt": "...",
  "chosen": "...",
  "rejected": "..."
}
```

Guidance

- Chosen and rejected responses should differ meaningfully in quality
- Use the same prompt for both chosen and rejected
- The `system` message is optional

Python SDK example

Use `DPOTrainer` for serverless DPO customization jobs:

```
from sagemaker.train import DPOTrainer

trainer = DPOTrainer(
    model_id="meta-textgeneration-llama-3-1-8b-instruct",
    train_data="s3://my-bucket/dpo-train.jsonl",
    hyperparameters={
        "max_epochs": 2,
        "learning_rate": 1e-5,
        "global_batch_size": 32,
        "lora_rank": 16,
        "adam_beta": 0.01,
```

```
    },
)

trainer.train()
```

To run FFT instead of LoRA, use the same dataset format and remove LoRA-specific hyperparameters such as `lora_rank`, `lora_alpha`, and `lora_dropout`.

Hyperparameters - DPO LoRA

> **Note**
>
> The tables below show the hyperparameters available when you use serverless model customization. Other hyperparameters are preset by Amazon SageMaker AI using optimized defaults. When you use SageMaker AI Training Jobs or HyperPod, you can access the full list of hyperparameters available in the recipes. See the SageMaker AI Recipes repository to get a recipe and access all hyperparameters.

Parameter	Type	Require	Range / Values	Description
`max_epochs`	integer	**Require**	1–100	Number of complete passes through the training dataset.
`global_batch_size`	integer	**Require**	16, 32, 64, 128	Total samples processed per optimizer step across all instances.
`learning_rate`	float	**Require**	5e-07–1e-04	Step size for weight updates during optimization.
`lr_scheduler`	string	**Require**	cosine, constant	Learning rate decay schedule over training.
`lr_warmup_steps_ratio`	float	**Require**	0–1	Fraction of total steps spent ramping learning rate from 0.
`weight_decay`	float	**Require**	0.0–1.0	L2 regularization coefficient. Helps prevent overfitting.

Parameter	Type	Require	Range / Values	Description
gradient_clipping	boolean	**Require**	true, false	Scale down gradients if norm exceeds threshold.
gradient_clipping_threshold	float	**Require**	0.0–5.0	Maximum allowed gradient norm.
dataset_max_len	integer	**Require**	256–131072	Maximum sequence length in tokens. Longer sequences are truncated.
seed	integer	**Require**	0–2147483647	Random seed for reproducibility.

gradient_clipping_threshold	float	**Require**	0.0–5.0	Maximum allowed gradient norm.
dataset_max_len	integer	**Require**	256–131072	Maximum sequence length in tokens.
max_response_length	integer	**Require**	100–200000	Maximum tokens for generated response.

Parameter	Type	Require	Range / Values	Description
`seed`	integer	**Require**	0–2147483647	Random seed for reproducibility.
`logging_steps`	integer	**Require**	1–100	Frequency of metric logging.
`train_val_split_ratio`	float	Optiona	0.0–1.0	Fraction allocated to training vs validation.
`temperature`	float	**Require**	0.0–2.0	Sampling temperature for evaluation.
`adam_beta`	float	**Require**	1e-03–0.1	DPO inverse temperature. Controls how strongly the model enforces preference rankings.

RFT

Reinforcement Fine-Tuning (RFT) uses reinforcement learning to optimize model behavior based on reward signals rather than explicit input-output examples. Amazon SageMaker AI supports two RFT variants: RLVR (Reinforcement Learning with Verifiable Rewards) and RLAIF (Reinforcement Learning from AI Feedback).

RLVR

RLVR uses a code-based reward function that programmatically verifies whether model outputs are correct. Best suited for tasks with objectively right or wrong answers.

When to use

- Your task has verifiable correct answers (math, code, factual questions)
- You can write a scoring function that evaluates response correctness
- You want to improve factual accuracy and reduce hallucinations

Dataset format

Each record contains a prompt and reward model metadata. The reward function evaluates model-generated responses during training.

```
{
  "data_source": "openai/gsm8k",
  "prompt": [
    {
      "content": "Natalia sold clips to 48 of her friends in April, and then she sold
 half as many clips in May. How many clips did Natalia sell altogether in April and
 May? Let's think step by step and output the final answer after \"####\".",
      "role": "user"
    }
  ],
  "ability": "math",
  "reward_model": {
    "ground_truth": "72",
    "style": "rule"
  }
}
```

Required fields:

- `prompt` — array of message objects with `role` and `content`
- `reward_model.style` — set to `"rule"` for programmatic verification
- `reward_model.ground_truth` — the correct answer for verification

To implement your own Lambda-based reward function, see the section called “RLVR - Custom Lambda”. For the supported Lambda response envelopes, see the section called “Sample Lambda Output Payload”.

> **Note**
>
> If your Lambda reward function returns a malformed payload, RLVR jobs can fail with `InvalidLambdaResponseException`. Return exactly one of the supported response envelopes described in the section called “Sample Lambda Output Payload” and make sure each result includes a matching `id`.

Preset reward functions

- `gsm8k` — Grade school math verification
- `prime_code` — Code correctness verification
- `prime_math` — Mathematical reasoning verification

Python SDK example

Use `RLVRTrainer` for serverless RLVR customization jobs:

```
from sagemaker.train import RLVRTrainer

trainer = RLVRTrainer(
    model_id="meta-textgeneration-llama-3-1-8b-instruct",
    train_data="s3://my-bucket/rlvr-train.jsonl",
    hyperparameters={
        "preset_reward_function": "gsm8k",
        "learning_rate": 1e-5,
        "max_epochs": 1,
        "global_batch_size": 128,
        "lora_rank": 16,
    },
)

trainer.train()
```

To run RLVR with FFT, use the same dataset format and remove LoRA-specific hyperparameters such as `lora_rank` and `lora_alpha`.

RLVR LoRA hyperparameters

> **Note**
>
> The tables below show the hyperparameters available when you use serverless model customization. Other hyperparameters are preset by Amazon SageMaker AI using optimized defaults. When you use SageMaker AI Training Jobs or HyperPod, you can access the full list of hyperparameters available in the recipes. See the SageMaker AI Recipes repository to get a recipe and access all hyperparameters.

Parameter	Type	Require	Range / Values	Description
`preset_reward_function`	string	**Require**	gsm8k, prime_code, prime_math	Preset reward function for verification.
`learning_rate`	float	**Require**	1e-07–1e-03	Step size for weight updates. Set lower for RL (e.g., 1e-5).
`lr_warmup_steps_ratio`	float	**Require**	0–1	Fraction of steps for LR warmup.
`max_epochs`	integer	**Require**	1–100	Number of passes through the dataset.
`global_batch_size`	integer	**Require**	128, 256, 512, 1024	Total samples per optimizer step.
`max_prompt_length`	integer	**Require**	512–16384	Maximum tokens for prompt portion.
`weight_decay`	float	**Require**	0.0–1.0	L2 regularization coefficient.
`clip_ratio`	float	**Require**	0.1–1.5	GRPO clipping parameter. Limits policy change per update.
`kl_loss_coef`	float	**Require**	0–0.1	KL divergence penalty weight. Prevents policy drift.
`rollout_n`	integer	**Require**	1, 2, 4, 8, 16, 32	Candidate responses per prompt during rollouts.
`rollout_temperature`	float	**Require**	0.01–2.0	Temperature for rollout generation.
`lora_rank`	integer	**Require**	8, 16, 32, 64, 128	LoRA rank. Dimensionality of low-rank matrices.

Parameter	Type	Require	Range / Values	Description
lora_alpha	integer	**Require**	16, 32, 64, 128, 256	LoRA scaling factor. Effective LR scales as alpha/rank.
warmup_steps	integer	**Require**	-1–100	Absolute warmup steps (-1 for auto).
min_lr	float	**Require**	0.0–1.0	Minimum learning rate floor.
clip_ratio_high	float	**Require**	0.0–0.5	Upper clipping threshold.
clip_ratio_low	float	**Require**	0.0–0.5	Lower clipping threshold.
temperature	float	**Require**	0.0–2.0	Sampling temperature for evaluation.
use_kl_loss	boolean	**Require**	true, false	Add KL divergence penalty to loss.
train_val_split_ratio	float	Optiona	0.0–1.0	Train/validation split.

RLVR FFT hyperparameters

Same parameters as RLVR LoRA without `lora_rank` and `lora_alpha`.

RLAIF

RLAIF uses another LLM as a judge to evaluate model responses based on a natural language reward prompt. Best suited for tasks with subjective quality criteria that are difficult to evaluate programmatically.

When to use

- Your quality criteria are subjective (helpfulness, safety, tone)
- You can describe what "good" looks like in natural language
- You want to scale feedback beyond what human annotation can provide

Dataset format

Each record contains a prompt and reward model metadata. The LLM judge evaluates model-generated responses during training.

```
{
  "data_source": "WeOpenML/PandaLM",
  "prompt": [
    {
      "role": "user",
      "content": "Below are two responses for a given task...Evaluate the responses and
 generate a reference answer.\n\n### Instruction:\nCompare the given products..."
    }
  ],
  "ability": "pairwise-judging",
  "reward_model": {
    "style": "llmj",
    "ground_truth": "2\n\n### Reason: Response 2 provides a more detailed
 comparison..."
  }
}
```

Required fields:

- `prompt` — array of message objects with `role` and `content`
- `reward_model.style` — set to `"llmj"` for LLM-as-judge
- `reward_model.ground_truth` — reference judgment for calibration

Judge templates

The following preset judge templates are provided in the training container. Set `judge_prompt_template` to one of these values:

Value	Container path	Use case	Example
`cot.jinja`	`/opt/ml/code/verl/cot.jinja`	Chain-of-thought judging	the section called "RLAIF - Chain of Thought"

Value	Container path	Use case	Example
`evaluate.jinja`	`/opt/ml/code/verl/evaluate.jinja`	General response comparison and scoring	the section called "Reinforcement Learning from AI Feedback (RLAIF) - Pair-Wise Judging"
`faithfulness.jinja`	`/opt/ml/code/verl/faithfulness.jinja`	Groundedness and source faithfulness	the section called "RLAIF - Faithfulness"
`summarize.jinja`	`/opt/ml/code/verl/summarize.jinja`	Summarization quality	the section called "RLAIF - Summarization"

To replace a preset template with your own Jinja prompt, see the section called "RLAIF - Custom Prompt".

Python SDK example

Use `RLAIFTrainer` for serverless RLAIF customization jobs:

```
from sagemaker.train import RLAIFTrainer

trainer = RLAIFTrainer(
    model_id="meta-textgeneration-llama-3-1-8b-instruct",
    train_data="s3://my-bucket/rlaif-train.jsonl",
    hyperparameters={
        "judge_prompt_template": "evaluate.jinja",
        "learning_rate": 1e-5,
        "max_epochs": 1,
        "global_batch_size": 128,
        "lora_rank": 16,
    },
)

trainer.train()
```

To run RLAIF with FFT, use the same dataset format and remove LoRA-specific hyperparameters such as `lora_rank` and `lora_alpha`.

RLAIF LoRA hyperparameters

Same parameters as RLVR LoRA with the following difference:

Parameter	Type	Require	Range / Values	Description
`judge_prompt_template`	string	Optiona	cot.jinja, evaluate.jinja, faithfulness.jinja, summarize.jinja	Template for LLM judge evaluation. Replaces `preset_reward_function`. For the corresponding container paths and example prompts, see the section called "Judge templates".

RLAIF FFT hyperparameters

Same parameters as RLAIF LoRA without `lora_rank` and `lora_alpha`.

Supported sequence lengths for open weight model serverless customization

The following table shows the maximum sequence lengths (in tokens) supported for serverless customization of open weight models. For more information about serverless customization of open weight models, see the section called "Open weight model customization". For each open weight model, each populated cell shows the maximum sequence length that you can set for that customization technique and training type by using the overridable sequence-length parameters.

How to think about sequence length

The sequence length is the sum of the prompt length and the response length, and you set them independently:

- **SFT and DPO** – Set `dataset_max_len` (the full prompt and completion length) up to the maximum in the following table.

- **RLVR and RLAIF (GRPO)** – Set `max_prompt_length` (input budget) and `max_response_length` (generation budget). Their sum must stay within the model's maximum in the following table.

Keep the following tips in mind:

- Response length can affect quality for tasks that require extended generation, such as coding or mathematical reasoning. Allocate enough `max_response_length` for the expected output while reserving sufficient `max_prompt_length` for the input.
- Longer sequences can increase memory and compute requirements per example. Actual training time and cost depend on factors such as batching, packing, hardware utilization, and the training configuration.
- The maximums in the following table are current ceilings. You can set any value up to that ceiling.

Provider	Model	Model ID	SFT (LoRA)	SFT (FFT)	DPO (LoRA)	DPO (FFT)	RLVR (LoRA)	RLVR (FFT)	RLAIF (LoRA)	RLAIF (FFT)

In the preceding table, * means the sequence length is fixed at 4K and is not overridable. An em dash (—) means that the technique and training type are not supported for serverless customization on that model.

Multi-turn reinforcement learning

Multi-turn reinforcement learning (RL) trains an agent to make good decisions across a sequence of steps, not just in a single moment. The agent observes its environment, takes an action, receives a reward, and moves to a new state, repeating this process over many timesteps. The goal is to learn a policy (model behavior) that maximizes cumulative reward across the whole sequence rather than optimizing for any one step in isolation. This approach is increasingly used to train language models on multi-step reasoning and agentic tasks, where the model takes actions like tool calls, code execution, or web search across several turns and is rewarded based on the whole sequence. This is different from single-turn RLHF/RLAIF, where a reward is assigned to one output at a time.

A simple analogy

Imagine you are a customer service agent handling a support ticket. You do not resolve it in one message. You ask clarifying questions, look up the customer's account, try a fix, check if it worked, and follow up if it did not. At the end, the customer either leaves satisfied or they do not. Over time, you get better at recognizing which sequence of steps tends to lead to a good resolution.

Multi-turn RL trains the model the same way. Instead of grading the model on a single response, it lets the model work through a task across multiple steps and rewards it based on the whole sequence. The model learns which decisions earlier in the conversation actually mattered.

Key terminology

- **Agent:** the decision-making entity in the system. It observes the current situation, decides what action to take, and learns over time to improve its strategy. In practice, the agent is powered by an AI model, but the two are not the same thing. The model is the underlying neural network; the agent is the broader system that uses it to perceive, decide, and act. *In simple terms: the customer service rep handling the ticket.*
- **Environment/Agentic Application:** everything the agent interacts with, including the conversation history, the customer's account details, and any tools the agent can use. *In simple terms: the support platform, the customer, and all the information available to the rep.*
- **State:** a snapshot of the current situation the agent observes before deciding what to do next. *In simple terms: what the rep knows right now, such as the customer's issue, what has already been tried, and the latest reply.*
- **Action:** what the agent does at each step, such as asking a clarifying question, calling a tool, or sending a response. *In simple terms: the rep's next move, whether that is asking a question, looking something up, or sending a fix.*

- **Reward:** the feedback signal the agent receives, either at each step or at the end of the task, indicating how well things went. *In simple terms: did the customer leave satisfied? That outcome is the reward.*
- **Policy:** the strategy the agent has learned. It maps a given state to the action most likely to lead to a good outcome. *In simple terms: the rep's knowledge built up from experience, knowing what tends to work in a given situation.*
- **Episode:** one complete run of a task from start to finish. *In simple terms: one full support conversation, from the customer's first message to the resolution.*
- **Turn:** a single exchange within an episode, typically one action taken by the agent and the response it receives from the environment. In a conversation, this is one message and its reply. *In simple terms: one step in the support conversation, like the agent asking a question and the customer responding.*
- **Trajectory:** the full sequence of states, actions, and rewards recorded across an entire episode. It is the complete record of what the agent did and what happened as a result, used to compute the reward and update the policy. *In simple terms: the entire transcript of the support conversation from start to finish, including every decision the agent made and how things unfolded.*
- **Cumulative reward:** the total reward accumulated across all steps in an episode, which is what the agent is ultimately trying to maximize. *In simple terms: not just whether one step went well, but whether the whole conversation went well overall.*

Use cases for multi-turn reinforcement learning

Multi-turn RL is the right approach when a single response is not enough to complete a task well. If your use case involves a sequence of steps, decisions that depend on earlier ones, multi-turn RL is worth considering.

Here are some signals that point toward it:

- **Your task requires back-and-forth interaction:** The model needs to ask questions, gather information, and adapt based on what it learns along the way. A single prompt-response cycle is not enough. Example: a support agent that diagnoses an issue by asking follow-up questions before suggesting a fix.
- **The quality of the outcome depends on a sequence of actions:** Getting the right answer at the end requires making the right moves throughout. Rewarding only the final output is not enough

if the path to get there matters. Example: a coding assistant that plans, writes, runs, and debugs code across multiple steps.

- **The model needs to use tools across multiple steps:** The model calls external tools like search, APIs, or code execution, and the results of one tool call influence what it does next. Example: a research assistant that searches for information, evaluates the results, and refines its query before producing a summary.
- **Mistakes mid-task should be recoverable:** You want the model to recognize when something is not working and course-correct, rather than committing to a bad path from the start. Example: an agent that tries a solution, checks if it worked, and tries a different approach if it did not.
- **You are seeing good single-turn performance but poor end-to-end task completion:** If your model handles individual steps well but struggles to string them together into a coherent, successful outcome, multi-turn RL can help bridge that gap.

Supported models, pricing, and regions

Supported models

Model	Region
Nova Lite 2.0	IAD (us-east-1), PDX (us-west-2)
GPT-OSS-20B	IAD (us-east-1), PDX (us-west-2)
Gemma-4-31B-it	PDX (us-west-2)
Qwen 3.6 27B	PDX (us-west-2)

Pricing

For full pricing details, refer to the public pricing page. Charges are based on three dimensions:

- **Prefill:** the cost of processing the input tokens fed into the model at the start of each training step. This includes the prompt, conversation history, and any context the model receives before generating a response.
- **Sample:** the cost of the tokens the model generates during the training rollout. This is where the model produces its responses, which are then evaluated and used to compute the reward signal.

- **Train:** the cost of the backward pass, where the model's weights are updated based on the reward signal. This is the core learning step in the RL process.

- the section called “Quotas”
- the section called “Sample datasets and tutorials”

Prerequisites

Multi-turn RL uses the SageMaker AI `CreateJob` API, which requires additional permissions on top of the existing model customization prerequisites. The table below summarizes what's new versus already covered.

What	Status	Notes
Trust policy: job.sagemaker.amazonaws.com	New	Required for CreateJob API
Trust policy: bedrock-agentcore.amazonaws.com	New	Required on agent runtime role (AgentCore path only)

What	Status	Notes
PassRole: job.sagemaker.amazonaws.com	New	Existing prereqs only cover sagemaker.amazonaws.com
Job actions (CreateJob, DescribeJob, etc.)	New	Not in AmazonSageMakerFullAccess
bedrock-agentcore: ListAgentRuntimes	New	Required for Studio runtime picker
bedrock-agentcore: ListAgentRuntimeVersions	New	Required for Studio version selector
AmazonSageMakerJobFullAccess managed policy	New	Attach to job execution role
AmazonSageMakerJobRuntimeAccess managed policy	New	Attach to agent runtime role
Lambda, Bedrock deployment, S3, KMS, MLflow, CloudWatch	Already covered	Via existing prereqs or managed policies

Caller role

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "PassRoleForCreateJob",
      "Effect": "Allow",
      "Action": "iam:PassRole",
      "Resource": "arn:aws:iam::<account-id>:role/<ExecutionRoleName>",
      "Condition": {
        "StringEquals": {
          "iam:PassedToService": "job.sagemaker.amazonaws.com"
```

```
        }
      }
    },
    {
      "Sid": "MTRLJobActions",
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreateJob",
        "sagemaker:DescribeJob",
        "sagemaker:StopJob",
        "sagemaker:DeleteJob"
      ],
      "Resource": "arn:aws:sagemaker:*:*:job/*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceAccount": "${aws:PrincipalAccount}"
        }
      }
    },
    {
      "Sid": "MTRLListJobsPermission",
      "Effect": "Allow",
      "Action": [
        "sagemaker:ListJobs",
        "sagemaker:ListJobSchemaVersions",
        "sagemaker:DescribeJobSchemaVersion"
      ],
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceAccount": "${aws:PrincipalAccount}"
        }
      }
    }
  ]
}
```

PassRole — lets the caller delegate the execution role to `job.sagemaker.amazonaws.com`.

Managed policies

Multi-turn RL uses two Amazon managed policies. Attach each to the appropriate role before creating a job.

AmazonSageMakerJobFullAccess – attach to the SageMaker AI job execution role (the `RoleArn` you pass to `CreateJob`).

This policy grants the job the permissions it needs while running: read/write access to training data and checkpoints in S3, KMS permissions for S3-side encryption, access to SageMaker AI hub content and model packages, MLflow experiment tracing, agent invocation via Bedrock AgentCore or Lambda, VPC network interface management, and CloudWatch Logs writes. Reference: AmazonSageMakerJobFullAccess.

AmazonSageMakerJobRuntimeAccess – attach to the agent runtime role (the role your agent runs under, whether on Bedrock AgentCore or behind a Lambda forwarder). This policy grants the runtime APIs your agent calls during a rollout: `sagemaker:Sample`, `sagemaker:SampleWithResponseStream`, `sagemaker:CompleteRollout`, `sagemaker:UpdateReward`, and `sagemaker:CallWithBearerToken`. Reference: AmazonSageMakerJobRuntimeAccess.

Trust policy updates

Add `job.sagemaker.amazonaws.com` to your execution role's trust policy:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "job.sagemaker.amazonaws.com"
      },
      "Action": ["sts:AssumeRole", "sts:TagSession"]
    }
  ]
}
```

If using Bedrock AgentCore, your agent runtime role also needs its own trust policy:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "bedrock-agentcore.amazonaws.com"
```

```
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

Additional inline policy for Studio UI

If you are submitting jobs through SageMaker AI Studio, add the following inline policy to your SageMaker AI domain execution role:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "MTRLJobActions",
      "Effect": "Allow",
      "Action": [
        "sagemaker:CreateJob",
        "sagemaker:DescribeJob",
        "sagemaker:StopJob",
        "sagemaker:DeleteJob",
        "sagemaker:ListJobs",
        "sagemaker:ListJobSchemaVersions",
        "sagemaker:DescribeJobSchemaVersion"
      ],
      "Resource": "arn:aws:sagemaker:*:*:job/*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceAccount": "${aws:PrincipalAccount}"
        }
      }
    },
    {
      "Sid": "BedrockAgentCoreListPermissions",
      "Effect": "Allow",
      "Action": [
        "bedrock-agentcore:ListAgentRuntimes",
        "bedrock-agentcore:ListAgentRuntimeVersions"
      ],
      "Resource": "*",
      "Condition": {
        "StringEquals": {
```

```
          "aws:ResourceAccount": "${aws:PrincipalAccount}"
        }
      }
    },
    {
      "Sid": "PassRoleForCreateJob",
      "Effect": "Allow",
      "Action": "iam:PassRole",
      "Resource": "arn:aws:iam::*:role/*",
      "Condition": {
        "StringEquals": {
          "iam:PassedToService": "job.sagemaker.amazonaws.com",
          "aws:ResourceAccount": "${aws:PrincipalAccount}"
        }
      }
    }
  ]
}
```

Custom policy option

If you prefer to define your own policies instead of using the Amazon managed ones, use the following as a starting point.

SageMaker AI job execution role policy (equivalent to `AmazonSageMakerJobFullAccess`):

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "S3Permissions",
      "Effect": "Allow",
      "Action": [
        "s3:GetObject",
        "s3:PutObject",
        "s3:ListBucket"
      ],
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "s3:ResourceAccount": "${aws:PrincipalAccount}"
        }
      }
```

```
    },
    {
      "Sid": "KMSPermissions",
      "Effect": "Allow",

        "kms:GenerateDataKey"
      ],
      "Resource": "arn:aws:kms:*:*:key/*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceAccount": "${aws:PrincipalAccount}"
        },
        "StringLike": {
          "kms:ViaService": "sagemaker.*.amazonaws.com"
        }
      }
    }
  ]
}
```

Trust relationship for the agent runtime role:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
```

```
        "Service": "bedrock-agentcore.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

Lambda forwarder note

The existing model customization Lambda permissions cover functions with *SageMaker* or *sagemaker* in the name. If your Lambda forwarder uses a different naming convention, add its ARN explicitly:

```
{
  "Sid": "CustomAgentLambdaPermission",
  "Effect": "Allow",
  "Action": ["lambda:InvokeFunction"],
  "Resource": "arn:aws:lambda:*:*:function:your-agent-forwarder-function-name",
  "Condition": {
    "StringEquals": {"aws:ResourceAccount": "${aws:PrincipalAccount}"}
  }
}
```

Other Setup

- If you use a customer-managed VPC, see the section called “Configure a VPC”.
- If you use a customer-managed KMS key to encrypt job input and output, the execution role, caller role, and agent runtime role must have additional permissions. See the section called “Encryption at rest”.

Preparing your agent

Before you can launch a training job, you need to set up an agent that can participate in the training loop. This section walks you through how to configure and deploy your agent, whether you are using Amazon Bedrock AgentCore for managed hosting or bringing your own infrastructure with a custom agent.

Agent code integration overview

During training, SageMaker AI sends prompts from your training dataset to your agent. Your agent processes each prompt, calls the policy model for a response, and takes actions in your

environment such as calling tools. The policy model is the model being trained. It starts as your base model and its weights are updated over time as it receives feedback through the training loop. Based on the outcome, your agent reports a reward back to SageMaker AI to complete the training loop. This repeats for all prompts in your dataset, and the policy model improves over time based on the rewards collected.

SageMaker AI Job Runtime Service

During training, your agent communicates with the SageMaker AI Job Runtime Service to call the policy model for inference and report results back to the trainer. The SDK decorator handles this integration automatically, but if your agent has custom requirements, you can call the Runtime APIs directly.

Endpoint

`https://job-runtime.sagemaker.region.api.aws`

APIs

API	Purpose	When to call
`Sample`	Call the policy model for a single inference response	Each turn where your agent needs model output
`SampleWithResponseStream`	Call the policy model with streaming response (SSE)	Same as Sample, when you need token-by-token streaming
`CompleteRollout`	Signal that the rollout is finished	After your agent completes all turns for a prompt
`UpdateReward`	Report the reward score for the complete rollout	After computing reward, typically called with CompleteRollout

> **Note**
>
> Both `Sample` and `SampleWithResponseStream` are OpenAI-compatible APIs.

Authentication

Your agent authenticates with the Runtime Service using bearer tokens. Generate a token using the SDK:

```
from sagemaker.core.token_generator import generate_token

token = generate_token(region="us-west-2")
```

Pass this token as the API key when calling the Runtime Service.

Direct API integration (advanced)

If your agent framework cannot use the SDK decorator, call the APIs directly:

```
import requests
import openai
from sagemaker.core.token_generator import generate_token
from sagemaker.train.rft.headers import make_inference_headers

token = generate_token(region="us-west-2")
endpoint = "https://job-runtime.sagemaker.us-west-2.api.aws"
headers = {
    "Authorization": f"Bearer {token}",
    "Content-Type": "application/json",
    **make_inference_headers(metadata),  # injects jobArn, rolloutId tracking
}

# Sample (inference call)

# Option 1: Create OpenAI-compatible client pointing to the Runtime Service
 (recommended)
client = openai.OpenAI(
    base_url=endpoint + "/v1",
    api_key=token,
    default_headers=headers,
)

# Option 2: direct request call
response = requests.post(
    f"{endpoint}/v1/chat/completions",
    headers=headers,
    json={
```

```
        "model": "default",
        "messages": [{"role": "user", "content": "..."}],
        "max_tokens": 256,
        "temperature": 1.0,
    }
)

# CompleteRollout + UpdateReward (after all turns complete)
# The decorator handles this; for direct calls, use the SDK's
# RolloutFeedbackClient or call the APIs per the Smithy model.
```

Agent deployment options

SageMaker AI supports two options for connecting your agent to the training loop:

- **Bedrock AgentCore:** Deploy your agent to Amazon Bedrock AgentCore for fully managed hosting. SageMaker AI calls your agent directly during training with no additional infrastructure setup required. This option works best for agents built with the Strands SDK.
- **Bring your own agent:** Host your agent in any environment, including Amazon EKS, Amazon EC2, or your own infrastructure, and connect it to the training loop through a Lambda forwarder. The Lambda forwarder is a Lambda function that acts as a bridge between SageMaker AI and your agent, giving SageMaker AI a consistent way to reach your agent without requiring direct access to your infrastructure or credentials. This option is a good fit when you want full control over your hosting environment or want to use an agent framework of your choice.

Scenario 1: Agents on Bedrock AgentCore Runtime

Deploy your agent to Amazon Bedrock AgentCore for fully managed hosting. SageMaker AI invokes your agent during the model training.

Prerequisites

Before you begin, complete the following prerequisites.

Bedrock AgentCore execution role

During training, SageMaker AI assumes your SageMaker execution role to invoke your agent. Your agent also needs its own separate role, called the Bedrock AgentCore execution role, to call the RFT Runtime for model inference and reward reporting. The RFT Runtime is the SageMaker AI service endpoint your agent communicates with during training. It handles two things: serving responses

from the policy model during inference, and receiving the reward your agent reports at the end of each rollout.

Create the Bedrock AgentCore execution role with the following trust policy. This policy grants Bedrock AgentCore permission to assume the role on your behalf during training. Without it, Bedrock AgentCore cannot access your container image or call the RFT Runtime.

```
{
    "Version": "2012-10-17",
    "Statement": [{
        "Effect": "Allow",
        "Principal": {"Service": "bedrock-agentcore.amazonaws.com"},
        "Action": "sts:AssumeRole"
    }]
}
```

Then attach the **AmazonSageMakerJobRuntimeAccess** managed policy to this role. This grants the permissions your agent needs to call the policy model for inference and report results during training.

Write or update your agent code

Your agent must use the `sagemaker-train` SDK and apply the `@sagemaker_rft_handler` decorator to your agent's entry point function. This decorator sets up the HTTP server that AgentCore invokes during training, listening for incoming rollout requests and routing prompts to your entrypoint function.

Install the SDK

Install the SDK in your agent's environment using one of the following methods.

Option 1: Direct install

```
pip install sagemaker-train
```

Option 2: Build and install wheels individually. Use this if the direct install exceeds your environment's size constraints.

```
# Clone the SDK repository
git clone https://github.com/aws/sagemaker-python-sdk.git

# Build the wheels
```

```
cd sagemaker-python-sdk/sagemaker-train
python -m build --wheel --outdir ./dist/

cd sagemaker-python-sdk/sagemaker-core
python -m build --wheel --outdir ./dist/

# Install
pip install ./sagemaker-train/dist/sagemaker_train-*.whl
pip install ./sagemaker-core/dist/sagemaker_core-*.whl
```

Authentication

Your agent authenticates with SageMaker AI using bearer tokens. Generate a token using the SDK's `generate_token()` method and pass it as the API key when calling the policy model for inference.

Agent requirements

Your agent must do the following for each rollout:

- Receive a rollout request containing a prompt
- Call the policy model for a response
- Execute actions in your environment such as tool calls or API requests
- Repeat the previous two steps for multiple turns until the task is complete
- Return a reward score

The following example shows a basic agent template using the Strands SDK:

```
from sagemaker.train.rft import sagemaker_rft_handler, RolloutFeedbackClient
from sagemaker.train.rft.adapters.strands import wrap_model
from sagemaker.core.token_generator import generate_token
from strands import Agent, OpenAIModel
import os

@sagemaker_rft_handler
def handle_rollout(payload):
    metadata = payload.get("metadata", {})
    prompt = payload.get("prompt", "")
    endpoint = metadata.get("endpoint", os.environ.get("RFT_RUNTIME_ENDPOINT", ""))

    # Generate bearer token for authenticating with the RFT Runtime
```

```
    token = generate_token(region=os.environ.get("AWS_REGION", "us-west-2"))

    # Create client for model inference
    model = OpenAIModel(
        model_id="default",
        client_args={
            "api_key": token,
            "base_url": endpoint + "/v1",
        },
    )

    # Wrap model to auto-inject RFT tracking headers and inference parameters
    model = wrap_model(model)

    # Execute actions in your environment (tools, APIs, etc.)
    agent = Agent(model=model, tools=[..., ...])
    result = agent(prompt)

    # Return reward -   decorator handles CompleteRollout + UpdateReward
    return {"reward": compute_reward(result)}
```

Deploy your agent to Bedrock AgentCore

Deploy your agent to Amazon Bedrock AgentCore following the AgentCore development guide.

Once you have deployed your agent using the AgentCore CLI, note the Agent Runtime ARN from the output. You need this when creating your training job. The Runtime ARN follows the format of `arn:aws:bedrock-agentcore:<region>:<account-id>:runtime/<agent-name>`.

Verify your agent is deployed and healthy:

```
aws bedrock-agentcore-control list-agent-runtimes --region us-west-2
```

Scenario 2: Custom Agent with Lambda Forwarder

In addition to Bedrock AgentCore, SageMaker AI supports custom agents hosted in any environment. Your agent connects to the training loop through a Lambda forwarder, giving you the flexibility to use any agent framework and hosting platform of your choice.

Your agent can be built using any framework or platform, such as Strands Agents SDK, or your own custom implementation. It can run on any compute environment including Amazon Bedrock AgentCore, Amazon EKS, Amazon EC2, Amazon Fargate, or your own infrastructure.

The Lambda function receives rollout requests from SageMaker AI and forwards them to your agent's HTTP endpoint.

The following sections provide more information about setting up a custom agent with a Lambda forwarder, with examples using a custom agent deployed on Amazon EKS.

Prerequisites

Lambda execution role

During training, SageMaker AI assumes your SageMaker execution role to invoke your Lambda forwarder. The Lambda function requires its own execution role so that Amazon Lambda can run it. This role allows Lambda to run and write logs.

```
aws iam create-role \
  --role-name RFTLambdaForwarderRole \
  --assume-role-policy-document '{
    "Version": "2012-10-17",
    "Statement": [{
      "Effect": "Allow",
      "Principal": {"Service": "lambda.amazonaws.com"},
      "Action": "sts:AssumeRole"
    }]
  }'

aws iam attach-role-policy \
  --role-name RFTLambdaForwarderRole \
  --policy-arn arn:aws:iam::aws:policy/service-role/AWSLambdaBasicExecutionRole
```

Write your agent code

Your agent must expose an HTTP endpoint that accepts rollout requests and interacts with the RFT Runtime service, by calling it for model inference and reporting the rewards once the task is complete.

Rollout request format

Your agent receives requests in the following format from the Lambda forwarder:

```
{
    "prompt": "string",
    "metadata": {
        "jobArn": "string",
```

```
        "rolloutId": "string"
    },
    "inferenceParams": {
        "temperature": 1.0,
        "topP": 1.0,
        "maxTokens": 256
    }
}
```

Agent expectations

For Amazon SageMaker AI to successfully complete rollouts, your agent must:

- Accept rollout requests from the Lambda forwarder
- Call the RFT Runtime for model inference using the provided headers and token
- Execute actions in your environment (tools, APIs, etc.)
- Support multiple inference calls per rollout (multi-turn)
- Report the trajectory as complete when the task is finished
- Submit a reward score to the RFT Runtime

The following example shows a custom agent with a FastAPI endpoint:

```
"""
Custom Lambda Agent for SageMaker RFT.

This is a minimal example showing the required integration points.
You can use any framework (Strands, LangChain, raw OpenAI, etc.)
or any HTTP framework (FastAPI, Flask, Django, etc.) for your agent.
"""
import os
from fastapi import FastAPI
from fastapi.responses import JSONResponse
from pydantic import BaseModel
from typing import Any, Dict
from sagemaker.train.rft import sagemaker_rft_handler, set_rollout_context
from sagemaker.train.rft.headers import make_inference_headers
from sagemaker.core.token_generator import generate_token

app = FastAPI()

@app.post("/rollout")
```

```
def rollout_endpoint(payload: dict):
    handle_rollout(payload)
    return {"status": "accepted"}

@sagemaker_rft_handler
def handle_rollout(payload):
    """Handle a rollout request from RFT."""
    prompt = payload.get("prompt", "")
    metadata = payload.get("metadata", {})
    inference_params = payload.get("inferenceParams", {})
    endpoint = metadata.get("endpoint", os.environ.get("RFT_RUNTIME_ENDPOINT", ""))

    # 1. Set rollout context and capture inference headers
    set_rollout_context(metadata)
    headers = make_inference_headers(metadata)

    # 2. Get bearer token for RFT Runtime authentication
    token = generate_token(region=os.environ.get("AWS_REGION", "us-west-2"))

    # 3. Run your agent logic
    result = run_agent(prompt, token, endpoint, inference_params, headers)

    # 4. Compute reward based on your task's success criteria
    reward = compute_reward(result)

    # 5. Report completion with reward to RFT Runtime
    # decorator handles CompleteRollout + UpdateReward
    return {"reward": reward}

def run_agent(prompt: str, token: str, endpoint: str, inference_params: dict, headers:
 dict) -> str:
    """Your agent logic goes here."""
    import openai
    client = openai.OpenAI(
        base_url=(endpoint or os.environ.get("RFT_RUNTIME_ENDPOINT", "")) + "/v1",
        api_key=token,
        default_headers=headers,
    )

    response = client.chat.completions.create(
        model="default",
        messages=[{"role": "user", "content": prompt}],
        max_tokens=inference_params.get("maxTokens", 256),
        temperature=inference_params.get("temperature", 1.0),
```

```
        top_p=inference_params.get("topP", 1.0),
    )

    return response.choices[0].message.content

def compute_reward(result: str) -> float:
    """Implement your task-specific reward function here."""

@app.get("/health")
def health():
    return {"status": "ok"}
```

Install the required dependencies in your agent environment:

```
pip install sagemaker-train fastapi uvicorn openai
```

Deploy your agent

Your agent can run on any compute environment. It needs outbound network access to reach the SageMaker AI Runtime for inference and reward reporting. If the Lambda forwarder calls your agent directly, your agent must also expose an HTTP endpoint reachable from Lambda.

The following steps deploy a custom agent to Amazon EKS.

Create an EKS cluster

For full EKS setup instructions, see the EKS Getting Started guide. The following is a minimal setup for this example:

```
eksctl create cluster \
  --name external-agent \
  --region us-west-2 \
  --nodegroup-name agent-nodes \
  --node-type t3.medium \
  --nodes 1 \
  --nodes-min 1 \
  --nodes-max 2 \
  --managed
```

Update your kubeconfig to connect to the cluster:

```
aws eks update-kubeconfig --name external-agent --region us-west-2
```

Build and push your container image:

```
aws ecr create-repository --repository-name my-external-agent --region us-west-2

aws ecr get-login-password --region us-west-2 | \
  docker login --username AWS --password-stdin account-id.dkr.ecr.us-
west-2.amazonaws.com

docker build -t my-external-agent .
docker tag my-external-agent:latest account-id.dkr.ecr.us-west-2.amazonaws.com/my-
external-agent:latest
docker push account-id.dkr.ecr.us-west-2.amazonaws.com/my-external-agent:latest
```

Deploy to EKS:

```
kubectl apply -f - <<EOF
apiVersion: apps/v1
kind: Deployment
metadata:
  name: external-agent
spec:
  replicas: 1
  selector:
    matchLabels:
      app: external-agent
  template:
    metadata:
      labels:
        app: external-agent
    spec:
      containers:
      - name: agent
        image: <account-id>.dkr.ecr.us-west-2.amazonaws.com/external-agent:latest
        ports:
        - containerPort: 8080
        env:
        - name: AWS_REGION
          value: us-west-2
        - name: RFT_RUNTIME_ENDPOINT
          value: https://job-runtime.sagemaker.us-west-2.api.aws
---
apiVersion: v1
kind: Service
```

```
metadata:
  name: external-agent
spec:
  selector:
    app: external-agent
  ports:
  - port: 80
    targetPort: 8080
  type: LoadBalancer
EOF
```

Get your agent endpoint:

```
AGENT_ENDPOINT=$(kubectl get svc external-agent -o
 jsonpath='{.status.loadBalancer.ingress[0].hostname}')

echo "Agent endpoint: http://$AGENT_ENDPOINT"
```

Verify the deployment:

```
curl -s "http://$AGENT_ENDPOINT/health"

# Expected: {"status": "ok"}
```

Create your Lambda forwarder

The Lambda forwarder receives rollout requests from SageMaker AI and forwards them to your agent. The main thing to customize is the `_call_agent()` function, which translates the rollout request into your agent's API format.

If your agent doesn't have a public HTTP endpoint, you can replace the HTTP call in `_call_agent()` with an SQS `send_message` and have your agent poll the queue instead.

```
"""
Lambda Template

Bridges SageMaker Job rollout requests to any agent platform with a public endpoint.
Implement _call_agent() with your platform-specific logic.

If your agent environment does not have a public endpoint, you can
replace the HTTP call with an SQS send_message to enqueue the request,
and have your agent poll the queue for work.
```

```
Env vars:
    AGENT_ENDPOINT  - target agent base URL
    AGENT_API_KEY   - API key for the target agent (prefer Secrets Manager)
"""

import json
import logging
import os
import re
import urllib.error
import urllib.request

logger = logging.getLogger()
logger.setLevel(os.environ.get("LOG_LEVEL", "INFO"))

AGENT_ENDPOINT = os.environ.get("AGENT_ENDPOINT", "")
AGENT_API_KEY = os.environ.get("AGENT_API_KEY", "")

_SAFE_ID = re.compile(r"^[\w\-.]+$")

# ---------------------------------------------------------------------------
# CUSTOMIZE THIS - translate rollout request to your platform's API
# ---------------------------------------------------------------------------
def _call_agent(prompt: str, metadata: dict, inference_params: dict):

        raise ValueError("'prompt' is required and must be a non-empty string")

    meta = body.get("metadata")
    if not isinstance(meta, dict):
        raise ValueError("'metadata' is required")
    for key in ("jobArn", "rolloutId"):
        val = meta.get(key)
        if not isinstance(val, str) or not val.strip():
            raise ValueError(f"metadata.{key} must match [a-zA-Z0-9_\\-.]")

    params = body.get("inferenceParams") or {}
    if not isinstance(params, dict):
        raise ValueError("'inferenceParams' must be an object")

    return {
        "prompt": prompt.strip(),
        "metadata": meta,
        "inferenceParams": params,
    }

# ---------------------------------------------------------------------------
# CUSTOMIZE THIS - handle errors thrown from your agent environment
# ---------------------------------------------------------------------------
def _handle_agent_error(exc: Exception) -> dict:
    """
    Called when _call_agent() raises an exception. Customize this to map
    platform-specific errors to appropriate error types and messages.

    The return payload must follow this structure:
        {"errorType": "<type>", "errorMessage": "<description>"}
```

```
    Supported errorType values:
        ValidationError, InternalServerError, AccessDenied

    Examples:
          return {"errorType": "AccessDenied","errorMessage": "Agent denied access"}
          return {"errorType": "ValidationError","errorMessage": "Missing required
 field"}
          return {"errorType":"InternalServerError", "errorMessage": str(exc)}
    """

def handler(event, context):
    try:
        body = _validate(event)
    except ValueError as exc:
        logger.warning("Validation error: %s", exc)
        return {"errorType": "ValidationError", "errorMessage": str(exc)}

    try:
        result = _call_agent(body["prompt"], body["metadata"], body["inferenceParams"])
        logger.info("Rollout %s completed", body["metadata"]["rolloutId"])
        return {}
    except Exception as exc:
        return _handle_agent_error(exc)
```

Deploy the Lambda function:

Package the Lambda function:

```
zip lambda_forwarder.zip lambda_forwarder.py
```

Create the function:

```
aws lambda create-function \
  --function-name rft-agent-forwarder \
  --runtime python3.12 \
  --handler lambda_forwarder.handler \
  --role arn:aws:iam::account-id:role/RFTLambdaForwarderRole \
  --zip-file fileb://lambda_forwarder.zip \
  --timeout 600 \
  --environment "Variables={AGENT_ENDPOINT=http://$AGENT_ENDPOINT}" \
  --region us-west-2
```

Test the Lambda:

```
aws lambda invoke \
  --function-name rft-agent-forwarder \
  --cli-binary-format raw-in-base64-out \
  --payload '{"prompt": "Plan a 3-day itinerary for a trip to Seattle", "metadata":
 {"jobArn": "arn:aws:sagemaker:us-west-2:123456789012:job/AgentRFT/test", "rolloutId":
 "roll-1"}}' \
  --region us-west-2 \
  /tmp/response.json && cat /tmp/response.json
```

Note

This test confirms that Lambda is deployed and can reach your agent. The rollout won't complete successfully because no active training job exists, so an error response is expected. Check your agent's logs to confirm it received the request.

Creating assets for multi-turn reinforcement learning

Prompt dataset format

Your training dataset is a collection of prompts that SageMaker AI sends to your agent during training. Each prompt kicks off one rollout: your agent processes it, takes actions across one or more turns, and returns a reward. The quality and structure of your dataset directly affects what the model learns.

Supported file formats

Format	Extension	Notes
Apache Parquet	.parquet	Recommended for large datasets — efficient storage and fast loading
JSON Lines	.jsonl	One JSON object per line — easy to create and human-readable
JSON	.json	Array of JSON objects

Format	Extension	Notes
CSV	.csv	Comma-separated values with a header row

Dataset schema

Prompt column detection

The RFT service detects the prompt column using the following rules, in order:

- If a column named `prompt` exists, that column is used.
- Otherwise, the first column in the dataset is used.

Always name your prompt column `prompt` to avoid ambiguity. You can include additional columns for your own tracking purposes, but only the prompt column is read by the RFT service.

How prompts are used

The RFT service reads the prompt column and passes the string value directly to your agent as-is. It does not parse, validate, or transform the content. What format to use depends entirely on what your agent expects — a simple agent might take plain text, while a more sophisticated one might expect a JSON string containing conversation history, tool configuration, and reward specifications.

Data protection

Because the RFT service passes prompts through without inspection, you are responsible for protecting sensitive content. Consider encoding or encrypting prompt data before storing it, and handling decoding or decryption in your agent.

Common approaches:

- Base64 encoding — simple obfuscation for non-sensitive data
- Encryption — for sensitive or proprietary data (e.g., AES with keys managed by your agent)

Example 1: Simple Q&A Dataset (Plain Text)

For straightforward training tasks with plain text prompts.

Use case: Basic question answering, simple instruction following

Parquet (Python)

```
import pyarrow as pa
import pyarrow.parquet as pq

data = {
    "prompt": [
        "What is 2 + 2?",
        "Explain the concept of machine learning.",
        "Write a Python function to reverse a string.",
        "What is the capital of France?",
        "How does photosynthesis work?",
    ]
}

table = pa.table(data)
pq.write_table(table, "training_data.parquet")
```

JSON Lines (.jsonl)

```
{"prompt": "What is 2 + 2?"}
{"prompt": "Explain the concept of machine learning."}
{"prompt": "Write a Python function to reverse a string."}
```

Example 2: Search/Reasoning with Tool Use

For tasks requiring external tool access (e.g., search engines) during model reasoning.

Use case: Fact-based Q&A with web search, retrieval-augmented reasoning

Structure:

```
prompt (column) = JSON string (recommend encoded/encrypted) containing:
### data_source: Dataset origin identifier
### prompt: Conversation messages [system, user]
### ability: Task category (e.g., "fact-reasoning")
### env_class: "search"
### reward_spec: Ground truth answer for evaluation
### extra_info: Tool configuration and metadata
```

Example Row:

```
import pyarrow as pa
import pyarrow.parquet as pq
import json

task_data = {
    "data_source": "searchR1_nq",
    "prompt": [
        {
            "role": "system",
            "content": "You are a helpful and harmless assistant."
        },
        {
            "role": "user",
            "content": "Answer the given question. You must conduct reasoning inside
 <think> and </think> first every time you get new information. After reasoning, if you
 find you lack some knowledge, you can call a search engine by <search> query </search>
 and it will return the top searched results between <information> and </information>.
 You can search as many times as you want. If you find no further external knowledge
 needed, you can directly provide the answer inside <answer> and </answer>, without
 detailed illustrations. For example, <answer> Beijing </answer>. Question: total
 number of death row inmates in the us?"
        }
    ],
    "ability": "fact-reasoning",
    "env_class": "search",
    "reward_spec": {
        "ground_truth": {
            "target": [
                "2,718"
            ]
        },
        "style": "rule"
    },
    "extra_info": {
        "index": 0,
        "question": "total number of death row inmates in the us?",
        "split": "train",
        "need_tools_kwargs": true,
        "tools_kwargs": {
            "search": {
                "create_kwargs": {
                    "question": "total number of death row inmates in the us?",
```

```
                    "ground_truth": {
                        "target": [
                            "2,718"
                        ]
                    },
                    "data_source": "searchR1_nq"
                }
            }
        }
    }
}

# Recommend: encode or encrypt before storing
data = {"prompt": [json.dumps(task_data)]}
table = pa.table(data)
pq.write_table(table, "search_training_data.parquet")
```

Example 3: SQL Generation (Multi-Turn with Complex Context)

For code generation tasks requiring database schemas, multi-step reasoning, and SQL execution feedback.

Use case: Text-to-SQL, code generation with execution verification

Structure:

```
prompt (column) = JSON string (recommend encoded/encrypted) containing:
### input_seq: Human-readable task description
### prompt: Conversation messages [system, user]
### env_class: "text2sql"
### reward_spec: Ground truth SQL and evaluation config
### instance_id: Unique task identifier
### schema: Database schema definition
### question: Natural language question
### extra_info: Additional metadata
```

Example Row:

```
import pyarrow as pa
import pyarrow.parquet as pq
import json

task_data = {
```

```
    "input_seq": "Task Overview:\nYou are a data science expert. Below, you are
 provided with a database schema\nand a natural language question. Your task is to
 understand the schema and\ngenerate a valid SQL query to answer the question.\n
\nDatabase Engine: SQLite\n\nDatabase Schema:\nCREATE TABLE countries (\n    country_id
 INTEGER PRIMARY KEY,\n    english_name TEXT,\n    population INTEGER\n);\n\nCREATE
 TABLE country_metrics (\n    metric_id INTEGER PRIMARY KEY,\n    country_id INTEGER,
\n    metric_type TEXT,\n    year INTEGER,\n    value REAL\n);\n\nQuestion: List all
 countries with their current population and average\npopulation over the last five
 years.",
    "prompt": [
        {
            "role": "system",
            "content": "Task Overview:\nYou are a data science expert. Your task is to
 understand the schema and generate\na valid SQL query to answer the question within
 limited turns.\n\nInstructions:\n- Make sure you only output the information asked
 in the question.\n- Think through the steps before generating the final SQL query.
\n\nFormat:\n- Conduct thinking inside <think>...</think> blocks.\n- You can use SQL
 tool written within <sql>your sql</sql> to explore or verify.\n- SQL tool output will
 be shown inside <observation>...</observation>.\n- Provide the final SQL query inside
 <solution>...</solution>."
        },
        {
            "role": "user",
            "content": "Database Schema:\nCREATE TABLE countries (\n    country_id
 INTEGER PRIMARY KEY,\n    english_name TEXT,\n    population INTEGER\n);\n\nCREATE
 TABLE country_metrics (\n    metric_id INTEGER PRIMARY KEY,\n    country_id INTEGER,
\n    metric_type TEXT,\n    year INTEGER,\n    value REAL\n);\n\nQuestion: List all
 countries with their current population and average\npopulation over the last five
 years."
        }
    ],
    "env_class": "text2sql",
    "instance_id": "sql_task_001",
    "reward_spec": {
        "ground_truth": "SELECT c.english_name, c.population, AVG(m.value) as avg_pop
\nFROM countries c\nJOIN country_metrics m ON c.country_id = m.country_id\nWHERE
 m.metric_type = 'Population' AND m.year > strftime('%Y', 'now') - 5\nGROUP BY
 c.country_id;",
        "style": "rule"
    },
    "schema": "CREATE TABLE countries (...); CREATE TABLE country_metrics (...);",
    "question": "List all countries with their current population...",
    "extra_info": {
        "split": "train",
```

```
        "difficulty": "medium"
    }
}

# Recommend: encode or encrypt before storing
data = {"prompt": [json.dumps(task_data)]}
table = pa.table(data)
pq.write_table(table, "sql_training_data.parquet")
```

Best Practices

Dataset Size

Minimum examples at least equal to `training_batch_size`. 10x+ your batch size for diversity is recommended.

Prompt Quality

- **Complete context**: Include all information needed for the model to generate useful responses
- **Consistent structure**: Maintain consistent formatting across all prompts
- **Avoid duplicates**: Unique prompts provide better training signal
- **Clear instructions**: For tool-use tasks, provide explicit format instructions

Data Protection

- **Encode or encrypt** prompt content to protect sensitive data
- **Manage decryption keys** securely on your rollout server
- The RFT service passes prompts through without inspection, so protection is your responsibility

Reward function design

Reward function design is critical for providing effective learning signals in complex, multi-step agent systems. When designing reward functions for multi-turn RL, consider the following guidelines.

- **Start with outcome-based rewards.** Score the final result first to establish a clean and reliable baseline before adding intermediate rewards or reward shaping.

- **Consider continuous rewards over binary rewards.** Continuous rewards can provide clearer partial-credit signals, but are easy to game. Binary rewards are preferred when partial credit is hard to define or when a clean baseline is needed.
- **Use shaping rewards carefully.** Shaping rewards can guide learning, but they should be used sparingly because overly strong or misaligned shaping may teach shortcuts.
- **Guard against reward hacking.** Make rewards difficult to exploit, and verify that the model is solving the real task rather than gaming the scoring rule.
- **Validate before training.** Test the reward function on real trajectories before training to catch bugs, loopholes, or misleading signals.
- **Monitor behavioral metrics, not just reward.** Track metrics such as completion rate, turn count, tool use, and overfitting gap to ensure the model is improving in the intended way.

Reward design process

1. Define what success looks like and determine whether it can be scored automatically.
2. Evaluate the base model to establish a baseline success rate.
3. Design reward tiers: positive rewards for success, zero rewards for failure, and negative rewards for degenerate behavior.
4. Handle edge cases explicitly, including timeouts, environment errors, malformed outputs, and empty responses.
5. Check each reward component for potential reward hacking.
6. Validate on real trajectories before training.
7. Monitor alongside behavioral metrics during training.
8. Iterate based on initial results.

In practice, a reward function takes the full message history of an episode as input and returns two outputs: a scalar reward (a floating-point score measuring trajectory quality, with higher values indicating better performance) and a metrics dictionary for logging, debugging, and monitoring.

Example: Search agent reward function

The following example shows a reward function for an agent that answers questions using search. It demonstrates outcome evaluation, format shaping, and answer correctness checking.

```
class TextAnswerReward:
```

```
    """Reward function to check text answer against gold answers.

    formula: format_coef * (correct_format - 1) + correct_answer
    """

    gold_answers: list[str]
    format_coef: float = 0.1

    async def __call__(self, history: list[Message]) -> tuple[float, dict[str, float]]:
        """Grade the completed episode by checking the final assistant message."""
        final_message = None
        for msg in reversed(history):
            if msg.get("role") == "assistant":
                final_message = msg
                break

        if final_message is None:
            return 0.0, {"format": 0.0, "correct": 0.0}

        content = get_text_content(final_message)

        correct_format = float(self._extract_answer(content) is not None)
        correct_answer = float(self._check_answer(content))

        reward = self.format_coef * (correct_format - 1) + correct_answer
        return reward, {"format": correct_format, "correct": correct_answer}

    def _extract_answer(self, text: str) -> str | None:
        if "Answer:" not in text:
            return None
        parts = text.split("Answer:")
        if len(parts) != 2:
            return None
        return parts[1].strip()

    def _check_answer(self, text: str) -> bool:
        model_answer = self._extract_answer(text)
        if model_answer is None or len(self.gold_answers) == 0:
            return False
        for gold in self.gold_answers:
            if normalize_answer(model_answer) == normalize_answer(gold):
                return True
        return False
```

This reward function includes the following key design choices:

- **Correctness dominates.** A correct answer always scores higher than an incorrect one, regardless of format.
- **Format is a small shaping signal.** The format coefficient (0.1) is 10% of the outcome reward, small enough that the model cannot profit from format compliance alone, but large enough to steer it toward parseable outputs.
- **Wrong format with wrong answer is mildly penalized.** The -0.1 score creates a small gradient away from completely unstructured outputs, without overwhelming the learning signal.
- **No answer is treated as incorrect with bad format.** If the model never produces an assistant message, the function returns 0.0, distinguishing it from the active penalty of -0.1 for a present but malformed response.

Training job submission

Launching Training Jobs

After your agent is deployed and your dataset is in S3, create a training job using one of the following methods.

SageMaker AI Studio

- Navigate to Models in the navigation pane and select JumpStart Base Models.
- Select a model that supports multi-turn RL (see the supported models table) and choose Customize model, then Customize with UI.
- Select Multi-Turn Reinforcement Learning as the customization technique.
- Configure your agent environment — select your Bedrock AgentCore runtime or provide your Lambda forwarder ARN.
- Provide your training dataset as an S3 URI or registered dataset.
- Adjust hyperparameters as needed.
- Review your configuration and choose Submit.

SageMaker AI Python SDK

Discover supported models

```
from sagemaker.train.multi_turn_rl_trainer import MultiTurnRLTrainer
```

```
supported_models = MultiTurnRLTrainer.list_supported_models()
print(f"Supported MTRL models ({len(supported_models)}):")
for m in supported_models:
    print(f"  - {m}")
```

Set up your agent environment

Option 1: Bedrock AgentCore runtime

```
# List available runtimes
runtimes = MultiTurnRLTrainer.list_bedrock_agentcore_runtimes()
for rt in runtimes:
    print(f"  - {rt['name']} ({rt['status']}) # {rt['arn']}")
```

Option 2: Custom Lambda agent

```
from sagemaker.train.agent_lambda import AgentLambda

# Create from inline code
adapter = AgentLambda.create(
    source='''
import json
def handler(event, context):
    prompt = event.get("prompt", "")
    return {"statusCode": 200, "body": json.dumps({"status": "ok", "agentResponse":
 prompt})}
''',
    role="arn:aws:iam::123456789012:role/AgentLambdaRole",
)

# Create from a local file
adapter = AgentLambda.create(
    source="~/my_agent_handler.py",
    role="arn:aws:iam::123456789012:role/AgentLambdaRole",
)

# Create from S3
adapter = AgentLambda.create(
    source="s3://my-bucket/agent_handler.py",
    role="arn:aws:iam::123456789012:role/AgentLambdaRole",
)
```

```
# Wrap an existing Lambda
adapter = AgentLambda.get("arn:aws:lambda:us-west-2:123456789012:function:my-agent")
```

Register your dataset (optional)

```
from sagemaker.ai_registry.dataset import DataSet

dataset = DataSet.create(
    name="my-mtrl-dataset",
    source="s3://my-bucket/prompts/training_prompts.parquet"
)
print(f"Dataset ARN: {dataset.arn}")
```

Create Restricted Model Package Group for Nova (optional)

If you are choosing Nova model (`nova-textgeneration-lite-v2`), then optionally create Restricted Model Package Group prior to submitting a training job (next step). If you skip this step, the SDK automatically creates one for you.

Restricted Model Package Group (RMPG) is a Model Package Group with ManagedStorageType: Restricted. It's required for closed-source models like Nova where the model weights are managed by Amazon and not directly accessible to the customer.

The RFT job schema requires two separate Restricted MPGs:

- Output MPG — stores the final fine-tuned model package
- Intermediate Checkpoint MPG — reserved for intermediate training checkpoints (must differ from the Output MPG)

```
from sagemaker.core.resources import Job, ModelPackageGroup
from sagemaker.core.shapes import ManagedConfiguration

model_name = "nova-textgeneration-lite-v2"

# Restricted configuration
managed_config = ManagedConfiguration(managed_storage_type="Restricted")

# Output Model package group
output_mpg_name = f"{model_name}-mtrl-output-mpg"
create_kwargs = {
```

```
    "model_package_group_name": output_mpg_name,
    "region": "us-east-1",
    "managed_configuration": managed_config
}
output_mpg = ModelPackageGroup.create(**create_kwargs)

# Intermediate Model package group
intermediate_mpg_name = f"{model_name}-mtrl-inter-mpg"
create_kwargs = {
    "model_package_group_name": intermediate_mpg_name,
    "region": "us-east-1",
    "managed_configuration": managed_config
}
intermediate_mpg = ModelPackageGroup.create(**create_kwargs)
```

Once the Model package group is created, pass the groups in the next step when submitting a training job.

Submit a training job with Bedrock AgentCore

```
from sagemaker.train.multi_turn_rl_trainer import MultiTurnRLTrainer

trainer = MultiTurnRLTrainer(
    model="openai-reasoning-gpt-oss-20b",
    agent_env="arn:aws:bedrock-agentcore:us-west-2:123456789012:runtime/my-agent-
runtime",
    training_dataset="s3://my-bucket/prompts/prompts.parquet",
    mlflow_app_arn="arn:aws:sagemaker:us-west-2:123456789012:mlflow-app/mlflow-app-id",
    s3_output_path="s3://my-bucket/output/",
    role="arn:aws:iam::123456789012:role/SageMakerRole",
    accept_eula=True,
)

# View and adjust hyperparameters
trainer.hyperparameters.get_info()
trainer.hyperparameters.max_epochs = 1
trainer.hyperparameters.global_batch_size = 32
trainer.hyperparameters.max_steps = 12

job = trainer.train(wait=True)
print(f"Job: {job.job_name}")
print(f"Status: {job.job_status}")
print(f"Output Model Package: {job.output_model_package_arn}")
```

Submit a training job with a custom Lambda agent

```
trainer = MultiTurnRLTrainer(
    model="openai-reasoning-gpt-oss-20b",
    agent_env=adapter,  # AgentLambda object or Lambda ARN string
    training_dataset="s3://my-bucket/prompts/prompts.parquet",
    mlflow_app_arn="arn:aws:sagemaker:us-west-2:123456789012:mlflow-app/mlflow-app-id",
    s3_output_path="s3://my-bucket/output/",
    role="arn:aws:iam::123456789012:role/SageMakerRole",
    accept_eula=True,
)

trainer.hyperparameters.max_epochs = 1
trainer.hyperparameters.global_batch_size = 32
trainer.hyperparameters.max_steps = 12

job = trainer.train(wait=True)
print(f"Job: {job.job_name}")
print(f"Status: {job.job_status}")
print(f"Output Model Package: {job.output_model_package_arn}")
```

Submit a training job with Restricted Model package group for Nova

Refer to the step above (Create Restricted Model Package Group for Nova) on how to create a Restricted Model Package group.

```
from sagemaker.train.multi_turn_rl_trainer import MultiTurnRLTrainer

trainer = MultiTurnRLTrainer(
    model="nova-textgeneration-lite-v2",
    agent_env="arn:aws:bedrock-agentcore:us-west-2:123456789012:runtime/my-agent-
runtime",
    training_dataset="s3://my-bucket/prompts/prompts.parquet",
    mlflow_app_arn="arn:aws:sagemaker:us-west-2:123456789012:mlflow-app/mlflow-app-id",
    s3_output_path="s3://my-bucket/output/",
    role="arn:aws:iam::123456789012:role/SageMakerRole",
    accept_eula=True,
    output_model_package_group=output_mpg,
    intermediate_checkpoint_model_package_group=intermediate_mpg
)

# View and adjust hyperparameters
trainer.hyperparameters.get_info()
```

```
trainer.hyperparameters.max_epochs = 1
trainer.hyperparameters.global_batch_size = 32
trainer.hyperparameters.max_steps = 12

job = trainer.train(wait=True)
print(f"Job: {job.job_name}")
print(f"Status: {job.job_status}")
print(f"Output Model Package: {job.output_model_package_arn}")
```

Amazon CLI

Create a training job using the `CreateJob` API. You specify the agent configuration, training data location, base model, and output settings in the `JobConfigDocument`.

To retrieve the full JobConfigDocument schema:

```
aws sagemaker list-job-schema-versions --job-category AgentRFT
aws sagemaker describe-job-schema-version --job-category AgentRFT --version "1.0.0"
```

Create job with Bedrock AgentCore

```
aws sagemaker create-job \
  --job-category AgentRFT \
  --job-name "my-agent-rft-job" \
  --role-arn "arn:aws:iam::123456789012:role/SageMakerFineTuningJobRole" \
  --job-config-schema-version "1.0.0" \
  --job-config-document '{
    "AgentConfig": {
      "BedrockAgentCoreConfig": {
        "AgentRuntimeArn": "arn:aws:bedrock-agentcore:us-west-2:123456789012:runtime/
my-agent"
      }
    },
    "InputDataConfig": [...],
    "OutputDataConfig": {...},
    "ModelPackageConfig": {...},
    "TrainingConfig": {...}
  }' \
  --region us-west-2
```

Create job with custom Lambda agent

```
aws sagemaker create-job \
```

```
  --job-category AgentRFT \
  --job-name "my-custom-agent-rft-job" \
  --role-arn "arn:aws:iam::account-id:role/SageMakerFineTuningJobRole" \
  --job-config-schema-version "1.0.0" \
  --job-config-document '{
    "AgentConfig": {
      "CustomAgentLambdaConfig": {
        "LambdaArn": "arn:aws:lambda:us-west-2:account-id:function:rft-agent-forwarder"
      }
    },
    "InputDataConfig": [...],
    "OutputDataConfig": {...},
    "ModelPackageConfig": {...},
    "TrainingConfig": {...}
  }' \
  --region us-west-2
```

boto3

Create job with Bedrock AgentCore

```
import json
import boto3

sm = boto3.client("sagemaker")

response = sm.create_job(
    JobName="my-agent-rft-job",
    RoleArn="arn:aws:iam::123456789012:role/SageMakerFineTuningJobRole",
    JobCategory="AgentRFT",
    JobConfigSchemaVersion="1.0.0",
    JobConfigDocument=json.dumps({
        "AgentConfig": {
            "BedrockAgentCoreConfig": {
                "AgentRuntimeArn": "arn:aws:bedrock-agentcore:us-
west-2:123456789012:runtime/my-agent"
            }
        },
        "InputDataConfig": [...],
        "OutputDataConfig": {...},
        "ModelPackageConfig": {...},
        "TrainingConfig": {...}
    })
)
```

```
print(f"Job ARN: {response['JobArn']}")
```

Create job with custom Lambda agent

```
import json
import boto3

sm = boto3.client("sagemaker")

response = sm.create_job(
    JobName="my-custom-agent-rft-job",
    RoleArn="arn:aws:iam::account-id:role/SageMakerFineTuningJobRole",
    JobCategory="AgentRFT",
    JobConfigSchemaVersion="1.0.0",
    JobConfigDocument=json.dumps({
        "AgentConfig": {
            "CustomAgentLambdaConfig": {
                "LambdaArn": "arn:aws:lambda:us-west-2:account-id:function:rft-agent-
forwarder"
            }
        },
        "InputDataConfig": [...],
        "OutputDataConfig": {...},
        "ModelPackageConfig": {...},
        "TrainingConfig": {...}
    })
)

print(f"Job ARN: {response['JobArn']}")
```

Monitoring Training

Monitor your Training Job

Use the `DescribeJob` API to check your job's current status at any time. The job status transitions through `InProgress`, and then to `Completed`, `Failed` or `Stopped`.

```
aws sagemaker describe-job \
  --job-name "my-agent-rft-job" \
  --job-category AgentRFT \
  --region us-west-2
```

Use the SDK:

```
# Run without blocking
job = trainer.train(wait=False)
job.wait(poll=5, timeout=3000, max_log_lines=10)
# Check status
job.refresh()
print(f"Status: {job.job_status}")
print(f"Secondary Status: {job.secondary_status}")
print(f"Output Model Package: {job.output_model_package_arn}")
print(f"MLflow Details: {job.mlflow_details}")
print(f"Billable Tokens: {job.billable_token_usage}")
# Open MLflow tracking URL
job.get_mlflow_url()
# Stop a running job
job.stop()
# Attach to an existing job from a different session
existing_job = MultiTurnRLTrainer.attach(job_name="my-existing-job-name")
print(f"Status: {existing_job.job_status}")
print(f"Output Model: {existing_job.output_model_package_arn}")
# List all completed jobs
from sagemaker.train.agent_rft_job import AgentRFTJob
for j in AgentRFTJob.get_all(status_equals="Completed"):
    print(f"{j.job_name}: {j.job_status}")
```

Monitor Training in MLflow

SageMaker AI automatically integrates with managed MLflow to track your training job's progress, metrics, and artifacts. To enable MLflow tracking, include an `MlflowConfig` in your job's `OutputDataConfig`:

```
"OutputDataConfig": {
    "S3OutputPath": "s3://your-bucket/output/",
    "MlflowConfig": {
        "MlflowResourceArn": "arn:aws:sagemaker:us-west-2:123456789012:mlflow-app/my-
rft-mlflow-app"
    }
}
```

Prerequisites

- Create a managed MLflow App in your account. For setup instructions, see MLflow App Setup.

- Ensure your SageMaker AI execution role has permissions to write to the MLflow App (`sagemaker-mlflow:*` actions).
- Include the `MlflowResourceArn` in your job configuration.

What gets logged

#	Category	What's logged	Where in MLflow UI
1	Training metrics	Per-step counters, throughput, datum and token accounting, all-clock duration of each phase of a step, trajectory-reward summary rollout batch, and turn-count distribution per trajectory	Metrics tab (time-series charts)
2	Trajectory traces	Full multi-turn conversations with tool calls and rewards	Traces tab

Detailed training metrics reference

The following metrics are logged at each training step.

Step counters and throughput (`training/`)

Metric	Description
`training/epoch`	Current epoch number
`training/global_step`	Global training step counter
`training/num_groups`	Trajectory groups in this step

Metric	Description
`training/num_trajectories`	Total trajectories processed in this step
`training/total_tokens`	Tokens summed across all micro-batches in this step
`training/num_datums`	Training datums formed from trajectories
`training/datums_per_trajectory`	Average datums emitted per trajectory
`training/action_tokens_mean`	Mean action (response) tokens per trajectory
`training/obs_tokens_mean`	Mean observation (prompt) tokens per trajectory
`training/trainable_token_positions`	Total trainable target positions in this step
`training/nontrainable_token_positions`	Total non-trainable target positions in this step
`training/trainable_token_ratio`	Ratio: `trainable / (trainable + nontrainable)` token positions

Phase durations (`timing_s/`)

Metric	Description
`timing_s/step`	Total time for the full step
`timing_s/training`	Time for forward/backward passes and optimizer step
`timing_s/policy_update`	Time saving updated weights for the sampler
`timing_s/save_checkpoint`	Time saving a checkpoint (only on checkpoint steps)
`timing_s/eval`	Time running evaluation (only on eval steps)

Reward distribution (`rollout/reward/`)

Metric	Description
`rollout/reward/mean`	Mean trajectory reward across all groups
`rollout/reward/valid_mean`	Mean reward over only the valid (non-zero-advantage) groups; equals `mean` when no filtering occurred
`rollout/reward/std`	Standard deviation of trajectory rewards
`rollout/reward/min`	Minimum trajectory reward
`rollout/reward/max`	Maximum trajectory reward
`rollout/reward/zero_frac`	Fraction of trajectories with total reward exactly 0.0

Turn counts (`rollout/turns/`)

Metric	Description
`rollout/turns/mean`	Mean turns (transitions) per trajectory
`rollout/turns/min`	Minimum turns across trajectories
`rollout/turns/max`	Maximum turns across trajectories

Token lengths (`rollout/tokens/`)

Metric	Description
`rollout/tokens/prompt_mean`	Mean prompt token count per transition
`rollout/tokens/response_mean`	Mean response token count per transition

Metric	Description
`rollout/tokens/response_std`	Standard deviation of response token counts
`rollout/tokens/response_min`	Minimum response tokens
`rollout/tokens/response_max`	Maximum response tokens (watch for clustering at `sampling_max_tokens`)

Log-probability health (`rollout/logprob/`)

Metric	Description
`rollout/logprob/zero_count`	Total zero-logprob tokens
`rollout/logprob/zero_frac`	Fraction of all logprobs that are exactly 0.0
`rollout/logprob/zero_per_group`	Average zero logprobs per trajectory group
`rollout/logprob/nz_mean`	Mean of non-zero logprobs
`rollout/logprob/nz_std`	Standard deviation of non-zero logprobs
`rollout/logprob/nz_min`	Minimum non-zero logprob
`rollout/logprob/nz_max`	Maximum non-zero logprob

Advantage distribution (`rollout/advantage/`)

Metric	Description
`rollout/advantage/mean`	Mean advantage value across all transitions
`rollout/advantage/std`	Standard deviation of advantages

Metric	Description
`rollout/advantage/min`	Minimum advantage
`rollout/advantage/max`	Maximum advantage
`rollout/advantage/n_positive`	Transitions with positive advantage
`rollout/advantage/n_negative`	Transitions with negative advantage

Batch-quality classification (`analysis/`)

Metric	Description
`analysis/batch_completion_ratio`	`total_completed / batch_size` — fraction of expected groups that arrived
`analysis/batch_valid_ratio`	`valid_count / batch_size` — non-zero-advantage groups relative to full batch
`analysis/zero_adv_groups`	Groups where all transitions have near-zero advantage
`analysis/zero_adv_nonzero_reward`	Zero-advantage groups where at least one transition has reward not equal to 0 (all-correct case for binary rewards)
`analysis/zero_adv_zero_reward`	Zero-advantage groups where all rewards are 0 (all-wrong case)
`analysis/reward_variance_across_groups`	Variance of per-group mean rewards (high = diverse batch)
`analysis/mean_group_reward_spread`	Average within-group reward spread `max - min`

Evaluation reward and pass@k (`val/reward/`)

Emitted at baseline (step 0), at every `val_every` interval, and at the final step. Includes the same distribution metrics as `rollout/reward` plus group-reward metrics aggregated by prompt.

Distribution:

Metric	Description
`val/reward/mean`	Mean reward over the eval set
`val/reward/std`	Reward std dev
`val/reward/min`	Minimum reward
`val/reward/max`	Maximum reward
`val/reward/zero_frac`	Fraction of zero-reward trajectories

Group-reward (per-prompt aggregation):

Metric	Description
`val/reward/min_within_groups`	Average per-prompt minimum reward
`val/reward/mean_within_groups`	Average per-prompt mean reward
`val/reward/max_within_groups`	Average per-prompt maximum reward
`val/reward/std_within_groups`	Average per-prompt reward std (consistency)
`val/reward/rollouts_per_prompt`	Mean rollouts (n) across prompts
`val/reward/num_prompts`	Distinct prompts evaluated

Pass@k and success accounting:

Metric	Description
`val/reward/succeeded_rollouts`	Total rollouts with reward ≥ `success_threshold`
`val/reward/failed_rollouts`	Total rollouts with reward < `success_threshold`
`val/reward/success_threshold`	Threshold used (echoed for clarity)
`val/reward/pass_at_{k}`	Probability ≥1 of k samples passes
`val/reward/pass_power_{k}`	Probability all k samples pass (reliability)

Evaluation turn counts (`val/turns/`)

Metric	Description
`val/turns/mean`	Mean turns per eval trajectory
`val/turns/min`	Minimum turns
`val/turns/max`	Maximum turns

Evaluation token lengths (`val/tokens/`)

Metric	Description
`val/tokens/prompt_mean`	Mean prompt tokens per transition
`val/tokens/response_mean`	Mean response tokens per transition
`val/tokens/response_std`	Standard deviation of response tokens
`val/tokens/response_min`	Minimum response tokens

Metric	Description
val/tokens/response_max	Maximum response tokens

Evaluation log-probability health (val/logprob/)

Metric	Description
val/logprob/zero_count	Total zero-logprob tokens
val/logprob/zero_frac	Fraction of zero logprobs
val/logprob/zero_per_group	Zero logprobs per group
val/logprob/nz_mean	Mean of non-zero logprobs
val/logprob/nz_std	Standard deviation of non-zero logprobs
val/logprob/nz_min	Minimum non-zero logprob
val/logprob/nz_max	Maximum non-zero logprob

Accessing the MLflow UI

Access the MLflow UI via a presigned URL:

```
aws sagemaker create-presigned-mlflow-app-url \
  --arn arn:aws:sagemaker:us-west-2:123456789012:mlflow-app/mlflow-app-id \
  --region us-west-2
```

Copy the `AuthorizedUrl` from the output into your browser.

Agent trajectories and traces

During training, SageMaker AI records every interaction between your agent and the policy model as a trajectory — the complete record of one rollout. Each trajectory captures every prompt sent to the model, every response generated, every tool call made, and the final reward. Trajectories are published to your MLflow experiment as structured traces.

Trace contents

- The input prompt from your training dataset
- Every model inference turn (prompt, response, and token-level data)
- Tool calls and their results, if your agent uses tools
- The final reward score
- Timing information for each turn

Viewing trajectories in the MLflow UI

Access the MLflow UI via a presigned URL:

```
aws sagemaker create-presigned-mlflow-app-url \
  --arn arn:aws:sagemaker:us-west-2:123456789012:mlflow-app/mlflow-app-id \
  --region us-west-2
```

Copy the `AuthorizedUrl` from the output into your browser.

Open the MLflow UI using the presigned URL above. Navigate to your experiment's run and select the Traces tab. Each trace represents one completed rollout and shows:

- The system prompt and user prompt
- Each assistant response (with thinking/reasoning if applicable)
- Tool use spans showing which tools were called and their outputs
- The reward score assigned to the trajectory

Use trajectories to debug low reward scores

Symptom	What to look for
Low reward across most rollouts	Are model responses coherent? Is the prompt format correct?
Tool-related failures	Are tool calls succeeding? Are inputs and outputs well-formed?

Symptom	What to look for
Agent looping	Is the agent repeating the same actions without making progress?
Truncated responses	Are responses being cut off by the maxTokens limit?

Get Training Results

When a training job completes, your trained model weights are stored as a SageMaker AI Model Package. This section explains how to find your results, understand the checkpoint types produced during training, and use them for deployment or continued training.

How results are stored

SageMaker AI stores training output as versioned, immutable Model Packages inside Model Package Groups. Multi-turn RL uses two separate groups, which you specify when creating a job:

Group	Purpose	Contents
Output Model Package Group	Final trained model	HuggingFace-compatible LoRA adapter weights (adapter_config.json + adapter_model.safetensors)
Intermediate Checkpoint Model Package Group	Resumable training state	LoRA adapter weights + optimizer states + training step metadata

Configure both groups in your ModelPackageConfig:

```
"ModelPackageConfig": {
  "OutputModelPackageGroupArn": "arn:aws:sagemaker:us-west-2:123456789012:model-
package-group/my-final-models",
  "IntermediateCheckpointModelPackageGroupArn": "arn:aws:sagemaker:us-
west-2:123456789012:model-package-group/my-intermediate-checkpoints"
}
```

Checkpoint types

Training produces two types of checkpoints, saved at every training step:

Model checkpoint (weights only)

- Stored in the Output Model Package Group
- Contains HuggingFace-compatible LoRA adapter weights in SafeTensors format
- Use for inference, deployment, or as the starting point for a new training job
- Created at every step, at job completion, and when a job is stopped

Resumable checkpoint (full state)

- Stored in the Intermediate Checkpoint Model Package Group
- Contains LoRA adapter weights, optimizer states, and per-GPU training step metadata
- Use to resume an interrupted job from the exact step it stopped
- Internal format — not directly usable for inference

Checkpoint lifecycle

```
Step 1 # Intermediate Checkpoint (resumable)
Step 1 # Intermediate Checkpoint (HF-compatible)
...
Step N-1 # Intermediate Checkpoint (resumable)
Step N-1 # Intermediate Checkpoint (HF-compatible)
...
Step N (final) # Model Checkpoint (HuggingFace LoRA) # Output Model Package Group
```

Retrieve your trained model

When a job completes successfully, the final model is saved as a Model Package in the Output Model Package Group. The `OutputModelPackageArn` field on the job record contains the ARN.

Check job completion and retrieve the output model ARN:

```
aws sagemaker describe-job \
--job-name "my-agent-rft-job" \
--job-category AgentRFT \
--region us-west-2
```

Look for `OutputModelPackageArn` in the response. Use it to describe the Model Package and get the S3 location of the weights:

```
aws sagemaker describe-model-package \
--model-package-name "arn:aws:sagemaker:us-west-2:123456789012:model-package/my-final-models/5"
```

If a job fails or is stopped before completion, the last intermediate checkpoint is promoted to the Output Model Package Group on a best-effort basis. Check `OutputModelPackageArn` the same way.

To monitor checkpoint creation during training, watch the `ResumableCheckpoint` and `ModelCheckpoint` fields in DescribeJob output.

Resume an interrupted job

If a job fails or is stopped mid-training, you can start a new job that picks up from the exact step where it left off. The platform restores the full training state — weights, optimizer momentum, and step counter — from the resumable checkpoint.

Specify a resumable checkpoint from the Intermediate Checkpoint Model Package Group as `InputModelPackageArn`:

```
"ModelPackageConfig": {
  "OutputModelPackageGroupArn": "arn:aws:sagemaker:us-west-2:123456789012:model-package-group/my-final-models",
  "IntermediateCheckpointModelPackageGroupArn": "arn:aws:sagemaker:us-west-2:123456789012:model-package-group/my-intermediate-checkpoints",
  "InputModelPackageArn": "arn:aws:sagemaker:us-west-2:123456789012:model-package/my-intermediate-checkpoints/5"
}
```

The `InputModelPackageArn` must point to a resumable checkpoint (one with `IsCheckpoint=true` in its Model Package metadata). Training resumes from the step after the checkpoint — for example, if the checkpoint was saved at step 4, training continues from step 5.

The following must stay the same between the original job and the resumed job:

- Base model
- LoRA configuration (rank and alpha)

- Hyperparameters (learning rate, batch size, etc.)
- Dataset

Continue training on a new job (iterative training)

Iterative training lets you build on a previously trained model with a different dataset, different hyperparameters, or a refined reward function. Unlike resuming, this starts a fresh training run — the optimizer resets, the step counter resets to 0, and only the trained LoRA weights carry over.

Specify a model checkpoint from the Output Model Package Group as `InputModelPackageArn`:

```
"ModelPackageConfig": {
  "OutputModelPackageGroupArn": "arn:aws:sagemaker:us-west-2:123456789012:model-package-group/my-final-models",
  "IntermediateCheckpointModelPackageGroupArn": "arn:aws:sagemaker:us-west-2:123456789012:model-package-group/my-intermediate-checkpoints",
  "InputModelPackageArn": "arn:aws:sagemaker:us-west-2:123456789012:model-package/my-final-models/3"
}
```

What you can change between iterations:

- Hyperparameters (learning rate, batch size, max_steps, group_size, etc.)
- Dataset (different prompts or data distribution)
- Reward function
- Agent configuration

What must stay the same:

- Base model — the LoRA adapter is tied to the base model architecture

Common patterns for iterative training:

- **Curriculum learning** — train on easier problems first, then continue on harder ones
- **Reward refinement** — start with a simple reward function, then iterate with a more nuanced one
- **Hyperparameter adjustment** — increase batch size or tune learning rate after observing initial training dynamics

Checkpoint best practices

- **Monitor checkpoint creation**. Use DescribeJob to track `ResumableCheckpoint` and `ModelCheckpoint` fields during training so you know what's available if you need to resume.
- **Plan for failures on long jobs.** If a job has many steps, design your workflow to resume from checkpoints rather than restart from scratch.

Model evaluation

Evaluation runs your agent against a prompt set and reports reward, pass@k, and trajectory metrics. Use it to compare a fine-tuned model against its base or benchmark a candidate before deployment.

Note: Evaluation jobs use `JobCategory: AgentRFTEvaluation` (not `AgentRFT` as used in training). Use this category on `CreateJob` and `DescribeJob` calls for eval jobs.

Preparing evaluation data

Evaluation datasets use the same format and schema as training datasets. See the section called "Prompt dataset format". The guidance below is eval-specific.

1. **Hold out evaluation data from training datasets.** Never evaluate on training prompts as scores will overstate performance. Reserve a portion of the data for a held-out set, or maintain a separate eval dataset. Keep the same eval set across iterations so results are comparable.
2. **Match the training prompt format.** The agent must parse eval prompts the same way it parsed training prompts. If you used encoding or encryption during training, use the identical structure here. Generating both from the same code path avoids drift.
3. **Cover the behaviors you care about.** Exercise each tool and tool combination your agent uses. Include prompts that previously caused failures so regressions surface.
4. **Protect sensitive content the same way as in training** as the service passes prompts through without inspection.

Launching an evaluation job

After training completes, evaluate your model using one of the following methods.

SageMaker AI Studio

- Navigate to your custom model's details page (**Models** > **My Models** > select your MTRL model).

- Choose **Evaluate** to open the evaluation configuration page.
- Select **Multi-Turn RL** as the evaluation type.
- Configure your agent environment — select your Bedrock AgentCore runtime or provide your Lambda forwarder ARN.
- Provide your evaluation dataset (S3 URI or registered dataset containing held-out evaluation prompts).
- Choose **Submit** to start the evaluation job.

SageMaker AI Python SDK

The `MultiTurnRLEvaluator` provides a high-level interface for launching evaluation jobs. When you pass a completed trainer, the evaluator automatically resolves the model package ARN, agent configuration, and agent qualifier.

Evaluate a fine-tuned model

```
from sagemaker.train.evaluate import MultiTurnRLEvaluator
from sagemaker.train.multi_turn_rl_trainer import MultiTurnRLTrainer

# Attach to a completed training job
trainer = MultiTurnRLTrainer.attach(job_name="my-mtrl-job-20260512082005")

# Minimal evaluator — everything else inferred from trainer
evaluator = MultiTurnRLEvaluator(
    model=trainer,
    dataset="s3://my-bucket/eval-prompts.parquet",
    s3_output_path="s3://my-bucket/eval-output/",
)

execution = evaluator.evaluate()
print(f"Evaluation started: {execution.arn}")

# Wait for completion
execution.wait()
print(f"Status: {execution.status.overall_status}")
print(f"S3 Output: {execution.s3_output_path}")
print(f"MLflow: {execution.mlflow_url}")
```

Evaluate a base model (no training)

When evaluating a base model directly, `agent_config` is required since there is no trainer to inherit from:

```
from sagemaker.train.evaluate import MultiTurnRLEvaluator

# With Bedrock AgentCore
evaluator_base = MultiTurnRLEvaluator(
    model="openai-reasoning-gpt-oss-20b",
    dataset="s3://my-bucket/eval-prompts.parquet",
    agent_config="arn:aws:bedrock-agentcore:us-west-2:123456789012:runtime/my-agent",
    s3_output_path="s3://my-bucket/eval-output/base/",
    mlflow_resource_arn="arn:aws:sagemaker:us-west-2:123456789012:mlflow-tracking-
server/my-mlflow",
    role="arn:aws:iam::123456789012:role/SageMakerRole",
    accept_eula=True,
)

execution = evaluator_base.evaluate()
execution.wait()
```

Side-by-side comparison (base vs fine-tuned)

A single `evaluate()` call that evaluates both the base model and the fine-tuned model in one pipeline:

```
comparison_evaluator = MultiTurnRLEvaluator(
    model=trainer,
    dataset="s3://my-bucket/eval-prompts.parquet",
    s3_output_path="s3://my-bucket/eval-output/comparison/",
    evaluate_base_model=True,
)

execution = comparison_evaluator.evaluate()
execution.wait()
print(f"Status: {execution.status.overall_status}")
```

Monitor and retrieve results

```
# Refresh status
execution.refresh()
print(f"Status: {execution.status.overall_status}")
```

```
# Step-level detail
for step in execution.status.step_details:
    print(f"  {step.name}: {step.status}")
    if step.job_arn:
        print(f"    Job ARN: {step.job_arn}")

# MLflow URL
print(f"MLflow: {execution.mlflow_url}")
```

Amazon CLI and boto3

You can also create evaluation jobs directly using the `CreateJob` API.

Create an evaluation job (Bedrock AgentCore)

To create an evaluation job, call the `CreateJob` API with `JobCategory` set to `AgentRFTEvaluation`. Agent setup and configuration follows the same process as training jobs.

Using Amazon CLI

```
aws sagemaker create-job \
  --job-category AgentRFTEvaluation \
  --job-name "my-agent-rft-eval-job" \
  --role-arn "arn:aws:iam::123456789012:role/SageMakerFineTuningJobRole" \
  --job-config-schema-version "1.0.0" \
  --job-config-document '{
    "AgentConfig": {
      "BedrockAgentCoreConfig": {
        "AgentRuntimeArn": "arn:aws:bedrock-agentcore:us-west-2:123456789012:runtime/
my-agent"
      }
    },
    "InputDataConfig": [{
      "ChannelName": "evaluation",
      "DataSource": {
        "S3DataSource": {
          "S3DataType": "S3Prefix",
          "S3Uri": "s3://your-bucket-name/eval-prompts/"
        }
      }
    }],
    "OutputDataConfig": {
```

```
      "S3OutputPath": "s3://your-bucket-name/eval-output/",
      "MlflowConfig": {
        "MlflowResourceArn": "arn:aws:sagemaker:us-west-2:123456789012:mlflow-app/my-
rft-mlflow-app"
      }
    },
    "EvaluationConfig": {
      "BaseModelArn": "arn:aws:sagemaker:us-west-2:aws:hub-content/SageMakerPublicHub/
Model/openai-reasoning-gpt-oss-20b",
      "AcceptEula": true,
      "HyperParameters": {"batch": { "eval_group_size": 1 }, "eval_metrics_config":
 { "pass_k_values": [1, 2, 4, 8, 16, 32], "success_threshold": 1 }}
    }
  }' \
  --region us-west-2
```

Using SageMaker AI Python SDK (boto3)

```
import json
import boto3

sm = boto3.client("sagemaker")

response = sm.create_job(
    JobName="my-agent-rft-eval-job",
    RoleArn="arn:aws:iam::123456789012:role/SageMakerFineTuningJobRole",
    JobCategory="AgentRFTEvaluation",
    JobConfigSchemaVersion="1.0.0",
    JobConfigDocument=json.dumps({
        "AgentConfig": {
            "BedrockAgentCoreConfig": {
                "AgentRuntimeArn": "arn:aws:bedrock-agentcore:us-
west-2:123456789012:runtime/my-agent"
            }
        },
        "InputDataConfig": [{
            "ChannelName": "evaluation",
            "DataSource": {
                "S3DataSource": {
                    "S3DataType": "S3Prefix",
                    "S3Uri": "s3://your-bucket-name/eval-prompts/"
                }
```

```
            }
        }],
        "OutputDataConfig": {
            "S3OutputPath": "s3://your-bucket-name/eval-output/",
            "MlflowConfig": {
                "MlflowResourceArn": "arn:aws:sagemaker:us-west-2:123456789012:mlflow-
app/my-rft-mlflow-app"
            }
        },
        "EvaluationConfig": {
            "BaseModelArn": "arn:aws:sagemaker:us-west-2:aws:hub-content/
SageMakerPublicHub/Model/openai-reasoning-gpt-oss-20b",
            "AcceptEula": True,
            "HyperParameters": {"batch": { "eval_group_size": 1 },
 "eval_metrics_config": { "pass_k_values": [1, 2, 4, 8, 16, 32], "success_threshold":
 1 }}
        }
    })
)

print(f"Eval Job ARN: {response['JobArn']}")
```

Evaluating a fine-tuned model

To evaluate a model produced by a training job, include `ModelPackageConfig` with the `InputModelPackageArn`:

```
import json
import boto3

sm = boto3.client("sagemaker")

response = sm.create_job(
    JobName="my-agent-rft-eval-finetuned",
    RoleArn="arn:aws:iam::123456789012:role/SageMakerFineTuningJobRole",
    JobCategory="AgentRFTEvaluation",
    JobConfigSchemaVersion="1.0.0",
    JobConfigDocument=json.dumps({
        "AgentConfig": {...},
        "InputDataConfig": [...],
        "OutputDataConfig": {...},
        "ModelPackageConfig": {
```

```
            "InputModelPackageArn": "arn:aws:sagemaker:us-west-2:123456789012:model-
package/my-final-models/1"
        },
        "EvaluationConfig": {...}
    })
)

print(f"Eval Job ARN: {response['JobArn']}")
```

Create an evaluation job (Custom Agent with Lambda Forwarder)

Use the same approach as Bedrock AgentCore evaluation but specify `CustomAgentLambdaConfig` in the `AgentConfig`:

```
"AgentConfig": {
    "CustomAgentLambdaConfig": {
        "LambdaArn": "arn:aws:lambda:us-west-2:account-id:function:rft-agent-forwarder"
    }
}
```

Evaluation hyperparameters

Category	Parameter	Type	Default	Description
batch	eval_group_size	integer	1	Rollouts per prompt. Note: To compute pass@k, set eval_group_size >= k.
eval_metrics_config	pass_k_values	array	[1, 2, 4, 8, 16, 32]	List of k values for computing pass@k and pass^k metrics. pass@k = probability that at least 1 of k sampled rollouts succeeds. pass^k = probability that all k rollouts succeed.
eval_metrics_config	success_threshold	float	1	A rollout is "successful" when reward >= success_threshold. Note this applies for pass@k, pass^k, succeeded/failed count metrics.

Category	Parameter	Type	Default	Description
eval_sampling_params	temperature	float	0	Sampling temperature for evaluation rollouts. Note: it is recommended to increase this value beyond 0 for pass@k and pass^k metrics to avoid deterministic behavior.
eval_sampling_params	sampling_top_p	float	1	Nucleus sampling cutoff for evaluation rollouts.
eval_sampling_params	sampling_max_tokens	integer	4096	Maximum tokens the model can generate per turn during evaluation rollouts.
rollout	timeout	float	600	Time (seconds) after which an evaluation rollout is treated as failed and may be retried.
rollout	max_concurrency	int	96	Maximum number of evaluation rollouts that can execute in parallel.
rollout	max_retries	int	3	Number of retry attempts for failed evaluation rollouts before marking them as permanently failed.

Monitoring evaluation

```
aws sagemaker describe-job \
  --job-name "my-agent-rft-eval-job" \
  --job-category AgentRFTEvaluation \
  --region us-west-2
```

Interpreting evaluation results

Open your MLflow App to view logged metrics, reward distributions, and trajectory visualizations for the evaluation run. See below for explanation on what each of the metrics means.

Reward metrics (`eval/reward/`)

Metric	Description
`eval/reward/mean`	Average reward score across all rollouts.
`eval/reward/min`	Minimum reward score across all rollouts.
`eval/reward/max`	Maximum reward score across all rollouts.
`eval/reward/std`	Standard deviation of reward scores across all rollouts.
`eval/reward/zero_frac`	Fraction of rollouts that scored exactly 0 (complete failures).
`eval/reward/pass_at_1`	Probability that at least 1 out of 1 sample per prompt succeeds. This is the primary success metric.
`eval/reward/pass_power_1`	Pass rate with power weighting.
`eval/reward/succeeded_rollouts`	Total number of rollouts that achieved a positive reward.
`eval/reward/failed_rollouts`	Total number of rollouts that scored 0.
`eval/reward/num_prompts`	Number of distinct prompts evaluated.
`eval/reward/rollouts_per_prompt`	Number of attempts (samples) generated per prompt.
`eval/reward/success_threshold`	The reward value required to count a rollout as "successful".
`eval/reward/mean_within_groups`	Average reward per prompt group (requires setting rollouts_per_prompt > 1).
`eval/reward/std_within_groups`	Standard deviation of reward within each prompt group.

Metric	Description
`eval/reward/min_within_groups`	Minimum reward within each prompt group.
`eval/reward/max_within_groups`	Maximum reward within each prompt group.

Token metrics (`eval/tokens/`)

Metric	Description
`eval/tokens/prompt_mean`	Average prompt length in tokens (includes system prompt, tool descriptions, and multi-turn context).
`eval/tokens/response_mean`	Average model response length in tokens per turn.
`eval/tokens/response_min`	Shortest model response in tokens.
`eval/tokens/response_max`	Longest model response in tokens.
`eval/tokens/response_std`	Standard deviation of response lengths. High variance may indicate inconsistent agent behavior.

Turn metrics (`eval/turns/`)

Metric	Description
`eval/turns/mean`	Average number of turns per rollout. High values may indicate the agent is looping or retrying excessively.
`eval/turns/min`	Fewest turns in any rollout.
`eval/turns/max`	Most turns in any rollout. Very high values suggest the agent got stuck without solving the task.

Log probability metrics (`eval/logprob/`)

Metric	Description
`eval/logprob/nz_mean`	Mean log-probability of non-zero (non-padding) tokens. Values close to 0 indicate high model confidence.
`eval/logprob/nz_min`	Lowest log-probability token (least confident predictio n).
`eval/logprob/nz_max`	Highest log-probability token (most confident predictio n).
`eval/logprob/nz_std`	Standard deviation of non-zero log-probabilities. Low values mean consistently high confidence.
`eval/logprob/zero_frac`	Fraction of tokens with exactly zero log-probability (probability 1.0), typically padding or forced tokens.
`eval/logprob/zero_count`	Total count of zero-logprob tokens.
`eval/logprob/zero_ per_group`	Average zero-logprob tokens per prompt group.

Timing metrics (`timing_s/`)

Metric	Description
`timing_s/eval`	Total wall-clock time for the evaluation in seconds. Divide by `eval/reward/num_prompts` for average time per prompt.

How to diagnose common patterns

Pattern	Likely cause
`pass_at_1 = 0`, high `turns/mean`	Agent is looping without solving tasks. Check tool usage and action patterns in trajectories.
`pass_at_1 = 0`, low `tokens/response_mean`	Agent producing very short (possibly empty or malformed) responses. Check prompt format and model compatibility.
High `turns/max` with low `turns/min`	Agent is showing inconsistent behavior across prompts. Some tasks may be much harder or the agent may be failing on specific tool interactions.
High confidence (`logprob/mean` close to 0) but low reward	Model is confidently producing wrong outputs. It may need more training data diversity or reward signal refinement.
`zero_frac = 1.0` in reward	Complete failure. Verify agent deployment, tool connectivity, and that the evaluation dataset format is correct.

For raw results, review the artifacts written to the `S3OutputPath` specified in `OutputDataConfig`.

Limits & quotas for evaluation

Use Amazon service quotas to request a limit increase on the maximum number of concurrent evaluation jobs.

Quota	Default
rft-evaluation-job maximum concurrent jobs	1

Model deployment

After your training job completes, the trained model is available as a Model Package in your Output Model Package Group. You have two options for deploying it.

Option 1: Deploy with SageMaker AI AI Inference

Host your model on a SageMaker AI AI inference endpoint for real-time, serverless, or asynchronous predictions. This option gives you fine-grained control over instance types, scaling policies, and network configuration. It's a good fit when you need low-latency serving, custom inference logic, or tight integration with existing SageMaker AI AI workflows.

To deploy, retrieve the `OutputModelPackageArn` from your completed training job and use it to create an endpoint.

```
# Retrieve the output model ARN from your completed job
aws sagemaker describe-job \
  --job-name "my-agent-rft-job" \
  --job-category AgentRFT \
  --region us-west-2
```

For full deployment options and configuration, see Deploy models for inference in the SageMaker AI AI documentation.

Option 2: Import into Amazon Bedrock

Import your model into Amazon Bedrock to use Bedrock's managed inference APIs with no endpoint configuration required. Amazon Bedrock supports importing customized open-source foundation models (such as Mistral AI or Llama) and Amazon Nova models fine-tuned in SageMaker AI AI. For more information, see Import a pre-trained model into Amazon Bedrock in the Amazon Bedrock User Guide. For Nova models, see Import with create custom model.

Deploy using SageMaker AI Studio

- Navigate to **Jobs > Training** and select the **Multi-turn RL** tab.
- Select a completed job and choose the model under **Custom Model Details** to review performance metrics, model lineage, and training logs.
- Under the **Governance** tab, approve the model to make it eligible for deployment.

- Choose **Deploy**. Select whether to deploy to a SageMaker AI AI real-time endpoint or through Amazon Bedrock, and whether to create a new endpoint or reuse an existing one.
- Select the instance type and optionally configure VPC settings, IAM role, and KMS encryption key.
- Monitor deployment progress under the **Deployments** tab.
- Navigate to **Deployments > Endpoints**. When your endpoint and associated inference components reach a status of InService, your endpoint is ready for invocation.

Deploy using SageMaker AI Python SDK

Deploy to a SageMaker AI endpoint:

```
from sagemaker.serve import ModelBuilder
from sagemaker.core.resources import ModelPackage

# Get the output model package from your completed training job
model_package = ModelPackage.get(
    model_package_name=job.output_model_package_arn
)

model_builder = ModelBuilder(
    model=model_package,
    image_uri="763104351884.dkr.ecr.us-west-2.amazonaws.com/djl-inference:0.36.0-
lmi24.0.0-cu129",
    instance_type="ml.g6e.48xlarge",
)
model_builder.accept_eula = True
model_builder.build()

endpoint = model_builder.deploy(
    endpoint_name="mtrl-finetuned-endpoint",
    instance_type="ml.g6e.48xlarge",
    initial_instance_count=1,
)
```

Invoke the endpoint:

```
import json
```

```
response = endpoint.invoke(
    body=json.dumps({
        "model": "/opt/ml/model",
        "messages": [{"role": "user", "content": "What is 25 * 4?"}],
        "max_tokens": 200,
        "stream": False,
    }).encode("utf-8"),
    content_type="application/json",
)
```

Hyperparameters reference

The following table lists all configurable hyperparameters for multi-turn RL training jobs. Recipe defaults are included below.

Category	Params	Default	Choice	Explanation
Batch	global_batch_size	128	{32, 64, 128}	Number of unique prompts per training step.
Batch	group_size	8	[2, 32]	Rollouts per prompt used to compute group-based advantages (GRPO / RLOO).
RL	advantage_method	group_based	monte_carlo, group_based, group_based_per_turn, rloo, reinforce_pp, reinforce_pp_baseline, opo, grpo_passk, gpg	Method for computing advantages for rollouts.

Category	Params	Default	Choice	Explanation
RL	loss_fn	ppo	importanc e_sampling, ppo, cispo	RL loss formulati on.
RL	clip_low_ threshold	0.8	[0, 1]	Lower bound for clipping the policy probabili ty ratio π_new/ π_old in the PPO-style surrogate loss.
RL	clip_high _threshold	1.2	[1, 10]	Upper bound for clipping the policy probabili ty ratio in the loss.
sampling_ params	temperature	1	[0, 2]	Sampling temperature applied to logits before sampling.
sampling_ params	sampling_top_p	1	[0, 1]	Nucleus-s ampling cutoff. Samples only from the smallest set of tokens whose cumulative probability ≥ top_p.

Category	Params	Default	Choice	Explanation
sampling_ params	sampling_ max_tokens	4096	[512, 8192]	Max tokens the model can generate per turn during rollout.
val_sampl ing_params	sampling_ max_tokens	4096	[512, 8192]	Max tokens the model can generate per turn during evaluation.
val_metri cs_config	pass_k_values	[1, 2, 4, 8, 16, 32]	n/a	List of k values for computing pass@k metrics.
val_metri cs_config	success_t hreshold	1	n/a	Reward threshold for counting a rollout as "successful".
Schedule	max_epochs	1	[1, 30]	Total passes over the data.
Schedule	max_steps	50	[1, 1000]	Total training iterations.
Schedule	val_every	10	[0, 100]	Eval interval (steps).
Model	model_nam e_or_path	required		Model to fine-tune (e.g., "GPT-OSS-20B").

Category	Params	Default	Choice	Explanation
Model	lora_rank	32	[16,64]	The rank of LoRA adapter that controls adapter capacity.
Model	lora_alpha	64	[16,128]	LoRA scaling factor. Effective update magnitude ∝ alpha / rank.
Model	learning_rate	4.00E-05	(0, 1e-2]	Adam learning rate.
Model	adam_beta1	0.9	[0, 0.999999]	Exponential decay rate for the running average of the gradient (first moment) in Adam.
Model	adam_beta2	0.95	[0, 0.999999]	Exponential decay rate for the running average of the squared gradient (second moment) in Adam.

Category	Params	Default	Choice	Explanation
Model	adam_eps	1.00E-08	[1e-16, 1e-2]	Small constant added to the denominator for numerical stability in Adam's update rule.
Model	adam_weight_decay	0	[0, 1]	Decoupled weight-decay coefficient (AdamW-style).
Model	adam_grad_clip_norm	1	[0, 100]	Maximum global gradient norm.
Rollout	rollout_max_concurrency	96	[32, 96]	The max in-flight rollout processes can happen in parallel.
Rollout	rollout_timeout	600	[300, 86400]	Failure handling: time after which we treat as the rollout failure.
Rollout	rollout_max_retries	3	[1, 10]	Number of retry attempts for failed rollouts.

Category	Params	Default	Choice	Explanation
async_config	max_steps _off_policy	3	[0, 10]	Staleness threshold in asynchronous training. When 0, it is synchrono us training.

Best practices for tuning hyperparameters

When a run is flat or collapsing, the following six parameters account for almost all of the explanation.

Learning rate

The `learning_rate` controls how large a step the optimizer takes at each training iteration. In multi-turn RL, the gradient signal per step varies depending on the task: a sparse-reward environment with binary outcomes produces many groups where all rollouts score identically, yielding zero advantage for the entire group. Only groups with mixed outcomes produce gradient signal, so each step's useful gradient is diluted. The learning rate needs to be lower to align with weaker signal, or the run needs more steps.

A dense-reward environment where trajectories within a group reliably get different scores produces consistent, non-zero advantages across most groups, and the default learning rate is often already sufficient.

The effective step size also depends on LoRA configuration — the actual update magnitude is `learning_rate × alpha/rank` — so a fixed learning rate hits differently depending on adapter capacity.

Loss function and clipping range

If you are new to MTRL, importance sampling (`importance_sampling`) is a good starting point before moving to advanced clipping-based algorithms. PPO and CISPO use `clip_low_threshold` and `clip_high_threshold` to constrain the probability ratio `policy_new(action|state) / policy_old(action|state)` — how much the policy is allowed to change in a single training step.

A ratio of `1.0` means no change. The lower threshold (for example, `0.8`) prevents the policy from aggressively unlearning actions it previously favored. The upper threshold (for example, `1.2`) prevents it from overcommitting to actions that looked good in one batch.

- **PPO** with `(clip_low_threshold, clip_high_threshold) = (0.8, 1.2)` is the safe baseline for any first run.
- **CISPO** requires wide asymmetric clipping. Start with `clip_low_threshold = 1.0`, `clip_high_threshold = 6.0`. CISPO allows bad-action probabilities to decrease freely and relies solely on the upper clip to prevent instability.

Tweaking clipping thresholds is recommended if training collapse or under-training is observed.

Batch size and group size

These two parameters jointly determine how much useful gradient signal each training step receives.

`global_batch_size` controls how many unique prompts are included in one optimizer step. Larger batches (128) average gradients over more prompts, producing smoother reward curves and more stable updates. Smaller batches (32) are cheaper per step and useful for fast iteration, but produce noisier gradients. For production runs, 128 is a good default; for debugging or hyperparameter screening, 32 is fine.

`group_size` determines how many independent rollouts are generated for each prompt. These rollouts are compared against each other to compute advantages. If all rollouts receive the same reward (all succeed or all fail), the advantage is zero and the group produces no gradient signal. The default is `group_size = 8`. Reduce it if you have enough diversity in the group, increase it if the environment demands more diversity.

Total rollouts per step = `global_batch_size × group_size`. In sparse-reward settings where most groups yield zero signal, it is often more efficient to keep group size moderate and increase batch size or step count instead.

Off-policy staleness

In asynchronous training, `max_steps_off_policy` controls how stale a rollout is allowed to be before it is discarded. The default of `3` hides rollout-server tail latency. But stale rollouts have importance ratios that deviate substantially from `1.0`, and when those ratios hit clip bounds they contribute no gradient signal.

Set to 0 when debugging collapse. Async staleness compounds with importance-weighted updates and can obscure root causes. Set to `0`, stabilize, then re-enable once the issue is understood. For environments where rollouts are fast, `max_steps_off_policy = 1` may be a better default.

Sampling max tokens

`sampling_max_tokens` is the per-turn generation cap. If the cap is too low, the model's responses get truncated mid-thought, and it receives reward for an incomplete attempt. The policy then learns to associate those truncated prefixes with bad outcomes, suppressing exploratory behaviors that would have succeeded given more room.

The default of 4096 works for most tasks. Raise to 8192 for models with overlong thinking/reasoning responses. The sizing rule is: `max_turns × (sampling_max_tokens + expected_tool_output) + prompt ≤ max_sequence_length` with some margin.

Diagnostic: monitor `rollout/tokens/response_max`. If trajectories cluster at exactly the cap, the model is being silently truncated and likely losing signal. `val_sampling_params.sampling_max_tokens` should match training.

Rollout configuration

These parameters control how rollouts are produced and how the trainer handles slow or failed rollouts.

- `rollout_max_concurrency` — Controls how many rollouts are in flight at once. The default of 96 works well for most setups. Setting it too high in async mode produces stale rollouts and can overwhelm the inference engine.
- `rollout_timeout` — How long (in seconds) to wait for a single rollout before treating it as failed. The default of 600 is sized for typical tool-using environments. Setting it too low truncates rollouts that would have succeeded given more time.
- `rollout_max_retries` — Controls retry attempts for failed rollouts. If the permanent failure rate exceeds approximately 1%, the problem is in the environment setup, not retry count.

Supporting parameters

- **LoRA capacity (`lora_rank` and `lora_alpha`).** The effective update magnitude per step is proportional to `alpha/rank`, which acts as a multiplier on the learning rate. The default is

`lora_rank = 32, lora_alpha = 64` (a 2:1 ratio). Consider increasing only if everything else is well-tuned and the reward curve still plateaus — double both together (64/128) to add capacity while preserving the same effective learning rate.

- **temperature = 1.0, sampling_top_p = 1.0 for training.** For RL training you want diversity across rollouts within a group so that the group baseline has signal. Temperature 1.0 is a good default. For evaluation, use temperature = 0.0 (greedy decoding) so that eval curves are deterministic and comparable across runs.
- **pass_k_values.** Pass@1 is the headline evaluation metric. Pass@G (where G = group_size) is a useful sanity check: if pass@G is very high, most prompts are too easy; if pass@G is very low, most prompts are too hard and the group signal is sparse.
- **max_steps and max_epochs.** `max_steps = 50` for screening (enough to see whether the curve is moving), 100 for production. CISPO collapse tends to appear between steps 40–80. `max_epochs = 1` is the default; multiple epochs re-use the same prompts with fresh rollouts, which can help if the prompt set is small but risks overfitting to a narrow prompt distribution.
- **adam_beta2 = 0.95.** Lower than the SFT default of 0.999. In RL, gradient statistics are non-stationary, so the optimizer needs to track recent gradient variance more aggressively.
- **weight_decay = 0.0.** LoRA already constrains updates via low-rank parameterization. Adding weight decay compounds the regularization in ways that have not been well-characterized for RL fine-tuning.
- **adam_grad_clip_norm = 1.0.** Caps the global gradient norm. If collapse correlates with large pre-clip spikes, drop to 0.5. If the norm sits at exactly 1.0 for many steps and reward is flat, the clip may be the bottleneck — raise to 2.0 cautiously.

Configure a VPC for multi-turn RL jobs

When you provide a `VpcConfig` in your multi-turn RL job configuration, Amazon SageMaker AI places a proxy elastic network interface (ENI) in your VPC. All customer data traffic — including access to your S3 buckets, agent invocations, and logging — flows through this ENI. This keeps data within your VPC network boundary.

Required VPC setup

Subnets

Provide two or more private subnets in different Availability Zones for redundancy. The subnets do not need a NAT gateway or internet access because all traffic exits through VPC endpoints.

Security group

Create a security group with the following outbound rules. No inbound rules are required.

- Outbound TCP 443 to `0.0.0.0/0`
- Outbound UDP 53 to `0.0.0.0/0`

> **Note**
>
> For tighter security, you can restrict egress to the S3 managed prefix list and the private IP addresses of your interface endpoint ENIs instead of allowing `0.0.0.0/0`.

VPC endpoints

Create the following VPC endpoints so that traffic from the proxy ENI can reach Amazon services without internet access.

Endpoint	Traffic routed	Service name	Type
S3 (required)	Prompt data, job output, MLflow artifacts (`GetObject` , `PutObject` , `ListBucket`)	`com.amazonaws.` *region* `.s3`	Gateway
CloudWatch Logs (required)	Training container logs (`PutLogEvents` , `CreateLogGroup` , `CreateLogStream`)	`com.amazonaws.` *region* `.logs`	Interface
Bedrock AgentCore (required if using Bedrock agent)	Agent invocations (`InvokeAgentRuntime`)	`com.amazonaws.` *region* `.bedrock-agentcore`	Interface
Lambda (required if using Lambda agent)	Agent invocations via Lambda forwarder (`Invoke`)	`com.amazonaws.` *region* `.lambda`	Interface

Endpoint	Traffic routed	Service name	Type
MLflow (required if using MLflow tracking)	Training metrics and traces (LogBatch, StartTrace , EndTrace)	aws.sagemaker. *region*.mlflow	Interface

> **Note**
>
> Enable Private DNS on all interface endpoints.

Interface endpoint security group

All interface endpoints must share a security group with inbound TCP 443 from your VPC CIDR.

IAM permissions

The execution role must include EC2 permissions for ENI management. Add the following policy statement to the role.

```
[
    {
        "Effect": "Allow",
        "Action": [
            "ec2:CreateNetworkInterface",
            "ec2:CreateNetworkInterfacePermission",
            "ec2:DeleteNetworkInterface",
            "ec2:DeleteNetworkInterfacePermission",
            "ec2:DescribeNetworkInterfaces",
            "ec2:DescribeSubnets",
            "ec2:DescribeSecurityGroups",
            "ec2:DescribeVpcs"
        ],
        "Resource": "*"
    },
    {
        "Effect": "Allow",
        "Action": [
            "ec2:CreateTags"
```

```
        ],
        "Resource": "arn:aws:ec2:*:*:network-interface/*",
        "Condition": {
            "StringEquals": {
                "ec2:CreateAction": "CreateNetworkInterface"
            }
        }
    }
]
```

API configuration

Include the `VpcConfig` parameter in your multi-turn RL job request.

```
"VpcConfig": {
    "Subnets": ["subnet-0abc123", "subnet-0def456"],
    "SecurityGroupIds": ["sg-0abc123def"]
}
```

Restrict access to your VPC

You can apply additional restrictions to further secure your VPC configuration.

S3 bucket policy

To restrict S3 access to your VPC only, add a deny policy with the `aws:SourceVpc` condition.

```
{
    "Sid": "DenyAccessFromOutsideVpc",
    "Effect": "Deny",
    "Principal": "*",
    "Action": "s3:*",
    "Resource": [
        "arn:aws:s3:::my-mtrl-bucket",
        "arn:aws:s3:::my-mtrl-bucket/*"
    ],
    "Condition": {
        "StringNotEquals": {
            "aws:SourceVpc": "vpc-0abc123def"
        }
    }
}
```

> **Note**
>
> The `aws:SourceVpc` condition key is only populated when the request traverses an S3 Gateway Endpoint.

VPC endpoint policies

You can restrict interface endpoints to allow only the actions that multi-turn RL jobs need. The following example restricts a CloudWatch Logs endpoint to log groups with the `/aws/sagemaker/Job/` prefix.

```
{
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": "*",
            "Action": [
                "logs:PutLogEvents",
                "logs:CreateLogGroup",
                "logs:CreateLogStream"
            ],
            "Resource": "arn:aws:logs:*:*:log-group:/aws/sagemaker/Job/*"
        }
    ]
}
```

Encryption at rest for multi-turn reinforcement learning

Options for encryption at rest

Multi-turn reinforcement learning jobs in Amazon SageMaker AI encrypt all data at rest. Your training input data, output data (including model checkpoints and trained model artifacts), and intermediate data stored in Amazon S3 are encrypted using server-side encryption. You do not need to perform any additional configuration to ensure that your data is encrypted at rest.

Amazon SageMaker AI supports the following encryption options for multi-turn RL jobs:

- **Server-side encryption with Amazon owned KMS key** – By default, Amazon SageMaker AI encrypts all training output and intermediate data using an Amazon owned KMS key. No additional configuration is required.

- **Server-side encryption with Amazon KMS keys (SSE-KMS)** – You can optionally specify a customer managed KMS key to encrypt your training output data in Amazon S3. If your input data in Amazon S3 is already encrypted with a customer managed key, the execution role must have permission to decrypt that data.

Encrypting data at rest using customer managed Amazon KMS keys

How multi-turn RL uses a customer managed KMS key

When you specify a customer managed KMS key in the output configuration of your multi-turn RL job, Amazon SageMaker AI uses that key to encrypt the following resources in Amazon S3:

- Training output data, including trained model artifacts (LoRA adapter weights)
- Intermediate model input/output (resumable model checkpoints and trajectory data)
- MLflow experiment data and traces

When you specify a customer managed KMS key, Amazon SageMaker AI uses two mechanisms to encrypt your data:

- **Grants** – At job creation time, Amazon SageMaker AI uses the caller's credentials to create one or two grants on the KMS key:
  - **Write grant** – Created for every job that specifies a customer managed key. Allows the service to encrypt and decrypt the current job's checkpoint and temporary data stored within the platform during training.
  - **Read grant** – Created only for iterative jobs that resume from a previous job's checkpoint when the previous job also used a customer managed key. Allows the service to decrypt the previous job's checkpoint data. This grant permits decryption only and does not allow writing new data.

  All grants are retired automatically when the job completes, ensuring that the service no longer has access to the key after the job lifecycle ends.
- **Execution role** – When saving output data (model artifacts, checkpoints) to your Amazon S3 bucket, Amazon SageMaker AI uses the execution role you provide. The execution role must have permissions to use the KMS key for encryption and decryption through Amazon S3.

During a training job, the following Amazon KMS operations occur:

- `kms:GenerateDataKey` – Called through Amazon S3 when writing encrypted output data (model artifacts, checkpoints, and logs).
- `kms:Decrypt` – Called through Amazon S3 when reading encrypted input data or previously written output data.
- `kms:DescribeKey` – Called by the caller identity at job creation time to verify the KMS key configuration and state.
- `kms:CreateGrant` – Called by the caller identity at job creation time to give permission to the service to store temporary data within the platform for the lifecycle of the job.

The service does not cache data keys. Each Amazon S3 read or write operation calls Amazon KMS independently through the Amazon S3 service integration.

Configuring a customer managed KMS key

Multi-turn RL jobs support symmetric Amazon KMS keys only. Multi-region keys are not supported.

Configuring permissions to use a customer managed KMS key

To use a customer managed KMS key with multi-turn RL jobs, you must configure permissions on both the IAM execution role and the KMS key policy.

Execution role permissions

The IAM execution role that you pass to the `CreateJob` API must have the following Amazon KMS permissions. These permissions allow the training job to encrypt output data and decrypt input data through Amazon S3.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "KMSPermissionsForS3Encryption",
            "Effect": "Allow",
            "Action": [
                "kms:Decrypt",
                "kms:GenerateDataKey"
            ],
            "Resource": "arn:aws:kms:region:account-id:key/key-id",
            "Condition": {
                "StringLike": {
                    "kms:ViaService": "s3.*.amazonaws.com"
```

```
                }
            }
        }
    ]
}
```

- `kms:Decrypt` – Required to read encrypted input data and previously written output data from Amazon S3.
- `kms:GenerateDataKey` – Required to encrypt output data (model artifacts, checkpoints) written to Amazon S3.

The `kms:ViaService` condition restricts use of the key to requests that come through Amazon S3, preventing the key from being used for other purposes.

Agent runtime role permissions

The agent runtime role that your Amazon Bedrock AgentCore agent or Amazon Lambda forwarder assumes must have the following Amazon KMS permissions. SageMaker AI checks that the caller has these permissions before using the KMS key during a multi-turn reinforcement learning (RL) job.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "KMSPermissionsForMTRLRuntime",
            "Effect": "Allow",
            "Action": [
                "kms:Decrypt",
                "kms:GenerateDataKey"
            ],
            "Resource": "arn:aws:kms:region:account-id:key/key-id",
            "Condition": {
                "StringLike": {
                    "kms:ViaService": "sagemaker.*.amazonaws.com"
                }
            }
        }
    ]
}
```

The `kms:ViaService` condition for the agent runtime role specifies `sagemaker.*.amazonaws.com` because the SageMaker AI runtime service performs the Amazon KMS operations on behalf of the caller. In contrast, the execution role uses `s3.*.amazonaws.com` because it accesses the key through Amazon S3.

KMS key policy

The default KMS key policy already allows IAM roles in the same account to use the key. Optionally, you can add the following statement to further restrict access to only the execution role and agent runtime role:

```
{
    "Sid": "AllowMTRLJobEncryption",
    "Effect": "Allow",
    "Principal": {
        "AWS": [
            "arn:aws:iam::account-id:role/SageMakerExecutionRole",
            "arn:aws:iam::account-id:role/AgentRuntimeRole"
        ]
    },
    "Action": [
        "kms:Decrypt",
        "kms:GenerateDataKey"
    ],
    "Resource": "*",
    "Condition": {
        "StringLike": {
            "kms:ViaService": [
                "s3.*.amazonaws.com",
                "sagemaker.*.amazonaws.com"
            ]
        }
    }
}
```

To allow the caller to create grants and describe the key, add the following statement to the key policy:

```
{
    "Sid": "AllowCreateGrantForCaller",
    "Effect": "Allow",
    "Principal": {
```

```
        "AWS": "arn:aws:iam::account-id:role/CallerRole"
    },
    "Action": [
        "kms:CreateGrant",
        "kms:DescribeKey"
    ],
    "Resource": "*",
    "Condition": {
        "StringEquals": {
            "kms:CallerAccount": "account-id"
        },
        "StringLike": {
            "kms:ViaService": "sagemaker.*.amazonaws.com"
        },
        "Bool": {
            "kms:GrantIsForAWSResource": "true"
        }
    }
}
```

Creating a multi-turn RL job with a customer managed KMS key

To encrypt output data with your customer managed KMS key, specify the key ARN in the `KmsKeyArn` field of the `OutputDataConfig` in your `CreateJob` request. For more information, see CreateJob in the *SageMaker AI API Reference*.

The following example shows how to specify a KMS key in the `OutputDataConfig`:

```
{
    "OutputDataConfig": {
        "S3OutputPath": "s3://your-bucket/output/",
        "KmsKeyArn": "arn:aws:kms:region:account-id:key/key-id"
    }
}
```

If your input data in Amazon S3 is encrypted with a customer managed key (SSE-KMS), ensure that the execution role has `kms:Decrypt` permission for that key. You can use the same key for both input and output encryption, or different keys.

Scoping down access to the customer managed KMS key

You can use the following mechanisms to restrict access to your customer managed KMS key:

sagemaker:OutputKmsKeyArn condition key

Use the `sagemaker:OutputKmsKeyArn` condition key in the caller's IAM policy to control which KMS key can be specified for job output encryption. This allows administrators to enforce that only approved keys are used when creating multi-turn RL jobs. For the full list of SageMaker AI condition keys, see Actions, resources, and condition keys for Amazon SageMaker AI.

```
"Condition": {
    "ArnEquals": {
        "sagemaker:OutputKmsKeyArn": "arn:aws:kms:region:account-id:key/key-id"
    }
}
```

Confused deputy protection

Use the `aws:SourceArn` or `aws:SourceAccount` condition keys in your KMS key policy to prevent the confused deputy problem. This ensures that only requests originating from your specific account or resource can use the key.

```
"Condition": {
    "StringEquals": {
        "aws:SourceAccount": "account-id"
    },
    "ArnLike": {
        "aws:SourceArn": "arn:aws:sagemaker:region:account-id:job/*"
    }
}
```

Encryption context for multi-turn RL jobs

When a multi-turn RL job encrypts data using your customer managed KMS key, Amazon SageMaker AI includes an *encryption context* in every Amazon KMS request made through Amazon S3. An encryption context is a set of key-value pairs that provide additional authenticated data (AAD) for Amazon KMS operations. The encryption context is logged in Amazon CloudTrail and can be used in KMS key policies and grant constraints to further restrict access.

Amazon SageMaker AI uses the following encryption context key-value pair for multi-turn RL training jobs:

```
{
    "aws:sagemaker:finetuning-job-arn": "arn:aws:sagemaker:region:account-id:job/
AgentRFT/job-name"
}
```

For multi-turn RL evaluation jobs, the encryption context uses:

```
{
    "aws:sagemaker:agent-rft-evaluation-job-arn": "arn:aws:sagemaker:region:account-
id:job/AgentRFTEvaluation/job-name"
}
```

The encryption context is bound to the specific job that creates the encrypted data. Each job encrypts its own output with its own ARN in the encryption context. This provides cryptographic binding between the encrypted data and the job that produced it.

Using encryption context in key policies

The encryption context is enforced automatically through the grant constraints that Amazon SageMaker AI creates at job creation time. You do not need to add encryption context conditions to your KMS key policy for encryption to work correctly.

If you add encryption context conditions to the `kms:CreateGrant` statement in your KMS key policy, you must allow grants for both the current job and the previous job in iterative training chains. The following example allows Amazon SageMaker AI to create grants with any training job ARN in the encryption context:

```
{
    "Sid": "AllowCreateGrantForCaller",
    "Effect": "Allow",
    "Principal": {
        "AWS": "arn:aws:iam::account-id:role/CallerRole"
    },
    "Action": [
        "kms:CreateGrant",
        "kms:DescribeKey"
    ],
    "Resource": "*",
    "Condition": {
        "StringLike": {
```

```
            "kms:ViaService": "sagemaker.*.amazonaws.com",
            "kms:EncryptionContext:aws:sagemaker:finetuning-job-arn":
 "arn:aws:sagemaker:region:account-id:job/AgentRFT/*"
        },
        "Bool": {
            "kms:GrantIsForAWSResource": "true"
        }
    }
}
```

Note

If you restrict `kms:CreateGrant` to a single specific job ARN in the encryption context, iterative training will fail because Amazon SageMaker AI also creates a read grant with the previous job's ARN as the encryption context. Use a wildcard pattern to allow grants for any job in your account.

Encryption context in iterative training

When you run iterative training jobs (where a subsequent job resumes from a previous job's checkpoint), the encryption context for each job contains that job's own ARN. Amazon SageMaker AI automatically manages two Amazon KMS grants to support iterative training:

- **Write grant** – Allows the current job to encrypt its own checkpoint data using the current job's ARN as the encryption context.
- **Read grant** – Allows the current job to decrypt checkpoint data from the previous job using the previous job's ARN as the encryption context.

Both grants are automatically retired when the job completes. You do not need to add any additional key policy statements for iterative training to work with customer managed keys.

Encryption context in Amazon CloudTrail

When you review CloudTrail logs for Amazon KMS API calls made by multi-turn RL jobs, the encryption context appears in the `requestParameters` field of the log entry. You can use this information to determine which job performed a specific encryption or decryption operation on your data.

Monitoring multi-turn RL interaction with Amazon KMS

You can use Amazon CloudTrail to monitor Amazon KMS API calls made on behalf of your multi-turn RL jobs. The following CloudTrail event names are relevant for monitoring KMS key usage:

- `Decrypt` – Logged when the job reads encrypted data from Amazon S3.
- `GenerateDataKey` – Logged when the job writes encrypted data to Amazon S3.
- `CreateGrant` – Logged when the caller creates a grant at job creation time.
- `DescribeKey` – Logged when the job describes the KMS key for validation.

In the CloudTrail log entries for these events, look for the following values:

- **requestParameters.granteePrincipal** – For `CreateGrant` events, shows the service principal that received the grant (`job.sagemaker.amazonaws.com`).

For more information about logging Amazon KMS API calls, see Logging Amazon KMS API calls with Amazon CloudTrail in the *Amazon KMS Developer Guide*.

Troubleshooting

If your training job fails or behaves unexpectedly, the following sections can help you identify and resolve the issue. Checking your job status can help narrow down whether the issue is in your configuration or your agent, and the agent-specific sections below cover logs and common issues for each deployment path.

Job level debugging

Use the `DescribeJob` API to check your job's current status and see why it failed. The response includes the job's status, a failure reason if the job has failed, and a timeline of status transitions that shows how far the job progressed before the issue occurred.

```
aws sagemaker describe-job \
  --job-name "my-agent-rft-job" \
  --job-category AgentRFT \
  --region us-west-2
```

Key fields to check:

- **JobStatus:** Current state (`InProgress`, `Completed`, `Failed`, `Stopping`, `Stopped`)

- **SecondaryStatus:** More granular phase (`Starting`, `Downloading`, `Training`, `Uploading`)
- **FailureReason:** If the job failed, a description of why
- **SecondaryStatusTransitions:** Full timeline of status changes with timestamps

Job CloudWatch logs

Training progress and rollout-level information is logged to the following log group in your account:

```
/aws/sagemaker/Job/AgentRFT
```

The log stream name is `<job-name>/`.

These logs capture training step progress, rollout invocation events, and high-level errors. They can be helpful for understanding how far your job progressed and whether rollouts are being invoked successfully.

If your job fails, check the `FailureReason` field for details. If it fails during the `Training` phase, the issue could likely be in your agent. In this case, check your agent logs for more information.

Agent level debugging

Amazon Bedrock AgentCore debugging

If you have deployed your agent to Amazon Bedrock AgentCore, the following can be helpful for investigating agent-side issues.

Agent logs

Your agent container's stdout and stderr output are captured in Amazon CloudWatch Logs in your account. You can find them at the following log group:

```
/aws/bedrock-agentcore/runtimes/<runtime-name>-<id>-<qualifier>
```

These logs capture output from your agent code, including errors, stack traces, and SDK messages. These logs can be used for investigating issues related to your agent code, dependencies, or connectivity to the RFT Runtime.

Check agent health

Verify your agent runtime is healthy:

```
aws bedrock-agentcore-control list-agent-runtimes --region us-west-2
```

For details on a specific runtime:

```
aws bedrock-agentcore-control get-agent-runtime \
  --agent-runtime-id <runtime-id> \
  --region us-west-2
```

Custom agent debugging

If you are using the Lambda forwarder path, issues can occur in the Lambda function itself or in your external agent. The following can be helpful for investigating both.

Lambda forwarder logs

Your Lambda function's execution logs are captured in Amazon CloudWatch Logs. You can find them at the following log group:

```
/aws/lambda/<function-name>
```

These logs can be used for investigating issues related to request forwarding, timeouts, or connectivity between the Lambda and your agent. Check for:

- Invocation errors (Lambda couldn't reach your agent)
- Timeout errors (agent took too long to respond)
- Validation errors (malformed rollout request)

Verify connectivity

If your Lambda logs show invocation errors or timeouts, the issue may be that the Lambda cannot reach your agent. The following checks can help confirm whether the connection between your Lambda and agent is working.

Health check — confirm your agent is running:

```
curl -s "http://$AGENT_ENDPOINT/health"
```

```
# Expected: {"status": "ok"}
```

Lambda test invoke — confirm Lambda can reach your agent:

```
aws lambda invoke \
  --function-name rft-agent-forwarder \
  --cli-binary-format raw-in-base64-out \
  --payload '{"prompt": "test", "metadata": {"jobArn": "test", "rolloutId": "test-1"}}'
 \
  --region us-west-2 \
  /tmp/response.json && cat /tmp/response.json

# Note: This will return an InternalServerError because the jobArn "test"
# does not correspond to an active training job. This is expected.
# Success means the Lambda executed and reached your agent — check agent
# logs to confirm the request was received.
```

If your Lambda executes successfully but the job still fails, your agent logs may have more details. Check your agent logs for errors related to inference calls or reward reporting.

Agent logs

Your agent's own logs depend on where it's deployed. These logs can be used for investigating issues related to your agent code, inference calls to the RFT Runtime, or reward reporting.

For example, if you deployed your agent to Amazon EKS, you can check your agent's logs with:

```
kubectl logs -l app=external-agent --tail=50
```

Using CloudTrail for debugging

CloudTrail data events can help confirm whether your agent's calls to the RFT Runtime are succeeding. Look for events with:

- **eventName:** `Sample`, `SampleWithResponseStream`, `CompleteRollout`, `UpdateReward`
- **resources.type:** `AWS::SageMaker::Job`

If you don't see these events, your agent is not successfully calling the RFT Runtime. Check agent logs and permissions.

Logging API calls with Amazon CloudTrail

Amazon SageMaker AI is integrated with Amazon CloudTrail, a service that provides a record of actions taken by a user, role, or an Amazon service. CloudTrail captures all API calls for Amazon SageMaker AI as events. The calls captured include calls from the Amazon SageMaker AI console and code calls to the Amazon SageMaker AI API operations. Using the information collected by CloudTrail, you can determine the request that was made to Amazon SageMaker AI, the IP address from which the request was made, when it was made, and additional details.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root user or user credentials.
- Whether the request was made on behalf of an IAM Identity Center user.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another Amazon service.

CloudTrail is active in your Amazon account when you create the account and you automatically have access to the CloudTrail **Event history**. The CloudTrail **Event history** provides a viewable, searchable, downloadable, and immutable record of the past 90 days of recorded management events in an Amazon Region. For more information, see Working with CloudTrail Event history in the *Amazon CloudTrail User Guide*. There are no CloudTrail charges for viewing the **Event history**.

For an ongoing record of events in your Amazon account past 90 days, create a trail or a CloudTrail Lake event data store.

CloudTrail trails

A *trail* enables CloudTrail to deliver log files to an Amazon S3 bucket. All trails created using the Amazon Management Console are multi-Region. You can create a single-Region or a multi-Region trail by using the Amazon CLI. Creating a multi-Region trail is recommended because you capture activity in all Amazon Regions in your account. If you create a single-Region trail, you can view only the events logged in the trail's Amazon Region. For more information about trails, see Creating a trail for your Amazon account and Creating a trail for an organization in the *Amazon CloudTrail User Guide*.

You can deliver one copy of your ongoing management events to your Amazon S3 bucket at no charge from CloudTrail by creating a trail, however, there are Amazon S3 storage charges. For

more information about CloudTrail pricing, see Amazon CloudTrail Pricing. For information about Amazon S3 pricing, see Amazon S3 Pricing.

CloudTrail Lake event data stores

CloudTrail Lake lets you run SQL-based queries on your events. CloudTrail Lake converts existing events in row-based JSON format to Apache ORC format. ORC is a columnar storage format that is optimized for fast retrieval of data. Events are aggregated into *event data stores*, which are immutable collections of events based on criteria that you select by applying advanced event selectors. The selectors that you apply to an event data store control which events persist and are available for you to query. For more information about CloudTrail Lake, see Working with Amazon CloudTrail Lake in the *Amazon CloudTrail User Guide*.

CloudTrail Lake event data stores and queries incur costs. When you create an event data store, you choose the pricing option you want to use for the event data store. The pricing option determines the cost for ingesting and storing events, and the default and maximum retention period for the event data store. For more information about CloudTrail pricing, see Amazon CloudTrail Pricing.

SageMaker AI data events in CloudTrail

Data events provide information about the resource operations performed on or in a resource (for example, reading or writing to an Amazon S3 object). These are also known as data plane operations. Data events are often high-volume activities. By default, CloudTrail doesn't log data events. The CloudTrail **Event history** doesn't record data events.

Additional charges apply for data events. For more information about CloudTrail pricing, see Amazon CloudTrail Pricing.

You can log data events for various Amazon SageMaker AI resource types by using the CloudTrail console, Amazon CLI, or CloudTrail API operations. For more information about how to log data events, see Logging data events with the Amazon Management Console and Logging data events with the Amazon Command Line Interface in the *Amazon CloudTrail User Guide*.

The following table lists the Amazon SageMaker AI resource types for which you can log data events:

Resource type (console)	resources.type value	Data APIs logged to CloudTrail	API Reference
SageMaker endpoint	`AWS::SageMaker::Endpoint`	InvokeEndpoint, InvokeEndpointAsync, InvokeEndpointWithResponseStream	InvokeEndpoint, InvokeEndpointAsync, InvokeEndpointWithResponseStream
SageMaker jobs	`AWS::SageMaker::Job`	CompleteRollout, Sample, SampleWithResponseStream	CompleteRollout, Sample, SampleWithResponseStream

Note

The `InvokeEndpoint`, `InvokeEndpointAsync`, `Sample`, and `SampleWithResponseStream` API calls don't log the request parameters.

You can configure advanced event selectors to filter on the `eventName`, `readOnly`, and `resources.ARN` fields to log only those events that are important to you. For more information about these fields, see AdvancedFieldSelector in the *Amazon CloudTrail API Reference*.

Example: Log data events for a SageMaker endpoint and job

The following example shows how to use the put-event-selectors Amazon CLI command to add advanced event selectors:

```
[
  {
    "FieldSelectors": [
      { "Field": "eventCategory", "Equals": ["Data"] },
      { "Field": "resources.ARN", "Equals": ["arn:aws:sagemaker:us-
east-1:111122223333:endpoint/your-inference-endpoint-arn"] },
      { "Field": "resources.type", "Equals": ["AWS::SageMaker::Endpoint"] }
    ]
  },
  {
```

```
    "FieldSelectors": [
      { "Field": "eventCategory", "Equals": ["Data"] },
      { "Field": "resources.ARN", "Equals": ["arn:aws:sagemaker:us-
east-1:111122223333:job/your-job-arn"] },
      { "Field": "resources.type", "Equals": ["AWS::SageMaker::Job"] }
    ]
  }
]
```

Then run:

```
aws cloudtrail put-event-selectors \
    --trail-name your-trail-name \
    --advanced-event-selectors=file://advanced-event-selectors.json
```

SageMaker AI management events in CloudTrail

Management events provide information about management operations that are performed on resources in your Amazon account. These are also known as control plane operations. By default, CloudTrail logs management events.

Amazon SageMaker AI logs all Amazon SageMaker AI control plane operations as management events. For a list of the Amazon SageMaker AI control plane operations that Amazon SageMaker AI logs to CloudTrail, see the Amazon SageMaker AI API Reference.

CloudTrail event examples

For information about CloudTrail record contents, see CloudTrail record contents in the *Amazon CloudTrail User Guide*.

Model packages and checkpoints

Overview

During multi-turn RL training, the platform periodically saves the model's learned parameters as **checkpoints**. These checkpoints are stored as **SageMaker Model Packages** within **Model Package Groups**, enabling versioning, lineage tracking, and cross-job continuity.

Key concepts

Model Package

A Model Package is a versioned, immutable artifact in SageMaker AI that contains trained model weights at a specific point in time. Each checkpoint produced during training is stored as a Model Package. A Model Package has:

- An ARN (e.g., `arn:aws:sagemaker:us-west-2:123456789012:model-package/my-group/5`)
- An S3 location containing the model files
- Metadata about when it was created and from which training step

Model Package Group

A Model Package Group is a container that holds multiple Model Package versions. Multi-turn RL uses two separate groups:

Group	Purpose	Contents
Output Model Package Group	Final trained model checkpoints	HuggingFace-compatible LoRA adapter weights suitable for inference and continued training
Intermediate Checkpoint Model Package Group	Resumable training state	Full optimizer state + adapter weights for resuming interrupted training

You specify both when creating a job:

```
{
  "ModelPackageConfig": {
    "OutputModelPackageGroupArn": "arn:aws:sagemaker:us-west-2:123456789012:model-package-group/my-final-models",
    "IntermediateCheckpointModelPackageGroupArn": "arn:aws:sagemaker:us-west-2:123456789012:model-package-group/my-intermediate-checkpoints"
  }
}
```

Checkpoint types

Resumable Checkpoint (Full State)

- **Contents**: LoRA adapter weights + optimizer states + training step metadata (per GPU rank)
- **Stored in**: Intermediate Checkpoint Model Package Group
- **Purpose**: Resume training from the exact point it was interrupted
- **Format**: Internal format (not directly usable for inference)
- **When created**: Every step
- **Use case**: Automatic resilience or explicit continued training

Model Checkpoint (Weights Only)

- **Contents**: HuggingFace-compatible LoRA adapter weights in SafeTensors format
- **Stored in**: Output Model Package Group
- **Purpose**: Inference, deployment, or continued training
- **Format**: Standard HuggingFace adapter format (`adapter_config.json` + `adapter_model.safetensors`)
- **When created**: Every step, at job completion, and when a job is stopped
- **Use case**: Deploy the fine-tuned model for inference, or use as input for a new training job

Resuming interrupted training

If a training job fails or is stopped mid-training, you can start a new job that resumes from the exact point where the previous job left off. The platform loads the full training state (weights + optimizer + step counter) from a resumable checkpoint.

To resume, specify a resumable checkpoint (from the Intermediate Checkpoint Model Package Group) as `InputModelPackageArn`:

```
{
  "ModelPackageConfig": {
    "OutputModelPackageGroupArn": "arn:aws:sagemaker:us-west-2:123456789012:model-
package-group/my-final-models",
    "IntermediateCheckpointModelPackageGroupArn": "arn:aws:sagemaker:us-
west-2:123456789012:model-package-group/my-intermediate-checkpoints",
```

```
    "InputModelPackageArn": "arn:aws:sagemaker:us-west-2:123456789012:model-package/my-
intermediate-checkpoints/5"
  }
}
```

Requirements:

- The `InputModelPackageArn` must point to a resumable checkpoint (one with `IsCheckpoint=true` in its Model Package metadata)
- The new job must use the same base model
- The new job must use the same LoRA configuration (rank, alpha)
- The new job must use the same hyperparameters (learning rate, batch size, etc.)
- The new job must use the same dataset

Iterative training (continued training)

Iterative training lets you build on a previously trained model with new hyperparameters, a different dataset, or a different training configuration. Unlike resuming, this starts a fresh training run that initializes from the trained LoRA weights but with a fresh optimizer state.

To do iterative training, specify a model checkpoint (from the Output Model Package Group) as `InputModelPackageArn`:

```
{
  "ModelPackageConfig": {
    "OutputModelPackageGroupArn": "arn:aws:sagemaker:us-west-2:123456789012:model-
package-group/my-final-models",
    "IntermediateCheckpointModelPackageGroupArn": "arn:aws:sagemaker:us-
west-2:123456789012:model-package-group/my-intermediate-checkpoints",
    "InputModelPackageArn": "arn:aws:sagemaker:us-west-2:123456789012:model-package/my-
final-models/3"
  }
}
```

What you can change between iterations:

- Hyperparameters (learning rate, batch size, max_steps, group_size, etc.)
- Dataset (different prompts, different data distribution)

- Reward function (different reward lambda)
- Agent configuration

What must stay the same:

- The base model (the LoRA adapter is specific to the base model architecture)

Typical use cases:

- Train on easy problems first, then continue on harder problems (curriculum learning)
- Train with a simple reward function, then refine with a more nuanced one
- Increase batch size or adjust learning rate after observing initial training dynamics

Checkpoint lifecycle

```
Training Step 1 # Intermediate Checkpoint (Resumable)
Training Step 1 # Intermediate Checkpoint (HFCompatible)
...
Training Step N-1 # Intermediate Checkpoint (Resumable)
Training Step N-1 # Intermediate Checkpoint (HFCompatible)
...
Training Step N (final) # Model Checkpoint (HuggingFace LoRA) # Output Model Package
 Group
```

When a job completes successfully: The final model weights are saved as a Model Package in the Output Model Package Group. The `OutputModelPackageArn` field on the job record contains the ARN of the final model.

When a job fails or is stopped: The last intermediate checkpoint is promoted to the Output Model Package Group (best-effort).

Best practices for checkpoints

- **Monitor checkpoint creation** — use `DescribeJob` to track `ResumableCheckpoint` and `ModelCheckpoint` fields during training
- **For long jobs, use iterative training** — if a job with many steps might fail, plan to resume from checkpoints rather than restarting from scratch

Quotas

The following quotas apply to multi-turn reinforcement learning jobs. These quotas are adjustable. To request an increase, open the Service Quotas console. For more information, see Requesting a quota increase.

Quota	Default value	Adjustable
Maximum number of concurrent multi-turn reinforcement fine tuning jobs	1	Yes
Maximum number of concurrent multi-turn reinforcement evaluation jobs	1	Yes

API throttling limits for `CreateJob`, `DescribeJob`, and other management APIs are not adjustable. For the full list of Amazon SageMaker AI quotas, see Amazon SageMaker AI endpoints and quotas in the *Amazon Web Services General Reference*.

Sample datasets and tutorials

End-to-end example: Customer onboarding agent

The following example demonstrates the complete workflow for multi-turn RL: training an agent, evaluating its performance, and deploying the trained model.

```
from sagemaker.train.multi_turn_rl_trainer import MultiTurnRLTrainer
from sagemaker.train.evaluate import MultiTurnRLEvaluator
from sagemaker.serve import ModelBuilder
from sagemaker.core.resources import ModelPackage

DATASET = "s3://my-bucket/prompts/prompts.parquet"
AGENT_ARN = "arn:aws:bedrock-agentcore:us-west-2:123456789012:runtime/my-agent"

# ## 1. Train ##################################################################
trainer = MultiTurnRLTrainer(
    model="openai-reasoning-gpt-oss-20b",
```

```
    agent_env=AGENT_ARN,
    training_dataset=DATASET,
    s3_output_path="s3://my-bucket/train-output/",
    accept_eula=True,
)
trainer.hyperparameters.max_epochs = 1
trainer.hyperparameters.global_batch_size = 10

job = trainer.train(wait=True)
print(f"Training complete: {job.output_model_package_arn}")

# ## 2. Evaluate ################################################################
evaluator = MultiTurnRLEvaluator(
    model=trainer,
    dataset=DATASET,
    s3_output_path="s3://my-bucket/eval-output/",
    evaluate_base_model=True,  # Compare base vs fine-tuned
)
execution = evaluator.evaluate()
execution.wait()
print(f"Evaluation: {execution.status.overall_status}")

# ## 3. Deploy ##################################################################
model_package = ModelPackage.get(model_package_name=job.output_model_package_arn)

model_builder = ModelBuilder(
    model=model_package,
    instance_type="ml.g6e.48xlarge",
)
model_builder.accept_eula = True
model_builder.build()

endpoint = model_builder.deploy(
    endpoint_name="mtrl-production-endpoint",
    instance_type="ml.g6e.48xlarge",
    initial_instance_count=1,
)
print(f"Deployed: {endpoint.endpoint_name}")
```

Continuous customization

With **continuous customization**, you can build on a previously customized model by applying additional training — either with a *different technique* or the *same technique* with new data.

For example, start with SFT to teach domain knowledge, then apply DPO to align with user preferences, then apply RLVR to improve factual accuracy.

> **Important**
>
> Continuous customization is different from MTRL (Multi-Turn Reinforcement Learning). Continuous customization chains training jobs across techniques. MTRL trains agents for multi-step tool-use tasks within a single training job.

How it works

- Loads LoRA adapter weights from a previous training job
- Resets optimizer, scheduler, and step counter (fresh training with new technique or data)
- The previous job's output becomes the starting point for the new training run

> **Note**
>
> Continuous customization is currently available through the MTRL and continuous customization workflows using the Python SDK only. It is supported with the LoRA training type. Continuous customization across different techniques with FFT is not supported.

Supported technique transitions

The following table shows all supported combinations for continuous customization:

From technique	To technique	Supported
SFT	DPO	✓
SFT	RLVR	✓
SFT	RLAIF	✓
SFT	SFT (new data)	✓
SFT	MTRL	✓

From technique	To technique	Supported
DPO	DPO (new data)	✓
DPO	RLVR	✓
DPO	RLAIF	✓
DPO	SFT	✓
RLVR	DPO	✓
RLVR	RLVR (new data)	✓
RLAIF	DPO	✓
RLAIF	RLAIF (new data)	✓

Continuous customization vs resume training

	Continuous customization	Resume training
Technique	Different or same technique	Same technique only
Optimizer state	Reset (fresh start)	Restored from checkpoint
Use case	Chain techniques (SFT → DPO → RLVR)	Continue interrupted training
Training type	LoRA only	LoRA only

Getting started

Continuous customization is available through the Python SDK. Provide the output path of a previous training job as the `resume_from_path` for the next technique.

```
from sagemaker.train import DPOTrainer

# Continue from a previous SFT job with DPO
```

```
trainer = DPOTrainer(
    model_id="meta-textgeneration-llama-3-1-8b-instruct",
    train_data="s3://my-bucket/dpo-preferences.jsonl",
    resume_from_path="s3://my-bucket/previous-sft-output/",
    hyperparameters={
        "max_epochs": 2,
        "learning_rate": 1e-5,
        "lora_rank": 16,
    }
)
trainer.train()
```

Example workflows

SFT → DPO

Teach domain knowledge first, then align with user preferences

SFT → RLVR

Teach task format first, then optimize for factual correctness

SFT → DPO → RLVR

Full pipeline — knowledge → preferences → accuracy

SFT → MTRL

Teach base capabilities, then train for multi-turn agentic tasks

DPO → DPO (new data)

Iteratively refine preferences with new feedback data

Distillation

Distillation transfers knowledge from a *teacher* model to a *student* model. The result is a student that gains domain expertise from the teacher while operating at the inference cost, latency, and memory requirements of the student model.

Key terminology

Teacher model

A more capable model, often larger, that provides the training signal. The teacher can be a model that you host yourself, for example on an Amazon SageMaker AI endpoint, or a model that you access through an API, such as Amazon Bedrock. This is the expert whose domain you want the student to learn.

Student model

The model you are training to learn from the expert. It is typically a smaller model than the teacher. After distillation, the student model serves your inference workload.

Off-policy distillation

Distillation in which the student trains on sequences that it did not generate, such as the teacher's responses or the responses in your dataset.

On-policy distillation

Distillation in which the student trains on sequences that it generates itself during training, with the teacher scoring each of the student's tokens. The teacher must be available throughout training.

Distillation compared to other approaches

Distillation is one of several ways to adapt a model to your task. Which approach to use depends on *what you are trying to change* and *what resources you have*.

Approach	What it does	Best when	Limitations
Prompt engineering / Context engineering	Provides instructions or examples in the prompt at inference time. No training required.	You need quick iteration, have no training data, or the task can be solved with a few examples in context.	Limited by the model's context window. Per-request cost increases with longer prompts. Cannot permanently teach new knowledge or fundamentally change the model's behavior.

Approach	What it does	Best when	Limitations
RAG (Retrieval-Augmented Generation)	Retrieves relevant documents at inference time and adds them to the prompt as context.	Your knowledge base changes frequently, you need citations or source attribution, or the knowledge is too large to fit in a training set.	Adds retrieval latency and cost per request. Quality depends on retrieval accuracy. The model still cannot learn new behaviors or reasoning patterns.
Fine-tuning	Updates the model's weights to change its behavior or teach it a new task. The training signal depends on the technique: labeled responses (SFT), preference pairs (DPO), or reward scores on the model's own responses (reinforcement fine-tuning (RFT), using RLVR or RLAIF).	You have high-quality training data, or a way to score responses, and want to change the model's style, format, or domain behavior.	Requires your own training data or reward signal.
Distillation	Transfers knowledge from a capable teacher to a student model. The teacher provides the training signal: generated responses, per-token log probabilities, or both.	You have a capable teacher but little or no labeled data, or want to transfer a post-trained teacher's skills to the student (often a smaller, more cost-efficient one).	Student quality is bounded by what it can represent: very large capability gaps reduce effectiveness. Requires access to a teacher model during data generation or training, depending on the distillation method.

Distillation methods

Distillation methods differ by *who generates the training sequences* and *what signal the teacher provides*. Amazon SageMaker AI supports off-policy sequence-level knowledge distillation, which runs as supervised fine-tuning on the teacher's responses. Off-policy logit-based and on-policy distillation are described for context.

- **Off-policy sequence-level knowledge distillation (supported)** is the simplest form of distillation: it trains the student on the teacher's generated responses. The teacher's generated tokens are treated as the correct answers (one-hot labels), so the loss is the standard cross-entropy against these tokens. Because it does not require the teacher's log probabilities, it works even with a closed or API-only teacher. See the section called "Sequence-level knowledge distillation" for a step-by-step walkthrough.
- **Off-policy logit-based knowledge distillation (not currently supported)** trains the student on the ground-truth responses in your dataset, with the teacher providing the per-token log probabilities as an added signal. It requires the teacher's next-token distribution (its logits, or its log probabilities over the vocabulary), and the teacher and student must share a tokenizer.
- **On-policy distillation (not currently supported)** has the student generate its own responses, while the teacher provides a per-token signal for these responses: the teacher's log probabilities for the tokens that the student generated. It therefore requires a teacher that exposes log probabilities and shares the student's tokenizer. As the student trains on its own outputs, it learns to recover from the mistakes it actually makes at inference time. On-policy distillation is typically run after an off-policy warm start (for example, after sequence-level knowledge distillation).

Best practices

- **Combine distillation with other approaches when they address different problems.** Distillation and fine-tuning change the model's weights, while RAG and prompt engineering change only what the model sees at inference time, so the two kinds of approach compose. A common pattern is to distill a smaller model for cost-efficient serving, then augment it with RAG for knowledge that changes frequently. You can also fine-tune a model and then distill the fine-tuned version into a student model.
- **Check for length inflation without accuracy gains.** If the student's responses grow longer (or frequently hit the token limit) while accuracy does not improve, the student may be reproducing the teacher's output structure without learning the underlying reasoning.

- **Check for regressions outside the target task.** Specializing on teacher data can degrade unrelated capabilities such as instruction-following and general knowledge. Evaluate a small portfolio of held-out capabilities alongside your task metric. For example, you can use the IFEval dataset on the Hugging Face website to evaluate a model's instruction-following capability.
- **Expect some forgetting with both LoRA and full fine-tuning.** Further training a post-trained student on narrow-domain data tends to degrade behaviors from its original post-training, such as instruction-following. Full fine-tuning learns more of the new task but typically forgets more. LoRA reduces forgetting but does not prevent it, and it learns less of the new task. Start with LoRA, and use full fine-tuning when LoRA does not reach your task target and you can perform additional regression testing.

Getting started

For a step-by-step walkthrough, see the section called “Sequence-level knowledge distillation”.

Sequence-level knowledge distillation

Sequence-level knowledge distillation is the simplest form of distillation. You use the teacher model to generate high-quality responses for a set of prompts, then fine-tune the student on those responses with supervised fine-tuning (SFT). The teacher's output responses can be persisted as a dataset and reused to train different students without regenerating the data.

Use cases for sequence-level knowledge distillation

- **You have prompts but no high-quality target outputs.** You supply the prompts, and the teacher writes the targets, so you can build a training set for a task or domain that has no existing labels. Targets can be single answers, full reasoning traces with chain-of-thought, or multi-turn tool-use trajectories.
- **You want to transfer reasoning capability to a smaller model.** Sequence-level knowledge distillation on teacher-generated reasoning traces is an effective way to transfer reasoning skills.
- **Your teacher is a closed or API-only model.** Sequence-level knowledge distillation needs only the teacher's generated output. It does not require access to the teacher's log probabilities. Once the student is trained, you no longer need to call the teacher at inference time.
- **You want to serve a high-volume task at lower cost.** If you are currently calling a large model for a repetitive, well-defined task, sequence-level knowledge distillation lets you train a smaller student to handle that task at a fraction of the per-request cost.

- **You want a reusable dataset that serves multiple students.** Because the teacher's responses persist as a dataset, you can reuse them to train different student models or experiment with different training configurations without regenerating the data.
- **You want a starting point for more advanced methods.** Sequence-level knowledge distillation provides an effective warm start for on-policy distillation, which typically requires an SFT-initialized student.

Steps to run sequence-level knowledge distillation

The following steps describe how to run sequence-level knowledge distillation in Amazon SageMaker AI.

> **Important**
>
> Before you use a model as a teacher, review applicable licensing and terms of use for any restrictions on using outputs to train other models. For models on Amazon Bedrock, applicable terms are available at Amazon Bedrock third-party model terms.

Step 1: Prepare the distillation dataset

Generate teacher responses and assemble them into an SFT dataset:

1. Collect a set of prompts that represent your target task or domain.
2. Generate a response for each prompt by calling the teacher model. For a hosted foundation model, call the Amazon Bedrock Converse API. For a self-hosted teacher, deploy it to an Amazon SageMaker AI endpoint and call that endpoint.
3. Filter and decontaminate the responses. For verifiable tasks such as math and code, keep only the responses whose final answer is correct (rejection sampling). For all tasks, drop truncated responses, deduplicate the records, and remove any overlap with your evaluation sets.
4. Build the SFT dataset as (prompt, teacher response) pairs in JSONL format, using the `messages` format.

Each record pairs a user message (the prompt) with an assistant message (the teacher response). This is the same `messages` dataset format described on the the section called “SFT” page.

```
{
```

```
  "messages": [
    {"role": "user", "content": "What is the derivative of f(x) = 3x^2 + 2x?"},
    {"role": "assistant", "content": "The derivative is f'(x) = 6x + 2."}
  ]
}
```

The following Python example calls the Amazon Bedrock Converse API for a single prompt and writes one (prompt, teacher response) record to a JSONL file. Extend it to loop over your full set of prompts.

```
import json
import boto3

client = boto3.client("bedrock-runtime")

prompt = "What is the derivative of f(x) = 3x^2 + 2x?"

response = client.converse(
    modelId="<teacher-model-id>",  # for example, openai.gpt-oss-120b-1:0
    messages=
    [
        {"role": "user", "content": [{"text": prompt}]}
    ],
    inferenceConfig={"maxTokens": 1024, "temperature": 0.7, "topP": 0.9},
)

# Extract the teacher response from the Bedrock API response
blocks = response["output"]["message"]["content"]
teacher_response = next(b["text"] for b in blocks if "text" in b)

record = {
    "messages": [
        {"role": "user", "content": prompt},
        {"role": "assistant", "content": teacher_response},
    ]
}

with open("training_dataset.jsonl", "a") as f:
    f.write(json.dumps(record) + "\n")
```

Step 2: Train the student model

Train the student on the teacher-generated dataset using standard SFT. Because SFT computes the loss only on the response tokens, the student learns to produce the teacher's responses.

You can run sequence-level knowledge distillation with either LoRA or full fine-tuning (FFT). For guidance on choosing between them, see the section called “Training types”.

Serverless training with the SFTTrainer

Use the Amazon SageMaker AI Python SDK `SFTTrainer`. You can override individual hyperparameters on the `hyperparameters` attribute; parameters that you don't set use the recipe default values.

```
from sagemaker.train import SFTTrainer
from sagemaker.train.common import TrainingType

trainer = SFTTrainer(
    model="<student-model-id>", # For example,"huggingface-vlm-qwen3-5-4b",
    training_type=TrainingType.LORA,
    model_package_group=model_package_group,   # Create a new or use an existing model
 package group ARN
    mlflow_experiment_name="<add-exp-name>",
    mlflow_run_name="<add-run-name>",
    training_dataset=TRAINING_DATASET,
    validation_dataset=VALIDATION_DATASET,
    s3_output_path="s3://<output-bucket>",
    accept_eula=True,
)

# Optionally set individual hyperparameters (otherwise the recipe defaults apply):
trainer.hyperparameters.global_batch_size = 64
trainer.hyperparameters.learning_rate = 1e-4
trainer.hyperparameters.max_epochs = 2
trainer.hyperparameters.lora_rank = 64
trainer.hyperparameters.lora_alpha = 256
trainer.hyperparameters.dataset_max_len = 16384

trainer.train()
```

The serverless job emits a registered model package as its output, which you can deploy and evaluate directly in Step 3.

Step 3: Deploy and evaluate the student model

After training, deploy the student model to an Amazon SageMaker AI endpoint and run benchmarks to evaluate the student model after distillation.

For the mechanics of deploying the student model, see the section called "Deployment". For evaluation guidance, see the section called "Model evaluation job submission" and the section called "Evaluation".

Limitations

- **The capacity wall.** Distillation transfers a distribution the student can represent, not raw capability it lacks. If response length or truncation rate at the maximum sequence length increases while accuracy does not improve, the student may be reproducing the surface structure of the teacher's output without the reasoning ability behind it.
- **The hardest-tail plateau.** Sequence-level knowledge distillation improves performance on easy and moderate problems but tends to plateau on the hardest ones. One reason is that the student trains on the teacher's trajectories but generates from its own distribution at inference time. When the student makes an early mistake that the teacher never made, it enters a state it never saw during training, and subsequent errors can compound, particularly in multi-turn tasks. On-policy distillation methods address this by training on the student's own generations, which is why sequence-level knowledge distillation is commonly used as the first stage in a multi-stage distillation pipeline.
- **Catastrophic forgetting.** The student trains only on teacher responses for your target task, so it can lose abilities it already had, such as following instructions, refusing unsafe requests, or answering questions outside that task.

Training types

Training types determine how model weights are updated during customization. Every customization technique (SFT, DPO, RFT) can be combined with either training type. Choose based on your quality requirements, compute budget, and use case.

the section called "LoRA" — Low-Rank Adaptation

> Trains a small set of adapter weights. Lower cost, faster training. Required for continuous customization.

the section called "FFT" — Full Fine-Tuning

Updates all model weights. Higher compute, deeper customization. Best for large domain shifts.

LoRA

LoRA (Low-Rank Adaptation) efficiently adapts large models by training a small set of *low-rank decomposition matrices* rather than all model weights. The base model weights remain frozen — only the adapter weights are learned.

When to use LoRA

- Most use cases — LoRA achieves near-FFT quality with significantly lower cost
- You want faster training and lower compute spend
- You need to chain techniques using continuous customization (LoRA required)
- You want smaller output artifacts (adapter weights only)
- You want to serve multiple task-specific adapters from a single base model — unfused adapters can be swapped at inference time, so one base model can be reused with many bespoke tuned adapters

> **Note**
>
> Although the output artifact is small (the adapter weights only), the adapter still requires the base model for inference. Unless you merge the adapter into the base model (see `merge_weights` below), you must load both the base model and the adapter to run the customized model.

Key parameters

Parameter	Values	Description
`lora_rank`	8, 16, 32, 64, 128	Dimensionality of low-rank matrices. Higher rank = more capacity but more compute. Start with 16.

Parameter	Values	Description
`lora_alpha`	16, 32, 64, 128, 256	Scaling factor. Effective learning rate scales as `alpha/rank` . Typically set to 2x the rank.
`lora_dropout`	0.0–1.0	Dropout probability for LoRA adapter layers. Helps prevent overfitting.
`merge_weights`	true, false	Whether to merge adapter weights back into the base model after training. Set to `true` for deployment without adapter overhead.

For the full parameter reference including LoRA-specific hyperparameters, see each technique page: the section called "SFT", the section called "DPO", the section called "RFT".

FFT

FFT (Full Fine-Tuning) updates *all* model weights during training. This provides the deepest level of customization but requires more compute resources and longer training time.

When to use FFT

- Large domain shifts where the model needs fundamental knowledge changes
- You have a large, high-quality dataset (small datasets risk catastrophic forgetting)
- You want no adapter overhead at inference time
- Maximum customization depth is required

Key differences from LoRA

- No `lora_rank`, `lora_alpha`, or `merge_weights` parameters
- Adds `max_response_length` parameter for controlling generated output length
- Higher compute cost and longer training time
- Larger output artifacts (full model weights)
- Not compatible with continuous customization

For the full parameter reference including FFT-specific hyperparameters, see each technique page: the section called "SFT", the section called "DPO", the section called "RFT".

Dataset compatibility

FFT uses the same dataset formats as LoRA for each customization technique. You do not need a separate dataset schema when you switch from LoRA to FFT.

- SFT FFT uses the same dataset formats described in the section called "Dataset format".
- DPO FFT uses the same dataset formats described in the section called "Dataset format".
- RLVR FFT uses the same dataset format described in the section called "Dataset format".
- RLAIF FFT uses the same dataset format described in the section called "Dataset format".

The main difference between LoRA and FFT is how weights are updated and which hyperparameters are available, not how you structure your training data.

Evaluation

After training, evaluation confirms that your customized model improves on the metrics that matter for your use case, helping you catch regressions before deployment and compare techniques objectively. Evaluation is available through both Serverless and Recipes paths.

Serverless evaluation

Submit evaluation jobs through the same Serverless infrastructure used for training. Available via **Studio UI** (Jobs → Model evaluation) or Python SDK.

For detailed instructions, see the evaluation workflows in the section called "Serverless".

SageMaker AI Training Jobs and HyperPod evaluation

Run evaluation using **Recipes** with the following evaluation types:

Deterministic evaluation

Benchmark your model on standard tasks including *MMLU*, *MMLU Pro*, *BBH*, *GPQA*, *MATH*, and *IFEval*. Supports zero-shot, few-shot, and chain-of-thought strategies.

LLM-as-Judge evaluation

Use another LLM to evaluate your model's outputs on subjective criteria such as correctness, completeness, faithfulness, and helpfulness.

Custom dataset evaluation

Evaluate on your own dataset using custom metrics or preset reward functions (`prime_math`, `prime_code`).

For evaluation recipes and configuration, see SageMaker AI Recipes documentation.

Deploying customized models

After customizing and evaluating your model, deploy it for inference. The deployment path depends on the model type. For end-to-end serverless deployment workflows (including one-click deploy from **Studio UI**), see the section called "Serverless".

Amazon Nova models

Customized Amazon Nova models deploy to Amazon Bedrock. After your training job completes, the model is registered in SageMaker AI Model Registry and can be deployed as a Bedrock imported model.

For deployment instructions, see Importing custom models in Amazon Bedrock.

Open weight models (OSS)

Customized open weight models deploy to SageMaker AI Inference endpoints.

Studio UI

Navigate to Models → My models → select your logged model → Deploy.

Deploy models for inference

With Amazon SageMaker AI, you can start getting predictions, or *inferences*, from your trained machine learning models. SageMaker AI provides a broad selection of ML infrastructure and model deployment options to help meet all your ML inference needs. With SageMaker AI Inference, you can scale your model deployment, manage models more effectively in production, and reduce operational burden. SageMaker AI provides you with various inference options, such as real-time endpoints for getting low latency inference, serverless endpoints for fully managed infrastructure and auto-scaling, and asynchronous endpoints for batches of requests. By leveraging the appropriate inference option for your use case, you can ensure efficient model deployment and inference.

Choosing a feature

There are several use cases for deploying ML models with SageMaker AI. This section describes those use cases, as well as the SageMaker AI feature we recommend for each use case.

Use cases

The following are the main uses cases for deploying ML models with SageMaker AI.

- **Use case 1: Deploy a machine learning model in a low-code or no-code environment.** For beginners or those new to SageMaker AI, you can deploy pre-trained models using Amazon SageMaker JumpStart through the Amazon SageMaker Studio interface, without the need for complex configurations.
- **Use case 2: Use code to deploy machine learning models with more flexibility and control.** Experienced ML practitioners can deploy their own models with customized settings for their application needs using the `ModelBuilder` class in the SageMaker AI Python SDK, which provides fine-grained control over various settings, such as instance types, network isolation, and resource allocation.
- **Use case 3: Deploy machine learning models at scale.** For advanced users and organizations who want to manage models at scale in production, use the Amazon SDK for Python (Boto3) and Amazon CloudFormation along with your desired Infrastructure as Code (IaC) and CI/CD tools to provision resources and automate resource management.

Recommended features

The following table describes key considerations and tradeoffs for SageMaker AI features corresponding with each use case.

	Use case 1	Use case 2	Use case 3
SageMak AI feature	Use JumpStart in Studio to accelerate your foundational model deployment.	Deploy models using ModelBuilder from the SageMaker Python SDK.	Deploy and manage models at scale with Amazon CloudFormation.
Descripti on	Use the Studio UI to deploy pre-trained models from a catalog to pre-confi gured inference endpoints . This option is ideal for citizen data scientists, or for anyone who wants to deploy a model without configuring complex settings.	Use the `ModelBuilder` class from the Amazon SageMaker AI Python SDK to deploy your own model and configure deploymen t settings. This option is ideal for experienced data scientists, or for anyone who has their own model to deploy and requires fine-grained control.	Use Amazon CloudForm ation and Infrastructure as Code (IaC) for programma tic control and automatio n for deploying and managing SageMaker AI models. This option is ideal for advanced users who require consistent and repeatable deploymen ts.
Optimize for	Fast and streamlined deployments of popular open source models	Deploying your own models	Ongoing management of models in production
Consider tions	Lack of customization for container settings and specific application needs	No UI, requires that you're comfortable developing and maintaining Python code	Requires infrastru cture management and organizational resources, and also requires familiari ty with the Amazon SDK for Python (Boto3) or with Amazon CloudFormation templates.

	Use case 1	Use case 2	Use case 3
Recommended environment	A SageMaker AI domain	A Python development environment configured with your Amazon credentials and the SageMaker Python SDK installed, or a SageMaker AI IDE such as SageMaker JupyterLab	The Amazon CLI, a local development environment, and Infrastructure as Code (IaC) and CI/CD tools

Additional options

SageMaker AI provides different options for your inference use cases, giving you choice over the technical breadth and depth of your deployments:

- **Deploying a model to an endpoint.** When deploying your model, consider the following options:
  - Real-time inference. Real-time inference is ideal for inference workloads where you have interactive, low latency requirements.
  - Deploy models with Amazon SageMaker Serverless Inference. Use Serverless Inference to deploy models without configuring or managing any of the underlying infrastructure. This option is ideal for workloads which have idle periods between traffic spurts and can tolerate cold starts.
  - Asynchronous inference. Queues incoming requests and processes them asynchronously. This option is ideal for requests with large payload sizes (up to 1GB), long processing times (up to one hour), and near real-time latency requirements.
- **Cost optimization.** To optimize your inference costs, consider the following options:
  - Model performance optimization with SageMaker Neo. Use SageMaker Neo to optimize and run your machine learning models with better performance and efficiency, helping you to minimize compute costs by automatically optimizing models to run in environments like Amazon Inferentia chips.
  - Automatic scaling of Amazon SageMaker AI models. Use autoscaling to dynamically adjust the compute resources for your endpoints based on incoming traffic patterns, which helps you optimize costs by only paying for the resources you're using at a given time.

Model deployment options in Amazon SageMaker AI

After you train your machine learning model, you can deploy it using Amazon SageMaker AI to get predictions. Amazon SageMaker AI supports the following ways to deploy a model, depending on your use case:

- For persistent, real-time endpoints that make one prediction at a time, use SageMaker AI real-time hosting services. See Real-time inference.
- Workloads that have idle periods between traffic spikes and can tolerate cold starts, use Serverless Inference. See Deploy models with Amazon SageMaker Serverless Inference.
- Requests with large payload sizes up to 1GB, long processing times, and near real-time latency requirements, use Amazon SageMaker Asynchronous Inference. See Asynchronous inference.
- To get predictions for an entire dataset, use SageMaker AI batch transform. See Batch transform for inference with Amazon SageMaker AI.

SageMaker AI also provides features to manage resources and optimize inference performance when deploying machine learning models:

- To manage models on edge devices so that you can optimize, secure, monitor, and maintain machine learning models on fleets of edge devices, see Model deployment at the edge with SageMaker Edge Manager. This applies to edge devices like smart cameras, robots, personal computers, and mobile devices.
- To optimize Gluon, Keras, MXNet, PyTorch, TensorFlow, TensorFlow-Lite, and ONNX models for inference on Android, Linux, and Windows machines based on processors from Ambarella, ARM, Intel, Nvidia, NXP, Qualcomm, Texas Instruments, and Xilinx, see Model performance optimization with SageMaker Neo.

For more information about all deployment options, see Deploy models for inference.

Understand the options for deploying models and getting inferences in Amazon SageMaker AI

To help you get started with SageMaker AI Inference, see the following sections which explain your options for deploying your model in SageMaker AI and getting inferences. The Inference options

in Amazon SageMaker AI section can help you determine which feature best fits your use case for inference.

You can refer to the Resources section for more troubleshooting and reference information, blogs and examples to help you get started, and common FAQs.

Topics

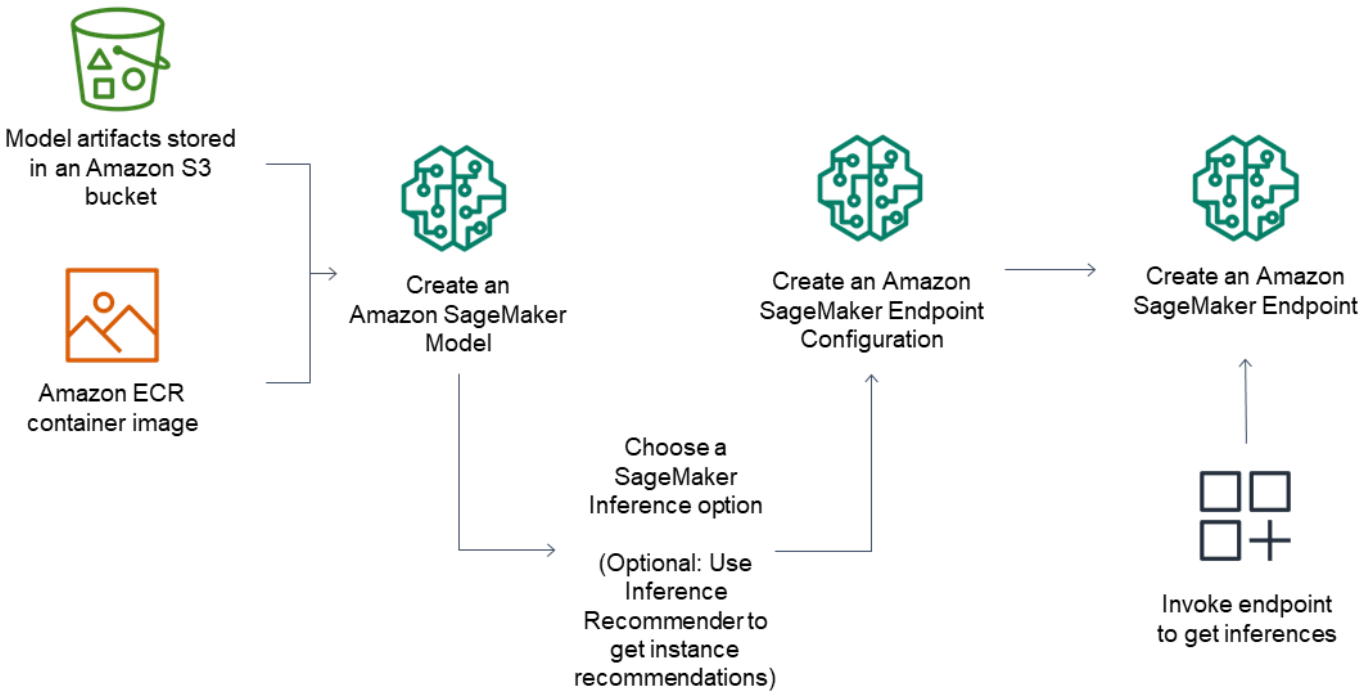
- Before you begin
- Steps for model deployment
- Inference options in Amazon SageMaker AI
- Advanced endpoint options for inference with Amazon SageMaker AI
- Next steps for inference with Amazon SageMaker AI

Before you begin

These topics assume that you have built and trained one or more machine learning models and are ready to deploy them. You don't need to train your model in SageMaker AI in order to deploy your model in SageMaker AI and get inferences. If you don't have your own model, you can also use SageMaker AI's built-in algorithms or pre-trained models.

If you are new to SageMaker AI and haven't picked out a model to deploy, work through the steps in the Get Started with Amazon SageMaker AI tutorial. Use the tutorial to get familiar with how SageMaker AI manages the data science process and how it handles model deployment. For more information about training a model, see Train Models.

For additional information, reference, and examples, see the Resources.



Steps for model deployment

For inference endpoints, the general workflow consists of the following:

- Create a model in SageMaker AI Inference by pointing to model artifacts stored in Amazon S3 and a container image.
- Select an inference option. For more information, see Inference options in Amazon SageMaker AI.
- Create a SageMaker AI Inference endpoint configuration by choosing the instance type and number of instances you need behind the endpoint. You can use Amazon SageMaker Inference Recommender to get recommendations for instance types. For Serverless Inference, you only need to provide the memory configuration you need based on your model size.

- Create a SageMaker AI Inference endpoint.
- Invoke your endpoint to receive an inference as a response.

The following diagram shows the preceding workflow.

You can perform these actions using the Amazon console, the Amazon SDKs, the SageMaker Python SDK, Amazon CloudFormation or the Amazon CLI.

For batch inference with batch transform, point to your model artifacts and input data and create a batch inference job. Instead of hosting an endpoint for inference, SageMaker AI outputs your inferences to an Amazon S3 location of your choice.

Inference options in Amazon SageMaker AI

SageMaker AI provides multiple inference options so that you can pick the option that best suits your workload:

- Real-Time Inference: *Real-time inference* is ideal for online inferences that have low latency or high throughput requirements. Use real-time inference for a persistent and fully managed endpoint (REST API) that can handle sustained traffic, backed by the instance type of your choice. Real-time inference can support payload sizes up to 25 MB and processing times of 60 seconds for regular responses and 8 min for streaming responses.

- Serverless Inference: *Serverless inference* is ideal when you have intermittent or unpredictable traffic patterns. SageMaker AI manages all of the underlying infrastructure, so there's no need to manage instances or scaling policies. You pay only for what you use and not for idle time. It can support payload sizes up to 4 MB and processing times up to 60 seconds.
- Batch Transform: *Batch transform* is suitable for offline processing when large amounts of data are available upfront and you don't need a persistent endpoint. You can also use batch transform for pre-processing datasets. It can support large datasets that are GBs in size and processing times of days.
- Asynchronous Inference: *Asynchronous inference* is ideal when you want to queue requests and have large payloads with long processing times. Asynchronous Inference can support payloads up to 1 GB and long processing times up to one hour. You can also scale down your endpoint to 0 when there are no requests to process.

Advanced endpoint options for inference with Amazon SageMaker AI

With real-time inference, you can further optimize for performance and cost with the following advanced inference options:

- Multi-model endpoints – Use this option if you have multiple models that use the same framework and can share a container. This option helps you optimize costs by improving endpoint utilization and reducing deployment overhead.
- Multi-container endpoints – Use this option if you have multiple models that use different frameworks and require their own containers. You get many of the benefits of Multi-Model Endpoints and can deploy a variety of frameworks and models.
- Serial Inference Pipelines – Use this option if you want to host models with pre-processing and post-processing logic behind an endpoint. Inference pipelines are fully managed by SageMaker AI and provide lower latency because all of the containers are hosted on the same Amazon EC2 instances.

Next steps for inference with Amazon SageMaker AI

After you have an endpoint and understand the general inference workflow, you can use the following features in SageMaker AI to improve your inference workflow.

Monitoring

To track your model over time through metrics such as model accuracy and drift, you can use Model Monitor. With Model Monitor, you can set alerts that notify you when there are deviations in your model's quality. To learn more, see the Model Monitor documentation.

To learn more about tools that can be used to monitor model deployments and events that change your endpoint, see Monitor Amazon SageMaker AI. For example, you can monitor your endpoint's health through metrics such as invocation errors and model latency using Amazon CloudWatch metrics. The SageMaker AI endpoint invocation metrics can provide you with valuable information about your endpoint's performance.

CI/CD for model deployment

To put together machine learning solutions in SageMaker AI, you can use SageMaker AI MLOps. You can use this feature to automate the steps in your machine learning workflow and practice CI/CD. You can use MLOps Project Templates to help with the setup and implementation of SageMaker AI MLOps projects. SageMaker AI also supports using your own third-party Git repo for creating a CI/CD system.

For your ML pipelines, use Model Registry to manage your model versions and the deployment and automation of your models.

Deployment guardrails

If you want to update your model while it's in production without impacting production, you can use deployment guardrails. Deployment guardrails are a set of model deployment options in SageMaker AI Inference to update your machine learning models in production. Using the fully managed deployment options, you can control the switch from the current model in production to a new one. Traffic shifting modes give you granular control over the traffic shifting process, and built-in safeguards like auto-rollbacks help you catch issues early on.

To learn more about deployment guardrails, see the deployment guardrails documentation.

Inferentia

If you need to run large-scale machine learning and deep learning applications, you can use an `Inf1` instance with a real-time endpoint. This instance type is suitable for use cases such as image or speech recognition, natural language processing (NLP), personalization, forecasting, or fraud detection.

`Inf1` instances are built to support machine learning inference applications and feature the Amazon Inferentia chips. `Inf1` instances provide higher throughput and lower cost per inference than GPU-based instances.

To deploy a model on `Inf1` instances, compile your model with SageMaker Neo and choose an `Inf1` instance for your deployment option. To learn more, see Optimize model performance using SageMaker Neo.

Optimize model performance

SageMaker AI provides features to manage resources and optimize inference performance when deploying machine learning models. You can use SageMaker AI's built-in algorithms and pre-built models, as well as prebuilt Docker images, which are developed for machine learning.

To train models and optimize them for deployment, see prebuilt Docker imagesOptimize model performance using SageMaker Neo. With SageMaker Neo, you can train TensorFlow, Apache MXNet, PyTorch, ONNX, and XGBoost models. Then, you can optimize them and deploy on ARM, Intel, and Nvidia processors.

Autoscaling

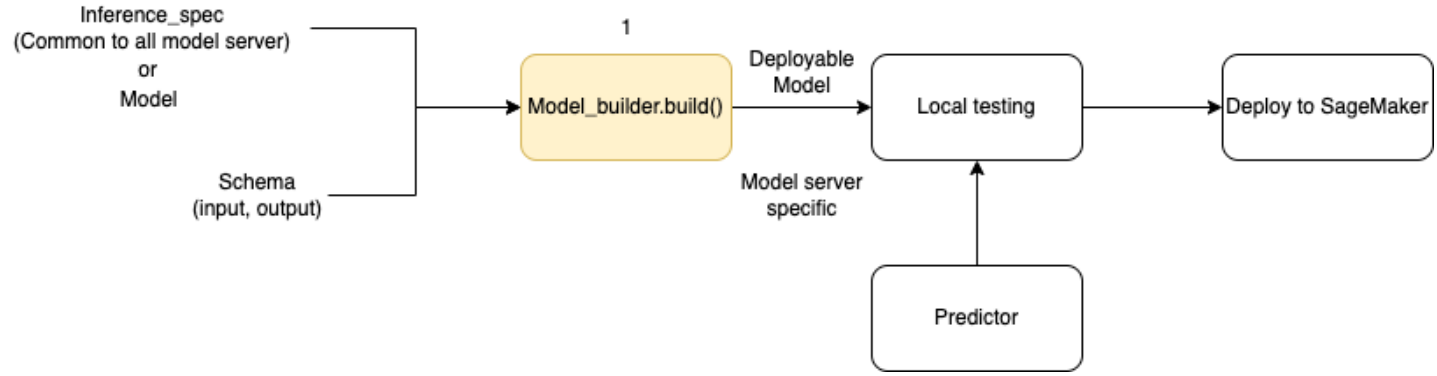
If you have varying amounts of traffic to your endpoints, you might want to try autoscaling. For example, during peak hours, you might require more instances to process requests. However, during periods of low traffic, you might want to reduce your use of computing resources. To dynamically adjust the number of instances provisioned in response to changes in your workload, see Automatic scaling of Amazon SageMaker AI models.

If you have unpredictable traffic patterns or don't want to set up scaling policies, you can also use Serverless Inference for an endpoint. Then, SageMaker AI manages autoscaling for you. During periods of low traffic, SageMaker AI scales down your endpoint, and if traffic increases, then SageMaker AI scales your endpoint up. For more information, see the Deploy models with Amazon SageMaker Serverless Inference documentation.

Create a model in Amazon SageMaker AI with ModelBuilder

Preparing your model for deployment on a SageMaker AI endpoint requires multiple steps, including choosing a model image, setting up the endpoint configuration, coding your serialization and deserialization functions to transfer data to and from server and client, identifying model

dependencies, and uploading them to Amazon S3. `ModelBuilder` can reduce the complexity of initial setup and deployment to help you create a deployable model in a single step.



`ModelBuilder` performs the following tasks for you:

- Converts machine learning models trained using various frameworks like XGBoost or PyTorch into deployable models in one step.
- Performs automatic container selection based on the model framework so you don't have to manually specify your container. You can still bring your own container by passing your own URI to `ModelBuilder`.
- Handles the serialization of data on the client side before sending it to the server for inference and deserialization of the results returned by the server. Data is correctly formatted without manual processing.
- Enables automatic capture of dependencies and packages the model according to model server expectations. `ModelBuilder`'s automatic capture of dependencies is a best-effort approach to dynamically load dependencies. (We recommend that you test the automated capture locally and update the dependencies to meet your needs.)
- For large language model (LLM) use cases, optionally performs local parameter tuning of serving properties that can be deployed for better performance when hosting on a SageMaker AI endpoint.
- Supports most of the popular model servers and containers like TorchServe, Triton, DJLServing and TGI container.

Build your model with ModelBuilder

`ModelBuilder` is a Python class that takes a framework model, such as XGBoost or PyTorch, or a user-specified inference specification and converts it into a deployable model. `ModelBuilder` provides a build function that generates the artifacts for deployment. The model artifact generated is specific to the model server, which you can also specify as one of the inputs. For more details about the `ModelBuilder` class, see ModelBuilder.

The following diagram illustrates the overall model creation workflow when you use `ModelBuilder`. `ModelBuilder` accepts a model or inference specification along with your schema to create a deployable model that you can test locally before deployment.

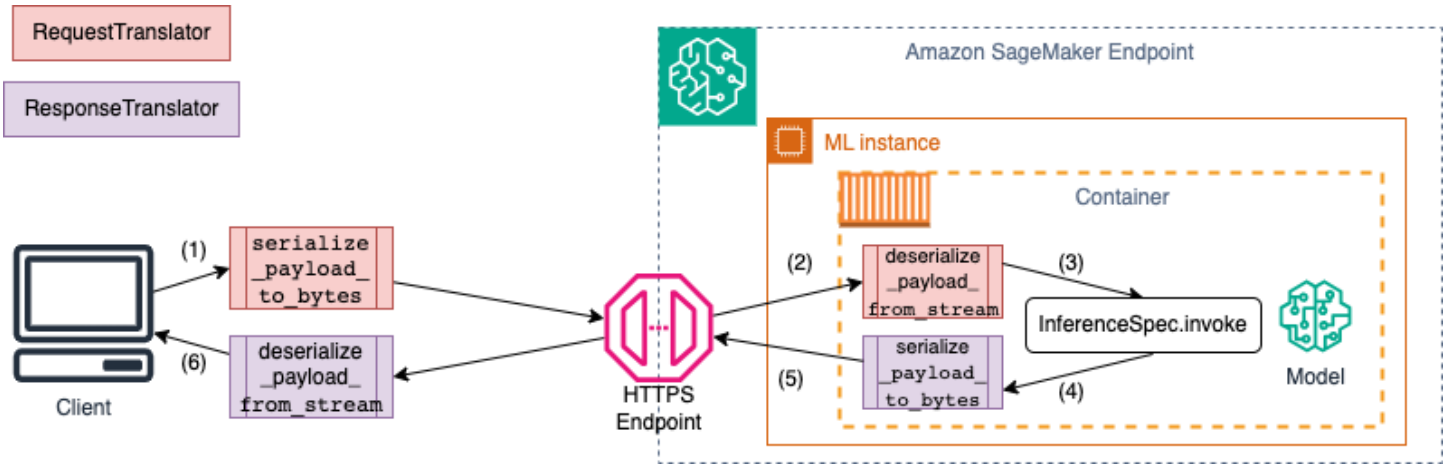
`ModelBuilder` can handle any customization you want to apply. However, to deploy a framework model, the model builder expects at minimum a model, sample input and output, and the role. In the following code example, `ModelBuilder` is called with a framework model and an instance of `SchemaBuilder` with minimum arguments (to infer the corresponding functions for serializing and deserializing the endpoint input and output). No container is specified and no packaged dependencies are passed—SageMaker AI automatically infers these resources when you build your model.

```
from sagemaker.serve.model_builder import ModelBuilder
from sagemaker.serve.builder.schema_builder import SchemaBuilder

model_builder = ModelBuilder(
    model=model,
    schema_builder=SchemaBuilder(input, output),
    role_arn="execution-role",
)
```

The following code sample invokes `ModelBuilder` with an inference specification (as an `InferenceSpec` instance) instead of a model, with additional customization. In this case, the call to model builder includes a path to store model artifacts and also turns on autocapture of all available dependencies. For additional details about `InferenceSpec`, see Customize model loading and handling of requests.

```
model_builder = ModelBuilder(
    mode=Mode.LOCAL_CONTAINER,
    model_path=model-artifact-directory,
    inference_spec=your-inference-spec,
    schema_builder=SchemaBuilder(input, output),
    role_arn=execution-role,
    dependencies={"auto": True}
```



```
)
```

Define serialization and deserialization methods

When invoking a SageMaker AI endpoint, the data is sent through HTTP payloads with different MIME types. For example, an image sent to the endpoint for inference needs to be converted to bytes at the client side and sent through an HTTP payload to the endpoint. When the endpoint receives the payload, it needs to deserialize the byte string back to the data type that is expected by the model (also known as server-side deserialization). After the model finishes prediction, the results also need to be serialized to bytes that can be sent back through the HTTP payload to the user or the client. Once the client receives the response byte data, it needs to perform client-side deserialization to convert the bytes data back to the expected data format, such as JSON. At minimum, you need to convert data for the following tasks:

1. Inference request serialization (handled by the client)
2. Inference request deserialization (handled by the server or algorithm)
3. Invoking the model against the payload and send response payload back
4. Inference response serialization (handled by the server or algorithm)
5. Inference response deserialization (handled by the client)

The following diagram shows the serialization and deserialization processes that occur when you invoke the endpoint.

When you supply sample input and output to `SchemaBuilder`, the schema builder generates the corresponding marshalling functions for serializing and deserializing the input and output. You can

further customize your serialization functions with `CustomPayloadTranslator`. But for most cases, a simple serializer such as the following would work:

```
input = "How is the demo going?"
output = "Comment la démo va-t-elle?"
schema = SchemaBuilder(input, output)
```

For further details about `SchemaBuilder`, see SchemaBuilder.

The following code snippet outlines an example where you want to customize both serialization and deserialization functions at the client and server sides. You can define your own request and response translators with `CustomPayloadTranslator` and pass these translators to `SchemaBuilder`.

By including the inputs and outputs with the translators, the model builder can extract the data format the model expects. For example, suppose the sample input is a raw image, and your custom translators crop the image and send the cropped image to the server as a tensor. `ModelBuilder` needs both the raw input and any custom preprocessing or postprocessing code to derive a method to convert data on both the client and server sides.

```
from sagemaker.serve import CustomPayloadTranslator

# request translator
class MyRequestTranslator(CustomPayloadTranslator):
    # This function converts the payload to bytes - happens on client side
    def serialize_payload_to_bytes(self, payload: object) -> bytes:
        # converts the input payload to bytes
        ... ...
        return  //return object as bytes

    # This function converts the bytes to payload - happens on server side
    def deserialize_payload_from_stream(self, stream) -> object:
        # convert bytes to in-memory object
        ... ...
        return //return in-memory object

# response translator
class MyResponseTranslator(CustomPayloadTranslator):
    # This function converts the payload to bytes - happens on server side
    def serialize_payload_to_bytes(self, payload: object) -> bytes:
        # converts the response payload to bytes
```

```
        ... ...
        return //return object as bytes

    # This function converts the bytes to payload - happens on client side
    def deserialize_payload_from_stream(self, stream) -> object:
        # convert bytes to in-memory object
        ... ...
        return //return in-memory object
```

You pass in the sample input and output along with the previously-defined custom translators when you create the `SchemaBuilder` object, as shown in the following example:

```
my_schema = SchemaBuilder(
    sample_input=image,
    sample_output=output,
    input_translator=MyRequestTranslator(),
    output_translator=MyResponseTranslator()
)
```

Then you pass in the sample input and output, along with the custom translators defined previously, to the `SchemaBuilder` object.

```
my_schema = SchemaBuilder(
    sample_input=image,
    sample_output=output,
    input_translator=MyRequestTranslator(),
    output_translator=MyResponseTranslator()
)
```

The following sections explain in detail how to build your model with `ModelBuilder` and use its supporting classes to customize the experience for your use case.

Topics

- Customize model loading and handling of requests
- Build your model and deploy
- Bring your own container (BYOC)
- Using ModelBuilder in local mode
- ModelBuilder examples

Customize model loading and handling of requests

Providing your own inference code through `InferenceSpec` offers an additional layer of customization. With `InferenceSpec`, you can customize how the model is loaded and how it handles incoming inference requests, bypassing its default loading and inference handling mechanisms. This flexibility is particularly beneficial when working with non-standard models or custom inference pipelines. You can customize the `invoke` method to control how the model preprocesses and postprocesses incoming requests. The `invoke` method ensures that the model handles inference requests correctly. The following example uses `InferenceSpec` to generate a model with the HuggingFace pipeline. For further details about `InferenceSpec`, refer to the InferenceSpec.

```
from sagemaker.serve.spec.inference_spec import InferenceSpec
from transformers import pipeline

class MyInferenceSpec(InferenceSpec):
    def load(self, model_dir: str):
        return pipeline("translation_en_to_fr", model="t5-small")

    def invoke(self, input, model):
        return model(input)

inf_spec = MyInferenceSpec()

model_builder = ModelBuilder(
    inference_spec=your-inference-spec,
    schema_builder=SchemaBuilder(X_test, y_pred)
)
```

The following example illustrates a more customized variation of a previous example. A model is defined with an inference specification that has dependencies. In this case, the code in the inference specification is dependent on the *lang-segment* package. The argument for `dependencies` contains a statement that directs the builder to install *lang-segment* using Git. Since the model builder is directed by the user to custom install a dependency, the `auto` key is `False` to turn off autocapture of dependencies.

```
model_builder = ModelBuilder(
    mode=Mode.LOCAL_CONTAINER,
    model_path=model-artifact-directory,
    inference_spec=your-inference-spec,
```

```
    schema_builder=SchemaBuilder(input, output),
    role_arn=execution-role,
    dependencies={"auto": False, "custom": ["-e git+https://github.com/luca-medeiros/
lang-segment-anything.git#egg=lang-sam"],}
)
```

Build your model and deploy

Call the `build` function to create your deployable model. This step creates inference code (as `inference.py`) in your working directory with the code necessary to create your schema, run serialization and deserialization of inputs and outputs, and run other user-specified custom logic.

As an integrity check, SageMaker AI packages and pickles the necessary files for deployment as part of the `ModelBuilder` build function. During this process, SageMaker AI also creates HMAC signing for the pickle file and adds the secret key in the CreateModel API as an environment variable during `deploy` (or `create`). The endpoint launch uses the environment variable to validate the integrity of the pickle file.

```
# Build the model according to the model server specification and save it as files in
 the working directory
model = model_builder.build()
```

Deploy your model with the model's existing `deploy` method. In this step, SageMaker AI sets up an endpoint to host your model as it starts making predictions on incoming requests. Although the `ModelBuilder` infers the endpoint resources needed to deploy your model, you can override those estimates with your own parameter values. The following example directs SageMaker AI to deploy the model on a single `ml.c6i.xlarge` instance. A model constructed from `ModelBuilder` enables live logging during deployment as an added feature.

```
endpoint = model_builder.deploy(
    endpoint_name="my-endpoint",
    instance_type="ml.c6i.xlarge"
)
```

If you want more fine-grained control over the endpoint resources assigned to your model, you can use a `ResourceRequirements` object. With the `ResourceRequirements` object, you can request a minimum number of CPUs, accelerators, and copies of models you want to deploy. You can also request a minimum and maximum bound of memory (in MB). To use this feature, you need to specify your endpoint type as `EndpointType.INFERENCE_COMPONENT_BASED`. The following

example requests four accelerators, a minimum memory size of 1024 MB, and one copy of your model to be deployed to an endpoint of type `EndpointType.INFERENCE_COMPONENT_BASED`.

```
resource_requirements = ResourceRequirements(
    requests={
        "num_accelerators": 4,
        "memory": 1024,
        "copies": 1,
    },
    limits={},
)
endpoint = model_builder.deploy(
    endpoint_name="my-endpoint",
    mode=Mode.SAGEMAKER_ENDPOINT,
    endpoint_type=EndpointType.INFERENCE_COMPONENT_BASED,
    resources=resource_requirements,
    role_arn="role"
)
```

Bring your own container (BYOC)

If you want to bring your own container (extended from a SageMaker AI container), you can also specify the image URI as shown in the following example. You also need to identify the model server that corresponds to the image for `ModelBuilder` to generate artifacts specific to the model server.

```
model_builder = ModelBuilder(
    model=model,
    model_server=ModelServer.TORCHSERVE,
    schema_builder=SchemaBuilder(X_test, y_pred),
    image_uri="123123123123.dkr.ecr.ap-southeast-2.amazonaws.com/byoc-image:xgb-1.7-1")
)
```

Using ModelBuilder in local mode

You can deploy your model locally by using the `mode` argument to switch between local testing and deployment to an endpoint. You need to store the model artifacts in the working directory, as shown in the following snippet:

```
model = XGBClassifier()
model.fit(X_train, y_train)
```

```
model.save_model(model_dir + "/my_model.xgb")
```

Pass the model object, a `SchemaBuilder` instance, and set mode to `Mode.LOCAL_CONTAINER`. When you call the `build` function, `ModelBuilder` automatically identifies the supported framework container and scans for dependencies. The following example demonstrates model creation with an XGBoost model in local mode.

```
model_builder_local = ModelBuilder(
    model=model,
    schema_builder=SchemaBuilder(X_test, y_pred),
    role_arn=execution-role,
    mode=Mode.LOCAL_CONTAINER
)
xgb_local_builder = model_builder_local.build()
```

Call the `deploy` function to deploy locally, as shown in the following snippet. If you specify parameters for instance type or count, these arguments are ignored.

```
local_endpoint = xgb_local_builder.deploy_local()
```

Troubleshooting local mode

Depending on your individual local setup, you may encounter difficulties running `ModelBuilder` smoothly in your environment. See the following list for some issues you may face and how to resolve them.

- **Already already in use**: You may encounter an `Address already in use` error. In this case, it is possible that a Docker container is running on that port or another process is utilizing it. You can follow the approach outlined in Linux documentation to identify the process and gracefully redirect your local process from port 8080 to another port or clean up the Docker instance.
- **IAM Permission Issue**: You might encounter a permission issue when trying to pull an Amazon ECR image or access Amazon S3. In this case, navigate to the execution role of the notebook or Studio Classic instance to verify the policy for `SageMakerFullAccess` or the respective API permissions.
- **EBS volume capacity issue**: If you deploy a large language model (LLM), you might run out of space while running Docker in local mode or experience space limitations for the Docker cache. In this case, you can try to move your Docker volume to a filesystem that has enough space. To move your Docker volume, complete the following steps:

1. Open a terminal and run `df` to display disk usage, as shown in the following output:

```
(python3) sh-4.2$ df
Filesystem     1K-blocks      Used Available Use% Mounted on
devtmpfs       195928700         0 195928700   0% /dev
tmpfs          195939296         0 195939296   0% /dev/shm
tmpfs          195939296      1048 195938248   1% /run
tmpfs          195939296         0 195939296   0% /sys/fs/cgroup
/dev/nvme0n1p1 141545452 135242112   6303340  96% /
tmpfs           39187860         0  39187860   0% /run/user/0
/dev/nvme2n1   264055236  76594068 176644712  31% /home/ec2-user/SageMaker
tmpfs           39187860         0  39187860   0% /run/user/1002
tmpfs           39187860         0  39187860   0% /run/user/1001
tmpfs           39187860         0  39187860   0% /run/user/1000
```

2. Move the default Docker directory from `/dev/nvme0n1p1` to `/dev/nvme2n1` so you can fully utilize the 256 GB SageMaker AI volume. For more details, see documentation about how to move your Docker directory.

3. Stop Docker with the following command:

```
sudo service docker stop
```

4. Add a `daemon.json` to `/etc/docker` or append the following JSON blob to the existing one.

```
{
    "data-root": "/home/ec2-user/SageMaker/{created_docker_folder}"
}
```

5. Move the Docker directory in `/var/lib/docker` to `/home/ec2-user/SageMaker AI` with the following command:

```
sudo rsync -aP /var/lib/docker/ /home/ec2-user/SageMaker/{created_docker_folder}
```

6. Start Docker with the following command:

```
sudo service docker start
```

7. Clean trash with the following command:

```
cd /home/ec2-user/SageMaker/.Trash-1000/files/*
sudo rm -r *
```

8. If you are using a SageMaker notebook instance, you can follow the steps in the Docker prep file to prepare Docker for local mode.

ModelBuilder examples

For more examples of using `ModelBuilder` to build your models, see ModelBuilder sample notebooks.

Generative AI

Optimize and benchmark your generative AI inference deployments.

Inference optimization for Amazon SageMaker AI models

Amazon SageMaker AI provides two approaches to optimize your generative AI model inference:

- **Inference recommendations.** SageMaker AI automatically analyzes your model and workload, evaluates instance types, applies optimizations, and returns validated, deployment-ready configurations with real performance metrics. This is the recommended approach for most customers. To get started, see Optimized generative AI inference recommendations.
- **Manual optimization.** For customers who want a do-it-yourself approach, you can apply individual optimization techniques such as quantization, speculative decoding, and compilation. You choose which techniques to apply, run optimization jobs, and evaluate the results yourself. After your model is optimized, you can run an evaluation to see performance metrics for latency, throughput, and price.

For many models, SageMaker AI also provides several pre-optimized versions, where each caters to different applications needs for latency and throughput. For such models, you can deploy one of the optimized versions without first optimizing the model yourself.

Optimized generative AI inference recommendations

Amazon SageMaker AI now supports inference recommendations, a capability that eliminates manual optimization and benchmarking to deliver optimal inference performance. Instead of

manually testing combinations of GPU instance types, serving containers, parallelism strategies, and optimization techniques, you provide your model and workload requirements, and SageMaker AI returns validated, deployment-ready configurations with real performance metrics.

Inference recommendations analyzes your model's architecture, narrows the configuration space, and applies goal-aligned optimizations such as speculative decoding for throughput and kernel tuning for latency. By evaluating multiple instance types, you can select the most price-performant option for your workload. It benchmarks each configuration on real GPU infrastructure, so you can deploy with confidence and right-size your inference spend.

How it works

Getting started with inference recommendations is straightforward, whether through SageMaker AI Studio or the SageMaker AI APIs. The following steps describe the workflow.

1. **Prepare your model.** Point to model artifacts in Amazon S3 or the SageMaker AI Model Registry. Inference recommendations supports HuggingFace checkpoint format with SafeTensor weights, including base models and custom or fine-tuned models.
2. **Define your workload.** Describe your expected traffic patterns, including input and output token distributions and concurrency levels. You can use inline specifications or a representative dataset from Amazon S3.
3. **Set your goal.** Choose a single performance objective: optimize for cost, minimize latency, or maximize throughput. Select up to three instance types to compare.
4. **Review results.** SageMaker AI returns validated configurations with real performance metrics: Time to First Token (TTFT), inter-token latency, request latency at P50/P90/P99, throughput, and cost per configuration. Each configuration is deployment-ready.
5. **Deploy.** Deploy the chosen configuration to a SageMaker AI inference endpoint with a single action from SageMaker AI Studio, or programmatically through the API.

You can also benchmark existing production endpoints to validate current performance or compare against new configurations.

Use cases

The following are common use cases for inference recommendations.

- **Pre-deployment validation.** Optimize and benchmark a new model before committing to a production deployment. Validate how the model performs before you invest in scaling it.

- **Regression testing after updates.** Validate performance after a container update, framework upgrade, or serving library release. Confirm that your configuration is still optimal before pushing to production.
- **Right-sizing when conditions change.** When traffic patterns shift or new instance types become available, re-run inference recommendations in hours rather than restarting a weeks-long manual process.
- **Model comparison.** Compare the performance and cost of different model variants across instance types to make an informed selection before production deployment.
- **Cost optimization.** Benchmark existing production endpoints to identify over-provisioned infrastructure. Use the results to right-size and reduce recurring inference spend.

Pricing

Inference recommendations has no additional service fee. You can use existing ML Reservations (Flexible Training Plans) at no additional compute cost, or use on-demand compute that is provisioned automatically.

Supported Regions

Inference recommendations is available in the following Amazon Regions:

- US East (N. Virginia)
- US East (Ohio)
- US West (Oregon)
- Asia Pacific (Singapore)
- Asia Pacific (Tokyo)
- Europe (Frankfurt)
- Europe (Ireland)

Set up a workload configuration for generative AI inference recommendations

A workload configuration defines the traffic patterns and benchmark parameters that SageMaker AI uses when evaluating your model or endpoint. You create a workload configuration before running a recommendation job or a benchmark job. The same workload configuration can be reused across multiple jobs.

You can define your workload in two ways:

- **Inline specification.** Specify token distributions and traffic parameters directly in the API call.
- **Dataset from Amazon S3.** Provide a representative dataset of real requests using the `DatasetConfig` parameter.

Create a workload configuration with inline parameters

Use inline parameters to specify token distributions when you don't have a representative dataset.

Python (boto3)

```
import boto3
import json

client = boto3.client("sagemaker", region_name="us-west-2")

workload_spec = {
    "benchmark": {"type": "aiperf"},
    "parameters": {
        "prompt_input_tokens_mean": 550,
        "prompt_input_tokens_stddev": 150,
        "output_tokens_mean": 150,
        "output_tokens_stddev": 50,
    },
}

response = client.create_ai_workload_config(
    AIWorkloadConfigName="my-workload-config",
    AIWorkloadConfigs={
        "WorkloadSpec": {"Inline": json.dumps(workload_spec)}
    },
)
print(response["AIWorkloadConfigArn"])
```

Amazon CLI

```
aws sagemaker create-ai-workload-config \
```

```
  --ai-workload-config-name "my-workload-config" \
  --ai-workload-configs '{"WorkloadSpec": {"Inline": "{\"benchmark\": {\"type\":
 \"aiperf\"}, \"parameters\": {\"prompt_input_tokens_mean\": 550, \"output_tokens_mean
\": 150}}"}}' \
  --region us-west-2
```

Create a workload configuration with a dataset

If you have a representative dataset of real requests, provide it through Amazon S3 using the `DatasetConfig` parameter with an `InputDataConfig` channel.

```
response = client.create_ai_workload_config(
    AIWorkloadConfigName="my-dataset-workload",
    DatasetConfig={
        "InputDataConfig": [
            {
                "ChannelName": "traffic",
                "DataSource": {
                    "S3DataSource": {
                        "S3Uri": "s3://DOC-EXAMPLE-BUCKET/datasets/traffic-trace/"
                    }
                }
            }
        ]
    },
    AIWorkloadConfigs={
        "WorkloadSpec": {"Inline": json.dumps(workload_spec)}
    },
)
```

By default, synthetic prompts are generated. You can also use a public dataset or provide a custom dataset from Amazon S3.

Workload configuration for benchmarking

When creating a workload configuration for benchmarking an existing endpoint, you can specify additional parameters such as the tokenizer, concurrency, request count, and request rate.

```
workload_spec = {
    "benchmark": {"type": "aiperf"},
    "parameters": {
        "tokenizer": "TinyLlama/TinyLlama-1.1B-Chat-v1.0",
        "concurrency": 1,
        "request_count": 10,
        "streaming": True,
        "prompt_input_tokens_mean": 550,
        "prompt_input_tokens_stddev": 150,
        "output_tokens_mean": 50,
        "output_tokens_stddev": 10,
        "request_rate": 1.0,
        "benchmark_duration": 60,
    },
    "tooling": {"api_standard": "openai", "version": "0.6.0"},
}
```

Manage workload configurations

Use the following operations to manage your workload configurations.

```
# List workload configurations
response = client.list_ai_workload_configs(MaxResults=10)
for config in response["AIWorkloadConfigs"]:
    print(f"{config['AIWorkloadConfigName']} - {config['AIWorkloadConfigArn']}")

# Describe a workload configuration
response = client.describe_ai_workload_config(
    AIWorkloadConfigName="my-workload-config"
)

# Delete a workload configuration
client.delete_ai_workload_config(
    AIWorkloadConfigName="my-workload-config"
)
```

Workload specification reference

This section provides the complete schema for the workload specification JSON document that you pass in the `WorkloadSpec.Inline` field when creating a workload configuration.

Syntax

The following is a representative example of a workload specification with commonly used parameters. All parameters are documented in the reference table below.

```
{
    "benchmark": {
        "type": "aiperf"
    },
    "parameters": {
        "prompt_input_tokens_mean": 550,
        "prompt_input_tokens_stddev": 150.0,
        "output_tokens_mean": 150,
        "output_tokens_stddev": 50.0,
        "concurrency": 10,
        "request_count": 100,
        "request_rate": 5.0,
        "benchmark_duration": 120,
        "streaming": true,
        "tokenizer": "meta-llama/Llama-3.2-1B"
    },
    "secrets": {
        "hf_token": "arn:aws:secretsmanager:us-west-2:111122223333:secret:my-hf-token-
AbCdEf"
    },
    "tooling": {
        "api_standard": "openai"
    }
}
```

Workload specification keys

The workload specification contains the following top-level keys. Unknown keys are rejected.

benchmark

Required mapping. Identifies the benchmarking tool to use.

`benchmark/type`

Required. The benchmark engine. The only valid value is `aiperf`.

parameters

Optional mapping. Benchmark parameters passed to the AIPerf engine. Unknown parameter names are rejected. All parameters are optional unless noted otherwise.

Token distribution

`prompt_input_tokens_mean`

Integer. Mean number of input tokens per request for synthetic prompt generation. Aliases: `synthetic_input_tokens_mean`, `isl`.

`prompt_input_tokens_stddev`

Float. Standard deviation of input token count. Aliases: `synthetic_input_tokens_stddev`, `isl_stddev`.

`output_tokens_mean`

Integer. Mean number of output tokens per request. Aliases: `prompt_output_tokens_mean`, `osl`.

`output_tokens_stddev`

Float. Standard deviation of output token count. Aliases: `prompt_output_tokens_stddev`, `osl_stddev`.

Traffic shaping

`concurrency`

Integer. Number of concurrent requests to send during the benchmark.

`request_count`

Integer. Total number of requests to send. Alias: `num_requests`.

`request_rate`

Float. Target requests per second.

`benchmark_duration`

Integer. Duration of the benchmark in seconds.

`max_concurrency`

Integer. Maximum number of concurrent requests allowed.

`request_rate_mode`

String. Request arrival pattern. Alias: `arrival_pattern`.

`arrival_smoothness`

Float. Controls burstiness of request arrivals. Higher values produce smoother traffic. Alias: `vllm_burstiness`.

`prefill_concurrency`

Integer. Number of concurrent prefill requests.

General

`streaming`

Boolean. Whether to use streaming responses. Default: `true`.

`tokenizer`

String. HuggingFace model name or local directory path for the tokenizer used to count tokens. Example: `meta-llama/Llama-3.2-1B`.

`hf_token`

String. Hugging Face access token for downloading gated models and tokenizers. Alias: `HF_TOKEN`. For sensitive values, use the `secrets` section instead of passing the token in plaintext.

`request_timeout_seconds`

Integer. Timeout in seconds for individual requests.

`goodput`

String. Define service level objectives (SLOs) for goodput measurement. Goodput is the number of completed requests per second that meet all specified latency constraints. Format: space-separated `metric:threshold_ms` pairs. For example, `"time_to_first_token:100 inter_token_latency:10"` measures throughput counting only requests where TTFT is under 100ms and ITL is under 10ms. When set, the benchmark results include a `goodput`

metric (requests/sec meeting all SLOs) and a `good_request_fraction` metric (proportion of requests meeting all SLOs). Requires streaming mode for token-level metrics.

`benchmark_grace_period`

Integer. Grace period in seconds after the benchmark completes to allow in-flight requests to finish.

`extra_inputs`

String. Space-separated key-value pairs passed through to the benchmark tool. Each pair uses `key:value` format. Common keys include `payload_template:/path/to/template.jinja` for custom-format endpoints, `response_field:jmespath.query` for response extraction, and `ignore_eos:true` to force max_tokens generation.

`random_seed`

Integer. Seed for random number generation. Default: `42`.

`verbose`

Boolean. Enable verbose logging. Default: `false`.

`num_conversations`

Integer. Number of multi-turn conversations to simulate. Aliases: `conversation_num`, `num_sessions`.

`model_selection_strategy`

String. Strategy for selecting models when multiple models are available on the endpoint.

Warmup

Warmup parameters control an optional warm-up phase that runs before the measured benchmark. This primes the model server's caches and JIT compilation.

`warmup_duration`

Integer. Duration of the warmup phase in seconds.

`warmup_request_count`

Integer. Number of warmup requests. Alias: `num_warmup_requests`.

`warmup_concurrency`

Integer. Concurrency level during warmup.

`warmup_prefill_concurrency`

Integer. Prefill concurrency during warmup.

`warmup_request_rate`

Float. Request rate during warmup.

`warmup_arrival_pattern`

String. Arrival pattern during warmup.

`warmup_grace_period`

Float. Grace period in seconds after warmup completes.

`num_warmup_sessions`

Integer. Number of warmup sessions.

Dataset

`public_dataset`

String. Name of a public dataset to use for benchmark prompts instead of synthetic generation.

`custom_dataset_type`

String. Format of a custom dataset provided via Amazon S3.

`input_file`

String. Path to the input dataset file inside the benchmark container. When you provide a dataset through the `DatasetConfig` parameter, the data is mounted at `/opt/ml/input/data/{ChannelName}/`. Use this parameter to point to a specific file within that mount path.

`dataset_sampling_strategy`

String. Controls how prompts are sampled from the dataset pool during benchmarking. Valid values: `shuffle` (default) — randomly shuffles the dataset and draws prompts without replacement; `sequential` — sends prompts in the order they appear in the dataset file. Use `sequential` when prompt order matters for your evaluation (for example, when measuring performance across increasing prompt lengths).

Image inputs

Parameters for benchmarking multimodal models that accept image inputs.

`image_width_mean`

Float. Mean width of synthetic images in pixels.

`image_width_stddev`

Float. Standard deviation of image width.

`image_height_mean`

Float. Mean height of synthetic images in pixels.

`image_height_stddev`

Float. Standard deviation of image height.

`image_batch_size`

Integer. Number of images per request. Alias: `batch_size_image`.

`image_format`

String. Image format (for example, png, `jpeg`).

Video inputs

Parameters for benchmarking multimodal models that accept video inputs.

`video_batch_size`

Integer. Number of videos per request. Alias: `batch_size_video`.

`video_duration`

Float. Duration of synthetic videos in seconds.

`video_fps`

Integer. Frames per second for synthetic videos.

`video_width`

Integer. Width of synthetic videos in pixels.

`video_height`

Integer. Height of synthetic videos in pixels.

`video_synth_type`

String. Type of synthetic video generation.

`video_format`

String. Video container format.

`video_codec`

String. Video codec.

`video_audio_sample_rate`

Integer. Audio sample rate in Hz.

`video_audio_num_channels`

Integer. Number of audio channels.

`video_audio_codec`

String. Audio codec.

`video_audio_depth`

String. Audio bit depth.

secrets

Optional mapping. Use this section to pass sensitive values (such as Hugging Face access tokens) by referencing Amazon Secrets Manager secrets instead of including them as plaintext in `parameters`.

Each key is a parameter name, and the value is the ARN of the secret in Amazon Secrets Manager. At job start time, the service resolves the secret and injects the value into the benchmark environment.

```
"secrets": {
    "hf_token": "arn:aws:secretsmanager:us-west-2:111122223333:secret:my-hf-token-
AbCdEf"
```

```
}
```

tooling

Optional mapping. Specifies the API standard and tool version.

`tooling/api_standard`

Optional. The API standard used by the endpoint. For example, `openai`.

`tooling/version`

Optional. The version of the benchmarking tool. Defaults to the latest available version.

Get generative AI inference deployment recommendations

AI recommendation jobs analyze your model and workload characteristics to generate deployment configurations optimized for cost, latency, or throughput. The service evaluates instance types, applies optimizations like speculative decoding, and benchmarks each configuration on real GPU infrastructure.

Prerequisites

Before you create a recommendation job, you need the following:

- Model artifacts stored in Amazon S3 in HuggingFace checkpoint format with SafeTensor weights
- An Amazon S3 bucket for recommendation output
- An Amazon Identity and Access Management (IAM) execution role that grants SageMaker AI access to your model artifacts and output bucket

Step 1: Create a recommendation job

A recommendation job analyzes your model and generates deployment recommendations. You specify the model location, output location, workload configuration, and a performance target.

Python (boto3)

```
response = client.create_ai_recommendation_job(
```

```
    AIRecommendationJobName="my-recommendation-job",
    ModelSource={
        "S3": {
            "S3Uri": "s3://DOC-EXAMPLE-BUCKET/models/my-model/",
        }
    },
    OutputConfig={
        "S3OutputLocation": "s3://DOC-EXAMPLE-BUCKET/recommendations/"
    },
    PerformanceTarget={
        "Constraints": [
            {"Metric": "ttft-ms"}
        ]
    },
    AIWorkloadConfigIdentifier="my-recommendation-workload",
    RoleArn="arn:aws:iam::111122223333:role/ExampleRole",
)
print(response["AIRecommendationJobArn"])
```

Amazon CLI

```
aws sagemaker create-ai-recommendation-job \
  --ai-recommendation-job-name "my-recommendation-job" \
  --model-source '{"S3": {"S3Uri": "s3://DOC-EXAMPLE-BUCKET/models/my-model/"}}' \
  --output-config '{"S3OutputLocation": "s3://DOC-EXAMPLE-BUCKET/recommendations/"}' \
  --performance-target '{"Constraints": [{"Metric": "ttft-ms"}]}' \
  --ai-workload-config-identifier "my-recommendation-workload" \
  --role-arn "arn:aws:iam::111122223333:role/ExampleRole" \
  --region us-west-2
```

You can also specify the following optional parameters:

`ComputeSpec`

Restrict the instance types to evaluate (maximum three). For example: `{"InstanceTypes": ["ml.g5.12xlarge", "ml.p4d.24xlarge"]}`

`OptimizeModel`

Set to `true` to allow model optimizations such as speculative decoding.

`InferenceSpecification`

Specify the inference framework. Valid values: `LMI`, `VLLM`.

To track the recommendation results with fully managed MLflow on SageMaker AI, add an `MlflowConfig` object to `OutputConfig`. For more information, see Track inference recommendation and benchmark results with MLflow.

Step 2: Monitor job status

Poll the job status until it reaches a terminal state.

Python (boto3)

```
import time

while True:
    response = client.describe_ai_recommendation_job(
        AIRecommendationJobName="my-recommendation-job"
    )
    status = response["AIRecommendationJobStatus"]
    print(f"Status: {status}")
    if status in ("Completed", "Failed", "Stopped"):
        break
    time.sleep(30)
```

Amazon CLI

```
aws sagemaker describe-ai-recommendation-job \
  --ai-recommendation-job-name "my-recommendation-job" \
  --region us-west-2
```

Step 3: Review recommendations

When the job completes, the describe response includes a `Recommendations` array. Each recommendation contains a deployment-ready configuration with the following information:

`DeploymentConfiguration`

Container image URI, instance type, instance count, and environment variables. You can use this configuration to deploy directly to a SageMaker AI endpoint.

`ExpectedPerformance`

Validated performance metrics including Time to First Token (TTFT), request latency at P90 and P99, throughput in tokens per second, and request throughput.

`OptimizationDetails`

Applied optimization techniques such as speculative decoding or kernel tuning, with their configuration parameters.

The following optimization techniques may be applied:

Speculative decoding

Speculative decoding speeds up text generation by processing multiple tokens in parallel rather than one token at a time. A lightweight speculator proposes several candidate tokens in a single step, and the primary model then verifies them together in one forward pass, keeping the candidates that agree with its own distribution and discarding the rest. The speculator is trained to align with the primary model's data distribution so that more of its proposals are accepted, which directly translates into more useful tokens produced per forward pass. The output distribution of the primary model is preserved, so response quality is unchanged. The result is higher output tokens per second and lower inter-token latency (ITL), thereby improving your throughput metrics.

Kernel tuning

Kernel tuning starts with parsing the model execution graph to identify performance-critical kernels that are good candidates for tuning, such as attention and fused operator kernels. Their launch and tiling parameters are then tuned so the implementation is better matched to the target GPU hardware and the expected traffic pattern, such as concurrency. These parameters affect memory reuse, cache locality, and parallelism, improving execution efficiency. The number of pipeline stages used for loading data and computing is also tuned, helping overlap memory movement with computation. By tuning these parameters for the specific combination of model, hardware, and serving workload, kernel tuning improves throughput and latency by ensuring the GPU is fully utilized.

The following performance target metrics are available:

`ttft-ms`

Time to first token in milliseconds.

`throughput`

Tokens per second.

`cost`

Cost per hour of the deployment configuration.

Each metric in the `ExpectedPerformance` response includes a `Stat` field indicating the statistical measure, a `Value`, and an optional `Unit`. Common statistics include: `average`, `p50`, `p90`, `p95`, `p99`, `max`, and `min`.

Manage recommendation resources

Use the following operations to manage your recommendation jobs and workload configurations.

```
# List recommendation jobs
response = client.list_ai_recommendation_jobs(MaxResults=10)
for job in response["AIRecommendationJobs"]:
    print(f"{job['AIRecommendationJobName']} - {job['AIRecommendationJobStatus']}")

# Stop a running job
client.stop_ai_recommendation_job(
    AIRecommendationJobName="my-recommendation-job"
)

# Delete a job (must be in a terminal state)
client.delete_ai_recommendation_job(
    AIRecommendationJobName="my-recommendation-job"
)

# List workload configurations
response = client.list_ai_workload_configs(MaxResults=10)
for config in response["AIWorkloadConfigs"]:
    print(f"{config['AIWorkloadConfigName']} - {config['AIWorkloadConfigArn']}")

# Delete a workload configuration
```

```
client.delete_ai_workload_config(
    AIWorkloadConfigName="my-recommendation-workload"
)
```

Get recommendations for models with LoRA adapters

Low-Rank Adaptation (LoRA) is a parameter-efficient fine-tuning technique that trains a small set of adapter weights on top of a frozen base model. You can serve many adapters that share a single base model on one endpoint. This is more cost-effective than deploying a separate copy of the model for each fine-tuned variant.

When you add adapters to a recommendation job, SageMaker AI sizes and benchmarks a *multi-adapter* deployment. This deployment is a single base model with one Inference components per adapter on the same endpoint. The recommendations account for the additional memory that the adapters require, so SageMaker AI validates the returned configurations against the base model and the adapters together.

Prerequisites

In addition to the Prerequisites for a recommendation job, you need the following to include adapters:

- 1–10 LoRA adapters, each trained against the base model that you specify in `ModelSource`.
- Each adapter in PEFT format. The adapter location must contain an `adapter_config.json` file with a positive rank (`r`), and the adapter weight files (`.safetensors` or `.bin`).
- All adapters provided in a single form: either in Amazon S3, or as registered SageMaker AI model packages. You can't mix the two forms in one job.

SageMaker AI reads your adapters with the IAM execution role that you pass in `RoleArn`. The role must be able to read (`s3:GetObject` and `s3:ListBucket`) the Amazon S3 location of each adapter. These are the same permissions that it uses for your base model artifacts. If you provide adapters as model packages, the role also needs `sagemaker:DescribeModelPackage` on each package so that SageMaker AI can resolve the Amazon S3 location of the adapter.

Requirements and restrictions

The following requirements and restrictions apply when you add adapters to a recommendation job:

- **One source form per job.** `AdapterSource` is a union. Set exactly one of `S3Uris` or `ModelPackageArns`. SageMaker AI rejects a job that sets both fields or neither field.
- **Adapter rank.** No adapter's rank can exceed 512, the largest LoRA rank that the vLLM serving engine supports. For more information, see the note in Add adapters to a recommendation job.

Add adapters to a recommendation job

To include adapters, add the optional `AdapterSource` object to your `CreateAIRecommendationJob` request. `AdapterSource` is a union: set exactly one of the following fields, each a list of 1–10 adapter entries:

`S3Uris`

A list of `{"AdapterId": ..., "S3Uri": ...}` entries. Use this form for adapters that you produced with your own or an open-source PEFT pipeline. Each `S3Uri` is the Amazon S3 prefix that holds the adapter's `adapter_config.json` and weight files.

`ModelPackageArns`

A list of `{"AdapterId": ..., "ModelPackageArn": ...}` entries. Use this form for adapters that are already registered as SageMaker AI model packages, such as adapters produced by a SageMaker AI fine-tuning workflow. SageMaker AI reads the adapter artifact location from each model package.

The `AdapterId` is a name that you assign to each adapter. It must meet the following requirements:

- Must be unique within the request.
- Must be no more than 63 characters.
- Must match the pattern `^[a-zA-Z0-9](-*[a-zA-Z0-9])*$`: it starts and ends with an alphanumeric character, allows hyphens only between alphanumeric characters, and doesn't use underscores.

SageMaker AI uses the `AdapterId` as the inference component name for that adapter. This name is also the routing handle that you use to send requests to the adapter when you invoke the deployed endpoint.

Python (boto3) — adapters in Amazon S3

```
try:
    response = client.create_ai_recommendation_job(
        AIRecommendationJobName="my-lora-recommendation-job",
        ModelSource={
            "S3": {
                "S3Uri": "s3://amzn-s3-demo-bucket/models/my-base-model/",
            }
        },
        OutputConfig={
            "S3OutputLocation": "s3://amzn-s3-demo-bucket/recommendations/"
        },
        AdapterSource={
            "S3Uris": [
                {"AdapterId": "sql", "S3Uri": "s3://amzn-s3-demo-bucket/adapters/
sql/"},
                {"AdapterId": "chat", "S3Uri": "s3://amzn-s3-demo-bucket/adapters/
chat/"},
            ]
        },
        PerformanceTarget={
            "Constraints": [
                {"Metric": "throughput"}
            ]
        },
        AIWorkloadConfigIdentifier="my-recommendation-workload",
        RoleArn="arn:aws:iam::111122223333:role/ExampleRole",
    )
    print(response["AIRecommendationJobArn"])
except client.exceptions.ResourceInUse as error:
    print(f"A job with this name already exists: {error}")
except Exception as error:
    print(f"Error creating recommendation job: {error}")
    raise
```

Python (boto3) — adapters as model packages

```
try:
    response = client.create_ai_recommendation_job(
        AIRecommendationJobName="my-lora-recommendation-job",
        ModelSource={
```

```
            "S3": {
                "S3Uri": "s3://amzn-s3-demo-bucket/models/my-base-model/",
            }
        },
        OutputConfig={
            "S3OutputLocation": "s3://amzn-s3-demo-bucket/recommendations/"
        },
        AdapterSource={
            "ModelPackageArns": [
                {
                    "AdapterId": "sql",
                    "ModelPackageArn": "arn:aws:sagemaker:us-west-2:111122223333:model-
package/my-sql-adapter/1",
                }
            ]
        },
        PerformanceTarget={
            "Constraints": [
                {"Metric": "throughput"}
            ]
        },
        AIWorkloadConfigIdentifier="my-recommendation-workload",
        RoleArn="arn:aws:iam::111122223333:role/ExampleRole",
    )
    print(response["AIRecommendationJobArn"])
except client.exceptions.ResourceInUse as error:
    print(f"A job with this name already exists: {error}")
except Exception as error:
    print(f"Error creating recommendation job: {error}")
    raise
```

Amazon CLI

```
aws sagemaker create-ai-recommendation-job \
  --ai-recommendation-job-name "my-lora-recommendation-job" \
  --model-source '{"S3": {"S3Uri": "s3://amzn-s3-demo-bucket/models/my-base-model/"}}'
 \
  --output-config '{"S3OutputLocation": "s3://amzn-s3-demo-bucket/recommendations/"}' \
  --adapter-source '{
    "S3Uris": [
      {"AdapterId": "sql", "S3Uri": "s3://amzn-s3-demo-bucket/adapters/sql/"},
```

```
      {"AdapterId": "chat", "S3Uri": "s3://amzn-s3-demo-bucket/adapters/chat/"}
    ]
}' \
--performance-target '{"Constraints": [{"Metric": "throughput"}]}' \
--ai-workload-config-identifier "my-recommendation-workload" \
--role-arn "arn:aws:iam::111122223333:role/ExampleRole" \
--region us-west-2
```

Note

No adapter's rank (`r` in `adapter_config.json`) can exceed 512, the largest LoRA rank that the vLLM serving engine supports. SageMaker AI serves all of your adapters at a single rank, and rounds that rank up to the nearest rank that vLLM supports: 1, 8, 16, 32, 64, 128, 256, 320, or 512. For example, SageMaker AI serves adapters with ranks of 4 and 12 at rank 16. If the largest rank across your adapters exceeds 512, the job fails with a validation error. Retrain the affected adapters with a smaller rank, or omit them from `AdapterSource`.

Interpret the recommendations

When the job completes, call `DescribeAIRecommendationJob`. In addition to the fields described in Step 3: Review recommendations, the response includes adapter-specific information.

`AdapterSource`

The top-level response echoes the `AdapterSource` that you supplied, in the same form (`S3Uris` or `ModelPackageArns`).

`AdapterDetails`

Each recommendation in the `Recommendations` array carries an `AdapterDetails` object that lists every adapter in *both* forms: `S3Uris` and `ModelPackageArns`, keyed by `AdapterId`. If you supplied adapters only as Amazon S3 URIs, SageMaker AI registers a model package for each adapter on your behalf and returns its ARN here. This gives you a registered, versioned artifact to deploy with.

The `DeploymentConfiguration` in each recommendation describes the multi-adapter, inference-component-based topology (the base model plus one inference component per adapter). `ExpectedPerformance` reports the benchmarked metrics for that configuration.

The following example shows the adapter-related fields of a `DescribeAIRecommendationJob` response for a job created with Amazon S3 adapters.

```
{
    "AIRecommendationJobName": "my-lora-recommendation-job",
    "AIRecommendationJobStatus": "Completed",
    "AdapterSource": {
        "S3Uris": [
            {"AdapterId": "sql", "S3Uri": "s3://amzn-s3-demo-bucket/adapters/sql/"},
            {"AdapterId": "chat", "S3Uri": "s3://amzn-s3-demo-bucket/adapters/chat/"}
        ]
    },
    "Recommendations": [
        {
            "AdapterDetails": {
                "S3Uris": [
                    {"AdapterId": "sql", "S3Uri": "s3://amzn-s3-demo-bucket/adapters/
sql/"},
                    {"AdapterId": "chat", "S3Uri": "s3://amzn-s3-demo-bucket/adapters/
chat/"}
                ],
                "ModelPackageArns": [
                    {"AdapterId": "sql", "ModelPackageArn": "arn:aws:sagemaker:us-
west-2:111122223333:model-package/my-lora-recommendation-job-adapters/1"},
                    {"AdapterId": "chat", "ModelPackageArn": "arn:aws:sagemaker:us-
west-2:111122223333:model-package/my-lora-recommendation-job-adapters/2"}
                ]
            },
            "DeploymentConfiguration": {
                "InstanceType": "ml.g6e.12xlarge",
                "InstanceCount": 1,
                "CopyCountPerInstance": 2,
                "MinCpuMemoryRequiredInMb": 12288,
                "EnvironmentVariables": {
                    "SAGEMAKER_SHM_SIZE_MB": "2048"
                }
            },
            "ExpectedPerformance": [
                {"Metric": "throughput", "Stat": "average", "Value": "512.0", "Unit":
 "tokens/second"}
            ]
        }
```

```
    ]
}
```

To benchmark a deployed multi-adapter endpoint, or to compare adapters against one another, target the inference component for each adapter in your benchmark job. For more information, see Benchmark multi-LoRA endpoints.

Benchmark generative AI inference endpoints

The SageMaker AI benchmarking service measures the performance of large language models (LLMs) hosted on SageMaker AI endpoints. It runs benchmarks using NVIDIA AIPerf, producing metrics such as request latency, throughput, time to first token, and inter-token latency.

Prerequisites

Before you create a benchmark job, you need the following:

- A SageMaker AI endpoint in `InService` status hosting an LLM that supports the OpenAI-compatible chat completions API
- An Amazon S3 bucket for benchmark output
- An IAM execution role that grants SageMaker AI access to your endpoint and output bucket

Step 1: Create a benchmark job

A benchmark job targets a specific SageMaker AI endpoint and references a workload configuration.

Python (boto3)

```
response = client.create_ai_benchmark_job(
    AIBenchmarkJobName="my-benchmark-job",
    BenchmarkTarget={
        "Endpoint": {
            "Identifier": "my-sagemaker-endpoint"
        }
    },
    OutputConfig={
        "S3OutputLocation": "s3://DOC-EXAMPLE-BUCKET/benchmark-results/"
    },
    AIWorkloadConfigIdentifier="my-benchmark-config",
```

```
    RoleArn="arn:aws:iam::111122223333:role/ExampleRole",
)
print(response["AIBenchmarkJobArn"])
```

Amazon CLI

```
aws sagemaker create-ai-benchmark-job \
  --ai-benchmark-job-name "my-benchmark-job" \
  --benchmark-target '{"Endpoint": {"Identifier": "my-sagemaker-endpoint"}}' \
  --output-config '{"S3OutputLocation": "s3://DOC-EXAMPLE-BUCKET/benchmark-results/"}'
 \
  --ai-workload-config-identifier "my-benchmark-config" \
  --role-arn "arn:aws:iam::111122223333:role/ExampleRole" \
  --region us-west-2
```

If your endpoint hosts multiple models through inference components, you can specify them in the `InferenceComponents` parameter of the `BenchmarkTarget`.

If your endpoint is in a VPC, pass the `NetworkConfig` parameter with your `VpcConfig` settings, including security group IDs and subnets.

To track the benchmark results with fully managed MLflow on SageMaker AI, add an `MlflowConfig` object to `OutputConfig`. For more information, see Track inference recommendation and benchmark results with MLflow.

Benchmark inference components

If your endpoint uses *inference components* instead of deploying a model directly, you must specify the inference components to benchmark in the `BenchmarkTarget`. When inference components are specified, the benchmarking service routes requests to those specific components rather than the endpoint's default model.

Pass one or more inference component names or ARNs in the `InferenceComponents` list:

Python (boto3)

```
response = client.create_ai_benchmark_job(
```

```
    AIBenchmarkJobName="my-ic-benchmark",
    BenchmarkTarget={
        "Endpoint": {
            "Identifier": "my-multi-model-endpoint",
            "InferenceComponents": [
                {"Identifier": "my-inference-component-llama"}
            ]
        }
    },
    OutputConfig={
        "S3OutputLocation": "s3://DOC-EXAMPLE-BUCKET/benchmark-results/"
    },
    AIWorkloadConfigIdentifier="my-benchmark-config",
    RoleArn="arn:aws:iam::111122223333:role/ExampleRole",
)
```

Amazon CLI

```
aws sagemaker create-ai-benchmark-job \
  --ai-benchmark-job-name "my-ic-benchmark" \
  --benchmark-target '{
    "Endpoint": {
      "Identifier": "my-multi-model-endpoint",
      "InferenceComponents": [
        {"Identifier": "my-inference-component-llama"}
      ]
    }
  }' \
  --output-config '{"S3OutputLocation": "s3://DOC-EXAMPLE-BUCKET/benchmark-results/"}'
 \
  --ai-workload-config-identifier "my-benchmark-config" \
  --role-arn "arn:aws:iam::111122223333:role/ExampleRole" \
  --region us-west-2
```

Note

If your endpoint is configured for inference components but you don't specify `InferenceComponents` in the benchmark target, the job fails with an error indicating that no model is deployed directly on the endpoint. Always include the

`InferenceComponents` parameter when benchmarking inference-component-based endpoints.

Benchmark multi-LoRA endpoints

To benchmark an endpoint that serves multiple LoRA adapters, specify each adapter as an inference component in the `BenchmarkTarget`. You can optionally use the `model_selection_strategy` workload parameter to control how the benchmark distributes requests across adapters. If you don't specify a strategy, the default is `round_robin`.

First, create a workload configuration. The following example includes the optional `model_selection_strategy` parameter:

```
# Create a workload config for multi-LoRA benchmarking
workload_spec = {
    "benchmark": {"type": "aiperf"},
    "parameters": {
        "prompt_input_tokens_mean": 550,
        "output_tokens_mean": 150,
        "concurrency": 10,
        "streaming": True,
        "tokenizer": "meta-llama/Llama-3.2-1B",
        "model_selection_strategy": "round_robin"
    },
    "secrets": {
        "hf_token": "arn:aws:secretsmanager:us-west-2:111122223333:secret:my-hf-token-
AbCdEf"
    },
    "tooling": {"api_standard": "openai"}
}

import json
client.create_ai_workload_config(
    AIWorkloadConfigName="multi-lora-config",
    WorkloadSpec={"Inline": json.dumps(workload_spec)}
)
```

Then, create a benchmark job that targets all the LoRA adapter inference components:

```
response = client.create_ai_benchmark_job(
    AIBenchmarkJobName="multi-lora-benchmark",
    BenchmarkTarget={
        "Endpoint": {
            "Identifier": "my-lora-endpoint",
            "InferenceComponents": [
                {"Identifier": "lora-adapter-customer-support"},
                {"Identifier": "lora-adapter-code-generation"},
                {"Identifier": "lora-adapter-summarization"}
            ]
        }
    },
    OutputConfig={
        "S3OutputLocation": "s3://DOC-EXAMPLE-BUCKET/multi-lora-results/"
    },
    AIWorkloadConfigIdentifier="multi-lora-config",
    RoleArn="arn:aws:iam::111122223333:role/ExampleRole",
)
```

The `model_selection_strategy` parameter is optional and determines how the benchmark tool distributes requests across the specified inference components. Valid values are:

- `round_robin` (default) — each adapter receives requests in order. The nth request is sent to the (n mod number-of-models)th adapter.
- `random` — each request is assigned to an adapter uniformly at random.

If you don't specify `model_selection_strategy`, the benchmark uses `round_robin` by default.

Benchmark multimodal endpoints with synthetic images

You can benchmark vision-language models by generating synthetic images as part of the workload configuration. The benchmarking service uses AIPerf to create images with configurable dimensions and format, then sends them as base64-encoded payloads to your endpoint.

The following example creates a workload configuration for benchmarking a vision-language model with synthetic images:

```
import json

workload_spec = {
    "benchmark": {"type": "aiperf"},
    "parameters": {
        "image_width_mean": 640,
        "image_height_mean": 480,
        "prompt_input_tokens_mean": 100,
        "output_tokens_mean": 150,
        "concurrency": 8,
        "request_count": 100,
        "streaming": True,
        "tokenizer": "meta-llama/Llama-3.2-1B"
    },
    "secrets": {
        "hf_token": "arn:aws:secretsmanager:us-west-2:111122223333:secret:my-hf-token-
AbCdEf"
    }
}

client.create_ai_workload_config(
    AIWorkloadConfigName="image-benchmark-config",
    WorkloadSpec={"Inline": json.dumps(workload_spec)}
)
```

The following parameters control synthetic image generation:

Parameter	Type	Default	Description
`image_width_mean`	float	None	Mean image width in pixels.
`image_width_stddev`	float	None	Standard deviation of image width. Set to vary image dimensions across requests.
`image_height_mean`	float	None	Mean image height in pixels.
`image_height_stddev`	float	None	Standard deviation of image height.
`image_batch_size`	int	1	Number of images per request.

Parameter	Type	Default	Description
`image_format`	string	png	Image format. Valid values: png (lossless), `jpeg` (lossy, smaller files), `random` (randomly selects PNG or JPEG per image).

Variable-size images

Use standard deviation parameters to generate images with varying dimensions, simulating real-world workloads where image sizes differ:

```
workload_spec = {
    "benchmark": {"type": "aiperf"},
    "parameters": {
        "image_width_mean": 800,
        "image_width_stddev": 200,
        "image_height_mean": 600,
        "image_height_stddev": 150,
        "image_batch_size": 2,
        "concurrency": 4,
        "request_count": 50,
        "streaming": True,
        "tokenizer": "meta-llama/Llama-3.2-1B"
    }
}
```

Benchmark multimodal endpoints with synthetic video

You can benchmark multimodal models that process video inputs by generating synthetic videos as part of the workload configuration. The benchmarking service uses AIPerf's synthetic video generation to create videos with configurable resolution, frame rate, duration, and encoding, then sends them as base64-encoded payloads to your endpoint.

> **Note**
>
> Video generation is disabled by default. You must specify both `video_width` and `video_height` in your workload configuration to enable it.

The following example creates a workload configuration for benchmarking a multimodal model with synthetic video at 640×480 resolution:

```
import json

workload_spec = {
    "benchmark": {"type": "aiperf"},
    "parameters": {
        "video_width": 640,
        "video_height": 480,
        "video_fps": 4,
        "video_duration": 5.0,
        "output_tokens_mean": 150,
        "concurrency": 4,
        "request_count": 50,
        "streaming": True,
        "tokenizer": "meta-llama/Llama-3.2-1B"
    },
    "secrets": {
        "hf_token": "arn:aws:secretsmanager:us-west-2:111122223333:secret:my-hf-token-
AbCdEf"
    }
}

client.create_ai_workload_config(
    AIWorkloadConfigName="video-benchmark-config",
    WorkloadSpec={"Inline": json.dumps(workload_spec)}
)
```

Video parameters

The following parameters control synthetic video generation:

Parameter	Type	Default	Description
`video_width`	int	None	Frame width in pixels. Must be set with `video_height` to enable video generation.

Parameter	Type	Default	Description
`video_height`	int	None	Frame height in pixels. Must be set with `video_width` to enable video generation.
`video_fps`	int	4	Frames per second.
`video_duration`	float	5.0	Clip duration in seconds.
`video_batch_size`	int	1	Number of videos per request.
`video_synth_type`	string	moving_shapes	Synthesis pattern. Valid values: `moving_shapes` (animated geometric shapes), `grid_clock` (grid with clock animation), `noise` (random pixel noise).
`video_format`	string	webm	Container format. Valid value: `webm`.
`video_codec`	string	libvpx-vp9	Video codec. Supported value: `libvpx-vp9` (VP9, WebM).

Note

The benchmarking service supports VP9 encoding with WebM format only.

Embedded audio tracks

For models that process video and audio together, you can embed a synthetic audio track in the generated videos. Audio is disabled by default. Set `video_audio_num_channels` to 1 (mono) or 2 (stereo) to enable it.

Parameter	Type	Default	Description
`video_audio_num_channels`	int	0	0 = disabled, 1 = mono, 2 = stereo.

Parameter	Type	Default	Description
video_audio_sample_rate	int	44100	Sample rate in Hz (8000–96000).
video_audio_codec	string	auto	Audio codec. Auto-selects libvorbis for WebM and aac for MP4. You can override with aac, libvorbis , or libopus.
video_audio_depth	int	16	Bit depth per sample (8, 16, 24, or 32).

Video benchmarking examples

Low-resolution video understanding

```
workload_spec = {
    "benchmark": {"type": "aiperf"},
    "parameters": {
        "video_width": 320,
        "video_height": 240,
        "video_fps": 2,
        "video_duration": 3.0,
        "video_synth_type": "moving_shapes",
        "concurrency": 4,
        "request_count": 50,
        "streaming": True,
        "tokenizer": "meta-llama/Llama-3.2-1B"
    }
}
```

HD video benchmarking

```
workload_spec = {
    "benchmark": {"type": "aiperf"},
    "parameters": {
        "video_width": 1920,
        "video_height": 1080,
        "video_fps": 8,
```

```
        "video_duration": 10.0,
        "concurrency": 2,
        "request_count": 20,
        "streaming": True,
        "tokenizer": "meta-llama/Llama-3.2-1B"
    }
}
```

Video with audio for multimodal models

```
workload_spec = {
    "benchmark": {"type": "aiperf"},
    "parameters": {
        "video_width": 640,
        "video_height": 480,
        "video_fps": 4,
        "video_duration": 5.0,
        "video_audio_num_channels": 1,
        "video_audio_sample_rate": 16000,
        "concurrency": 4,
        "request_count": 50,
        "streaming": True,
        "tokenizer": "meta-llama/Llama-3.2-1B"
    }
}
```

Mixed text and video

Combine video with text prompts for video question-answering or captioning workloads:

```
workload_spec = {
    "benchmark": {"type": "aiperf"},
    "parameters": {
        "video_width": 640,
        "video_height": 480,
        "video_fps": 4,
        "video_duration": 5.0,
        "prompt_input_tokens_mean": 100,
        "output_tokens_mean": 50,
        "concurrency": 8,
        "request_count": 100,
```

```
        "streaming": True,
        "tokenizer": "meta-llama/Llama-3.2-1B"
    }
}
```

Performance considerations

- Higher resolution and frame rates increase video encoding time and payload size. For high-throughput testing, use lower resolutions (320×240 or 640×480).
- VP9 (`libvpx-vp9`) with WebM format is the only supported codec and provides good compression for benchmarking payloads.
- Audio adds minimal overhead compared to the video stream. Use mono (1) at 16 kHz for speech-focused workloads.

Step 2: Monitor job status

Poll the job status until it reaches a terminal state.

Python (boto3)

```
import time

while True:
    response = client.describe_ai_benchmark_job(
        AIBenchmarkJobName="my-benchmark-job"
    )
    status = response["AIBenchmarkJobStatus"]
    print(f"Status: {status}")
    if status in ("Completed", "Failed", "Stopped"):
        break
    time.sleep(30)

if status == "Completed":
    print(f"Results at: {response['OutputConfig']['S3OutputLocation']}")
elif status == "Failed":
    print(f"Job failed: {response.get('FailureReason', 'unknown')}")
```

Amazon CLI

```
aws sagemaker describe-ai-benchmark-job \
  --ai-benchmark-job-name "my-benchmark-job" \
  --region us-west-2
```

Step 3: Review benchmark results

Benchmark results are written to the Amazon S3 output location that you specified. The results include the following key metrics:

`request_throughput`

Requests per second.

`request_latency`

End-to-end request latency with percentile breakdowns (P50, P90, P99).

`time_to_first_token`

Time from request submission to the first token received.

`inter_token_latency`

Time between consecutive output tokens.

`output_token_throughput`

Output tokens generated per second.

Each metric includes statistical summaries: average, minimum, maximum, P50, P90, P99, and standard deviation.

Benchmark custom-format endpoints

If your endpoint uses a custom request or response format (for example, DJL custom handlers, TensorRT-LLM native format, or other serving frameworks that don't support the OpenAI chat completions API), you can benchmark it using a Jinja2 template to define your endpoint's payload shape.

The benchmarking service renders the template per-request with synthetic or custom prompts, then forwards the payload to your SageMaker AI endpoint. You also specify a JMESPath query to extract the generated text from your endpoint's response.

Create the payload template

Define your endpoint's request format as a Jinja2 template file. The following variables are available in the template:

Variable	Description
`text`	First text content (synthetic or from dataset).
`texts`	List of all text contents.
`model`	Model name.
`max_tokens`	Output token limit.
`stream`	Whether streaming is enabled.

Use the `|tojson` filter for proper JSON escaping of string values. The following example shows a template for a DJL endpoint with tool-calling format:

```
{
  "messages": [{"role": "user", "content": {{ text|tojson }}}],
  "tools": [
    {"function": {"name": "Chit_Chat", "description": "casual conversation",
      "parameters": {"type": "object", "properties": {}}}}
  ],
  "max_tokens": {{ max_tokens }}
}
```

Upload the template file to Amazon S3 (for example, `s3://DOC-EXAMPLE-BUCKET/templates/my_endpoint_template.jinja`).

Create the workload configuration

Create a workload configuration that references the template file. Use the `extra_inputs` parameter to specify the template path and the response extraction query. Deliver the template file to the benchmark container through a `DatasetConfig` channel.

```
import json

TEMPLATE_LOCAL_PATH = "/opt/ml/input/data/template/my_endpoint_template.jinja"
RESPONSE_FIELD = "generation_details.generations[0].content"

workload_spec = {
    "benchmark": {"type": "aiperf"},
    "parameters": {
        "extra_inputs": f"payload_template:{TEMPLATE_LOCAL_PATH} response_field:
{RESPONSE_FIELD}",
        "tokenizer": "meta-llama/Llama-3.2-1B",
        # ... other benchmark parameters (concurrency, request_count, etc.)
    },
}

response = client.create_ai_workload_config(
    AIWorkloadConfigName="custom-format-config",
    AIWorkloadConfigs={"WorkloadSpec": {"Inline": json.dumps(workload_spec)}},
    DatasetConfig={
        "InputDataConfig": [
            {
                "ChannelName": "template",
                "DataSource": {
                    "S3DataSource": {
                        "S3Uri": "s3://DOC-EXAMPLE-BUCKET/templates/
my_endpoint_template.jinja",
                    }
                },
            }
        ]
    },
)
```

The `ChannelName` determines where the file appears inside the benchmark container. A channel named `template` makes the file available at `/opt/ml/input/data/template/<filename>`.

The `response_field` value is a JMESPath query that extracts the generated text from your endpoint's response. Common patterns include:

- `choices[0].message.content` — OpenAI format
- `generation_details.generations[0].content` — DJL format
- `output.text` — simple text response

If you omit `response_field`, the benchmarking tool auto-detects the response format.

Run the benchmark

Create a benchmark job targeting your endpoint. The service automatically detects template mode from the `payload_template` key in `extra_inputs` and routes requests through the appropriate proxy path.

```
response = client.create_ai_benchmark_job(
    AIBenchmarkJobName="custom-format-benchmark",
    BenchmarkTarget={"Endpoint": {"Identifier": "my-custom-endpoint"}},
    OutputConfig={"S3OutputLocation": "s3://DOC-EXAMPLE-BUCKET/results/"},
    AIWorkloadConfigIdentifier="custom-format-config",
    RoleArn="arn:aws:iam::111122223333:role/ExampleRole",
)
```

Considerations

- Templates must be delivered as files through Amazon S3. Inline JSON templates in the `extra_inputs` string are not supported because commas in JSON conflict with the parameter parser.
- Endpoints with a single inference component are supported. Endpoints with multiple inference components are not supported in template mode because the service cannot determine which component to route each request to from an arbitrary payload format.
- Both streaming and non-streaming endpoints are supported. Set `"streaming": true` or `"streaming": false` in the workload parameters.

Benchmark with a custom tokenizer from Amazon S3

The benchmarking service uses a tokenizer to generate synthetic prompts of the requested token length and to count input and output tokens in the results. By default, the service resolves the tokenizer automatically from one of the following sources:

- The model artifacts on your endpoint.
- The endpoint container's `HF_MODEL_ID` environment variable.
- An explicit Hugging Face model ID that you set in the `tokenizer` parameter.

If your model uses a custom or private tokenizer that isn't available on Hugging Face, you can supply the tokenizer files from Amazon S3. Upload the tokenizer files to Amazon S3, then set the `tokenizer` parameter in your workload configuration to the Amazon S3 URI. The benchmarking service downloads the tokenizer files into the benchmark container automatically. You don't need to configure a data channel yourself.

Upload the tokenizer files to Amazon S3

Upload your tokenizer files to an Amazon S3 prefix. Include the complete set of files that `AutoTokenizer.from_pretrained` expects. At minimum, include a `tokenizer.json`, plus any related files such as `tokenizer_config.json`, `special_tokens_map.json`, `tokenizer.model`, `vocab.json`, and `merges.txt`:

```
s3://DOC-EXAMPLE-BUCKET/tokenizer/
```

> **Note**
>
> A `tokenizer.json` file is the format that loads reliably across model architectures. Upload it whenever your tokenizer provides one.

Create the workload configuration

Create a workload configuration and set the `tokenizer` parameter to the Amazon S3 URI of the prefix that holds your tokenizer files.

```
import json

workload_spec = {
    "benchmark": {"type": "aiperf"},
    "parameters": {
        "tokenizer": "s3://DOC-EXAMPLE-BUCKET/tokenizer/",
        "concurrency": 1,
        "request_count": 100,
        "streaming": True,
        "output_tokens_mean": 50,
    },
    "tooling": {"api_standard": "openai"},
}
```

```
response = client.create_ai_workload_config(
    AIWorkloadConfigName="custom-tokenizer-config",
    AIWorkloadConfigs={"WorkloadSpec": {"Inline": json.dumps(workload_spec)}},
)
```

When the `tokenizer` value is an Amazon S3 URI, the service creates an input data channel for it. The service mounts the files into the benchmark container automatically. We recommend pointing at the prefix, but you can also point at a specific file. A file-level Amazon S3 URI such as `s3://DOC-EXAMPLE-BUCKET/tokenizer/tokenizer.json` is automatically corrected to its parent prefix, so that the tokenizer loads from the full set of files.

Alternative: attach the tokenizer as a local channel

Instead of passing an Amazon S3 URI, you can attach the tokenizer files yourself as a `DatasetConfig` input channel and set the `tokenizer` parameter to the local path where SageMaker AI mounts that channel. Define the `DatasetConfig` on the workload configuration.

The `ChannelName` determines the mount path. A channel named `tokenizer` mounts at `/opt/ml/input/data/tokenizer/` in the benchmark container.

```
import json

# The "tokenizer" channel mounts at /opt/ml/input/data/tokenizer/ in the container
workload_spec = {
    "benchmark": {"type": "aiperf"},
    "parameters": {
        "tokenizer": "/opt/ml/input/data/tokenizer/",
        "concurrency": 1,
        "request_count": 100,
        "streaming": True,
        "output_tokens_mean": 50,
    },
    "tooling": {"api_standard": "openai"},
}

response = client.create_ai_workload_config(
    AIWorkloadConfigName="custom-tokenizer-local-config",
    AIWorkloadConfigs={"WorkloadSpec": {"Inline": json.dumps(workload_spec)}},
    DatasetConfig={
        "InputDataConfig": [
```

```
            {
                "ChannelName": "tokenizer",
                "DataSource": {
                    "S3DataSource": {
                        "S3Uri": "s3://DOC-EXAMPLE-BUCKET/tokenizer/"
                    }
                },
                "ContentType": "application/octet-stream",
            }
        ]
    },
)
```

Set the `tokenizer` parameter to the channel's mount path. If you point at a specific file, such as `/opt/ml/input/data/tokenizer/tokenizer.json`, the service corrects it to the parent directory.

Run the benchmark

Create a benchmark job that references the workload configuration. The service resolves the tokenizer from Amazon S3 and mounts it into the benchmark container.

```
response = client.create_ai_benchmark_job(
    AIBenchmarkJobName="custom-tokenizer-benchmark",
    BenchmarkTarget={"Endpoint": {"Identifier": "my-sagemaker-endpoint"}},
    OutputConfig={"S3OutputLocation": "s3://DOC-EXAMPLE-BUCKET/results/"},
    AIWorkloadConfigIdentifier="custom-tokenizer-config",
    RoleArn="arn:aws:iam::111122223333:role/ExampleRole",
)
```

Considerations

- The IAM execution role that you pass in `RoleArn` must have read access to the Amazon S3 location that holds the tokenizer files.
- The `tokenizer` parameter accepts one of the following values:
  - An Amazon S3 URI.
  - A Hugging Face model ID, for example `meta-llama/Llama-3.2-1B`.
  - A local container path, when you attach the tokenizer files through your own `DatasetConfig` channel.

- The service resolves the tokenizer automatically when you don't set the `tokenizer` parameter. It uses the model artifacts on the target endpoint, or the endpoint container's `HF_MODEL_ID` environment variable.

Correlate benchmark prompts and responses

After a benchmark job completes, the output artifacts include per-request input and output data that you can join together for post-processing. This enables use cases such as quality evaluation, safety auditing, response comparison across configurations, and debugging unexpected model behavior.

Benchmark output artifacts

The `output.tar.gz` archive in your Amazon S3 output location contains the following files relevant to prompt-response correlation:

`inputs.json`

The full synthetic dataset of generated conversations. Each record has a `session_id` and the complete request payload (messages, max_tokens, model).

`outputs.json`

Per-request response metadata for requests that were sent to the endpoint. Each record includes the model's response text, per-request latency, output token count, and a `conversation_id` that maps back to the input.

Join inputs to outputs

Correlate prompts with their responses using the `conversation_id` field in `outputs.json` and the `session_id` field in `inputs.json`:

```
import json

# Load the artifacts extracted from output.tar.gz in your S3 output location
with open("inputs.json") as f:
    inputs = json.load(f)
with open("outputs.json") as f:
    outputs = json.load(f)
```

```
# Build lookup tables and join
inputs_by_id = {rec["session_id"]: rec for rec in inputs["data"]}
outputs_by_id = {rec["conversation_id"]: rec for rec in outputs["data"]}

matched_ids = set(inputs_by_id.keys()) & set(outputs_by_id.keys())
print(f"Matched: {len(matched_ids)} prompt-response pairs")

# Display a correlated sample
for sid in sorted(matched_ids)[:3]:
    in_rec = inputs_by_id[sid]
    out_rec = outputs_by_id[sid]
    prompt = in_rec["payloads"][0]["messages"][0]["content"][:100]
    response = out_rec.get("response_text", "")[:100]
    latency = out_rec["metrics"]["request_latency"]
    print(f"\n[{sid}] Latency: {latency:.0f}ms")
    print(f"  Prompt:   {prompt}...")
    print(f"  Response: {response}...")
```

Important notes

- **Join key.** Use `conversation_id` in `outputs.json` to match against `session_id` in `inputs.json`. Do not use `session_num` as a positional index — it represents execution order, which differs from input creation order when concurrency is greater than 1.
- **Not all inputs have outputs.** The `inputs.json` file contains the full generated dataset pool. When `request_count` is less than the pool size, only a subset of conversations are sent to the endpoint. The unmatched inputs are conversations that were generated but not used.
- **Output schema.** Each record in `outputs.json` includes `conversation_id`, `response_text`, `metrics` (with `request_latency` and `output_sequence_length`), and timing fields (`request_start_ns`, `request_end_ns`).

Manage benchmark resources

Use the following operations to manage your benchmark jobs and workload configurations.

```
# List benchmark jobs
response = client.list_ai_benchmark_jobs(MaxResults=10)
for job in response["AIBenchmarkJobs"]:
    print(f"{job['AIBenchmarkJobName']} - {job['AIBenchmarkJobStatus']}")
```

```
# Stop a running job
client.stop_ai_benchmark_job(
    AIBenchmarkJobName="my-benchmark-job"
)

# Delete a job (must be in a terminal state)
client.delete_ai_benchmark_job(
    AIBenchmarkJobName="my-benchmark-job"
)

# List workload configurations
response = client.list_ai_workload_configs(MaxResults=10)
for config in response["AIWorkloadConfigs"]:
    print(f"{config['AIWorkloadConfigName']} - {config['AIWorkloadConfigArn']}")

# Delete a workload configuration
client.delete_ai_workload_config(
    AIWorkloadConfigName="my-benchmark-config"
)
```

Find the maximum concurrency an endpoint can serve under an SLA

When you benchmark a generative artificial intelligence (generative AI) endpoint, you often want to find its maximum *concurrency*. Concurrency is the number of simultaneous requests the endpoint handles while still meeting a performance target, such as a latency ceiling. You can explore concurrency in two ways in a single benchmark job:

- **Concurrency list** – Benchmark a fixed set of concurrency levels (for example, 1, 10, and 100) in one job. Use this when you already know the levels you want to compare.
- **Find-max-concurrency search** – Use this option to find the largest concurrency that still satisfies one or more service-level agreement (SLA) thresholds, without manually specifying the levels to test.

SLA parameters

Specify one or more SLA thresholds in the workload configuration parameters. The winning concurrency must satisfy *all* of the thresholds that you set.

Parameter	Meaning	Requires streaming
`ttft_sla_ms`	Maximum time to first token, in milliseconds	Yes
`tpot_sla_ms`	Maximum time per output token (inter-token latency), in milliseconds	Yes
`e2e_sla_ms`	Maximum end-to-end request latency, in milliseconds	No
`error_rate_sla`	Maximum fraction of failed requests (for example, `0.01` for 1 percent)	No

Note

Set `search_stat` to choose the statistic that the latency SLA is evaluated on: `avg` (default), `p50`, `p90`, `p95`, or `p99`. Bound the search with the optional `concurrency_min` and `concurrency_max` parameters, and cap cost with `search_max_iterations`.

Benchmark a list of concurrency levels

Pass a list to the `concurrency` parameter of the workload configuration. The benchmark runs each level and writes per-level results under `concurrency_`*N*`/` directories in the output.

Python (Boto3)

```
client.create_ai_workload_config(
    AIWorkloadConfigName="concurrency-list-config",
    AIWorkloadConfigs={"WorkloadSpec": {"Inline": json.dumps({
        "benchmark": {"type": "aiperf"},
        "parameters": {
            "tokenizer": "TinyLlama/TinyLlama-1.1B-Chat-v1.0",
            "streaming": True,
            "prompt_input_tokens_mean": 128,
            "output_tokens_mean": 256,
```

```
            "concurrency": [1, 10, 100],   # list -> sweep each level in one job
            "request_count": 100,
        },
    })}},
)
```

Search for the maximum concurrency under an SLA

Set `search_recipe` to `max-concurrency-under-sla` and provide at least one SLA threshold. Do *not* also set a fixed `concurrency` value; the search selects it.

Python (Boto3)

```
client.create_ai_workload_config(
    AIWorkloadConfigName="find-max-config",
    AIWorkloadConfigs={"WorkloadSpec": {"Inline": json.dumps({
        "benchmark": {"type": "aiperf"},
        "parameters": {
            "tokenizer": "TinyLlama/TinyLlama-1.1B-Chat-v1.0",
            "streaming": True,
            "prompt_input_tokens_mean": 128,
            "output_tokens_mean": 256,
            "search_recipe": "max-concurrency-under-sla",
            "e2e_sla_ms": 5000,        # end-to-end latency ceiling (ms)
            "ttft_sla_ms": 1000,       # time-to-first-token ceiling (ms)
            "search_stat": "p99",      # evaluate the SLA on p99
            "concurrency_min": 1,
            "concurrency_max": 256,
            "search_max_iterations": 15,
        },
    })}},
)
```

Create a benchmark job that references the workload configuration and targets your endpoint, and then poll it to a terminal state. For the full `create_ai_benchmark_job` and `describe_ai_benchmark_job` sequence, see the section called “Benchmark endpoints”.

> **Important**
>
> The `error_rate_sla` threshold requires a benchmarking tooling version that reports the request error-rate metric on runs that have no errors. On tooling versions that do not report this metric, the service treats every candidate concurrency as failing the SLA and

finds no feasible level. Until your account's tooling is updated, gate the search on latency SLAs (`ttft_sla_ms`, `tpot_sla_ms`, or `e2e_sla_ms`). Then review the winning level's error rate in the results.

Read the search result

A find-max-concurrency search writes a `search_history.json` file at the root of the job's output. The winning concurrency is at `boundary_summary.feasible_max.value`, which is the largest level that satisfied every SLA. If no level met the SLA, `feasible_max` is `null` and `boundary_summary.infeasible_min` records the smallest level that breached it.

Python (Boto3)

```
import io, json, tarfile

resp = client.describe_ai_benchmark_job(AIBenchmarkJobName="find-max-job")
location = resp["OutputConfig"]["S3OutputLocation"]     # s3://bucket/prefix/
bucket, _, prefix = location.replace("s3://", "").partition("/")

obj = s3.list_objects_v2(Bucket=bucket, Prefix=prefix)["Contents"]
tar_key = next(o["Key"] for o in obj if o["Key"].endswith("output.tar.gz"))
body = s3.get_object(Bucket=bucket, Key=tar_key)["Body"].read()

with tarfile.open(fileobj=io.BytesIO(body), mode="r:gz") as tar:
    member = next(m for m in tar.getnames() if m.endswith("search_history.json"))
    history = json.loads(tar.extractfile(member).read())

boundary = history["boundary_summary"]
feasible_max = boundary.get("feasible_max")
if feasible_max and feasible_max.get("value") is not None:
    print("Max concurrency under SLA:", feasible_max["value"])
else:
    print("No level met the SLA. Smallest breaching level:",
          boundary.get("infeasible_min", {}).get("value"))
```

Track inference recommendation and benchmark results with MLflow

You can track the results of your recommendation and benchmark jobs with fully managed MLflow on Amazon SageMaker AI. When you provide an MLflow configuration, SageMaker AI logs the performance metrics and artifacts that the job produces to an MLflow App. You can then use the

MLflow UI to view individual runs, compare configurations across jobs, and share results with your team. For more information about MLflow on SageMaker AI, see Accelerate generative AI development using managed MLflow on Amazon SageMaker AI.

MLflow tracking is optional. To enable it, provide an MLflow configuration that references an MLflow App when you create the job.

Prerequisites

Before you track results with MLflow, you need the following in addition to the Prerequisites for a recommendation or benchmark job:

- An MLflow App in an operational state, in the same Amazon Web Services Region as your job. For information about creating an MLflow App, see MLflow App Setup.
- An IAM execution role (the `RoleArn` that you pass to the job) with permission to describe the MLflow App and call the MLflow REST APIs. Add the `sagemaker:DescribeMlflowApp` action and the `sagemaker-mlflow` actions that the job uses to log runs. For more information about MLflow permissions, see MLflow App Setup.

MLflow configuration parameters

To track results, add an `MlflowConfig` object to the `OutputConfig` of your `CreateAIRecommendationJob` or `CreateAIBenchmarkJob` request. `MlflowConfig` contains the following fields:

`MlflowResourceArn`

Required. The Amazon Resource Name (ARN) of the MLflow App to log results to, in the format `arn:aws:sagemaker:`*`region`*`:`*`account-id`*`:mlflow-app/`*`app-id`*.

`MlflowExperimentName`

Optional. The name of the MLflow experiment to log the run under. If the experiment does not exist, SageMaker AI creates it; if it already exists, SageMaker AI reuses it, so you can group runs from multiple jobs under one experiment by passing the same name.

`MlflowRunName`

Optional. The name of the top-level MLflow run that the job's results are nested under. To group the results of multiple jobs under one top-level run, pass the same `MlflowRunName` to each job.

Each job creates a top-level MLflow run, with nested child runs that break the results down by dimensions such as the benchmark target or instance type, the deployment configuration, and the concurrency level. This structure lets you drill into individual measurements and compare configurations in the MLflow UI.

The `MlflowConfig` that you supply on the create request is echoed back in the `OutputConfig` of the corresponding `Describe` response.

Track a recommendation job

Add the `MlflowConfig` object to `OutputConfig` when you create a recommendation job.

Python (boto3)

```
response = client.create_ai_recommendation_job(
    AIRecommendationJobName="my-recommendation-job",
    ModelSource={
        "S3": {
            "S3Uri": "s3://DOC-EXAMPLE-BUCKET/models/my-model/",
        }
    },
    OutputConfig={
        "S3OutputLocation": "s3://DOC-EXAMPLE-BUCKET/recommendations/",
        "MlflowConfig": {
            "MlflowResourceArn": "arn:aws:sagemaker:us-west-2:111122223333:mlflow-app/
app-EXAMPLE",
            "MlflowExperimentName": "my-recommendation-experiment",
            "MlflowRunName": "my-recommendation-job-run",
        },
    },
    PerformanceTarget={
        "Constraints": [
            {"Metric": "ttft-ms"}
        ]
    },
    AIWorkloadConfigIdentifier="my-recommendation-workload",
    RoleArn="arn:aws:iam::111122223333:role/ExampleRole",
)
print(response["AIRecommendationJobArn"])
```

Amazon CLI

```
aws sagemaker create-ai-recommendation-job \
  --ai-recommendation-job-name "my-recommendation-job" \
  --model-source '{"S3": {"S3Uri": "s3://DOC-EXAMPLE-BUCKET/models/my-model/"}}' \
  --output-config '{
    "S3OutputLocation": "s3://DOC-EXAMPLE-BUCKET/recommendations/",
    "MlflowConfig": {
      "MlflowResourceArn": "arn:aws:sagemaker:us-west-2:111122223333:mlflow-app/app-
EXAMPLE",
      "MlflowExperimentName": "my-recommendation-experiment",
      "MlflowRunName": "my-recommendation-job-run"
    }
  }' \
  --performance-target '{"Constraints": [{"Metric": "ttft-ms"}]}' \
  --ai-workload-config-identifier "my-recommendation-workload" \
  --role-arn "arn:aws:iam::111122223333:role/ExampleRole" \
  --region us-west-2
```

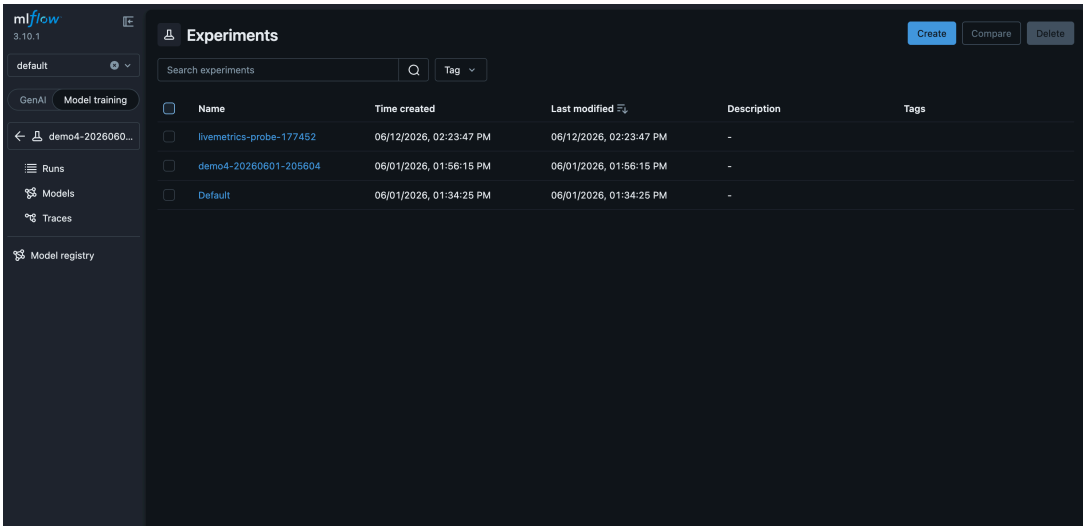
Track a benchmark job

Add the `MlflowConfig` object to `OutputConfig` when you create a benchmark job.

Python (boto3)

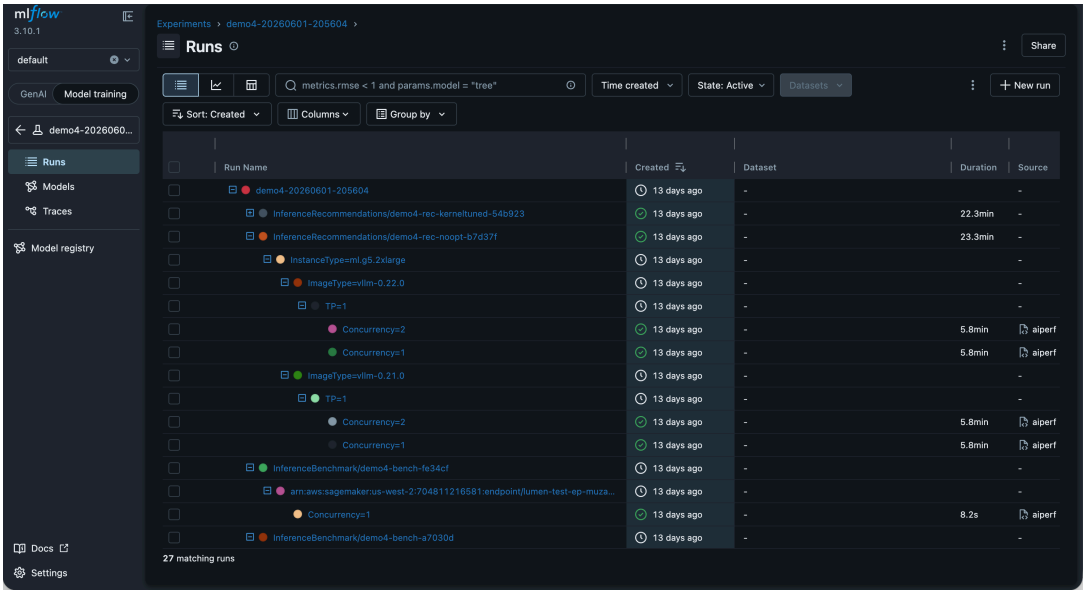
```
response = client.create_ai_benchmark_job(
    AIBenchmarkJobName="my-benchmark-job",
    BenchmarkTarget={
        "Endpoint": {
            "Identifier": "my-sagemaker-endpoint"
        }
    },
    OutputConfig={
        "S3OutputLocation": "s3://DOC-EXAMPLE-BUCKET/benchmark-results/",
        "MlflowConfig": {
            "MlflowResourceArn": "arn:aws:sagemaker:us-west-2:111122223333:mlflow-app/
app-EXAMPLE",
            "MlflowExperimentName": "my-benchmark-experiment",
            "MlflowRunName": "my-benchmark-job-run",
        },
    },
    AIWorkloadConfigIdentifier="my-benchmark-config",
```

```
    RoleArn="arn:aws:iam::111122223333:role/ExampleRole",
)
print(response["AIBenchmarkJobArn"])
```



Amazon CLI

```
aws sagemaker create-ai-benchmark-job \
  --ai-benchmark-job-name "my-benchmark-job" \
  --benchmark-target '{"Endpoint": {"Identifier": "my-sagemaker-endpoint"}}' \
  --output-config '{
    "S3OutputLocation": "s3://DOC-EXAMPLE-BUCKET/benchmark-results/",
    "MlflowConfig": {
      "MlflowResourceArn": "arn:aws:sagemaker:us-west-2:111122223333:mlflow-app/app-
EXAMPLE",
      "MlflowExperimentName": "my-benchmark-experiment",
      "MlflowRunName": "my-benchmark-job-run"
    }
  }' \
  --ai-workload-config-identifier "my-benchmark-config" \
  --role-arn "arn:aws:iam::111122223333:role/ExampleRole" \
  --region us-west-2
```



View results in MLflow

After the job reaches the `Completed` status, open the MLflow UI from the MLflow App to inspect the logged runs. For more information about launching the MLflow UI, see Launch the MLflow UI using a presigned URL.

On the **Experiments** page, select the experiment that you specified in `MlflowExperimentName`.

The experiment's **Runs** view shows a top-level run that contains a per-job run, which expands into child runs for each instance type, deployment configuration, and concurrency level. Select a run to view its parameters, metrics, and artifacts.

Deploy a generative AI inference recommendation

When a recommendation job completes, each recommendation includes a deployment-ready configuration. You can deploy the chosen configuration to a SageMaker AI inference endpoint with a single action from SageMaker AI Studio, or programmatically through the API.

Understanding deployment configurations

Each recommendation in the job response contains a `DeploymentConfiguration` object with the following information:

`ImageUri`

The container image URI optimized for the recommended instance type.

`InstanceType`

The recommended instance type for deployment.

`InstanceCount`

The number of instances needed to meet the performance target.

`CopyCountPerInstance`

The number of model copies to run per instance. When set to a value greater than one, multiple copies of the model are loaded on each instance to increase throughput.

`EnvironmentVariables`

Environment variables configured for optimal performance, such as tensor parallel size and maximum sequence length.

`S3`

S3 channel references for model artifacts, including any optimized model outputs.

Deploy using the API

To deploy a recommendation programmatically, use the model package from the recommendation to create a SageMaker AI model and endpoint. Each recommendation includes a `ModelDetails` object with the model package ARN and inference specification name. This is the simplest deployment path because the model package already contains the container image, environment variables, and model artifact channels.

```
import boto3

client = boto3.client("sagemaker", region_name="us-west-2")

# Get the recommendation from a completed job
response = client.describe_ai_recommendation_job(
    AIRecommendationJobName="my-recommendation-job"
)

# Select a recommendation (e.g., the first one)
```

```
recommendation = response["Recommendations"][0]
model_details = recommendation["ModelDetails"]
deploy_config = recommendation["DeploymentConfiguration"]

# Create a model from the model package.
# The model package already contains the container image, environment
# variables, and S3 data channels (base model + optimization artifacts).
model_name = "my-recommended-model"
container_def = {
    "ModelPackageName": model_details["ModelPackageArn"],
}
# If the recommendation uses a named inference specification (e.g., for
# a specific optimization variant), specify it so SageMaker selects the
# correct container and instance configuration from the model package.
if model_details.get("InferenceSpecificationName"):
    container_def["InferenceSpecificationName"] =
 model_details["InferenceSpecificationName"]

client.create_model(
    ModelName=model_name,
    PrimaryContainer=container_def,
    ExecutionRoleArn="arn:aws:iam::111122223333:role/ExampleRole",
)

# Create an endpoint configuration
endpoint_config_name = "my-recommended-endpoint-config"
production_variant = {
    "VariantName": "AllTraffic",
    "ModelName": model_name,
    "InstanceType": deploy_config["InstanceType"],
    "InitialInstanceCount": deploy_config.get("InstanceCount", 1),
}
copy_count = deploy_config.get("CopyCountPerInstance")
if copy_count and copy_count > 1:
    production_variant["InferenceAmiVersion"] = "al2-ami-sagemaker-inference-gpu-2"
    production_variant["RoutingConfig"] = {"RoutingStrategy":
 "LEAST_OUTSTANDING_REQUESTS"}

client.create_endpoint_config(
    EndpointConfigName=endpoint_config_name,
    ProductionVariants=[production_variant],
)

# Create the endpoint
```

```
endpoint_name = "my-recommended-endpoint"
client.create_endpoint(
    EndpointName=endpoint_name,
    EndpointConfigName=endpoint_config_name,
)
print(f"Endpoint {endpoint_name} is being created.")
```

After the endpoint is created, you can monitor its status using the `DescribeEndpoint` API until it reaches `InService` status.

```
import time

while True:
    response = client.describe_endpoint(EndpointName=endpoint_name)
    status = response["EndpointStatus"]
    print(f"Endpoint status: {status}")
    if status in ("InService", "Failed"):
        break
    time.sleep(60)
```

Deploy from SageMaker AI Studio

You can also deploy a recommended configuration directly from SageMaker AI Studio with a single action. In SageMaker AI Studio, navigate to the completed recommendation job, review the recommendations and their performance metrics, and choose the configuration you want to deploy.

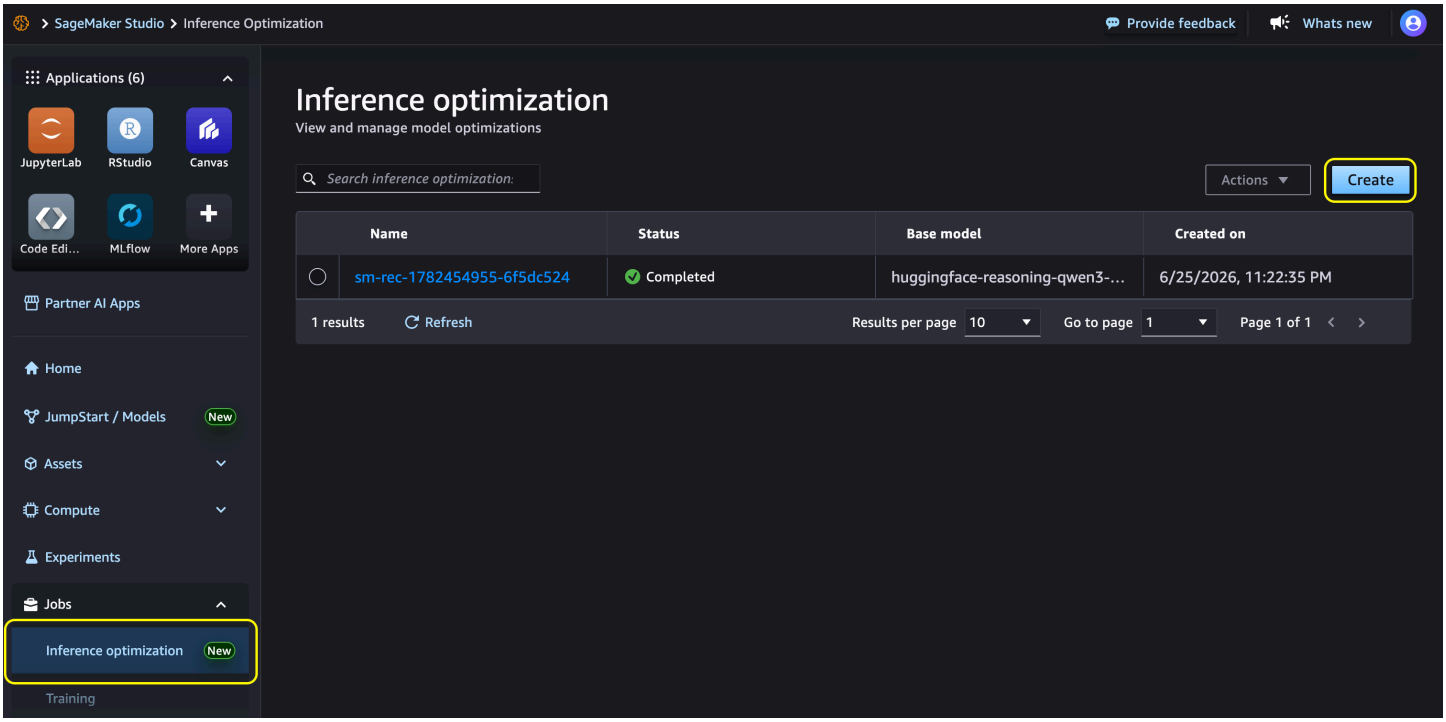
Get inference recommendations by using Amazon SageMaker Studio

With Amazon SageMaker Studio, you get a guided, end-to-end console experience for generative AI inference recommendations. Instead of writing code to call the API, you configure an optimization job through a visual workflow: choose a preset use case profile, set an optimization goal, select your model and compute, and then review and deploy ranked, deployment-ready configurations. This experience uses the same benchmarking infrastructure as the API. When you use the API, the same workflow is called an AI recommendation job. For more information about the API workflow, see Get generative AI inference deployment recommendations.

The inference recommendations experience is available in Studio under **Jobs**, **Inference optimization**.

Prerequisites

You don't need prior experience with Amazon SageMaker Studio or generative AI model deployment to complete this task. Before you create an inference optimization job in Studio, you need the following:



- An Amazon account with a Amazon SageMaker Studio domain.
- IAM permissions for SageMaker AI inference optimization operations.
- An IAM execution role that grants SageMaker AI access to your model artifacts in Amazon S3. For more information, see How to use SageMaker AI execution roles.

> **Pricing**
>
> Generating recommendations incurs no additional cost. Standard compute costs apply for the optimization jobs and the endpoints that SageMaker AI provisions during benchmarking. SageMaker AI automatically deletes these endpoints when the job completes. For pricing information, see Amazon SageMaker pricing.

Step 1: Create an optimization job

1. Open the Amazon SageMaker Studio application.
2. In the left navigation pane, under **Jobs**, choose **Inference optimization**.

   The **Inference optimization** page lists your existing jobs, sorted newest first, with their **Name**, **Status**, **Base model**, and **Created on** date.
3. Choose **Create**. Studio opens the job configuration page, which contains the **Strategy**, **Model**, and **Compute** sections that you complete in the following steps.

Step 2: Configure your strategy

In the **Strategy** section, you select a preset use case profile and an optimization goal. The profile determines the traffic pattern that SageMaker AI benchmarks against, so you don't have to specify token distributions and concurrency manually.

1. For **Use-case**, choose the profile that best describes your primary workload's traffic:

   Generate

   Optimized for short inputs and long outputs, such as code generation.

   Interact

   Optimized for fast, multi-turn exchanges with balanced input and output, such as multi-turn chat.

   Summarize

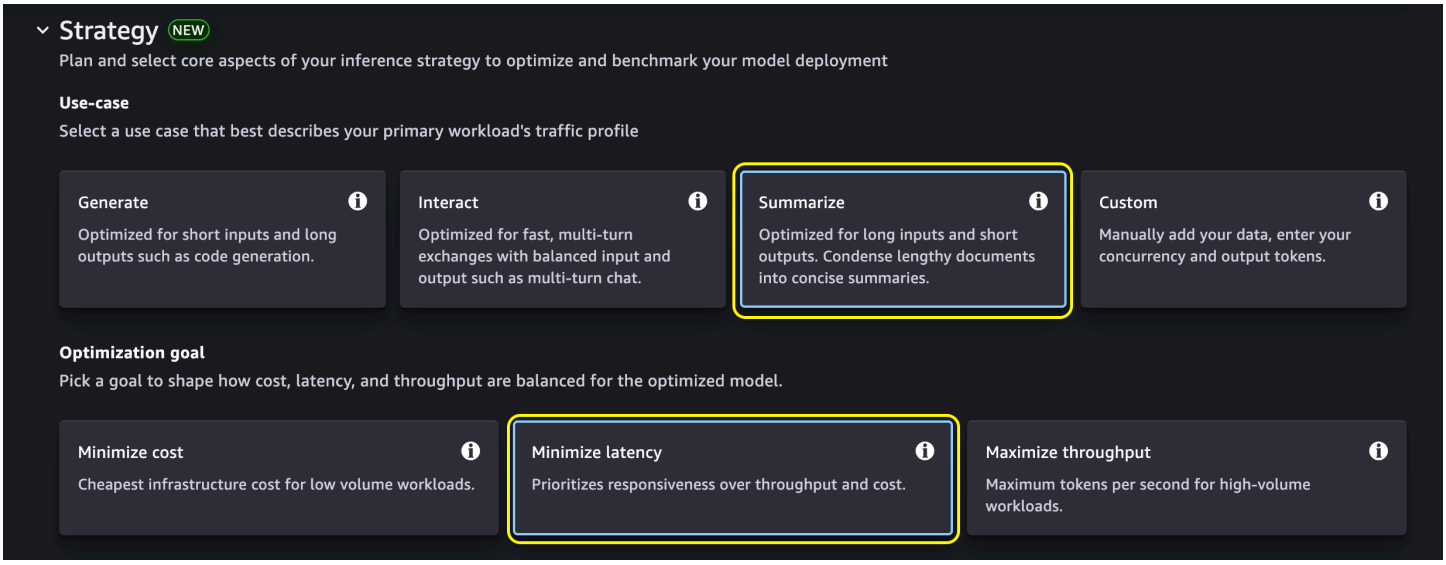
   Optimized for long inputs and short outputs. Condenses lengthy documents into concise summaries.

Custom

Bring your own dataset and parameters. Manually add your data and enter your concurrency and output token length.

2. For **Optimization goal**, choose how SageMaker AI balances cost, latency, and throughput for the optimized model:

Minimize cost



Finds the cheapest infrastructure cost for low-volume workloads.

Minimize latency

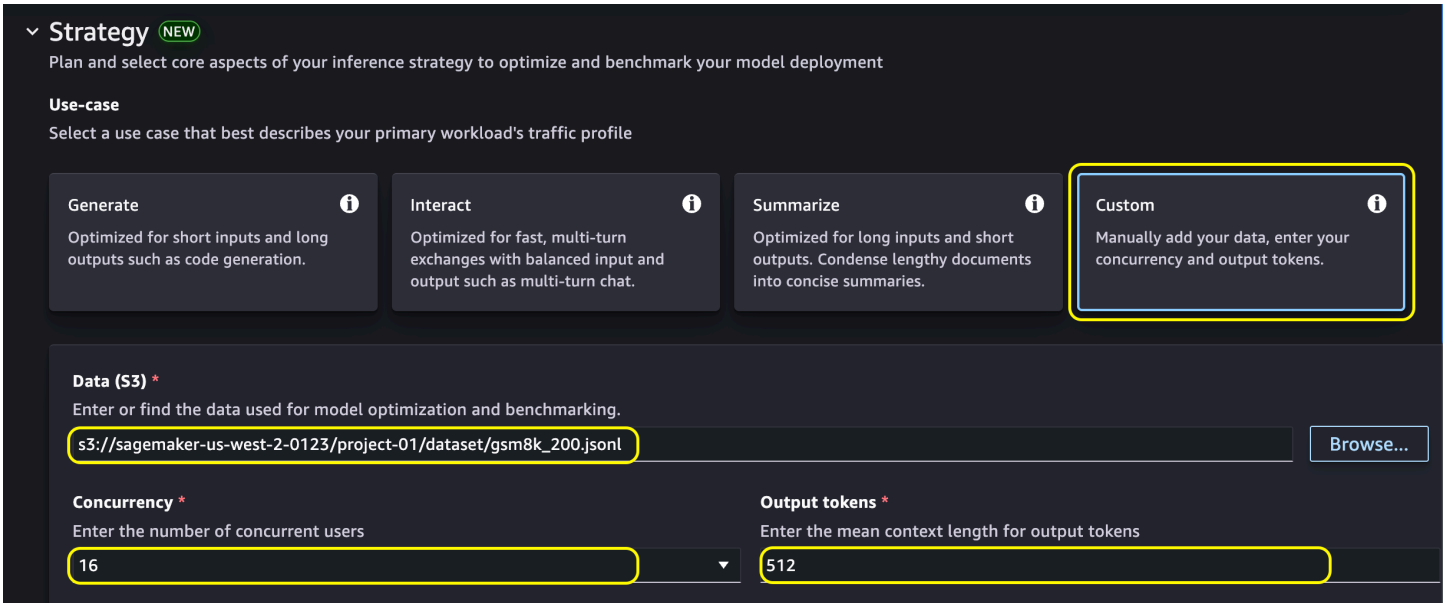
Prioritizes responsiveness over throughput and cost.

Maximize throughput

Serves the maximum number of tokens per second for high-volume workloads.

If you choose **Custom**, additional fields appear so that you can benchmark against your own representative data:

Data (S3)



Enter or browse to the Amazon S3 URI of your evaluation dataset, in JSON Lines (JSONL) format. SageMaker AI uses this data for model optimization and benchmarking.

Concurrency

Enter the number of concurrent users (simultaneous requests) to simulate.

Output tokens

Enter the mean number of output tokens per request.

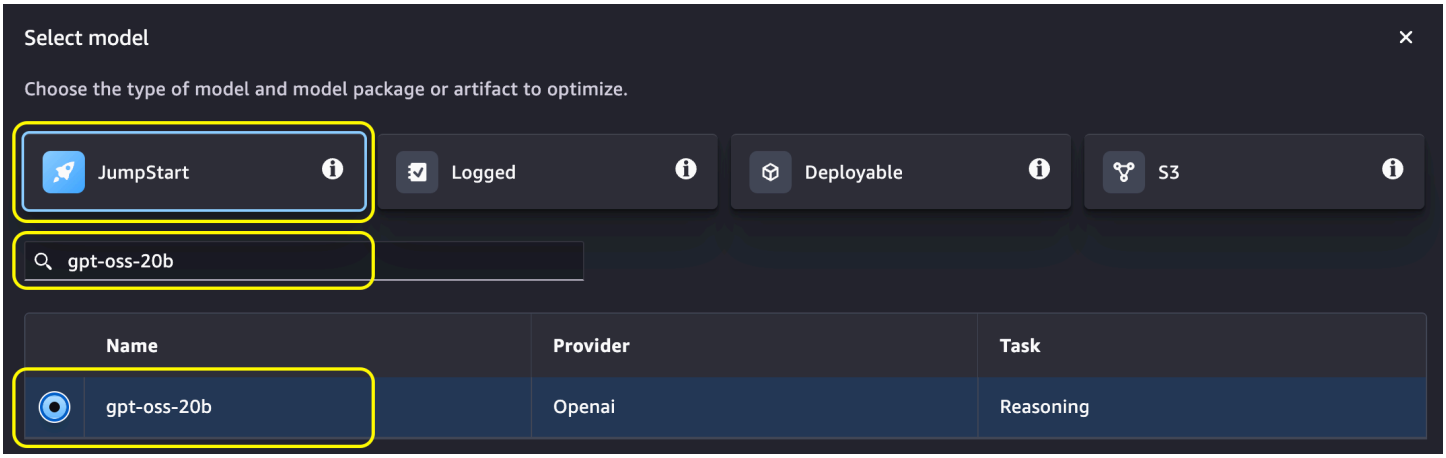
Step 3: Select your model

In the **Model** section, choose **Select**. The **Select model** dialog box opens with a tab for each supported model source. Choose the tab for your model source, provide the requested information, and then choose **Select**.

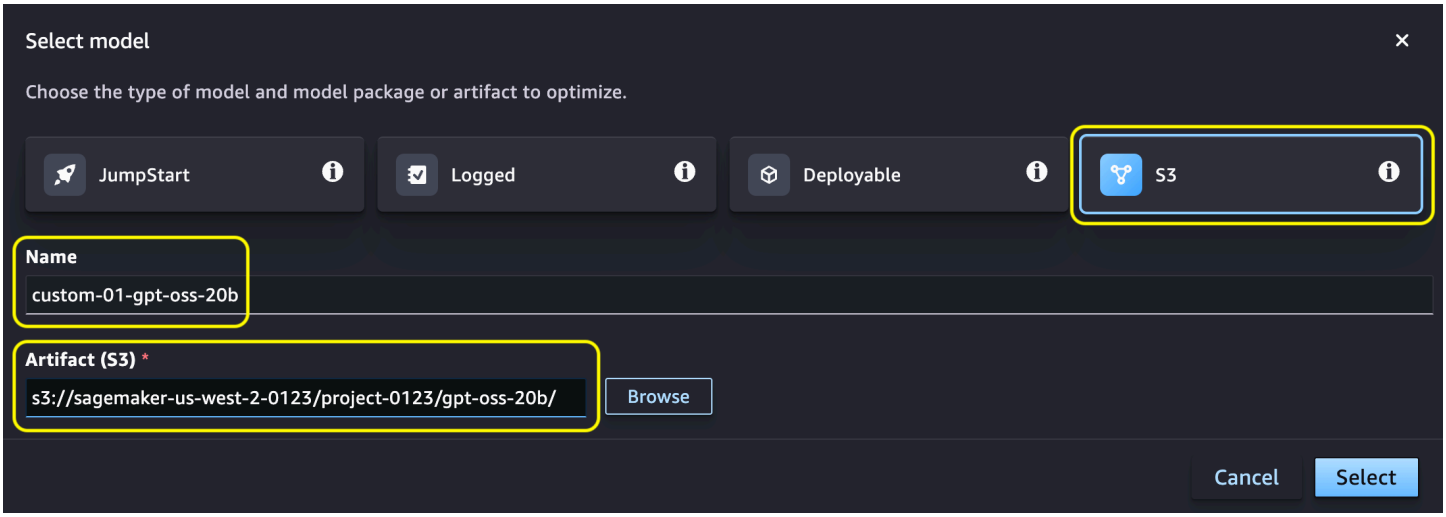
JumpStart

Browse the JumpStart catalog and choose a foundation model (for example, `gpt-oss-20b` or `meta-textgeneration-llama-3-1-8b-instruct`). Use the search box to filter by name; the table shows the model **Name**, **Provider**, and **Task**. If the model requires it, accept the end-user license agreement (EULA) when prompted.

Logged



Search for a registered model package group from your SageMaker AI Model Registry. Models that you customized with a model customization job also appear here. The artifact URI resolves automatically.



Deployable

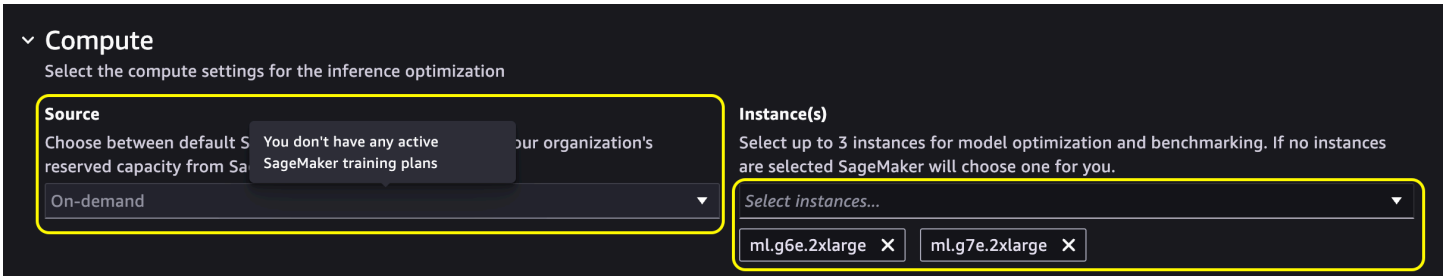
Search for an existing SageMaker AI model by name (for example, a model from a previous deployment or training job). The artifact URI resolves from the model metadata.

S3

Bring your own model artifact. For **Name**, enter a name for the model. For **Artifact (S3)**, enter or browse to the Amazon S3 URI of your model artifact (for example, `s3://amzn-s3-demo-bucket/model.tar.gz`).

Step 4: Select compute (optional)

If you chose **Minimize latency** or **Maximize throughput** as your optimization goal, you can optionally expand the **Compute** section to control which instances SageMaker AI evaluates.



Source

Choose between default on-demand compute and reserved capacity. If you have reserved capacity from a SageMaker AI flexible training plan, it appears in this dropdown list.

Instance(s)

Select up to three instance types for SageMaker AI to evaluate and benchmark (for example, `ml.g6e.2xlarge` and `ml.g7e.2xlarge`). If you don't select any instances, SageMaker AI chooses compatible instances based on your model's requirements.

> **Instance selection**
>
> For the **Minimize cost** goal, SageMaker AI selects a recommended instance for you, so you can't select instances.

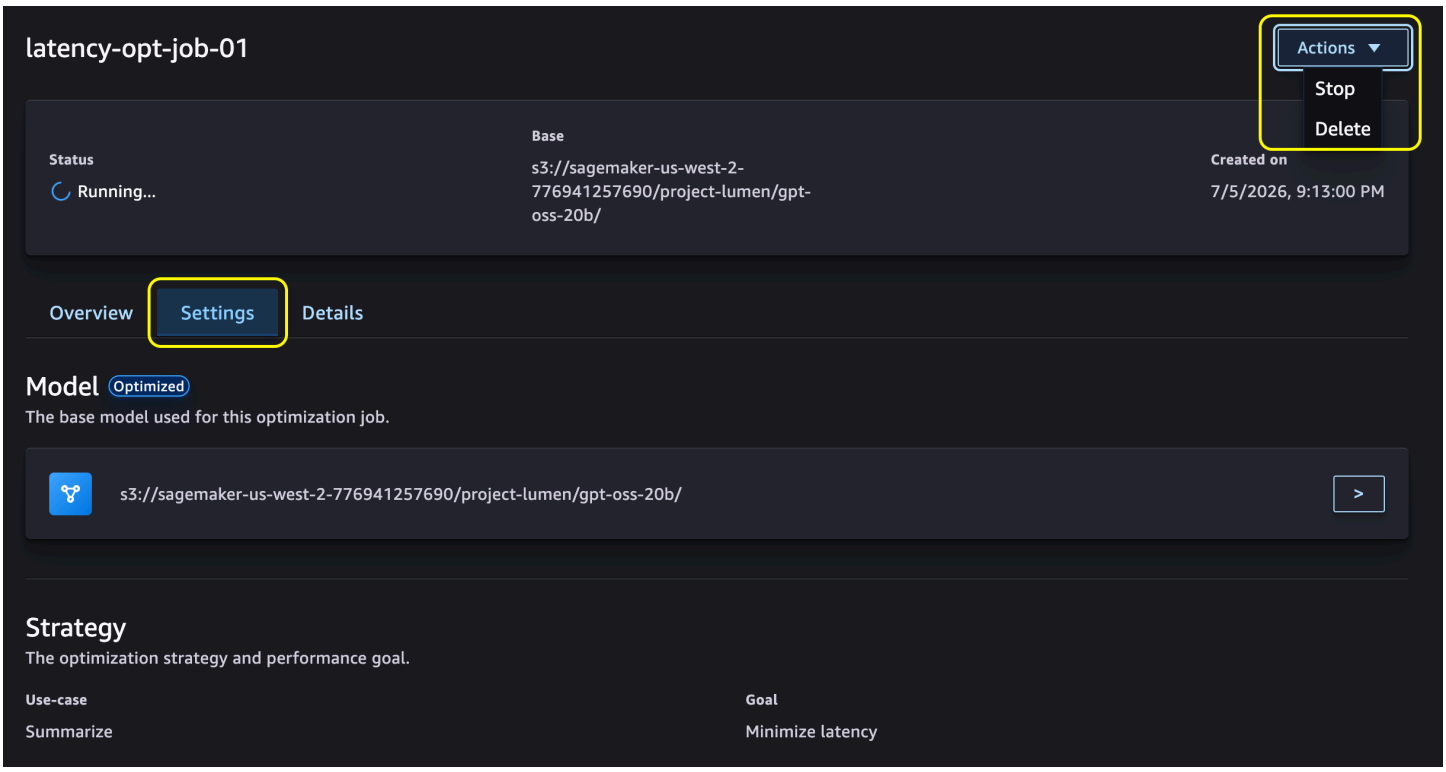
Step 5: Launch the job

When you complete the job configuration, choose **Optimize** to submit it. SageMaker AI opens the job's detail page, where the **Status** transitions from **Running** to **Completed**. For preset use cases such as **Interact**, SageMaker AI matches your workload against pre-validated configurations, which can return recommendations faster than a custom benchmark. For custom benchmarks, jobs typically take one to three hours.

Use the tabs on the detail page to inspect the job:

Overview

The ranked recommendations with their performance metrics. This tab populates when the job completes.



Settings

The configuration you submitted, including the base model, use case, goal, and compute.

Details

Job metadata, timestamps, and output artifacts.

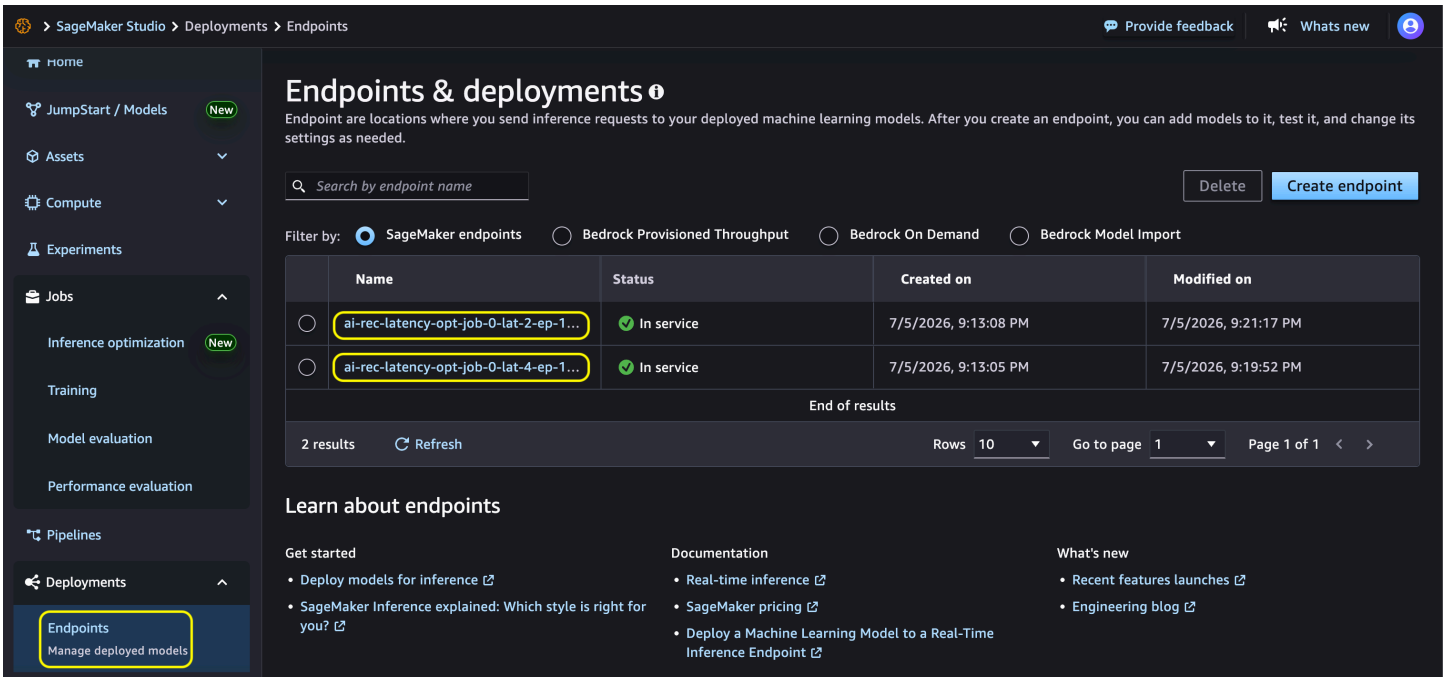
To stop a running job, choose **Actions**, and then choose **Stop**.

Step 6: Monitor and troubleshoot

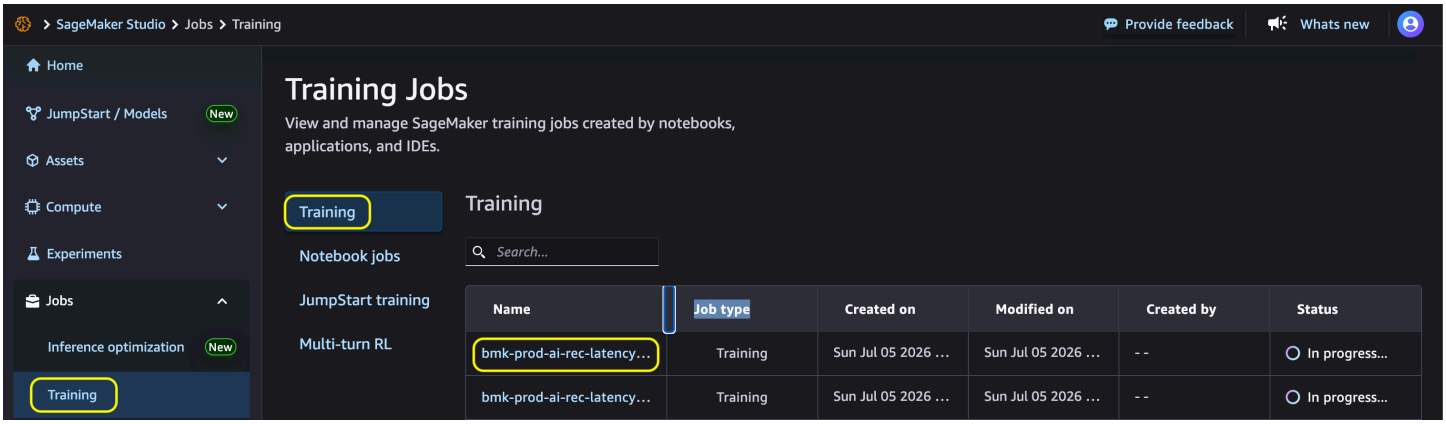
After you submit the job, the **Status** shows **Running** for a period that depends on the number of instance types you selected, whether you provided a custom dataset, and the optimization goal. The job can take anywhere from a few minutes to several hours. Depending on the optimization goal, the job runs different steps that you can monitor from other Studio pages:

Minimize cost

SageMaker AI creates an endpoint using the recommended instance type and runs benchmark jobs. To check the endpoint, in **Deployments**, choose **Endpoints** and look for the **InService** status. To review the benchmark runs, in **Jobs**, choose **Training** and find your job under **Training Jobs**.



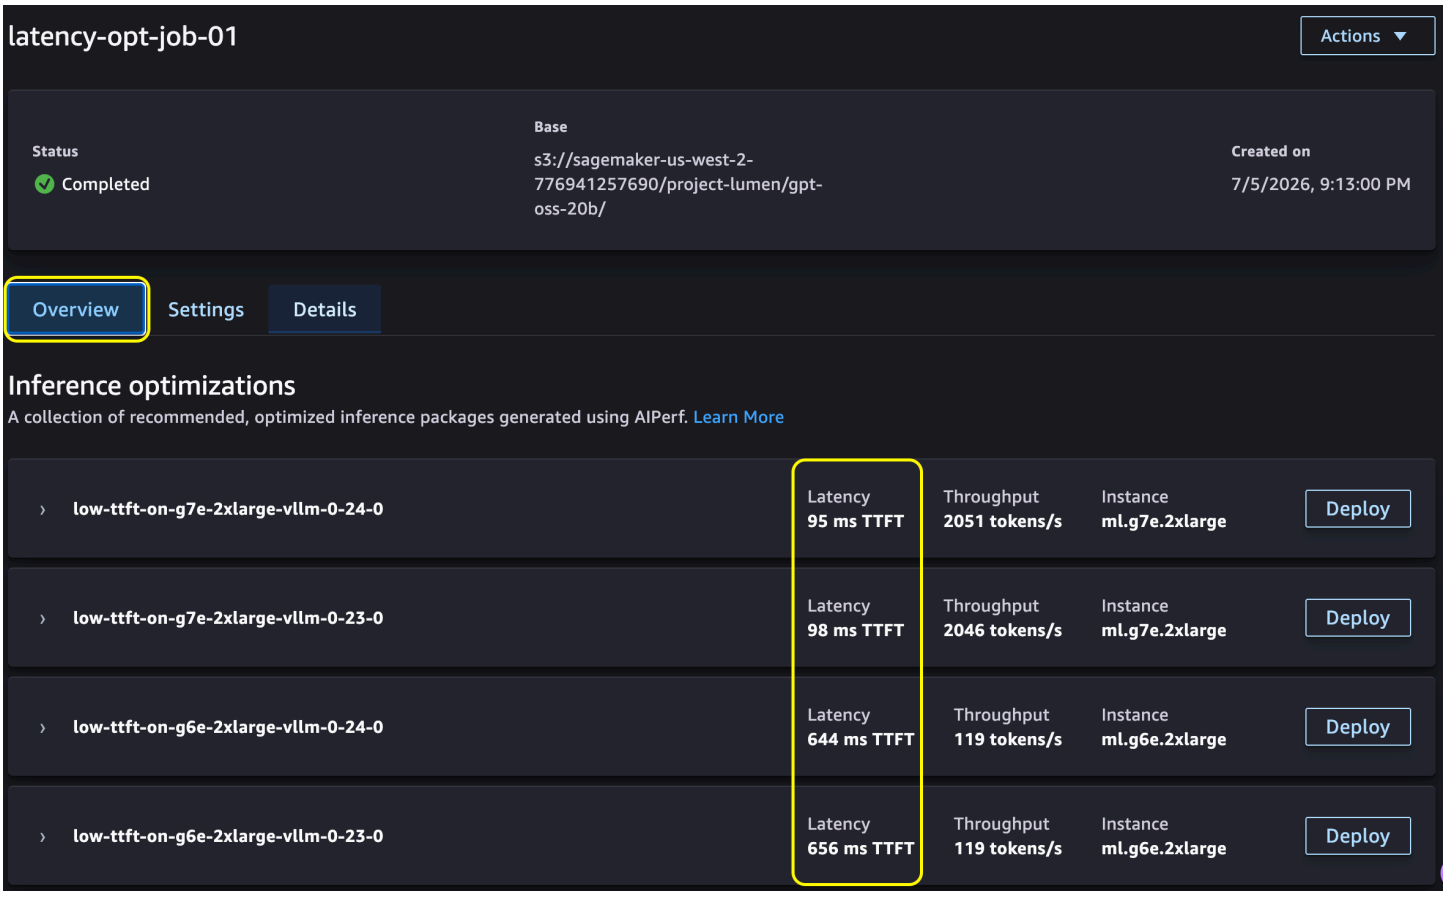
Minimize latency



SageMaker AI creates one or more endpoints, one per instance type. If the model architecture and instance type support a kernel-tuned deployment, SageMaker AI uses that deployment type. Otherwise, SageMaker AI uses a standard deployment. SageMaker AI then runs a benchmark training job for each combination. Monitor both the **Endpoints** and **Training** pages to view the logs.

Maximize throughput

If the model architecture and instance type support speculative decoding, a training job runs first to train the draft model, and then SageMaker AI deploys the endpoints. Monitor both the **Endpoints** and **Training** pages to view the logs. For more information, see Speculative decoding.



> **Endpoint cleanup**
>
> SageMaker AI automatically deletes the endpoints that the optimization job creates after the job completes.

Step 7: Review recommendations and deploy

When the job completes, the **Overview** tab displays the ranked inference packages that SageMaker AI generated from benchmarks performed by NVIDIA AIPerf on the GitHub website. Each package shows its optimized configuration, its performance metrics (such as Time to First Token (TTFT), inter-token latency (ITL), throughput, and cost), the recommended instance type, and a **Deploy** button.

1. Review the ranked packages and their metrics, and choose **Deploy** on your preferred package.

2. In the deployment dialog box, SageMaker AI pre-fills the endpoint name and instance type. Choose to deploy to a new endpoint or to update an existing endpoint.

   When you confirm, SageMaker AI runs the following operations for you:

   - `CreateModel` — Registers the optimized model.
   - `CreateEndpointConfig` — Sets up the endpoint configuration.
   - `CreateEndpoint` — Provisions the endpoint.
3. Wait for the endpoint to reach the **InService** status. You can then invoke it to serve inference requests.

Manage optimization jobs

The **Jobs**, **Inference optimization** page provides centralized management of your jobs:

- **Search and filter.** Use the search bar to filter jobs by name.
- **Stop a running job.** Select a job, choose **Actions**, choose **Stop**, and then confirm.
- **Delete a job.** Select a completed or failed job, choose **Actions**, choose **Delete**, and then confirm.
- **Inspect details.** Choose any job to open its detail page with the **Overview**, **Settings**, and **Details** tabs.

Consider re-running an optimization job after you fine-tune or update your model, when new instance types become available in your Amazon Region, when your traffic patterns change significantly, or after a serving container or framework upgrade. You can also re-run jobs on a regular cadence, such as every two weeks, to pick up the latest optimizations as SageMaker AI adds them.

Security in Amazon SageMaker AI inference optimization

Cloud security at Amazon is the highest priority. As an Amazon customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between Amazon and you. The shared responsibility model describes this as security *of* the cloud and security *in* the cloud:

- **Security of the cloud** – Amazon is responsible for protecting the infrastructure that runs Amazon services in the Amazon Cloud. Amazon also provides you with services that you can use

securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the Amazon compliance programs. To learn about the compliance programs that apply to Amazon SageMaker AI, see Amazon Services in Scope by Compliance Program.

- **Security in the cloud** – Your responsibility is determined by the Amazon service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using SageMaker AI inference optimization features, including AI benchmarking jobs, AI recommendation jobs, and AI workload configurations.

Data protection

The Amazon shared responsibility model applies to data protection in Amazon SageMaker AI inference optimization. As described in this model, Amazon is responsible for protecting the global infrastructure that runs all of the Amazon Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure.

For data protection purposes, we recommend that you protect Amazon account credentials and set up individual users with Amazon IAM Identity Center or Amazon Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with Amazon resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with Amazon CloudTrail.
- Use Amazon encryption solutions, along with all default security controls within Amazon services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field.

What data SageMaker AI inference optimization stores

SageMaker AI inference optimization stores the following types of data:

- **Job metadata** – When you create AI benchmark jobs or AI recommendation jobs, the service stores job configuration metadata such as job names, status, creation timestamps, and resource configuration parameters.
- **Workload configurations** – When you create AI workload configurations, the service stores the configuration parameters you provide, including benchmark parameters, dataset configuration, and tags.
- **Benchmark results and recommendations** – Job outputs such as performance metrics, cost estimates, and deployment recommendations are stored as job metadata within the service.

SageMaker AI inference optimization does not store your model weights, training data, or inference results. Your model artifacts and benchmark output files remain in your Amazon S3 buckets within your Amazon account.

Encryption at rest

SageMaker AI inference optimization encrypts all stored data at rest by default. Job metadata and workload configurations are stored in Amazon DynamoDB, with encryption at rest. You do not need to take any action to enable encryption at rest.

Encryption in transit

SageMaker AI inference optimization uses TLS to encrypt all data in transit. API requests to the service are made over HTTPS using TLS 1.2 or later.

All communication between SageMaker AI inference optimization and other Amazon services (such as Amazon DynamoDB, Amazon Lambda, Amazon S3, and Amazon Secrets Manager) uses TLS-encrypted connections.

Internetwork traffic privacy

SageMaker AI inference optimization API endpoints are accessible over the public internet using HTTPS. You can use VPC endpoints for SageMaker AI API to keep traffic between your VPC and the SageMaker AI API within the Amazon network, without traversing the public internet.

When you provide a VPC configuration for your AI benchmark jobs, the service creates resources within your specified VPC subnets and security groups.

Identity and Access Management

Amazon SageMaker AI inference optimization uses Amazon Identity and Access Management (IAM) to control access to its resources and operations.

How SageMaker AI inference optimization works with IAM

SageMaker AI inference optimization is accessed through the SageMaker AI API. All API calls are authenticated and authorized using IAM.

The inference optimization APIs use the following IAM action namespace:

- `sagemaker:CreateAIWorkloadConfig`
- `sagemaker:DescribeAIWorkloadConfig`
- `sagemaker:ListAIWorkloadConfigs`
- `sagemaker:DeleteAIWorkloadConfig`
- `sagemaker:CreateAIBenchmarkJob`
- `sagemaker:DescribeAIBenchmarkJob`
- `sagemaker:ListAIBenchmarkJobs`
- `sagemaker:StopAIBenchmarkJob`
- `sagemaker:DeleteAIBenchmarkJob`
- `sagemaker:CreateAIRecommendationJob`
- `sagemaker:DescribeAIRecommendationJob`
- `sagemaker:ListAIRecommendationJobs`
- `sagemaker:StopAIRecommendationJob`
- `sagemaker:DeleteAIRecommendationJob`

Execution roles

When you create an AI benchmark job or AI recommendation job, you provide an IAM execution role (`RoleArn`). The service assumes this role to perform operations in your Amazon account, such as:

- Creating and managing SageMaker AI training jobs, endpoints, and optimization jobs
- Reading model artifacts from Amazon S3

- Writing benchmark results to Amazon S3
- Accessing secrets from Amazon Secrets Manager

The execution role must have a trust policy that allows the SageMaker AI service to assume it. For more information about creating SageMaker AI execution roles, see SageMaker AI Roles.

Resource isolation

SageMaker AI inference optimization enforces account-level isolation. Each job and workload configuration is scoped to the Amazon account that created it. You cannot access or modify resources belonging to another Amazon account.

All SageMaker AI resources created by the service (training jobs, endpoints, optimization jobs) are created in your Amazon account using your execution role, and are subject to your account's IAM policies and service quotas.

Security best practices

The following best practices are general guidelines and don't represent a complete security solution. Because these best practices might not be appropriate or sufficient for your environment, treat them as helpful considerations rather than prescriptions.

Preventative best practices

- **Use least privilege for IAM policies.** Grant only the minimum permissions required for users and execution roles. Avoid using wildcard (*) actions or resources in IAM policies.
- **Use separate execution roles for different workloads.** Create dedicated IAM execution roles for benchmark jobs and recommendation jobs rather than sharing a single role across all workloads.
- **Use Amazon Secrets Manager for sensitive values.** When your workload specification requires sensitive values such as Hugging Face access tokens, use the `secrets` field to reference Amazon Secrets Manager secrets by ARN instead of passing them as plaintext parameters.
- **Restrict execution role trust policies.** Use `aws:SourceAccount` and `aws:SourceArn` conditions in your execution role trust policies to prevent the confused deputy problem.
- **Scope Amazon S3 permissions to specific buckets.** Restrict `s3:GetObject` and `s3:PutObject` permissions to the specific Amazon S3 buckets and prefixes used for model artifacts and benchmark outputs.
