- `securityhub` – Allows principals to retrieve information about Amazon Security Hub CSPM hub resources in the current account.
- `states` – Allows principals to start and retrieve information for Amazon Step Functions that are configured specifically for use by Systems Manager.
- `support` – Allows principals to retrieve information about checks and cases in Amazon Trusted Advisor.
- `tag` – Allows principals to retrieve information about all the tagged or previously tagged resources that are located in a specified Amazon Web Services Region for an account.

To view more details about the policy, including the latest version of the JSON policy document, see AmazonSSMServiceRolePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AmazonSSMAutomationRole

You can attach the `AmazonSSMAutomationRole` policy to your IAM identities. This policy provides permissions for the Amazon Systems Manager Automation service to run activities defined within Automation runbooks.

Permissions details

This policy includes the following permissions.

- `lambda` – Allows principals to invoke Lambda functions with names that begin with "Automation". This is required for Automation runbooks to execute Lambda functions as part of their workflow.
- `ec2` – Allows principals to perform various Amazon EC2 operations including creating, copying, and deregistering images; managing snapshots; starting, running, stopping, and terminating

instances; managing instance status; and creating, deleting, and describing tags. These permissions enable Automation runbooks to manage Amazon EC2 resources during execution.

- `cloudformation` – Allows principals to create, describe, update, and delete Amazon CloudFormation stacks. This enables Automation runbooks to manage infrastructure as code through CloudFormation.
- `ssm` – Allows principals to use all Systems Manager actions. This comprehensive access is required for Automation runbooks to interact with all Systems Manager capabilities.
- `sns` – Allows principals to publish messages to Amazon SNS topics with names that begin with "Automation". This enables Automation runbooks to send notifications during execution.
- `ssmmessages` – Allows principals to open data channels to Systems Manager sessions. This enables Automation runbooks to establish communication channels for session-based operations.

To view more details about the policy, including the latest version of the JSON policy document, see AmazonSSMAutomationRole in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AmazonSSMReadOnlyAccess

You can attach the `AmazonSSMReadOnlyAccess` policy to your IAM identities. This policy grants read-only access to Amazon Systems Manager API operations including `Describe*`, `Get*`, and `List*`.

To view more details about the policy, including the latest version of the JSON policy document, see AmazonSSMReadOnlyAccess in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSSystemsManagerOpsDataSyncServiceRolePolicy

You can't attach `AWSSystemsManagerOpsDataSyncServiceRolePolicy` to your IAM entities. This policy is attached to a service-linked role that allows Systems Manager to perform actions on your behalf. For more information, see Using roles to create OpsData and OpsItems for Explorer.

`AWSSystemsManagerOpsDataSyncServiceRolePolicy` allows the `AWSServiceRoleForSystemsManagerOpsDataSync` service-linked role to create and update OpsItems and OpsData from Amazon Security Hub CSPM findings.

The policy allows Systems Manager to complete the following actions on all related resources (`"Resource": "*"`), except where indicated:

- ssm:GetOpsItem [1]
- ssm:UpdateOpsItem [1]
- ssm:CreateOpsItem
- ssm:AddTagsToResource [2]
- ssm:UpdateServiceSetting [3]
- ssm:GetServiceSetting [3]
- securityhub:GetFindings
- securityhub:GetFindings
- securityhub:BatchUpdateFindings [4]

[1] The ssm:GetOpsItem and ssm:UpdateOpsItem actions are allowed permissions by the following condition for the Systems Manager service only.

```
"Condition": {
    "StringEquals": {
        "aws:ResourceTag/ExplorerSecurityHubOpsItem": "true"
    }
}
```

[2] The ssm:AddTagsToResource action is allowed permissions for the following resource only.

```
arn:aws-cn:ssm:*:*:opsitem/*
```

[3] The ssm:UpdateServiceSetting and ssm:GetServiceSetting actions are allowed permissions for the following resources only.

```
arn:aws-cn:ssm:*:*:servicesetting/ssm/opsitem/*
arn:aws-cn:ssm:*:*:servicesetting/ssm/opsdata/*
```

[4] The securityhub:BatchUpdateFindings are denied permissions by the following condition for the Systems Manager service only.

```
{
   "Effect": "Deny",
   "Action": "securityhub:BatchUpdateFindings",
   "Resource": "*",
   "Condition": {
```

```
    "StringEquals": {
     "securityhub:ASFFSyntaxPath/Workflow.Status": "SUPPRESSED"
    }
   }
  },
  {
   "Effect": "Deny",
   "Action": "securityhub:BatchUpdateFindings",
   "Resource": "*",
   "Condition": {
    "Null": {
     "securityhub:ASFFSyntaxPath/Confidence": false
    }
   }
  },
  {
   "Effect": "Deny",
   "Action": "securityhub:BatchUpdateFindings",
   "Resource": "*",
   "Condition": {
    "Null": {
     "securityhub:ASFFSyntaxPath/Criticality": false
    }
   }
  },
  {
   "Effect": "Deny",
   "Action": "securityhub:BatchUpdateFindings",
   "Resource": "*",
   "Condition": {
    "Null": {
     "securityhub:ASFFSyntaxPath/Note.Text": false
    }
   }
  },
  {
   "Effect": "Deny",
   "Action": "securityhub:BatchUpdateFindings",
   "Resource": "*",
   "Condition": {
    "Null": {
     "securityhub:ASFFSyntaxPath/Note.UpdatedBy": false
    }
   }
```

```
  },
  {
   "Effect": "Deny",
   "Action": "securityhub:BatchUpdateFindings",
   "Resource": "*",
   "Condition": {
    "Null": {
     "securityhub:ASFFSyntaxPath/RelatedFindings": false
    }
   }
  },
  {
   "Effect": "Deny",
   "Action": "securityhub:BatchUpdateFindings",
   "Resource": "*",
   "Condition": {
    "Null": {
     "securityhub:ASFFSyntaxPath/Types": false
    }
   }
  },
  {
   "Effect": "Deny",
   "Action": "securityhub:BatchUpdateFindings",
   "Resource": "*",
   "Condition": {
    "Null": {
     "securityhub:ASFFSyntaxPath/UserDefinedFields.key": false
    }
   }
  },
  {
   "Effect": "Deny",
   "Action": "securityhub:BatchUpdateFindings",
   "Resource": "*",
   "Condition": {
    "Null": {
     "securityhub:ASFFSyntaxPath/UserDefinedFields.value": false
    }
   }
  },
  {
   "Effect": "Deny",
   "Action": "securityhub:BatchUpdateFindings",
```

```
    "Resource": "*",
    "Condition": {
     "Null": {
      "securityhub:ASFFSyntaxPath/VerificationState": false
     }
    }
```

To view more details about the policy, including the latest version of the JSON policy document, see AWSSystemsManagerOpsDataSyncServiceRolePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AmazonSSMManagedEC2InstanceDefaultPolicy

You should only attach `AmazonSSMManagedEC2InstanceDefaultPolicy` to IAM roles for Amazon EC2 instances that you want to have permission to use Systems Manager functionality. You shouldn't attached this role to other IAM entities, such as IAM users and IAM groups, or to IAM roles that serve other purposes. For more information, see Managing EC2 instances automatically with Default Host Management Configuration.

This policy grants permissions that allow SSM Agent on your Amazon EC2 instance to communicate with the Systems Manager service in the cloud to perform a variety of tasks. It also grants permissions for the two services that provide authorization tokens to make sure that operations are performed on the correct instance.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to retrieve Documents, execute commands using Run Command, establish sessions using Session Manager, collect an inventory of the instance, and scan for patches and patch compliance using Patch Manager.
- `ssmmessages` – Allows principals to access, for each instance, a personalized authorization token that was created by the *Amazon Message Gateway Service*. Systems Manager validates the personalized authorization token against the Amazon Resource Name (ARN) of the instance that was provided in the API operation. This access is necessary to make sure that SSM Agent performs the API operations on the correct instance.
- `ec2messages` – Allows principals to access, for each instance, a personalized authorization token that was created by the *Amazon Message Delivery Service*. Systems Manager validates the personalized authorization token against the Amazon Resource Name (ARN) of the instance

that was provided in the API operation. This access is necessary to make sure that SSM Agent performs the API operations on the correct instance.

For related information about the `ssmmessages` and `ec2messages` endpoints, including the differences between the two, see Agent-related API operations (`ssmmessages` and `ec2messages` endpoints).

To view more details about the policy, including the latest version of the JSON policy document, see AmazonSSMManagedEC2InstanceDefaultPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: SSMQuickSetupRolePolicy

You can't attach SSMQuickSetupRolePolicy to your IAM entities. This policy is attached to a service-linked role that allows Systems Manager to perform actions on your behalf. For more information, see Using roles to maintain Quick Setup-provisioned resource health and consistency.

This policy grants read-only permissions that allow Systems Manager to check configuration health, ensure consistent use of parameters and provisioned resources, and remediate resources when drift is detected. It also grants administrative permissions for creating a service-linked role.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to read information Resource Data Syncs and SSM Documents in Systems Manager, including in delegated administrator accounts. This is required so Quick Setup can determine the state that configured resources are intended to be in.
- `organizations` – Allows principals to read information about the member accounts that belong to an organization as configured in Amazon Organizations. This is required so Quick Setup can identify all accounts in an organization where resource health checks are to be performed.
- `cloudformation` – Allows principals to read information from Amazon CloudFormation. This is required so Quick Setup can gather data about the Amazon CloudFormation stacks used to manage the state of resources and CloudFormation stackset operations.

To view more details about the policy, including the latest version of the JSON policy document, see SSMQuickSetupRolePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupDeploymentRolePolicy

The managed policy `AWSQuickSetupDeploymentRolePolicy` supports multiple Quick Setup configuration types. These configuration types create IAM roles and automations that configure frequently used Amazon Web Services services and features with recommended best practices.

You can attach `AWSQuickSetupDeploymentRolePolicy` to your IAM entities.

This policy grants administrative permissions needed to create resources associated with the following Quick Setup configurations:

- Set up Amazon EC2 host management using Quick Setup
- Create an Amazon Config configuration recorder using Quick Setup
- Deploy Amazon Config conformance pack using Quick Setup
- Set up DevOps Guru using Quick Setup
- Deploy Distributor packages using Quick Setup
- Stop and start EC2 instances automatically on a schedule using Quick Setup

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to read, create, update, and delete SSM documents with names beginning with "AWSQuickSetup-" or "AWSOperationsPack-" when called through Amazon CloudFormation; to read specific Amazon owned documents including "AWSQuickSetupType-ManageInstanceProfile", "AWSQuickSetupType-ConfigureDevOpsGuru", and "AWSQuickSetupType-DeployConformancePack"; to create, update, and delete associations for Quick Setup documents and Amazon owned documents when called through Amazon CloudFormation; and to clean up legacy resources tagged with `QuickSetupID`. This enables Quick Setup to deploy and manage automation workflows and associations.
- `cloudformation` – Allows principals to read information about Amazon CloudFormation stacks and stack sets; and to create, update, and delete Amazon CloudFormation stacks and change sets for resources with names beginning with "StackSet-AWS-QuickSetup-". This enables Quick Setup to manage infrastructure deployments across accounts and regions.
- `config` – Allows principals to read information about Amazon Config conformance packs and their status; and to create and delete conformance packs with names beginning with "AWS-

QuickSetup-" when called through Amazon CloudFormation. This enables Quick Setup to deploy compliance monitoring configurations.

- `events` – Allows principals to manage EventBridge rules and targets for resources with names containing "QuickSetup-". This enables Quick Setup to create scheduled automation workflows.
- `iam` – Allows principals to create service-linked roles for Amazon Config and Systems Manager; to create, manage, and delete IAM roles with names beginning with "AWS-QuickSetup-" or "AWSOperationsPack-" when called through Amazon CloudFormation; to pass these roles to Systems Manager and EventBridge services; to attach specific Amazon managed policies to these roles; and to set permissions boundaries using specific Quick Setup managed policies. This enables Quick Setup to create the necessary service roles for its operations.
- `resource-groups` – Allows principals to retrieve resource group queries. This enables Quick Setup to target specific sets of resources for configuration management.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupDeploymentRolePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupPatchPolicyDeploymentRolePolicy

The managed policy `AWSQuickSetupPatchPolicyDeploymentRolePolicy` supports the Configure patching for instances in an organization using a Quick Setup patch policy Quick Setup type. This configuration type helps automate patching of applications and nodes in a single account or across your organization.

You can attach `AWSQuickSetupPatchPolicyDeploymentRolePolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

This policy grants administrative permissions that allow Quick Setup to create resources associated with a patch policy configuration.

Permissions details

This policy includes the following permissions.

- `iam` – Allows principals to manage and delete IAM roles required for Automation configuration tasks; and to manage Automation role policies.

- `cloudformation` – Allows principals to read Amazon CloudFormation stack information; and to control Amazon CloudFormation stacks that were created by Quick Setup using Amazon CloudFormation stack sets.
- `ssm` – Allows principals to create, update, read, and delete Automation runbooks required for configuration tasks; and to create, update, and delete State Manager associations.
- `resource-groups` – Allows principals to retrieve resource queries that are associated with resource groups targeted by Quick Setup configurations.
- `s3` – Allows principals to list Amazon S3 buckets; and to manage the buckets for storing patch policy access logs.
- `lambda` – Allows principals to manage Amazon Lambda remediation functions that maintain configurations in the correct state.
- `logs` – Allows principals to describe and manage log groups for Lambda configuration resources.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupPatchPolicyDeploymentRolePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupPatchPolicyBaselineAccess

The managed policy `AWSQuickSetupPatchPolicyBaselineAccess` supports the Configure patching for instances in an organization using a Quick Setup patch policy Quick Setup type. This configuration type helps automate patching of applications and nodes in a single account or across your organization.

You can attach `AWSQuickSetupPatchPolicyBaselineAccess` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

This policy provides read-only permissions to access patch baselines that have been configured by an administrator in the current Amazon Web Services account or organization using Quick Setup. The patch baselines are stored in an Amazon S3 bucket and can be used for patching instances in a single account or across an entire organization.

Permissions details

This policy includes the following permission.

- `s3` – Allows principals to read patch baseline overrides stored in Amazon S3 buckets.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupPatchPolicyBaselineAccess in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupPatchPolicyLambdaExecutionPolicy

The managed policy `AWSQuickSetupPatchPolicyLambdaExecutionPolicy` supports the Configure patching for instances in an organization using a Quick Setup patch policy Quick Setup type. This configuration type helps automate patching of applications and nodes in a single account or across your organization.

You can attach `AWSQuickSetupPatchPolicyLambdaExecutionPolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

This policy grants permissions to manage State Manager associations for automated cleanup operations when Quick Setup configurations are deleted.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to query and update State Manager associations by ID during automated cleanup operations. The policy grants permissions to describe association details, view association execution history, and update association configurations. Wildcard resources are required because association ARNs are dynamically generated.
- `iam` – Allows principals to pass automation roles to Systems Manager for association operations. The permission is scoped to Quick Setup automation roles with the pattern `AWS-QuickSetup-AutomationRole-*` and includes a condition that restricts role passing to the Systems Manager service only.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupPatchPolicyLambdaExecutionPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupPatchPolicyTagManagementExecutionPolicy

The managed policy `AWSQuickSetupPatchPolicyTagManagementExecutionPolicy` supports the Configure patching for instances in an organization using a Quick Setup patch policy Quick Setup type. This configuration type helps automate patching of applications and nodes in a single account or across your organization.

You can attach `AWSQuickSetupPatchPolicyTagManagementExecutionPolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

This policy grants permissions to track which instances are managed by Quick Setup patch policy configurations through automated tagging and inventory collection.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to retrieve inventory information from managed instances; and to add or remove configuration tracking tags on SSM managed instances.
- `ec2` – Allows principals to add or remove configuration tracking tags on Amazon EC2 instances.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupPatchPolicyTagManagementExecutionPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSSystemsManagerEnableExplorerExecutionPolicy

The managed policy `AWSSystemsManagerEnableExplorerExecutionPolicy` supports enabling Explorer, a tool in Amazon Systems Manager.

You can attach `AWSSystemsManagerEnableExplorerExecutionPolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

This policy grants administrative permissions for enabling Explorer. This includes permissions to update related Systems Manager service settings, and to create a service-linked role for Systems Manager.

Permissions details

This policy includes the following permissions.

- `config` – Allows principals to help enable Explorer by providing read-only access to configuration recorder details.
- `iam` – Allows principals to help enable Explorer.
- `ssm` – Allows principals to start an Automation workflow that enables Explorer.

To view more details about the policy, including the latest version of the JSON policy document, see AWSSystemsManagerEnableExplorerExecutionPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: `AWSSystemsManagerEnableConfigRecordingExecutionPolicy`

The managed policy `AWSSystemsManagerEnableConfigRecordingExecutionPolicy` supports the Create an Amazon Config configuration recorder using Quick Setup Quick Setup configuration type. This configuration type enables Quick Setup to track and record changes to the Amazon resource types you choose for Amazon Config. It also enables Quick Setup to configure delivery and notifications options for the recorded data.

You can attach `AWSSystemsManagerEnableConfigRecordingExecutionPolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

This policy grants administrative permissions that allow Quick Setup to enable and configure Amazon Config configuration recording.

Permissions details

This policy includes the following permissions.

- `s3` – Allows principals to create and configure Amazon S3 buckets for delivery of configuration recordings.
- `sns` – Allows principals to list and create Amazon SNS topics.
- `config` – Allows principals to configure and start the configuration recorder; and to help enable Explorer.

- `iam` – Allows principals to create, get, and pass a service-linked role for Amazon Config; and to create a service-linked role for Systems Manager; and to help enable Explorer.
- `ssm` – Allows principals to start an Automation workflow that enables Explorer.
- `compute-optimizer` – Allows principals to help enable Explorer by providing read-only access to determine whether a resource is enrolled with Amazon Compute Optimizer.
- `support` – Allows principals to help enable Explorer by providing read-only access to determine whether a resource is enrolled with Amazon Compute Optimizer.

To view more details about the policy, including the latest version of the JSON policy document, see AWSSystemsManagerEnableConfigRecordingExecutionPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupDevOpsGuruPermissionsBoundary

> **Note**
>
> This policy is a *permissions boundary*. A permissions boundary sets the maximum permissions that an identity-based policy can grant to an IAM entity. You should not use and attach Quick Setup permissions boundary policies on your own. Quick Setup permissions boundary policies should only be attached to Quick Setup managed roles. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the *IAM User Guide*.

The managed policy `AWSQuickSetupDevOpsGuruPermissionsBoundary` supports the Set up DevOps Guru using Quick Setup type. The configuration type enables the machine learning-powered Amazon DevOps Guru. The DevOps Guru service can help improve an application's operational performance and availability.

When you create an `AWSQuickSetupDevOpsGuruPermissionsBoundary` configuration using Quick Setup, the system applies this permissions boundary to the IAM roles that are created when the configuration is deployed. The permissions boundary limits the scope of the roles that Quick Setup creates.

This policy grants administrative permissions that allow Quick Setup to enable and configure Amazon DevOps Guru.

Permissions details

This policy includes the following permissions.

- `iam` – Allows principals to create service-linked roles for DevOps Guru and Systems Manager; and to list roles that help enable Explorer.
- `cloudformation` – Allows principals to list and describe Amazon CloudFormation stacks.
- `sns` – Allows principals to list and create Amazon SNS topics.
- `devops-guru` – Allows principals to configure DevOps Guru; and to add a notification channel.
- `config` – – Allows principals to help enable Explorer by providing read-only access to configuration recorder details.
- `ssm` – Allows principals to start an Automation workflow that enables Explorer; and to read and update Explorer service settings.
- `compute-optimizer` – Allows principals to help enable Explorer by providing read-only access to determine whether a resource is enrolled with Amazon Compute Optimizer.
- `support` – Allows principals to help enable Explorer by providing read-only access to determine whether a resource is enrolled with Amazon Compute Optimizer.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupDevOpsGuruPermissionsBoundary in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupDistributorPermissionsBoundary

> **Note**
>
> This policy is a *permissions boundary*. A permissions boundary sets the maximum permissions that an identity-based policy can grant to an IAM entity. You should not use and attach Quick Setup permissions boundary policies on your own. Quick Setup permissions boundary policies should only be attached to Quick Setup managed roles. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the *IAM User Guide*.

The managed policy `AWSQuickSetupDistributorPermissionsBoundary` supports the Deploy Distributor packages using Quick Setup Quick Setup configuration type. The configuration type helps enable the distribution of software packages, such as agents, to your Amazon Elastic Compute Cloud (Amazon EC2) instances, using Distributor, a tool in Amazon Systems Manager.

When you create an `AWSQuickSetupDistributorPermissionsBoundary` configuration using Quick Setup, the system applies this permissions boundary to the IAM roles that are created when the configuration is deployed. The permissions boundary limits the scope of the roles that Quick Setup creates.

This policy grants administrative permissions that allow Quick Setup to enable the distribution of software packages, such as agents, to your Amazon EC2 instances using Distributor.

Permissions details

This policy includes the following permissions.

- `iam` – Allows principals to get and pass the Distributor automation role; to create, read, update, and delete the default instance role; to pass the default instance role to Amazon EC2 and Systems Manager; to attach instance management policies to instance roles; to create a service-linked role for Systems Manager; to add the default instance role to instance profiles; to read information about IAM roles and instance profiles; and to create the default instance profile.
- `ec2` – Allows principals to associate the default instance profile with EC2 instances; and to help enable Explorer.
- `ssm` – Allows principals to start automation workflows that which configure instances and install packages; and to help start the automation workflow that enables Explorer; and to read and update Explorer service settings.
- `config` – Allows principals to help enable Explorer by providing read-only access to configuration recorder details.
- `compute-optimizer` – Allows principals to help enable Explorer by providing read-only access to determine whether a resource is enrolled with Amazon Compute Optimizer.
- `support` – Allows principals to help enable Explorer by providing read-only access to determine whether a resource is enrolled with Amazon Compute Optimizer.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupDistributorPermissionsBoundary in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupSSMHostMgmtPermissionsBoundary

> **Note**
>
> This policy is a *permissions boundary*. A permissions boundary sets the maximum permissions that an identity-based policy can grant to an IAM entity. You should not use and attach Quick Setup permissions boundary policies on your own. Quick Setup permissions boundary policies should only be attached to Quick Setup managed roles. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the *IAM User Guide*.

The managed policy `AWSQuickSetupSSMHostMgmtPermissionsBoundary` supports the Set up Amazon EC2 host management using Quick Setup Quick Setup configuration type. This configuration type configures IAM roles and enables commonly used Systems Manager tools to securely manage your Amazon EC2 instances.

When you create an `AWSQuickSetupSSMHostMgmtPermissionsBoundary` configuration using Quick Setup, the system applies this permissions boundary to the IAM roles that are created when the configuration is deployed. The permissions boundary limits the scope of the roles that Quick Setup creates.

This policy grants administrative permissions that allow Quick Setup to enable and configure Systems Manager tools needed for securely managing EC2 instances.

Permissions details

This policy includes the following permissions.

- `iam` – Allows principals to get and pass the service role to Automation. Allows principals to create, read, update, and delete the default instance role; to pass the default instance role to Amazon EC2 and Systems Manager; to attach instance management policies to instance roles; to create a service-linked role for Systems Manager; to add the default instance role to instance profiles; to read information about IAM roles and instance profiles; and to create the default instance profile.
- `ec2` – Allows principals to associate and disassociate the default instance profile with EC2 instances.

- `ssm` – Allows principals to start Automation workflows that enable Explorer; to read and update Explorer service settings; to configure instances; and to enable Systems Manager tools on instances.
- `compute-optimizer` – Allows principals to help enable Explorer by providing read-only access to determine whether a resource is enrolled with Amazon Compute Optimizer.
- `support` – Allows principals to help enable Explorer by providing read-only access to determine whether a resource is enrolled with Amazon Compute Optimizer.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupSSMHostMgmtPermissionsBoundary in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupPatchPolicyPermissionsBoundary

> **Note**
>
> This policy is a *permissions boundary*. A permissions boundary sets the maximum permissions that an identity-based policy can grant to an IAM entity. You should not use and attach Quick Setup permissions boundary policies on your own. Quick Setup permissions boundary policies should only be attached to Quick Setup managed roles. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the *IAM User Guide*.

The managed policy `AWSQuickSetupPatchPolicyPermissionsBoundary` supports the Configure patching for instances in an organization using a Quick Setup patch policy Quick Setup type. This configuration type helps automate patching of applications and nodes in a single account or across your organization.

When you create an `AWSQuickSetupPatchPolicyPermissionsBoundary` configuration using Quick Setup, the system applies this permissions boundary to the IAM roles that are created when the configuration is deployed. The permissions boundary limits the scope of the roles that Quick Setup creates.

This policy grants administrative permissions that allow Quick Setup to enable and configure patch policies in Patch Manager, a tool in Amazon Systems Manager.

Permissions details

This policy includes the following permissions.

- `iam` – Allows principals to get the Patch Manager Automation role; to pass Automation roles to Patch Manager patching operations; to create the default instance role, `AmazonSSMRoleForInstancesQuickSetup`; to pass the default instance role to Amazon EC2 and Systems Manager; to attach selected Amazon managed policies to the instance role; to create a service-linked role for Systems Manager; to add the default instance role to instance profiles; to read information about instance profiles and roles; to create a default instance profile; and to tag roles that have permissions to read patch baseline overrides.
- `ssm` – Allows principals to update the instance role this is managed by Systems Manager; to manage associations created by Patch Manager patch policies created in Quick Setup; to tag instances targeted by a patch policy configuration; to read information about instances and patching status; to start Automation workflows that configure, enable and remediate instance patching; to start automation workflows that enable Explorer; to help enable Explorer; and to read and update Explorer service settings.
- `ec2` – Allows principals to associate and disassociate the default instance profile with EC2 instances; to tag instances targeted by a patch policy configuration; to tag instances targeted by a patch policy configuration; and to help enable Explorer.
- `s3` – Allows principals to create and configure S3 buckets to store patch baseline overrides.
- `lambda` – Allows principals to invoke Amazon Lambda functions that configure patching and to perform clean-up operations after a Quick Setup patch policy configuration is deleted.
- `logs` – Allows principals to configure logging for Patch Manager Quick Setup Amazon Lambda functions.
- `config` – Allows principals to help enable Explorer by providing read-only access to configuration recorder details.
- `compute-optimizer` – Allows principals to help enable Explorer by providing read-only access to determine whether a resource is enrolled with Amazon Compute Optimizer.
- `support` – Allows principals to help enable Explorer by providing read-only access to determine whether a resource is enrolled with Amazon Compute Optimizer.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupPatchPolicyPermissionsBoundary in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupSchedulerPermissionsBoundary

> **Note**
>
> This policy is a *permissions boundary*. A permissions boundary sets the maximum permissions that an identity-based policy can grant to an IAM entity. You should not use and attach Quick Setup permissions boundary policies on your own. Quick Setup permissions boundary policies should only be attached to Quick Setup managed roles. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the *IAM User Guide*.

The managed policy `AWSQuickSetupSchedulerPermissionsBoundary` supports the Stop and start EC2 instances automatically on a schedule using Quick Setup Quick Setup configuration type. This configuration type lets you stop and start your EC2 instances and other resources at the times you specify.

When you create an `AWSQuickSetupSchedulerPermissionsBoundary` configuration using Quick Setup, the system applies this permissions boundary to the IAM roles that are created when the configuration is deployed. The permissions boundary limits the scope of the roles that Quick Setup creates.

This policy grants administrative permissions that allow Quick Setup to enable and configure scheduled operations on EC2 instances and other resources.

Permissions details

This policy includes the following permissions.

- `iam` – Allows principals to retrieve and pass roles for instance management automation actions; to manage, pass, and attach default instance roles for EC2 instance management; to create default instance profiles; to add default instance roles to instance profiles; to create a service-linked role for Systems Manager; to read information about IAM roles and instance profiles; to associate a default instance profile with EC2 instances; and to start Automation workflows to configure instances and enable Systems Manager tools on them.
- `ssm` – Allows principals to start Automation workflows that enable Explorer; and to read and update Explorer service settings.
- ec2 – Allows principals to locate targeted instances and to start and stop them on a schedule.

- `config` – Allows principals to help enable Explorer by providing read-only access to configuration recorder details.
- `compute-optimizer` – Allows principals to help enable Explorer by providing read-only access to determine whether a resource is enrolled with Amazon Compute Optimizer.
- `support` – Allows principals to help enable Explorer by providing read-only access to Amazon Trusted Advisor checks for an account.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupSchedulerPermissionsBoundary in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupCFGCPacksPermissionsBoundary

> **Note**
>
> This policy is a *permissions boundary*. A permissions boundary sets the maximum permissions that an identity-based policy can grant to an IAM entity. You should not use and attach Quick Setup permissions boundary policies on your own. Quick Setup permissions boundary policies should only be attached to Quick Setup managed roles. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the *IAM User Guide*.

The managed policy `AWSQuickSetupCFGCPacksPermissionsBoundary`supports the Deploy Amazon Config conformance pack using Quick Setup Quick Setup configuration type. This configuration type deploys Amazon Config conformance packs. Conformance packs are collections of Amazon Config rules and remediation actions that can be deployed as a single entity.

When you create an `AWSQuickSetupCFGCPacksPermissionsBoundary` configuration using Quick Setup, the system applies this permissions boundary to the IAM roles that are created when the configuration is deployed. The permissions boundary limits the scope of the roles that Quick Setup creates.

This policy grants administrative permissions that allow Quick Setup to deploy Amazon Config conformance packs.

Permissions details

This policy includes the following permissions.

- `iam` – Allows principals to create, get, and pass a service-linked role for Amazon Config.
- `sns` – Allows principals to list platform applications in Amazon SNS.
- `config` – Allows principals to deploy Amazon Config conformance packs; to get the status of conformance packs; and to get information about configuration recorders.
- `ssm` – Allows principals to get information about SSM documents and Automation workflows; to get information about resource tags; and to get information about and update service settings.
- `compute-optimizer` – Allows principals to get the opt-in status of an account.
- `support` – Allows principals to get information about Amazon Trusted Advisor checks.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupCFGCPacksPermissionsBoundary in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupStartStopInstancesExecutionPolicy

You can attach `AWSQuickSetupStartStopInstancesExecutionPolicy` to your IAM entities. This policy provides permissions for Quick Setup to manage the starting and stopping of Amazon EC2 instances using Systems Manager automation.

Permissions details

This policy includes the following permissions.

- `ec2` – Allows principals to describe Amazon EC2 instances, their status, regions, and tags. Also allows starting and stopping specific Amazon EC2 instances.
- `ssm` – Allows principals to get calendar state from Quick Setup change calendars, start associations, and execute automation documents for instance scheduling.
- `iam` – Allows principals to pass Quick Setup IAM roles to Systems Manager for automation execution, with conditions that restrict the service to ssm.amazonaws.com and specific resource ARNs.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupStartStopInstancesExecutionPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupStartSSMAssociationsExecutionPolicy

This policy grants permissions that allow Quick Setup to run the `AWSQuickSetupType-Scheduler-ChangeCalendarState` Automation runbook. This runbook is used to manage change calendar states for scheduled operations in Quick Setup configurations.

You can attach `AWSQuickSetupStartSSMAssociationsExecutionPolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to start automation executions specifically for the `AWSQuickSetupType-Scheduler-ChangeCalendarState` document. This is required for Quick Setup to manage change calendar states for scheduled operations.
- `iam` – Allows principals to pass roles with names that begin with "AWS-QuickSetup-" to the Systems Manager service. This permission is restricted to use with specific SSM documents related to change calendar management. This is required for Quick Setup to pass the appropriate execution role to the automation process.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupStartSSMAssociationsExecutionPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWS-SSM-DiagnosisAutomation-AdministrationRolePolicy

The policy `AWS-SSM-DiagnosisAutomation-AdministrationRolePolicy` provides permissions for diagnosing issues with nodes that interact with Systems Manager services by starting Automation workflows in accounts and Regions where nodes are managed.

You can attach `AWS-SSM-DiagnosisAutomation-AdministrationRolePolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform diagnosis actions on your behalf.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to run specific Automation runbooks that diagnose node issues, access the execution status for workflows, and retrieve automation execution details. The policy grants permissions to describe automation executions, describe automation step executions, get automation execution details, and start automation executions for diagnosis-related documents.
- `kms` – Allows principals to use customer-specified Amazon Key Management Service keys for decryption and data key generation when accessing encrypted objects in Amazon S3 buckets used for diagnosis operations. These permissions are restricted to keys tagged with `SystemsManagerManaged` and used through Amazon S3 service with specific encryption context requirements.
- `sts` – Allows principals to assume diagnosis execution roles to run Automation runbooks in the same account. This permission is restricted to roles with the `AWS-SSM-DiagnosisExecutionRole` naming pattern and includes a condition to make sure the resource account matches the principal account.
- `iam` – Allows principals to pass the diagnosis administration role to Systems Manager to run Automation runbooks. This permission is restricted to roles with the `AWS-SSM-DiagnosisAdminRole` naming pattern and can only be passed to the Systems Manager service.
- `s3` – Allows principals to access, read, write, and delete objects in Amazon S3 buckets used for diagnosis operations. These permissions are restricted to buckets with the `do-not-delete-ssm-diagnosis-` naming pattern and include conditions to make sure operations are performed within the same account.

To view more details about the policy, including the latest version of the JSON policy document, see AWS-SSM-DiagnosisAutomation-AdministrationRolePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy

The managed policy `AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy` provides administrative permission for running Automation runbooks in a targeted Amazon Web Services account and Region to diagnose issues with managed nodes that interact with Systems Manager services.

You can attach `AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

Permissions details

This policy includes the following permissions.

- `ec2` – Allows principals to describe Amazon EC2 and Amazon VPC resources and their configurations to diagnose issues with Systems Manager services. This includes permissions to describe VPCs, VPC attributes, VPC endpoints, subnets, security groups, instances, instance status, network ACLs, and internet gateways.
- `ssm` – Allows principals to run diagnosis-specific Automation runbooks and access the automation workflow status and execution metadata. This includes permissions to describe automation step executions, describe instance information, describe automation executions, describe activations, get automation execution details, get service settings, and start automation executions for specific Amazon unmanaged EC2 diagnosis documents.
- `kms` – Allows principals to use customer-specified Amazon Key Management Service keys for decryption and data key generation when accessing encrypted objects in Amazon S3 buckets used for diagnosis operations. These permissions are restricted to keys tagged with `SystemsManagerManaged` and used through Amazon S3 service with specific encryption context requirements for diagnosis buckets.
- `iam` – Allows principals to pass the diagnosis execution role to Systems Manager to run Automation documents. This permission is restricted to roles with the `AWS-SSM-DiagnosisExecutionRole` naming pattern and can only be passed to the Systems Manager service.

To view more details about the policy, including the latest version of the JSON policy document, see AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWS-SSM-RemediationAutomation-AdministrationRolePolicy

The policy `AWS-SSM-RemediationAutomation-AdministrationRolePolicy` provides permissions for remediating issues with Systems Manager services by executing activities defined within Automation documents, primarily used for running the Automation documents. This policy enables starting Automation workflows in accounts and Regions where nodes are managed to address connectivity and configuration issues.

You can attach `AWS-SSM-RemediationAutomation-AdministrationRolePolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform remediation actions on your behalf.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to run specific Automation runbooks that remediate node issues, access the execution status for workflows, and retrieve automation execution details. The policy grants permissions to describe automation executions, describe automation step executions, get automation execution details, and start automation executions for remediation-related documents.
- `kms` – Allows principals to use customer-specified Amazon Key Management Service keys for decryption and data key generation when accessing encrypted objects in Amazon S3 buckets used for remediation operations. These permissions are restricted to keys tagged with `SystemsManagerManaged` and used through Amazon S3 service with specific encryption context requirements.
- `sts` – Allows principals to assume remediation execution roles to run Automation runbooks in the same account. This permission is restricted to roles with the `AWS-SSM-RemediationExecutionRole` naming pattern and includes a condition to make sure the resource account matches the principal account.
- `iam` – Allows principals to pass the remediation administration role to Systems Manager to run Automation runbooks. This permission is restricted to roles with the `AWS-SSM-RemediationAdminRole` naming pattern and can only be passed to the Systems Manager service.
- `s3` – Allows principals to access, read, write, and delete objects in Amazon S3 buckets used for remediation operations. These permissions are restricted to buckets with the `do-not-delete-ssm-diagnosis-` naming pattern and include conditions to make sure operations are performed within the same account.

To view more details about the policy, including the latest version of the JSON policy document, see AWS-SSM-RemediationAutomation-AdministrationRolePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWS-SSM-RemediationAutomation-ExecutionRolePolicy

The managed policy `AWS-SSM-RemediationAutomation-ExecutionRolePolicy` provides permissions for running Automation runbooks in a specific target account and Region to remediate

networking and connectivity issues with managed nodes that interact with Systems Manager services. This policy enables remediation activities defined within Automation documents, primarily used for running the Automation documents to address connectivity and configuration issues.

You can attach the policy to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform remediation actions on your behalf.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to retrieve information about Automation executions and their step executions, and to start specific remediation Automation runbooks including `AWS-OrchestrateUnmanagedEC2Actions` and `AWS-RemediateSSMAgent` documents. The policy grants permissions to describe automation executions, describe automation step executions, get automation execution details, and start automation executions for remediation-related documents.
- `ec2` – Allows principals to describe and modify Amazon VPC networking resources to remediate connectivity issues. This includes:
  - Describing Amazon VPC attributes, subnets, Amazon VPC endpoints, and security groups.
  - Creating Amazon VPC endpoints for Systems Manager services (`ssm`, `ssmmessages`, and `ec2messages`) with required tags.
  - Modifying Amazon VPC attributes to enable DNS support and hostnames.
  - Creating and managing security groups with specific tags for Amazon VPC endpoint access.
  - Authorizing and revoking security group rules for HTTPS access with appropriate tags.
  - Creating tags on Amazon VPC endpoints, security groups, and security group rules during resource creation.
- `kms` – Allows principals to use customer-specified Amazon Key Management Service keys for decryption and data key generation when accessing encrypted objects in Amazon S3 buckets used for remediation operations. These permissions are restricted to keys tagged with `SystemsManagerManaged` and used through Amazon S3 service with specific encryption context requirements.
- `iam` – Allows principals to pass the remediation execution role to Systems Manager to run Automation runbooks. This permission is restricted to roles with the `AWS-SSM-RemediationExecutionRole` naming pattern and can only be passed to the Systems Manager service.

To view more details about the policy, including the latest version of the JSON policy document, see AWS-SSM-RemediationAutomation-ExecutionRolePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupSSMManageResourcesExecutionPolicy

This policy grants permissions that allow Quick Setup to run the `AWSQuickSetupType-SSM-SetupResources` Automation runbook. This runbook creates IAM roles for Quick Setup associations, which in turn are created by a `AWSQuickSetupType-SSM` deployment. It also grants permissions to clean up an associated Amazon S3 bucket on during a Quick Setup delete operation.

You can attach the policy to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

Permissions details

This policy includes the following permissions.

- `iam` – Allows principals to list and manage IAM roles for use with Quick Setup Systems Manager Explorer operations; to view, attach, and detach IAM policies for use with Quick Setup and Systems Manager Explorer These permissions are required so Quick Setup can create the roles needed for some of its configuration operations.
- `s3` – Allows principals to retrieve information about objects in, and to delete objects from Amazon S3 buckets, in the principal account, that are used specifically in Quick Setup configuration operations. This is required so that S3 objects that are no longer needed after configuration can be removed.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupSSMManageResourcesExecutionPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupSSMLifecycleManagementExecutionPolicy

The `AWSQuickSetupSSMLifecycleManagementExecutionPolicy` policy grants administrative permissions that allow Quick Setup to run the a Amazon CloudFormation custom resource on lifecycle events during Quick Setup deployment in Systems Manager.

You can attach this policy to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to get information about automation executions and start automation executions for setting up certain Quick Setup operations.
- `iam` – Allows principals to pass roles from IAM for setting up certain Quick Setup resources.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupSSMLifecycleManagementExecutionPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupSSMDeploymentRolePolicy

The managed policy `AWSQuickSetupSSMDeploymentRolePolicy` grants administrative permissions that allow Quick Setup to create resources that are used during the Systems Manager onboarding process.

Though you can manually attach this policy to your IAM entities, this is not recommended. Quick Setup creates entities that attach this policy to a service role that allows Systems Manager to perform actions on your behalf.

This policy is not related to the `SSMQuickSetupRolePolicy` policy, which is used to provide permissions for the `AWSServiceRoleForSSMQuickSetup` service-linked role.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to manage associations for certain resources that are created using Amazon CloudFormation templates and a specific set of SSM documents; to manage roles and role policies using for diagnosing and remediating managed nodes through Amazon CloudFormation templates; and to attach and delete policies for Quick Setup lifecycle events
- `iam` – Allows principals to tag roles and pass roles permissions for the Systems Manager service and Lambda service, and to pass role permissions for diagnosis operations.
- `lambda` – Allows principals to tag and manage functions for the Quick Setup lifecycle in the principal account using Amazon CloudFormation templates.

- `cloudformation` – Allows principals to read information from Amazon CloudFormation. This is required so Quick Setup can gather data about the Amazon CloudFormation stacks used to manage the state of resources and CloudFormation stackset operations.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupSSMDeploymentRolePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupSSMDeploymentS3BucketRolePolicy

The `AWSQuickSetupSSMDeploymentS3BucketRolePolicy` policy grants permissions for listing all S3 buckets in an account; and for managing and retrieving information about specific buckets in the principal account that are managed through Amazon CloudFormation templates.

You can attach `AWSQuickSetupSSMDeploymentS3BucketRolePolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

Permissions details

This policy includes the following permissions.

- `s3` – Allows principals list all S3 buckets in an account; and to manage and retrieve information about specific buckets in the principal account that are managed through Amazon CloudFormation templates.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupSSMDeploymentS3BucketRolePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupEnableDHMCExecutionPolicy

This policy grants administrative permissions that allow principals to run the `AWSQuickSetupType-EnableDHMC` Automation runbook, which enables Default Host Management Configuration. The Default Host Management Configuration setting allows Systems Manager to automatically manage Amazon EC2 instances as *managed instances*. A managed instance is an EC2 instance that is configured for use with Systems Manager. This policy also grants permissions for creating IAM roles that are specified in Systems Manager service settings as the default roles for SSM Agent.

You can attach `AWSQuickSetupEnableDHMCExecutionPolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to update and get information about Systems Manager service settings.
- `iam` – Allows principals to create and retrieve information about IAM roles for Quick Setup operations.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupEnableDHMCExecutionPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupEnableAREXExecutionPolicy

This policy grants administrative permissions that allow Systems Manager to run the `AWSQuickSetupType-EnableAREX` Automation runbook, which enables Amazon Resource Explorer for use with Systems Manager. Resource Explorer makes it possible to view resources in your account with a search experience similar to an Internet search engine. The policy also grants permissions for managing Resource Explorer indexes and views.

You can attach `AWSQuickSetupEnableAREXExecutionPolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

Permissions details

This policy includes the following permissions.

- `iam` – Allows principals to create a service-linked role in the Amazon Identity and Access Management (IAM) service.
- `resource-explorer-2` – Allows principals to retrieve information about Resource Explorer views and indexes; to create Resource Explorer views and indexes; to change the index type for indexes displayed in Quick Setup.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupEnableAREXExecutionPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupManagedInstanceProfileExecutionPolicy

This policy grants administrative permissions that allow Systems Manager to create a default IAM instance profile for the Quick Setup capability and attach it to Amazon EC2 instances that don't already have an instance profile attached.

You can attach `AWSQuickSetupManagedInstanceProfileExecutionPolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

Permissions details

This policy includes the following permissions.

- `ec2` – Allows principals to associate IAM instance profiles to Amazon EC2 instances and retrieve information about instance profile associations and instances.
- `iam` – Allows principals to create and manage the default IAM role and instance profile for Quick Setup, attach managed policies to roles, tag roles, and pass roles to Amazon EC2 and Systems Manager services.
- `ssm` – Allows principals to start and monitor automation executions, retrieve instance information, update managed instance roles, and add tags to automation resources.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupManagedInstanceProfileExecutionPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupManageJITNAResourcesExecutionPolicy

The managed policy `AWSQuickSetupManageJITNAResourcesExecutionPolicy` enables Quick Setup, a tool in Systems Manager, to set up just-in-time node access.

You can attach `AWSQuickSetupManageJITNAResourcesExecutionPolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

This policy grants administrative permissions that allow Systems Manager to create resources associated with just-in-time node access.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to get and update the service setting that specifies the identity provider for just-in-time node access.
- `iam` – Allows principals to create, tag, and get roles, attach role policies for just-in-time node access managed policies, and create service-linked roles for just-in-time node access and notifications.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupManageJITNAResourcesExecutionPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSQuickSetupJITNADeploymentRolePolicy

The managed policy `AWSQuickSetupJITNADeploymentRolePolicy` allows Quick Setup to deploy the configuration type required to set up just-in-time node access.

You can attach `AWSQuickSetupJITNADeploymentRolePolicy` to your IAM entities. Systems Manager also attaches this policy to a service role that allows Systems Manager to perform actions on your behalf.

This policy grants administrative permissions that allow Systems Manager to create resources associated with just-in-time node access.

Permissions details

This policy includes the following permissions.

- `cloudformation` – Allows principals to create, update, delete, and read Amazon CloudFormation stacks.
- `ssm` – Allows principals to create, delete, update, and read State Manager associations that are called by Amazon CloudFormation.
- `iam` – Allows principals create, delete, read and tag IAM roles that are called by Amazon CloudFormation.

To view more details about the policy, including the latest version of the JSON policy document, see AWSQuickSetupJITNADeploymentRolePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSSystemsManagerJustInTimeAccessServicePolicy

The managed policy `AWSSystemsManagerJustInTimeAccessServicePolicy` provides access to Amazon resources managed or used by the Amazon Systems Manager just-in-time access framework. This policy update adds automation execution tagging permissions to enable customers to scope down operator permissions to specific tags.

You can't attach `AWSSystemsManagerJustInTimeAccessServicePolicy` to your IAM entities. This policy is attached to a service-linked role that allows Systems Manager to perform actions on your behalf. For more information, see Using roles to enable just-in-time node access.

This policy grants administrative permissions that allows access to resources associated with just-in-time node access.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to create and manage OpsItems, add tags to OpsItems and automation executions, get and update OpsItems, retrieve and describe documents, describe OpsItems and sessions, list documents and tags for managed instances.
- `ssm-guiconnect` – Allows principals to list connections.
- `identitystore` – Allows principals to get user and group IDs, describe users, and list group membership.
- `sso-directory` – Allows principals to describe users and determine if a user is a member of a group.
- `sso` – Allows principals to describe registered Regions and list instances and directory associations.
- `cloudwatch` – Allows principals to put metric data for the `AWS/SSM/JustInTimeAccess` namespace.
- `ec2` – Allows principals to describe tags.

To view more details about the policy, including the latest version of the JSON policy document, see AWSSystemsManagerJustInTimeAccessServicePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSSystemsManagerJustInTimeAccessTokenPolicy

The managed policy `AWSSystemsManagerJustInTimeAccessTokenPolicy` provides permissions for users to establish secure connections to Amazon EC2 instances and managed instances through Session Manager and Systems Manager GUI Connect RDP connections as part of just-in-time node access workflows.

You can attach `AWSSystemsManagerJustInTimeAccessTokenPolicy` to your IAM entities.

This policy grants contributor permissions that allow users to start and manage secure sessions, establish RDP connections, and perform necessary cryptographic operations for just-in-time node access.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to start Session Manager sessions on Amazon EC2 instances and managed instances using the SSM-SessionManagerRunShell document. Also allows terminating and resuming sessions, retrieving command invocation details, and sending commands to instances for SSO user setup when called through Systems Manager GUI Connect. Additionally allows starting port forwarding sessions for RDP connections when called through Systems Manager GUI Connect.
- `ssmmessages` – Allows principals to open data channels for secure communication during Session Manager sessions.
- `ssm-guiconnect` – Allows principals to start, get details about, and cancel Systems Manager GUI Connect RDP connections to instances.
- `kms` – Allows principals to generate data keys for Session Manager encryption and create grants for RDP connections. These permissions are restricted to Amazon KMS keys tagged with `SystemsManagerJustInTimeNodeAccessManaged=true`. Grant creation is further restricted to be used only through the Systems Manager GUI Connect service.
- `sso` – Allows principals to list directory associations when called through Systems Manager GUI Connect. This is required for RDP SSO user setup.
- `identitystore` – Allows principals to describe users in the identity store when called through Systems Manager GUI Connect. This is required for RDP SSO user setup.

To view more details about the policy, including the latest version of the JSON policy document, see AWSSystemsManagerJustInTimeAccessTokenPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSSystemsManagerJustInTimeAccessTokenSessionPolicy

The managed policy `AWSSystemsManagerJustInTimeAccessTokenSessionPolicy` allows Systems Manager to apply scoped down permissions to a just-in-time node access token.

You can attach `AWSSystemsManagerJustInTimeAccessTokenSessionPolicy` to your IAM entities.

This policy grants administrative permissions that allow Systems Manager to scope down permissions for just-in-time node access tokens.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to start Session Manager sessions using the `SSM-SessionManagerRunShell` document. Also when called first through `ssm-guiconnect`, start sessions using the `AWS-StartPortForwardingSession` document, list command invocations, and send commands using the `AWSSSO-CreateSSOUser` document.
- `ssm-guiconnect` – Allows principals to cancel, get, and start connections on all resources.
- `kms` – Allows principals to create grants and generate data keys for keys tagged with `SystemsManagerJustInTimeNodeAccessManaged` when called through `ssm-guiconnect` by an Amazon service.
- `sso` – Allows principals to list directory associations when called through `ssm-guiconnect`.
- `identitystore` – Allows principals to describe a user when called through `ssm-guiconnect`.

To view more details about the policy, including the latest version of the JSON policy document, see AWSSystemsManagerJustInTimeAccessTokenSessionPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSSystemsManagerJustInTimeNodeAccessRolePropagationPolicy

The managed policy `AWSSystemsManagerJustInTimeNodeAccessRolePropagationPolicy` allows Systems Manager to share deny-access policies from the delegated administrator account to member accounts, and replicate the policies across multiple Amazon Web Services Regions.

You can attach `AWSSystemsManagerJustInTimeNodeAccessRolePropagationPolicy` to your IAM entities.

This policy provides the administrative permissions necessary for Systems Manager to share and create deny-access policies. This ensures that deny-access policies are applied to all accounts in an Amazon Organizations organization and Regions configured for just-in-time node access.

Permissions details

This policy includes the following permissions.

- `ssm` – Allows principals to manage SSM documents and resource policies.
- `ssm-quicksetup` – Allows principals to read Quick Setup configuration managers.
- `organizations` – Allows principals to list details about an Amazon Organizations organization and delegated administrators.
- `ram` – Allows principals to create, tag, and describe resource shares.
- `iam` – Allows principals to describe a service role.

To view more details about the policy, including the latest version of the JSON policy document, see AWSSystemsManagerJustInTimeNodeAccessRolePropagationPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWSSystemsManagerNotificationsServicePolicy

The managed policy `AWSSystemsManagerNotificationsServicePolicy` allows Systems Manager to send email notifications for just-in-time node access requests to access request approvers.

You can't attach `AWSSystemsManagerJustInTimeAccessServicePolicy` to your IAM entities. This policy is attached to a service-linked role that allows Systems Manager to perform actions

on your behalf. For more information, see Using roles to send just-in-time node access request notifications.

This policy grants administrative permissions that allow Systems Manager to send email notifications for just-in-time node access requests to access request approvers.

Permissions details

This policy includes the following permissions.

- `identitystore` – Allows principals to list and describe users and group membership.
- `sso` – Allows principals to list instances, directories, and describe registered Regions.
- `sso-directory` – Allows principals to describe users and list members in a group.
- `iam` – Allows principals to get information about roles.

To view more details about the policy, including the latest version of the JSON policy document, see AWSSystemsManagerNotificationsServicePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWS-SSM-Automation-DiagnosisBucketPolicy

The managed policy `AWS-SSM-Automation-DiagnosisBucketPolicy` provides permissions for diagnosing issues with nodes that interact with Amazon Systems Manager services, by allowing access to S3 buckets that are used for diagnosis and remediation of issues.

You can attach the `AWS-SSM-Automation-DiagnosisBucketPolicy` policy to your IAM identities. Systems Manager also attaches this policy to an IAM role that allows Systems Manager to perform diagnosis actions on your behalf.

Permissions details

This policy includes the following permissions.

- `s3` – Allows principals to access and write objects to an Amazon S3 bucket.

To view more details about the policy, including the latest version of the JSON policy document, see AWS-SSM-Automation-DiagnosisBucketPolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWS-SSM-RemediationAutomation-OperationalAccountAdministrationRolePolicy

The managed policy `AWS-SSM-RemediationAutomation-OperationalAccountAdministrationRolePolicy` provides permissions for an operational account to diagnose issues with nodes by providing organization-specific permissions.

You can attach `AWS-SSM-RemediationAutomation-OperationalAccountAdministrationRolePolicy` to your IAM identities. Systems Manager also attaches this policy to an IAM role that allows Systems Manager to perform diagnosis actions on your behalf.

Permissions details

This policy includes the following permissions.

- `organizations` – Allows principals to list a root of the organization, and get member accounts to determine target accounts.
- `sts` – Allows principals to assume remediation execution roles to run SSM Automation documents across accounts and Regions, within the same organization.

To view more details about the policy, including the latest version of the JSON policy document, see AWS-SSM-RemediationAutomation-OperationalAccountAdministrationRolePolicy in the *Amazon Managed Policy Reference Guide*.

Amazon managed policy: AWS-SSM-DiagnosisAutomation-OperationalAccountAdministrationRolePolicy

The managed policy `AWS-SSM-DiagnosisAutomation-OperationalAccountAdministrationRolePolicy` provides permissions for an operational account to diagnose issues with nodes by providing organization-specific permissions.

You can attach the `AWS-SSM-DiagnosisAutomation-OperationalAccountAdministrationRolePolicy` policy to your IAM identities. Systems Manager also attaches this policy to an IAM role that allows Systems Manager to perform diagnosis actions on your behalf.

Permissions details

This policy includes the following permissions.

- `organizations` – Allows principals to list a root of the organization, and get member accounts to determine target accounts.
- `sts` – Allows principals to assume diagnosis execution roles to run SSM Automation documents across accounts and Regions, within the same organization.

To view more details about the policy, including the latest version of the JSON policy document, see AWS-SSM-DiagnosisAutomation-OperationalAccountAdministrationRolePolicy in the *Amazon Managed Policy Reference Guide*.

Systems Manager updates to Amazon managed policies

In the following table, view details about updates to Amazon managed policies for Systems Manager since this service began tracking these changes on March 12, 2021. For information about other managed policies for the Systems Manager service, see Additional managed policies for Systems Manager later in this topic. For automatic alerts about changes to this page, subscribe to the RSS feed on the Systems Manager Document history page.

Change	Description	Date
AWSQuickSetupPatchPolicyLambdaExecutionPolicy – New managed policy	Systems Manager added a new managed policy `AWSQuickSetupPatchPolicyLambdaExecutionPolicy` that grants permissions to manage State Manager associations for automated cleanup operations when Quick Setup configurations are deleted.	June 3, 2026
AWSQuickSetupPatchPolicyTagManagementExecutionPolicy – New managed policy	Systems Manager added a new managed policy to enable Quick Setup patch policy configurations to track which instances are managed	June 3, 2026

Change	Description	Date
	through automated tagging and inventory collection. The policy grants permissions to add or remove QSConfigName-* tags on Amazon EC2 instances and SSM managed instances, along with SSM inventory retrieval capabilities.	
AWSQuickSetupManagedInstanceProfileExecutionPolicy – Updated managed policy	Systems Manager updated the managed policy to support Quick Setup PatchPolicy migration from Amazon CloudFormation inline policies to managed policies. The update adds automation execution capabilities including instance discovery, role updates, role tagging, and expanded PassRole permissions to Systems Manager. A protective Deny statement prevents modification of Quick Setup automation roles.	June 3, 2026

Change	Description	Date
AmazonSSMAutomationRole – Update to an existing policy	Systems Manager added the `cloudformation:TagResource` and `cloudformation:UntagResource` permissions. These permissions allow Automation runbooks that create CloudFormation stacks to add and remove tags from resources.	March 20, 2026
AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy – Updated managed policy	Systems Manager updated the managed policy to add additional EC2 and SSM permissions for enhanced diagnosis capabilities. The policy now includes permissions to describe EC2 instance status and network ACLs, and SSM activations and service settings, providing more comprehensive diagnostic information for troubleshooting managed node issues.	December 19, 2025

Change	Description	Date
AWSQuickSetupDeploymentRolePolicy – Updated managed policy	Systems Manager updated the managed policy `AWSQuickSetupDeploymentRolePolicy` to add support for two additional SSM documents : `AWSQuickSetupType-ConfigureDevOpsGuru` and `AWSQuickSetupType-DeployConformancePack` . These additions enable Quick Setup to deploy DevOps Guru configurations and conformance packs through the policy.	December 15, 2025
AWSSystemsManagerJustInTimeAccessTokenPolicy – Update to an existing policy	Systems Manager updated the managed policy `AWSSystemsManagerJustInTimeAccessTokenPolicy` . The statement (SID) `TerminateAndResumeSession` has been renamed to `TerminateAndResumeSessionAndOpenDataChannel` and now includes the `ssmmessages:OpenDataChannel` action, combining session management and data channel permissions into a single statement.	September 25, 2025

Change	Description	Date
Updated managed policies: • AWSQuickSetupSSMLifecycleManagementExecutionPolicy • AWSQuickSetupPatchPolicyPermissionsBoundary • AWSQuickSetupManagedInstanceProfileExecutionPolicy	Systems Manager updated three managed policies to add support for starting Automation executions on additional Systems Manager resources, including specific Automation runbooks and SSM Command documents.	September 12, 2025
AWSQuickSetupStartStopInstancesExecutionPolicy – Updated managed policy	Systems Manager updated the managed policy to refine permissions for Quick Setup scheduler configuration. The policy now provides more specific permissions for starting and stopping Amazon EC2 instances, accessing change calendars, and executing automation documents with enhanced security conditions.	September 12, 2025

Change	Description	Date
AWSQuickSetupStartSSMAssociationsExecutionPolicy – Updated managed policy	Systems Manager updated the managed policy to change the automation document from `AWSQuickSetupType-StartSSMAssociations` to `AWSQuickSetupType-Scheduler-ChangeCalendarState` . This update changes the policy's purpose from starting SSM associations to managing change calendar states for scheduled operations.	September 12, 2025
AmazonSSMAutomationRole – Update to an existing policy	Systems Manager added new permissions to allow Automation runbooks to establish communication channels for session-based operations. Added the `ssmmessages:OpenDataChannel` permission for the resource `arn:*:ssm:*:*:session/*` .	September 11, 2025

Change	Description	Date
AWSSystemsManagerJustInTimeAccessServicePolicy – Updated managed policy	Systems Manager updated the managed policy to add automation execution tagging permissions. The service needs to tag automation executions with `SystemsManagerJustInTimeNodeAccessManaged=true` tag to enable customers to scope down operator permissions to specific tags.	August 25, 2025
AWSQuickSetupStartSSMAssociationsExecutionPolicy – New policy	Systems Manager added a new policy to allow Quick Setup to run the `AWSQuickSetupType-StartSSMAssociations` Automation runbook. This runbook is used to start State Manager associations that are created by Quick Setup configurations.	August 12, 2025
AWSQuickSetupStartStopInstancesExecutionPolicy – New policy	Systems Manager added a new policy to allow Quick Setup to start and stop Amazon EC2 instances on a schedule. This policy provides the necessary permissions for the Quick Setup scheduler configuration type to manage instance state based on defined schedules.	August 12, 2025

Change	Description	Date
AWSQuickSetupDeploymentRolePolicy – Update to documentation	Systems Manager has updated the `AWSQuickSetupDeploymentRolePolicy` managed policy to grant permissions for additional resources. In addition, the documentation for `AWSQuickSetupDeploymentRolePolicy` has been updated with more detailed descriptions of the permissions granted by this policy for Quick Setup configuration management operations.	August 12, 2025

Change	Description	Date
AWS-SSM-RemediationAutomation-ExecutionRolePolicy – Update to an existing policy	Systems Manager updated the managed policy to improve the security posture of the ssm:StartAutomationExecution API by requiring permissions for both "document" and "automation-execution" resource types. The updated policy provides more comprehensive and detailed permissions for remediation automation execution, including enhanced descriptions for networking remediation capabilities, more specific Amazon VPC endpoint creation permissions, detailed security group management permissions, and improved resource tagging controls for remediation operations.	July 16th, 2025

Change	Description	Date
AWS-SSM-RemediationAutomation-AdministrationRolePolicy – Update to an existing policy	Systems Manager updated the managed policy to support API authorization improvements for remediation automation operations. The updated policy enhances permissions for executing activities defined within Automation documents, with improved security controls and resource access patterns for remediation workflows.	July 16th, 2025
AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy – Update to an existing policy	Systems Manager updated the managed policy to provide more detailed and accurate permissions for diagnosis automation execution. The updated policy includes enhanced descriptions for Amazon EC2 and Amazon VPC resource access, more specific SSM automation permissions, and improved Amazon KMS and IAM permission descriptions with proper resource restrictions.	July 16th, 2025

Change	Description	Date
AWS-SSM-DiagnosisAutomation-AdministrationRolePolicy – Update to an existing policy	Systems Manager updated the managed policy to provide more specific permissions and security conditions for diagnosis automation operations. The updated policy provides enhanced security controls for Amazon KMS key usage, Amazon S3 bucket access, and role assumptions, with stricter resource-based conditions and account-level restrictions.	July 16th, 2025
AWSQuickSetupDeploymentRolePolicy – Update to a policy	Systems Manager added permissions to the managed policy `AWSQuickSetupDeploymentRolePolicy` for accessing the Amazon owned runbook AWSQuickSetupType-ManageInstanceProfile. This permission makes it possible for Quick Setup to create associations using the managed policy instead of inline policies.	July 14th, 2025

Change	Description	Date
AmazonSSMAutomationRole – Update to documentation	Systems Manager added comprehensive documentation for the existing `AmazonSSMAutomationRole` policy, which provides permissions for the Systems Manager Automation service to run activities defined within Automation runbooks.	July 15, 2025
AWSSystemsManagerJustInTimeNodeAccessRolePropagationPolicy – Update to an policy	Systems Manager added permissions to allow Systems Manager to tag a resource shared by Amazon Resource Access Manager for just-in-time node access.	April 30th, 2025
AWSQuickSetupManageJITNAResourcesExecutionPolicy – Update to a policy	Systems Manager added permissions to allow Systems Manager to tag IAM roles created for just-in-time node access.	April 30th, 2025
AWSSystemsManagerJustInTimeAccessTokenSessionPolicy – New policy	Systems Manager added a new policy to allow Systems Manager to apply scoped down permissions to a just-in-time node access token.	April 30th, 2025

Change	Description	Date
AWSSystemsManagerNotificationsServicePolicy – New policy	Systems Manager added a new policy to allow Systems Manager to send email notifications for just-in-time node access requests to access request approvers.	April 30th, 2025
AWSSystemsManagerJustInTimeNodeAccessRolePropagationPolicy – New policy	Systems Manager added a new policy to allow Systems Manager to replicate approval policies to different Regions.	April 30th, 2025
AWSSystemsManagerJustInTimeAccessTokenPolicy – New policy	Systems Manager added a new policy to allow Systems Manager to generate access tokens used for just-in-time node access.	April 30th, 2025
AWSSystemsManagerJustInTimeAccessServicePolicy – New policy	Systems Manager added a new policy to provide permissions to Amazon resources managed or used by the Systems Manager just-in-time node access feature.	April 30th, 2025
AWSQuickSetupManageJITNAResourcesExecutionPolicy – New policy	Systems Manager added a new policy to allow Quick Setup, a tool in Systems Manager to create the IAM roles necessary for just-in-time node access.	April 30th, 2025

Change	Description	Date
AWSQuickSetupJITNADeploymentRolePolicy – New policy	Systems Manager added a new policy that provides permissions that allow Quick Setup to deploy the configuration type required to set up just-in-time node access.	April 30th, 2025
AWSSystemsManagerJustInTimeNodeAccessRolePropagationPolicy – Update to an policy	Systems Manager added permissions to allow Systems Manager to tag a resource shared by Amazon Resource Access Manager for just-in-time node access.	April 30th, 2025
AWSQuickSetupManageJITNAResourcesExecutionPolicy – Update to an policy	Systems Manager added permissions to allow Systems Manager to tag IAM roles created for just-in-time node access.	April 30th, 2025
AWSSystemsManagerJustInTimeAccessTokenSessionPolicy – New policy	Systems Manager added a new policy to allow Systems Manager to apply scoped down permissions to a just-in-time node access token.	April 30th, 2025
AWSSystemsManagerNotificationsServicePolicy – New policy	Systems Manager added a new policy to allow Systems Manager to send email notifications for just-in-time node access requests to access request approvers.	April 30th, 2025

Change	Description	Date
AWSSystemsManagerJustInTimeNodeAccessRolePropagationPolicy – New policy	Systems Manager added a new policy to allow Systems Manager to replicate approval policies to different Regions.	April 30th, 2025
AWSSystemsManagerJustInTimeAccessTokenPolicy – New policy	Systems Manager added a new policy to allow Systems Manager to generate access tokens used for just-in-time node access.	April 30th, 2025
AWSSystemsManagerJustInTimeAccessServicePolicy – New policy	Systems Manager added a new policy to provide permissions to Amazon resources managed or used by the Systems Manager just-in-time node access feature.	April 30th, 2025
AWSQuickSetupManageJITNAResourcesExecutionPolicy – New policy	Systems Manager added a new policy to allow Quick Setup, a tool in Systems Manager to create the IAM roles necessary for just-in-time node access.	April 30th, 2025
AWSQuickSetupJITNADeploymentRolePolicy – New policy	Systems Manager added a new policy that provides permissions that allow Quick Setup to deploy the configuration type required to set up just-in-time node access.	April 30th, 2025

Change	Description	Date
AWS-SSM-DiagnosisAutomation-OperationalAccountAdministrationRolePolicy – New policy	Systems Manager added a new policy that provides permissions for an operational account to diagnose issues with nodes by providing organization-specific permissions.	November 21, 2024
AWS-SSM-RemediationAutomation-OperationalAccountAdministrationRolePolicy – New policy	Systems Manager added a new policy that provides permissions for an operational account to diagnose issues with nodes by providing organization-specific permissions.	November 21, 2024
AWS-SSM-Automation-DiagnosisBucketPolicy – New policy	Systems Manager added a new policy to support starting Automation workflows that diagnose issues with managed nodes in targeted accounts and Regions.	November 21, 2024
AmazonSSMServiceRolePolicy – Update to an existing policy	Systems Manager added new permissions to allow Amazon Resource Explorer to gather details about Amazon EC2 instances and display the results in widgets in the new Systems Manager Dashboard.	November 21, 2024

Change	Description	Date
SSMQuickSetupRolePolicy – Update to an existing policy	Systems Manager has updated the managed policy SSMQuickSetupRolePolicy . This updates allows the associated service-linked role AWSServiceRoleForSSMQuickSetup to manage resource data syncs.	November 21, 2024
AWS-SSM-DiagnosisAutomation-AdministrationRolePolicy – New policy	Systems Manager added a new policy to support starting Automation workflows that diagnose issues with managed nodes in targeted account and Regions.	November 21, 2024
AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy – New policy	Systems Manager added a new policy to support starting Automation workflows that diagnose issues with managed nodes in a targeted account and Region.	November 21, 2024
AWS-SSM-RemediationAutomation-AdministrationRolePolicy – New policy	Systems Manager added a new policy to support starting Automation workflows that remediate issues in managed nodes in targeted accounts and Regions.	November 21, 2024

Change	Description	Date
AWS-SSM-RemediationAutomation-ExecutionRolePolicy – New policy	Systems Manager added a new policy to support starting Automation workflows that remediate issues in managed nodes in a targeted account and Region.	November 21, 2024
AWSQuickSetupSSMDeploymentRolePolicy – Update to an policy	Systems Manager added permissions to allow Systems Manager to tag IAM roles and Lambda created for the unified console.	May 7th, 2025
AWSQuickSetupSSMManageResourcesExecutionPolicy – New policy	Systems Manager added a new policy to support running an operation in Quick Setup that creates IAM roles for Quick Setup associations, which in turn are created by a AWSQuickSetupType-SSM deployment.	November 21, 2024
AWSQuickSetupSSMLifecycleManagementExecutionPolicy – New policy	Systems Manager added a new policy to support Quick Setup running a Amazon CloudFormation custom resource on lifecycle events during a Quick Setup deployment.	November 21, 2024

Change	Description	Date
AWSQuickSetupSSMDeploymentRolePolicy – New policy	Systems Manager added a new policy to support granting administrative permissions that allow Quick Setup to create resources that are using during the Systems Manager onboarding process.	November 21, 2024
AWSQuickSetupSSMDeploymentS3BucketRolePolicy – New policy	Systems Manager added a new policy to support managing and retrieving information about specific buckets in the principal account that are managed through Amazon CloudFormation templates	November 21, 2024
AWSQuickSetupEnableDHMCExecutionPolicy – New policy	Systems Manager is introducing a new policy to allow Quick Setup to create an IAM role that itself uses the existing AmazonSSMManagedEC2InstanceDefaultPolicy. This policy contains all the permissions required for SSM Agent to communicate with Systems Manager service. The new policy also allows modifications to the Systems Manager service settings.	November 21, 2024

Change	Description	Date
AWSQuickSetupEnableAREXExecutionPolicy – New policy	Systems Manager added a new policy to allow Quick Setup to create a service-linked role for Amazon Resource Explorer, for accessing Resource Explorer views and aggregator indexes.	November 21, 2024
AWSQuickSetupManagedInstanceProfileExecutionPolicy – New policy	Systems Manager added a new policy to allow Quick Setup to create a default Quick Setup instance profile and to attach it to any Amazon EC2 instances that lack an associated instance profile. This new policy also allows Quick Setup to attach permissions to existing profiles to make sure that all required Systems Manager permissions have been granted.	November 21, 2024
SSMQuickSetupRolePolicy – Update to an existing policy	Systems Manager added new permissions to allow Quick Setup to check the health of additional Amazon CloudFormation stack sets that it has created.	August 13, 2024

Change	Description	Date
AmazonSSMManagedEC2InstanceDefaultPolicy – Update to an existing policy	Systems Manager has added statement IDs (Sids) to the JSON policy for AmazonSSMManagedEC2InstanceDefaultPolicy. These Sids provide inline descriptions of the purpose of each policy statement.	July 18, 2024
SSMQuickSetupRolePolicy – New policy	Systems Manager added a new policy to allow Quick Setup to check the health of deployed resources and remediate instances that have drifted from the original configuration.	July 3, 2024
AWSQuickSetupDeploymentRolePolicy – New policy	Systems Manager added a new policy to support multiple Quick Setup configuration types that create IAM roles and automations, which in turn configure frequently used Amazon Web Services services and features with recommended best practices.	July 3, 2024
AWSQuickSetupPatchPolicyDeploymentRolePolicy – New policy	Systems Manager added a new policy to allow Quick Setup to create resources associated with Patch Manager patch policy Quick Setup configurations.	July 3, 2024

Change	Description	Date
AWSQuickSetupPatchPolicyBaselineAccess – New policy	Systems Manager added a new policy to allow Quick Setup to access patch baselines in Patch Manager with read-only permissions.	July 3, 2024
AWSSystemsManagerEnableExplorerExecutionPolicy – New policy	Systems Manager added a new policy to allow Quick Setup to grant administrative permissions for enabling Explorer.	July 3, 2024
AWSSystemsManagerEnableConfigRecordingExecutionPolicy – New policy	Systems Manager added a new policy to allow Quick Setup to enable and configure Amazon Config configuration recording.	July 3, 2024
AWSQuickSetupDevOpsGuruPermissionsBoundary – New policy	Systems Manager added a new policy to allow Quick Setup to enable and configure Amazon DevOps Guru.	July 3, 2024
AWSQuickSetupDistributorPermissionsBoundary – New policy	Systems Manager added a new policy to allow Quick Setup to enable and configure Distributor, a tool in Amazon Systems Manager.	July 3, 2024
AWSQuickSetupSSMHostMgmtPermissionsBoundary – New policy	Systems Manager added a new policy to allow Quick Setup to enable and configure Systems Manager tools for securely managing Amazon EC2 instances.	July 3, 2024

Change	Description	Date
AWSQuickSetupPatchPolicyPermissionsBoundary – New policy	Systems Manager added a new policy to allow Quick Setup to enable and configure patch policies in Patch Manager, a tool in Amazon Systems Manager.	July 3, 2024
AWSQuickSetupSchedulerPermissionsBoundary – New policy	Systems Manager added a new policy to allow Quick Setup to enable and configure scheduled operations on Amazon EC2 instances and other resources.	July 3, 2024
AWSQuickSetupCFGCPacksPermissionsBoundary – New policy	Systems Manager added a new policy to allow Quick Setup to deploy Amazon Config conformance packs.	July 3, 2024
AWSSystemsManagerOpsDataSyncServiceRolePolicy – Update to an existing policy	OpsCenter updated the policy to improve the security of the service code within the service-linked role for Explorer to manage OpsData-related operations.	July 3, 2023
AmazonSSMManagedEC2InstanceDefaultPolicy – New policy	Systems Manager added a new policy to allow Systems Manager functionality on Amazon EC2 instances without the use of an IAM instance profile.	August 18, 2022

Change	Description	Date
AmazonSSMServiceRolePolicy – Update to an existing policy	Systems Manager added new permissions to allow Explorer to create a managed rule when you turn on Security Hub CSPM from Explorer or OpsCenter. New permissions were added to check that config and the compute-optimizer meet the necessary requirements before allowing OpsData.	April 27, 2021
AWSSystemsManagerOpsDataSyncServiceRolePolicy – New policy	Systems Manager added a new policy to create and update OpsItems and OpsData from Security Hub CSPM findings in Explorer and OpsCenter.	April 27, 2021
AmazonSSMServiceRolePolicy – Update to an existing policy	Systems Manager added new permissions to allow viewing aggregate OpsData and OpsItems details from multiple accounts and Amazon Web Services Regions in Explorer.	March 24, 2021
Systems Manager started tracking changes	Systems Manager started tracking changes for its Amazon managed policies.	March 12, 2021

Additional managed policies for Systems Manager

Besides the managed policies described earlier in this topic, the following policies are also supported by Systems Manager.

- AmazonSSMAutomationApproverAccess – Amazon managed policy that allows access to view automation executions and send approval decisions to automation that is waiting for approval.
- AmazonSSMDirectoryServiceAccess – Amazon managed policy that that allows SSM Agent to access Amazon Directory Service on behalf of the user for requests to join the domain by the managed node.
- AmazonSSMFullAccess – Amazon managed policy that grants full access to the Systems Manager API and documents.
- AmazonSSMMaintenanceWindowRole – Amazon managed policy that provides maintenance windows with permissions to the Systems Manager API.
- AmazonSSMManagedInstanceCore – Amazon managed policy that allows a node to use Systems Manager service core functionality.
- AmazonSSMPatchAssociation – Amazon managed policy that provides access to child instances for patch association operations.
- AmazonSSMReadOnlyAccess – Amazon managed policy that grants access to Systems Manager read-only API operations, such as `Get*` and `List*`.
- AWSSSMOpsInsightsServiceRolePolicy – Amazon managed policy that provides permissions for creating and updating operational insight *OpsItems* in Systems Manager. Used to provide permissions through the service-linked role AWSServiceRoleForAmazonSSM_OpsInsights.
- AWSSystemsManagerAccountDiscoveryServicePolicy – Amazon managed policy that grants Systems Manager permission to discover Amazon Web Services account information.
- AmazonEC2RoleforSSM – This policy is no longer supported and should not be used. In its place, use the `AmazonSSMManagedInstanceCore` policy to allow Systems Manager service core functionality on EC2 instances. For information, see Configure instance permissions required for Systems Manager.

Troubleshooting Amazon Systems Manager identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with Amazon Systems Manager and Amazon Identity and Access Management (IAM).

Topics

- I am not authorized to perform an action in Systems Manager

- I am not authorized to perform iam:PassRole
- I want to allow people outside of my Amazon Web Services account to access my Systems Manager resources

I am not authorized to perform an action in Systems Manager

If the Amazon Web Services Management Console tells you that you're not authorized to perform an action, then you must contact your administrator for assistance. Your administrator is the person that provided you with your sign-in credentials.

The following example error occurs when the `mateojackson` user tries to use the console to view details about a document but doesn't have `ssm:GetDocument` permissions.

```
User: arn:aws-cn:ssm::123456789012:user/mateojackson isn't authorized to perform:
 ssm:GetDocument on resource: MyExampleDocument
```

In this case, Mateo asks his administrator to update his policies to allow him to access the `MyExampleDocument` resource using the `ssm:GetDocument` action.

I am not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the `iam:PassRole` action, your policies must be updated to allow you to pass a role to Systems Manager.

Some Amazon Web Services services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named `marymajor` tries to use the console to perform an action in Systems Manager. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws-cn:iam::123456789012:user/marymajor is not authorized to perform:
 iam:PassRole
```

In this case, Mary's policies must be updated to allow her to perform the `iam:PassRole` action.

If you need help, contact your Amazon administrator. Your administrator is the person who provided you with your sign-in credentials.

I want to allow people outside of my Amazon Web Services account to access my Systems Manager resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether Systems Manager supports these features, see How Amazon Systems Manager works with IAM.
- To learn how to provide access to your resources across Amazon Web Services accounts that you own, see Providing access to an IAM user in another Amazon Web Services account that you own in the *IAM User Guide*.
- To learn how to provide access to your resources to third-party Amazon Web Services accounts, see Providing access to Amazon Web Services accounts owned by third parties in the *IAM User Guide*.
- To learn how to provide access through identity federation, see Providing access to externally authenticated users (identity federation) in the *IAM User Guide*.
- To learn the difference between using roles and resource-based policies for cross-account access, see Cross account resource access in IAM in the *IAM User Guide*.

Using service-linked roles for Systems Manager

Amazon Systems Manager uses Amazon Identity and Access Management (IAM) service-linked roles. A service-linked role is a unique type of IAM role that is linked directly to Systems Manager. Service-linked roles are predefined by Systems Manager and include all the permissions that the service requires to call other Amazon Web Services services on your behalf.

> **Note**
>
> A *service role* role differs from a service-linked role. A service role is a type of Amazon Identity and Access Management (IAM) role that grants permissions to an Amazon Web Services service so that the service can access Amazon resources. Only a few Systems Manager scenarios require a service role. When you create a service role for Systems

Manager, you choose the permissions to grant so that it can access or interact with other Amazon resources.

A service-linked role makes setting up Systems Manager easier because you don't have to manually add the necessary permissions. Systems Manager defines the permissions of its service-linked roles, and unless defined otherwise, only Systems Manager can assume its roles. The defined permissions include the trust policy and the permissions policy, and that permissions policy can't be attached to any other IAM entity.

You can delete a service-linked role only after first deleting their related resources. This protects your Systems Manager resources because you can't inadvertently remove permission to access the resources.

Note

For non-EC2 nodes in a hybrid and multicloud environment , you need an additional IAM role that allows those machines to communicate with the Systems Manager service. This is the IAM service role for Systems Manager. This role grants Amazon Security Token Service (Amazon STS) *AssumeRole* trust to the Systems Manager service. The `AssumeRole` action returns a set of temporary security credentials (consisting of an access key ID, a secret access key, and a security token). You use these temporary credentials to access Amazon resources that you might not normally have access to. For more information, see Create the IAM service role required for Systems Manager in hybrid and multicloud environments and AssumeRole in the *Amazon Security Token Service API Reference*.

For information about other services that support service-linked roles, see Amazon Web Services services that work with IAM and look for the services that have **Yes** in the **Service-linked roles** column. Choose a **Yes** with a link to view the service-linked role documentation for that service.

Note

Systems Manager Automation no longer uses the service-linked role for CloudWatch alarm monitoring. This operation now uses your runbook execution identity. Make sure your execution identity has the required permissions. For more information, see Configuring Automations to monitor CloudWatch Alarms.

Topics

- Using roles to collect inventory and view OpsData
- Using roles to collect Amazon Web Services account information for OpsCenter and Explorer
- Using roles to create OpsData and OpsItems for Explorer
- Using roles to create operational insight OpsItems in Systems Manager OpsCenter
- Using roles to maintain Quick Setup-provisioned resource health and consistency
- Using roles to export Explorer OpsData
- Using roles to enable just-in-time node access
- Using roles to send just-in-time node access request notifications

Using roles to collect inventory and view OpsData

Systems Manager uses the service-linked role named **`AWSServiceRoleForAmazonSSM`**. Amazon Systems Manager uses this IAM service role to manage Amazon resources on your behalf.

Service-linked role permissions for inventory, OpsData, and OpsItems

The `AWSServiceRoleForAmazonSSM` service-linked role trusts only `ssm.amazonaws.com.cn` to assume this role.

You can use the Systems Manager service-linked role `AWSServiceRoleForAmazonSSM` for the following:

- The Systems Manager Inventory tool uses the service-linked role `AWSServiceRoleForAmazonSSM` to collect inventory metadata from tags and resource groups.
- The Explorer tool uses the service-linked role `AWSServiceRoleForAmazonSSM` to enable viewing OpsData and OpsItems from multiple accounts. This service-linked role also allows Explorer to create a managed rule when you enable Security Hub CSPM as a data source from Explorer or OpsCenter.

> **Important**
>
> Previously, the Systems Manager console provided you with the ability to choose the Amazon managed IAM service-linked role `AWSServiceRoleForAmazonSSM` to use as the maintenance role for your tasks. Using this role and its associated policy, `AmazonSSMServiceRolePolicy`, for maintenance window tasks is no longer

recommended. If you're using this role for maintenance window tasks now, we encourage you to stop using it. Instead, create your own IAM role that enables communication between Systems Manager and other Amazon Web Services services when your maintenance window tasks run.
For more information, see Setting up Maintenance Windows.

The managed policy that is used to provide permissions for the `AWSServiceRoleForAmazonSSM` role is `AmazonSSMServiceRolePolicy`. For details about the permissions it grants, see Amazon managed policy: AmazonSSMServiceRolePolicy.

Creating the `AWSServiceRoleForAmazonSSM` service-linked role for Systems Manager

You can use the IAM console to create a service-linked role with the **EC2** use case. Using commands for IAM in the Amazon Command Line Interface (Amazon CLI) or using the IAM API, create a service-linked role with the `ssm.amazonaws.com.cn` service name. For more information, see Creating a service-linked role in the *IAM User Guide*.

If you delete this service-linked role, and then need to create it again, you can use the same process to recreate the role in your account.

Editing the `AWSServiceRoleForAmazonSSM` service-linked role for Systems Manager

Systems Manager doesn't allow you to edit the `AWSServiceRoleForAmazonSSM` service-linked role. After you create a service-linked role, you can't change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Deleting the `AWSServiceRoleForAmazonSSM` service-linked role for Systems Manager

If you no longer need to use any feature or service that requires a service-linked role, then we recommend that you delete that role. That way you don’t have an unused entity that isn't actively monitored or maintained. You can use the IAM console, the Amazon CLI, or the IAM API to manually delete the service-linked role. To do this, you must first manually clean up the resources for your service-linked role. Then, you can manually delete it.

Because the AWSServiceRoleForAmazonSSM service-linked role can be used by multiple tools, make sure that none are using the role before attempting to delete it.

- **Inventory:** If you delete the service-linked role used by the Inventory tool, then the Inventory data for tags and resource groups will no longer be synchronized. You must clean up the resources for your service-linked role before you can manually delete it.
- **Explorer:** If you delete the service-linked role used by the Explorer tool, then the cross-account and cross-Region OpsData and OpsItems are no longer viewable.

> **Note**
>
> If the Systems Manager service is using the role when you try to delete tags or resource groups, then the deletion might fail. If that happens, wait for a few minutes and try the operation again.

To delete Systems Manager resources used by the AWSServiceRoleForAmazonSSM

1. To delete tags, see Add and delete tags on an individual resource.
2. To delete resource groups, see Delete groups from Amazon Resource Groups.

To manually delete the AWSServiceRoleForAmazonSSM service-linked role using IAM

Use the IAM console, the Amazon CLI, or the IAM API to delete the AWSServiceRoleForAmazonSSM service-linked role. For more information, see Deleting a service-linked role in the *IAM User Guide*.

Supported Regions for the Systems Manager AWSServiceRoleForAmazonSSM service-linked role

Systems Manager supports using the AWSServiceRoleForAmazonSSM service-linked role in all of the Amazon Web Services Regions where the service is available. For more information, see Amazon Systems Manager endpoints and quotas.

Using roles to collect Amazon Web Services account information for OpsCenter and Explorer

Systems Manager uses the service-linked role named **`AWSServiceRoleForAmazonSSM_AccountDiscovery`**. Amazon Systems Manager uses this IAM service role to call other Amazon Web Services services to discover Amazon Web Services account information.

Service-linked role permissions for Systems Manager account discovery

The `AWSServiceRoleForAmazonSSM_AccountDiscovery` service-linked role trusts the following services to assume the role:

- `accountdiscovery.ssm.amazonaws.com.cn`

The role permissions policy allows Systems Manager to complete the following actions on the specified resources:

- `organizations:DescribeAccount`
- `organizations:DescribeOrganizationalUnit`
- `organizations:DescribeOrganization`
- `organizations:ListAccounts`
- `organizations:ListAWSServiceAccessForOrganization`
- `organizations:ListChildren`
- `organizations:ListParents`
- `organizations:ListDelegatedServicesForAccount`
- `organizations:ListDelegatedAdministrators`
- `organizations:ListRoots`

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see Service-linked role permissions in the *IAM User Guide*.

Creating the `AWSServiceRoleForAmazonSSM_AccountDiscovery` service-linked role for Systems Manager

You must create a service-linked role if you want to use Explorer and OpsCenter, tools in Systems Manager, across multiple Amazon Web Services accounts. For OpsCenter, you must manually create the service-linked role. For more information, see (Optional) Manually set up OpsCenter to centrally manage OpsItems across accounts.

For Explorer if you create a resource data sync by using Systems Manager in the Amazon Web Services Management Console, you can create the service-linked role by choosing the **Create role** button. If you want to create a resource data sync programmatically, then you must create the role before you create the resource data sync. You can create the role by using the CreateServiceLinkedRole API operation.

Editing the `AWSServiceRoleForAmazonSSM_AccountDiscovery` service-linked role for Systems Manager

Systems Manager doesn't allow you to edit the `AWSServiceRoleForAmazonSSM_AccountDiscovery` service-linked role. After you create a service-linked role, you can't change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Deleting the `AWSServiceRoleForAmazonSSM_AccountDiscovery` service-linked role for Systems Manager

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you don’t have an unused entity that isn't actively monitored or maintained. However, you must clean up your service-linked role before you can manually delete it.

Cleaning up the `AWSServiceRoleForAmazonSSM_AccountDiscovery` service-linked role

Before you can use IAM to delete the `AWSServiceRoleForAmazonSSM_AccountDiscovery` service-linked role, you must first delete all Explorer resource data syncs.

> **Note**
>
> If the Systems Manager service is using the role when you try to delete the resources, then the deletion might fail. If that happens, wait for a few minutes and try the operation again.

Manually delete the AWSServiceRoleForAmazonSSM_AccountDiscovery service-linked role

Use the IAM console, the Amazon CLI, or the Amazon API to delete the AWSServiceRoleForAmazonSSM_AccountDiscovery service-linked role. For more information, see Deleting a service-linked role in the *IAM User Guide*.

Supported Regions for the Systems Manager AWSServiceRoleForAmazonSSM_AccountDiscovery service-linked role

Systems Manager supports using service-linked roles in all of the regions where the service is available. For more information, see Amazon Systems Manager endpoints and quotas.

Updates to the AWSServiceRoleForAmazonSSM_AccountDiscovery service-linked role

View details about updates to the AWSServiceRoleForAmazonSSM_AccountDiscovery service-linked role since this service began tracking these changes. For automatic alerts about changes to this page, subscribe to the RSS feed on the Systems Manager Document history page.

Change	Description	Date
New permissions added	This service-linked role now includes organizations:DescribeOrganizationalUnit and organizations:ListRoots permissions. These permissions enable an Amazon Organizations management account or a Systems Manager delegated administrator account to work with OpsItems across accounts. For more information, see (Optional) Manually set up OpsCenter to centrally manage OpsItems across accounts.	October 17, 2022

Using roles to create OpsData and OpsItems for Explorer

Systems Manager uses the service-linked role named **`AWSServiceRoleForSystemsManagerOpsDataSync`**. Amazon Systems Manager uses this IAM service role for Explorer to create OpsData and OpsItems.

Service-linked role permissions for Systems Manager OpsData sync

The `AWSServiceRoleForSystemsManagerOpsDataSync` service-linked role trusts the following services to assume the role:

- `opsdatasync.ssm.amazonaws.com.cn`

The role permissions policy allows Systems Manager to complete the following actions on the specified resources:

- Systems Manager Explorer requires that a service-linked role grant permission to update a security finding when an OpsItem is updated, create and update an OpsItem, and turn off the Security Hub CSPM data source when an SSM managed rule is deleted by customers.

The managed policy that is used to provide permissions for the `AWSServiceRoleForSystemsManagerOpsDataSync` role is `AWSSystemsManagerOpsDataSyncServiceRolePolicy`. For details about the permissions it grants, see Amazon managed policy: AWSSystemsManagerOpsDataSyncServiceRolePolicy.

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see Service-linked role permissions in the *IAM User Guide*.

Creating the `AWSServiceRoleForSystemsManagerOpsDataSync` service-linked role for Systems Manager

You don't need to manually create a service-linked role. When you enable Explorer in the Amazon Web Services Management Console, Systems Manager creates the service-linked role for you.

> **Important**
>
> This service-linked role can be displayed in your account if you completed an action in another service that uses the features supported by this role. Also,

if you were using the Systems Manager service before January 1, 2017, when it began supporting service-linked roles, then Systems Manager created the `AWSServiceRoleForSystemsManagerOpsDataSync` role in your account. To learn more, see A new role appeared in my IAM account.

If you delete this service-linked role, and then need to create it again, you can use the same process to recreate the role in your account. When you enable Explorer in the Amazon Web Services Management Console, Systems Manager creates the service-linked role for you again.

You can also use the IAM console to create a service-linked role with the **Amazon service role that allows Explorer to create OpsData and OpsItems** use case. In the Amazon CLI or the Amazon API, create a service-linked role with the `opsdatasync.ssm.amazonaws.com.cn` service name. For more information, see Creating a service-linked role in the *IAM User Guide*. If you delete this service-linked role, you can use this same process to create the role again.

Editing the `AWSServiceRoleForSystemsManagerOpsDataSync` service-linked role for Systems Manager

Systems Manager doesn't allow you to edit the `AWSServiceRoleForSystemsManagerOpsDataSync` service-linked role. After you create a service-linked role, you can't change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Deleting the `AWSServiceRoleForSystemsManagerOpsDataSync` service-linked role for Systems Manager

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you don’t have an unused entity that isn't actively monitored or maintained. However, you must clean up the resources for your service-linked role before you can manually delete it.

Note

If the Systems Manager service is using the role when you try to delete the resources, then the deletion might fail. If that happens, wait for a few minutes and try the operation again.

The procedure for deleting Systems Manager resources used by the `AWSServiceRoleForSystemsManagerOpsDataSync` role depends on if you've configured Explorer or OpsCenter to integrate with Security Hub CSPM.

To delete Systems Manager resources used by the `AWSServiceRoleForSystemsManagerOpsDataSync` role

- To stop Explorer from creating new OpsItems for Security Hub CSPM findings, see How to stop receiving findings.
- To stop OpsCenter from creating new OpsItems for Security Hub CSPM findings, see

To manually delete the `AWSServiceRoleForSystemsManagerOpsDataSync` service-linked role using IAM

Use the IAM console, the Amazon CLI, or the Amazon API to delete the `AWSServiceRoleForSystemsManagerOpsDataSync` service-linked role. For more information, see Deleting a service-linked role in the *IAM User Guide*.

Supported Regions for the Systems Manager `AWSServiceRoleForSystemsManagerOpsDataSync` service-linked role

Systems Manager supports using service-linked roles in all of the Regions where the service is available. For more information, see Amazon Systems Manager endpoints and quotas.

Systems Manager doesn't support using service-linked roles in every Region where the service is available. You can use the `AWSServiceRoleForSystemsManagerOpsDataSync` role in the following Regions.

Amazon Web Services Region name	Region identity	Support in Systems Manager
US East (N. Virginia)	us-east-1	Yes
	us-west-2	Yes
US West (N. California)	us-west-1	Yes
US West (Oregon)	us-west-2	Yes

Amazon Web Services Region name	Region identity	Support in Systems Manager
Asia Pacific (Mumbai)	ap-south-1	Yes
Asia Pacific (Osaka)	ap-northeast-3	Yes
Asia Pacific (Seoul)	ap-northeast-2	Yes
Asia Pacific (Singapore)	ap-southeast-1	Yes
Asia Pacific (Sydney)	ap-southeast-2	Yes
Asia Pacific (Tokyo)	ap-northeast-1	Yes
Canada (Central)	ca-central-1	Yes
Europe (Frankfurt)	eu-central-1	Yes
Europe (Ireland)	eu-west-1	Yes
Europe (London)	eu-west-2	Yes
Europe (Paris)	eu-west-3	Yes
Europe (Stockholm)	eu-north-1	Yes
South America (São Paulo)	sa-east-1	Yes
China (Beijing)	cn-north-1	No
China (Ningxia)	cn-northwest-1	No
Amazon GovCloud (US)	us-gov-west-1	No

Using roles to create operational insight OpsItems in Systems Manager OpsCenter

Systems Manager uses the service-linked role named **`AWSServiceRoleForAmazonSSM_OpsInsights`**. Amazon Systems Manager uses this IAM service role to create and update operational insight OpsItems in Systems Manager OpsCenter.

`AWSServiceRoleForAmazonSSM_OpsInsights` service-linked role permissions for Systems Manager operational insight OpsItems

The `AWSServiceRoleForAmazonSSM_OpsInsights` service-linked role trusts the following services to assume the role:

- `opsinsights.ssm.amazonaws.com.cn`

The role permissions policy allows Systems Manager to complete the following actions on the specified resources:

JSON

```
{
 "Version":"2012-10-17",
 "Statement": [
  {
   "Sid": "AllowCreateOpsItem",
   "Effect": "Allow",
   "Action": [
    "ssm:CreateOpsItem",
    "ssm:AddTagsToResource"
   ],
   "Resource": "*"
  },
  {
   "Sid": "AllowAccessOpsItem",
   "Effect": "Allow",
   "Action": [
    "ssm:UpdateOpsItem",
    "ssm:GetOpsItem"
   ],
   "Resource": "*",
```

```
    "Condition": {
     "StringEquals": {
      "aws:ResourceTag/SsmOperationalInsight": "true"
     }
    }
   }
  ]
}
```

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see Service-linked role permissions in the *IAM User Guide*.

Creating the `AWSServiceRoleForAmazonSSM_OpsInsights` service-linked role for Systems Manager

You must create a service-linked role. If you enable operational insights by using Systems Manager in the Amazon Web Services Management Console, you can create the service-linked role by choosing the **Enable** button.

Editing the `AWSServiceRoleForAmazonSSM_OpsInsights` service-linked role for Systems Manager

Systems Manager does not allow you to edit the `AWSServiceRoleForAmazonSSM_OpsInsights` service-linked role. After you create a service-linked role, you cannot change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Deleting the `AWSServiceRoleForAmazonSSM_OpsInsights` service-linked role for Systems Manager

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you don't have an unused entity that is not actively monitored or maintained. However, you must clean up your service-linked role before you can manually delete it.

Cleaning up the AWSServiceRoleForAmazonSSM_OpsInsights service-linked role

Before you can use IAM to delete the AWSServiceRoleForAmazonSSM_OpsInsights service-linked role, you must first deactivate operational insights in Systems Manager OpsCenter. For more information, see Analyzing operational insights to reduce OpsItems.

Manually delete the AWSServiceRoleForAmazonSSM_OpsInsights service-linked role

Use the IAM console, the Amazon CLI, or the Amazon API to delete the AWSServiceRoleForAmazonSSM_OpsInsights service-linked role. For more information, see Deleting a service-linked role in the *IAM User Guide*.

Supported Regions for the Systems Manager AWSServiceRoleForAmazonSSM_OpsInsights service-linked role

Systems Manager does not support using service-linked roles in every Region where the service is available. You can use the AWSServiceRoleForAmazonSSM_OpsInsights role in the following Regions.

Region name	Region identity	Support in Systems Manager
US East (N. Virginia)	us-east-1	Yes
	us-west-2	Yes
US West (N. California)	us-west-1	Yes
US West (Oregon)	us-west-2	Yes
Asia Pacific (Mumbai)	ap-south-1	Yes
Asia Pacific (Tokyo)	ap-northeast-1	Yes
Asia Pacific (Seoul)	ap-northeast-2	Yes
Asia Pacific (Singapore)	ap-southeast-1	Yes
Asia Pacific (Sydney)	ap-southeast-2	Yes
Asia Pacific (Hong Kong)	ap-east-1	Yes

Region name	Region identity	Support in Systems Manager
Canada (Central)	ca-central-1	Yes
Europe (Frankfurt)	eu-central-1	Yes
Europe (Ireland)	eu-west-1	Yes
Europe (London)	eu-west-2	Yes
Europe (Paris)	eu-west-3	Yes
Europe (Stockholm)	eu-north-1	Yes
Europe (Milan)	eu-south-1	Yes
South America (São Paulo)	sa-east-1	Yes
Middle East (Bahrain)	me-south-1	Yes
Africa (Cape Town)	af-south-1	Yes
China (Beijing)	cn-north-1	Yes
China (Ningxia)	cn-northwest-1	Yes
Amazon GovCloud (US)	us-gov-west-1	Yes
Amazon GovCloud (US)	us-gov-east-1	Yes

Using roles to maintain Quick Setup-provisioned resource health and consistency

Systems Manager uses the service-linked role named **`AWSServiceRoleForSSMQuickSetup`**.

AWSServiceRoleForSSMQuickSetup service-linked role permissions for Systems Manager

The AWSServiceRoleForSSMQuickSetup service-linked role trusts the following services to assume the role:

- ssm-quicksetup.amazonaws.com.cn

Amazon Systems Manager uses this IAM service role to check configuration health, ensure consistent use of parameters and provisioned resources, and remediate resources when drift is detected.

The role permissions policy allows Systems Manager to complete the following actions on the specified resources:

- ssm (Systems Manager) – Reads information about the state that configured resources are intended to be in, including in delegated administrator accounts.
- iam (Amazon Identity and Access Management) – This is required for resource data syncs to be accessible across entire organizations in Amazon Organizations.
- organizations (Amazon Organizations) – Reads information about the member accounts that belong to an organization as configured in Organizations.
- cloudformation (Amazon CloudFormation) – Reads information about CloudFormation stacks used to manage the state of resources and CloudFormation stackset operations.

The managed policy that is used to provide permissions for the AWSServiceRoleForSSMQuickSetup role is SSMQuickSetupRolePolicy. For details about the permissions it grants, see Amazon managed policy: SSMQuickSetupRolePolicy.

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see Service-linked role permissions in the *IAM User Guide*.

Creating the AWSServiceRoleForSSMQuickSetup service-linked role for Systems Manager

You don't need to manually create the AWSServiceRoleForSSMQuickSetup service-linked role. When you create a Quick Setup configuration in the Amazon Web Services Management Console, Systems Manager creates the service-linked role for you.

Editing the AWSServiceRoleForSSMQuickSetup service-linked role for Systems Manager

Systems Manager does not allow you to edit the AWSServiceRoleForSSMQuickSetup service-linked role. After you create a service-linked role, you cannot change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Deleting the AWSServiceRoleForSSMQuickSetup service-linked role for Systems Manager

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you don't have an unused entity that is not actively monitored or maintained. However, you must clean up your service-linked role before you can manually delete it.

Cleaning up the AWSServiceRoleForSSMQuickSetup service-linked role

Before you can use IAM to delete the AWSServiceRoleForSSMQuickSetup service-linked role, you must first delete the Quick Setup configurations that are using the role. For more information, see Editing and deleting your configuration.

Manually delete the AWSServiceRoleForSSMQuickSetup service-linked role

Use the IAM console, the Amazon CLI, or the Amazon API to delete the AWSServiceRoleForSSMQuickSetup service-linked role. For more information, see the following topics:

- Deleting a service-linked role in the *IAM User Guide*
- delete-configuration-manager in the Quick Setup section of the *Amazon CLI Reference*
- DeleteConfigurationManager in the *Quick Setup API Reference*

Supported Regions for the Systems Manager `AWSServiceRoleForSSMQuickSetup` service-linked role

Systems Manager does not support using service-linked roles in every Region where the service is available. You can use the AWSServiceRoleForSSMQuickSetup role in the following Regions.

- US East (Ohio)
- US East (N. Virginia)
- US West (N. California)
- US West (Oregon)
- Asia Pacific (Mumbai)
- Asia Pacific (Seoul)
- Asia Pacific (Singapore)
- Asia Pacific (Sydney)
- Asia Pacific (Tokyo)
- Canada (Central)
- Europe (Frankfurt)
- Europe (Stockholm)
- Europe (Ireland)
- Europe (London)
- Europe (Paris)
- South America (São Paulo)

Using roles to export Explorer OpsData

Amazon Systems Manager Explorer uses the **AmazonSSMExplorerExportRole** service role to export operations data (OpsData) using the `AWS-ExportOpsDataToS3` automation runbook.

Service-linked role permissions for Explorer

The `AmazonSSMExplorerExportRole` service-linked role trusts only `ssm.amazonaws.com.cn` to assume this role.

You can use the `AmazonSSMExplorerExportRole` service-linked role to export operations data (OpsData) using the `AWS-ExportOpsDataToS3` automation runbook. You can export 5,000

OpsData items from Explorer as a comma separated value (.csv) file to an Amazon Simple Storage Service (Amazon S3) bucket.

The role permissions policy allows Systems Manager to complete the following actions on the specified resources:

- `s3:PutObject`
- `s3:GetBucketAcl`
- `s3:GetBucketLocation`
- `sns:Publish`
- `logs:DescribeLogGroups`
- `logs:DescribeLogStreams`
- `logs:CreateLogGroup`
- `logs:PutLogEvents`
- `logs:CreateLogStream`
- `ssm:GetOpsSummary`

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see Service-linked role permissions in the *IAM User Guide*.

Creating the `AmazonSSMExplorerExportRole` service-linked role for Systems Manager

Systems Manager creates the `AmazonSSMExplorerExportRole` service-linked role when you export OpsData using Explorer in the Systems Manager console. For more information, see Exporting OpsData from Systems Manager Explorer.

If you delete this service-linked role, and then need to create it again, you can use the same process to recreate the role in your account.

Editing the `AmazonSSMExplorerExportRole` service-linked role for Systems Manager

Systems Manager doesn't allow you to edit the `AmazonSSMExplorerExportRole` service-linked role. After you create a service-linked role, you can't change the name of the role because various

entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Deleting the `AmazonSSMExplorerExportRole` service-linked role for Systems Manager

If you no longer need to use any feature or service that requires a service-linked role, then we recommend that you delete that role. That way you don't have an unused entity that isn't actively monitored or maintained. You can use the IAM console, the Amazon CLI, or the IAM API to manually delete the service-linked role. To do this, you must first manually clean up the resources for your service-linked role. Then, you can manually delete it.

> **Note**
>
> If the Systems Manager service is using the role when you try to delete tags or resource groups, then the deletion might fail. If that happens, wait for a few minutes and try the operation again.

To delete Systems Manager resources used by the `AmazonSSMExplorerExportRole`

1. To delete tags, see Add and delete tags on an individual resource.
2. To delete resource groups, see Delete groups from Amazon Resource Groups.

To manually delete the `AmazonSSMExplorerExportRole` service-linked role using IAM

Use the IAM console, the Amazon CLI, or the IAM API to delete the `AmazonSSMExplorerExportRole` service-linked role. For more information, see Deleting a service-linked role in the *IAM User Guide*.

Supported Regions for the Systems Manager `AmazonSSMExplorerExportRole` service-linked role

Systems Manager supports using the `AmazonSSMExplorerExportRole` service-linked role in all of the Amazon Web Services Regions where the service is available. For more information, see Amazon Systems Manager endpoints and quotas.

Using roles to enable just-in-time node access

Systems Manager uses the service-linked role named **`AWSServiceRoleForSystemsManagerJustInTimeAccess`**. Amazon Systems Manager uses this IAM service role to enable just-in-time node access.

Service-linked role permissions for Systems Manager just-in-time node access

The `AWSServiceRoleForSystemsManagerJustInTimeAccess` service-linked role trusts the following services to assume the role:

- `ssm.amazonaws.com.cn`

The role permissions policy allows Systems Manager to complete the following actions on the specified resources:

- `ssm:CreateOpsItem`
- `ssm:GetOpsItem`
- `ssm:UpdateOpsItem`
- `ssm:DescribeOpsItems`
- `ssm:DescribeSessions`
- `ssm:ListTagsForResource`
- `ssm-guiconnect:ListConnections`
- `identitystore:ListGroupMembershipsForMember`
- `identitystore:DescribeUser`
- `identitystore:GetGroupId`
- `identitystore:GetUserId`
- `sso-directory:DescribeUsers`
- `sso-directory:IsMemberInGroup`
- `sso:ListInstances`
- `sso:DescribeRegisteredRegions`
- `sso:ListDirectoryAssociations`
- `ec2:DescribeTags`

The managed policy that is used to provide permissions for the `AWSServiceRoleForSystemsManagerJustInTimeAccess` role is `AWSSystemsManagerEnableJustInTimeAccessPolicy`. For details about the permissions it grants, see Amazon managed policy: AWSSystemsManagerJustInTimeAccessServicePolicy.

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see Service-linked role permissions in the *IAM User Guide*.

Creating the `AWSServiceRoleForSystemsManagerJustInTimeAccess` service-linked role for Systems Manager

You don't need to manually create a service-linked role. When you enable just-in-time node access in the Amazon Web Services Management Console, Systems Manager creates the service-linked role for you.

> **Important**
>
> This service-linked role can be displayed in your account if you completed an action in another service that uses the features supported by this role. Also, if you were using the Systems Manager service before November 19, 2024, when it began supporting service-linked roles, then Systems Manager created the `AWSServiceRoleForSystemsManagerJustInTimeAccess` role in your account. To learn more, see A new role appeared in my IAM account.

If you delete this service-linked role, and then need to create it again, you can use the same process to recreate the role in your account. When you enable just-in-time node access in the Amazon Web Services Management Console, Systems Manager creates the service-linked role for you again.

You can also use the IAM console to create a service-linked role with the **Amazon service role that allows Systems Manager to enable just-in-time node access.** use case. In the Amazon CLI or the Amazon API, create a service-linked role with the `ssm.amazonaws.com.cn` service name. For more information, see Creating a service-linked role in the *IAM User Guide*. If you delete this service-linked role, you can use this same process to create the role again.

Editing the AWSServiceRoleForSystemsManagerJustInTimeAccess service-linked role for Systems Manager

Systems Manager doesn't allow you to edit the AWSServiceRoleForSystemsManagerJustInTimeAccess service-linked role. After you create a service-linked role, you can't change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Deleting the AWSServiceRoleForSystemsManagerJustInTimeAccess service-linked role for Systems Manager

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you don’t have an unused entity that isn't actively monitored or maintained. However, you must clean up the resources for your service-linked role before you can manually delete it.

> **Note**
>
> If the Systems Manager service is using the role when you try to delete the resources, then the deletion might fail. If that happens, wait for a few minutes and try the operation again.

To manually delete the AWSServiceRoleForSystemsManagerJustInTimeAccess service-linked role using IAM

Use the IAM console, the Amazon CLI, or the Amazon API to delete the AWSServiceRoleForSystemsManagerJustInTimeAccess service-linked role. For more information, see Deleting a service-linked role in the *IAM User Guide*.

Supported Regions for the Systems Manager AWSServiceRoleForSystemsManagerJustInTimeAccess service-linked role

Amazon Web Services Region name	Region identity	Support in Systems Manager
US East (N. Virginia)	us-east-1	Yes

Amazon Web Services Region name	Region identity	Support in Systems Manager
	us-west-2	Yes
US West (N. California)	us-west-1	Yes
US West (Oregon)	us-west-2	Yes
Asia Pacific (Mumbai)	ap-south-1	Yes
Asia Pacific (Osaka)	ap-northeast-3	Yes
Asia Pacific (Seoul)	ap-northeast-2	Yes
Asia Pacific (Singapore)	ap-southeast-1	Yes
Asia Pacific (Sydney)	ap-southeast-2	Yes
Asia Pacific (Tokyo)	ap-northeast-1	Yes
Canada (Central)	ca-central-1	Yes
Europe (Frankfurt)	eu-central-1	Yes
Europe (Ireland)	eu-west-1	Yes
Europe (London)	eu-west-2	Yes
Europe (Paris)	eu-west-3	Yes
Europe (Stockholm)	eu-north-1	Yes
South America (São Paulo)	sa-east-1	Yes
China (Beijing)	cn-north-1	No
China (Ningxia)	cn-northwest-1	No
Amazon GovCloud (US)	us-gov-west-1	No

Using roles to send just-in-time node access request notifications

Systems Manager uses the service-linked role named **`AWSServiceRoleForSystemsManagerNotifications`**. Amazon Systems Manager uses this IAM service role to send notifications to access request approvers.

Service-linked role permissions for Systems Manager just-in-time node access notifications

The `AWSServiceRoleForSystemsManagerNotifications` service-linked role trusts the following services to assume the role:

- `ssm.amazonaws.com.cn`

The role permissions policy allows Systems Manager to complete the following actions on the specified resources:

- `identitystore:ListGroupMembershipsForMember`
- `identitystore:ListGroupMemberships`
- `identitystore:DescribeUser`
- `sso:ListInstances`
- `sso:DescribeRegisteredRegions`
- `sso:ListDirectoryAssociations`
- `sso-directory:DescribeUser`
- `sso-directory:ListMembersInGroup`
- `iam:GetRole`

The managed policy that is used to provide permissions for the `AWSServiceRoleForSystemsManagerNotifications` role is `AWSSystemsManagerNotificationsServicePolicy`. For details about the permissions it grants, see Amazon managed policy: AWSSystemsManagerNotificationsServicePolicy.

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see Service-linked role permissions in the *IAM User Guide*.

Creating the AWSServiceRoleForSystemsManagerNotifications service-linked role for Systems Manager

You don't need to manually create a service-linked role. When you enable just-in-time node access in the Amazon Web Services Management Console, Systems Manager creates the service-linked role for you.

> **Important**
>
> This service-linked role can be displayed in your account if you completed an action in another service that uses the features supported by this role. Also, if you were using the Systems Manager service before November 19, 2024, when it began supporting service-linked roles, then Systems Manager created the AWSServiceRoleForSystemsManagerNotifications role in your account. To learn more, see A new role appeared in my IAM account.

If you delete this service-linked role, and then need to create it again, you can use the same process to recreate the role in your account. When you enable just-in-time node access in the Amazon Web Services Management Console, Systems Manager creates the service-linked role for you again.

You can also use the IAM console to create a service-linked role with the **Amazon service role that allows Systems Manager to send notifications to access request approvers.** use case. In the Amazon CLI or the Amazon API, create a service-linked role with the ssm.amazonaws.com.cn service name. For more information, see Creating a service-linked role in the *IAM User Guide*. If you delete this service-linked role, you can use this same process to create the role again.

Editing the AWSServiceRoleForSystemsManagerNotifications service-linked role for Systems Manager

Systems Manager doesn't allow you to edit the AWSServiceRoleForSystemsManagerNotifications service-linked role. After you create a service-linked role, you can't change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Deleting the AWSServiceRoleForSystemsManagerNotifications service-linked role for Systems Manager

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you don't have an unused entity that isn't actively monitored or maintained. However, you must clean up the resources for your service-linked role before you can manually delete it.

> **Note**
>
> If the Systems Manager service is using the role when you try to delete the resources, then the deletion might fail. If that happens, wait for a few minutes and try the operation again.

To manually delete the AWSServiceRoleForSystemsManagerNotifications service-linked role using IAM

Use the IAM console, the Amazon CLI, or the Amazon API to delete the `AWSServiceRoleForSystemsManagerNotifications` service-linked role. For more information, see Deleting a service-linked role in the *IAM User Guide*.

Supported Regions for the Systems Manager AWSServiceRoleForSystemsManagerNotifications service-linked role

Amazon Web Services Region name	Region identity	Support in Systems Manager
US East (N. Virginia)	us-east-1	Yes
	us-west-2	Yes
US West (N. California)	us-west-1	Yes
US West (Oregon)	us-west-2	Yes

China (Beijing)	cn-north-1	No
China (Ningxia)	cn-northwest-1	No
Amazon GovCloud (US)	us-gov-west-1	No

Logging and monitoring in Amazon Systems Manager

Monitoring is an important part of maintaining the reliability, availability, and performance of Amazon Systems Manager and your Amazon solutions. You should collect monitoring data from all of the parts of your Amazon solution so that you can more debug a multi-point failure if one occurs. Amazon provides several tools for monitoring your Systems Manager and other resources and responding to potential incidents.

Amazon CloudTrail logs

CloudTrail provides a record of actions taken by a user, role, or an Amazon Web Services service in Systems Manager. Using the information collected by CloudTrail, you can determine the request that was made to Systems Manager, the IP address from which the request was made, who made the request, when it was made, and additional details. For more information, see Logging Amazon Systems Manager API calls with Amazon CloudTrail.

Amazon CloudWatch alarms

Using Amazon CloudWatch alarms, you watch a single metric over a time period that you specify for your Amazon Elastic Compute Cloud (Amazon EC2) instances and other resources. If the metric exceeds a given threshold, a notification is sent to an Amazon Simple Notification Service (Amazon SNS) topic or Amazon Auto Scaling policy. CloudWatch alarms don't invoke actions because they're in a particular state. Rather the state must have changed and been maintained for a specified number of periods. For more information, see Using Amazon CloudWatch alarms in the *Amazon CloudWatch User Guide*.

Amazon CloudWatch dashboards

CloudWatch dashboards are customizable home pages in the CloudWatch console that you can use to monitor your resources in a single view, even those resources that are spread across different Amazon Web Services Regions. You can use CloudWatch dashboards to create customized views of the metrics and alarms for your Amazon resources. For more information, see Using Amazon CloudWatch dashboards in the *Amazon CloudWatch User Guide*.

Amazon EventBridge

Using Amazon EventBridge, you can configure rules to alert you to changes in Systems Manager resources, and to direct EventBridge to take actions based on the content of those events. EventBridge provides support for several events that are emitted by various Systems Manager tools. For more information, see Monitoring Systems Manager events with Amazon EventBridge.

Amazon CloudWatch Logs and SSM Agent logs

SSM Agent writes information about executions, scheduled actions, errors, and health statuses to log files on each node. You can view log files by manually connecting to a node. We recommend automatically sending agent log data to a log group in CloudWatch Logs for analysis. For more information, see Sending node logs to unified CloudWatch Logs (CloudWatch agent) and Viewing SSM Agent logs.

Amazon Systems Manager Compliance

You can use Compliance to scan your fleet of managed nodes for patch compliance and configuration inconsistencies. You can collect and aggregate data from multiple Amazon Web Services accounts and Amazon Web Services Regions, and then drill down into specific resources that aren't compliant. By default, Compliance displays current compliance data about patching in Patch Manager, and associations in State Manager, a tool in Amazon Systems Manager. For more information, see Amazon Systems Manager Compliance.

Amazon Systems Manager Explorer

Explorer is a customizable operations dashboard that reports information about your Amazon resources. Explorer displays an aggregated view of operations data (OpsData) for your Amazon Web Services accounts and across Amazon Web Services Regions. In Explorer, OpsData includes metadata about your EC2 instances, patch compliance details, and operational work items (OpsItems). Explorer provides context about how OpsItems are distributed across your business units or applications, how they trend over time, and how they vary by category. You can group and filter information in Explorer to focus on items that are relevant to you and that require action. For more information, see Amazon Systems Manager Explorer.

Amazon Systems Manager OpsCenter

OpsCenter provides a central location where operations engineers and IT professionals can view, investigate, and resolve operational work items (OpsItems) related to Amazon resources. OpsCenter aggregates and standardizes OpsItems across services while providing contextual investigation data about each OpsItem, related OpsItems, and related resources. OpsCenter also provides runbooks in Automation, that you can use to quickly resolve issues. OpsCenter is integrated with Amazon EventBridge. This means you can create EventBridge rules that automatically create OpsItems for any Amazon Web Services service that publishes events to EventBridge. For more information, see Amazon Systems Manager OpsCenter.

Amazon Simple Notification Service

You can configure Amazon Simple Notification Service (Amazon SNS) to send notifications about the status of commands that you send using Run Command or Maintenance Windows, tools in Amazon Systems Manager. Amazon SNS coordinates and manages sending and delivering notifications to clients or endpoints that are subscribed to Amazon SNS topics. You can receive a notification whenever a command changes to a new state or to a specific state, such as `Failed` or `Timed Out`. In cases where you send a command to multiple nodes, you can receive a notification for each copy of the command sent to a specific node. For more information, see Monitoring Systems Manager status changes using Amazon SNS notifications.

Amazon Trusted Advisor and Amazon Health Dashboard

Trusted Advisor draws upon best practices learned from serving hundreds of thousands of Amazon customers. Trusted Advisor inspects your Amazon environment and then makes recommendations when opportunities exist to save money, improve system availability and performance, or help close security gaps. All Amazon customers have access to five Trusted Advisor checks. Customers with either an Amazon Web Services Support Business or Enterprise plan can view all Trusted Advisor checks. For more information, see Amazon Trusted Advisor in the *Amazon Web Services Support User Guide* and the *Amazon Health User Guide*.

More info

- Logging and monitoring in Amazon Systems Manager

Compliance validation for Amazon Systems Manager

This topic addresses Amazon Systems Manager compliance with third-party assurance programs. For information about viewing compliance data for your managed nodes, see Amazon Systems Manager Compliance.

Third-party auditors assess the security and compliance of Systems Manager as part of multiple Amazon compliance programs. These include SOC, PCI, FedRAMP, HIPAA, and others.

For a list of Amazon Web Services services in scope of specific compliance programs, see Amazon Web Services services in Scope by Compliance Program. For general information, see Amazon Compliance Programs.

You can download third-party audit reports using Amazon Artifact. For more information, see Downloading Reports in Amazon Artifact.

Your compliance responsibility when using Systems Manager is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. Amazon provides the following resources to help with compliance:

- Security and Compliance Quick Start GuidesSecurity and Compliance Quick Start Guides – These deployment guides discuss architectural considerations and provide steps for deploying security- and compliance-focused baseline environments on Amazon.
- Architecting for HIPAA Security and Compliance Whitepaper – This whitepaper describes how companies can use Amazon to create HIPAA-compliant applications.

- Amazon Compliance Resources – This collection of workbooks and guides might apply to your industry and location.
- Evaluating Resources with Rules in the *Amazon Config Developer Guide* – The Amazon Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- Amazon Security Hub CSPM – This Amazon Web Services service provides a comprehensive view of your security state within Amazon that helps you check your compliance with security industry standards and best practices.

Resilience in Amazon Systems Manager

The Amazon global infrastructure is built around Amazon Web Services Regions and Availability Zones. Amazon Web Services Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about Amazon Web Services Regions and Availability Zones, see Amazon Global Infrastructure.

Infrastructure security in Amazon Systems Manager

As a managed service, Amazon Systems Manager is protected by Amazon global network security. For information about Amazon security services and how Amazon protects infrastructure, see Amazon Cloud Security. To design your Amazon environment using the best practices for infrastructure security, see Infrastructure Protection in *Security Pillar Amazon Well-Architected Framework*.

You use Amazon published API calls to access Systems Manager through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
- Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

Configuration and vulnerability analysis in Amazon Systems Manager

Amazon handles basic security tasks such as firewall configuration and disaster recovery. These procedures have been reviewed and certified by the appropriate third parties. For more details, see the following resources:

- Compliance validation for Amazon Systems Manager
- Shared Responsibility Model
- Best Practices for Security, Identity, & Compliance

Security best practices for Systems Manager

Amazon Systems Manager provides several security features to consider as you develop and implement your own security policies. The following best practices are general guidelines and don't represent a complete security solution. Because these best practices might not be appropriate or sufficient for your environment, treat them as helpful considerations rather than prescriptions.

Topics

- Systems Manager preventative security best practices
- SSM Agent installation best practices
- Systems Manager monitoring and auditing best practices

Systems Manager preventative security best practices

The following best practices for Systems Manager can help prevent security incidents.

Implement least privilege access

When granting permissions, you decide who is getting what permissions to which Systems Manager resources. You allow specific actions that you want to allow on those resources. Therefore you should grant only the permissions needed to perform a task. Implementing least privilege access is fundamental in reducing security risk and the impact that could result from errors or malicious intent.

The following tools are available to implement least privilege access:

- IAM policies and Permissions boundaries for IAM entities
- Service control policies

Use recommended settings for SSM Agent when configured to use a proxy

If you configure SSM Agent to use a proxy, use the no_proxy variable with the IP address of the Systems Manager instance metadata service to make sure that calls to Systems Manager don't take on the identity of the proxy service.

For more information, see Configuring SSM Agent to use a proxy on Linux nodes and Configure SSM Agent to use a proxy for Windows Server instances.

Use SecureString parameters to encrypt and protect secret data

In Parameter Store, a `SecureString` parameter is any sensitive data that needs to be stored and referenced in a secure manner. If you have data that you don't want users to alter or reference in plaintext, such as passwords or license keys, create those parameters using the `SecureString` data type. Parameter Store uses an Amazon KMS key in Amazon Key Management Service (Amazon KMS) to encrypt the parameter value. Amazon KMS uses either a customer managed key or an Amazon managed key when encrypting the parameter value. For maximum security, we recommend using your own KMS key. If you use the Amazon managed key, any user with permission to run the GetParameter and GetParameters actions in your account can view or retrieve the content of all `SecureString` parameters. If you're using customer managed keys to encrypt your secure `SecureString` values, you can use IAM policies and key policies to manage permissions for encrypting and decrypting parameters.

It's more difficult to establish access control policies for these operations when using an Amazon managed key. For example, you if you use an Amazon managed key to encrypt `SecureString` parameters and don't want users to work with `SecureString` parameters, the user's IAM policies must explicitly deny access to the default key.

For more information, see Managing access to Parameter Store parameters using IAM policies and How Amazon Systems Manager Parameter Store Uses Amazon KMS in the *Amazon Key Management Service Developer Guide*.

Define allowedValues and allowedPattern for document parameters

You can validate user input for parameters in Systems Manager documents (SSM documents) by defining `allowedValues` and `allowedPattern`. For `allowedValues`, you define an array of values allowed for the parameter. If a user inputs a value that isn't allowed, the execution

fails to start. For `allowedPattern`, you define a regular expression that validates whether the user input matches the defined pattern for the parameter. If the user input doesn't match the allowed pattern, the execution fails to start.

For more information about `allowedValues` and `allowedPattern`, see Data elements and parameters.

Block public sharing for documents

Unless your use case requires public sharing to be allowed, we recommend turning on the block public sharing setting for your SSM documents in the **Preferences** section of the Systems Manager Documents console.

Use an Amazon Virtual Private Cloud (Amazon VPC) and VPC endpoints

You can use Amazon VPC to launch Amazon resources into a virtual network that you've defined. This virtual network closely resembles a traditional network that you'd operate in your own data center, with the benefits of using the scalable infrastructure of Amazon.

By implementing a VPC endpoint, you can privately connect your VPC to supported Amazon Web Services services and VPC endpoint services powered by Amazon PrivateLink without requiring an internet gateway, NAT device, VPN connection, or Amazon Direct Connect connection. Instances in your VPC don't require public IP addresses to communicate with resources in the service. Traffic between your VPC and the other service doesn't leave the Amazon network.

For more information about Amazon VPC security, see Improve the security of EC2 instances by using VPC endpoints for Systems Manager and Internetwork traffic privacy in Amazon VPC in the *Amazon VPC User Guide*.

Restrict Session Manager users to sessions using interactive commands and specific SSM session documents

Session Manager provides several methods for starting sessions to your managed nodes. For the most secure connections, you can require users to connect using the *interactive commands* method to limit user interaction to a specific command or command sequence. This helps you manage the interactive actions a user can take. For more information, see Starting a session (interactive and noninteractive commands).

For added security, you can limit Session Manager access to specific Amazon EC2 instances and specific Session Manager session documents. You grant or revoke Session Manager access in this

way by using Amazon Identity and Access Management (IAM) policies. For more information, see Step 3: Control session access to managed nodes.

Provide temporary node permissions for Automation workflows

During a workflow in Automation, a tool in Amazon Systems Manager, your nodes might need permissions that are needed for that execution only but not for other Systems Manager operations. For example, an Automation workflow might require a node to call a particular API operation or access an Amazon resource specifically during the workflow. If these calls or resources are ones that you want to limit access to, you can provide temporary, supplemental permissions for your nodes within the Automation runbook itself instead of adding the permissions to your IAM instance profile. At the end of the Automation workflow, the temporary permissions are removed. For more information, see Providing temporary instance permissions with Amazon Systems Manager Automations on the *Amazon Management and Governance Blog*.

Keep Amazon and Systems Manager tools up to date

Amazon regularly releases updated versions of tools and plugins that you can use in your Amazon and Systems Manager operations. Keeping these resources up to date ensures that users and nodes in your account have access to the latest functionality and security features in these tools.

- SSM Agent – Amazon Systems Manager Agent (SSM Agent) is Amazon software that can be installed and configured on an Amazon Elastic Compute Cloud (Amazon EC2) instance, an on-premises server, or a virtual machine (VM). SSM Agent makes it possible for Systems Manager to update, manage, and configure these resources. We recommend checking for new versions, or automating updates to the agent, at least every two weeks. For information, see Automating updates to SSM Agent. We also recommend verifying the signature of SSM Agent as part of your update process. For information, see Verifying the signature of SSM Agent.
- Amazon CLI – The Amazon Command Line Interface (Amazon CLI) is an open source tool that lets you interact with Amazon Web Services services using commands in your command-line shell. To update the Amazon CLI, you run the same command used to install the Amazon CLI. We recommend creating a scheduled task on your local machine to run the command appropriate to your operating system at least once every two weeks. For information about installation commands, see Installing the Amazon CLI version 2 in the *Amazon Command Line Interface User Guide*.
- Amazon Tools for Windows PowerShell – The Tools for Windows PowerShell are a set of PowerShell modules that are built on the functionality exposed by the Amazon SDK

for .NET. The Amazon Tools for Windows PowerShell allow you to script operations on your Amazon resources from the PowerShell command line. Periodically, as updated versions of the Tools for Windows PowerShell are released, you should update the version that you're running locally. For information, see Updating the Amazon Tools for Windows PowerShell on Windows or Updating the Amazon Tools for Windows PowerShell on Linux or macOS in the *IAM Policy Simulator User Guide*.

- Session Manager plugin – If users in your organization with permissions to use Session Manager want to connect to a node using the Amazon CLI, they must first install the Session Manager plugin on their local machines. To update the plugin, you run the same command used to install the plugin. We recommend creating a scheduled task on your local machine to run the command appropriate to your operating system at least once every two weeks. For information, see Install the Session Manager plugin for the Amazon CLI.
- CloudWatch agent – You can configure and use the CloudWatch agent to collect metrics and logs from your EC2 instances, on-premises instances, and virtual machines (VMs). These logs can be sent to Amazon CloudWatch Logs for monitoring and analysis. We recommend checking for new versions, or automating updates to the agent, at least every two weeks. For the simplest updates, use Amazon Systems Manager Quick Setup. For information, see Amazon Systems Manager Quick Setup.

SSM Agent installation best practices

When installing SSM Agent, use the appropriate installation method for your machine type. In particular, use the `ssm-setup-cli` tool for all non-EC2 installations in a hybrid and multicloud environment. This tool provides additional security protections for non-EC2 machines.

To install the agent on on-premises servers and virtual machines, use the `ssm-setup-cli` tool as described in the following topics:

- the section called “Install SSM Agent on hybrid Linux nodes”
- the section called “Install SSM Agent on hybrid Windows Server nodes”

To install the agent on EC2 instances, use the appropriate installation procedure for your operating system type:

- the section called “Manually installing and uninstalling SSM Agent on EC2 instances for Linux”
- the section called “Manually installing and uninstalling SSM Agent on EC2 instances for macOS”

- the section called “Manually installing and uninstalling SSM Agent on EC2 instances for Windows Server”

Systems Manager monitoring and auditing best practices

The following best practices for Systems Manager can help detect potential security weaknesses and incidents.

Identify and audit all your Systems Manager resources

Identification of your IT assets is a crucial aspect of governance and security. You need to identify all of your Systems Manager resources to assess their security posture and take action on potential areas of weakness.

Use Tag Editor to identify security-sensitive or audit-sensitive resources, then use those tags when you need to search for these resources. For more information, see Find resources to tag in the *Amazon Resource Groups User Guide*.

Create resource groups for your Systems Manager resources. For more information, see What are resource groups?

Implement monitoring using Amazon CloudWatch monitoring tools

Monitoring is an important part of maintaining the reliability, security, availability, and performance of Systems Manager and your Amazon solutions. Amazon CloudWatch provides several tools and services to help you monitor Systems Manager and your other Amazon Web Services services. For more information, see Sending node logs to unified CloudWatch Logs (CloudWatch agent) and Monitoring Systems Manager events with Amazon EventBridge.

Use CloudTrail

Amazon CloudTrail provides a record of actions taken by a user, role, or an Amazon Web Services service in Systems Manager. Using the information collected by CloudTrail, you can determine the request that was made to Systems Manager, the IP address from which the request was made, who made the request, when it was made, and additional details. For more information, see Logging Amazon Systems Manager API calls with Amazon CloudTrail.

Turn on Amazon Config

Amazon Config lets you assess, audit, and evaluate the configurations of your Amazon resources. Amazon Config monitors resource configurations, allowing you to evaluate the

recorded configurations against the required secure configurations. Using Amazon Config, you can review changes in configurations and relationships between Amazon resources, investigate detailed resource configuration histories, and determine your overall compliance against the configurations specified in your internal guidelines. This can help you simplify compliance auditing, security analysis, change management, and operational troubleshooting. For more information, see Setting Up Amazon Config with the Console in the *Amazon Config Developer Guide*. When specifying the resource types to record, make sure that you include Systems Manager resources.

Monitor Amazon security advisories

You should regularly check security advisories posted in Trusted Advisor for your Amazon Web Services account. You can do this programmatically using describe-trusted-advisor-checks.

Further, actively monitor the primary email address registered to each of your Amazon Web Services accounts. Amazon will contact you, using this email address, about emerging security issues that might affect you.

Amazon operational issues with broad impact are posted on the Amazon Service Health Dashboard. Operational issues are also posted to individual accounts through the Personal Health Dashboard. For more information, see the Amazon Health Documentation.

Code examples for Systems Manager using Amazon SDKs

The following code examples show how to use Systems Manager with an Amazon software development kit (SDK).

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other Amazon Web Services services.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Hello Systems Manager

The following code examples show how to get started using Systems Manager.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.ssm.SsmClient;
import software.amazon.awssdk.services.ssm.model.DocumentFilter;
import software.amazon.awssdk.services.ssm.model.ListDocumentsRequest;
import software.amazon.awssdk.services.ssm.model.ListDocumentsResponse;

public class HelloSSM {

    public static void main(String[] args) {
        final String usage = """

                Usage:
                    <awsAccount>
```

```
                Where:
                    awsAccount - Your AWS Account number.
                """;

        if (args.length != 1) {
            System.out.println(usage);
            System.exit(1);
        }

        String awsAccount = args[0] ;
        Region region = Region.US_EAST_1;
        SsmClient ssmClient = SsmClient.builder()
            .region(region)
            .build();

        listDocuments(ssmClient, awsAccount);
    }

    /*
    This code automatically fetches the next set of results using the `nextToken`
and
    stops once the desired maxResults (20 in this case) have been reached.
    */
    public static void listDocuments(SsmClient ssmClient, String awsAccount) {
        String nextToken = null;
        int totalDocumentsReturned = 0;
        int maxResults = 20;
        do {
            ListDocumentsRequest request = ListDocumentsRequest.builder()
                .documentFilterList(
                    DocumentFilter.builder()
                        .key("Owner")
                        .value(awsAccount)
                        .build()
                    )
                .maxResults(maxResults)
                .nextToken(nextToken)
                .build();

            ListDocumentsResponse response = ssmClient.listDocuments(request);
            response.documentIdentifiers().forEach(identifier ->
System.out.println("Document Name: " + identifier.name()));
            nextToken = response.nextToken();
            totalDocumentsReturned += response.documentIdentifiers().size();
```

```
        } while (nextToken != null && totalDocumentsReturned < maxResults);
    }
}
```

- For API details, see ListDocuments in *Amazon SDK for Java 2.x API Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
import { paginateListDocuments, SSMClient } from "@aws-sdk/client-ssm";

// Call ListDocuments and display the result.
export const main = async () => {
  const client = new SSMClient();
  const listDocumentsPaginated = [];
  console.log(
    "Hello, AWS Systems Manager! Let's list some of your documents:\n",
  );
  try {
    // The paginate function is a wrapper around the base command.
    const paginator = paginateListDocuments({ client }, { MaxResults: 5 });
    for await (const page of paginator) {
      listDocumentsPaginated.push(...page.DocumentIdentifiers);
    }
  } catch (caught) {
    console.error(`There was a problem saying hello: ${caught.message}`);
    throw caught;
  }

  for (const { Name, DocumentFormat, CreatedDate } of listDocumentsPaginated) {
    console.log(`${Name} - ${DocumentFormat} - ${CreatedDate}`);
  }
};
```

```
// Call function if run directly.
import { fileURLToPath } from "node:url";
if (process.argv[1] === fileURLToPath(import.meta.url)) {
  main();
}
```

- For API details, see ListDocuments in *Amazon SDK for JavaScript API Reference*.

Python

SDK for Python (Boto3)

> **Note**

Learn the basics of Systems Manager with an Amazon SDK

The following code examples show how to:

- Create a maintenance window.
- Modify the maintenance window schedule.
- Create a document.
- Send a command to a specified EC2 instance.
- Create an OpsItem.
- Update and resolve the OpsItem.
- Delete the maintenance window, OpsItem, and document.

Java

Actions for Systems Manager using Amazon SDKs

The following code examples demonstrate how to perform individual Systems Manager actions with Amazon SDKs. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

These excerpts call the Systems Manager API and are code excerpts from larger programs that must be run in context. You can see actions in context in Scenarios for Systems Manager using Amazon SDKs.

The following examples include only the most commonly used actions. For a complete list, see the Amazon Systems Manager API Reference.

Examples

- Use AddTagsToResource with a CLI
- Use CancelCommand with a CLI
- Use CreateActivation with a CLI
- Use CreateAssociation with a CLI
- Use CreateAssociationBatch with a CLI
- Use CreateDocument with an Amazon SDK or CLI
- Use CreateMaintenanceWindow with an Amazon SDK or CLI
- Use CreateOpsItem with an Amazon SDK or CLI
- Use CreatePatchBaseline with a CLI
- Use DeleteActivation with a CLI
- Use DeleteAssociation with a CLI
- Use DeleteDocument with an Amazon SDK or CLI
- Use DeleteMaintenanceWindow with an Amazon SDK or CLI
- Use DeleteOpsItem with an Amazon SDK
- Use DeleteParameter with a CLI
- Use DeletePatchBaseline with a CLI
- Use DeregisterManagedInstance with a CLI
- Use DeregisterPatchBaselineForPatchGroup with a CLI
- Use DeregisterTargetFromMaintenanceWindow with a CLI
- Use DeregisterTaskFromMaintenanceWindow with a CLI

- Use DescribeActivations with a CLI
- Use DescribeAssociation with a CLI
- Use DescribeAssociationExecutionTargets with a CLI
- Use DescribeAssociationExecutions with a CLI
- Use DescribeAutomationExecutions with a CLI
- Use DescribeAutomationStepExecutions with a CLI
- Use DescribeAvailablePatches with a CLI
- Use DescribeDocument with an Amazon SDK or CLI
- Use DescribeDocumentPermission with a CLI
- Use DescribeEffectiveInstanceAssociations with a CLI
- Use DescribeEffectivePatchesForPatchBaseline with a CLI
- Use DescribeInstanceAssociationsStatus with a CLI
- Use DescribeInstanceInformation with a CLI
- Use DescribeInstancePatchStates with a CLI
- Use DescribeInstancePatchStatesForPatchGroup with a CLI
- Use DescribeInstancePatches with a CLI
- Use DescribeMaintenanceWindowExecutionTaskInvocations with a CLI
- Use DescribeMaintenanceWindowExecutionTasks with a CLI
- Use DescribeMaintenanceWindowExecutions with a CLI
- Use DescribeMaintenanceWindowTargets with a CLI
- Use DescribeMaintenanceWindowTasks with a CLI
- Use DescribeMaintenanceWindows with a CLI
- Use DescribeOpsItems with an Amazon SDK or CLI
- Use DescribeParameters with an Amazon SDK or CLI
- Use DescribePatchBaselines with a CLI
- Use DescribePatchGroupState with a CLI
- Use DescribePatchGroups with a CLI
- Use GetAutomationExecution with a CLI
- Use GetCommandInvocation with a CLI
- Use GetConnectionStatus with a CLI

- Use GetDefaultPatchBaseline with a CLI
- Use GetDeployablePatchSnapshotForInstance with a CLI
- Use GetDocument with a CLI
- Use GetInventory with a CLI
- Use GetInventorySchema with a CLI
- Use GetMaintenanceWindow with a CLI
- Use GetMaintenanceWindowExecution with a CLI
- Use GetMaintenanceWindowExecutionTask with a CLI
- Use GetParameter with an Amazon SDK or CLI
- Use GetParameterHistory with a CLI
- Use GetParameters with a CLI
- Use GetPatchBaseline with a CLI
- Use GetPatchBaselineForPatchGroup with a CLI
- Use ListAssociationVersions with a CLI
- Use ListAssociations with a CLI
- Use ListCommandInvocations with an Amazon SDK or CLI
- Use ListCommands with a CLI
- Use ListComplianceItems with a CLI
- Use ListComplianceSummaries with a CLI
- Use ListDocumentVersions with a CLI
- Use ListDocuments with a CLI
- Use ListInventoryEntries with a CLI
- Use ListResourceComplianceSummaries with a CLI
- Use ListTagsForResource with a CLI
- Use ModifyDocumentPermission with a CLI
- Use PutComplianceItems with a CLI
- Use PutInventory with a CLI
- Use PutParameter with an Amazon SDK or CLI
- Use RegisterDefaultPatchBaseline with a CLI
- Use RegisterPatchBaselineForPatchGroup with a CLI

- Use RegisterTargetWithMaintenanceWindow with a CLI
- Use RegisterTaskWithMaintenanceWindow with a CLI
- Use RemoveTagsFromResource with a CLI
- Use SendCommand with an Amazon SDK or CLI
- Use StartAutomationExecution with a CLI
- Use StartSession with a CLI
- Use StopAutomationExecution with a CLI
- Use UpdateAssociation with a CLI
- Use UpdateAssociationStatus with a CLI
- Use UpdateDocument with a CLI
- Use UpdateDocumentDefaultVersion with a CLI
- Use UpdateMaintenanceWindow with an Amazon SDK or CLI
- Use UpdateManagedInstanceRole with a CLI
- Use UpdateOpsItem with an Amazon SDK or CLI
- Use UpdatePatchBaseline with a CLI

Use `AddTagsToResource` with a CLI

The following code examples show how to use `AddTagsToResource`.

CLI

Amazon CLI

Example 1: To add tags to a maintenance window

The following `add-tags-to-resource` example adds a tag to the specified maintenance window.

```
aws ssm add-tags-to-resource \
    --resource-type "MaintenanceWindow" \
    --resource-id "mw-03eb9db428EXAMPLE" \
    --tags "Key=Stack,Value=Production"
```

This command produces no output.

Example 2: To add tags to a parameter

The following `add-tags-to-resource` example adds two tags to to the specified parameter.

```
aws ssm add-tags-to-resource \
    --resource-type "Parameter" \
    --resource-id "My-Parameter" \
    --tags '[{"Key":"Region","Value":"East"},{"Key":"Environment",
 "Value":"Production"}]'
```

This command produces no output.

Example 3: To add tags to an SSM document

The following `add-tags-to-resource` example adds a tag to to the specified document.

```
aws ssm add-tags-to-resource \
    --resource-type "Document" \
    --resource-id "My-Document" \
    --tags "Key=Quarter,Value=Q322"
```

This command produces no output.

For more information, see Managing tags with Tag Editor in the *Amazon Systems Manager User Guide*.

- For API details, see AddTagsToResource in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates a maintenance window with new tags. There is no output if the command succeeds. The syntax used by this example requires PowerShell version 3 or later.

```
$option1 = @{Key="Stack";Value=@("Production")}
Add-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow" -Tag $option1
```

Example 2: With PowerShell version 2, you must use New-Object to create each tag. There is no output if the command succeeds.

```
$tag1 = New-Object Amazon.SimpleSystemsManagement.Model.Tag
$tag1.Key = "Stack"
$tag1.Value = "Production"

Add-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow" -Tag $tag1
```

- For API details, see AddTagsToResource in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates a maintenance window with new tags. There is no output if the command succeeds. The syntax used by this example requires PowerShell version 3 or later.

```
$option1 = @{Key="Stack";Value=@("Production")}
Add-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow" -Tag $option1
```

Example 2: With PowerShell version 2, you must use New-Object to create each tag. There is no output if the command succeeds.

```
$tag1 = New-Object Amazon.SimpleSystemsManagement.Model.Tag
$tag1.Key = "Stack"
$tag1.Value = "Production"

Add-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow" -Tag $tag1
```

- For API details, see AddTagsToResource in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CancelCommand` with a CLI

The following code examples show how to use `CancelCommand`.

CLI

Amazon CLI

Example 1: To cancel a command for all instances

The following `cancel-command` example attempts to cancel the specified command that is already running for all instances.

```
aws ssm cancel-command \
    --command-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

Example 2: To cancel a command for specific instances

The following `cancel-command` example attempts to cancel a command for the specified instance only.

```
aws ssm cancel-command \
    --command-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --instance-ids "i-02573cafcfEXAMPLE"
```

This command produces no output.

For more information, see Canceling a command in the *Amazon Systems Manager User Guide*.

- For API details, see CancelCommand in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example attempts to cancel a command. There is no output if the operation succeeds.

```
Stop-SSMCommand -CommandId "9ded293e-e792-4440-8e3e-7b8ec5feaa38"
```

- For API details, see CancelCommand in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example attempts to cancel a command. There is no output if the operation succeeds.

```
Stop-SSMCommand -CommandId "9ded293e-e792-4440-8e3e-7b8ec5feaa38"
```

- For API details, see CancelCommand in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateActivation` with a CLI

The following code examples show how to use `CreateActivation`.

CLI

Amazon CLI

To create a managed instance activation

The following `create-activation` example creates a managed instance activation.

```
aws ssm create-activation \
    --default-instance-name "HybridWebServers" \
    --iam-role "HybridWebServersRole" \
    --registration-limit 5
```

Output:

```
{
    "ActivationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "ActivationCode": "dRmgnYaFv567vEXAMPLE"
}
```

For more information, see Step 4: Create a Managed-Instance Activation for a Hybrid Environment in the *Amazon Systems Manager User Guide*.

- For API details, see CreateActivation in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a managed instance.

```
New-SSMActivation -DefaultInstanceName "MyWebServers" -IamRole
 "SSMAutomationRole" -RegistrationLimit 10
```

Output:

```
ActivationCode       ActivationId
--------------       ------------
KWChhOxBTiwDcKE9BlKC 08e51e79-1e36-446c-8e63-9458569c1363
```

- For API details, see CreateActivation in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a managed instance.

```
New-SSMActivation -DefaultInstanceName "MyWebServers" -IamRole
 "SSMAutomationRole" -RegistrationLimit 10
```

Output:

```
ActivationCode       ActivationId
--------------       ------------
KWChhOxBTiwDcKE9BlKC 08e51e79-1e36-446c-8e63-9458569c1363
```

- For API details, see CreateActivation in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateAssociation` with a CLI

The following code examples show how to use `CreateAssociation`.

CLI

Amazon CLI

Example 1: To associate a document using instance IDs

The following `create-association` example associates a configuration document with an instance, using instance IDs.

```
aws ssm create-association \
    --instance-id "i-0cb2b964d3e14fd9f" \
    --name "AWS-UpdateSSMAgent"
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487875500.33,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
```

```
        ]
    }
}
```

For more information, see Creating associations in the *Amazon Systems Manager User Guide*.

Example 2: To associate a document using targets

The following `create-association` example associates a configuration document with an instance, using targets.

```
aws ssm create-association \
    --name "AWS-UpdateSSMAgent" \
    --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f"
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487875500.33,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
```

```
}
```

For more information, see Creating associations in the *Amazon Systems Manager User Guide*.

Example 3: To create an association that runs only once

The following `create-association` example creates a new association that only runs once on the specified date and time. Associations created with a date in the past or present (by the time it is processed the date is in the past) run immediately.

```
aws ssm create-association \
    --name "AWS-UpdateSSMAgent" \
    --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f" \
    --schedule-expression "at(2020-05-14T15:55:00)"  \
    --apply-only-at-cron-interval
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487875500.33,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
```

```
        ]
    }
}
```

For more information, see Creating associations and Reference: Cron and rate expressions for Systems Manager in the *Amazon Systems Manager User Guide*.

- For API details, see CreateAssociation in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example associates a configuration document with an instance, using instance IDs.

```
New-SSMAssociation -InstanceId "i-0cb2b964d3e14fd9f" -Name "AWS-UpdateSSMAgent"
```

Output:

```
Name                 : AWS-UpdateSSMAgent
InstanceId           : i-0000293ffd8c57862
Date                 : 2/23/2017 6:55:22 PM
Status.Name          : Associated
Status.Date          : 2/20/2015 8:31:11 AM
Status.Message       : Associated with AWS-UpdateSSMAgent
Status.AdditionalInfo :
```

Example 2: This example associates a configuration document with an instance, using targets.

```
$target = @{Key="instanceids";Values=@("i-0cb2b964d3e14fd9f")}
New-SSMAssociation -Name "AWS-UpdateSSMAgent" -Target $target
```

Output:

```
Name                 : AWS-UpdateSSMAgent
InstanceId           :
Date                 : 3/1/2017 6:22:21 PM
Status.Name          :
Status.Date          :
```

```
Status.Message        :
Status.AdditionalInfo :
```

Example 3: This example associates a configuration document with an instance, using targets and parameters.

```
$target = @{Key="instanceids";Values=@("i-0cb2b964d3e14fd9f")}
$params = @{
  "action"="configure"
  "mode"="ec2"
  "optionalConfigurationSource"="ssm"
  "optionalConfigurationLocation"=""
  "optionalRestart"="yes"
}
New-SSMAssociation -Name "Configure-CloudWatch" -AssociationName
 "CWConfiguration" -Target $target -Parameter $params
```

Output:

```
Name                  : Configure-CloudWatch
InstanceId            :
Date                  : 5/17/2018 3:17:44 PM
Status.Name           :
Status.Date           :
Status.Message        :
Status.AdditionalInfo :
```

Example 4: This example creates an association with all instances in the region, with `AWS-GatherSoftwareInventory`. It also provides custom files and registry locations in the parameters to collect

```
$params =
 [Collections.Generic.Dictionary[String,Collections.Generic.List[String]]]::new()
$params["windowsRegistry"] ='[{"Path":"HKEY_LOCAL_MACHINE\SOFTWARE\Amazon
\MachineImage","Recursive":false,"ValueNames":["AMIName"]}]'
$params["files"] = '[{"Path":"C:\Program Files","Pattern":
["*.exe"],"Recursive":true}, {"Path":"C:\ProgramData","Pattern":
["*.log"],"Recursive":true}]'
New-SSMAssociation -AssociationName new-in-mum -Name AWS-GatherSoftwareInventory
 -Target @{Key="instanceids";Values="*"} -Parameter $params -region ap-south-1 -
ScheduleExpression "rate(720 minutes)"
```

Output:

```
Name                  : AWS-GatherSoftwareInventory
InstanceId            :
Date                  : 6/9/2019 8:57:56 AM
Status.Name           :

Tools for PowerShell V5

Example 1: This example associates a configuration document with an instance, using instance IDs.

```
New-SSMAssociation -InstanceId "i-0cb2b964d3e14fd9f" -Name "AWS-UpdateSSMAgent"
```

Output:

```
Name                  : AWS-UpdateSSMAgent
InstanceId            : i-0000293ffd8c57862
Date                  : 2/23/2017 6:55:22 PM
Status.Name           : Associated
Status.Date           : 2/20/2015 8:31:11 AM
Status.Message        : Associated with AWS-UpdateSSMAgent
Status.AdditionalInfo :
```

Example 2: This example associates a configuration document with an instance, using targets.

```
$target = @{Key="instanceids";Values=@("i-0cb2b964d3e14fd9f")}
New-SSMAssociation -Name "AWS-UpdateSSMAgent" -Target $target
```

Output:

```
Name                  : AWS-UpdateSSMAgent
InstanceId            :
```

```
Date                  : 3/1/2017 6:22:21 PM
Status.Name           :
Status.Date           :
Status.Message        :
Status.AdditionalInfo :
```

Example 3: This example associates a configuration document with an instance, using targets and parameters.

```
$target = @{Key="instanceids";Values=@("i-0cb2b964d3e14fd9f")}
$params = @{
  "action"="configure"
  "mode"="ec2"
  "optionalConfigurationSource"="ssm"
  "optionalConfigurationLocation"=""
  "optionalRestart"="yes"
}
New-SSMAssociation -Name "Configure-CloudWatch" -AssociationName
 "CWConfiguration" -Target $target -Parameter $params
```

Output:

```
Name                  : Configure-CloudWatch
InstanceId            :
Date                  : 5/17/2018 3:17:44 PM
Status.Name           :
Status.Date           :
Status.Message        :
Status.AdditionalInfo :
```

Example 4: This example creates an association with all instances in the region, with `AWS-GatherSoftwareInventory`. It also provides custom files and registry locations in the parameters to collect

```
$params =
 [Collections.Generic.Dictionary[String,Collections.Generic.List[String]]]::new()
$params["windowsRegistry"] ='[{"Path":"HKEY_LOCAL_MACHINE\SOFTWARE\Amazon
\MachineImage","Recursive":false,"ValueNames":["AMIName"]}]'
$params["files"] = '[{"Path":"C:\Program Files","Pattern":
["*.exe"],"Recursive":true}, {"Path":"C:\ProgramData","Pattern":
["*.log"],"Recursive":true}]'
```

```
New-SSMAssociation -AssociationName new-in-mum -Name AWS-GatherSoftwareInventory
 -Target @{Key="instanceids";Values="*"} -Parameter $params -region ap-south-1 -
ScheduleExpression "rate(720 minutes)"
```

Output:

```
Name                  : AWS-GatherSoftwareInventory
InstanceId            :
Date                  : 6/9/2019 8:57:56 AM
Status.Name           :
Status.Date           :
Status.Message        :
Status.AdditionalInfo :
```

Use `CreateAssociationBatch` with a CLI

The following code examples show how to use `CreateAssociationBatch`.

CLI

Amazon CLI

To create multiple associations

The following `create-association-batch` example associates a configuration document with multiple instances. The output returns a list of successful and failed operations, if applicable.

```
aws ssm create-association-batch \
    --entries "Name=AWS-UpdateSSMAgent,InstanceId=i-1234567890abcdef0" "Name=AWS-
UpdateSSMAgent,InstanceId=i-9876543210abcdef0"
```

Output:

```
{
    "Successful": [
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-1234567890abcdef0",
            "AssociationVersion": "1",
            "Date": 1550504725.007,

Use `CreateDocument` with an Amazon SDK or CLI

The following code examples show how to use `CreateDocument`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

Amazon CLI

To create a document

The following `create-document` example creates a Systems Manager document.

```
aws ssm create-document \
    --content file://exampleDocument.yml \
    --name "Example" \
    --document-type "Automation" \
    --document-format YAML
```

Contents of `exampleDocument.yml`:

```
description: Document Example
schemaVersion: '0.3'
assumeRole: '{{ AutomationAssumeRole }}'
parameters:
    AutomationAssumeRole:
        type: String
        description: (Required) The ARN of the role that allows Automation to
 perform the actions on your behalf. If no role is specified, Systems Manager
 Automation uses your IAM permissions to execute this document.
        default: ''
    InstanceId:
        type: String
        description: (Required) The ID of the Amazon EC2 instance.
        default: ''
mainSteps:
    - name: rebootInstance
      action: 'aws:executeAwsApi'
      inputs:
          Service: ec2
          Api: RebootInstances
          InstanceIds:
              - '{{ InstanceId }}'
```

Output:

```
{
```

```
    "DocumentDescription": {
        "Hash":
"fc2410281f40779e694a8b95975d0f9f316da8a153daa94e3d9921102EXAMPLE",

Use `CreateMaintenanceWindow` with an Amazon SDK or CLI

The following code examples show how to use `CreateMaintenanceWindow`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

Amazon CLI

Example 1: To create a maintenance window

The following `create-maintenance-window` example creates a new maintenance window that every five minutes for up to two hours (as needed), prevents new tasks from starting within one hour of the end of the maintenance window execution, allows unassociated targets (instances that you haven't registered with the maintenance window), and indicates through the use of custom tags that its creator intends to use it in a tutorial.

```
aws ssm create-maintenance-window \
    --name "My-Tutorial-Maintenance-Window" \
    --schedule "rate(5 minutes)" \
    --duration 2 \
    --cutoff 1 \
    --allow-unassociated-targets \
    --tags "Key=Purpose,Value=Tutorial"
```

Output:

```
{
    "WindowId": "mw-0c50858d01EXAMPLE"
}
```

For more information, see Tutorial: Create and configure a maintenance window using the Amazon CLI in the *Amazon Systems Manager User Guide*.

Example 2: To create a maintenance window that runs only once

The following `create-maintenance-window` example creates a new maintenance window that only runs one time on the specified date and time.

```
aws ssm create-maintenance-window \
    --name My-One-Time-Maintenance-Window \
    --schedule "at(2020-05-14T15:55:00)" \
    --duration 5 \
    --cutoff 2 \
    --allow-unassociated-targets \
    --tags "Key=Environment,Value=Production"
```

Output:

```
{
    "WindowId": "mw-01234567890abcdef"
}
```

For more information, see Amazon Systems Manager Maintenance Windows in the *Amazon Systems Manager User Guide*.

- For API details, see CreateMaintenanceWindow in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new maintenance window with the specified name that runs at 4 PM on every Tuesday for 4 hours, with a 1 hour cutoff, and that allows unassociated targets.

```
New-SSMMaintenanceWindow -Name "MyMaintenanceWindow" -Duration 4 -Cutoff 1 -
AllowUnassociatedTarget $true -Schedule "cron(0 16 ? * TUE *)"
```

Output:

```
mw-03eb53e1ea7383998
```

- For API details, see CreateMaintenanceWindow in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new maintenance window with the specified name that runs at 4 PM on every Tuesday for 4 hours, with a 1 hour cutoff, and that allows unassociated targets.

```
New-SSMMaintenanceWindow -Name "MyMaintenanceWindow" -Duration 4 -Cutoff 1 -
AllowUnassociatedTarget $true -Schedule "cron(0 16 ? * TUE *)"
```

Output:

```
mw-03eb53e1ea7383998
```

- For API details, see CreateMaintenanceWindow in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

Use `CreateOpsItem` with an Amazon SDK or CLI

The following code examples show how to use `CreateOpsItem`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

Amazon CLI

To create an OpsItems

The following `create-ops-item` example uses the /aws/resources key in OperationalData to create an OpsItem with an Amazon DynamoDB related resource.

```
aws ssm create-ops-item \
    --title "EC2 instance disk full" \
    --description "Log clean up may have failed which caused the disk to be full"
 \
```

```
    --priority 2 \
    --source ec2 \
    --operational-data '{"/aws/resources":{"Value":"[{\"arn
\": \"arn:aws:dynamodb:us-west-2:12345678:table/OpsItems
\"}]","Type":"SearchableString"}}' \
    --notifications Arn="arn:aws:sns:us-west-2:12345678:TestUser"
```

Output:

```
{
    "OpsItemId": "oi-1a2b3c4d5e6f"
}
```

For more information, see Creating OpsItems manually (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see CreateOpsItem in *Amazon CLI Command Reference*.

Use `CreatePatchBaseline` with a CLI

The following code examples show how to use `CreatePatchBaseline`.

CLI

Amazon CLI

Example 1: To create a patch baseline with auto-approval

The following `create-patch-baseline` example creates a patch baseline for Windows Server that approves patches for a production environment seven days after they are released by Microsoft.

```
aws ssm create-patch-baseline \
    --name "Windows-Production-Baseline-AutoApproval" \
    --operating-system "WINDOWS" \
    --approval-
rules "PatchRules=[{PatchFilterGroup={PatchFilters=[{Key=MSRC_SEVERITY,Values=[Critical,1
{Key=CLASSIFICATION,Values=[SecurityUpdates,Updates,UpdateRollups,CriticalUpdates]}]},App
 \
    --description "Baseline containing all updates approved for Windows Server
 production systems"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

Example 2: To create a patch baseline with an approval cutoff date

The following `create-patch-baseline` example creates a patch baseline for Windows Server that approves all patches for a production environment that are released on or before July 7, 2020.

```
aws ssm create-patch-baseline \
    --name "Windows-Production-Baseline-AutoApproval" \
    --operating-system "WINDOWS" \
    --approval-
rules "PatchRules=[{PatchFilterGroup={PatchFilters=[{Key=MSRC_SEVERITY,Values=[Critical,1
{Key=CLASSIFICATION,Values=[SecurityUpdates,Updates,UpdateRollups,CriticalUpdates]}]},App
 \
    --description "Baseline containing all updates approved for Windows Server
 production systems"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

Example 3: To create a patch baseline with approval rules stored in a JSON file

The following `create-patch-baseline` example creates a patch baseline for Amazon Linux 2017.09 that approves patches for a production environment seven days after they are released, specifies approval rules for the patch baseline, and specifies a custom repository for patches.

```
aws ssm create-patch-baseline \
    --cli-input-json file://my-amazon-linux-approval-rules-and-repo.json
```

Contents of `my-amazon-linux-approval-rules-and-repo.json`:

```
{
    "Name": "Amazon-Linux-2017.09-Production-Baseline",
```

```
   "Description": "My approval rules patch baseline for Amazon Linux 2017.09
instances",
   "OperatingSystem": "AMAZON_LINUX",
   "Tags": [
       {
           "Key": "Environment",
           "Value": "Production"
       }
   ],
   "ApprovalRules": {
       "PatchRules": [
           {
               "ApproveAfterDays": 7,
               "EnableNonSecurity": true,
               "PatchFilterGroup": {
                   "PatchFilters": [
                       {
                           "Key": "SEVERITY",
                           "Values": [
                               "Important",
                               "Critical"
                           ]
                       },
                       {
                           "Key": "CLASSIFICATION",
                           "Values": [
                               "Security",
                               "Bugfix"
                           ]
                       },

        }
    ]
}
```

Output:

```
{
    "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

Example 4: To create a patch baseline that specifies approved and rejected patches

The following `create-patch-baseline` example explicitly specifies patches to approve and reject as exception to the default approval rules.

```
aws ssm create-patch-baseline \
    --name "Amazon-Linux-2017.09-Alpha-Baseline" \
    --description "My custom approve/reject patch baseline for Amazon Linux
 2017.09 instances" \
    --operating-system "AMAZON_LINUX" \
    --approved-patches "CVE-2018-1234567,example-pkg-EE-2018*.amzn1.noarch" \
    --approved-patches-compliance-level "HIGH" \
    --approved-patches-enable-non-security \
    --tags "Key=Environment,Value=Alpha"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

For more information, see Create a Custom Patch Baseline in the *Amazon Systems Manager User Guide*.

- For API details, see CreatePatchBaseline in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example creates a patch baseline that approves patches, seven days after they are released by Microsoft, for managed instances running Windows Server 2019 in a production environment.

```
$rule = New-Object Amazon.SimpleSystemsManagement.Model.PatchRule
$rule.ApproveAfterDays = 7

$ruleFilters = New-Object Amazon.SimpleSystemsManagement.Model.PatchFilterGroup

$patchFilter = New-Object Amazon.SimpleSystemsManagement.Model.PatchFilter
$patchFilter.Key="PRODUCT"
$patchFilter.Values="WindowsServer2019"

$severityFilter = New-Object Amazon.SimpleSystemsManagement.Model.PatchFilter
$severityFilter.Key="MSRC_SEVERITY"
$severityFilter.Values.Add("Critical")
$severityFilter.Values.Add("Important")
$severityFilter.Values.Add("Moderate")

$classificationFilter = New-Object
 Amazon.SimpleSystemsManagement.Model.PatchFilter
$classificationFilter.Key = "CLASSIFICATION"
$classificationFilter.Values.Add( "SecurityUpdates" )
$classificationFilter.Values.Add( "Updates" )
$classificationFilter.Values.Add( "UpdateRollups" )
$classificationFilter.Values.Add( "CriticalUpdates" )

$ruleFilters.PatchFilters.Add($severityFilter)
$ruleFilters.PatchFilters.Add($classificationFilter)
$ruleFilters.PatchFilters.Add($patchFilter)
$rule.PatchFilterGroup = $ruleFilters

New-SSMPatchBaseline -Name "Production-Baseline-Windows2019" -Description
 "Baseline containing all updates approved for production systems" -
ApprovalRules_PatchRule $rule
```

Output:

```
pb-0z4z6221c4296b23z
```

- For API details, see CreatePatchBaseline in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a patch baseline that approves patches, seven days after they are released by Microsoft, for managed instances running Windows Server 2019 in a production environment.

```
$rule = New-Object Amazon.SimpleSystemsManagement.Model.PatchRule
$rule.ApproveAfterDays = 7

$ruleFilters = New-Object Amazon.SimpleSystemsManagement.Model.PatchFilterGroup

Use `DeleteActivation` with a CLI

The following code examples show how to use `DeleteActivation`.

CLI

Amazon CLI

To delete a managed instance activation

The following `delete-activation` example deletes a managed instance activation.

```
aws ssm delete-activation \
    --activation-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Setting Up Amazon Systems Manager for Hybrid Environments in the *Amazon Systems Manager User Guide*.

- For API details, see DeleteActivation in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes an activation. There is no output if the command succeeds.

```
Remove-SSMActivation -ActivationId "08e51e79-1e36-446c-8e63-9458569c1363"
```

- For API details, see DeleteActivation in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes an activation. There is no output if the command succeeds.

```
Remove-SSMActivation -ActivationId "08e51e79-1e36-446c-8e63-9458569c1363"
```

- For API details, see DeleteActivation in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteAssociation` with a CLI

The following code examples show how to use `DeleteAssociation`.

CLI

Amazon CLI

Example 1: To delete an association using the association ID

The following `delete-association` example deletes the association for the specified association ID. There is no output if the command succeeds.

```
aws ssm delete-association \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Editing and creating a new version of an association in the *Amazon Systems Manager User Guide*.

Example 2: To delete an association

The following `delete-association` example deletes the association between an instance and a document. There is no output if the command succeeds.

```
aws ssm delete-association \
    --instance-id "i-1234567890abcdef0" \
    --name "AWS-UpdateSSMAgent"
```

This command produces no output.

For more information, see Working with associations in Systems Manager in the *Amazon Systems Manager User Guide*.

- For API details, see DeleteAssociation in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes the association between an instance and a document. There is no output if the command succeeds.

```
Remove-SSMAssociation -InstanceId "i-0cb2b964d3e14fd9f" -Name "AWS-
UpdateSSMAgent"
```

- For API details, see DeleteAssociation in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes the association between an instance and a document. There is no output if the command succeeds.

```
Remove-SSMAssociation -InstanceId "i-0cb2b964d3e14fd9f" -Name "AWS-
UpdateSSMAgent"
```

- For API details, see DeleteAssociation in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteDocument` with an Amazon SDK or CLI

The following code examples show how to use `DeleteDocument`.

CLI

Amazon CLI

To delete a document

The following `delete-document` example deletes a Systems Manager document.

```
aws ssm delete-document \
    --name "Example"
```

This command produces no output.

For more information, see Creating Systems Manager Documents in the *Amazon Systems Manager User Guide*.

- For API details, see DeleteDocument in *Amazon CLI Command Reference*.

```

- For API details, see DeleteOpsItem in *Amazon SDK for SAP ABAP API reference*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteParameter` with a CLI

The following code examples show how to use `DeleteParameter`.

CLI

Amazon CLI

To delete a parameter

The following `delete-parameter` example deletes the specified single parameter.

```
aws ssm delete-parameter \
    --name "MyParameter"
```

This command produces no output.

For more information, see Working with Parameter Store in the *Amazon Systems Manager User Guide*.

- For API details, see DeleteParameter in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes a parameter. There is no output if the command succeeds.

```
Remove-SSMParameter -Name "helloWorld"
```

- For API details, see DeleteParameter in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes a parameter. There is no output if the command succeeds.

```
Remove-SSMParameter -Name "helloWorld"
```

- For API details, see DeleteParameter in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeletePatchBaseline` with a CLI

The following code examples show how to use `DeletePatchBaseline`.

CLI

Amazon CLI

To delete a patch baseline

The following `delete-patch-baseline` example deletes the specified patch baseline.

```
aws ssm delete-patch-baseline \
    --baseline-id "pb-045f10b4f382baeda"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f382baeda"
}
```

For more information, see Update or Delete a Patch Baseline (Console) in the *Amazon Systems Manager User Guide*.

- For API details, see DeletePatchBaseline in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deletes a patch baseline.

```
Remove-SSMPatchBaseline -BaselineId "pb-045f10b4f382baeda"
```

Output:

```
pb-045f10b4f382baeda
```

- For API details, see DeletePatchBaseline in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deletes a patch baseline.

```
Remove-SSMPatchBaseline -BaselineId "pb-045f10b4f382baeda"
```

Output:

```
pb-045f10b4f382baeda
```

- For API details, see DeletePatchBaseline in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeregisterManagedInstance` with a CLI

The following code examples show how to use `DeregisterManagedInstance`.

CLI

Amazon CLI

To deregister a managed instance

The following `deregister-managed-instance` example deregisters the specified managed instance.

```
aws ssm deregister-managed-instance \
    --instance-id 'mi-08ab247cdfEXAMPLE'
```

This command produces no output.

For more information, see Deregistering managed nodes in a hybrid and multicloud environment in the *Amazon Systems Manager User Guide*.

- For API details, see DeregisterManagedInstance in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deregisters a managed instance. There is no output if the command succeeds.

```
Unregister-SSMManagedInstance -InstanceId "mi-08ab247cdf1046573"
```

- For API details, see DeregisterManagedInstance in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deregisters a managed instance. There is no output if the command succeeds.

```
Unregister-SSMManagedInstance -InstanceId "mi-08ab247cdf1046573"
```

- For API details, see DeregisterManagedInstance in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeregisterPatchBaselineForPatchGroup` with a CLI

The following code examples show how to use `DeregisterPatchBaselineForPatchGroup`.

CLI

Amazon CLI

To deregister a patch group from a patch baseline

The following `deregister-patch-baseline-for-patch-group` example deregisters the specified patch group from the specified patch baseline.

```
aws ssm deregister-patch-baseline-for-patch-group \
    --patch-group "Production" \
```

```
    --baseline-id "pb-0ca44a362fEXAMPLE"
```

Output:

```
{
    "PatchGroup":"Production",
    "BaselineId":"pb-0ca44a362fEXAMPLE"
}
```

For more information, see Add a Patch Group to a Patch Baseline in the *Amazon Systems Manager User Guide*.

- For API details, see DeregisterPatchBaselineForPatchGroup in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example deregisters a patch group from a patch baseline.

```
Unregister-SSMPatchBaselineForPatchGroup -BaselineId "pb-045f10b4f382baeda" -
PatchGroup "Production"
```

Output:

```
BaselineId           PatchGroup
----------           ----------
pb-045f10b4f382baeda Production
```

- For API details, see DeregisterPatchBaselineForPatchGroup in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example deregisters a patch group from a patch baseline.

```
Unregister-SSMPatchBaselineForPatchGroup -BaselineId "pb-045f10b4f382baeda" -
PatchGroup "Production"
```

Output:

```
BaselineId           PatchGroup
----------           ----------
pb-045f10b4f382baeda Production
```

- For API details, see DeregisterPatchBaselineForPatchGroup in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeregisterTargetFromMaintenanceWindow` with a CLI

The following code examples show how to use `DeregisterTargetFromMaintenanceWindow`.

CLI

Amazon CLI

To remove a target from a maintenance window

The following `deregister-target-from-maintenance-window` example removes the specified target from the specified maintenance window.

```
aws ssm deregister-target-from-maintenance-window \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --window-target-id "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
```

Output:

```
{
    "WindowId":"mw-ab12cd34efEXAMPLE",
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

For more information, see Update a Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DeregisterTargetFromMaintenanceWindow in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes a target from a maintenance window.

```
Unregister-SSMTargetFromMaintenanceWindow -WindowTargetId
 "6ab5c208-9fc4-4697-84b7-b02a6cc25f7d" -WindowId "mw-06cf17cbefcb4bf4f"
```

Output:

```
WindowId             WindowTargetId
--------             --------------
mw-06cf17cbefcb4bf4f 6ab5c208-9fc4-4697-84b7-b02a6cc25f7d
```

- For API details, see DeregisterTargetFromMaintenanceWindow in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes a target from a maintenance window.

```
Unregister-SSMTargetFromMaintenanceWindow -WindowTargetId
 "6ab5c208-9fc4-4697-84b7-b02a6cc25f7d" -WindowId "mw-06cf17cbefcb4bf4f"
```

Output:

```
WindowId             WindowTargetId
--------             --------------
mw-06cf17cbefcb4bf4f 6ab5c208-9fc4-4697-84b7-b02a6cc25f7d
```

- For API details, see DeregisterTargetFromMaintenanceWindow in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DeregisterTaskFromMaintenanceWindow` with a CLI

The following code examples show how to use `DeregisterTaskFromMaintenanceWindow`.

CLI

Amazon CLI

To remove a task from a maintenance window

The following `deregister-task-from-maintenance-window` example removes the specified task from the specified maintenance window.

```
aws ssm deregister-task-from-maintenance-window \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --window-task-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "WindowTaskId":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "WindowId":"mw-ab12cd34efEXAMPLE"
}
```

For more information, see Systems Manager Maintenance Windows Tutorials (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DeregisterTaskFromMaintenanceWindow in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes a task from a maintenance window.

```
Unregister-SSMTaskFromMaintenanceWindow -WindowTaskId "f34a2c47-ddfd-4c85-
a88d-72366b69af1b" -WindowId "mw-03a342e62c96d31b0"
```

Output:

```
WindowId             WindowTaskId
--------             ------------
mw-03a342e62c96d31b0 f34a2c47-ddfd-4c85-a88d-72366b69af1b
```

- For API details, see DeregisterTaskFromMaintenanceWindow in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes a task from a maintenance window.

```
Unregister-SSMTaskFromMaintenanceWindow -WindowTaskId "f34a2c47-ddfd-4c85-
a88d-72366b69af1b" -WindowId "mw-03a342e62c96d31b0"
```

Output:

```
WindowId             WindowTaskId
--------             ------------
mw-03a342e62c96d31b0 f34a2c47-ddfd-4c85-a88d-72366b69af1b
```

- For API details, see DeregisterTaskFromMaintenanceWindow in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeActivations` with a CLI

The following code examples show how to use `DescribeActivations`.

CLI

Amazon CLI

To describe activations

The following `describe-activations` example lists details about the activations in your Amazon account.

```
aws ssm describe-activations
```

Output:

```
{
    "ActivationList": [
```

```
        {
            "ActivationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Description": "Example1",
            "IamRole": "HybridWebServersRole",
            "RegistrationLimit": 5,
            "RegistrationsCount": 5,
            "ExpirationDate": 1584316800.0,
            "Expired": false,
            "CreatedDate": 1581954699.792
        },
        {
            "ActivationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Description": "Example2",
            "IamRole": "HybridDatabaseServersRole",
            "RegistrationLimit": 5,
            "RegistrationsCount": 5,
            "ExpirationDate": 1580515200.0,
            "Expired": true,
            "CreatedDate": 1578064132.002
        }
    ]
}
```

For more information, see Step 4: Create a Managed-Instance Activation for a Hybrid Environment in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeActivations in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example provides details about the activations on your account.

```
Get-SSMActivation
```

Output:

```
ActivationId        : 08e51e79-1e36-446c-8e63-9458569c1363
CreatedDate         : 3/1/2017 12:01:51 AM
DefaultInstanceName : MyWebServers
Description         :
ExpirationDate      : 3/2/2017 12:01:51 AM
```

```
Expired             : False
IamRole             : AutomationRole
RegistrationLimit   : 10
RegistrationsCount  : 0
```

- For API details, see DescribeActivations in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example provides details about the activations on your account.

```
Get-SSMActivation
```

Output:

```
ActivationId        : 08e51e79-1e36-446c-8e63-9458569c1363
CreatedDate         : 3/1/2017 12:01:51 AM
DefaultInstanceName : MyWebServers
Description         :
ExpirationDate      : 3/2/2017 12:01:51 AM
Expired             : False
IamRole             : AutomationRole
RegistrationLimit   : 10
RegistrationsCount  : 0
```

- For API details, see DescribeActivations in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeAssociation` with a CLI

The following code examples show how to use `DescribeAssociation`.

CLI

Amazon CLI

Example 1: To get details of an association

The following `describe-association` example describes the association for the specified association ID.

```
aws ssm describe-association \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-GatherSoftwareInventory",
        "AssociationVersion": "1",
        "Date": 1534864780.995,
        "LastUpdateAssociationDate": 1543235759.81,
        "Overview": {
            "Status": "Success",
            "AssociationStatusAggregatedCount": {
                "Success": 2
            }
        },
        "DocumentVersion": "$DEFAULT",
        "Parameters": {
            "applications": [
                "Enabled"
            ],
            "awsComponents": [
                "Enabled"
            ],
            "customInventory": [
                "Enabled"
            ],
            "files": [
                ""
            ],
            "instanceDetailedInformation": [
                "Enabled"
            ],
            "networkConfig": [
                "Enabled"
            ],
            "services": [
                "Enabled"
            ],
```

```
            "windowsRegistry": [
                ""
            ],
            "windowsRoles": [
                "Enabled"
            ],
            "windowsUpdates": [
                "Enabled"
            ]
        },
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Targets": [
            {
                "Key": "InstanceIds",
                "Values": [
                    "*"
                ]
            }
        ],
        "ScheduleExpression": "rate(24 hours)",
        "LastExecutionDate": 1550501886.0,
        "LastSuccessfulExecutionDate": 1550501886.0,
        "AssociationName": "Inventory-Association"
    }
}
```

For more information, see Editing and creating a new version of an association in the *Amazon Systems Manager User Guide*.

Example 2: To get details of an association for a specific instance and document

The following `describe-association` example describes the association between an instance and a document.

```
aws ssm describe-association \
    --instance-id "i-1234567890abcdef0" \
    --name "AWS-UpdateSSMAgent"
```

Output:

```
{
    "AssociationDescription": {
```

```
        "Status": {
            "Date": 1487876122.564,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-1234567890abcdef0",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Associated",
            "AssociationStatusAggregatedCount": {
                "Pending": 1
            }
        },
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487876122.564,
        "Date": 1487876122.564,
        "Targets": [
            {
                "Values": [
                    "i-1234567890abcdef0"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see Editing and creating a new version of an association in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeAssociation in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example describes the association between an instance and a document.

```
Get-SSMAssociation -InstanceId "i-0000293ffd8c57862" -Name "AWS-UpdateSSMAgent"
```

Output:

```
Name                  : AWS-UpdateSSMAgent
InstanceId            : i-0000293ffd8c57862
Date                  : 2/23/2017 6:55:22 PM
Status.Name           : Pending
Status.Date           : 2/20/2015 8:31:11 AM
Status.Message        : temp_status_change
Status.AdditionalInfo : Additional-Config-Needed
```

- For API details, see DescribeAssociation in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example describes the association between an instance and a document.

```
Get-SSMAssociation -InstanceId "i-0000293ffd8c57862" -Name "AWS-UpdateSSMAgent"
```

Output:

```
Name                  : AWS-UpdateSSMAgent
InstanceId            : i-0000293ffd8c57862
Date                  : 2/23/2017 6:55:22 PM
Status.Name           : Pending
Status.Date           : 2/20/2015 8:31:11 AM
Status.Message        : temp_status_change
Status.AdditionalInfo : Additional-Config-Needed
```

- For API details, see DescribeAssociation in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeAssociationExecutionTargets` with a CLI

The following code examples show how to use `DescribeAssociationExecutionTargets`.

CLI

Amazon CLI

To get details of an association execution

The following `describe-association-execution-targets` example describes the specified association execution.

```
aws ssm describe-association-execution-targets \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --execution-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```
{
    "AssociationExecutionTargets": [
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AssociationVersion": "1",
            "ExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ResourceId": "i-1234567890abcdef0",
            "ResourceType": "ManagedInstance",
            "Status": "Success",
            "DetailedStatus": "Success",
            "LastExecutionDate": 1550505538.497,
            "OutputSource": {
                "OutputSourceId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
                "OutputSourceType": "RunCommand"
            }
        }
    ]
}
```

For more information, see Viewing association histories in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeAssociationExecutionTargets in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example displays the resource ID and its execution status that are part of the the association execution targets

```
Get-SSMAssociationExecutionTarget -AssociationId 123a45a0-
c678-9012-3456-78901234db5e -ExecutionId 123a45a0-c678-9012-3456-78901234db5e |
 Select-Object ResourceId, Status
```

Output:

```
ResourceId           Status
----------           ------
i-0b1b2a3456f7a890b  Success
i-01c12a45d6fc7a89f  Success
i-0a1caf234f56d7dc8  Success
i-012a3fd45af6dbcfe  Failed
i-0ddc1df23c4a5fb67  Success
```

Example 2: This command checks the particular execution of a particular automation since yesterday, where a command document is associated. It further checkes if the association execution failed, and if so, it will display the command invocation details for the execution along with the instance id

```
$AssociationExecution= Get-SSMAssociationExecutionTarget -
AssociationId 1c234567-890f-1aca-a234-5a678d901cb0 -ExecutionId
 12345ca12-3456-2345-2b45-23456789012 |
    Where-Object {$_.LastExecutionDate -gt (Get-Date -Hour 00 -Minute
 00).AddDays(-1)}

foreach ($execution in $AssociationExecution) {
    if($execution.Status -ne 'Success'){
        Write-Output "There was an issue executing the association

Use `DescribeAssociationExecutions` with a CLI

The following code examples show how to use `DescribeAssociationExecutions`.

CLI

Amazon CLI

Example 1: To get details of all executions for an association

The following `describe-association-executions` example describes all executions of the specified association.

```
aws ssm describe-association-executions \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "AssociationExecutions": [
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AssociationVersion": "1",
            "ExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505827.119,
            "ResourceCountByStatus": "{Success=1}"
        },
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AssociationVersion": "1",
            "ExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Status": "Success",
```

```
            "DetailedStatus": "Success",
            "CreatedTime": 1550505536.843,
            "ResourceCountByStatus": "{Success=1}"
        }
    ]
}
```

For more information, see Viewing association histories in the *Amazon Systems Manager User Guide*.

Example 2: To get details of all executions for an association after a specific date and time

The following `describe-association-executions` example describes all executions of an association after the specified date and time.

```
aws ssm describe-association-executions \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --filters "Key=CreatedTime,Value=2019-02-18T16:00:00Z,Type=GREATER_THAN"
```

Output:

```
{
    "AssociationExecutions": [
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AssociationVersion": "1",
            "ExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505827.119,
            "ResourceCountByStatus": "{Success=1}"
        },
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AssociationVersion": "1",
            "ExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505536.843,
            "ResourceCountByStatus": "{Success=1}"
        }
```

```
    ]
}
```

For more information, see Viewing association histories in the *Amazon Systems Manager User Guide*.

Use `DescribeAutomationStepExecutions` with a CLI

The following code examples show how to use `DescribeAutomationStepExecutions`.

CLI

Amazon CLI

Example 1: To describe all steps for an automation execution

The following `describe-automation-step-executions` example displays details about the steps of an Automation execution.

```
aws ssm describe-automation-step-executions \
    --automation-execution-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "StepExecutions": [
        {
            "StepName": "startInstances",
            "Action": "aws:changeInstanceState",
            "ExecutionStartTime": 1583737234.134,
            "ExecutionEndTime": 1583737234.672,
            "StepStatus": "Success",
            "Inputs": {
                "DesiredState": "\"running\"",
                "InstanceIds": "[\"i-0cb99161f6EXAMPLE\"]"
            },
            "Outputs": {
                "InstanceStates": [
                    "running"
                ]
            },
            "StepExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "OverriddenParameters": {}
        }
    ]
}
```

Example 2: To describe a specific step for an automation execution

The following `describe-automation-step-executions` example displays details about a specific step of an Automation execution.

```
aws ssm describe-automation-step-executions \
    --automation-execution-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --filters Key=StepExecutionId,Values=a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "StepExecutions": [
        {
            "StepName": "startInstances",
            "Action": "aws:changeInstanceState",
            "ExecutionStartTime": 1583737234.134,
            "ExecutionEndTime": 1583737234.672,
            "StepStatus": "Success",
            "Inputs": {
                "DesiredState": "\"running\"",
                "InstanceIds": "[\"i-0cb99161f6EXAMPLE\"]"
            },
            "Outputs": {
                "InstanceStates": [
                    "running"
                ]
            },
            "StepExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "OverriddenParameters": {}
        }
    ]
}
```

TerminateInstance         aws:changeInstanceState Pending
```

- For API details, see DescribeAutomationStepExecutions in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeAvailablePatches` with a CLI

The following code examples show how to use `DescribeAvailablePatches`.

CLI

Amazon CLI

Example 1: To get available patches

The following `describe-available-patches` example retrieves details about all available patches for Windows Server 2019 that have a MSRC severity of Critical.

```
aws ssm describe-available-patches \
    --
filters "Key=PRODUCT,Values=WindowsServer2019" "Key=MSRC_SEVERITY,Values=Critical"
```

Output:

```
{
    "Patches": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ReleaseDate": 1544047205.0,
            "Title": "2018-11 Update for Windows Server 2019 for x64-based
 Systems (KB4470788)",
            "Description": "Install this update to resolve issues in Windows.
 For a complete listing of the issues that are included in this update, see the
 associated Microsoft Knowledge Base article for more information. After you
 install this item, you may have to restart your computer.",
            "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",
            "Vendor": "Microsoft",
```

```
            "ProductFamily": "Windows",
            "Product": "WindowsServer2019",
            "Classification": "SecurityUpdates",
            "MsrcSeverity": "Critical",
            "KbNumber": "KB4470788",
            "MsrcNumber": "",
            "Language": "All"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ReleaseDate": 1549994410.0,
            "Title": "2019-02 Security Update for Adobe Flash Player for Windows
 Server 2019 for x64-based Systems (KB4487038)",
            "Description": "A security issue has been identified in a Microsoft
 software product that could affect your system. You can help protect your system
 by installing this update from Microsoft. For a complete listing of the issues
 that are included in this update, see the associated Microsoft Knowledge Base
 article. After you install this update, you may have to restart your system.",
            "ContentUrl": "https://support.microsoft.com/en-us/kb/4487038",
            "Vendor": "Microsoft",

            "Product": "WindowsServer2019",
            "Classification": "SecurityUpdates",
            "MsrcSeverity": "Critical",
            "KbNumber": "KB4487038",
            "MsrcNumber": "",
            "Language": "All"
        }
    ]
}
```

Example 2: To get details of a specific patch

The following `describe-available-patches` example retrieves details about the specified patch.

```
aws ssm describe-available-patches \
    --filters "Key=PATCH_ID,Values=KB4480979"
```

Output:

```
{
    "Patches": [
```

```
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "ReleaseDate": 1546970408.0,
            "Title": "2019-01 Security Update for Adobe Flash Player for Windows
 Server 2016 for x64-based Systems (KB4480979)",
            "Description": "A security issue has been identified in a Microsoft
 software product that could affect your system. You can help protect your system
 by installing this update from Microsoft. For a complete listing of the issues
 that are included in this update, see the associated Microsoft Knowledge Base
 article. After you install this update, you may have to restart your system.",
            "ContentUrl": "https://support.microsoft.com/en-us/kb/4480979",
            "Vendor": "Microsoft",
            "ProductFamily": "Windows",
            "Product": "WindowsServer2016",
            "Classification": "SecurityUpdates",
            "MsrcSeverity": "Critical",
            "KbNumber": "KB4480979",
            "MsrcNumber": "",
            "Language": "All"
        }
    ]
}
```

For more information, see How Patch Manager Operations Work in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeAvailablePatches in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets all available patches for Windows Server 2012 that have a MSRC severity of Critical. The syntax used by this example requires PowerShell version 3 or later.

```
$filter1 = @{Key="PRODUCT";Values=@("WindowsServer2012")}
$filter2 = @{Key="MSRC_SEVERITY";Values=@("Critical")}

Get-SSMAvailablePatch -Filter $filter1,$filter2
```

Output:

```
Classification : SecurityUpdates
ContentUrl     : https://support.microsoft.com/en-us/kb/2727528
Description    : A security issue has been identified that could allow an
 unauthenticated remote attacker to compromise your system and gain control
                 over it. You can help protect your system by installing this
 update from Microsoft. After you install this update, you may have to
                 restart your system.
Id             : 1eb507be-2040-4eeb-803d-abc55700b715
KbNumber       : KB2727528
Language       : All
MsrcNumber     : MS12-072
MsrcSeverity   : Critical
Product        : WindowsServer2012
ProductFamily  : Windows
ReleaseDate    : 11/13/2012 6:00:00 PM
Title          : Security Update for Windows Server 2012 (KB2727528)
Vendor         : Microsoft
...
```

Example 2: With PowerShell version 2, you must use New-Object to create each filter.

```
$filter1 = New-Object
 Amazon.SimpleSystemsManagement.Model.PatchOrchestratorFilter
$filter1.Key = "PRODUCT"
$filter1.Values = "WindowsServer2012"
$filter2 = New-Object
 Amazon.SimpleSystemsManagement.Model.PatchOrchestratorFilter
$filter2.Key = "MSRC_SEVERITY"
$filter2.Values = "Critical"

Get-SSMAvailablePatch -Filter $filter1,$filter2
```

Example 3: This example fetches all the updates which are released in last 20 days and applicable to products matching WindowsServer2019

```
Get-SSMAvailablePatch | Where-Object ReleaseDate -ge (Get-Date).AddDays(-20)
 | Where-Object Product -eq "WindowsServer2019" | Select-Object ReleaseDate,
 Product, Title
```

Output:

```
ReleaseDate         Product           Title
```

```
-----------         -------           -----
4/9/2019 5:00:12 PM WindowsServer2019 2019-04 Security Update for Adobe Flash
 Player for Windows Server 2019 for x64-based Systems (KB4493478)
4/9/2019 5:00:06 PM WindowsServer2019 2019-04 Cumulative Update for Windows
 Server 2019 for x64-based Systems (KB4493509)
4/2/2019 5:00:06 PM WindowsServer2019 2019-03 Servicing Stack Update for Windows
 Server 2019 for x64-based Systems (KB4493510)
```

- For API details, see DescribeAvailablePatches in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets all available patches for Windows Server 2012 that have a MSRC severity of Critical. The syntax used by this example requires PowerShell version 3 or later.

```

- For API details, see DescribeAvailablePatches in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeDocument` with an Amazon SDK or CLI

The following code examples show how to use `DescribeDocument`.

CLI

Amazon CLI

To display details of a document

The following `describe-document` example displays details about a Systems Manager document in your Amazon account.

```
aws ssm describe-document \
    --name "Example"
```

Output:

```
{
    "Document": {
        "Hash":
 "fc2410281f40779e694a8b95975d0f9f316da8a153daa94e3d9921102EXAMPLE",
        "HashType": "Sha256",
        "Name": "Example",
        "Owner": "29884EXAMPLE",
        "CreatedDate": 1583257938.266,
        "Status": "Active",
        "DocumentVersion": "1",
        "Description": "Document Example",
        "Parameters": [
            {
                "Name": "AutomationAssumeRole",
                "Type": "String",
                "Description": "(Required) The ARN of the role that allows
 Automation to perform the actions on your behalf. If no role is specified,
 Systems Manager Automation uses your IAM permissions to execute this document.",
                "DefaultValue": ""
            },
            {
                "Name": "InstanceId",
                "Type": "String",
                "Description": "(Required) The ID of the Amazon EC2 instance.",
                "DefaultValue": ""
            }
        ],
        "PlatformTypes": [
            "Windows",
```

```
            "Linux"
        ],
        "DocumentType": "Automation",
        "SchemaVersion": "0.3",
        "LatestVersion": "1",
        "DefaultVersion": "1",
        "DocumentFormat": "YAML",
        "Tags": []
    }
}
```

```

- For API details, see DescribeDocument in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

SAP ABAP

SDK for SAP ABAP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
    TRY.
        DATA(lo_result) = lo_ssm->describedocument( iv_name = iv_name ).
        DATA(lo_document) = lo_result->get_document( ).
        IF lo_document IS BOUND.
          rv_status = lo_document->get_status( ).
          MESSAGE |Document status: { rv_status }| TYPE 'I'.
        ENDIF.
      CATCH /aws1/cx_ssminvaliddocument.
        MESSAGE 'Invalid document.' TYPE 'I'.
    ENDTRY.
```

- For API details, see DescribeDocument in *Amazon SDK for SAP ABAP API reference*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeDocumentPermission` with a CLI

The following code examples show how to use `DescribeDocumentPermission`.

CLI

Amazon CLI

To describe document permissions

The following `describe-document-permission` example displays permission details about a Systems Manager document that is shared publicly.

```
aws ssm describe-document-permission \
    --name "Example" \
    --permission-type "Share"
```

Output:

```
{
    "AccountIds": [
        "all"
    ],
```

```
    "AccountSharingInfoList": [
        {
            "AccountId": "all",
            "SharedDocumentVersion": "$DEFAULT"
        }
    ]
}
```

For more information, see Share a Systems Manager Document in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeDocumentPermission in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all the versions for a document.

```
Get-SSMDocumentVersionList -Name "RunShellScript"
```

Output:

```
CreatedDate          DocumentVersion IsDefaultVersion Name
-----------          --------------- ---------------- ----
2/24/2017 5:25:13 AM 1               True             RunShellScript
```

- For API details, see DescribeDocumentPermission in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists all the versions for a document.

```
Get-SSMDocumentVersionList -Name "RunShellScript"
```

Output:

```
CreatedDate          DocumentVersion IsDefaultVersion Name
-----------          --------------- ---------------- ----
2/24/2017 5:25:13 AM 1               True             RunShellScript
```

- For API details, see DescribeDocumentPermission in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeEffectiveInstanceAssociations` with a CLI

The following code examples show how to use `DescribeEffectiveInstanceAssociations`.

CLI

Amazon CLI

To get details of the effective associations for an instance

The following `describe-effective-instance-associations` example retrieves details about the effective associations for an instance.

```
aws ssm describe-effective-instance-associations \
    --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "Associations": [
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "InstanceId": "i-1234567890abcdef0",
            "Content": "{\n    \"schemaVersion\": \"1.2\",\n    \"description\":
 \"Update the Amazon SSM Agent to the latest version or specified version.\",\n
  \"parameters\": {\n        \"version\": {\n            \"default\": \"\",\n
       \"description\": \"(Optional) A specific version of the Amazon SSM Agent
 to install. If not specified, the agent will be updated to the latest version.
\",\n            \"type\": \"String\"\n        },\n        \"allowDowngrade
\": {\n            \"default\": \"false\",\n            \"description\":
 \"(Optional) Allow the Amazon SSM Agent service to be downgraded to an earlier
 version. If set to false, the service can be upgraded to newer versions only
 (default). If set to true, specify the earlier version.\",\n            \"type
\": \"String\",\n            \"allowedValues\": [\n                \"true\",\n
```

```
                \"false\"\n            ]\n        }\n    },\n    \"runtimeConfig
\": {\n        \"aws:updateSsmAgent\": {\n            \"properties\": [\n
        {\n                \"agentName\": \"amazon-ssm-agent\",\n
  \"source\": \"https://s3.{Region}.amazonaws.com/amazon-ssm-{Region}/ssm-agent-
manifest.json\",\n                \"allowDowngrade\": \"{{ allowDowngrade }}\",\n
                \"targetVersion\": \"{{ version }}\"\n                }\n
    ]\n        }\n    }\n}\n",
            "AssociationVersion": "1"
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeEffectiveInstanceAssociations in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example describes the effective associations for an instance.

```
Get-SSMEffectiveInstanceAssociationList -InstanceId "i-0000293ffd8c57862" -
MaxResult 5
```

Output:

```
AssociationId                        Content
-------------                        -------
d8617c07-2079-4c18-9847-1655fc2698b0 {...
```

Example 2: This example displays the contents of the effective associations for an instance.

```
(Get-SSMEffectiveInstanceAssociationList -InstanceId "i-0000293ffd8c57862" -
MaxResult 5).Content
```

Output:

```
{
    "schemaVersion": "1.2",
    "description": "Update the Amazon SSM Agent to the latest version or
 specified version.",
    "parameters": {
        "version": {
            "default": "",
            "description": "(Optional) A specific version of the Amazon SSM Agent
 to install. If not specified, the agen
t will be updated to the latest version.",
            "type": "String"
        },
        "allowDowngrade": {
            "default": "false",

Use `DescribeEffectivePatchesForPatchBaseline` with a CLI

The following code examples show how to use `DescribeEffectivePatchesForPatchBaseline`.

CLI

Amazon CLI

Example 1: To get all patches defined by a custom patch baseline

The following `describe-effective-patches-for-patch-baseline` example returns the patches defined by a custom patch baseline in the current Amazon account. Note that for a custom baseline, only the ID is required for `--baseline-id`.

```
aws ssm describe-effective-patches-for-patch-baseline \
    --baseline-id "pb-08b654cf9b9681f04"
```

Output:

```
{
    "EffectivePatches": [
        {
            "Patch": {
                "Id": "fe6bd8c2-3752-4c8b-ab3e-1a7ed08767ba",
                "ReleaseDate": 1544047205.0,
                "Title": "2018-11 Update for Windows Server 2019 for x64-based
 Systems (KB4470788)",
                "Description": "Install this update to resolve issues in Windows.
 For a complete listing of the issues that are included in this update, see the
 associated Microsoft Knowledge Base article for more information. After you
 install this item, you may have to restart your computer.",
                "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",
                "Vendor": "Microsoft",
                "ProductFamily": "Windows",
                "Product": "WindowsServer2019",
                "Classification": "SecurityUpdates",
                "MsrcSeverity": "Critical",
                "KbNumber": "KB4470788",
                "MsrcNumber": "",
                "Language": "All"
            },
            "PatchStatus": {
                "DeploymentStatus": "APPROVED",
                "ComplianceLevel": "CRITICAL",
                "ApprovalDate": 1544047205.0
            }
        },
        {
            "Patch": {
                "Id": "915a6b1a-f556-4d83-8f50-b2e75a9a7e58",
                "ReleaseDate": 1549994400.0,
                "Title": "2019-02 Cumulative Update for .NET Framework 3.5 and
 4.7.2 for Windows Server 2019 for x64 (KB4483452)",
                "Description": "A security issue has been identified in a
 Microsoft software product that could affect your system. You can help protect
 your system by installing this update from Microsoft. For a complete listing
 of the issues that are included in this update, see the associated Microsoft
```

```
 Knowledge Base article. After you install this update, you may have to restart
 your system.",
                "ContentUrl": "https://support.microsoft.com/en-us/kb/4483452",
                "Vendor": "Microsoft",
                "ProductFamily": "Windows",
                "Product": "WindowsServer2019",

                "Language": "All"
            },
            "PatchStatus": {
                "DeploymentStatus": "APPROVED",
                "ComplianceLevel": "CRITICAL",
                "ApprovalDate": 1549994400.0
            }
        }
    ],
    "NextToken": "--token string truncated--"
}
```

Example 2: To get all patches defined by an Amazon managed patch baseline

The following `describe-effective-patches-for-patch-baseline` example returns the patches defined by an Amazon managed patch baseline. Note that for an Amazon managed baseline, the complete baseline ARN is required for `--baseline-id`.

```
aws ssm describe-effective-patches-for-patch-baseline \
    --baseline-id "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-020d361a05defe4ed"
```

Output:

```
{
    "EffectivePatches": [
        {
            "Patch": {
                "Id": "fe6bd8c2-3752-4c8b-ab3e-1a7ed08767ba",
                "ReleaseDate": 1544047205.0,
                "Title": "2018-11 Update for Windows Server 2019 for x64-based
 Systems (KB4470788)",
```

```
                "Description": "Install this update to resolve issues in Windows.
 For a complete listing of the issues that are included in this update, see the
 associated Microsoft Knowledge Base article for more information. After you
 install this item, you may have to restart your computer.",
                "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",
                "Vendor": "Microsoft",
                "ProductFamily": "Windows",
                "Product": "WindowsServer2019",
                "Classification": "SecurityUpdates",
                "MsrcSeverity": "Critical",
                "KbNumber": "KB4470788",
                "MsrcNumber": "",
                "Language": "All"
            },
            "PatchStatus": {

PowerShell

Tools for PowerShell V4

Example 1: This example lists all patch baselines, with a maximum result list of 1.

```
Get-SSMEffectivePatchesForPatchBaseline -BaselineId "pb-0a2f1059b670ebd31" -
MaxResult 1
```

Output:

```
Patch                                          PatchStatus
```

```
-----                                          -----------
Amazon.SimpleSystemsManagement.Model.Patch
 Amazon.SimpleSystemsManagement.Model.PatchStatus
```

Example 2: This example displays the patch status for all patch baselines, with a maximum result list of 1.

```
(Get-SSMEffectivePatchesForPatchBaseline -BaselineId "pb-0a2f1059b670ebd31" -
MaxResult 1).PatchStatus
```

Output:

```
ApprovalDate          DeploymentStatus
------------          ----------------
12/21/2010 6:00:00 PM APPROVED
```

- For API details, see DescribeEffectivePatchesForPatchBaseline in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists all patch baselines, with a maximum result list of 1.

```
Get-SSMEffectivePatchesForPatchBaseline -BaselineId "pb-0a2f1059b670ebd31" -
MaxResult 1
```

Output:

```
Patch                                          PatchStatus
-----                                          -----------
Amazon.SimpleSystemsManagement.Model.Patch
 Amazon.SimpleSystemsManagement.Model.PatchStatus
```

Example 2: This example displays the patch status for all patch baselines, with a maximum result list of 1.

```
(Get-SSMEffectivePatchesForPatchBaseline -BaselineId "pb-0a2f1059b670ebd31" -
MaxResult 1).PatchStatus
```

Output:

```
ApprovalDate          DeploymentStatus
------------          ----------------
12/21/2010 6:00:00 PM APPROVED
```

Use `DescribeInstanceAssociationsStatus` with a CLI

The following code examples show how to use `DescribeInstanceAssociationsStatus`.

CLI

Amazon CLI

To describe the status of an instance's associations

The following `describe-instance-associations-status` example shows details of the associations for an instance.

```
aws ssm describe-instance-associations-status \
    --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "InstanceAssociationStatusInfos": [
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Name": "AWS-GatherSoftwareInventory",
            "DocumentVersion": "1",
            "AssociationVersion": "1",
            "InstanceId": "i-1234567890abcdef0",
            "ExecutionDate": 1550501886.0,
            "Status": "Success",
            "ExecutionSummary": "1 out of 1 plugin processed, 1 success, 0
 failed, 0 timedout, 0 skipped. ",
```

```
            "AssociationName": "Inventory-Association"
        },
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Name": "AWS-UpdateSSMAgent",
            "DocumentVersion": "1",
            "AssociationVersion": "1",
            "InstanceId": "i-1234567890abcdef0",
            "ExecutionDate": 1550505828.548,
            "Status": "Success",
            "DetailedStatus": "Success",
            "AssociationName": "UpdateSSMAgent"
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeInstanceAssociationsStatus in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example shows details of the associations for an instance.

```
Get-SSMInstanceAssociationsStatus -InstanceId "i-0000293ffd8c57862"
```

Output:

```
AssociationId    : d8617c07-2079-4c18-9847-1655fc2698b0

```

- For API details, see DescribeInstanceAssociationsStatus in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeInstanceInformation` with a CLI

The following code examples show how to use `DescribeInstanceInformation`.

CLI

Amazon CLI

Example 1: To describe managed instance information

The following `describe-instance-information` example retrieves details of each of your managed instances.

```
aws ssm describe-instance-information
```

Output:

```
{
    "InstanceInformationList": [
        {
```

```
            "InstanceId": "i-028ea792daEXAMPLE",
            "PingStatus": "Online",
            "LastPingDateTime": 1582221233.421,
            "AgentVersion": "2.3.842.0",
            "IsLatestVersion": true,
            "PlatformType": "Linux",
            "PlatformName": "SLES",
            "PlatformVersion": "15.1",
            "ResourceType": "EC2Instance",
            "IPAddress": "192.0.2.0",
            "ComputerName": "ip-198.51.100.0.us-west-2.compute.internal",
            "AssociationStatus": "Success",
            "LastAssociationExecutionDate": 1582220806.0,
            "LastSuccessfulAssociationExecutionDate": 1582220806.0,
            "AssociationOverview": {
                "DetailedStatus": "Success",
                "InstanceAssociationStatusAggregatedCount": {
                    "Success": 2
                }
            }
        },
        {
            "InstanceId": "i-0cb99161f6EXAMPLE",
            "PingStatus": "Online",
            "LastPingDateTime": 1582221158.297,
            "AgentVersion": "2.3.842.0",
            "IsLatestVersion": true,
            "PlatformType": "Windows",
            "PlatformName": "Microsoft Windows Server 2019 Datacenter",
            "PlatformVersion": "10.0.17763",
            "ResourceType": "EC2Instance",
            "IPAddress": "192.0.2.1",
            "ComputerName": "EC2AMAZ-EXAMPLE.WORKGROUP",
            "AssociationStatus": "Success",
            "LastAssociationExecutionDate": 1582220806.0,
            "LastSuccessfulAssociationExecutionDate": 1582220806.0,
            "AssociationOverview": {
                "DetailedStatus": "Success",
                "InstanceAssociationStatusAggregatedCount": {
                    "Success": 1
                }
            }
        }
    ]
```

```
}
```

Example 2: To describe information about a specific managed instance

The following `describe-instance-information` example shows details of the managed instance `i-028ea792daEXAMPLE`.

```
aws ssm describe-instance-information \
    --filters "Key=InstanceIds,Values=i-028ea792daEXAMPLE"
```

Output:

```
{
    "InstanceInformationList": [
        {
            "InstanceId": "i-028ea792daEXAMPLE",
            "PingStatus": "Online",
            "LastPingDateTime": 1582221233.421,
            "AgentVersion": "2.3.842.0",
            "IsLatestVersion": true,
            "PlatformType": "Linux",
            "PlatformName": "SLES",
            "PlatformVersion": "15.1",
            "ResourceType": "EC2Instance",
            "IPAddress": "192.0.2.0",
            "ComputerName": "ip-198.51.100.0.us-west-2.compute.internal",
            "AssociationStatus": "Success",
            "LastAssociationExecutionDate": 1582220806.0,
            "LastSuccessfulAssociationExecutionDate": 1582220806.0,
            "AssociationOverview": {
                "DetailedStatus": "Success",
                "InstanceAssociationStatusAggregatedCount": {
                    "Success": 2
                }
            }
        }
    ]
}
```

Example 3: To describe information about managed instances with a specific tag key

The following `describe-instance-information` example shows details for managed instances that have the tag key `DEV`.

```
aws ssm describe-instance-information \
    --filters "Key=tag-key,Values=DEV"
```

Output:

```
{
    "InstanceInformationList": [
        {
            "InstanceId": "i-028ea792daEXAMPLE",
            "PingStatus": "Online",
            "LastPingDateTime": 1582221233.421,
            "AgentVersion": "2.3.842.0",
            "IsLatestVersion": true,
            "PlatformType": "Linux",
            "PlatformName": "SLES",
            "PlatformVersion": "15.1",
            "ResourceType": "EC2Instance",
            "IPAddress": "192.0.2.0",

Use `DescribeInstancePatchStates` with a CLI

The following code examples show how to use `DescribeInstancePatchStates`.

CLI

Amazon CLI

To get the patch summary states for instances

The following `describe-instance-patch-states` example gets the patch summary states for an instance.

```
aws ssm describe-instance-patch-states \
    --instance-ids "i-1234567890abcdef0"
```

Output:

```
{
```

```
    "InstancePatchStates": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "PatchGroup": "my-patch-group",
            "BaselineId": "pb-0713accee01234567",
            "SnapshotId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "CriticalNonCompliantCount": 2,
            "SecurityNonCompliantCount": 2,
            "OtherNonCompliantCount": 1,
            "InstalledCount": 123,
            "InstalledOtherCount": 334,
            "InstalledPendingRebootCount": 0,
            "InstalledRejectedCount": 0,
            "MissingCount": 1,
            "FailedCount": 2,
            "UnreportedNotApplicableCount": 11,
            "NotApplicableCount": 2063,
            "OperationStartTime": "2021-05-03T11:00:56-07:00",
            "OperationEndTime": "2021-05-03T11:01:09-07:00",
            "Operation": "Scan",
            "LastNoRebootInstallOperationTime": "2020-06-14T12:17:41-07:00",
            "RebootOption": "RebootIfNeeded"
        }
    ]
}
```

For more information, see About Patch Compliance in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeInstancePatchStates in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets the patch summary states for an instance.

```
Get-SSMInstancePatchState -InstanceId "i-08ee91c0b17045407"
```

Example 2: This example gets the patch summary states for two instances.

```
Get-SSMInstancePatchState -InstanceId "i-08ee91c0b17045407","i-09a618aec652973a9"
```

- For API details, see DescribeInstancePatchStates in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets the patch summary states for an instance.

```
Get-SSMInstancePatchState -InstanceId "i-08ee91c0b17045407"
```

Example 2: This example gets the patch summary states for two instances.

```
Get-SSMInstancePatchState -InstanceId "i-08ee91c0b17045407","i-09a618aec652973a9"
```

- For API details, see DescribeInstancePatchStates in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeInstancePatchStatesForPatchGroup` with a CLI

The following code examples show how to use `DescribeInstancePatchStatesForPatchGroup`.

CLI

Amazon CLI

Example 1: To get the instance states for a patch group

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states per-instance for the specified patch group.

```
aws ssm describe-instance-patch-states-for-patch-group \
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
```

```
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "PatchGroup": "Production",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "OwnerInformation": "",
            "InstalledCount": 32,
            "InstalledOtherCount": 1,
            "InstalledPendingRebootCount": 0,
            "InstalledRejectedCount": 0,
            "MissingCount": 2,
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 2671,
            "NotApplicableCount": 400,
            "OperationStartTime": "2021-08-04T11:03:50.590000-07:00",

            "RebootOption": "NoReboot",
            "CriticalNonCompliantCount": 0,
            "SecurityNonCompliantCount": 1,
            "OtherNonCompliantCount": 0
        }
```

```
    ]
}
```

Example 2: To get the instance states for a patch group with more than five missing patches

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states for the specified patch group for instances with more than five missing patches.

```
aws ssm describe-instance-patch-states-for-patch-group \
    --filters Key=MissingCount,Type=GreaterThan,Values=5 \
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "PatchGroup": "Production",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "OwnerInformation": "",
            "InstalledCount": 46,
            "InstalledOtherCount": 4,
            "InstalledPendingRebootCount": 1,
            "InstalledRejectedCount": 1,
            "MissingCount": 7,
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 232,
            "NotApplicableCount": 654,
            "OperationStartTime": "2021-08-04T11:03:50.590000-07:00",
            "OperationEndTime": "2021-08-04T11:04:21.555000-07:00",
            "Operation": "Scan",
            "RebootOption": "NoReboot",
            "CriticalNonCompliantCount": 0,
            "SecurityNonCompliantCount": 1,
            "OtherNonCompliantCount": 1
        }
    ]
}
```

Example 3: To get the instance states for a patch group with fewer than ten instances that require a reboot

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states for the specified patch group for instances with fewer than ten instances requiring a reboot.

```
aws ssm describe-instance-patch-states-for-patch-group \
    --filters Key=InstalledPendingRebootCount,Type=LessThan,Values=10 \
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "PatchGroup": "Production",
            "OwnerInformation": "",
            "InstalledCount": 32,
            "InstalledOtherCount": 1,
            "InstalledPendingRebootCount": 4,
            "InstalledRejectedCount": 0,
            "MissingCount": 2,
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 846,
            "NotApplicableCount": 212,
            "OperationStartTime": "2021-08-06T11:03:50.590000-07:00",
            "OperationEndTime": "2021-08-06T11:04:21.555000-07:00",
            "Operation": "Scan",
            "RebootOption": "NoReboot",
            "CriticalNonCompliantCount": 0,
            "SecurityNonCompliantCount": 1,
            "OtherNonCompliantCount": 0
        }
    ]
}
```

For more information, see Understanding patch compliance state values in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeInstancePatchStatesForPatchGroup in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets the patch summary states per-instance for a patch group.

```
Get-SSMInstancePatchStatesForPatchGroup -PatchGroup "Production"
```

- For API details, see DescribeInstancePatchStatesForPatchGroup in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets the patch summary states per-instance for a patch group.

```
Get-SSMInstancePatchStatesForPatchGroup -PatchGroup "Production"
```

- For API details, see DescribeInstancePatchStatesForPatchGroup in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeInstancePatches` with a CLI

The following code examples show how to use `DescribeInstancePatches`.

CLI

Amazon CLI

Example 1: To get the patch state details for an instance

The following `describe-instance-patches` example retrieves details about the patches for the specified instance.

```
aws ssm describe-instance-patches \
```

```
    --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "Patches": [
        {
            "Title": "2019-01 Security Update for Adobe Flash Player for Windows
 Server 2016 for x64-based Systems (KB4480979)",
            "KBId": "KB4480979",
            "Classification": "SecurityUpdates",
            "Severity": "Critical",
            "State": "Installed",
            "InstalledTime": "2019-01-09T00:00:00+00:00"
        },
        {
            "Title": "",
            "KBId": "KB4481031",
            "Classification": "",
            "Severity": "",
            "State": "InstalledOther",
            "InstalledTime": "2019-02-08T00:00:00+00:00"
        }
    ],
    "NextToken": "--token string truncated--"
}
```

Example 2: To get a list of patches in the Missing state for an instance

The following `describe-instance-patches` example retrieves information about patches that are in the Missing state for the specified instance.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0" \
    --filters Key=State,Values=Missing
```

Output:

```
{
    "Patches": [
        {
```

```
            "Title": "Windows Malicious Software Removal Tool x64 - February 2019
 (KB890830)",
            "KBId": "KB890830",
            "Classification": "UpdateRollups",
            "Severity": "Unspecified",
            "State": "Missing",
            "InstalledTime": "1970-01-01T00:00:00+00:00"
        }
    ],
    "NextToken": "--token string truncated--"
}
```

For more information, see About Patch Compliance States in the *Amazon Systems Manager User Guide*.

Example 3: To get a list of patches installed since a specified InstalledTime for an instance

The following `describe-instance-patches` example retrieves information about patches installed since a specified time for the specified instance by combining the use of `--filters` and `--query`.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0" \
    --filters Key=State,Values=Installed \
    --query 'Patches[?InstalledTime >= `"2023-01-01T16:00:00"`]'
```

Output:

```
[
    {
        "Title": "2023-03 Cumulative Update for Windows Server 2019 (1809) for
 x64-based Systems (KB5023702)",
        "KBId": "KB5023702",
        "Classification": "SecurityUpdates",
        "Severity": "Critical",
        "State": "Installed",
        "InstalledTime": "2023-03-16T11:00:00+00:00"
    }
]
```

- For API details, see DescribeInstancePatches in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets the patch compliance details for an instance.

```
Get-SSMInstancePatch -InstanceId "i-08ee91c0b17045407"
```

- For API details, see DescribeInstancePatches in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets the patch compliance details for an instance.

```
Get-SSMInstancePatch -InstanceId "i-08ee91c0b17045407"
```

- For API details, see DescribeInstancePatches in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeMaintenanceWindowExecutionTaskInvocations` with a CLI

The following code examples show how to use `DescribeMaintenanceWindowExecutionTaskInvocations`.

CLI

Amazon CLI

To get the specific task invocations performed for a maintenance window task execution

The following `describe-maintenance-window-execution-task-invocations` example lists the invocations for the specified task executed as part of the specified maintenance window execution.

```
aws ssm describe-maintenance-window-execution-task-invocations \
    --window-execution-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
```

```
    --task-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```
{
    "WindowExecutionTaskInvocationIdentities": [
        {
            "Status": "SUCCESS",
            "Parameters": "{\"documentName\":\"AWS-RunShellScript\",
\"instanceIds\":[\"i-0000293ffd8c57862\"],\"parameters\":{\"commands\":[\"df\"]},
\"maxConcurrency\":\"1\",\"maxErrors\":\"1\"}",
            "InvocationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "StartTime": 1487692834.723,
            "EndTime": 1487692834.871,
            "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TaskExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

For more information, see View Information About Tasks and Task Executions (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutionTaskInvocations in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists the invocations for a task executed as part of a maintenance window execution.

```
Get-SSMMaintenanceWindowExecutionTaskInvocationList -TaskId "ac0c6ae1-

- For API details, see DescribeMaintenanceWindowExecutionTaskInvocations in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeMaintenanceWindowExecutionTasks` with a CLI

The following code examples show how to use `DescribeMaintenanceWindowExecutionTasks`.

CLI

Amazon CLI

To list all tasks associated with a maintenance window execution

The following `describe-maintenance-window-execution-tasks` example lists the tasks associated with the specified maintenance window execution.

```
aws ssm describe-maintenance-window-execution-tasks \
    --window-execution-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "WindowExecutionTaskIdentities": [
        {
            "Status": "SUCCESS",
            "TaskArn": "AWS-RunShellScript",
            "StartTime": 1487692834.684,
            "TaskType": "RUN_COMMAND",
            "EndTime": 1487692835.005,
            "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TaskExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

For more information, see View Information About Tasks and Task Executions (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutionTasks in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists the tasks associated with a maintenance window execution.

```
Get-SSMMaintenanceWindowExecutionTaskList -WindowExecutionId
 "518d5565-5969-4cca-8f0e-da3b2a638355"
```

Output:

```
EndTime           : 2/21/2017 4:00:35 PM

TaskExecutionId   : ac0c6ae1-daa3-4a89-832e-d384503b6586
TaskType          : RUN_COMMAND
WindowExecutionId : 518d5565-5969-4cca-8f0e-da3b2a638355
```

- For API details, see DescribeMaintenanceWindowExecutionTasks in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists the tasks associated with a maintenance window execution.

```
Get-SSMMaintenanceWindowExecutionTaskList -WindowExecutionId
 "518d5565-5969-4cca-8f0e-da3b2a638355"
```

Output:

```
EndTime           : 2/21/2017 4:00:35 PM
StartTime         : 2/21/2017 4:00:34 PM
Status            : SUCCESS
TaskArn           : AWS-RunShellScript
TaskExecutionId   : ac0c6ae1-daa3-4a89-832e-d384503b6586
TaskType          : RUN_COMMAND
WindowExecutionId : 518d5565-5969-4cca-8f0e-da3b2a638355
```

- For API details, see DescribeMaintenanceWindowExecutionTasks in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeMaintenanceWindowExecutions` with a CLI

The following code examples show how to use `DescribeMaintenanceWindowExecutions`.

CLI

Amazon CLI

Example 1: To list all executions for a maintenance window

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34efEXAMPLE"
```

Output:

```
{
    "WindowExecutions": [
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Status": "IN_PROGRESS",
            "StartTime": "2021-08-04T11:00:00.000000-07:00"

        },
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Status": "SUCCESS",
            "StartTime": "2021-08-03T11:00:00.000000-07:00",
            "EndTime": "2021-08-03T11:37:21.450000-07:00"
        },
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Status": "FAILED",
```

```
            "StatusDetails": "One or more tasks in the orchestration failed.",
            "StartTime": "2021-08-02T11:00:00.000000-07:00",
            "EndTime": "2021-08-02T11:22:36.190000-07:00"
        }
    ]
}
```

Example 2: To list all executions for a maintenance window before a specified date

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window before the specified date.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --filters "Key=ExecutedBefore,Values=2021-08-03T00:00:00Z"
```

Output:

```
{
    "WindowExecutions": [
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Status": "FAILED",
            "StatusDetails": "One or more tasks in the orchestration failed.",
            "StartTime": "2021-08-02T11:00:00.000000-07:00",
            "EndTime": "2021-08-02T11:22:36.190000-07:00"
        }
    ]
}
```

Example 3: To list all executions for a maintenance window after a specified date

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window after the specified date.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --filters "Key=ExecutedAfter,Values=2021-08-04T00:00:00Z"
```

Output:

```
{
    "WindowExecutions": [
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Status": "IN_PROGRESS",
            "StartTime": "2021-08-04T11:00:00.000000-07:00"
        }
    ]
}
```

For more information, see View information about tasks and task executions (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutions in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all of the executions for a maintenance window.

```
Get-SSMMaintenanceWindowExecutionList -WindowId "mw-03eb9db42890fb82d"
```

Output:

```
EndTime           : 2/20/2017 6:30:17 PM
StartTime         : 2/20/2017 6:30:16 PM
Status            : FAILED
StatusDetails     : One or more tasks in the orchestration failed.
WindowExecutionId : 6f3215cf-4101-4fa0-9b7b-9523269599c7
WindowId          : mw-03eb9db42890fb82d
```

Example 2: This example lists all of the executions for a maintenance window before a specified date.

```
$option1 = @{Key="ExecutedBefore";Values=@("2016-11-04T05:00:00Z")}
Get-SSMMaintenanceWindowExecutionList -WindowId "mw-03eb9db42890fb82d" -Filter
 $option1
```

Example 3: This example lists all of the executions for a maintenance window after a specified date.

```
$option1 = @{Key="ExecutedAfter";Values=@("2016-11-04T05:00:00Z")}
Get-SSMMaintenanceWindowExecutionList -WindowId "mw-03eb9db42890fb82d" -Filter
 $option1
```

- For API details, see DescribeMaintenanceWindowExecutions in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Get-SSMMaintenanceWindowExecutionList -WindowId "mw-03eb9db42890fb82d" -Filter
 $option1
```

- For API details, see DescribeMaintenanceWindowExecutions in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeMaintenanceWindowTargets` with a CLI

The following code examples show how to use `DescribeMaintenanceWindowTargets`.

CLI

Amazon CLI

Example 1: To list all targets for a Maintenance Window

The following `describe-maintenance-window-targets` example lists all of the targets for a maintenance window.

```
aws ssm describe-maintenance-window-targets \
    --window-id "mw-06cf17cbefEXAMPLE"
```

Output:

```
{
    "Targets": [
        {
            "ResourceType": "INSTANCE",
            "OwnerInformation": "Single instance",
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "Targets": [
                {
                    "Values": [
                        "i-0000293ffdEXAMPLE"
                    ],
                    "Key": "InstanceIds"
                }
            ],
            "WindowTargetId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "ResourceType": "INSTANCE",
            "OwnerInformation": "Two instances in a list",
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "Targets": [
```

```
                {
                    "Values": [
                        "i-0000293ffdEXAMPLE",
                        "i-0cb2b964d3EXAMPLE"
                    ],
                    "Key": "InstanceIds"
                }
            ],
            "WindowTargetId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ]
}
```

Example 2: To list all targets for a maintenance window matching a specific owner information value

The following `describe-maintenance-window-targets` example lists all of the targets for a maintenance window with a specific value.

```
aws ssm describe-maintenance-window-targets \
    --window-id "mw-0ecb1226ddEXAMPLE" \
    --filters "Key=OwnerInformation,Values=CostCenter1"
```

Output:

```
{
    "Targets": [
        {
            "WindowId": "mw-0ecb1226ddEXAMPLE",
            "WindowTargetId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "ResourceType": "INSTANCE",
            "Targets": [
                {
                    "Key": "tag:Environment",
                    "Values": [
                        "Prod"
                    ]
                }
            ],
            "OwnerInformation": "CostCenter1",
            "Name": "ProdTarget1"
        }
    ]
```

```
}
```

For more information, see View Information About Maintenance Windows (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowTargets in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all of the targets for a maintenance window.

```
Get-SSMMaintenanceWindowTarget -WindowId "mw-06cf17cbefcb4bf4f"
```

Output:

```
OwnerInformation : Single instance
ResourceType     : INSTANCE
Targets          : {InstanceIds}
WindowId         : mw-06cf17cbefcb4bf4f
WindowTargetId   : 350d44e6-28cc-44e2-951f-4b2c985838f6

OwnerInformation : Two instances in a list
ResourceType     : INSTANCE
Targets          : {InstanceIds}
WindowId         : mw-06cf17cbefcb4bf4f
WindowTargetId   : e078a987-2866-47be-bedd-d9cf49177d3a
```

Use `DescribeMaintenanceWindowTasks` with a CLI

The following code examples show how to use `DescribeMaintenanceWindowTasks`.

CLI

Amazon CLI

Example 1: To list all tasks for a maintenance window

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-06cf17cbefEXAMPLE"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "WindowTaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TaskArn": "AWS-RestartEC2Instance",
```

```
            "TaskParameters": {},
            "Type": "AUTOMATION",
            "Description": "Restarting EC2 Instance for maintenance",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "My-Automation-Example-Task",
            "Priority": 0,
            "ServiceRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                    ]
                }
            ]
        },
        {
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "WindowTaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "TaskArn": "AWS-DisableS3BucketPublicReadWrite",
            "TaskParameters": {},
            "Type": "AUTOMATION",
            "Description": "Automation task to disable read/write access on
 public S3 buckets",
            "MaxConcurrency": "10",
            "MaxErrors": "5",
            "Name": "My-Disable-S3-Public-Read-Write-Access-Automation-Task",
            "Priority": 0,
            "ServiceRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                    ]
                }
            ]
        }
    ]
}
```

Example 2: To list all tasks for a maintenance window that invokes the Amazon-RunPowerShellScript command document

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that invokes the `AWS-RunPowerShellScript` command document.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --filters "Key=TaskArn,Values=AWS-RunPowerShellScript"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowTaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "TaskArn": "AWS-RunPowerShellScript",
            "Type": "RUN_COMMAND",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                    ]
                }
            ],
            "TaskParameters": {},
            "Priority": 1,
            "ServiceRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "MyTask"
        }
    ]
}
```

Example 3: To list all tasks for a maintenance window that have a Priority of 3

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that have a `Priority` of 3.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --filters "Key=Priority,Values=3"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowTaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "TaskArn": "AWS-RunPowerShellScript",
            "Type": "RUN_COMMAND",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                    ]
                }
            ],
            "TaskParameters": {},
            "Priority": 3,
            "ServiceRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "MyRunCommandTask"
        },
        {
            "WindowId": "mw-ab12cd34efEXAMPLE",
            "WindowTaskId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
            "TaskArn": "AWS-RestartEC2Instance",
            "Type": "AUTOMATION",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                    ]
```

```
                }
            ],
            "TaskParameters": {},
            "Priority": 3,
            "ServiceRoleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "10",
            "MaxErrors": "5",
            "Name": "My-Automation-Task",
            "Description": "A description for my Automation task"
        }
    ]
}
```

Example 4: To list all tasks for a maintenance window that have a Priority of 1 and use Run Command

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that have a `Priority` of 1 and use `Run Command`.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --filters "Key=Priority,Values=1" "Key=TaskType,Values=RUN_COMMAND"

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeMaintenanceWindows` with a CLI

The following code examples show how to use `DescribeMaintenanceWindows`.

CLI

Amazon CLI

Example 1: To list all maintenance windows

The following `describe-maintenance-windows` example lists all maintenance windows in your Amazon account in the current Region.

```
aws ssm describe-maintenance-windows
```

Output:

```
{
    "WindowIdentities": [
        {
            "WindowId": "mw-0ecb1226ddEXAMPLE",
            "Name": "MyMaintenanceWindow-1",
            "Enabled": true,
            "Duration": 2,
            "Cutoff": 1,
            "Schedule": "rate(180 minutes)",
            "NextExecutionTime": "2020-02-12T23:19:20.596Z"
        },
        {
            "WindowId": "mw-03eb9db428EXAMPLE",
            "Name": "MyMaintenanceWindow-2",
            "Enabled": true,
            "Duration": 3,
            "Cutoff": 1,
            "Schedule": "rate(7 days)",
            "NextExecutionTime": "2020-02-17T23:22:00.956Z"
        },
        {
            "WindowId": "mw-1a2b3c4d5eEXAMPLE",
            "Name": "MyMaintenanceWindow",
            "Enabled": false,
            "Duration": 2,
            "Cutoff": 0,
            "Schedule": "cron(0 16 ? * TUE *)"
        }
    ]
}
```

Example 2: To list all enabled maintenance windows

The following `describe-maintenance-windows` example lists all enabled maintenance windows.

```
aws ssm describe-maintenance-windows \
    --filters "Key=Enabled,Values=true"
```

Output:

```
{
```

```
    "WindowIdentities": [
        {
            "WindowId": "mw-0ecb1226ddEXAMPLE",
            "Name": "MyMaintenanceWindow-1",
            "Enabled": true,
            "Duration": 2,
            "Cutoff": 1,
            "Schedule": "rate(180 minutes)",
            "NextExecutionTime": "2020-02-12T23:19:20.596Z"
        },
        {
            "WindowId": "mw-03eb9db428EXAMPLE",
            "Name": "MyMaintenanceWindow-2",
            "Enabled": true,
            "Duration": 3,
            "Cutoff": 1,
            "Schedule": "rate(7 days)",
            "NextExecutionTime": "2020-02-17T23:22:00.956Z"
        }
    ]
}
```

Example 3: To list maintenance windows matching a specific name

The following `describe-maintenance-windows` example lists all maintenance windows with the specified name.

```
aws ssm describe-maintenance-windows \
    --filters "Key=Name,Values=MyMaintenanceWindow"
```

Output:

```
{
    "WindowIdentities": [
        {
            "WindowId": "mw-1a2b3c4d5eEXAMPLE",
            "Name": "MyMaintenanceWindow",
            "Enabled": false,
            "Duration": 2,
            "Cutoff": 0,
            "Schedule": "cron(0 16 ? * TUE *)"
        }
    ]
```

```
}
```

For more information, see View Information About Maintenance Windows (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindows in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all maintenance windows on your account.

```
Get-SSMMaintenanceWindowList
```

Output:

```
Cutoff   : 1
Duration : 4
Enabled  : True
Name     : My-First-Maintenance-Window
WindowId : mw-06d59c1a07c022145
```

- For API details, see DescribeMaintenanceWindows in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists all maintenance windows on your account.

```
Get-SSMMaintenanceWindowList
```

Output:

```
Cutoff   : 1
Duration : 4
Enabled  : True
Name     : My-First-Maintenance-Window
WindowId : mw-06d59c1a07c022145
```

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribeOpsItems` with an Amazon SDK or CLI

The following code examples show how to use `DescribeOpsItems`.

CLI

Amazon CLI

To list a set of OpsItems

The following `describe-ops-items` example displays a list of all open OpsItems in your Amazon account.

```
aws ssm describe-ops-items \
    --ops-item-filters "Key=Status,Values=Open,Operator=Equal"
```

Output:

```
{
    "OpsItemSummaries": [
        {
            "CreatedBy": "arn:aws:sts::123456789012:assumed-role/OpsItem-CWE-

            "Policies": []
        }
    ]
}
```

Example 2: To list all parameters matching specific metadata

The following `describe-parameters` example lists all parameters matching a filter.

```
aws ssm describe-parameters \
    --filters "Key=Type,Values=StringList"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyStringListParameter",
            "Type": "StringList",

Use `DescribePatchBaselines` with a CLI

The following code examples show how to use `DescribePatchBaselines`.

CLI

Amazon CLI

Example 1: To list all patch baselines

The following `describe-patch-baselines` example retrieves details for all patch baselines in your account in the current Region.

```
aws ssm describe-patch-baselines
```

Output:

```
{
    "BaselineIdentities": [
        {
            "BaselineName": "AWS-SuseDefaultPatchBaseline",
            "DefaultBaseline": true,
            "BaselineDescription": "Default Patch Baseline for Suse Provided by
 AWS.",
            "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-0123fdb36e334a3b2",
            "OperatingSystem": "SUSE"
        },
        {
            "BaselineName": "AWS-DefaultPatchBaseline",
            "DefaultBaseline": false,
            "BaselineDescription": "Default Patch Baseline Provided by AWS.",
            "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-020d361a05defe4ed",
            "OperatingSystem": "WINDOWS"
        },
        {
            "BaselineName": "MyWindowsPatchBaseline",
            "DefaultBaseline": true,
            "BaselineDescription": "My patch baseline for EC2 instances for
 Windows Server",
            "BaselineId": "pb-0ad00e0dd7EXAMPLE",
            "OperatingSystem": "WINDOWS"
        }
    ]
}
```

Example 2: To list all patch baselines provided by Amazon

The following `describe-patch-baselines` example lists all patch baselines provided by Amazon.

```
aws ssm describe-patch-baselines \
    --filters "Key=OWNER,Values=[AWS]"
```

Output:

```
{
```

```
    "BaselineIdentities": [
        {
            "BaselineName": "AWS-SuseDefaultPatchBaseline",
            "DefaultBaseline": true,
            "BaselineDescription": "Default Patch Baseline for Suse Provided by
 AWS.",
            "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-0123fdb36e334a3b2",
            "OperatingSystem": "SUSE"
        },
        {
            "BaselineName": "AWS-DefaultPatchBaseline",
            "DefaultBaseline": false,
            "BaselineDescription": "Default Patch Baseline Provided by AWS.",
            "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-020d361a05defe4ed",
            "OperatingSystem": "WINDOWS"
        }
    ]
}
```

Example 3: To list all patch baselines that you own

The following `describe-patch-baselines` example lists all custom patch baselines created in your account in the current Region.

```
aws ssm describe-patch-baselines \
    --filters "Key=OWNER,Values=[Self]"
```

Output:

```
{
    "BaselineIdentities": [
        {
            "BaselineName": "MyWindowsPatchBaseline",
            "DefaultBaseline": true,
            "BaselineDescription": "My patch baseline for EC2 instances for
 Windows Server",
            "BaselineId": "pb-0ad00e0dd7EXAMPLE",
            "OperatingSystem": "WINDOWS"
        }
    ]
```

```
}
```

For more information, see About Predefined and Custom Patch Baselines in the *Amazon Systems Manager User Guide*.

- For API details, see DescribePatchBaselines in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all patch baselines.

```
Get-SSMPatchBaseline
```

Output:

```
BaselineDescription                                                BaselineId
                                                  BaselineName
------------------                                                ----------
                                                  ------------
Default Patch Baseline Provided by AWS.                           arn:aws:ssm:us-
west-2:123456789012:patchbaseline/pb-04fb4ae6142167966 AWS-DefaultP...
Baseline containing all updates approved for production systems
 pb-045f10b4f382baeda
 Production-B...
Baseline containing all updates approved for production systems
 pb-0a2f1059b670ebd31
 Production-B...
```

Example 2: This example lists all patch baselines provided by Amazon. The syntax used by this example requires PowerShell version 3 or later.

```
$filter1 = @{Key="OWNER";Values=@("AWS")}
```

Output:

```
Get-SSMPatchBaseline -Filter $filter1
```

Example 3: This example lists all patch baselines with you as the owner. The syntax used by this example requires PowerShell version 3 or later.

```
$filter1 = @{Key="OWNER";Values=@("Self")}
```

Output:

```
Get-SSMPatchBaseline -Filter $filter1
```

Example 4: With PowerShell version 2, you must use New-Object to create each tag.

```
$filter1 = New-Object
 Amazon.SimpleSystemsManagement.Model.PatchOrchestratorFilter
$filter1.Key = "OWNER"
$filter1.Values = "AWS"

Get-SSMPatchBaseline -Filter $filter1
```

Output:

```
BaselineDescription                    BaselineId
                            BaselineName             DefaultBaselin

                                                     e
------------------                     ----------
                            ------------             --------------
Default Patch Baseline Provided by AWS. arn:aws:ssm:us-
west-2:123456789012:patchbaseline/pb-04fb4ae6142167966 AWS-DefaultPatchBaseline
 True
```

- For API details, see [DescribePatchBaselines](#) in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists all patch baselines.

```
Get-SSMPatchBaseline
```

Output:

```
BaselineDescription                                              BaselineId
                                                    BaselineName
------------------                                               ----------
                                                    ------------
```

```
Default Patch Baseline Provided by AWS.                          arn:aws:ssm:us-

```

Example 2: This example lists all patch baselines provided by Amazon. The syntax used by this example requires PowerShell version 3 or later.

```
$filter1 = @{Key="OWNER";Values=@("AWS")}
```

Output:

```
Get-SSMPatchBaseline -Filter $filter1
```

Example 3: This example lists all patch baselines with you as the owner. The syntax used by this example requires PowerShell version 3 or later.

```
$filter1 = @{Key="OWNER";Values=@("Self")}
```

Output:

```
Get-SSMPatchBaseline -Filter $filter1
```

Example 4: With PowerShell version 2, you must use New-Object to create each tag.

```
$filter1 = New-Object
 Amazon.SimpleSystemsManagement.Model.PatchOrchestratorFilter
$filter1.Key = "OWNER"
$filter1.Values = "AWS"

Get-SSMPatchBaseline -Filter $filter1
```

Output:

```
BaselineDescription                    BaselineId
                            BaselineName             DefaultBaselin
```

```
                                                    e
-------------------                    ----------
                              ------------            --------------
Default Patch Baseline Provided by AWS. arn:aws:ssm:us-
west-2:123456789012:patchbaseline/pb-04fb4ae6142167966 AWS-DefaultPatchBaseline
 True
```

- For API details, see DescribePatchBaselines in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribePatchGroupState` with a CLI

The following code examples show how to use `DescribePatchGroupState`.

CLI

Amazon CLI

To get the state of a patch group

The following `describe-patch-group-state` example retrieves the high-level patch compliance summary for a patch group.

```
aws ssm describe-patch-group-state \
    --patch-group "Production"
```

Output:

```
{
    "Instances": 21,
    "InstancesWithCriticalNonCompliantPatches": 1,
    "InstancesWithFailedPatches": 2,
    "InstancesWithInstalledOtherPatches": 3,
    "InstancesWithInstalledPatches": 21,
    "InstancesWithInstalledPendingRebootPatches": 2,
    "InstancesWithInstalledRejectedPatches": 1,
    "InstancesWithMissingPatches": 3,
```

```
    "InstancesWithNotApplicablePatches": 4,
    "InstancesWithOtherNonCompliantPatches": 1,
    "InstancesWithSecurityNonCompliantPatches": 1,
    "InstancesWithUnreportedNotApplicablePatches": 2
}
```

For more information, see About patch groups <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-patchgroups.html>__ and Understanding patch compliance state values in the *Amazon Systems Manager User Guide*.

- For API details, see DescribePatchGroupState in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets the high-level patch compliance summary for a patch group.

```
Get-SSMPatchGroupState -PatchGroup "Production"
```

Output:

```
Instances                          : 4
InstancesWithFailedPatches         : 1
InstancesWithInstalledOtherPatches : 4
InstancesWithInstalledPatches      : 3
InstancesWithMissingPatches        : 0
InstancesWithNotApplicablePatches  : 0
```

- For API details, see DescribePatchGroupState in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets the high-level patch compliance summary for a patch group.

```
Get-SSMPatchGroupState -PatchGroup "Production"
```

Output:

```
Instances                          : 4
InstancesWithFailedPatches         : 1
InstancesWithInstalledOtherPatches : 4
InstancesWithInstalledPatches      : 3
InstancesWithMissingPatches        : 0
InstancesWithNotApplicablePatches  : 0
```

- For API details, see DescribePatchGroupState in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `DescribePatchGroups` with a CLI

The following code examples show how to use `DescribePatchGroups`.

CLI

Amazon CLI

To display patch group registrations

The following `describe-patch-groups` example lists the patch group registrations.

```
aws ssm describe-patch-groups
```

Output:

```
{
    "Mappings": [
        {
            "PatchGroup": "Production",
            "BaselineIdentity": {
                "BaselineId": "pb-0123456789abcdef0",
                "BaselineName": "ProdPatching",
                "OperatingSystem": "WINDOWS",
                "BaselineDescription": "Patches for Production",
                "DefaultBaseline": false
            }
```

```
        },
        {
            "PatchGroup": "Development",
            "BaselineIdentity": {
                "BaselineId": "pb-0713accee01234567",
                "BaselineName": "DevPatching",
                "OperatingSystem": "WINDOWS",
                "BaselineDescription": "Patches for Development",
                "DefaultBaseline": true
            }
        }
    ]
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *Amazon Systems Manager User Guide*.

- For API details, see DescribePatchGroups in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists the patch group registrations.

```
Get-SSMPatchGroup
```

Output:

```
BaselineIdentity                                                PatchGroup
----------------                                                ----------
Amazon.SimpleSystemsManagement.Model.PatchBaselineIdentity Production
```

- For API details, see DescribePatchGroups in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists the patch group registrations.

```
Get-SSMPatchGroup
```

Output:

```
BaselineIdentity                                                PatchGroup
----------------                                                ----------
Amazon.SimpleSystemsManagement.Model.PatchBaselineIdentity Production
```

- For API details, see DescribePatchGroups in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetAutomationExecution` with a CLI

The following code examples show how to use `GetAutomationExecution`.

CLI

Amazon CLI

To display details about an automation execution

The following `get-automation-execution` example displays detailed information about an Automation execution.

```
aws ssm get-automation-execution \

Use `GetCommandInvocation` with a CLI

The following code examples show how to use `GetCommandInvocation`.

CLI

Amazon CLI

To display the details of a command invocation

The following `get-command-invocation` example lists all the invocations of the specified command on the specified instance.

```
aws ssm get-command-invocation \
    --command-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "InstanceId": "i-1234567890abcdef0",

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetConnectionStatus` with a CLI

The following code examples show how to use `GetConnectionStatus`.

CLI

Amazon CLI

To display the connection status of a managed instance

The following `get-connection-status` example returns the connection status of the specified managed instance.

```
aws ssm get-connection-status \
    --target i-1234567890abcdef0
```

Output:

```
{
    "Target": "i-1234567890abcdef0",
    "Status": "connected"
}
```

For more information, see Amazon Systems Manager Session Manager in the *Amazon Systems Manager User Guide*.

- For API details, see GetConnectionStatus in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves the Session Manager connection status for an instance to determine whether it is connected and ready to receive Session Manager connections.

```
Get-SSMConnectionStatus -Target i-0a1caf234f12d3dc4
```

Output:

```
Status    Target
------    ------
Connected i-0a1caf234f12d3dc4
```

- For API details, see GetConnectionStatus in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves the Session Manager connection status for an instance to determine whether it is connected and ready to receive Session Manager connections.

```
Get-SSMConnectionStatus -Target i-0a1caf234f12d3dc4
```

Output:

```
Status    Target
------    ------
Connected i-0a1caf234f12d3dc4
```

- For API details, see GetConnectionStatus in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetDefaultPatchBaseline` with a CLI

The following code examples show how to use `GetDefaultPatchBaseline`.

CLI

Amazon CLI

Example 1: To display the default Windows patch baseline

The following `get-default-patch-baseline` example retrieves details for the default patch baseline for Windows Server.

```
aws ssm get-default-patch-baseline
```

Output:

```
{
    "BaselineId": "pb-0713accee01612345",
    "OperatingSystem": "WINDOWS"
}
```

Example 2: To display the default patch baseline for Amazon Linux

The following `get-default-patch-baseline` example retrieves details for the default patch baseline for Amazon Linux.

```
aws ssm get-default-patch-baseline \
    --operating-system AMAZON_LINUX
```

Output:

```
{
    "BaselineId": "pb-047c6eb9c8fc12345",
    "OperatingSystem": "AMAZON_LINUX"
}
```

For more information, see About Predefined and Custom Patch Baselines <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-baselines.html>__ and Set an Existing Patch Baseline as the Default in the *Amazon Systems Manager User Guide*.

- For API details, see GetDefaultPatchBaseline in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example displays the default patch baseline.

```
Get-SSMDefaultPatchBaseline
```

Output:

```
arn:aws:ssm:us-west-2:123456789012:patchbaseline/pb-04fb4ae6142167966
```

- For API details, see GetDefaultPatchBaseline in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example displays the default patch baseline.

```
Get-SSMDefaultPatchBaseline
```

Output:

```
arn:aws:ssm:us-west-2:123456789012:patchbaseline/pb-04fb4ae6142167966
```

- For API details, see GetDefaultPatchBaseline in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetDeployablePatchSnapshotForInstance` with a CLI

The following code examples show how to use `GetDeployablePatchSnapshotForInstance`.

CLI

Amazon CLI

To retrieve the current snapshot for the patch baseline an instance uses

The following `get-deployable-patch-snapshot-for-instance` example retrieves details for the current snapshot for the specified patch baseline used by an instance. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, run `aws configure` and specify only the Region of your instance. Leave the `Access Key` and `Secret Key` fields empty.

Tip: Use `uuidgen` to generate a `snapshot-id`.

```
aws ssm get-deployable-patch-snapshot-for-instance \
    --instance-id "i-1234567890abcdef0" \
    --snapshot-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "SnapshotId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Product": "AmazonLinux2018.03",
    "SnapshotDownloadUrl": "https://patch-baseline-snapshot-us-
east-1.s3.amazonaws.com/
ed85194ef27214f5984f28b4d664d14f7313568fea7d4b6ac6c10ad1f729d7e7-123456789012/
AMAZON_LINUX-521c3536-930c-4aa9-950e-01234567abcd?X-Amz-
Algorithm=AWS4-HMAC-SHA256&X-Amz-Date=20190215T164031Z&X-Amz-

%2F20190215%2Fus-east-1%2Fs3%2Faws4_request&X-Amz-
Signature=efaaaf6e3878e77f48a6697e015efdbda9c426b09c5822055075c062f6ad2149"
}
```

For more information, see Parameter name: Snapshot ID in the *Amazon Systems Manager User Guide*.

- For API details, see GetDeployablePatchSnapshotForInstance in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example displays the current snapshot for the patch baseline used by an Instance. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, the example passes an

`Amazon.Runtime.InstanceProfileAWSCredentials` object to the Credentials parameter.

```
$credentials = [Amazon.Runtime.InstanceProfileAWSCredentials]::new()
Get-SSMDeployablePatchSnapshotForInstance -SnapshotId "4681775b-098f-4435-
a956-0ef33373ac11" -InstanceId "i-0cb2b964d3e14fd9f" -Credentials $credentials
```

Output:

```
InstanceId          SnapshotDownloadUrl
----------          -------------------
i-0cb2b964d3e14fd9f https://patch-baseline-snapshot-us-west-2.s3-us-
west-2.amazonaws.com/853d0d3db0f0cafe...1692/4681775b-098f-4435...
```

Example 2: This example shows how to get the full SnapshotDownloadUrl. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, the example configures the PowerShell session to use an `Amazon.Runtime.InstanceProfileAWSCredentials` object.

```
Set-AWSCredential -Credential
 ([Amazon.Runtime.InstanceProfileAWSCredentials]::new())
(Get-SSMDeployablePatchSnapshotForInstance -SnapshotId "4681775b-098f-4435-
a956-0ef33373ac11" -InstanceId "i-0cb2b964d3e14fd9f").SnapshotDownloadUrl
```

Output:

```
https://patch-baseline-snapshot-us-west-2.s3-us-
west-2.amazonaws.com/853d0d3db0f0cafe...
```

- For API details, see GetDeployablePatchSnapshotForInstance in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example displays the current snapshot for the patch baseline used by an Instance. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, the example passes an `Amazon.Runtime.InstanceProfileAWSCredentials` object to the Credentials parameter.

```
$credentials = [Amazon.Runtime.InstanceProfileAWSCredentials]::new()
Get-SSMDeployablePatchSnapshotForInstance -SnapshotId "4681775b-098f-4435-
a956-0ef33373ac11" -InstanceId "i-0cb2b964d3e14fd9f" -Credentials $credentials
```

Output:

```
InstanceId          SnapshotDownloadUrl
----------          -------------------
i-0cb2b964d3e14fd9f https://patch-baseline-snapshot-us-west-2.s3-us-
west-2.amazonaws.com/853d0d3db0f0cafe...1692/4681775b-098f-4435...
```

Example 2: This example shows how to get the full SnapshotDownloadUrl. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, the example configures the PowerShell session to use an `Amazon.Runtime.InstanceProfileAWSCredentials` object.

```
Set-AWSCredential -Credential
 ([Amazon.Runtime.InstanceProfileAWSCredentials]::new())
(Get-SSMDeployablePatchSnapshotForInstance -SnapshotId "4681775b-098f-4435-
a956-0ef33373ac11" -InstanceId "i-0cb2b964d3e14fd9f").SnapshotDownloadUrl
```

Output:

```
https://patch-baseline-snapshot-us-west-2.s3-us-
west-2.amazonaws.com/853d0d3db0f0cafe...
```

- For API details, see GetDeployablePatchSnapshotForInstance in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

Use `GetDocument` with a CLI

The following code examples show how to use `GetDocument`.

CLI

Amazon CLI

To get document content

The following `get-document` example displays the content of a Systems Manager document.

```
aws ssm get-document \
    --name "AWS-RunShellScript"
```

Output:

```
{
    "Name": "AWS-RunShellScript",
    "DocumentVersion": "1",
    "Status": "Active",
    "Content": "{\n    \"schemaVersion\":\"1.2\",\n    \"description\":\"Run
 a shell script or specify the commands to run.\",\n    \"parameters\":{\n
        \"commands\":{\n            \"type\":\"StringList\",\n
 \"description\":\"(Required) Specify a shell script or a command to run.\",
\n            \"minItems\":1,\n            \"displayType\":\"textarea\"\n
      },\n        \"workingDirectory\":{\n            \"type\":\"String\",\n
            \"default\":\"\",\n            \"description\":\"(Optional) The
 path to the working directory on your instance.\",\n            \"maxChars
\":4096\n        },\n        \"executionTimeout\":{\n            \"type\":
\"String\",\n            \"default\":\"3600\",\n            \"description
\":\"(Optional) The time in seconds for a command to complete before it is
 considered to have failed. Default is 3600 (1 hour). Maximum is 172800 (48
 hours).\",\n            \"allowedPattern\":\"([1-9][0-9]{0,4})|(1[0-6][0-9]
{4})|(17[0-1][0-9]{3})|(172[0-7][0-9]{2})|(172800)\"\n        }\n    },\n
 \"runtimeConfig\":{\n        \"aws:runShellScript\":{\n            \"properties
\":[\n                {\n                    \"id\":\"0.aws:runShellScript
\",\n                    \"runCommand\":\"{{ commands }}\",\n
      \"workingDirectory\":\"{{ workingDirectory }}\",\n
 \"timeoutSeconds\":\"{{ executionTimeout }}\"\n                }\n
  ]\n        }\n    }\n}\n",
    "DocumentType": "Command",
    "DocumentFormat": "JSON"
}
```

For more information, see Amazon Systems Manager Documents in the *Amazon Systems Manager User Guide*.

- For API details, see GetDocument in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns the content of a document.

```
Get-SSMDocument -Name "RunShellScript"
```

Output:

```
Content
-------
{...
```

Example 2: This example displays the complete contents of a document.

```
(Get-SSMDocument -Name "RunShellScript").Content
{
   "schemaVersion":"2.0",

Use `GetInventory` with a CLI

The following code examples show how to use `GetInventory`.

CLI

Amazon CLI

To view your inventory

The following `get-inventory` example gets the custom metadata for your inventory.

```
aws ssm get-inventory
```

Output:

```
{
    "Entities": [
        {
            "Data": {
                "AWS:InstanceInformation": {
                    "Content": [
```

```
                        {
                            "ComputerName": "ip-172-31-44-222.us-
west-2.compute.internal",
                            "InstanceId": "i-0cb2b964d3e14fd9f",
                            "IpAddress": "172.31.44.222",
                            "AgentType": "amazon-ssm-agent",
                            "ResourceType": "EC2Instance",
                            "AgentVersion": "2.0.672.0",
                            "PlatformVersion": "2016.09",
                            "PlatformName": "Amazon Linux AMI",
                            "PlatformType": "Linux"
                        }
                    ],
                    "TypeName": "AWS:InstanceInformation",
                    "SchemaVersion": "1.0",
                    "CaptureTime": "2017-02-20T18:03:58Z"
                }
            },
            "Id": "i-0cb2b964d3e14fd9f"
        }
    ]
}
```

For more information, see Amazon Systems Manager Inventory in the *Amazon Systems Manager User Guide*.

- For API details, see GetInventory in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets the custom metadata for your inventory.

```
Get-SSMInventory
```

Output:

```
Data
     Id
----
     --
```

```
{[AWS:InstanceInformation,
 Amazon.SimpleSystemsManagement.Model.InventoryResultItem]} i-0cb2b964d3e14fd9f
```

- For API details, see GetInventory in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets the custom metadata for your inventory.

```
Get-SSMInventory
```

Output:

```
Data
     Id
----
     --
{[AWS:InstanceInformation,
 Amazon.SimpleSystemsManagement.Model.InventoryResultItem]} i-0cb2b964d3e14fd9f
```

- For API details, see GetInventory in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetInventorySchema` with a CLI

The following code examples show how to use `GetInventorySchema`.

CLI

Amazon CLI

Example 1: To view your inventory schema

The following `get-inventory-schema` example returns a list of inventory type names for the account.

```
aws ssm get-inventory-schema
```

Output:

```
{
    "Schemas": [
        {
            "TypeName": "AWS:AWSComponent",
            "Version": "1.0",
            "Attributes": [
                {
                    "Name": "Name",
                    "DataType": "STRING"
                },
                {
                    "Name": "ApplicationType",
                    "DataType": "STRING"
                },
                {
                    "Name": "Publisher",
                    "DataType": "STRING"
                },
                {
                    "Name": "Version",
                    "DataType": "STRING"
                },
                {
                    "Name": "InstalledTime",
                    "DataType": "STRING"
                },
                {
                    "Name": "Architecture",
                    "DataType": "STRING"
                },
                {
                    "Name": "URL",
                    "DataType": "STRING"
                }
            ]
    }
    ],
    "NextToken": "--token string truncated--"
}
```

For more information, see Metadata collected by Inventory in the *Amazon Systems Manager User Guide*.

Example 2: To view the inventory schema for a specific inventory type

The following `get-inventory-schema` example returns the inventory schema for the `AWS:AWSComponent` inventory type.

```
aws ssm get-inventory-schema \
    --type-name "AWS:AWSComponent"
```

Output:

```
{
    "Schemas": [
        {
            "TypeName": "AWS:AWSComponent",
            "Version": "1.0",
            "Attributes": [
                {
                    "Name": "Name",
                    "DataType": "STRING"
                },
                {
                    "Name": "ApplicationType",
                    "DataType": "STRING"
                },
                {
                    "Name": "Publisher",
                    "DataType": "STRING"
                },
                {
                    "Name": "Version",
                    "DataType": "STRING"
                },
                {
                    "Name": "InstalledTime",
                    "DataType": "STRING"
                },
                {
                    "Name": "Architecture",
                    "DataType": "STRING"
                },
                {
                    "Name": "URL",
                    "DataType": "STRING"
```

```
                }
            ]
        }
    ]
}
```

For more information, see Metadata collected by Inventory in the *Amazon Systems Manager User Guide*.

- For API details, see GetInventorySchema in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns a list of inventory type names for the account.

```
Get-SSMInventorySchema
```

- For API details, see GetInventorySchema in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns a list of inventory type names for the account.

```
Get-SSMInventorySchema
```

- For API details, see GetInventorySchema in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetMaintenanceWindow` with a CLI

The following code examples show how to use `GetMaintenanceWindow`.

CLI

Amazon CLI

To get information about a maintenance window

The following `get-maintenance-window` example retrieves details about the specified maintenance window.

```
aws ssm get-maintenance-window \
    --window-id "mw-03eb9db428EXAMPLE"
```

Output:

```
{
    "AllowUnassociatedTargets": true,
    "CreatedDate": 1515006912.957,
    "Cutoff": 1,
    "Duration": 6,
    "Enabled": true,
    "ModifiedDate": "2020-01-01T10:04:04.099Z",
    "Name": "My-Maintenance-Window",
    "Schedule": "rate(3 days)",
    "WindowId": "mw-03eb9db428EXAMPLE",
    "NextExecutionTime": "2020-02-25T00:08:15.099Z"
}
```

For more information, see View information about maintenance windows (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see GetMaintenanceWindow in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets details about a maintenance window.

```
Get-SSMMaintenanceWindow -WindowId "mw-03eb9db42890fb82d"
```

Output:

```
AllowUnassociatedTargets : False
CreatedDate              : 2/20/2017 6:14:05 PM
Cutoff                   : 1
Duration                 : 2
Enabled                  : True
ModifiedDate             : 2/20/2017 6:14:05 PM
Name                     : TestMaintWin
Schedule                 : cron(0 */30 * * * ? *)
WindowId                 : mw-03eb9db42890fb82d
```

- For API details, see GetMaintenanceWindow in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets details about a maintenance window.

```
Get-SSMMaintenanceWindow -WindowId "mw-03eb9db42890fb82d"
```

Output:

```
AllowUnassociatedTargets : False
CreatedDate              : 2/20/2017 6:14:05 PM
Cutoff                   : 1

Schedule                 : cron(0 */30 * * * ? *)
WindowId                 : mw-03eb9db42890fb82d
```

- For API details, see GetMaintenanceWindow in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetMaintenanceWindowExecution` with a CLI

The following code examples show how to use `GetMaintenanceWindowExecution`.

CLI

Amazon CLI

To get information about a maintenance window task execution

The following `get-maintenance-window-execution` example lists information about a task executed as part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution \
    --window-execution-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Status": "SUCCESS",
    "TaskIds": [
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
    ],
    "StartTime": 1487692834.595,
    "EndTime": 1487692835.051,
    "WindowExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see View Information About Tasks and Task Executions (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see GetMaintenanceWindowExecution in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists information about a task executed as part of a maintenance window execution.

```
Get-SSMMaintenanceWindowExecution -WindowExecutionId "518d5565-5969-4cca-8f0e-
da3b2a638355"
```

Output:

```
EndTime           : 2/21/2017 4:00:35 PM
```

```
StartTime         : 2/21/2017 4:00:34 PM
Status            : FAILED
StatusDetails     : One or more tasks in the orchestration failed.
TaskIds           : {ac0c6ae1-daa3-4a89-832e-d384503b6586}

```

- For API details, see GetMaintenanceWindowExecution in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists information about a task executed as part of a maintenance window execution.

```
Get-SSMMaintenanceWindowExecution -WindowExecutionId "518d5565-5969-4cca-8f0e-
da3b2a638355"
```

Output:

```
EndTime           : 2/21/2017 4:00:35 PM
StartTime         : 2/21/2017 4:00:34 PM
Status            : FAILED
StatusDetails     : One or more tasks in the orchestration failed.
TaskIds           : {ac0c6ae1-daa3-4a89-832e-d384503b6586}
WindowExecutionId : 518d5565-5969-4cca-8f0e-da3b2a638355
```

- For API details, see GetMaintenanceWindowExecution in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetMaintenanceWindowExecutionTask` with a CLI

The following code examples show how to use `GetMaintenanceWindowExecutionTask`.

CLI

Amazon CLI

To get information about a maintenance window task execution

The following `get-maintenance-window-execution-task` example lists information about a task that is part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution-task \
    --window-execution-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --task-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

Output:

```

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetParameter` with an Amazon SDK or CLI

The following code examples show how to use `GetParameter`.

CLI

Amazon CLI

Example 1: To display the value of a parameter

The following `get-parameter` example lists the value for the specified single parameter.

```
aws ssm get-parameter \
    --name "MyStringParameter"
```

Output:

```
{
    "Parameter": {
        "Name": "MyStringParameter",
        "Type": "String",
        "Value": "Veni",
        "Version": 1,
        "LastModifiedDate": 1530018761.888,
        "ARN": "arn:aws:ssm:us-west-2:123456789012:parameter/MyStringParameter",
        "DataType": "text"
    }
}
```

For more information, see Working with Parameter Store in the *Amazon Systems Manager User Guide*.

Example 2: To decrypt the value of a SecureString parameter

The following `get-parameter` example decrypts the value of the specified `SecureString` parameter.

```
aws ssm get-parameter \
```

```
    --name "MySecureStringParameter" \
    --with-decryption
```

Output:

```
{
    "Parameter": {
        "Name": "MySecureStringParameter",
        "Type": "SecureString",
        "Value": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Version": 2,
        "LastModifiedDate": 1582155479.205,
        "ARN": "arn:aws:ssm:us-west-2:123456789012:parameter/
MySecureStringParameter",
        "DataType": "text"
    }
}
```

For more information, see Working with Parameter Store in the *Amazon Systems Manager User Guide*.

Example 3: To display the value of a parameter using labels

The following `get-parameter` example lists the value for the specified single parameter with a specified label.

```
aws ssm get-parameter \
    --name "MyParameter:label"
```

Output:

```
{
    "Parameter": {
        "Name": "MyParameter",
        "Type": "String",
        "Value": "parameter version 2",
        "Version": 2,
        "Selector": ":label",
        "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
        "ARN": "arn:aws:ssm:us-west-2:123456789111:parameter/MyParameter",
        "DataType": "text"
    }
```

```
}
```

For more information, see Working with parameter labels in the *Amazon Systems Manager User Guide*.

Example 4: To display the value of a parameter using versions

The following `get-parameter` example lists the value for the specified single parameter version.

```
aws ssm get-parameter \
    --name "MyParameter:2"
```

Output:

```
{
    "Parameter": {
        "Name": "MyParameter",
        "Type": "String",
        "Value": "parameter version 2",
        "Version": 2,
        "Selector": ":2",
        "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
        "ARN": "arn:aws:ssm:us-west-2:123456789111:parameter/MyParameter",
        "DataType": "text"
    }
}
```

For more information, see Working with parameter labels in the *Amazon Systems Manager User Guide*.

- For API details, see GetParameter in *Amazon CLI Command Reference*.

Rust

SDK for Rust

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
    pub async fn list_path(&self, path: &str) -> Result<Vec<Parameter>, EC2Error>
{
        let maybe_params: Vec<Result<Parameter, _>> = TryFlatMap::new(
            self.inner
                .get_parameters_by_path()
                .path(path)
                .into_paginator()
                .send(),
        )
        .flat_map(|item| item.parameters.unwrap_or_default())
        .collect()
        .await;
        // Fail on the first error
        let params = maybe_params
            .into_iter()
            .collect::<Result<Vec<Parameter>, _>>()?;
        Ok(params)
    }
```

- For API details, see GetParameter in *Amazon SDK for Rust API reference*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetParameterHistory` with a CLI

The following code examples show how to use `GetParameterHistory`.

CLI

Amazon CLI

To get a value history for a parameter

The following `get-parameter-history` example lists the history of changes for the specified parameter, including its value.

```
aws ssm get-parameter-history \
    --name "MyStringParameter"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582154711.976,
            "LastModifiedUser": "arn:aws:iam::123456789012:user/Mary-Major",
            "Description": "This is the first version of my String parameter",
            "Value": "Veni",
            "Version": 1,
            "Labels": [],
            "Tier": "Standard",
            "Policies": []
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582156093.471,
            "LastModifiedUser": "arn:aws:iam::123456789012:user/Mary-Major",
            "Description": "This is the second version of my String parameter",
            "Value": "Vidi",
            "Version": 2,
            "Labels": [],
            "Tier": "Standard",
            "Policies": []
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582156117.545,
            "LastModifiedUser": "arn:aws:iam::123456789012:user/Mary-Major",
            "Description": "This is the third version of my String parameter",
            "Value": "Vici",
            "Version": 3,
            "Labels": [],
            "Tier": "Standard",
            "Policies": []
        }
    ]
}
```

For more information, see Working with parameter versions in the *Amazon Systems Manager User Guide*.

- For API details, see GetParameterHistory in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists the value history for a parameter.

```
Get-SSMParameterHistory -Name "Welcome"
```

Output:

```
Description      :
KeyId            :
LastModifiedDate : 3/3/2017 6:55:25 PM
LastModifiedUser : arn:aws:iam::123456789012:user/admin
Name             : Welcome
Type             : String
Value            : helloWorld
```

- For API details, see GetParameterHistory in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists the value history for a parameter.

```
Get-SSMParameterHistory -Name "Welcome"
```

Output:

```
Description      :
KeyId            :
LastModifiedDate : 3/3/2017 6:55:25 PM
LastModifiedUser : arn:aws:iam::123456789012:user/admin
Name             : Welcome
Type             : String
Value            : helloWorld
```

- For API details, see GetParameterHistory in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetParameters` with a CLI

The following code examples show how to use `GetParameters`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Creating a container service for virtual machine instances

CLI

Amazon CLI

Example 1: To list the values for a parameter

The following `get-parameters` example lists the values for the three specified parameters.

```
aws ssm get-parameters \
    --names "MyStringParameter" "MyStringListParameter" "MyInvalidParameterName"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyStringListParameter",
            "Type": "StringList",
            "Value": "alpha,beta,gamma",
            "Version": 1,
            "LastModifiedDate": 1582154764.222,
            "ARN": "arn:aws:ssm:us-west-2:123456789012:parameter/
MyStringListParameter",
            "DataType": "text"
```

```
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "Value": "Vici",
            "Version": 3,
            "LastModifiedDate": 1582156117.545,
            "ARN": "arn:aws:ssm:us-west-2:123456789012:parameter/
MyStringParameter",
            "DataType": "text"
        }
    ],
    "InvalidParameters": [
        "MyInvalidParameterName"
    ]
}
```

For more information, see Working with Parameter Store in the *Amazon Systems Manager User Guide*.

Example 2: To list names and values of multiple parameters using the ``--query`` option

The following `get-parameters` example lists the names and values for the specified parameters.

```
aws ssm get-parameters \
    --names MyStringParameter MyStringListParameter \
    --query "Parameters[*].{Name:Name,Value:Value}"
```

Output:

```
[
    {
        "Name": "MyStringListParameter",
        "Value": "alpha,beta,gamma"
    },
    {
        "Name": "MyStringParameter",
        "Value": "Vidi"
    }
]
```

For more information, see Working with Parameter Store in the *Amazon Systems Manager User Guide*.

Example 3: To display the value of a parameter using labels

The following `get-parameters` example lists the values for the specified parameters, one specified by label and one specified by version.

```
aws ssm get-parameters \
    --names "MyLabelParameter:label" "MyVersionParameter:2"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyLabelParameter",
            "Type": "String",
            "Value": "parameter by label",
            "Version": 1,
            "Selector": ":label",
            "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
            "ARN": "arn:aws:ssm:us-west-2:123456789111:parameter/
MyLabelParameter",
            "DataType": "text"
        },
        {
            "Name": "MyVersionParameter",
            "Type": "String",
            "Value": "parameter by version",
            "Version": 2,
            "Selector": ":2",
            "LastModifiedDate": "2021-03-24T16:20:28.236000-07:00",
            "ARN": "arn:aws:ssm:us-west-2:123456789111:parameter/
MyVersionParameter",
            "DataType": "text"
        }
    ],
    "InvalidParameters": []
}
```

For more information, see Working with parameter labels in the *Amazon Systems Manager User Guide*.

- For API details, see GetParameters in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists the values for a parameter.

```
Get-SSMParameterValue -Name "Welcome"
```

Output:

```
InvalidParameters Parameters
----------------- ----------
{}                {Welcome}
```

Example 2: This example lists the details of the value.

```
(Get-SSMParameterValue -Name "Welcome").Parameters
```

Output:

```
Name    Type   Value
----    ----   -----
Welcome String Good day, Sunshine!
```

- For API details, see GetParameters in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists the values for a parameter.

```
Get-SSMParameterValue -Name "Welcome"
```

Output:

```
InvalidParameters Parameters
```

```
----------------- ----------
{}                {Welcome}
```

Example 2: This example lists the details of the value.

```
(Get-SSMParameterValue -Name "Welcome").Parameters
```

Output:

```
Name    Type   Value
----    ----   -----
Welcome String Good day, Sunshine!
```

- For API details, see GetParameters in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetPatchBaseline` with a CLI

The following code examples show how to use `GetPatchBaseline`.

CLI

Amazon CLI

To display a patch baseline

The following `get-patch-baseline` example retrieves the details for the specified patch baseline.

```
aws ssm get-patch-baseline \
    --baseline-id "pb-0123456789abcdef0"
```

Output:

```
{
```

```
    "BaselineId": "pb-0123456789abcdef0",
    "Name": "WindowsPatching",
    "OperatingSystem": "WINDOWS",
    "GlobalFilters": {
        "PatchFilters": []
    },
    "ApprovalRules": {
        "PatchRules": [
            {
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "PRODUCT",
                            "Values": [
                                "WindowsServer2016"
                            ]
                        }
                    ]
                },
                "ComplianceLevel": "CRITICAL",
                "ApproveAfterDays": 0,
                "EnableNonSecurity": false
            }
        ]
    },
    "ApprovedPatches": [],

    "ModifiedDate": 1550244180.465,
    "Description": "Patches for Windows Servers",
    "Sources": []
}
```

For more information, see About Patch Baselines in the *Amazon Systems Manager User Guide*.

- For API details, see GetPatchBaseline in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example displays the details for a patch baseline.

```
Get-SSMPatchBaselineDetail -BaselineId "pb-03da896ca3b68b639"
```

Output:

```
ApprovalRules   : Amazon.SimpleSystemsManagement.Model.PatchRuleGroup
ApprovedPatches : {}
BaselineId      : pb-03da896ca3b68b639
CreatedDate     : 3/3/2017 5:02:19 PM
Description     : Baseline containing all updates approved for production systems
GlobalFilters   : Amazon.SimpleSystemsManagement.Model.PatchFilterGroup
ModifiedDate    : 3/3/2017 5:02:19 PM
Name            : Production-Baseline
PatchGroups     : {}
RejectedPatches : {}
```

- For API details, see GetPatchBaseline in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example displays the details for a patch baseline.

```
Get-SSMPatchBaselineDetail -BaselineId "pb-03da896ca3b68b639"
```

Output:

```
ApprovalRules   : Amazon.SimpleSystemsManagement.Model.PatchRuleGroup
ApprovedPatches : {}
BaselineId      : pb-03da896ca3b68b639
CreatedDate     : 3/3/2017 5:02:19 PM
Description     : Baseline containing all updates approved for production systems
GlobalFilters   : Amazon.SimpleSystemsManagement.Model.PatchFilterGroup
ModifiedDate    : 3/3/2017 5:02:19 PM
Name            : Production-Baseline
PatchGroups     : {}
```

```
RejectedPatches : {}
```

- For API details, see GetPatchBaseline in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `GetPatchBaselineForPatchGroup` with a CLI

The following code examples show how to use `GetPatchBaselineForPatchGroup`.

CLI

Amazon CLI

To display the patch baseline for a patch group

The following `get-patch-baseline-for-patch-group` example retrieves details about the patch baseline for the specified patch group.

```
aws ssm get-patch-baseline-for-patch-group \
    --patch-group "DEV"
```

Output:

```
{
    "PatchGroup": "DEV",
    "BaselineId": "pb-0123456789abcdef0",
    "OperatingSystem": "WINDOWS"
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *Amazon Systems Manager User Guide*.

- For API details, see GetPatchBaselineForPatchGroup in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example displays the patch baseline for a patch group.

```
Get-SSMPatchBaselineForPatchGroup -PatchGroup "Production"
```

Output:

```
BaselineId           PatchGroup
----------           ----------
pb-045f10b4f382baeda Production
```

- For API details, see GetPatchBaselineForPatchGroup in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example displays the patch baseline for a patch group.

```
Get-SSMPatchBaselineForPatchGroup -PatchGroup "Production"
```

Output:

```
BaselineId           PatchGroup
----------           ----------
pb-045f10b4f382baeda Production
```

- For API details, see GetPatchBaselineForPatchGroup in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListAssociationVersions` with a CLI

The following code examples show how to use `ListAssociationVersions`.

CLI

Amazon CLI

To list all versions of an association for a specific association ID

The following `list-association-versions` example lists all versions of the specified associations.

```
aws ssm list-association-versions \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
"AssociationVersions": [
        {
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AssociationVersion": "1",
            "CreatedDate": 1550505536.726,
            "Name": "AWS-UpdateSSMAgent",
            "Parameters": {
                "allowDowngrade": [
                    "false"
                ],
                "version": [
                    ""
                ]
            },
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-1234567890abcdef0"
                    ]
                }
            ],
            "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
            "AssociationName": "UpdateSSMAgent"
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *Amazon Systems Manager User Guide*.

- For API details, see ListAssociationVersions in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves all versions of the association provided.

```
Get-SSMAssociationVersionList -AssociationId 123a45a0-c678-9012-3456-78901234db5e
```

Output:

```
AssociationId      : 123a45a0-c678-9012-3456-78901234db5e

```

- For API details, see ListAssociationVersions in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListAssociations` with a CLI

The following code examples show how to use `ListAssociations`.

CLI

Amazon CLI

Example 1: To list your associations for a specific instance

The following `list-associations` example lists all associations with the AssociationName, UpdateSSMAgent.

```
aws ssm list-associations \
    --association-filter-list "key=AssociationName,value=UpdateSSMAgent"
```

Output:

```
{
    "Associations": [
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-1234567890abcdef0",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AssociationVersion": "1",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-016648b75dd622dab"
                    ]
                }
            ],
            "Overview": {
                "Status": "Pending",
                "DetailedStatus": "Associated",
                "AssociationStatusAggregatedCount": {
                    "Pending": 1
                }
```

```
            },
            "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
            "AssociationName": "UpdateSSMAgent"
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *Systems Manager User Guide*.

Example 2: To list your associations for a specific document

The following `list-associations` example lists all associations for the specified document.

```
aws ssm list-associations \
    --association-filter-list "key=Name,value=AWS-UpdateSSMAgent"
```

Output:

```
{
    "Associations": [
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-1234567890abcdef0",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "AssociationVersion": "1",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-1234567890abcdef0"
                    ]
                }
            ],
            "LastExecutionDate": 1550505828.548,
            "Overview": {
                "Status": "Success",
                "DetailedStatus": "Success",
                "AssociationStatusAggregatedCount": {
                    "Success": 1
                }
```

```
            },
            "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
            "AssociationName": "UpdateSSMAgent"
        },
    {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-9876543210abcdef0",
            "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "AssociationVersion": "1",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-9876543210abcdef0"
                    ]
                }
            ],
            "LastExecutionDate": 1550507531.0,
            "Overview": {
                "Status": "Success",
                "AssociationStatusAggregatedCount": {
                    "Success": 1
                }
            }
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *Systems Manager User Guide*.

- For API details, see ListAssociations in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all the associations for an instance. The syntax used by this example requires PowerShell version 3 or later.

```
$filter1 = @{Key="InstanceId";Value=@("i-0000293ffd8c57862")}
Get-SSMAssociationList -AssociationFilterList $filter1
```

Output:

```
AssociationId      : d8617c07-2079-4c18-9847-1655fc2698b0
DocumentVersion    :
InstanceId         : i-0000293ffd8c57862
LastExecutionDate  : 2/20/2015 8:31:11 AM
Name               : AWS-UpdateSSMAgent
Overview           : Amazon.SimpleSystemsManagement.Model.AssociationOverview
ScheduleExpression :
Targets            : {InstanceIds}
```

Example 2: This example lists all associations for a configuration document. The syntax used by this example requires PowerShell version 3 or later.

```
$filter2 = @{Key="Name";Value=@("AWS-UpdateSSMAgent")}
Get-SSMAssociationList -AssociationFilterList $filter2
```

Output:

```
AssociationId      : d8617c07-2079-4c18-9847-1655fc2698b0
DocumentVersion    :
InstanceId         : i-0000293ffd8c57862
LastExecutionDate  : 2/20/2015 8:31:11 AM
Name               : AWS-UpdateSSMAgent
Overview           : Amazon.SimpleSystemsManagement.Model.AssociationOverview
ScheduleExpression :
Targets            : {InstanceIds}
```

Example 3: With PowerShell version 2, you must use New-Object to create each filter.

```
$filter1 = New-Object Amazon.SimpleSystemsManagement.Model.AssociationFilter
$filter1.Key = "InstanceId"
$filter1.Value = "i-0000293ffd8c57862"

Get-SSMAssociationList -AssociationFilterList $filter1
```

Output:

```
AssociationId      : d8617c07-2079-4c18-9847-1655fc2698b0
DocumentVersion    :
InstanceId         : i-0000293ffd8c57862
```

```
LastExecutionDate  : 2/20/2015 8:31:11 AM
Name               : AWS-UpdateSSMAgent
Overview           : Amazon.SimpleSystemsManagement.Model.AssociationOverview
ScheduleExpression :
Targets            : {InstanceIds}
```

- For API details, see ListAssociations in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists all the associations for an instance. The syntax used by this example requires PowerShell version 3 or later.

```
$filter1 = @{Key="InstanceId";Value=@("i-0000293ffd8c57862")}
Get-SSMAssociationList -AssociationFilterList $filter1
```

Output:

```
AssociationId      : d8617c07-2079-4c18-9847-1655fc2698b0
DocumentVersion    :

Name               : AWS-UpdateSSMAgent
Overview           : Amazon.SimpleSystemsManagement.Model.AssociationOverview
ScheduleExpression :
Targets            : {InstanceIds}
```

- For API details, see ListAssociations in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListCommandInvocations` with an Amazon SDK or CLI

The following code examples show how to use `ListCommandInvocations`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

Amazon CLI

To list the invocations of a specific command

The following `list-command-invocations` example lists all the invocations of a command.

```
aws ssm list-command-invocations \
    --command-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --details
```

Output:

```
{
    "CommandInvocations": [
        {
            "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

Use `ListCommands` with a CLI

The following code examples show how to use `ListCommands`.

CLI

Amazon CLI

Example 1: To get the status of a specific command

The following `list-commands` example retrieves and displays the status of the specified command.

```
aws ssm list-commands \
    --command-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Commands": [
        {
            "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "DocumentName": "AWS-RunShellScript",
            "DocumentVersion": "1",
            "Comment": "",
            "ExpiresAfter": "2020-02-19T12:28:02.500000-08:00",
            "Parameters": {
                "commands": [
                    "ifconfig"
                ]
            },
            "InstanceIds": [
                "i-028ea792daEXAMPLE"
            ],
            "Targets": [],
            "RequestedDateTime": "2020-02-19T11:18:02.500000-08:00",
            "Status": "Success",
            "StatusDetails": "Success",
            "OutputS3BucketName": "",
            "OutputS3KeyPrefix": "",
            "MaxConcurrency": "50",
            "MaxErrors": "0",
            "TargetCount": 1,
            "CompletedCount": 1,
            "ErrorCount": 0,
            "DeliveryTimedOutCount": 0,
            "ServiceRole": "",
```

```
            "NotificationConfig": {
                "NotificationArn": "",
                "NotificationEvents": [],
                "NotificationType": ""
            },

PowerShell

Tools for PowerShell V4

Example 1: This example lists all commands requested.

```
Get-SSMCommand
```

Output:

```
CommandId          : 4b75a163-d39a-4d97-87c9-98ae52c6be35
Comment            : Apply association with id at update time: 4cc73e42-
d5ae-4879-84f8-57e09c0efcd0
CompletedCount     : 1
DocumentName       : AWS-RefreshAssociation
ErrorCount         : 0
ExpiresAfter       : 2/24/2017 3:19:08 AM
InstanceIds        : {i-0cb2b964d3e14fd9f}
MaxConcurrency     : 50
MaxErrors          : 0
NotificationConfig : Amazon.SimpleSystemsManagement.Model.NotificationConfig
OutputS3BucketName :
OutputS3KeyPrefix  :
OutputS3Region     :
Parameters         : {[associationIds,
 Amazon.Runtime.Internal.Util.AlwaysSendList`1[System.String]]}
RequestedDateTime  : 2/24/2017 3:18:08 AM
ServiceRole        :
```

```
Status             : Success
StatusDetails      : Success
TargetCount        : 1
Targets            : {}
```

Example 2: This example gets the status of a specific command.

```
Get-SSMCommand -CommandId "4b75a163-d39a-4d97-87c9-98ae52c6be35"
```

Example 3: This example retrieves all SSM commands invoked after 2019-04-01T00:00:00Z

```
Get-SSMCommand -Filter @{Key="InvokedAfter";Value="2019-04-01T00:00:00Z"} |
 Select-Object CommandId, DocumentName, Status, RequestedDateTime | Sort-Object -
Property RequestedDateTime -Descending
```

Output:

```

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListComplianceItems` with a CLI

The following code examples show how to use `ListComplianceItems`.

CLI

Amazon CLI

Example 1: To list compliance items for a specific instance

The following `list-compliance-items` example lists all compliance items for the specified instance.

```
aws ssm list-compliance-items \
    --resource-ids "i-1234567890abcdef0" \
    --resource-types "ManagedInstance"
```

Output:

```
{
    "ComplianceItems": [
        {
            "ComplianceType": "Association",
```

```
            "ResourceType": "ManagedInstance",
            "ResourceId": "i-1234567890abcdef0",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Title": "",
            "Status": "COMPLIANT",
            "Severity": "UNSPECIFIED",
            "ExecutionSummary": {
                "ExecutionTime": 1550408470.0
            },
            "Details": {
                "DocumentName": "AWS-GatherSoftwareInventory",
                "DocumentVersion": "1"
            }
        },
        {
            "ComplianceType": "Association",
            "ResourceType": "ManagedInstance",
            "ResourceId": "i-1234567890abcdef0",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Title": "",
            "Status": "COMPLIANT",
            "Severity": "UNSPECIFIED",
            "ExecutionSummary": {
                "ExecutionTime": 1550508475.0
            },
            "Details": {
                "DocumentName": "AWS-UpdateSSMAgent",
                "DocumentVersion": "1"
            }
    }
    ],
    "NextToken": "--token string truncated--"
}
```

For more information, see Learn details about Compliance in the *Amazon Systems Manager User Guide*.

Example 2: To list compliance items for a specific instance and association ID

The following `list-compliance-items` example lists all compliance items for the specified instance and association ID.

```
aws ssm list-compliance-items \
```

```
    --resource-ids "i-1234567890abcdef0" \
    --resource-types "ManagedInstance" \
    --
filters "Key=ComplianceType,Values=Association,Type=EQUAL" "Key=Id,Values=a1b2c3d4-5678-9
cdef-EXAMPLE22222,Type=EQUAL"
```

Output:

```
{
    "ComplianceItems": [
        {
            "ComplianceType": "Association",
            "ResourceType": "ManagedInstance",
            "ResourceId": "i-1234567890abcdef0",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Title": "",
            "Status": "COMPLIANT",
            "Severity": "UNSPECIFIED",
            "ExecutionSummary": {
                "ExecutionTime": 1550508475.0
            },
            "Details": {
                "DocumentName": "AWS-UpdateSSMAgent",
                "DocumentVersion": "1"
            }
        }
    ]
}
```

For more information, see Learn details about Compliance in the *Amazon Systems Manager User Guide*.

Example 3: To list compliance items for an instance after a specific date and time

The following `list-compliance-items` example lists all compliance items for an instance after the specified date and time.

```
aws ssm list-compliance-items \
    --resource-ids "i-1234567890abcdef0" \
    --resource-types "ManagedInstance" \
    --filters "Key=ExecutionTime,Values=2019-02-18T16:00:00Z,Type=GREATER_THAN"
```

Output:

```
{
    "ComplianceItems": [
        {
            "ComplianceType": "Association",
            "ResourceType": "ManagedInstance",
            "ResourceId": "i-1234567890abcdef0",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Title": "",
            "Status": "COMPLIANT",
            "Severity": "UNSPECIFIED",
            "ExecutionSummary": {
                "ExecutionTime": 1550508475.0
            },
            "Details": {
                "DocumentName": "AWS-UpdateSSMAgent",
                "DocumentVersion": "1"
            }
        }
    ]
}
```

For more information, see Learn details about Compliance in the *Amazon Systems Manager User Guide*.

- For API details, see ListComplianceItems in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists compliance items list for the given resource id and type, filtering compliance-type being 'Association'

```
Get-SSMComplianceItemList -ResourceId i-1a2caf345f67d0dc2 -ResourceType
 ManagedInstance -Filter @{Key="ComplianceType";Values="Association"}
```

Output:

```
ComplianceType   : Association
```

```
Details          : {[DocumentName, AWS-GatherSoftwareInventory],
 [DocumentVersion, 1]}
ExecutionSummary :
 Amazon.SimpleSystemsManagement.Model.ComplianceExecutionSummary
Id               : 123a45a1-c234-1234-1245-67891236db4e
ResourceId       : i-1a2caf345f67d0dc2
ResourceType     : ManagedInstance
Severity         : UNSPECIFIED
Status           : COMPLIANT
Title            :
```

- For API details, see ListComplianceItems in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists compliance items list for the given resource id and type, filtering compliance-type being 'Association'

```
Get-SSMComplianceItemList -ResourceId i-1a2caf345f67d0dc2 -ResourceType
 ManagedInstance -Filter @{Key="ComplianceType";Values="Association"}
```

Output:

```
ComplianceType   : Association
Details          : {[DocumentName, AWS-GatherSoftwareInventory],
 [DocumentVersion, 1]}
ExecutionSummary :
 Amazon.SimpleSystemsManagement.Model.ComplianceExecutionSummary
Id               : 123a45a1-c234-1234-1245-67891236db4e
ResourceId       : i-1a2caf345f67d0dc2
ResourceType     : ManagedInstance
Severity         : UNSPECIFIED
Status           : COMPLIANT
Title            :
```

- For API details, see ListComplianceItems in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListComplianceSummaries` with a CLI

The following code examples show how to use `ListComplianceSummaries`.

CLI

Amazon CLI

Example 1: To list compliance summaries for all compliance types

The following `list-compliance-summaries` example lists compliance summaries for all compliance types in your account.

```
aws ssm list-compliance-summaries
```

Output:

```
{
    "ComplianceSummaryItems": [
        {
            "ComplianceType": "Association",
            "CompliantSummary": {
                "CompliantCount": 2,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 2
                }
            },
            "NonCompliantSummary": {
                "NonCompliantCount": 0,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,

                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 0
                }
            }
    }
    ],
    "NextToken":
 "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ=="
}
```

For more information, see Learn details about Compliance in the *Amazon Systems Manager User Guide*.

Example 2: To list compliance summaries for a specific compliance type

The following `list-compliance-summaries` example lists the compliance summary for the Patch compliance type.

```
aws ssm list-compliance-summaries \
    --filters "Key=ComplianceType,Values=Patch,Type=EQUAL"
```

Output:

```
{
    "ComplianceSummaryItems": [
        {
            "ComplianceType": "Patch",
            "CompliantSummary": {
                "CompliantCount": 1,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 1
                }
            },
            "NonCompliantSummary": {
                "NonCompliantCount": 1,
                "SeveritySummary": {
                    "CriticalCount": 1,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 0
                }
            }
        }
    ]
}
```

For more information, see Learn details about Compliance in the *Amazon Systems Manager User Guide*.

- For API details, see ListComplianceSummaries in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example returns a summary count of compliant and non-compliant resources for all compliance types.

```
Get-SSMComplianceSummaryList
```

Output:

```
ComplianceType CompliantSummary
 NonCompliantSummary
-------------- ---------------
 -------------------
FleetTotal     Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
Association    Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
Custom:InSpec  Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
Patch          Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
```

- For API details, see ListComplianceSummaries in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example returns a summary count of compliant and non-compliant resources for all compliance types.

```
Get-SSMComplianceSummaryList
```

Output:

```
ComplianceType CompliantSummary
 NonCompliantSummary
-------------- ---------------
 -------------------
FleetTotal     Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
Association    Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
Custom:InSpec  Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
Patch          Amazon.SimpleSystemsManagement.Model.CompliantSummary
 Amazon.SimpleSystemsManagement.Model.NonCompliantSummary
```

- For API details, see ListComplianceSummaries in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListDocumentVersions` with a CLI

The following code examples show how to use `ListDocumentVersions`.

CLI

Amazon CLI

To list document versions

The following `list-document-versions` example lists all versions for a Systems Manager document.

```
aws ssm list-document-versions \
    --name "Example"
```

Output:

```
{
    "DocumentVersions": [
        {
            "Name": "Example",
            "DocumentVersion": "1",
            "CreatedDate": 1583257938.266,
            "IsDefaultVersion": true,
            "DocumentFormat": "YAML",
            "Status": "Active"
        }
    ]
}
```

For more information, see Sending Commands that Use the Document Version Parameter in the *Amazon Systems Manager User Guide*.

- For API details, see ListDocumentVersions in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all the versions for a document.

```
Get-SSMDocumentVersionList -Name "AWS-UpdateSSMAgent"
```

Output:

```
CreatedDate       : 6/1/2021 5:19:10 PM
DocumentFormat    : JSON
DocumentVersion   : 1
IsDefaultVersion  : True
Name              : AWS-UpdateSSMAgent
Status            : Active
```

- For API details, see ListDocumentVersions in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists all the versions for a document.

```
Get-SSMDocumentVersionList -Name "AWS-UpdateSSMAgent"
```

Output:

```
CreatedDate       : 6/1/2021 5:19:10 PM
DocumentFormat    : JSON
DocumentVersion   : 1
IsDefaultVersion  : True
Name              : AWS-UpdateSSMAgent
Status            : Active
```

- For API details, see ListDocumentVersions in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListDocuments` with a CLI

The following code examples show how to use `ListDocuments`.

CLI

Amazon CLI

Example 1: To list documents

The following `list-documents` example lists documents owned by the requesting account tagged with the custom tag.

```
aws ssm list-documents \
    --filters Key=Owner,Values=Self Key=tag:DocUse,Values=Testing
```

Output:

```
{
    "DocumentIdentifiers": [
        {
            "Name": "Example",
            "Owner": "29884EXAMPLE",
            "PlatformTypes": [
                "Windows",
                "Linux"
            ],
            "DocumentVersion": "1",
            "DocumentType": "Automation",
            "SchemaVersion": "0.3",
            "DocumentFormat": "YAML",
            "Tags": [
                {
                    "Key": "DocUse",
                    "Value": "Testing"
                }
            ]
        }
    ]
}
```

For more information, see Amazon Systems Manager Documents in the *Amazon Systems Manager User Guide*.

Example 2: To list shared documents

The following `list-documents` example lists shared documents, including private shared documents not owned by Amazon.

```
aws ssm list-documents \
    --filters Key=Name,Values=sharedDocNamePrefix  Key=Owner,Values=Private
```

Output:

```
{
    "DocumentIdentifiers": [
        {
            "Name": "Example",
            "Owner": "12345EXAMPLE",
            "PlatformTypes": [
                "Windows",
                "Linux"
            ],
            "DocumentVersion": "1",
            "DocumentType": "Command",
            "SchemaVersion": "0.3",
            "DocumentFormat": "YAML",
            "Tags": []
        }
    ]
}
```

For more information, see Amazon Systems Manager Documents in the *Amazon Systems Manager User Guide*.

- For API details, see ListDocuments in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: Lists all the configuration documents in your account.

```
Get-SSMDocumentList
```

Output:

```
DocumentType    : Command
DocumentVersion : 1
Name            : AWS-ApplyPatchBaseline
Owner           : Amazon
PlatformTypes   : {Windows}
SchemaVersion   : 1.2

DocumentType    : Command
DocumentVersion : 1
Name            : AWS-ConfigureAWSPackage
Owner           : Amazon
PlatformTypes   : {Windows, Linux}
SchemaVersion   : 2.0

DocumentType    : Command
DocumentVersion : 1
Name            : AWS-ConfigureCloudWatch
Owner           : Amazon
PlatformTypes   : {Windows}
SchemaVersion   : 1.2
...
```

Example 2: This example retrieves all automation documents with name matchingi 'Platform'

```
Get-SSMDocumentList -DocumentFilterList @{Key="DocumentType";Value="Automation"}
 | Where-Object Name -Match "Platform"
```

Output:

```
DocumentFormat  : JSON
DocumentType    : Automation
DocumentVersion : 7
Name            : KT-Get-Platform
Owner           : 987654123456
PlatformTypes   : {Windows, Linux}
SchemaVersion   : 0.3
Tags            : {}
TargetType      :
VersionName     :
```

- For API details, see ListDocuments in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: Lists all the configuration documents in your account.

```
Get-SSMDocumentList
```

Output:

```
DocumentType    : Command
DocumentVersion : 1
Name            : AWS-ApplyPatchBaseline
Owner           : Amazon
PlatformTypes   : {Windows}
SchemaVersion   : 1.2

DocumentType    : Command
DocumentVersion : 1
Name            : AWS-ConfigureAWSPackage
Owner           : Amazon
PlatformTypes   : {Windows, Linux}
SchemaVersion   : 2.0

DocumentType    : Command
DocumentVersion : 1
Name            : AWS-ConfigureCloudWatch
Owner           : Amazon
PlatformTypes   : {Windows}
SchemaVersion   : 1.2
...
```

Example 2: This example retrieves all automation documents with name matchingi 'Platform'

```
Get-SSMDocumentList -DocumentFilterList @{Key="DocumentType";Value="Automation"}
 | Where-Object Name -Match "Platform"
```

Output:

```
DocumentFormat  : JSON
DocumentType    : Automation
DocumentVersion : 7
Name            : KT-Get-Platform
```

```
Owner           : 987654123456
PlatformTypes   : {Windows, Linux}
SchemaVersion   : 0.3
Tags            : {}
TargetType      :
VersionName     :
```

- For API details, see ListDocuments in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListInventoryEntries` with a CLI

The following code examples show how to use `ListInventoryEntries`.

CLI

Amazon CLI

Example 1: To view specific inventory type entries for an instance

The following `list-inventory-entries` example lists the inventory entries for the Amazon:Application inventory type on a specific instance.

```
aws ssm list-inventory-entries \
    --instance-id "i-1234567890abcdef0" \
    --type-name "AWS:Application"
```

Output:

```
{
    "TypeName": "AWS:Application",
    "InstanceId": "i-1234567890abcdef0",
    "SchemaVersion": "1.1",
    "CaptureTime": "2019-02-15T12:17:55Z",
    "Entries": [
        {
            "Architecture": "i386",
            "Name": "Amazon SSM Agent",
```

```
            "PackageId": "{a1b2c3d4-5678-90ab-cdef-EXAMPLE11111}",
            "Publisher": "Amazon Web Services",
            "Version": "2.3.274.0"
        },
        {
            "Architecture": "x86_64",
            "InstalledTime": "2018-05-03T13:42:34Z",
            "Name": "AmazonCloudWatchAgent",
            "Publisher": "",
            "Version": "1.200442.0"
        }
    ]
}
```

For more information, see Amazon Systems Manager Inventory in the *Amazon Systems Manager User Guide*.

Example 2: To view custom inventory entries assigned to an instance

The following `list-inventory-entries` example lists a custom inventory entry assigned to an instance.

```
aws ssm list-inventory-entries \
    --instance-id "i-1234567890abcdef0" \
    --type-name "Custom:RackInfo"
```

Output:

```
{
    "TypeName": "Custom:RackInfo",
    "InstanceId": "i-1234567890abcdef0",
    "SchemaVersion": "1.0",
    "CaptureTime": "2021-05-22T10:01:01Z",
    "Entries": [
        {
            "RackLocation": "Bay B/Row C/Rack D/Shelf E"
        }
    ]
}
```

For more information, see Assigning custom inventory metadata to a managed node in the *Amazon Systems Manager User Guide*.

- For API details, see ListInventoryEntries in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists all the custom inventory entries for an instance.

```
Get-SSMInventoryEntriesList -InstanceId "i-0cb2b964d3e14fd9f" -TypeName
 "Custom:RackInfo"
```

Output:

```
CaptureTime   : 2016-08-22T10:01:01Z
Entries       :
 {Amazon.Runtime.Internal.Util.AlwaysSendDictionary`2[System.String,System.String]}
InstanceId    : i-0cb2b964d3e14fd9f
NextToken     :
SchemaVersion : 1.0
TypeName      : Custom:RackInfo
```

Example 2: This example lists the details.

```
(Get-SSMInventoryEntriesList -InstanceId "i-0cb2b964d3e14fd9f" -TypeName
 "Custom:RackInfo").Entries
```

Output:

```
Key          Value
---          -----
RackLocation Bay B/Row C/Rack D/Shelf E
```

- For API details, see ListInventoryEntries in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists all the custom inventory entries for an instance.

```
Get-SSMInventoryEntriesList -InstanceId "i-0cb2b964d3e14fd9f" -TypeName
 "Custom:RackInfo"
```

Output:

```
CaptureTime   : 2016-08-22T10:01:01Z
Entries       :
 {Amazon.Runtime.Internal.Util.AlwaysSendDictionary`2[System.String,System.String]}
InstanceId    : i-0cb2b964d3e14fd9f
NextToken     :
SchemaVersion : 1.0
TypeName      : Custom:RackInfo
```

Example 2: This example lists the details.

```
(Get-SSMInventoryEntriesList -InstanceId "i-0cb2b964d3e14fd9f" -TypeName
 "Custom:RackInfo").Entries
```

Output:

```
Key          Value
---          -----
RackLocation Bay B/Row C/Rack D/Shelf E
```

- For API details, see ListInventoryEntries in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListResourceComplianceSummaries` with a CLI

The following code examples show how to use `ListResourceComplianceSummaries`.

CLI

Amazon CLI

Example 1: To list resource-level compliance summary counts

The following `list-resource-compliance-summaries` example lists resource-level compliance summary counts.

```
aws ssm list-resource-compliance-summaries
```

Output:

```
{
    "ResourceComplianceSummaryItems": [
        {
            "ComplianceType": "Association",
            "ResourceType": "ManagedInstance",
            "ResourceId": "i-1234567890abcdef0",
            "Status": "COMPLIANT",
            "OverallSeverity": "UNSPECIFIED",
            "ExecutionSummary": {
                "ExecutionTime": 1550509273.0
            },
            "CompliantSummary": {
                "CompliantCount": 2,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 2
                }
            },
            "NonCompliantSummary": {
                "NonCompliantCount": 0,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 0
                }
            }
        },
        {
            "ComplianceType": "Patch",
            "ResourceType": "ManagedInstance",
            "ResourceId": "i-9876543210abcdef0",
            "Status": "COMPLIANT",
```

```
            "OverallSeverity": "UNSPECIFIED",
            "ExecutionSummary": {
                "ExecutionTime": 1550248550.0,
                "ExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                "ExecutionType": "Command"
            },
            "CompliantSummary": {
                "CompliantCount": 397,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 397
                }
            },
            "NonCompliantSummary": {
                "NonCompliantCount": 0,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 0
                }
            }
        }
    ],
    "NextToken": "--token string truncated--"
}
```

For more information, see Learn details about Compliance in the *Amazon Systems Manager User Guide*.

Example 2: To list resource-level compliance summaries for a specific compliance type

The following `list-resource-compliance-summaries` example lists resource-level compliance summaries for the Patch compliance type.

```
aws ssm list-resource-compliance-summaries \
    --filters "Key=ComplianceType,Values=Patch,Type=EQUAL"
```

Output:

```
{
    "ResourceComplianceSummaryItems": [
        {
            "ComplianceType": "Patch",
            "ResourceType": "ManagedInstance",
            "ResourceId": "i-9876543210abcdef0",
            "Status": "COMPLIANT",
            "OverallSeverity": "UNSPECIFIED",
            "ExecutionSummary": {
                "ExecutionTime": 1550248550.0,
                "ExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                "ExecutionType": "Command"
            },
            "CompliantSummary": {
                "CompliantCount": 397,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 397
                }
            },
            "NonCompliantSummary": {
                "NonCompliantCount": 0,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 0
                }
            }
        }
    ]
}
```

For more information, see Learn details about Compliance in the *Amazon Systems Manager User Guide*.

- For API details, see ListResourceComplianceSummaries in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example gets a resource-level summary count. The summary includes information about compliant and non-compliant statuses and detailed compliance-item severity counts for products that match "Windows10". Because the MaxResult default is 100 if the parameter is not specified, and this value is not valid, MaxResult parameter is added, and the value is set to 50.

```
$FilterValues = @{
  "Key"="Product"
        "Type"="EQUAL"
        "Values"="Windows10"
}
        Get-SSMResourceComplianceSummaryList -Filter $FilterValues -MaxResult 50
```

- For API details, see ListResourceComplianceSummaries in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example gets a resource-level summary count. The summary includes information about compliant and non-compliant statuses and detailed compliance-item severity counts for products that match "Windows10". Because the MaxResult default is 100 if the parameter is not specified, and this value is not valid, MaxResult parameter is added, and the value is set to 50.

```
$FilterValues = @{
  "Key"="Product"
        "Type"="EQUAL"
        "Values"="Windows10"
}
        Get-SSMResourceComplianceSummaryList -Filter $FilterValues -MaxResult 50
```

- For API details, see ListResourceComplianceSummaries in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ListTagsForResource` with a CLI

The following code examples show how to use `ListTagsForResource`.

CLI

Amazon CLI

To list the tags applied to a patch baseline

The following `list-tags-for-resource` example lists the tags for a patch baseline.

```
aws ssm list-tags-for-resource \
    --resource-type "PatchBaseline" \
    --resource-id "pb-0123456789abcdef0"
```

Output:

```
{
    "TagList": [
        {
            "Key": "Environment",
            "Value": "Production"
        },
        {
            "Key": "Region",
            "Value": "EMEA"
        }
    ]
}
```

For more information, see Working with Patch Manager resources using the Amazon CLI in the *Amazon Systems Manager User Guide*.

- For API details, see ListTagsForResource in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example lists the tags for a maintenance window.

```
Get-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow"
```

Output:

```
Key   Value
---   -----
Stack Production
```

- For API details, see ListTagsForResource in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example lists the tags for a maintenance window.

```
Get-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow"
```

Output:

```
Key   Value
---   -----
Stack Production
```

- For API details, see ListTagsForResource in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `ModifyDocumentPermission` with a CLI

The following code examples show how to use `ModifyDocumentPermission`.

CLI

Amazon CLI

To modify document permissions

The following `modify-document-permission` example shares a Systems Manager document publicly.

```
aws ssm modify-document-permission \
    --name "Example" \
    --permission-type "Share" \
    --account-ids-to-add "All"
```

This command produces no output.

For more information, see Share a Systems Manager Document in the *Amazon Systems Manager User Guide*.

- For API details, see ModifyDocumentPermission in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example adds "share" permissions to all accounts for a document. There is no output if the command succeeds.

```
Edit-SSMDocumentPermission -Name "RunShellScript" -PermissionType "Share" -
AccountIdsToAdd all
```

Example 2: This example adds "share" permissions to a specific account for a document. There is no output if the command succeeds.

```
Edit-SSMDocumentPermission -Name "RunShellScriptNew" -PermissionType "Share" -
AccountIdsToAdd "123456789012"
```

- For API details, see ModifyDocumentPermission in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example adds "share" permissions to all accounts for a document. There is no output if the command succeeds.

```
Edit-SSMDocumentPermission -Name "RunShellScript" -PermissionType "Share" -
AccountIdsToAdd all
```

Example 2: This example adds "share" permissions to a specific account for a document. There is no output if the command succeeds.

```
Edit-SSMDocumentPermission -Name "RunShellScriptNew" -PermissionType "Share" -
AccountIdsToAdd "123456789012"
```

- For API details, see ModifyDocumentPermission in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `PutComplianceItems` with a CLI

The following code examples show how to use `PutComplianceItems`.

CLI

Amazon CLI

To register a compliance type and compliance details to a designated instance

The following `put-compliance-items` example registers the compliance type `Custom:AVCheck` to the specified managed instance.

```
aws ssm put-compliance-items \
    --resource-id "i-1234567890abcdef0" \
    --resource-type "ManagedInstance" \
    --compliance-type "Custom:AVCheck" \
    --execution-summary "ExecutionTime=2019-02-18T16:00:00Z" \
```

```
    --items "Id=Version2.0,Title=ScanHost,Severity=CRITICAL,Status=COMPLIANT"
```

This command produces no output.

For more information, see Assign custom compliance metadata using the Amazon CLI in the *Amazon Systems Manager User Guide*.

- For API details, see PutComplianceItems in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example writes a custom compliance item for the given managed instance

```
$item = [Amazon.SimpleSystemsManagement.Model.ComplianceItemEntry]::new()
$item.Id = "07Jun2019-3"
$item.Severity="LOW"
$item.Status="COMPLIANT"
$item.Title="Fin-test-1 - custom"
Write-SSMComplianceItem -ResourceId mi-012dcb3ecea45b678 -ComplianceType
 Custom:VSSCompliant2 -ResourceType ManagedInstance -Item $item -
ExecutionSummary_ExecutionTime "07-Jun-2019"
```

- For API details, see PutComplianceItems in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example writes a custom compliance item for the given managed instance

```
$item = [Amazon.SimpleSystemsManagement.Model.ComplianceItemEntry]::new()
$item.Id = "07Jun2019-3"
$item.Severity="LOW"
$item.Status="COMPLIANT"
$item.Title="Fin-test-1 - custom"
Write-SSMComplianceItem -ResourceId mi-012dcb3ecea45b678 -ComplianceType
 Custom:VSSCompliant2 -ResourceType ManagedInstance -Item $item -
ExecutionSummary_ExecutionTime "07-Jun-2019"
```

- For API details, see PutComplianceItems in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `PutInventory` with a CLI

The following code examples show how to use `PutInventory`.

CLI

Amazon CLI

To assign customer metadata to an instance

The following `put-inventory` example assigns rack location information to an instance.

Linux version.

```
aws ssm put-inventory \
    --instance-id "i-016648b75dd622dab" \
    --items '[{"TypeName": "Custom:RackInfo","SchemaVersion":
 "1.0","CaptureTime": "2019-01-22T10:01:01Z","Content":[{"RackLocation": "Bay B/
Row C/Rack D/Shelf E"}]}]'
```

Windows version.

```
aws ssm put-inventory ^
    --instance-id "i-016648b75dd622dab" ^
    --
items "TypeName=Custom:RackInfo,SchemaVersion=1.0,CaptureTime=2019-01-22T10:01:01Z,Conten
 B/Row C/Rack D/Shelf F'}]"
```

This command produces no output.

For more information, see Working with custom inventory in the *Amazon Systems Manager User Guide*.

- For API details, see PutInventory in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example assigns rack location information to an instance. There is no output if the command succeeds.

```
$data = New-Object
 "System.Collections.Generic.Dictionary[System.String,System.String]"
$data.Add("RackLocation", "Bay B/Row C/Rack D/Shelf F")

$items = New-Object
 "System.Collections.Generic.List[System.Collections.Generic.Dictionary[System.String,
 System.String]]"
$items.Add($data)

$customInventoryItem = New-Object
 Amazon.SimpleSystemsManagement.Model.InventoryItem
$customInventoryItem.CaptureTime = "2016-08-22T10:01:01Z"
$customInventoryItem.Content = $items
$customInventoryItem.TypeName = "Custom:TestRackInfo2"
$customInventoryItem.SchemaVersion = "1.0"

$inventoryItems = @($customInventoryItem)

Write-SSMInventory -InstanceId "i-0cb2b964d3e14fd9f" -Item $inventoryItems
```

- For API details, see PutInventory in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example assigns rack location information to an instance. There is no output if the command succeeds.

```
$data = New-Object
 "System.Collections.Generic.Dictionary[System.String,System.String]"
$data.Add("RackLocation", "Bay B/Row C/Rack D/Shelf F")

$items = New-Object
 "System.Collections.Generic.List[System.Collections.Generic.Dictionary[System.String,
 System.String]]"
$items.Add($data)
```

```
$customInventoryItem = New-Object
 Amazon.SimpleSystemsManagement.Model.InventoryItem
$customInventoryItem.CaptureTime = "2016-08-22T10:01:01Z"
$customInventoryItem.Content = $items
$customInventoryItem.TypeName = "Custom:TestRackInfo2"
$customInventoryItem.SchemaVersion = "1.0"

$inventoryItems = @($customInventoryItem)

Write-SSMInventory -InstanceId "i-0cb2b964d3e14fd9f" -Item $inventoryItems
```

- For API details, see PutInventory in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `PutParameter` with an Amazon SDK or CLI

The following code examples show how to use `PutParameter`.

CLI

Amazon CLI

Example 1: To change a parameter value

The following `put-parameter` example changes the value of the specified parameter.

```
aws ssm put-parameter \
    --name "MyStringParameter" \
    --type "String" \
    --value "Vici" \
    --overwrite
```

Output:

```
{
    "Version": 2,
    "Tier": "Standard"
}
```

For more information, see Create a Systems Manager parameter (Amazon CLI), Managing parameter tiers, and Working with parameter policies in the *Amazon Systems Manager User Guide*.

Example 2: To create an advanced parameter

The following `put-parameter` example creates an advanced parameter.

```
aws ssm put-parameter \
    --name "MyAdvancedParameter" \
    --description "This is an advanced parameter" \
    --value "Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do
 eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim
 veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo
 consequat [truncated]" \
    --type "String" \
    --tier Advanced
```

Output:

```
{
    "Version": 1,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (Amazon CLI), Managing parameter tiers, and Working with parameter policies in the *Amazon Systems Manager User Guide*.

Example 3: To convert a standard parameter to an advanced parameter

The following `put-parameter` example converts an existing standard parameter into an advanced parameter.

```
aws ssm put-parameter \
    --name "MyConvertedParameter" \
    --value "abc123" \
    --type "String" \
    --tier Advanced \
    --overwrite
```

Output:

```
{
    "Version": 2,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (Amazon CLI), Managing parameter tiers, and Working with parameter policies in the *Amazon Systems Manager User Guide*.

Example 4: To create a parameter with a policy attached

The following `put-parameter` example creates an advanced parameter with a parameter policy attached.

```
aws ssm put-parameter \
    --name "/Finance/Payroll/q2accesskey" \
    --value "P@sSwW)rd" \
    --type "SecureString" \
    --tier Advanced \
    --policies "[{\"Type\":\"Expiration\",\"Version\":\"1.0\",\"Attributes\":
{\"Timestamp\":\"2020-06-30T00:00:00.000Z\"}},{\"Type\":\"ExpirationNotification
\",\"Version\":\"1.0\",\"Attributes\":{\"Before\":\"5\",\"Unit\":\"Days\"}},
{\"Type\":\"NoChangeNotification\",\"Version\":\"1.0\",\"Attributes\":{\"After\":
\"60\",\"Unit\":\"Days\"}}]"
```

Output:

```
{
    "Version": 1,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (Amazon CLI), Managing parameter tiers, and Working with parameter policies in the *Amazon Systems Manager User Guide*.

Example 5: To add a policy to an existing parameter

The following `put-parameter` example attaches a policy to an existing advanced parameter.

```
aws ssm put-parameter \
    --name "/Finance/Payroll/q2accesskey" \
    --value "N3wP@sSwW)rd" \
    --type "SecureString" \
    --tier Advanced \
    --policies "[{\"Type\":\"Expiration\",\"Version\":\"1.0\",\"Attributes\":
{\"Timestamp\":\"2020-06-30T00:00:00.000Z\"}},{\"Type\":\"ExpirationNotification
\",\"Version\":\"1.0\",\"Attributes\":{\"Before\":\"5\",\"Unit\":\"Days\"}},
{\"Type\":\"NoChangeNotification\",\"Version\":\"1.0\",\"Attributes\":{\"After\":
\"60\",\"Unit\":\"Days\"}}]" \
    --overwrite
```

Output:

```
{
    "Version": 2,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (Amazon CLI), Managing parameter tiers, and Working with parameter policies in the *Amazon Systems Manager User Guide*.

- For API details, see PutParameter in *Amazon CLI Command Reference*.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.ssm.SsmClient;
import software.amazon.awssdk.services.ssm.model.ParameterType;
import software.amazon.awssdk.services.ssm.model.PutParameterRequest;
import software.amazon.awssdk.services.ssm.model.SsmException;
```

```
public class PutParameter {

    public static void main(String[] args) {
        final String usage = """

                Usage:
                    <paraName>

                Where:
                    paraName - The name of the parameter.
                    paraValue - The value of the parameter.
                """;

        if (args.length != 2) {
            System.out.println(usage);
            System.exit(1);
        }

        String paraName = args[0];
        String paraValue = args[1];
        Region region = Region.US_EAST_1;

PowerShell

Tools for PowerShell V4

Example 1: This example creates a parameter. There is no output if the command succeeds.

```
Write-SSMParameter -Name "Welcome" -Type "String" -Value "helloWorld"
```

Example 2: This example changes a parameter. There is no output if the command succeeds.

```
Write-SSMParameter -Name "Welcome" -Type "String" -Value "Good day, Sunshine!" -
Overwrite $true
```

- For API details, see PutParameter in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a parameter. There is no output if the command succeeds.

```
Write-SSMParameter -Name "Welcome" -Type "String" -Value "helloWorld"
```

Example 2: This example changes a parameter. There is no output if the command succeeds.

```
Write-SSMParameter -Name "Welcome" -Type "String" -Value "Good day, Sunshine!" -
Overwrite $true
```

- For API details, see PutParameter in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

Rust

SDK for Rust

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
async fn make_parameter(
    client: &Client,
    name: &str,
    value: &str,
    description: &str,
) -> Result<(), Error> {
    let resp = client
        .put_parameter()
        .overwrite(true)
        .r#type(ParameterType::String)
        .name(name)
        .value(value)
        .description(description)
        .send()
        .await?;

    println!("Success! Parameter now has version: {}", resp.version());

    Ok(())
}
```

- For API details, see PutParameter in *Amazon SDK for Rust API reference*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `RegisterDefaultPatchBaseline` with a CLI

The following code examples show how to use `RegisterDefaultPatchBaseline`.

CLI

Amazon CLI

To set the default patch baseline

The following `register-default-patch-baseline` example registers the specified custom patch baseline as the default patch baseline for the operating system type that it supports.

```
aws ssm register-default-patch-baseline \
    --baseline-id "pb-abc123cf9bEXAMPLE"
```

Output:

```
{
    "BaselineId":"pb-abc123cf9bEXAMPLE"
}
```

The following `register-default-patch-baseline` example registers the default patch baseline provided by Amazon for CentOS as the default patch baseline.

```
aws ssm register-default-patch-baseline \
    --baseline-id "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-0574b43a65ea646ed"
```

Output:

```
{
    "BaselineId":"pb-abc123cf9bEXAMPLE"
}
```

For more information, see About Predefined and Custom Patch Baselines in the *Amazon Systems Manager User Guide*.

- For API details, see RegisterDefaultPatchBaseline in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example registers a patch baseline as the default patch baseline.

```
Register-SSMDefaultPatchBaseline -BaselineId "pb-03da896ca3b68b639"
```

Output:

```
pb-03da896ca3b68b639
```

- For API details, see RegisterDefaultPatchBaseline in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example registers a patch baseline as the default patch baseline.

```
Register-SSMDefaultPatchBaseline -BaselineId "pb-03da896ca3b68b639"
```

Output:

```
pb-03da896ca3b68b639
```

- For API details, see RegisterDefaultPatchBaseline in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `RegisterPatchBaselineForPatchGroup` with a CLI

The following code examples show how to use `RegisterPatchBaselineForPatchGroup`.

CLI

Amazon CLI

To register a patch baseline for a patch group

The following `register-patch-baseline-for-patch-group` example registers a patch baseline for a patch group.

```
aws ssm register-patch-baseline-for-patch-group \
    --baseline-id "pb-045f10b4f382baeda" \
    --patch-group "Production"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f382baeda",
    "PatchGroup": "Production"
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *Amazon Systems Manager User Guide*.

- For API details, see RegisterPatchBaselineForPatchGroup in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example registers a patch baseline for a patch group.

```
Register-SSMPatchBaselineForPatchGroup -BaselineId "pb-03da896ca3b68b639" -
PatchGroup "Production"
```

Output:

```
BaselineId           PatchGroup
----------           ----------
pb-03da896ca3b68b639 Production
```

- For API details, see RegisterPatchBaselineForPatchGroup in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example registers a patch baseline for a patch group.

```
Register-SSMPatchBaselineForPatchGroup -BaselineId "pb-03da896ca3b68b639" -
PatchGroup "Production"
```

Output:

```
BaselineId           PatchGroup
----------           ----------
pb-03da896ca3b68b639 Production
```

- For API details, see RegisterPatchBaselineForPatchGroup in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `RegisterTargetWithMaintenanceWindow` with a CLI

The following code examples show how to use `RegisterTargetWithMaintenanceWindow`.

CLI

Amazon CLI

Example 1: To register a single target with a maintenance window

The following `register-target-with-maintenance-window` example registers an instance with a maintenance window.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --targets "Key=InstanceIds,Values=i-0000293ffd8c57862" \
    --owner-information "Single instance" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 2: To register multiple targets with a maintenance window using instance IDs

The following `register-target-with-maintenance-window` example registers two instances with a maintenance window by specifying their instance IDs.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --targets "Key=InstanceIds,Values=i-0000293ffd8c57862,i-0cb2b964d3e14fd9f" \
    --owner-information "Two instances in a list" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 3: To register targets with a maintenance window using resource tags

The following `register-target-with-maintenance-window` example registers instances with a maintenance window by specifying resource tags that have been applied to the instances.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-06cf17cbefcb4bf4f" \
    --targets "Key=tag:Environment,Values=Prod" "Key=Role,Values=Web" \
    --owner-information "Production Web Servers" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 4: To register targets using a group of tag keys

The following `register-target-with-maintenance-window` example register instances that all have one or more tag keys assigned to them, regardless of their key values.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-0c50858d01EXAMPLE" \
    --resource-type "INSTANCE" \
    --targets "Key=tag-key,Values=Name,Instance-Type,CostCenter"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 5: To register targets using a resource group name

The following `register-target-with-maintenance-window` example register a specified resource group, regardless of the type of resources it contains.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-0c50858d01EXAMPLE" \
    --resource-type "RESOURCE_GROUP" \
    --targets "Key=resource-groups:Name,Values=MyResourceGroup"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

For more information, see Register a Target Instance with the Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see RegisterTargetWithMaintenanceWindow in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example registers an instance with a maintenance window.

```
$option1 = @{Key="InstanceIds";Values=@("i-0000293ffd8c57862")}
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target
 $option1 -OwnerInformation "Single instance" -ResourceType "INSTANCE"
```

Output:

```
d8e47760-23ed-46a5-9f28-927337725398
```

Example 2: This example registers multiple instances with a maintenance window.

```
$option1 =
 @{Key="InstanceIds";Values=@("i-0000293ffd8c57862","i-0cb2b964d3e14fd9f")}
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target
 $option1 -OwnerInformation "Single instance" -ResourceType "INSTANCE"
```

Output:

```
6ab5c208-9fc4-4697-84b7-b02a6cc25f7d
```

Example 3: This example registers an instance with a maintenance window using EC2 tags.

```
$option1 = @{Key="tag:Environment";Values=@("Production")}
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target
 $option1 -OwnerInformation "Production Web Servers" -ResourceType "INSTANCE"
```

Output:

```
2994977e-aefb-4a71-beac-df620352f184
```

- For API details, see RegisterTargetWithMaintenanceWindow in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example registers an instance with a maintenance window.

```
$option1 = @{Key="InstanceIds";Values=@("i-0000293ffd8c57862")}
```

```
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target
 $option1 -OwnerInformation "Single instance" -ResourceType "INSTANCE"
```

Output:

```
d8e47760-23ed-46a5-9f28-927337725398
```

Example 2: This example registers multiple instances with a maintenance window.

```
$option1 =
 @{Key="InstanceIds";Values=@("i-0000293ffd8c57862","i-0cb2b964d3e14fd9f")}
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target
 $option1 -OwnerInformation "Single instance" -ResourceType "INSTANCE"
```

Output:

```
6ab5c208-9fc4-4697-84b7-b02a6cc25f7d
```

Example 3: This example registers an instance with a maintenance window using EC2 tags.

```
$option1 = @{Key="tag:Environment";Values=@("Production")}
Register-SSMTargetWithMaintenanceWindow -WindowId "mw-06cf17cbefcb4bf4f" -Target
 $option1 -OwnerInformation "Production Web Servers" -ResourceType "INSTANCE"
```

Output:

```
2994977e-aefb-4a71-beac-df620352f184
```

- For API details, see RegisterTargetWithMaintenanceWindow in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `RegisterTaskWithMaintenanceWindow` with a CLI

The following code examples show how to use `RegisterTaskWithMaintenanceWindow`.

CLI

Amazon CLI

Example 1: To register an Automation task with a maintenance window

The following `register-task-with-maintenance-window` example registers an Automation task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --cli-binary-format raw-in-base64-out \
    --window-id "mw-082dcd7649EXAMPLE" \
    --targets Key=InstanceIds,Values=i-1234520122EXAMPLE \
    --task-arn AWS-RestartEC2Instance \
    --service-role-arn arn:aws:iam::123456789012:role/SSM \
    --task-type AUTOMATION \
    --task-invocation-parameters '{"Automation":
{"DocumentVersion":"$LATEST","Parameters":{"InstanceId":["{{RESOURCE_ID}}"]}}}' \
    --priority 0 \
    --max-concurrency 1 \
    --max-errors 1 \
    --name "AutomationExample" \
    --description "Restarting EC2 Instance for maintenance"
```

Output:

```
{
    "WindowTaskId":"11144444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

Example 2: To register a Lambda task with a Maintenance Window

The following `register-task-with-maintenance-window` example registers a Lambda task with a Maintenance Window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --cli-binary-format raw-in-base64-out \
    --window-id "mw-082dcd7649dee04e4" \
```

```
    --targets Key=InstanceIds,Values=i-12344d305eEXAMPLE \
    --task-arn arn:aws:lambda:us-west-2:123456789012:function:SSMTestLAMBDA \
    --service-role-arn arn:aws:iam::123456789012:role/SSM \
    --task-type LAMBDA \
    --task-invocation-parameters '{"Lambda":{"Payload":"{\"InstanceId\":
\"{{RESOURCE_ID}}\",\"targetType\":\"{{TARGET_TYPE}}\"}","Qualifier":"$LATEST"}}'
 \
    --priority 0 \
    --max-concurrency 10 \
    --max-errors 5 \
    --name "Lambda_Example" \
    --description "My Lambda Example"
```

Output:

```
{
    "WindowTaskId":"22244444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

Example 3: To register a Run Command task with a maintenance window

The following `register-task-with-maintenance-window` example registers a Run Command task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --cli-binary-format raw-in-base64-out \
    --window-id "mw-082dcd7649dee04e4" \
    --targets "Key=InstanceIds,Values=i-12344d305eEXAMPLE" \
    --service-role-arn "arn:aws:iam::123456789012:role/SSM" \
    --task-type "RUN_COMMAND" \
    --name "SSMInstallPowerShellModule" \
    --task-arn "AWS-InstallPowerShellModule" \
    --task-invocation-parameters "{\"RunCommand\":{\"Comment\":\"\",
\"OutputS3BucketName\":\"runcommandlogs\",\"Parameters\":{\"commands\":[\"Get-
Module -ListAvailable\"],\"executionTimeout\":[\"3600\"],\"source\":[\"https:\/
\/gallery.technet.microsoft.com\/EZOut-33ae0fb7\/file\/110351\/1\/EZOut.zip\"],
\"workingDirectory\":[\"\\\\\"]},\"TimeoutSeconds\":600}}" \
    --max-concurrency 1 \
    --max-errors 1 \
```

```
    --priority 10
```

Output:

```
{
    "WindowTaskId":"33344444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

Example 4: To register a Step Functions task with a maintenance window

The following `register-task-with-maintenance-window` example registers a Step Functions task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --cli-binary-format raw-in-base64-out \
    --window-id "mw-1234d787d6EXAMPLE" \
    --targets Key=WindowTargetIds,Values=a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --task-arn arn:aws:states:us-
west-2:123456789012:stateMachine:SSMTestStateMachine \
    --service-role-arn arn:aws:iam::123456789012:role/MaintenanceWindows \
    --task-type STEP_FUNCTIONS \
    --task-invocation-parameters '{"StepFunctions":{"Input":"{\"InstanceId\":
\"{{RESOURCE_ID}}\"}"}}' \
    --priority 0 \
    --max-concurrency 10 \
    --max-errors 5 \
    --name "Step_Functions_Example" \
    --description "My Step Functions Example"
```

Output:

```
{
    "WindowTaskId":"44444444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

Example 5: To register a task using a maintenance windows target ID

The following `register-task-with-maintenance-window` example registers a task using a maintenance window target ID. The maintenance window target ID was in the output of the `aws ssm register-target-with-maintenance-window` command. You can also retrieve it from the output of the `aws ssm describe-maintenance-window-targets` command.

```
aws ssm register-task-with-maintenance-window \
    --cli-binary-format raw-in-base64-out \
    --targets "Key=WindowTargetIds,Values=a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" \
    --task-arn "AWS-RunShellScript" \
    --service-role-arn "arn:aws:iam::123456789012:role/MaintenanceWindowsRole" \
    --window-id "mw-ab12cd34efEXAMPLE" \
    --task-type "RUN_COMMAND" \
    --task-parameters  "{\"commands\":{\"Values\":[\"df\"]}}" \
    --max-concurrency 1 \
    --max-errors 1 \
    --priority 10
```

Output:

```
{
    "WindowTaskId":"33344444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see RegisterTaskWithMaintenanceWindow in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example registers a task with a maintenance window using an instance ID. The output is the Task ID.

```
$parameters = @{}
$parameterValues = New-Object
 Amazon.SimpleSystemsManagement.Model.MaintenanceWindowTaskParameterValueExpression
```

```
$parameterValues.Values = @("Install")
$parameters.Add("Operation", $parameterValues)

Register-SSMTaskWithMaintenanceWindow -WindowId "mw-03a342e62c96d31b0"
 -ServiceRoleArn "arn:aws:iam::123456789012:role/MaintenanceWindowsRole"
 -MaxConcurrency 1 -MaxError 1 -TaskArn "AWS-RunShellScript" -Target
 @{ Key="InstanceIds";Values="i-0000293ffd8c57862" } -TaskType "RUN_COMMAND" -
Priority 10 -TaskParameter $parameters
```

Output:

```
f34a2c47-ddfd-4c85-a88d-72366b69af1b
```

Example 2: This example registers a task with a maintenance window using a target ID. The output is the Task ID.

```
$parameters = @{}
$parameterValues = New-Object
 Amazon.SimpleSystemsManagement.Model.MaintenanceWindowTaskParameterValueExpression
$parameterValues.Values = @("Install")
$parameters.Add("Operation", $parameterValues)

register-ssmtaskwithmaintenancewindow -WindowId "mw-03a342e62c96d31b0"
 -ServiceRoleArn "arn:aws:iam::123456789012:role/MaintenanceWindowsRole"
 -MaxConcurrency 1 -MaxError 1 -TaskArn "AWS-RunShellScript" -Target
 @{ Key="WindowTargetIds";Values="350d44e6-28cc-44e2-951f-4b2c985838f6" } -

Use `RemoveTagsFromResource` with a CLI

The following code examples show how to use `RemoveTagsFromResource`.

CLI

Amazon CLI

To remove a tag from a patch baseline

The following `remove-tags-from-resource` example removes tags from a patch baseline.

```
aws ssm remove-tags-from-resource \
    --resource-type "PatchBaseline" \
    --resource-id "pb-0123456789abcdef0" \
    --tag-keys "Region"
```

This command produces no output.

For more information, see Working with Patch Manager resources using the Amazon CLI in the *Amazon Systems Manager User Guide*.

- For API details, see RemoveTagsFromResource in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example removes a tag from a maintenance window. There is no output if the command succeeds.

```
Remove-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow" -TagKey "Production"
```

- For API details, see RemoveTagsFromResource in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example removes a tag from a maintenance window. There is no output if the command succeeds.

```
Remove-SSMResourceTag -ResourceId "mw-03eb9db42890fb82d" -ResourceType
 "MaintenanceWindow" -TagKey "Production"
```

- For API details, see RemoveTagsFromResource in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use SendCommand with an Amazon SDK or CLI

The following code examples show how to use SendCommand.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

Amazon CLI

Example 1: To run a command on one or more remote instances

The following send-command example runs an echo command on a target instance.

```
aws ssm send-command \
    --document-name "AWS-RunShellScript" \
    --parameters 'commands=["echo HelloWorld"]' \
    --targets "Key=instanceids,Values=i-1234567890abcdef0" \
    --comment "echo HelloWorld"
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "DocumentName": "AWS-RunShellScript",
        "DocumentVersion": "",
        "Comment": "echo HelloWorld",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "echo HelloWorld"
            ]
        },
        "InstanceIds": [
            "i-0f00f008a2dcbefe2"
        ],
        "Targets": [],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 1,
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
```

```
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
            "CloudWatchOutputEnabled": false
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *Amazon Systems Manager User Guide*.

Example 2: To get IP information about an instance

The following `send-command` example retrieves the IP information about an instance.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig"
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "DocumentName": "AWS-RunShellScript",
        "DocumentVersion": "",
        "Comment": "IP config",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "ifconfig"
            ]
        },
        "InstanceIds": [
            "i-1234567890abcdef0"
        ],
```

```
        "Targets": [],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 1,
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {

        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *Amazon Systems Manager User Guide*.

Example 3: To run a command on instances with specific tags

The following `send-command` example runs a command on instances that have the tag key "ENV" and the value "Dev".

```
aws ssm send-command \
    --targets "Key=tag:ENV,Values=Dev" \
    --document-name "AWS-RunShellScript" \
    --parameters "commands=ifconfig"
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
```

```
        "DocumentName": "AWS-RunShellScript",
        "DocumentVersion": "",
        "Comment": "",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "ifconfig"
            ]
        },
        "InstanceIds": [],
        "Targets": [
            {
                "Key": "tag:ENV",
                "Values": [
                    "Dev"
                ]
            }
        ],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 0,
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
            "CloudWatchOutputEnabled": false
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *Amazon Systems Manager User Guide*.

Example 4: To run a command that sends SNS notifications

The following `send-command` example runs a command that sends SNS notifications for all notification events and the `Command` notification type.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig" \
    --service-role-arn "arn:aws:iam::123456789012:role/SNS_Role" \
    --notification-config "NotificationArn=arn:aws:sns:us-
west-2:123456789012:SNSTopicName,NotificationEvents=All,NotificationType=Command"
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
        "DocumentName": "AWS-RunShellScript",
        "DocumentVersion": "",
        "Comment": "IP config",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "ifconfig"
            ]
        },
        "InstanceIds": [
            "i-1234567890abcdef0"
        ],
        "Targets": [],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 1,
```

```
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "arn:aws:iam::123456789012:role/SNS_Role",
        "NotificationConfig": {
            "NotificationArn": "arn:aws:sns:us-west-2:123456789012:SNSTopicName",
            "NotificationEvents": [
                "All"
            ],
            "NotificationType": "Command"
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
            "CloudWatchOutputEnabled": false
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *Amazon Systems Manager User Guide*.

Example 5: To run a command that outputs to S3 and CloudWatch

The following `send-command` example runs a command that outputs command details to an S3 bucket and to a CloudWatch Logs log group.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig" \
    --output-s3-bucket-name "s3-bucket-name" \
    --output-s3-key-prefix "runcommand" \
    --cloud-watch-output-
config "CloudWatchOutputEnabled=true,CloudWatchLogGroupName=CWLGroupName"
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE55555",
        "DocumentName": "AWS-RunShellScript",
```

```
        "DocumentVersion": "",
        "Comment": "IP config",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "ifconfig"
            ]
        },
        "InstanceIds": [
            "i-1234567890abcdef0"
        ],
        "Targets": [],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "s3-bucket-name",
        "OutputS3KeyPrefix": "runcommand",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 1,
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "CWLGroupName",
            "CloudWatchOutputEnabled": true
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *Amazon Systems Manager User Guide*.

Example 6: To run commands on multiple instances with different tags

The following `send-command` example runs a command on instances with two different tag keys and values.

```
aws ssm send-command \
    --document-name "AWS-RunPowerShellScript" \
    --parameters commands=["echo helloWorld"] \
    --targets Key=tag:Env,Values=Dev Key=tag:Role,Values=WebServers
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE66666",
        "DocumentName": "AWS-RunPowerShellScript",
        "DocumentVersion": "",
        "Comment": "",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "echo helloWorld"
            ]
        },
        "InstanceIds": [],
        "Targets": [
            {
                "Key": "tag:Env",
                "Values": [
                    "Dev"
                ]
            },
            {
                "Key": "tag:Role",
                "Values": [
                    "WebServers"
                ]
            }
        ],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 0,
        "CompletedCount": 0,
```

```
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
            "CloudWatchOutputEnabled": false
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *Amazon Systems Manager User Guide*.

Example 7: To target multiple instances with the same tag key

The following `send-command` example runs a command on instances that have the same tag key but with different values.

```
aws ssm send-command \
    --document-name "AWS-RunPowerShellScript" \
    --parameters commands=["echo helloWorld"] \
    --targets Key=tag:Env,Values=Dev,Test
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE77777",
        "DocumentName": "AWS-RunPowerShellScript",
        "DocumentVersion": "",
        "Comment": "",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "echo helloWorld"
            ]
        },
        "InstanceIds": [],
```

```
        "Targets": [
            {
                "Key": "tag:Env",
                "Values": [
                    "Dev",
                    "Test"
                ]
            }
        ],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 0,
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
            "CloudWatchOutputEnabled": false
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *Amazon Systems Manager User Guide*.

Example 8: To run a command that uses a shared document

The following `send-command` example runs a shared document on a target instance.

```
aws ssm send-command \
    --document-name "arn:aws:ssm:us-west-2:123456789012:document/ExampleDocument"
 \
```

```
    --targets "Key=instanceids,Values=i-1234567890abcdef0"
```

Output:

```
{
    "Command": {
        "CommandId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE88888",
        "DocumentName": "arn:aws:ssm:us-west-2:123456789012:document/
ExampleDocument",
        "DocumentVersion": "",
        "Comment": "",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {},
        "InstanceIds": [],
        "Targets": [
            {
                "Key": "instanceids",
                "Values": [
                    "i-1234567890abcdef0"
                ]
            }
        ],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 0,
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
            "CloudWatchOutputEnabled": false
        }
```

```
    }
}
```

For more information, see Using shared SSM documents in the *Amazon Systems Manager User Guide*.

    console.log("Command sent successfully.");
    return { Success: true };
  } catch (caught) {
    if (caught instanceof Error && caught.name === "ValidationError") {
      console.warn(`${caught.message}. Did you provide a valid document name?`);
    } else {
      throw caught;
    }
  }
};
```

- For API details, see SendCommand in *Amazon SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example runs an echo command on a target instance.

```
Send-SSMCommand -DocumentName "AWS-RunPowerShellScript" -Parameter @{commands =
 "echo helloWorld"} -Target @{Key="instanceids";Values=@("i-0cb2b964d3e14fd9f")}
```

Output:

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `StartAutomationExecution` with a CLI

The following code examples show how to use `StartAutomationExecution`.

CLI

Amazon CLI

Example 1: To execute an automation document

The following `start-automation-execution` example runs an Automation document.

```
aws ssm start-automation-execution \
    --document-name "AWS-UpdateLinuxAmi" \
    --parameters "AutomationAssumeRole=arn:aws:iam::123456789012:role/
SSMAutomationRole,SourceAmiId=ami-EXAMPLE,IamInstanceProfileName=EC2InstanceRole"
```

Output:

```
{
    "AutomationExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Running an Automation Workflow Manually in the *Amazon Systems Manager User Guide*.

Example 2: To run a shared automation document

The following `start-automation-execution` example runs a shared Automation document.

```
aws ssm start-automation-execution \
    --document-name "arn:aws:ssm:us-west-2:123456789012:document/ExampleDocument"
```

Output:

```
{
```

```
    "AutomationExecutionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Using shared SSM documents in the *Amazon Systems Manager User Guide*.

- For API details, see StartAutomationExecution in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example runs a document specifying an Automation role, an AMI source ID, and an Amazon EC2 instance role.

```
Start-SSMAutomationExecution -DocumentName AWS-UpdateLinuxAmi -
Parameter @{'AutomationAssumeRole'='arn:aws:iam::123456789012:role/
SSMAutomationRole';'SourceAmiId'='ami-
f173cc91';'InstanceIamRole'='EC2InstanceRole'}
```

Output:

```
3a532a4f-0382-11e7-9df7-6f11185f6dd1
```

- For API details, see StartAutomationExecution in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example runs a document specifying an Automation role, an AMI source ID, and an Amazon EC2 instance role.

```
Start-SSMAutomationExecution -DocumentName AWS-UpdateLinuxAmi -
Parameter @{'AutomationAssumeRole'='arn:aws:iam::123456789012:role/
SSMAutomationRole';'SourceAmiId'='ami-
f173cc91';'InstanceIamRole'='EC2InstanceRole'}
```

Output:

```
3a532a4f-0382-11e7-9df7-6f11185f6dd1
```

- For API details, see StartAutomationExecution in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `StartSession` with a CLI

The following code examples show how to use `StartSession`.

CLI

Amazon CLI

Example 1: To start a Session Manager session

The following `start-session` example establishes a connection with an instance for a Session Manager session. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call.

```
aws ssm start-session \
    --target "i-1234567890abcdef0"
```

Output:

```
Starting session with SessionId: Jane-Roe-07a16060613c408b5
```

Example 2: To start a Session Manager session using SSH

The following `start-session` example establishes a connection with an instance for a Session Manager session using SSH. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call, and that the command uses the default user on the instance, such as `ec2-user` for EC2 instances for Linux.

```
ssh -i /path/my-key-pair.pem ec2-user@i-02573cafcfEXAMPLE
```

Output:

```
Starting session with SessionId: ec2-user-07a16060613c408b5
```

For more information, see Start a Session and Install the Session Manager Plugin for the Amazon CLI in the *Amazon Systems Manager User Guide*.

- For API details, see StartSession in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example initiates a connection to a target for a Session Manager session, enabling port forwarding.

```
Start-SSMSession -Target 'i-064578e5e7454488f' -DocumentName 'AWS-
StartPortForwardingSession' -Parameter @{ localPortNumber = '8080'; portNumber =
 '80' }
```

Output:

```
SessionId    StreamUrl
----------    ----------
random-id0    wss://ssmmessages.amazonaws.com/v1/data-channel/random-id
```

- For API details, see StartSession in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example initiates a connection to a target for a Session Manager session, enabling port forwarding. Note: You need to add Region parameter if not already set using AWSCredentials.

```
Start-SSMSession -Target 'i-064578e5e7454488f' -DocumentName 'AWS-
StartPortForwardingSession' -Parameter @{ localPortNumber = '8080'; portNumber =
 '80' } -Region 'us-west-1'
```

Output:

```
Starting session with SessionId: testUser-xi4glew849asyeryde34u4dfsdfy
Port 8080 opened for sessionId testUser-xi4glew849asyeryde34u4dfsdfy.
Waiting for connections...
```

Example 2: This example creates an interactive session with a specified instance for a Session Manager session.

```
Start-SSMSession -Target 'i-1234567890abcdef0' -Region 'us-west-1'
```

Output:

```
Starting session with SessionId : testUser-xi4glew849asyeryde34u4dfsdfy
Windows PowerShell
Copyright (C) Microsoft Corporation. All rights reserved.

Install the latest PowerShell for new features and improvements!

PS C:\Windows\system32> whoami
ec2amaz-fnsdrwv\ec2-test-user
PS C:\Windows\system32>
```

Example 3: This example creates a session without connecting to it and returns the SessionId, StreamUrl, and TokenValue properties required to connect to the session.

```
Start-SSMSession -Target 'i-1234567890abcdef0' -Region 'us-west-1' -
DisablePluginInvocation
```

Output:

```
SessionId        : testUser-xi4glew849asyeryde34u4dfsdfy
StreamUrl        : {StreamUrl value redacted}
TokenValue       : {Token value redacted}
ContentLength    : 1207
HttpStatusCode   : OK
```

- For API details, see StartSession in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `StopAutomationExecution` with a CLI

The following code examples show how to use `StopAutomationExecution`.

CLI

Amazon CLI

To stop an automation execution

The following `stop-automation-execution` example stops an Automation document.

```
aws ssm stop-automation-execution \
    --automation-execution-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Running an Automation Workflow Manually in the *Amazon Systems Manager User Guide*.

- For API details, see StopAutomationExecution in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example stops an Automation Execution. There is no output if the command succeeds.

```
Stop-SSMAutomationExecution -AutomationExecutionId "4105a4fc-
f944-11e6-9d32-8fb2db27a909"
```

- For API details, see StopAutomationExecution in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example stops an Automation Execution. There is no output if the command succeeds.

```
Stop-SSMAutomationExecution -AutomationExecutionId "4105a4fc-
f944-11e6-9d32-8fb2db27a909"
```

- For API details, see StopAutomationExecution in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateAssociation` with a CLI

The following code examples show how to use `UpdateAssociation`.

CLI

Amazon CLI

Example 1: To update a document association

The following `update-association` example updates an association with a new document version.

```
aws ssm update-association \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --document-version "\$LATEST"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-UpdateSSMAgent",
        "AssociationVersion": "2",
        "Date": 1550508093.293,
        "LastUpdateAssociationDate": 1550508106.596,
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "DocumentVersion": "$LATEST",
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Targets": [
            {
                "Key": "tag:Name",
```

```
                "Values": [
                    "Linux"
                ]
            }
        ],
        "LastExecutionDate": 1550508094.879,
        "LastSuccessfulExecutionDate": 1550508094.879
    }
}
```

For more information, see Editing and creating a new version of an association in the *Amazon Systems Manager User Guide*.

Example 2: To update the schedule expression of an association

The following `update-association` example updates the schedule expression for the specified association.

```
aws ssm update-association \
    --association-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --schedule-expression "cron(0 0 0/4 1/1 * ? *)"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-HelloWorld",
        "AssociationVersion": "2",
        "Date": "2021-02-08T13:54:19.203000-08:00",
        "LastUpdateAssociationDate": "2021-06-29T11:51:07.933000-07:00",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "DocumentVersion": "$DEFAULT",
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Targets": [
            {
                "Key": "aws:NoOpAutomationTag",
                "Values": [
                    "AWS-NoOpAutomationTarget-Value"
                ]
```

```
            }
        ],
        "ScheduleExpression": "cron(0 0 0/4 1/1 * ? *)",
        "LastExecutionDate": "2021-06-26T19:00:48.110000-07:00",
        "ApplyOnlyAtCronInterval": false
    }
}
```

For more information, see Editing and creating a new version of an association in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateAssociation in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates an association with a new document version.

```
Update-SSMAssociation -AssociationId "93285663-92df-44cb-9f26-2292d4ecc439" -
DocumentVersion "1"
```

Output:

```
Name                  : AWS-UpdateSSMAgent
InstanceId            :
Date                  : 3/1/2017 6:22:21 PM
Status.Name           :
Status.Date           :
Status.Message        :
Status.AdditionalInfo :
```

- For API details, see UpdateAssociation in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates an association with a new document version.

```
Update-SSMAssociation -AssociationId "93285663-92df-44cb-9f26-2292d4ecc439" -
DocumentVersion "1"
```

Output:

```
Name                  : AWS-UpdateSSMAgent
InstanceId            :
Date                  : 3/1/2017 6:22:21 PM
Status.Name           :
Status.Date           :
Status.Message        :
Status.AdditionalInfo :
```

- For API details, see UpdateAssociation in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateAssociationStatus` with a CLI

The following code examples show how to use `UpdateAssociationStatus`.

CLI

Amazon CLI

To update the association status

The following `update-association-status` example updates the association status of the association between an instance and a document.

```
aws ssm update-association-status \
    --name "AWS-UpdateSSMAgent" \
    --instance-id "i-1234567890abcdef0" \
    --association-
status "Date=1424421071.939,Name=Pending,Message=temp_status_change,AdditionalInfo=Additi
Config-Needed"
```

Output:

```
{
    "AssociationDescription": {
```

```
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-1234567890abcdef0",
        "AssociationVersion": "1",
        "Date": 1550507529.604,
        "LastUpdateAssociationDate": 1550507806.974,
        "Status": {
            "Date": 1424421071.0,
            "Name": "Pending",
            "Message": "temp_status_change",
            "AdditionalInfo": "Additional-Config-Needed"
        },
        "Overview": {
            "Status": "Success",
            "AssociationStatusAggregatedCount": {
                "Success": 1
            }
        },
        "DocumentVersion": "$DEFAULT",
        "AssociationId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Targets": [
            {
                "Key": "InstanceIds",
                "Values": [
                    "i-1234567890abcdef0"
                ]
            }
        ],
        "LastExecutionDate": 1550507808.0,
        "LastSuccessfulExecutionDate": 1550507808.0
    }
}
```

For more information, see Working with associations in Systems Manager in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateAssociationStatus in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the association status of the association between an instance and a configuration document.

```
Update-SSMAssociationStatus -Name "AWS-UpdateSSMAgent" -InstanceId
 "i-0000293ffd8c57862" -AssociationStatus_Date "2015-02-20T08:31:11Z"
 -AssociationStatus_Name "Pending" -AssociationStatus_Message
 "temporary_status_change" -AssociationStatus_AdditionalInfo "Additional-Config-
Needed"
```

Output:

```
Name                 : AWS-UpdateSSMAgent
InstanceId           : i-0000293ffd8c57862
Date                 : 2/23/2017 6:55:22 PM
Status.Name          : Pending
Status.Date          : 2/20/2015 8:31:11 AM
Status.Message       : temporary_status_change
Status.AdditionalInfo : Additional-Config-Needed
```

- For API details, see UpdateAssociationStatus in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the association status of the association between an instance and a configuration document.

```
Update-SSMAssociationStatus -Name "AWS-UpdateSSMAgent" -InstanceId
 "i-0000293ffd8c57862" -AssociationStatus_Date "2015-02-20T08:31:11Z"
 -AssociationStatus_Name "Pending" -AssociationStatus_Message
 "temporary_status_change" -AssociationStatus_AdditionalInfo "Additional-Config-
Needed"
```

Output:

```
Name                 : AWS-UpdateSSMAgent
InstanceId           : i-0000293ffd8c57862
Date                 : 2/23/2017 6:55:22 PM
Status.Name          : Pending
Status.Date          : 2/20/2015 8:31:11 AM
Status.Message       : temporary_status_change
Status.AdditionalInfo : Additional-Config-Needed
```

- For API details, see UpdateAssociationStatus in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateDocument` with a CLI

The following code examples show how to use `UpdateDocument`.

CLI

Amazon CLI

To create a new version of a document

The following `update-document` example creates a new version of a document when run on a Windows computer. The document specified by `--document` must be in JSON format. Note that `file://` must be referenced followed by the path of the content file. Because of the $ at the beginning of the `--document-version` parameter, On Windows you must surround the value with double quotes. On Linux, MacOS, or at a PowerShell prompt, you must surround the value with single quotes.

Windows version.

```
aws ssm update-document \
    --name "RunShellScript" \
    --content "file://RunShellScript.json" \
    --document-version "$LATEST"
```

Linux/Mac version.

```
aws ssm update-document \
    --name "RunShellScript" \
    --content "file://RunShellScript.json" \
    --document-version '$LATEST'
```

Contents of `RunShellScript.json`:

```
{
    "schemaVersion": "2.0",
    "description": "Run an updated script",
    "parameters": {
```

```
        "commands": {
            "type": "StringList",
            "description": "(Required) Specify a shell script or a command to
 run."
        }
    },
    "mainSteps": [
        {
            "action": "aws:runShellScript",
            "name": "runShellScript",
            "inputs": {
                "runCommand": "{{ commands }}"
            }
        }
    ]
}
```

Output:

```
{
    "DocumentDescription": {
        "Status": "Updating",
        "Hash":
 "f775e5df4904c6fa46686c4722fae9de1950dace25cd9608ff8d622046b68d9b",
        "Name": "RunShellScript",
        "Parameters": [
            {
                "Type": "StringList",
                "Name": "commands",
                "Description": "(Required) Specify a shell script or a command to
 run."
            }
        ],
        "DocumentType": "Command",
        "PlatformTypes": [
            "Linux"
        ],
        "DocumentVersion": "2",
        "HashType": "Sha256",
        "CreatedDate": 1487899655.152,
        "Owner": "123456789012",
        "SchemaVersion": "2.0",
        "DefaultVersion": "1",
```

```
        "LatestVersion": "2",
        "Description": "Run an updated script"
    }
}
```

For more information, see Amazon Systems Manager Documents in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateDocument in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This creates a new version of a document with the updated contents of the json file you specify. The document must be in JSON format. You can obtain the document version with the "Get-SSMDocumentVersionList" cmdlet.

```
Update-SSMDocument -Name RunShellScript -DocumentVersion "1" -Content (Get-
Content -Raw "c:\temp\RunShellScript.json")
```

Output:

```
CreatedDate     : 3/1/2017 2:59:17 AM
DefaultVersion  : 1
Description     : Run an updated script
DocumentType    : Command
DocumentVersion : 2
Hash            :
 1d5ce820e999ff051eb4841ed887593daf77120fd76cae0d18a53cc42e4e22c1
HashType        : Sha256
LatestVersion   : 2
Name            : RunShellScript
Owner           : 809632081692
Parameters      : {commands}
PlatformTypes   : {Linux}
SchemaVersion   : 2.0
Sha1            :
Status          : Updating
```

- For API details, see UpdateDocument in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This creates a new version of a document with the updated contents of the json file you specify. The document must be in JSON format. You can obtain the document version with the "Get-SSMDocumentVersionList" cmdlet.

```
Update-SSMDocument -Name RunShellScript -DocumentVersion "1" -Content (Get-
Content -Raw "c:\temp\RunShellScript.json")
```

Output:

```
CreatedDate     : 3/1/2017 2:59:17 AM
DefaultVersion  : 1
Description     : Run an updated script
DocumentType    : Command
DocumentVersion : 2

HashType        : Sha256
LatestVersion   : 2
Name            : RunShellScript
Owner           : 809632081692
Parameters      : {commands}
PlatformTypes   : {Linux}
SchemaVersion   : 2.0
Sha1            :
Status          : Updating
```

- For API details, see UpdateDocument in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateDocumentDefaultVersion` with a CLI

The following code examples show how to use `UpdateDocumentDefaultVersion`.

CLI

Amazon CLI

To update the default version of a document

The following `update-document-default-version` example updates the default version of a Systems Manager document.

```
aws ssm update-document-default-version \
    --name "Example" \
    --document-version "2"
```

Output:

```
{
    "Description": {
        "Name": "Example",
        "DefaultVersion": "2"
    }
}
```

For more information, see Writing SSM Document Content in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateDocumentDefaultVersion in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This updates the default version of a document. You can obtain the available document versions with the "Get-SSMDocumentVersionList" cmdlet.

```
Update-SSMDocumentDefaultVersion -Name "RunShellScript" -DocumentVersion "2"
```

Output:

```
DefaultVersion Name
-------------- ----
2              RunShellScript
```

- For API details, see UpdateDocumentDefaultVersion in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This updates the default version of a document. You can obtain the available document versions with the "Get-SSMDocumentVersionList" cmdlet.

```
Update-SSMDocumentDefaultVersion -Name "RunShellScript" -DocumentVersion "2"
```

Output:

```
DefaultVersion Name
-------------- ----
2              RunShellScript
```

- For API details, see UpdateDocumentDefaultVersion in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateMaintenanceWindow` with an Amazon SDK or CLI

The following code examples show how to use `UpdateMaintenanceWindow`.

CLI

Amazon CLI

Example 1: To update a maintenance window

The following `update-maintenance-window` example updates the name of a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
    --name "My-Renamed-MW"
```

Output:

```
{
    "Cutoff": 1,
    "Name": "My-Renamed-MW",
    "Schedule": "cron(0 16 ? * TUE *)",
    "Enabled": true,
    "AllowUnassociatedTargets": true,
    "WindowId": "mw-1a2b3c4d5e6f7g8h9",
    "Duration": 4
}
```

Example 2: To disable a maintenance window

The following `update-maintenance-window` example disables a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
    --no-enabled
```

Output:

```
{
    "Cutoff": 1,
    "Name": "My-Renamed-MW",
    "Schedule": "cron(0 16 ? * TUE *)",
    "Enabled": false,
    "AllowUnassociatedTargets": true,
    "WindowId": "mw-1a2b3c4d5e6f7g8h9",
    "Duration": 4
}
```

Example 3: To enable a maintenance window

The following `update-maintenance-window` example enables a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
    --enabled
```

Output:

```
{
    "Cutoff": 1,
```

```
    "Name": "My-Renamed-MW",
    "Schedule": "cron(0 16 ? * TUE *)",
    "Enabled": true,
    "AllowUnassociatedTargets": true,
    "WindowId": "mw-1a2b3c4d5e6f7g8h9",
    "Duration": 4
}
```

For more information, see Update a Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateMaintenanceWindow in *Amazon CLI Command Reference*.

Java

SDK for Java 2.x

Use `UpdateManagedInstanceRole` with a CLI

The following code examples show how to use `UpdateManagedInstanceRole`.

CLI

Amazon CLI

To update the IAM role of a managed instance

The following `update-managed-instance-role` example updates the IAM instance profile of a managed instance.

```
aws ssm update-managed-instance-role \
    --instance-id "mi-08ab247cdfEXAMPLE" \
    --iam-role "ExampleRole"
```

This command produces no output.

For more information, see Step 4: Create an IAM Instance Profile for Systems Manager in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateManagedInstanceRole in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example updates the role of a managed instance. There is no output if the command succeeds.

```
Update-SSMManagedInstanceRole -InstanceId "mi-08ab247cdf1046573" -IamRole
 "AutomationRole"
```

- For API details, see UpdateManagedInstanceRole in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example updates the role of a managed instance. There is no output if the command succeeds.

```
Update-SSMManagedInstanceRole -InstanceId "mi-08ab247cdf1046573" -IamRole
 "AutomationRole"
```

- For API details, see UpdateManagedInstanceRole in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateOpsItem` with an Amazon SDK or CLI

The following code examples show how to use `UpdateOpsItem`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

Amazon CLI

To update an OpsItem

The following `update-ops-item` example updates the description, priority, and category for an OpsItem. In addition, the command specifies an SNS topic where the notifications are sent when this OpsItem is edited or changed.

```
aws ssm update-ops-item \
    --ops-item-id "oi-287b5EXAMPLE" \
    --description "Primary OpsItem for failover event 2020-01-01-fh398yf" \
    --priority 2 \
    --category "Security" \
    --notifications "Arn=arn:aws:sns:us-west-2:123456789012:my-us-east-2-topic"
```

This command produces no output.

For more information, see Working with OpsItems in the *Amazon Systems Manager User Guide*.

Use `UpdatePatchBaseline` with a CLI

The following code examples show how to use `UpdatePatchBaseline`.

CLI

Amazon CLI

Example 1: To update a patch baseline

The following `update-patch-baseline` example adds the specified two patches as rejected and one patch as approved to the specified patch baseline.

```
aws ssm update-patch-baseline \
    --baseline-id "pb-0123456789abcdef0" \
    --rejected-patches "KB2032276" "MS10-048" \
    --approved-patches "KB2124261"
```

Output:

```
{
    "BaselineId": "pb-0123456789abcdef0",
    "Name": "WindowsPatching",
    "OperatingSystem": "WINDOWS",
    "GlobalFilters": {
        "PatchFilters": []
    },
    "ApprovalRules": {
        "PatchRules": [
            {
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "PRODUCT",
                            "Values": [
                                "WindowsServer2016"
                            ]
                        }
                    ]
                },
                "ComplianceLevel": "CRITICAL",
                "ApproveAfterDays": 0,
                "EnableNonSecurity": false
            }
        ]
    },
    "ApprovedPatches": [
        "KB2124261"
    ],
    "ApprovedPatchesComplianceLevel": "UNSPECIFIED",
    "ApprovedPatchesEnableNonSecurity": false,
    "RejectedPatches": [
        "KB2032276",
```

```
        "MS10-048"
    ],
    "RejectedPatchesAction": "ALLOW_AS_DEPENDENCY",
    "CreatedDate": 1550244180.465,
    "ModifiedDate": 1550244180.465,
    "Description": "Patches for Windows Servers",
    "Sources": []
}
```

For more information, see Updating or deleting a custom patch baseline in the *Amazon Systems Manager User Guide*.

Example 2: To rename a patch baseline

The following `update-patch-baseline` example renames the specified patch baseline.

```
aws ssm update-patch-baseline \
    --baseline-id "pb-0713accee01234567" \
    --name "Windows-Server-2012-R2-Important-and-Critical-Security-Updates"
```

Output:

```
{
    "BaselineId": "pb-0713accee01234567",
    "Name": "Windows-Server-2012-R2-Important-and-Critical-Security-Updates",
    "OperatingSystem": "WINDOWS",
    "GlobalFilters": {
        "PatchFilters": [
            {
                "Key": "PRODUCT",
                "Values": [
                    "WindowsServer2012R2"
                ]
            },
            {
                "Key": "MSRC_SEVERITY",
                "Values": [
                    "Critical",
                    "Important"
                ]
            },
            {
```

```
                "Key": "CLASSIFICATION",
                "Values": [
                    "SecurityUpdates"
                ]
            }
        ]
    },
    "ApprovalRules": {
        "PatchRules": [
            {
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "MSRC_SEVERITY",

- For API details, see UpdatePatchBaseline in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example adds two patches as rejected and one patch as approved to an existing patch baseline.

```
Update-SSMPatchBaseline -BaselineId "pb-03da896ca3b68b639" -RejectedPatch
 "KB2032276","MS10-048" -ApprovedPatch "KB2124261"
```

Output:

```
ApprovalRules   : Amazon.SimpleSystemsManagement.Model.PatchRuleGroup
ApprovedPatches : {KB2124261}
BaselineId      : pb-03da896ca3b68b639
CreatedDate     : 3/3/2017 5:02:19 PM
Description     : Baseline containing all updates approved for production systems
GlobalFilters   : Amazon.SimpleSystemsManagement.Model.PatchFilterGroup
ModifiedDate    : 3/3/2017 5:22:10 PM
Name            : Production-Baseline
RejectedPatches : {KB2032276, MS10-048}
```

- For API details, see UpdatePatchBaseline in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example adds two patches as rejected and one patch as approved to an existing patch baseline.

```
Update-SSMPatchBaseline -BaselineId "pb-03da896ca3b68b639" -RejectedPatch
 "KB2032276","MS10-048" -ApprovedPatch "KB2124261"
```

Output:

```
ApprovalRules   : Amazon.SimpleSystemsManagement.Model.PatchRuleGroup
ApprovedPatches : {KB2124261}
BaselineId      : pb-03da896ca3b68b639
CreatedDate     : 3/3/2017 5:02:19 PM
Description     : Baseline containing all updates approved for production systems
GlobalFilters   : Amazon.SimpleSystemsManagement.Model.PatchFilterGroup
```

```
ModifiedDate    : 3/3/2017 5:22:10 PM
Name            : Production-Baseline
RejectedPatches : {KB2032276, MS10-048}
```

- For API details, see UpdatePatchBaseline in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Using this service with an Amazon SDK. This topic also includes information about getting started and details about previous SDK versions.

Scenarios for Systems Manager using Amazon SDKs

The following code examples show you how to implement common scenarios in Systems Manager with Amazon SDKs. These scenarios show you how to accomplish specific tasks by calling multiple functions within Systems Manager or combined with other Amazon Web Services services. Each scenario includes a link to the complete source code, where you can find instructions on how to set up and run the code.

Scenarios target an intermediate level of experience to help you understand service actions in context.

Examples

- Creating a container service for virtual machine instances
- Getting started with virtual machines
- Setting up systems management

Creating a container service for virtual machine instances

The following code example shows how to:

- Create an ECS cluster
- Create and monitor a service
- Clean up resources

Bash

Amazon CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# ECS EC2 Launch Type Tutorial Script - UPDATED VERSION
# This script demonstrates creating an ECS cluster, launching a container
 instance,
# registering a task definition, and creating a service using the EC2 launch
 type.
# Updated to match the tutorial draft with nginx web server and service creation.
#
# - UPDATED: Changed from sleep task to nginx web server with service

set -e  # Exit on any error

# Configuration

Getting started with virtual machines

The following code example shows how to:

- Create a key pair
- Create a security group
- Stop and start your instance
- Test Elastic IP persistence
- Clean up resources

Bash

Amazon CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# EC2 Basics Tutorial Script - Revised
# This script demonstrates the basics of working with EC2 instances using AWS CLI
# Updated to use Amazon Linux 2023 and enhanced security settings
```

```
# Set up logging

Setting up systems management

The following code example shows how to:

- Create IAM permissions for Systems Manager
- Create an IAM role for Systems Manager
- Configure Systems Manager

- Verify the setup
- Clean up resources

Bash

Amazon CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Sample developer tutorials repository.

```
#!/bin/bash

# AWS Systems Manager Setup Script
# This script sets up AWS Systems Manager for a single account and region
#
# Version 17 fixes:
# 1. Added cloudformation.amazonaws.com to the IAM role trust policy
# 2. Systems Manager Quick Setup uses CloudFormation for deployments, so the role
 must trust CloudFormation service

# Initialize log file

Logging and monitoring in Amazon Systems Manager

Monitoring is an important part of maintaining the reliability, availability, and performance of Amazon Systems Manager and your Amazon solutions. You should collect monitoring data from all parts of your Amazon solution so that you can debug a multipoint failure if one occurs. But before you start monitoring Systems Manager, create a monitoring plan that includes answers to the following questions:

- What are your monitoring goals?
- What resources will you monitor?
- How often will you monitor these resources?
- What monitoring tools will you use?
- Who performs the monitoring tasks?
- Who should be notified when something goes wrong?

After you have defined your monitoring goals and have created your monitoring plan, the next step is to establish a baseline for normal Systems Manager performance in your environment. You should measure Systems Manager performance at various times and under different load conditions. As you monitor Systems Manager, you should store a history of monitoring data that you've collected. You can compare current Systems Manager performance to this historical data to help you to identify normal performance patterns and performance anomalies, and create methods to address them.

For example, you can monitor the success or failure of operations such as Automation workflows, the application of patch baselines, maintenance window events, and configuration compliance. Automation is a tool in Amazon Systems Manager.

You can also monitor CPU utilization, disk I/O, and network utilization of your managed nodes. When performance falls outside your established baseline, you might need to reconfigure or optimize the node to reduce CPU utilization, improve disk I/O, or reduce network traffic. For more information about monitoring EC2 instances, see Monitor Amazon EC2 in the *Amazon EC2 User Guide*.

Topics

- Monitoring tools

- Sending node logs to unified CloudWatch Logs (CloudWatch agent)
- Sending SSM Agent logs to CloudWatch Logs
- Monitoring your change request events
- Monitoring your automations
- Monitoring Run Command metrics using Amazon CloudWatch
- Logging Amazon Systems Manager API calls with Amazon CloudTrail
- Logging Automation action output with CloudWatch Logs
- Configuring Amazon CloudWatch Logs for Run Command
- Monitoring Systems Manager events with Amazon EventBridge
- Monitoring Systems Manager status changes using Amazon SNS notifications

Monitoring tools

The content in this chapter provides information for using tools available for monitoring your Systems Manager and other Amazon resources. For a more complete list of tools, see Logging and monitoring in Amazon Systems Manager.

Sending node logs to unified CloudWatch Logs (CloudWatch agent)

You can configure and use the Amazon CloudWatch agent to collect metrics and logs from your nodes instead of using Amazon Systems Manager Agent (SSM Agent) for these tasks. The CloudWatch agent allows you to gather more metrics on EC2 instances than are available using SSM Agent. In addition, you can gather metrics from on-premises servers using the CloudWatch agent.

You can also store agent configuration settings in the Systems Manager Parameter Store for use with the CloudWatch agent. Parameter Store is a tool in Amazon Systems Manager.

> **Note**
>
> Amazon Systems Manager supports migrating from SSM Agent to the unified CloudWatch agent for collecting logs and metrics on 64-bit versions of Windows only. For information about setting up the unified CloudWatch agent on other operating systems, and for

complete information about using the CloudWatch agent, see Collecting metrics and logs from Amazon EC2 instances and on-premises servers with the CloudWatch agent in the *Amazon CloudWatch User Guide*.
You can use the CloudWatch agent on other supported operating systems, but you won't be able to use Systems Manager to perform a tool migration.

SSM Agent writes information about executions, scheduled actions, errors, and health statuses to log files on each node. Manually connecting to a node to view log files and troubleshoot an issue with SSM Agent is time-consuming. For more efficient node monitoring, you can configure either SSM Agent itself or the CloudWatch agent to send this log data to Amazon CloudWatch Logs.

Important

The unified CloudWatch agent has replaced SSM Agent as the tool for sending log data to Amazon CloudWatch Logs. The SSM Agent aws:cloudWatch plugin is not supported. We recommend using only the unified CloudWatch agent for your log collection processes. For more information, see the following topics:

- Sending node logs to unified CloudWatch Logs (CloudWatch agent)
- Migrate Windows Server node log collection to the CloudWatch agent
- Collecting metrics, logs, and traces with the CloudWatch agent in the *Amazon CloudWatch User Guide*.

Using CloudWatch Logs, you can monitor log data in real time, search and filter log data by creating one or more metric filters, and archive and retrieve historical data when you need it. For more information about CloudWatch Logs, see the *Amazon CloudWatch Logs User Guide*.

Configuring an agent to send log data to Amazon CloudWatch Logs provides the following benefits:

- Centralized log file storage for all SSM Agent log files.
- Quicker access to files to investigate errors.
- Indefinite log file retention (configurable).
- Logs can be maintained and accessed regardless of the status of the node.
- Access to other CloudWatch features such as metrics and alarms.

For information about monitoring Session Manager activity, see Logging session activity and Enabling and disabling session logging.

Migrate Windows Server node log collection to the CloudWatch agent

If you're using SSM Agent on supported Windows Server nodes to send SSM Agent log files to Amazon CloudWatch Logs, you can use Systems Manager to migrate from SSM Agent to the CloudWatch agent as your log collection tool, and migrate your configuration settings.

The CloudWatch agent isn't supported on 32-bit versions of Windows Server.

For 64-bit EC2 instances for Windows Server, you can perform the migration to the CloudWatch agent automatically or manually. For on-premises servers and virtual machines, the process must be performed manually.

Note

During the migration process, the data sent to CloudWatch might be interrupted or duplicated. Your metrics and log data will be recorded accurately again in CloudWatch after the migration is completed.

We recommend testing the migration on a limited number of nodes before migrating an entire fleet to the CloudWatch agent. After migration, if you prefer log collection with SSM Agent, you can return to using it instead.

Important

In the following cases, you won't be able to migrate to the CloudWatch agent using the steps described in this topic:

- The existing configuration for SSM Agent specifies multiple Regions.
- The existing configuration for SSM Agent specifies multiple sets of access/secret key credentials.

In these cases, it will be necessary to turn off log collection in SSM Agent and install the CloudWatch agent without a migration process. For more information, see the following topics in the *Amazon CloudWatch User Guide*:

- Installing the CloudWatch agent
- Installing the CloudWatch agent on on-premises servers

Before you begin

Before you begin a migration to the CloudWatch agent for log collection, make sure that the nodes on which you perform the migration meet these requirements:

- The OS is a 64-bit version of Windows Server.
- SSM Agent 2.2.93.0 or later is installed on the node.
- SSM Agent is configured for monitoring on the node.

Topics

- Automatically migrating to the CloudWatch agent
- Manually migrating to the CloudWatch agent

Automatically migrating to the CloudWatch agent

For EC2 instances for Windows Server only, you can use the Amazon Systems Manager console or the Amazon Command Line Interface (Amazon CLI) to automatically migrate to the CloudWatch agent as your log collection tool.

Note

Amazon Systems Manager supports migrating from SSM Agent to the unified CloudWatch agent for collecting logs and metrics on 64-bit versions of Windows only. For information about setting up the unified CloudWatch agent on other operating systems, and for complete information about using the CloudWatch agent, see Collecting metrics and logs from Amazon EC2 instances and on-premises servers with the CloudWatch agent in the *Amazon CloudWatch User Guide*.

You can use the CloudWatch agent on other supported operating systems, but you won't be able to use Systems Manager to perform a tool migration.

After the migration succeeds, check your results in CloudWatch to make sure you're receiving the metrics, logs, or Windows event logs you expect. If you're satisfied with the results, you can optionally Store CloudWatch agent configuration settings in Parameter Store. If the migration isn't successful or the results aren't as expected, you can try Rolling back to log collection with SSM Agent.

Note

If you want to migrate a source configuration file that includes a `{hostname}` entry, then be aware that the `{hostname}` entry can change the value of the field after the migration is complete. For example, say that the following `"LogStream": "{hostname}"` entry maps to a server named *MyLogServer001*.

```
{
"Id": "CloudWatchIISLogs",
"FullName":
 "AWS.EC2.Windows.CloudWatch.CloudWatchLogsOutput,AWS.EC2.Windows.CloudWatch",
"Parameters": {
"AccessKey": "",
"SecretKey": "",
"Region": "us-east-1",
"LogGroup": "Production-Windows-IIS",
"LogStream": "{hostname}"
    }
}
```

After the migration, this entry maps to a domain, such as ip-11-1-1-11.production.ExampleCompany.com. To retain the local hostname value, specify `{local_hostname}` instead of `{hostname}`.

To automatically migrate to the CloudWatch agent (console)

1. Open the Amazon Systems Manager console at https://console.amazonaws.cn/systems-manager/.
2. In the navigation pane, choose **Run Command**, and then choose **Run command**.
3. In the **Command document** list, choose `AmazonCloudWatch-MigrateCloudWatchAgent`.
4. For **Status**, choose **Enabled**.

5. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   > **Tip**
   >
   > If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

6. For **Rate control**:

   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

     > **Note**
     >
     > If you selected targets by specifying tags applied to managed nodes or by specifying Amazon resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

   - For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

7. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

   > **Note**
   >
   > The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different Amazon Web Services account, make sure that the instance

profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

8. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

   For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

9. Choose **Run**.

To automatically migrate to the CloudWatch agent (Amazon CLI)

- Run the following command.

```
aws ssm send-command --document-name AmazonCloudWatch-MigrateCloudWatchAgent --
targets Key=instanceids,Values=ID1,ID2,ID3
```

ID1, *ID2*, and *ID3* represent the IDs of nodes you want to update, such as *i-02573cafcfEXAMPLE*.

Manually migrating to the CloudWatch agent

For on-premises Windows Server nodes or EC2 instances for Windows Server, follow these steps to manually migrate log collection to the Amazon CloudWatch agent.

Note

If you want to migrate a source configuration file that includes a `{hostname}` entry, then be aware that the `{hostname}` entry can change the value of the field after the migration is complete. For example, say that the following `"LogStream": "{hostname}"` entry maps to a server named *MyLogServer001*.

```
{
"Id": "CloudWatchIISLogs",
"FullName":
 "AWS.EC2.Windows.CloudWatch.CloudWatchLogsOutput,AWS.EC2.Windows.CloudWatch",
"Parameters": {
"AccessKey": "",
```

```
"SecretKey": "",
"Region": "us-east-1",
"LogGroup": "Production-Windows-IIS",
"LogStream": "{hostname}"
     }
}
```

After the migration, this entry maps to a domain, such as ip-11-1-1-11.production.ExampleCompany.com. To retain the local hostname value, specify `{local_hostname}` instead of `{hostname}`.

One: To install the CloudWatch agent (console)

1. Open the Amazon Systems Manager console at https://console.amazonaws.cn/systems-manager/.
2. In the navigation pane, choose **Run Command**, and then choose **Run command**.
3. In the **Command document** list, choose `AWS-ConfigureAWSPackage`.
4. For **Action**, choose `Install`.
5. For **Name**, enter **`AmazonCloudWatchAgent`**.
6. For **Version**, enter **`latest`** if it isn't already provided by default.
7. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   Tip

   If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

8. For **Rate control**:

   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

     Note

     If you selected targets by specifying tags applied to managed nodes or by specifying Amazon resource groups, and you aren't certain how many managed nodes are

targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

9. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

> **Note**
>
> The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different Amazon Web Services account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

10. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

    For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

11. Choose **Run**.

Two: To update config data JSON format

- To update the JSON formatting of the existing config settings for the CloudWatch agent, use **Run Command**, or log in to the node directly with an RDP connection to run the following Windows PowerShell commands on the node, one at a time.

```
cd ${Env:ProgramFiles}\\Amazon\\AmazonCloudWatchAgent
```

```
.\\amazon-cloudwatch-agent-config-wizard.exe --isNonInteractiveWindowsMigration
```

{Env:ProgramFiles} represents the location where the Amazon directory containing the CloudWatch agent can be found, typically `C:\Program Files`.

Three: To configure and start the CloudWatch agent (console)

1. Open the Amazon Systems Manager console at https://console.amazonaws.cn/systems-manager/.
2. In the navigation pane, choose **Run Command**, and then choose **Run command**.
3. In the **Command document** list, choose `AWS-RunPowerShellScript`.
4. For **Commands**, enter the following two commands.

```
cd ${Env:ProgramFiles}\Amazon\AmazonCloudWatchAgent
```

```
.\amazon-cloudwatch-agent-ctl.ps1 -a fetch-config -m ec2 -c file:config.json -s
```

{Env:ProgramFiles} represents the location where the Amazon directory containing the CloudWatch agent can be found, typically `C:\Program Files`.

5. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

> **Tip**
>
> If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

6. For **Rate control**:

- For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

> **Note**
>
> If you selected targets by specifying tags applied to managed nodes or by specifying Amazon resource groups, and you aren't certain how many managed nodes are

targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

7. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

   Note

   The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different Amazon Web Services account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

8. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

   For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

9. Choose **Run**.

Four: To turn off log collection in SSM Agent (console)

1. Open the Amazon Systems Manager console at https://console.amazonaws.cn/systems-manager/.
2. In the navigation pane, choose **Run Command**, and then choose **Run command**.
3. In the **Command document** list, choose `AWS-ConfigureCloudWatch`.
4. For **Status**, choose **Disabled**.

5. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   > **Tip**
   >
   > If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

6. For **Status**, choose `Disabled`.
7. For **Rate control**:

   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

     > **Note**
     >
     > If you selected targets by specifying tags applied to managed nodes or by specifying Amazon resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

   - For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

8. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

   > **Note**
   >
   > The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different Amazon Web Services account, make sure that the instance

profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

9. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

   For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

10. Choose **Run**.

    After completing these steps, check your logs in CloudWatch to verify you are receiving the metrics, logs, or Windows event logs you expect. If the results are satisfactory, you can optionally Store CloudWatch agent configuration settings in Parameter Store. If the migration isn't successful or the results aren't as expected, you can Rolling back to log collection with SSM Agent.

Store CloudWatch agent configuration settings in Parameter Store

You can store the contents of an CloudWatch agent configuration file in Parameter Store. By maintaining this configuration data in a parameter, multiple nodes can derive their configuration settings from it, and you avoid having to create or manually update configuration files on your nodes. For example, you can use Run Command to write the contents of the parameter to configuration files on multiple nodes, or use State Manager, a tool in Amazon Systems Manager, to help avoid configuration drift in the CloudWatch agent configuration settings across a fleet of nodes.

When you run the CloudWatch agent configuration wizard, you can choose to let the wizard save your configuration settings as a new parameter in Parameter Store. For information about running the CloudWatch agent configuration wizard, see Create the CloudWatch agent configuration file with the wizard in the *Amazon CloudWatch User Guide*.

If you ran the wizard but didn't choose the option to save the settings as a parameter, or you created the CloudWatch agent configuration file manually, you can retrieve the data to save as a parameter on your node in the following file.

```
${Env:ProgramFiles}\Amazon\AmazonCloudWatchAgent\config.json
```

{Env:ProgramFiles} represents the location where the Amazon directory containing the CloudWatch agent can be found, typically `C:\Program Files`.

We recommend keeping a backup of the JSON in this file on a location other than the node itself.

For information about creating a parameter, see Creating Parameter Store parameters in Systems Manager.

For more information about the CloudWatch agent, see Collecting metrics and logs from Amazon EC2 instances and on-premises servers with the CloudWatch agent in the *Amazon CloudWatch User Guide*.

Rolling back to log collection with SSM Agent

If you want to return to using SSM Agent for log collection, follow these steps.

One: To retrieve config data from SSM Agent

1. On the node where you want to return to collecting logs with the SSM Agent, locate the contents of the SSM Agent config file. This JSON file is typically found in the following location:

   `${Env:ProgramFiles}\\Amazon\\SSM\\Plugins\\awsCloudWatch\`
   `\AWS.EC2.Windows.CloudWatch.json`

   {Env:ProgramFiles} represents the location where the `Amazon` directory can be found, typically `C:\Program Files`.
2. Copy this data into a text file for use in a later step.

   We recommend storing a backup of the JSON on a location other than the node itself.

Two: To uninstall the CloudWatch agent (console)

1. Open the Amazon Systems Manager console at https://console.amazonaws.cn/systems-manager/.
2. In the navigation pane, choose **Run Command**, and then choose **Run command**.
3. In the **Command document** list, choose `AWS-ConfigureAWSPackage`.
4. For **Action**, choose **Uninstall**.

5. For **Name**, enter **`AmazonCloudWatchAgent`**.
6. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   > **Tip**
   >
   > If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

7. For **Rate control**:

   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

     > **Note**
     >
     > If you selected targets by specifying tags applied to managed nodes or by specifying Amazon resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

   - For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

8. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

   > **Note**
   >
   > The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different Amazon Web Services account, make sure that the instance

profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

9. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

   For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

10. Choose **Run**.

Three: To turn log collection back on in SSM Agent (console)

1. Open the Amazon Systems Manager console at https://console.amazonaws.cn/systems-manager/.
2. In the navigation pane, choose **Run Command**, and then choose **Run command**.
3. In the **Command document** list, choose `AWS-ConfigureCloudWatch`.
4. For **Status**, choose `Enabled`.
5. For **Properties**, paste the contents of the old config data you saved to the text file.
6. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   Tip

   If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

7. For **Rate control**:

   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

     Note

     If you selected targets by specifying tags applied to managed nodes or by specifying Amazon resource groups, and you aren't certain how many managed nodes are

targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

8. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

   Note

   The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different Amazon Web Services account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

9. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

   For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

10. Choose **Run**.

Sending SSM Agent logs to CloudWatch Logs

Amazon Systems Manager Agent (SSM Agent) is Amazon software that runs on your EC2 instances, edge devices, on-premises servers, and virtual machines (VMs) that are configured for Systems Manager. SSM Agent processes requests from the Systems Manager service in the cloud and configures your machine as specified in the request. For more information about SSM Agent, see Working with SSM Agent.

In addition, using the following steps, you can configure SSM Agent to send log data to Amazon CloudWatch Logs.

Before you begin

Create a log group in CloudWatch Logs. For more information, see Getting started with CloudWatch Logs in the *Amazon CloudWatch Logs User Guide*.

To configure SSM Agent to send logs to CloudWatch

1. Log into a node and locate the following file:

   Linux

   On most Linux node types: `/etc/amazon/ssm/seelog.xml.template`.

   On Ubuntu Server 20.04 and 18.04 LTS: `/snap/amazon-ssm-agent/current/seelog.xml.template`

   macOS

   `/opt/aws/ssm/seelog.xml.template`

   Windows

   `%ProgramFiles%\Amazon\SSM\seelog.xml.template`
2. Change the file name from `seelog.xml.template` to `seelog.xml`

   Note

   On Ubuntu Server 20.04 and 18.04 LTS, the file `seelog.xml` must be created in the directory `/etc/amazon/ssm/`. You can create this directory and file by running the following commands.

   ```
   sudo mkdir -p /etc/amazon/ssm
   ```

   ```
   sudo cp -pr /snap/amazon-ssm-agent/current/* /etc/amazon/ssm
   ```

   ```
   sudo cp -p /etc/amazon/ssm/seelog.xml.template /etc/amazon/ssm/seelog.xml
   ```

3. Open the `seelog.xml` file in a text editor, and locate the following section.

   Linux and macOS

```
<outputs formatid="fmtinfo">
   <console formatid="fmtinfo"/>
   <rollingfile type="size" filename="/var/log/amazon/ssm/amazon-ssm-agent.log"
 maxsize="30000000" maxrolls="5"/>
   <filter levels="error,critical" formatid="fmterror">
      <rollingfile type="size" filename="/var/log/amazon/ssm/errors.log"
 maxsize="10000000" maxrolls="5"/>
   </filter>
</outputs>
```

   Windows

```
<outputs formatid="fmtinfo">
   <console formatid="fmtinfo"/>
   <rollingfile type="size" maxrolls="5" maxsize="30000000"
 filename="{{LOCALAPPDATA}}\Amazon\SSM\Logs\amazon-ssm-agent.log"/>
   <filter formatid="fmterror" levels="error,critical">
      <rollingfile type="size" maxrolls="5" maxsize="10000000"
 filename="{{LOCALAPPDATA}}\Amazon\SSM\Logs\errors.log"/>
   </filter>
</outputs>
```

4. Edit the file, and add a *custom name* element after the closing </filter> tag. In the following example, the custom name as been specified as `cloudwatch_receiver`.

   Linux and macOS

```
<outputs formatid="fmtinfo">
   <console formatid="fmtinfo"/>
   <rollingfile type="size" filename="/var/log/amazon/ssm/amazon-ssm-agent.log"
 maxsize="30000000" maxrolls="5"/>
   <filter levels="error,critical" formatid="fmterror">
      <rollingfile type="size" filename="/var/log/amazon/ssm/errors.log"
 maxsize="10000000" maxrolls="5"/>
   </filter>
   <custom name="cloudwatch_receiver" formatid="fmtdebug" data-log-group="your-
CloudWatch-log-group-name"/>
</outputs>
```

Windows

```
<outputs formatid="fmtinfo">
   <console formatid="fmtinfo"/>
   <rollingfile type="size" maxrolls="5" maxsize="30000000"
 filename="{{LOCALAPPDATA}}\Amazon\SSM\Logs\amazon-ssm-agent.log"/>
   <filter formatid="fmterror" levels="error,critical">
      <rollingfile type="size" maxrolls="5" maxsize="10000000"
 filename="{{LOCALAPPDATA}}\Amazon\SSM\Logs\errors.log"/>
   </filter>
   <custom name="cloudwatch_receiver" formatid="fmtdebug" data-log-group="your-
CloudWatch-log-group-name"/>
</outputs>
```

5. Save your changes, and then restart SSM Agent or the node.
6. Open the CloudWatch console at https://console.amazonaws.cn/cloudwatch/.
7. In the navigation pane, choose **Log groups**, and then choose the name of your log group.

> **Tip**
>
> The log stream for SSM Agent log file data is organized by node ID.

Monitoring your change request events

> **Change Manager availability change**
>
> Amazon Systems Manager Change Manager will no longer be open to new customers starting November 7, 2025. If you would like to use Change Manager, sign up prior to that date. Existing customers can continue to use the service as normal. For more information, see Amazon Systems Manager Change Manager availability change.

After turning on integration with Amazon CloudTrail Lake and creating an event data store, you can view auditable details about the change requests that are run in your account or organization. This includes details such as the following:

- The identity of the user that initiated the change request

- The Amazon Web Services Regions where the changes were made
- The source IP address for the request
- The Amazon access key used for the request
- The API actions run for the change request
- The request parameters included for those actions
- The resources updated during the process

> **Important**
>
> If you're using Change Manager for an organization, you can complete the following procedure while signed in to either the management account or the delegated administrator account for Change Manager.
> However, to use the delegated administrator account to complete these steps, the same delegated administrator account must be specified for both CloudTrail and Change Manager.
> When you sign in to the management account for Change Manager, you can add or change the delegated administrator account for CloudTrail on the CloudTrail Settings page. This must be done before the delegated administrator account can create an event data store for use by the entire organization.

To turn on CloudTrail Lake event tracking from Change Manager

1. Open the Amazon Systems Manager console at https://console.amazonaws.cn/systems-manager/.
2. In the navigation pane, choose **Change Manager**.
3. Choose the **Requests** tab.
4. Choose any existing change request, and then choose the **Associated events** tab.
5. Choose **Enable CloudTrail Lake**.
6. Follow the steps in Create an event data store for CloudTrail events in the *Amazon CloudTrail User Guide*.

   To make sure that event data for your change requests is stored, make the following selections as you complete the procedure:

- For **Event type**, leave the defaults **Amazon events** and **CloudTrail events** selected.
- If you're using Change Manager with an organization, select **Enable for all accounts in my organization**.
- For **Management events**, do not clear the **Write** check box.

Other options you choose when creating your event data store don't affect the storage of event data for your change requests.

Monitoring your automations

Metrics are the fundamental concept in Amazon CloudWatch. A metric represents a time-ordered set of data points that are published to CloudWatch. Think of a metric as a variable to monitor and the data points as representing the values of that variable over time.

Automation is a tool in Amazon Systems Manager. Systems Manager publishes metrics about Automation usage to CloudWatch. This lets you set alarms based on those metrics.

To view Automation metrics in the CloudWatch console

1. Open the CloudWatch console at https://console.amazonaws.cn/cloudwatch/.
2. In the navigation pane, choose **Metrics**.
3. Choose **SSM**.
4. On the **Metrics** tab, choose **Usage**, and then choose **By Amazon Resource**.
5. In the search box near the list of metrics, enter **SSM**.

To view Automation metrics using the Amazon CLI

Open a command prompt, and use the following command.

```
aws cloudwatch list-metrics \
    --namespace "AWS/Usage"
```

Automation metrics

Systems Manager sends the following Automation metrics to CloudWatch.

Metric	Description
`ConcurrentAutomationUsage`	The number of automations running at the same time in the current Amazon Web Services account and Amazon Web Services Region.
`QueuedAutomationUsage`	The number of automations currently queued that have not started and have a status of `Pending`.

For more information about working with CloudWatch metrics, see the following topics in the *Amazon CloudWatch User Guide*:

- Metrics
- Using Amazon CloudWatch metrics
- Using Amazon CloudWatch alarms

Monitoring Run Command metrics using Amazon CloudWatch

Metrics are the fundamental concept in Amazon CloudWatch. A metric represents a time-ordered set of data points that are published to CloudWatch. Think of a metric as a variable to monitor, and the data points as representing the values of that variable over time.

Amazon Systems Manager publishes metrics about the status of Run Command commands to CloudWatch, allowing you to set alarms based on those metrics. Run Command is a tool in Amazon Systems Manager. These statistics are recorded for an extended period so you can access historical information and gain a better perspective on the success rate of commands run in your Amazon Web Services account.

The terminal status values for commands for which you can track metrics include `Success`, `Failed`, and `Delivery Timed Out`. For example, for an SSM Command document set to run every hour, you can configure an alarm to notify you when a status of `Success` isn't reported for any of those hours. For more information about command status values, see Understanding command statuses.

To view metrics in the CloudWatch console

1. Open the CloudWatch console at https://console.amazonaws.cn/cloudwatch/.
2. In the navigation pane, choose **Metrics**.
3. In the **Alarms by Amazon service** area, for **Services**, choose **SSM-Run Command**.

To view metrics using the Amazon CLI

Open a command prompt, and use the following command.

```
aws cloudwatch list-metrics --namespace "AWS/SSM-RunCommand"
```

To list all available metrics, use the following command.

```
aws cloudwatch list-metrics
```

Systems Manager Run Command metrics and dimensions

Systems Manager sends Run Command command metrics to CloudWatch one time every minute.

Systems Manager sends the following command metrics to CloudWatch.

> **Note**
>
> These metrics use `Count` as the unit, so `Sum` and `SampleCount` are the most useful statistics.

Metric	Description
`CommandsDeliveryTimedOut`	The number of commands that have a terminal status of `Delivery Timed Out`.
`CommandsFailed`	The number of commands that have a terminal status of `Failed`.
`CommandsSucceeded`	The number of commands that have a terminal status of `Success`.

For more information about working with CloudWatch metrics, see the following topics in the *Amazon CloudWatch User Guide*:

- Metrics
- Using Amazon CloudWatch metrics
- Using Amazon CloudWatch alarms

Logging Amazon Systems Manager API calls with Amazon CloudTrail

Amazon Systems Manager is integrated with Amazon CloudTrail, a service that provides a record of actions taken by a user, role, or an Amazon Web Services service. CloudTrail captures all API calls for Systems Manager as events. The calls captured include calls from the Systems Manager console and code calls to the Systems Manager API operations. You can use CloudTrail information to determine the request that was made to Systems Manager, the source IP address, and when it was made.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root user or user credentials.
- Whether the request was made on behalf of an IAM Identity Center user.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another Amazon Web Services service.

CloudTrail is active in your Amazon Web Services account when you create the account and you automatically have access to the CloudTrail **Event history**. The CloudTrail **Event history** provides a viewable, searchable, downloadable, and immutable record of the past 90 days of recorded management events in an Amazon Web Services Region. For more information, see Working with CloudTrail Event history in the *Amazon CloudTrail User Guide*. There are no CloudTrail charges for viewing the **Event history**.

For an ongoing record of events in your Amazon Web Services account past 90 days, create a trail or a CloudTrail Lake event data store.

CloudTrail trails

A *trail* enables CloudTrail to deliver log files to an Amazon S3 bucket. All trails created using the Amazon Web Services Management Console are multi-Region. You can create a single-Region or a multi-Region trail by using the Amazon CLI. Creating a multi-Region trail is recommended because you capture activity in all Amazon Web Services Regions in your account. If you create a single-Region trail, you can view only the events logged in the trail's Amazon Web Services Region. For more information about trails, see Creating a trail for your Amazon Web Services account and Creating a trail for an organization in the *Amazon CloudTrail User Guide*.

You can deliver one copy of your ongoing management events to your Amazon S3 bucket at no charge from CloudTrail by creating a trail, however, there are Amazon S3 storage charges. For more information about CloudTrail pricing, see Amazon CloudTrail Pricing. For information about Amazon S3 pricing, see Amazon S3 Pricing.

CloudTrail Lake event data stores

CloudTrail Lake lets you run SQL-based queries on your events. CloudTrail Lake converts existing events in row-based JSON format to Apache ORC format. ORC is a columnar storage format that is optimized for fast retrieval of data. Events are aggregated into *event data stores*, which are immutable collections of events based on criteria that you select by applying advanced event selectors. The selectors that you apply to an event data store control which events persist and are available for you to query. For more information about CloudTrail Lake, see Working with Amazon CloudTrail Lake in the *Amazon CloudTrail User Guide*.

CloudTrail Lake event data stores and queries incur costs. When you create an event data store, you choose the pricing option you want to use for the event data store. The pricing option determines the cost for ingesting and storing events, and the default and maximum retention period for the event data store. For more information about CloudTrail pricing, see Amazon CloudTrail Pricing.

Systems Manager data events in CloudTrail

Data events provide information about the resource operations performed on or in a resource (for example, creating or opening a control channel). These are also known as data plane operations. Data events are often high-volume activities. By default, CloudTrail doesn't log data events. The CloudTrail **Event history** doesn't record data events.

Additional charges apply for data events. For more information about CloudTrail pricing, see Amazon CloudTrail Pricing.

You can log data events for the Systems Manager resource types by using the CloudTrail console, Amazon CLI, or CloudTrail API operations. For more information about how to log data events, see Logging data events with the Amazon Web Services Management Console and Logging data events with the Amazon Command Line Interface in the *Amazon CloudTrail User Guide*.

The following table lists the Systems Manager resource types for which you can log data events. The **Data event type (console)** column shows the value to choose from the **Data event type** list on the CloudTrail console. The **resources.type value** column shows the `resources.type` value, which you would specify when configuring advanced event selectors using the Amazon CLI or CloudTrail APIs. The **Data APIs logged to CloudTrail** column shows the API calls logged to CloudTrail for the resource type.

Data event type (console)	resources.type value	Data APIs logged to CloudTrail
Systems Manager	`AWS::SSMMessages::ControlChannel`	• `CreateControlChannel` • `OpenControlChannel` For more information about these operations, see Actions defined by Amazon Message Gateway Service in the *Service Authorization Reference*.
Systems Manager managed node	`AWS::SSM::ManagedNode`	• `RequestManagedInstanceRoleToken` – This event is generated when the Amazon Systems Manager Agent (SSM Agent) running on a node managed by Systems Manager requests credentia

Data event type (console)	resources.type value	Data APIs logged to CloudTrail
		ls from the Systems Manager credential service. For more information about the `RequestManagedInstanceRoleToken` operation, see Validating hybrid-activated machines using a hardware fingerprint

You can configure advanced event selectors to filter on the `eventName`, `readOnly`, and `resources.`ARN fields to log only those events that are important to you. For more information about these fields, see AdvancedFieldSelector in the *Amazon CloudTrail API Reference*.

Systems Manager management events in CloudTrail

Management events provide information about management operations that are performed on resources in your Amazon Web Services account. These are also known as control plane operations. By default, CloudTrail logs management events.

Systems Manager logs all control plane operations to CloudTrail as management events. Systems Manager API operations are documented in the Amazon Systems Manager API Reference. For example, calls to the `CreateMaintenanceWindows`, `PutInventory`, `SendCommand`, and `StartSession` actions generate entries in the CloudTrail log files. For an example of setting up CloudTrail to monitor a Systems Manager API call, see Monitoring session activity using Amazon EventBridge (console).

Systems Manager event examples

An event represents a single request from any source and includes information about the requested API operation, the date and time of the operation, request parameters, and so on. CloudTrail log files aren't an ordered stack trace of the public API calls, so events don't appear in any specific order.

Examples:

- Management event examples
- Data event examples

Management event examples

Example 1: `DeleteDocument`

The following example shows a CloudTrail event that demonstrates the `DeleteDocument` operation on a document named `example-Document` in the US East (Ohio) Region (us-east-2).

```
{
    "eventVersion": "1.04",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "AKIAI44QH8DHBEXAMPLE:203.0.113.11",
        "arn": "arn:aws-cn:sts::123456789012:assumed-role/example-role/203.0.113.11",
        "accountId": "123456789012",
        "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "sessionContext": {
            "attributes": {
                "mfaAuthenticated": "false",
                "creationDate": "2018-03-06T20:19:16Z"
            },
            "sessionIssuer": {
                "type": "Role",
                "principalId": "AKIAI44QH8DHBEXAMPLE",
                "arn": "arn:aws-cn:iam::123456789012:role/example-role",
                "accountId": "123456789012",
                "userName": "example-role"
            }
        }
    },
    "eventTime": "2018-03-06T20:30:12Z",
    "eventSource": "ssm.amazonaws.com",
    "eventName": "DeleteDocument",
    "awsRegion": "us-east-2",
    "sourceIPAddress": "203.0.113.11",
    "userAgent": "example-user-agent-string",
    "requestParameters": {
        "name": "example-Document"
    },
    "responseElements": null,
```

```
    "requestID": "86168559-75e9-11e4-8cf8-75d18EXAMPLE",
    "eventID": "832b82d5-d474-44e8-a51d-093ccEXAMPLE",
    "resources": [
        {
            "ARN": "arn:aws:ssm:us-east-2:123456789012:document/example-Document",
            "accountId": "123456789012"
        }
    ],
    "eventType": "AwsApiCall",
    "recipientAccountId": "123456789012",
    "eventCategory": "Management"
}
```

Example 2: `StartConnection`

The following example shows a CloudTrail event for a user who starts an RDP connection using Fleet Manager in the US East (Ohio) Region (us-east-2). The underlying API action is `StartConnection`.

```
{
    "eventVersion": "1.08",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "AKIAI44QH8DHBEXAMPLE",
        "arn": "arn:aws-cn:sts::123456789012:assumed-role/exampleRole",
        "accountId": "123456789012",
        "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "sessionContext": {
            "sessionIssuer": {
                "type": "Role",
                "principalId": "AKIAI44QH8DHBEXAMPLE",
                "arn": "arn:aws-cn:sts::123456789012:assumed-role/exampleRole",
                "accountId": "123456789012",
                "userName": "exampleRole"
            },
            "webIdFederationData": {},
            "attributes": {
                "creationDate": "2021-12-13T14:57:05Z",
                "mfaAuthenticated": "false"
            }
        }
    },
    "eventTime": "2021-12-13T16:50:41Z",
```

```
    "eventSource": "ssm-guiconnect.amazonaws.com",
    "eventName": "StartConnection",
    "awsRegion": "us-east-2",
    "sourceIPAddress": "34.230.45.60",
    "userAgent": "example-user-agent-string",
    "requestParameters": {
        "AuthType": "Credentials",
        "Protocol": "RDP",
        "ConnectionType": "SessionManager",
        "InstanceId": "i-02573cafcfEXAMPLE"
    },
    "responseElements": {

    "eventCategory": "Data"
}
```

For information about CloudTrail record contents, see CloudTrail record contents in the *Amazon CloudTrail User Guide*.

Logging Automation action output with CloudWatch Logs

Automation integrates with Amazon CloudWatch Logs. You can send the output from `aws:executeScript` actions in your runbooks to the log group you specify. Systems Manager doesn't create a log group or any log streams for documents that don't use `aws:executeScript` actions. If the document does use `aws:executeScript`, the output sent to CloudWatch Logs only pertains to those actions. You can use the `aws:executeScript` action output stored in your CloudWatch Logs log group for debugging and troubleshooting purposes. If you choose a log group that is encrypted, the `aws:executeScript` action output is also encrypted. Logging output from `aws:executeScript` actions is an account-level setting.

To send action output to CloudWatch Logs for Amazon owned runbooks, the user or role that runs the automation must have permissions for the following operations:

- `logs:CreateLogGroup`
- `logs:CreateLogStream`
- `logs:DescribeLogGroups`
- `logs:DescribeLogStreams`
- `logs:PutLogEvents`

For runbooks that you own, the same permissions must be added to the IAM service role (or AssumeRole) you use to run the runbook.

To send action output to CloudWatch Logs (console)

1. Open the Amazon Systems Manager console at https://console.amazonaws.cn/systems-manager/.
2. In the navigation pane, choose **Automation**.
3. Choose the **Preferences** tab, and then choose **Edit**.
4. Select the check box next to **Send output to CloudWatch Logs**.
5. (Recommended) Select the check box next to **Encrypt log data**. With this option turned on, log data is encrypted using the server-side encryption key specified for the log group. If you don't want to encrypt the log data that is sent to CloudWatch Logs, clear the check box. Clear the check box if encryption isn't allowed on the log group.
6. For **CloudWatch Logs log group**, to specify the existing CloudWatch Logs log group in your Amazon Web Services account that you want to send action output to, select one of the following:
   - **Send output to the default log group** – If the default log group doesn't exist (`/aws/ssm/automation/executeScript`), Automation creates it for you.
   - **Choose from a list of log groups** – Select a log group that has already been created in your account to store action output.
   - **Enter a log group name** – Enter the name of a log group in the text box that has already been created in your account to store action output.
7. Choose **Save**.

To send action output to CloudWatch Logs (command line)

1. Open your preferred command line tool and run the following command to update the action output destination.

   Linux & macOS

```
aws ssm update-service-setting \
    --setting-id arn:aws-cn:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-destination \
```

```
    --setting-value CloudWatch
```

Windows

```
aws ssm update-service-setting ^
    --setting-id arn:aws-cn:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-destination ^
    --setting-value CloudWatch
```

PowerShell

```
Update-SSMServiceSetting `
    -SettingId "arn:aws-cn:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-destination" `
    -SettingValue "CloudWatch"
```

There is no output if the command succeeds.

2. Run the following command to specify the log group you want to send action output to.

Linux & macOS

```
aws ssm update-service-setting \
    --setting-id arn:aws-cn:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-group-name \
    --setting-value my-log-group
```

Windows

```
aws ssm update-service-setting ^
    --setting-id arn:aws-cn:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-group-name ^
    --setting-value my-log-group
```

PowerShell

```
Update-SSMServiceSetting `
    -SettingId "arn:aws-cn:ssm:region:account-id:servicesetting/ssm/automation/
customer-script-log-group-name" `
    -SettingValue "my-log-group"
```

There is no output if the command succeeds.

3. Run the following command to view the current service settings for Automation action logging preferences in the current Amazon Web Services account and Amazon Web Services Region.

   Linux & macOS

   ```
   aws ssm get-service-setting \
       --setting-id arn:aws-cn:ssm:region:account-id:servicesetting/ssm/automation/
   customer-script-log-destination
   ```

   Windows

   ```
   aws ssm get-service-setting ^
       --setting-id arn:aws-cn:ssm:region:account-id:servicesetting/ssm/automation/
   customer-script-log-destination
   ```

   PowerShell

   ```
   Get-SSMServiceSetting `
       -SettingId "arn:aws-cn:ssm:region:account-id:servicesetting/ssm/automation/
   customer-script-log-destination"
   ```

   The command returns information like the following.

   ```
   {
       "ServiceSetting": {
           "Status": "Customized",
           "LastModifiedDate": 1613758617.036,
           "SettingId": "/ssm/automation/customer-script-log-destination",
           "LastModifiedUser": "arn:aws-cn:sts::123456789012:assumed-role/
   Administrator/User_1",
           "SettingValue": "CloudWatch",
           "ARN": "arn:aws-cn:ssm:us-east-2:123456789012:servicesetting/ssm/
   automation/customer-script-log-destination"
       }
   }
   ```

Configuring Amazon CloudWatch Logs for Run Command

When you send a command by using Run Command, you can specify where you want to send the command output. By default, Systems Manager returns only the first 24,000 characters of the command output. If you want to view the full details of the command output, you can specify an Amazon Simple Storage Service (Amazon S3) bucket. Or you can specify Amazon CloudWatch Logs. If you specify CloudWatch Logs, Run Command periodically sends all command output and error logs to CloudWatch Logs. You can monitor output logs in near real-time, search for specific phrases, values, or patterns, and create alarms based on the search.

If you configured your managed node to use the Amazon Identity and Access Management (IAM) managed policies `AmazonSSMManagedInstanceCore` and `CloudWatchAgentServerPolicy`, then your node requires no additional configuration to send output to CloudWatch Logs. Choose this option if sending commands from the console, or add the `cloud-watch-output-config` section and `CloudWatchOutputEnabled` parameter if using the Amazon Command Line Interface (Amazon CLI), Amazon Tools for Windows PowerShell, or an API operation. The `cloud-watch-output-config` section and `CloudWatchOutputEnabled` parameter are described in more detail later in this topic.

For information about adding policies to an instance profile for EC2 instances, see Configure instance permissions required for Systems Manager. For information about adding policies to a service role for on-premises servers and virtual machines that you plan to use as managed nodes, see Create the IAM service role required for Systems Manager in hybrid and multicloud environments.

If you're using a custom policy on your nodes, update the policy on each node to allow Systems Manager to send output and logs to CloudWatch Logs. Add the following policy objects to your custom policy. For more information about updating an IAM policy, see Editing IAM policies in the *IAM User Guide*.

```
{
    "Effect": "Allow",
    "Action": "logs:DescribeLogGroups",
    "Resource": "*"
},
{
   "Effect":"Allow",
   "Action":[
      "logs:CreateLogGroup",
```

```
      "logs:CreateLogStream",
      "logs:DescribeLogStreams",
      "logs:PutLogEvents"
   ],
   "Resource":"arn:aws-cn:logs:*:*:log-group:/aws/ssm/*"
},
```

Specifying CloudWatch Logs when you send commands

To specify CloudWatch Logs as the output when you send a command from the Amazon Web Services Management Console, choose **CloudWatch Output** in the **Output options** section. Optionally, you can specify the name of CloudWatch Logs group where you want to send command output. If you don't specify a group name, Systems Manager automatically creates a log group for you. The log group uses the following naming format: `/aws/ssm/`*`SystemsManagerDocumentName`*

If you run commands by using the Amazon CLI, specify the `cloud-watch-output-config` section in your command. This section lets you specify the `CloudWatchOutputEnabled` parameter, and optionally, the `CloudWatchLogGroupName` parameter. Here is an example.

Linux & macOS

```
aws ssm send-command \
    --instance-ids "instance ID" \
    --document-name "AWS-RunShellScript" \
    --parameters "commands=echo helloWorld" \
    --cloud-watch-output-config
 "CloudWatchOutputEnabled=true,CloudWatchLogGroupName=log group name"
```

Windows

```
aws ssm send-command ^
    --document-name "AWS-RunPowerShellScript" ^
    --parameters commands=["echo helloWorld"] ^
    --targets "Key=instanceids,Values=an instance ID" ^
    --cloud-watch-output-config '{"CloudWatchLogGroupName":"log group
 name","CloudWatchOutputEnabled":true}'
```

Viewing command output in CloudWatch Logs

As soon as the command starts to run, Systems Manager sends output to CloudWatch Logs in near-real time. The output in CloudWatch Logs uses the following format:

CommandID/*InstanceID*/*PluginID*/stdout

CommandID/*InstanceID*/*PluginID*/stderr

Output from the execution is uploaded every 30 seconds or when the buffer exceeds 200 KB, whichever happens first.

> **Note**
>
> Log streams are only created when output data is available. For example, if there is no error data for an execution, the stderr stream isn't created.

Here is an example of the command output as it is displayed in CloudWatch Logs.

```
Group - /aws/ssm/AWS-RunShellScript
Streams –
1234-567-8910/i-abcd-efg-hijk/AWS-RunPowerShellScript/stdout
24/1234-567-8910/i-abcd-efg-hijk/AWS-RunPowerShellScript/stderr
```

Monitoring Systems Manager events with Amazon EventBridge

Amazon EventBridge is a serverless event bus service that lets you connect your applications with data from a variety of sources. EventBridge delivers a stream of real-time data from your own applications, software-as-a-service (SaaS) applications, and Amazon Web Services services and routes that data to targets such as Amazon Lambda. You can set up routing rules to determine where to send your data to build application architectures that react in real time to all of your data sources. EventBridge lets you build event driven architectures, which are loosely coupled and distributed.

EventBridge was formerly called Amazon CloudWatch Events. EventBridge includes new features that allow you to receive events from SaaS partners and your own applications. Existing CloudWatch Events users can access their existing default bus, rules, and events in the

new EventBridge console and in the CloudWatch Events console. EventBridge uses the same CloudWatch Events API, so all of your existing CloudWatch Events API usage remains the same.

EventBridge can add events from dozens of Amazon Web Services services to your rules, and targets from over 20 Amazon Web Services services.

EventBridge provides support for both Amazon Systems Manager events and Systems Manager targets.

Supported Systems Manager event types

Among the many types of Systems Manager events that EventBridge can detect are:

- A just-in-time node access request status update for manual approvals.
- A failed just-in-time node access request.
- A maintenance window being turned off.
- An Automation workflow completing successfully. Automation is a tool in Amazon Systems Manager.
- A managed node being out of patch compliance.
- A parameter value being updated.

EventBridge supports events from the following Amazon Systems Manager tools:

- Just-in-time node access (Events are emitted on a best effort basis.)
- Automation (Events are emitted on a best effort basis.)
- Change Calendar (Events are emitted on a best effort basis.)
- Compliance
- Inventory (Events are emitted on a best effort basis.)
- Maintenance Windows (Events are emitted on a best effort basis.)
- Parameter Store (Events are emitted on a best effort basis.)
- Run Command (Events are emitted on a best effort basis.)
- State Manager (Events are emitted on a best effort basis.)

For complete details about supported Systems Manager event types, see Reference: Amazon EventBridge event patterns and types for Systems Manager and Amazon EventBridge event examples for Systems Manager.

Supported Systems Manager target types

EventBridge supports the following three Systems Manager tools as targets of an event rule:

- Running an Automation workflow
- Running a Run Command Command document (Events are emitted on a best effort basis.)
- Creating an OpsCenter OpsItem

For suggested ways you might use these targets, see Sample scenarios: Systems Manager targets in Amazon EventBridge rules.

For more information about how to get started with EventBridge and set up rules, see Getting started with Amazon EventBridge in the *Amazon EventBridge User Guide*. For complete information about working with EventBridge, see the *Amazon EventBridge User Guide*.

Topics

- Configuring EventBridge for Systems Manager events
- Amazon EventBridge event examples for Systems Manager
- Sample scenarios: Systems Manager targets in Amazon EventBridge rules

Configuring EventBridge for Systems Manager events

You can use Amazon EventBridge to perform a target event when supported Amazon Systems Manager status changes, state changes, or other conditions occur. You can create a rule that runs whenever there is a state or status transition, or when there is a transition to one or more states that are of interest.

The following procedure provides general steps for creating an EventBridge rule that engages when a specified event is emitted by Systems Manager. For a list of procedures in this user guide that address specific scenarios, see **More info** at the end of this topic.

> **Note**
>
> When a service in your Amazon Web Services account emits an event, it always goes to your account's default event bus. To write a rule that responds to events from Amazon Web Services services in your account, associate it with the default event bus. You can create a rule on a custom event bus that looks for events from Amazon Web Services services,

but this rule only engages when you receive such an event from another account through cross-account event delivery. For more information, see Sending and receiving Amazon EventBridge events between Amazon Web Services accounts in the *Amazon EventBridge User Guide*.

To configure EventBridge for Systems Manager events

1. Open the Amazon EventBridge console at https://console.amazonaws.cn/events/.
2. In the navigation pane, choose **Rules**.
3. Choose **Create rule**.
4. Enter a name and description for the rule.

   A rule can't have the same name as another rule in the same Amazon Web Services Region and on the same event bus.
5. For **Event bus**, choose the event bus that you want to associate with this rule. If you want this rule to respond to matching events that come from your own Amazon Web Services account, select **default**. When an Amazon Web Services service in your account emits an event, it always goes to your account's default event bus.
6. For **Rule type**, choose **Rule with an event pattern**.
7. Choose **Next**.
8. For **Event source**, choose **Amazon events or EventBridge partner events**.
9. In the **Event pattern** section, choose **Event pattern form**.
10. For **Event source**, choose **Amazon services**.
11. For **Amazon service**, choose **Systems Manager**.
12. For **Event type**, do one of the following:

    - Choose **All Events**.

      If you choose **All Events**, all events emitted by Systems Manager will match the rule. Be aware that this option can result in many event target actions.
    - Choose the type of Systems Manager event to use for this rule. EventBridge supports events from the following Amazon Systems Manager tools:
      - Automation
      - Change Calendar

- Compliance
- Inventory
- Maintenance Windows
- Parameter Store
- Run Command
- State Manager

> **Note**
>
> For Systems Manager actions that aren't supported by EventBridge, you can choose an Amazon API call through CloudTrail to create an event rule that is based on an API call, which are recorded by CloudTrail. For an example, see Monitoring session activity using Amazon EventBridge (console).

13. (Optional) To make the rule more specific, add filter values. For example, if you chose **State Manager** and want to limit the rule to the state of a single managed instance that is targeted by an Association, for **Specific type(s)**, choose **EC2 State Manager Instance Association State Change**.

    For complete details about supported detail types, see Reference: Amazon EventBridge event patterns and types for Systems Manager.

    Some detail types have other supported options such as status. The available options depend on the tool you selected.
14. Choose **Next**.
15. For **Target types**, choose **Amazon service**.
16. For **Select a target**, choose a target such as an Amazon SNS topic or Amazon Lambda function. The target is triggered when an event is received that matches the event pattern defined in the rule.
17. For many target types, EventBridge needs permissions to send events to the target. In these cases, EventBridge can create the Amazon Identity and Access Management (IAM) role needed for your rule to run:

    - To create an IAM role automatically, choose **Create a new role for this specific resource**.
    - To use an IAM role that you created earlier, choose **Use existing role**.
18. (Optional) Choose **Add another target** to add another target for this rule.

19. Choose **Next**.
20. (Optional) Enter one or more tags for the rule. For more information, see Amazon EventBridge tags in the *Amazon EventBridge User Guide*.
21. Choose **Next**.
22. Review the details of the rule and choose **Create rule**.

Amazon Systems Manager Change Calendar Events

Use the information in this topic to plan and understand the behavior of EventBridge events for Amazon Systems Manager Change Calendar.

> **Note**
>
> State changes for calendars shared from other Amazon Web Services accounts are not currently supported.

Change Calendar integration with Amazon EventBridge

Amazon Systems Manager Change Calendar integrates with Amazon EventBridge to notify you of calendar state changes. Be aware of the following behaviors related to the underlying scheduling architecture:

Event timing and reliability

- EventBridge delivers notifications on a best-effort basis with up to a 15-minute scheduling tolerance.
- State change events reflect overall calendar status transitions, not individual calendar events.
- When multiple calendar events occur simultaneously, EventBridge generates only one event per actual calendar state change.
- EventBridge triggers events only when the calendar's overall state transitions (for example, from CLOSED to OPEN), not for individual calendar events that don't result in a state change.
- Advisory events that don't modify the calendar state don't trigger EventBridge notifications.

Event modifications and timing considerations

- If you modify calendar events within 15 minutes of their scheduled start or end time, EventBridge might generate duplicate notifications or miss notifications.
- This behavior occurs because the scheduling system might not have sufficient time to properly update or cancel previously scheduled notifications.

- For recurring events, this behavior typically affects only the first occurrence after modification.

Adjacent and overlapping events

- When calendar events are scheduled within 5 minutes of each other, state transition events might or might not occur, depending on the actual state change.
- Creating overlapping events in certain orders might generate additional EventBridge events even when no actual state change occurs.
- To help ensure predictable behavior, avoid creating or modifying calendar events close to their execution times.

Best practices

- Design your EventBridge rules and downstream automation to handle potential duplicate events.
- Implement idempotency in your automation workflows to prevent issues from duplicate notifications.
- Allow sufficient lead time (at least 15 minutes) when you create or modify calendar events.
- Test your EventBridge integrations thoroughly with your specific calendar event patterns.

Calendar OPEN

```

   }
}
```

Sample scenarios: Systems Manager targets in Amazon EventBridge rules

When you specify the target to invoke in an Amazon EventBridge rule, you can choose from over 20 target types and add up to five targets to each rule.

For related information, see Configuring EventBridge for Systems Manager events.

Of the various targets, you can choose from Automation, OpsCenter, and Run Command, which are tools in Amazon Systems Manager, as target actions when an EventBridge event occurs.

The following are several examples of ways you can use these tools as the target of an EventBridge rule.

Automation examples

You can configure an EventBridge rule to start Automation workflows when events such as the following occur:

- When an Amazon CloudWatch alarm reports that a managed node has failed a status check (`StatusCheckFailed_Instance=1`), run the `AWSSupport-ExecuteEC2Rescue` Automation runbook on the node.
- When an `EC2 Instance State-change Notification` event occurs because a new Amazon Elastic Compute Cloud (Amazon EC2) instance is running, run the `AWS-AttachEBSVolume` Automation runbook on the instance.
- When an Amazon Elastic Block Store (Amazon EBS) volume is created and available, run the `AWS-CreateSnapshot` Automation runbook on the volume.

OpsCenter examples

You can configure an EventBridge rule to create a new OpsItem when incidents such as the following occur:

- A throttling event for Amazon DynamoDB occurs, or Amazon EBS volume performance has degraded.
- An Amazon EC2 Auto Scaling group fails to launch a node, or a Systems Manager Automation workflow fails.
- An EC2 instance changes state from `Running` to `Stopped`.

Run Command examples

You can configure an EventBridge rule to run a Systems Manager Command document in Run Command when events such as the following occur:

- When an Auto Scaling group is about to end, a Run Command script could capture the log files from the node before it is ended.

- When a new node is created in an Auto Scaling group, a Run Command target action could turn on the web server role or install software on the node.
- When a managed node is found to be out of compliance, a Run Command target action could update patches on the node by running the `AWS-RunPatchBaseline` document.

Monitoring Systems Manager status changes using Amazon SNS notifications

You can configure Amazon Simple Notification Service (Amazon SNS) to send notifications about the status of commands that you send using Run Command or Maintenance Windows, which are tools in Amazon Systems Manager. Amazon SNS coordinates and manages sending and delivering notifications to clients or endpoints that are subscribed to Amazon SNS topics. You can receive a notification whenever a command changes to a new state or to a specific state, such as *Failed* or *Timed Out*. In cases where you send a command to multiple nodes, you can receive a notification for each copy of the command sent to a specific node. Each copy is called an *invocation*.

Amazon SNS can deliver notifications as HTTP or HTTPS POST, email (SMTP, either plaintext or in JSON format), or as a message posted to an Amazon Simple Queue Service (Amazon SQS) queue. For more information, see What is Amazon SNS in the *Amazon Simple Notification Service Developer Guide*. For examples of the structure of the JSON data included in the Amazon SNS notification provided by Run Command and Maintenance Windows, see Example Amazon SNS notifications for Amazon Systems Manager.

Important

Note the following important information.

- Amazon Simple Notification Service FIFO topics aren't supported.
- Amazon Q Developer in chat applications isn't supported for monitoring Systems Manager with Amazon SNS. If you wish to use Amazon Q Developer in chat applications to monitor Systems Manager, you must use it with Amazon EventBridge. For information about monitoring Systems Manager using EventBridge, see Monitoring Systems Manager events with Amazon EventBridge. For information about Amazon EventBridge and Amazon Q Developer in chat applications, see Tutorial: Creating an EventBridge rule that sends notifications to Amazon Q Developer in chat applications in the *Amazon Q Developer in chat applications Administrator Guide*.

Configure Amazon SNS notifications for Amazon Systems Manager

Run Command and Maintenance Windows tasks that are registered to a maintenance window can send Amazon SNS notifications for command tasks that enter the following statuses:

- In Progress
- Success
- Failed
- Timed Out
- Cancelled

For information about the conditions that cause a command to enter one of these statuses, see Understanding command statuses.

> **Note**
>
> Commands sent using Run Command also report Canceling and Pending status. These statuses aren't captured by Amazon SNS notifications.

Command summary Amazon SNS notifications

If you configure Run Command or a Run Command task in your maintenance window for Amazon SNS notifications, Amazon SNS sends summary messages that include the following information.

Field	Type	Description
eventTime	String	The time that the event was initiated. The timestamp is important because Amazon SNS doesn't guarantee message delivery order. Example: 2016-04-26T13:15:30Z

Field	Type	Description
documentName	String	The name of the SSM document used to run this command.
commandId	String	The ID generated by Run Command after the command was sent.
expiresAfter	Date	If this time is reached and the command hasn't already started executing, it won't run.
outputS3BucketName	String	The Amazon Simple Storage Service (Amazon S3) bucket where the responses to the command execution should be stored.
outputS3KeyPrefix	String	The Amazon S3 directory path inside the bucket where the responses to the command execution should be stored.
requestedDateTime	String	The time and date that the request was sent to this specific node.

Field	Type	Description
instanceIds	StringList	The nodes that were targeted by the command. **Note** Instance IDs are only included in the summary message if the Run Command task targeted instance IDs directly. Instance IDs aren't included in the summary message if the Run Command task was issued using tag-based targeting.
status	String	Command status for the command.

Invocation-based Amazon SNS notifications

If you send a command to multiple nodes, Amazon SNS can send messages about each copy or invocation of the command. The messages include the following information.

Field	Type	Description
eventTime	String	The time that the event was initiated. The timestamp is important because Amazon SNS doesn't guarantee message delivery order. Example: 2016-04-26T13:15:30Z

Field	Type	Description
documentName	String	The name of the Systems Manager document (SSM document) used to run this command.
requestedDateTime	String	The time and date that the request was sent to this specific node.
commandId	String	The ID generated by Run Command after the command was sent.
instanceId	String	The instance that was targeted by the command.
status	String	Command status for this invocation.

To set up Amazon SNS notifications when a command changes status, complete the following tasks.

> **Note**
>
> If you aren't configuring Amazon SNS notifications for your maintenance window, then you can skip Task 5 later in this topic.

Topics

- Task 1: Create and subscribe to an Amazon SNS topic
- Task 2: Create an IAM policy for Amazon SNS notifications
- Task 3: Create an IAM role for Amazon SNS notifications
- Task 4: Configure user access
- Task 5: Attach the iam:PassRole policy to your maintenance window role

Task 1: Create and subscribe to an Amazon SNS topic

An Amazon SNS *topic* is a communication channel that Run Command and Run Command tasks that are registered to a maintenance window use to send notifications about the status of your commands. Amazon SNS supports different communication protocols, including HTTP/S, email, and other Amazon Web Services services like Amazon Simple Queue Service (Amazon SQS). To get started, we recommend that you start with the email protocol. For information about how to create a topic, see Creating an Amazon SNS topic in the *Amazon Simple Notification Service Developer Guide*.

> **Note**
>
> After you create the topic, copy or make a note of the **Topic ARN**. You specify this ARN when you send a command that is configured to return status notifications.

After you create the topic, subscribe to it by specifying an **Endpoint**. If you chose the Email protocol, the endpoint is the email address where you want to receive notifications. For more information about how to subscribe to a topic, see Subscribing to an Amazon SNS topic in the *Amazon Simple Notification Service Developer Guide*.

Amazon SNS sends a confirmation email from *Amazon Notifications* to the email address that you specify. Open the email and choose the **Confirm subscription** link.

You receive an acknowledgement message from Amazon. Amazon SNS is now configured to receive notifications and send the notification as an email to the email address that you specified.

Task 2: Create an IAM policy for Amazon SNS notifications

Use the following procedure to create a custom Amazon Identity and Access Management (IAM) policy that provides permissions for inititating Amazon SNS notifications.

To create a custom IAM policy for Amazon SNS notifications

1. Open the IAM console at https://console.amazonaws.cn/iam/.
2. In the navigation pane, choose **Policies**, and then choose **Create Policy**. (If a **Get Started** button is shown, choose it, and then choose **Create Policy**.)
3. Choose the **JSON** tab.

4. Replace the default content with one of the following, depending on whether the Amazon SNS topic uses Amazon KMS encryption:

   SNS topic not encrypted

   JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sns:Publish"
            ],
            "Resource": "arn:aws-cn:sns:us-east-1:111122223333:sns-topic-
name"
        }
    ]
}
```

   region represents the identifier for an Amazon Web Services Region supported by Amazon Systems Manager, such as `us-east-2` for the US East (Ohio) Region. For a list of supported *region* values, see the **Region** column in Systems Manager service endpoints in the *Amazon Web Services General Reference*.

   account-id represents the 12-digit identifier for your Amazon Web Services account, in the format 123456789012.

   sns-topic-name represents the name of the Amazon SNS topic you want to use for publishing notifications.

   SNS topic encrypted

   JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
```

```
            "Effect": "Allow",
            "Action": [
                "sns:Publish"
            ],
            "Resource": "arn:aws-cn:sns:us-east-1:111122223333:sns-topic-
name"
        },
        {
            "Effect": "Allow",
            "Action": [
                "kms:GenerateDataKey",
                "kms:Decrypt"
            ],
            "Resource": "arn:aws-cn:kms:us-east-1:111122223333:key/kms-
key-id"
        }
    ]
}
```

region represents the identifier for an Amazon Web Services Region supported by Amazon Systems Manager, such as `us-east-2` for the US East (Ohio) Region. For a list of supported *region* values, see the **Region** column in Systems Manager service endpoints in the *Amazon Web Services General Reference*.

account-id represents the 12-digit identifier for your Amazon Web Services account, in the format `123456789012`.

sns-topic-name represents the name of the Amazon SNS topic you want to use for publishing notifications.

kms-key-id represents the ID of the symmetric encryption KMS key in Amazon KMS to use for encrypting and decrypting the topic, in the format `1234abcd-12ab-34cd-56ef-12345EXAMPLE`.

> **Note**
>
> There is a charge for using Amazon KMS encryption. For more information, see Managing Amazon SNS encryption keys and costs in the *Amazon Key Management Service Developer Guide*.

5. Choose **Next: Tags**.
6. (Optional) Add one or more tag-key value pairs to organize, track, or control access for this policy.
7. Choose **Next: Review**.
8. On the **Review policy** page, for **Name**, enter a name for the inline policy. For example: **`my-sns-publish-permissions`**.
9. (Optional) For **Description**, enter a description for the policy.
10. Choose **Create policy**.

Task 3: Create an IAM role for Amazon SNS notifications

Use the following procedure to create an IAM role for Amazon SNS notifications. This service role is used by Systems Manager to initiate Amazon SNS notifications. In all subsequent procedures, this role is referred to as the Amazon SNS IAM role.

To create an IAM service role for Amazon SNS notifications

1. Sign in to the Amazon Web Services Management Console and open the IAM console at https://console.amazonaws.cn/iam/.
2. In the navigation pane of the IAM console, choose **Roles**, and then choose **Create role**.
3. Choose the **Amazon Web Services service** role type, and then choose Systems Manager.
4. Choose the Systems Manager use case. Then, choose **Next**.
5. On the **Attach permissions policies** page, select the box to the left of the name of the custom policy you created in Task 2. For example: **`my-sns-publish-permissions`**.
6. (Optional) Set a permissions boundary. This is an advanced feature that is available for service roles, but not service-linked roles.

   Expand the **Permissions boundary** section and choose **Use a permissions boundary to control the maximum role permissions**. IAM includes a list of the Amazon managed and customer managed policies in your account. Select the policy to use for the permissions boundary or choose **Create policy** to open a new browser tab and create a new policy from scratch. For more information, see Creating IAM policies in the *IAM User Guide*. After you create the policy, close that tab and return to your original tab to select the policy to use for the permissions boundary.
7. Choose **Next**.

8. If possible, enter a role name or role name suffix to help you identify the purpose of this role. Role names must be unique within your Amazon Web Services account. They are not distinguished by case. For example, you cannot create roles named both **PRODROLE** and **prodrole**. Because various entities might reference the role, you cannot edit the name of the role after it has been created.
9. (Optional) For **Description**, enter a description for the new role.
10. Choose **Edit** in the **Step 1: Select trusted entities** or **Step 2: Select permissions** sections to edit the use cases and permissions for the role.
11. (Optional) Add metadata to the user by attaching tags as key-value pairs. For more information about using tags in IAM, see Tagging IAM resources in the *IAM User Guide*.
12. Review the role and then choose **Create role**.
13. Choose the name of the role, and then copy or make a note of the **Role ARN** value. This Amazon Resource Name (ARN) for the role is used when you send a command that is configured to return Amazon SNS notifications.
14. Keep the **Summary** page open.

Task 4: Configure user access

If an IAM entity (user, role, or group) is assigned administrator permissions, then the user or role has access to Run Command and Maintenance Windows, tools in Amazon Systems Manager.

For entities without administrator permissions, an administrator must grant the following permissions to the IAM entity:

- The `AmazonSSMFullAccess` managed policy, or a policy that provides comparable permissions.
- `iam:PassRole` permissions for the role created in Task 3: Create an IAM role for Amazon SNS notifications. For example:

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
```

```
            "Action": "iam:PassRole",
            "Resource": "arn:aws-cn:iam::111122223333:role/sns-role-name",
            "Condition": {
                "StringEquals": {
                    "iam:PassedToService": "ssm.amazonaws.com.cn"
                }
            }
        }
    ]
}
```

To provide access, add permissions to your users, groups, or roles:

- Users managed in IAM through an identity provider:

  Create a role for identity federation. Follow the instructions in Create a role for a third-party identity provider (federation) in the *IAM User Guide*.

- IAM users:
  - Create a role that your user can assume. Follow the instructions in Create a role for an IAM user in the *IAM User Guide*.
  - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in Adding permissions to a user (console) in the *IAM User Guide*.

To configure user access and attach the `iam:PassRole` policy to a user account

1. In the IAM navigation pane, choose **Users**, and then choose the user account that you want to configure.
2. On the **Permissions** tab, in the policies list, verify that either the **`AmazonSSMFullAccess`** policy is listed or that there is a comparable policy that gives the account permissions to access Systems Manager.
3. Choose **Add inline policy**.
4. On the **Create policy** page, choose the **Visual editor** tab.
5. Choose **Choose a service**, and then choose **IAM**.
6. For **Actions**, in the **Filter actions** text box, enter **`PassRole`**, and then select the check box next to **PassRole**.
7. For **Resources**, verify that **Specific** is selected, and then choose **Add ARN**.

8. In the **Specify ARN for role** field, paste the Amazon SNS IAM role ARN that you copied at the end of Task 3. The system automatically populates the **Account** and **Role name with path** fields.
9. Choose **Add**.
10. Choose **Review policy**.
11. On the **Review Policy** page, enter a name and then choose **Create policy**.

Task 5: Attach the iam:PassRole policy to your maintenance window role

When you register a Run Command task with a maintenance window, you specify a service role Amazon Resource Name (ARN). This service role is used by Systems Manager to run tasks registered to the maintenance window. To configure Amazon SNS notifications for a registered Run Command task, attach an `iam:PassRole` policy to the maintenance window service role specified. If you don't intend to configure the registered task for Amazon SNS notifications, then you can skip this task.

The `iam:PassRole` policy allows the Maintenance Windows service role to pass the Amazon SNS IAM role created in Task 3 to the Amazon SNS service. The following procedure shows how to attach the `iam:PassRole` policy to the Maintenance Windows service role.

> **Note**
>
> Use a custom service role for your maintenance window to send notifications related to the Run Command tasks registered. For information, see Setting up Maintenance Windows. If you need to create a custom service role for maintenance window tasks, see Setting up Maintenance Windows.

To attach the`iam:PassRole` policy to your Maintenance Windows role

1. Open the IAM console at https://console.amazonaws.cn/iam/.
2. In the navigation pane, choose **Roles** and select the Amazon SNS IAM role created in Task 3.
3. Copy or make a note of the **Role ARN** and return to the **Roles** section of the IAM console.
4. Select the custom Maintenance Windows service role you created from the **Role name** list.

5. On the **Permissions** tab, verify that either the `AmazonSSMMaintenanceWindowRole` policy is listed or there is a comparable policy that gives maintenance windows permission to the Systems Manager API. If it is not, choose **Add permissions, Attach policies** to attach it.
6. Choose **Add permissions, Create inline policy**.
7. Choose the **Visual editor** tab.
8. For **Service**, choose **IAM**.
9. For **Actions**, in the **Filter actions** text box, enter **`PassRole`**, and then select the check box next to **PassRole**.
10. For **Resources**, choose **Specific**, and then choose **Add ARN**.
11. In the **Specify ARN for role** box, paste the ARN of the Amazon SNS IAM role created in Task 3, and then choose **Add**.
12. Choose **Review policy**.
13. On the **Review policy** page, specify a name for the `PassRole` policy, and then choose **Create policy**.

Example Amazon SNS notifications for Amazon Systems Manager

You can configure Amazon Simple Notification Service (Amazon SNS) to send notifications about the status of commands that you send using Run Command or Maintenance Windows, which are tools in Amazon Systems Manager.

> **Note**
>
> This guide doesn't address how to configure notifications for Run Command or Maintenance Windows. For information about configuring Run Command or Maintenance Windows to send Amazon SNS notifications about the status of commands, see Configure Amazon SNS notifications for Amazon Systems Manager.

The following examples show the structure of the JSON output returned by Amazon SNS notifications when configured for Run Command or Maintenance Windows.

Sample JSON Output for Command summary messages using instance ID targeting

```
{
```

```
    "commandId": "a8c7e76f-15f1-4c33-9052-0123456789ab",
    "documentName": "AWS-RunPowerShellScript",
    "instanceIds": [
        "i-1234567890abcdef0",
        "i-9876543210abcdef0"
    ],
    "requestedDateTime": "2019-04-25T17:57:09.17Z",
    "expiresAfter": "2019-04-25T19:07:09.17Z",
    "outputS3BucketName": "amzn-s3-demo-bucket",
    "outputS3KeyPrefix": "runcommand",
    "status": "InProgress",
    "eventTime": "2019-04-25T17:57:09.236Z"
}
```

Sample JSON Output for Command summary messages using tag-based targeting

```
{
    "commandId": "9e92c686-ddc7-4827-b040-0123456789ab",
    "documentName": "AWS-RunPowerShellScript",
    "instanceIds": [],
    "requestedDateTime": "2019-04-25T18:01:03.888Z",
    "expiresAfter": "2019-04-25T19:11:03.888Z",
    "outputS3BucketName": "",
    "outputS3KeyPrefix": "",
    "status": "InProgress",
    "eventTime": "2019-04-25T18:01:05.825Z"
}
```

Sample JSON Output for Invocation messages

```
{
    "commandId": "ceb96b84-16aa-4540-91e3-925a9a278b8c",
    "documentName": "AWS-RunPowerShellScript",
    "instanceId": "i-1234567890abcdef0",
    "requestedDateTime": "2019-04-25T18:06:05.032Z",
    "status": "InProgress",
    "eventTime": "2019-04-25T18:06:05.099Z"
}
```

Use Run Command to send a command that returns status notifications

The following procedures show how to use the Amazon Command Line Interface (Amazon CLI) or Amazon Systems Manager console to send a command through Run Command, that is configured to return status notifications.

Sending a Run Command that returns notifications (console)

Use the following procedure to send a command through Run Command that is configured to return status notifications using the Systems Manager console.

To send a command that returns notifications (console)

1. Open the Amazon Systems Manager console at https://console.amazonaws.cn/systems-manager/.
2. In the navigation pane, choose **Run Command**.
3. Choose **Run command**.
4. In the **Command document** list, choose a Systems Manager document.
5. In the **Command parameters** section, specify values for required parameters.
6. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   > **Tip**
   >
   > If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

7. For **Other parameters**:
   - For **Comment**, enter information about this command.
   - For **Timeout (seconds)**, specify the number of seconds for the system to wait before failing the overall command execution.
8. For **Rate control**:
   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

> **Note**
>
> If you selected targets by specifying tags applied to managed nodes or by specifying Amazon resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

9. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

> **Note**
>
> The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different Amazon Web Services account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

10. In the **SNS Notifications** section, choose **Enable SNS notifications**.
11. For **IAM role**, choose the Amazon SNS IAM role ARN you created in Task 3 in Monitoring Systems Manager status changes using Amazon SNS notifications.
12. For **SNS topic**, enter the Amazon SNS topic ARN to be used.
13. For **Event notifications**, choose the events for which you want to receive notifications.
14. For **Change notifications**, choose to receive notifications for the command summary only (**Command status changes**) or for each copy of a command sent to multiple nodes (**Command status on each instance changes**) .
15. Choose **Run**.

16. Check your email for a message from Amazon SNS and open the email message. Amazon SNS can take several minutes to send the email message.

Sending a Run Command that returns notifications (CLI)

Use the following procedure to send a command through Run Command that is configured to return status notifications using the Amazon CLI.

To send a command that returns notifications (CLI)

1. Open the Amazon CLI.
2. Specify parameters in the following command to target based on managed node IDs.

```
aws ssm send-command --instance-ids "ID-1, ID-2" --document-name "Name"
 --parameters '{"commands":["input"]}' --service-role "SNSRoleARN" --
notification-config '{"NotificationArn":"SNSTopicName","NotificationEvents":
["All"],"NotificationType":"Command"}'
```

Following is an example.

```
aws ssm send-command --instance-ids "i-02573cafcfEXAMPLE, i-0471e04240EXAMPLE"
 --document-name "AWS-RunPowerShellScript" --parameters '{"commands":
["Get-Process"]}' --service-role "arn:aws-cn:iam::111122223333:role/
SNS_Role" --notification-config '{"NotificationArn":"arn:aws-
cn:sns:us-east-1:111122223333:SNSTopic","NotificationEvents":
["All"],"NotificationType":"Command"}'
```

Alternative commands

Specify parameters in the following command to target managed instances using tags.

```
aws ssm send-command --targets "Key=tag:TagName,Values=TagKey" --document-name
 "Name" --parameters '{"commands":["input"]}' --service-role "SNSRoleARN" --
notification-config '{"NotificationArn":"SNSTopicName","NotificationEvents":
["All"],"NotificationType":"Command"}'
```

Following is an example.

```
aws ssm send-command --targets "Key=tag:Environment,Values=Dev" --
document-name "AWS-RunPowerShellScript" --parameters '{"commands":
["Get-Process"]}' --service-role "arn:aws-cn:iam::111122223333:role/
SNS_Role" --notification-config '{"NotificationArn":"arn:aws-
cn:sns:us-east-1:111122223333:SNSTopic","NotificationEvents":
["All"],"NotificationType":"Command"}'
```

3. Press **Enter**.
4. Check your email for a message from Amazon SNS and open the email message. Amazon SNS can take several minutes to send the email message.

For more information, see send-command in the *Amazon CLI Command Reference*.

Use a maintenance window to send a command that returns status notifications

The following procedures show how to register a Run Command task with your maintenance window using the Amazon Systems Manager console or the Amazon Command Line Interface (Amazon CLI). Run Command is a tool in Amazon Systems Manager. The procedures also describe how to configure the Run Command task to return status notifications.

Before you begin

If you haven't created a maintenance window or registered targets, see Create and manage maintenance windows using the console for steps on how to create a maintenance window and register targets.

To receive notifications from the Amazon Simple Notification Service (Amazon SNS) service, attach an `iam:PassRole` policy to the Maintenance Windows service role specified in the registered task. If you haven't added `iam:PassRole` permissions to your Maintenance Windows service role, see Task 5: Attach the iam:PassRole policy to your maintenance window role.

Registering a Run Command task to a maintenance window that returns notifications (console)

Use the following procedure to register a Run Command task that is configured to return status notifications to your maintenance window using the Systems Manager console.

To register a Run Command task with your maintenance window that returns notifications (console)

1. Open the Amazon Systems Manager console at https://console.amazonaws.cn/systems-manager/.
2. In the navigation pane, choose **Maintenance Windows**.
3. Select the maintenance window for which you would like to register a Run Command task configured to send Amazon Simple Notification Service (Amazon SNS) notifications.
4. Choose **Actions** and then choose **Register Run command task**.
5. (Optional) In the **Name** field, enter a name for the task.
6. (Optional) In the **Description** field, enter a description.
7. For **Command document**, choose a Command document.
8. For **Task priority**, specify a priority for this task. Zero (`0`) is the highest priority. Tasks in a maintenance window are scheduled in priority order. Tasks that have the same priority are scheduled in parallel.
9. In the **Targets** section, select a registered target group or select unregistered targets.
10. For **Rate control**:

    - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

      > **Note**
      >
      > If you selected targets by specifying tags applied to managed nodes or by specifying Amazon resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

    - For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

11. In the **IAM service role** area, choose the Maintenance Windows service role that has `iam:PassRole` permissions to the SNS role.

> **Note**
>
> Add `iam:PassRole` permissions to the Maintenance Windows role to allow Systems Manager to pass the SNS role to Amazon SNS. If you haven't added `iam:PassRole` permissions, see Task 5 in the topic Monitoring Systems Manager status changes using Amazon SNS notifications.

12. (Optional) For **Output options**, to save the command output to a file, select the **Enable writing output to S3** box. Enter the bucket and prefix (folder) names in the boxes.

> **Note**
>
> The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile assigned to the managed node, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different Amazon Web Services account, verify that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

13. In the **SNS notifications** section, do the following:

    - Choose **Enable SNS Notifications**.
    - For **IAM role**, choose the Amazon SNS IAM role Amazon Resource Name (ARN) you created in Task 3 in Monitoring Systems Manager status changes using Amazon SNS notifications to initiate Amazon SNS.
    - For **SNS topic**, enter the Amazon SNS topic ARN to be used.
    - For **Event type**, choose the events for which you want to receive notifications.
    - For **Notification type**, choose to receive notifications for each copy of a command sent to multiple nodes (invocations) or the command summary.

14. In the **Parameters** section, enter the required parameters based on the Command document you chose.
15. Choose **Register Run command task**.

16. After the next time your maintenance window runs, check your email for a message from Amazon SNS and open the email message. Amazon SNS can take a few minutes to send the email message.

Registering a Run Command task to a maintenance window that returns notifications (CLI)

Use the following procedure to register a Run Command task that is configured to return status notifications to your maintenance window using the Amazon CLI.

To register a Run Command task with your maintenance window that returns notifications (CLI)

> **Note**
>
> To better manage your task options, this procedure uses the command option `--cli-input-json`, with option values stored in a JSON file.

1. On your local machine, create a file named `RunCommandTask.json`.
2. Paste the following contents into the file.

```
{
    "Name": "Name",
    "Description": "Description",
    "WindowId": "mw-0c50858d01EXAMPLE",
    "ServiceRoleArn": "arn:aws-cn:iam::account-id:role/MaintenanceWindowIAMRole",
    "MaxConcurrency": "1",
    "MaxErrors": "1",
    "Priority": 3,
    "Targets": [
        {
            "Key": "WindowTargetIds",
            "Values": [
                "e32eecb2-646c-4f4b-8ed1-205fbEXAMPLE"
            ]
        }
    ],
    "TaskType": "RUN_COMMAND",
    "TaskArn": "CommandDocumentName",
    "TaskInvocationParameters": {
```

```
        "RunCommand": {
            "Comment": "Comment",
            "TimeoutSeconds": 3600,
            "NotificationConfig": {
                "NotificationArn": "arn:aws-cn:sns:region:account-id:SNSTopicName",
                "NotificationEvents": [
                    "All"
                ],
                "NotificationType": "Command"
            },
            "ServiceRoleArn": "arn:aws-cn:iam::account-id:role/SNSIAMRole"
        }
    }
}
```

3. Replace the example values with information about your own resources.

   You can also restore options we've omitted from this example if you want to use them. For example, you can save command output to an S3 bucket.

   For more information, see register-task-with-maintenance-window in the *Amazon CLI Command Reference*.

4. Save the file.

5. In the directory on your local machine where you saved the file, run the following command.

```
aws ssm register-task-with-maintenance-window --cli-input-json file://
RunCommandTask.json
```

> **Important**
>
> Be sure to include `file://` before the file name. It's required in this command.

If successful, the command returns information similar to the following.

```
{
    "WindowTaskId": "j2l8d5b5c-mw66-tk4d-r3g9-1d4d1EXAMPLE"
}
```

6. After the next execution of your maintenance window, check your email for a message from Amazon SNS and open the email message. Amazon SNS can take a few minutes to send the email message.

For more information about registering tasks for a maintenance window from the command line, see Register tasks with the maintenance window.

Product and service integrations with Systems Manager

By default, Amazon Systems Manager integrates with Amazon Web Services services and other products and services. The following information can help you configure Systems Manager to integrate with the products and services you use.

- Integration with Amazon Web Services services
- Integration with other products and services

Integration with Amazon Web Services services

Through the use of Systems Manager Command documents (SSM documents) and Automation runbooks, you can use Amazon Systems Manager to integrate with Amazon Web Services services. For more information about these resources, see Amazon Systems Manager Documents.

This section includes the following topics.

- Use Parameter Store parameters in Amazon Elastic Kubernetes Service
- Run Ansible Playbooks from GitHub
- Run Python scripts from GitHub
- Install ASCP for Amazon EKS
- Amazon Secrets and Configuration Provider code examples

Systems Manager is integrated with the following Amazon Web Services services.

Compute

Service	Description
Amazon Elastic Compute Cloud (Amazon EC2)	Amazon EC2 provides scalable computing capacity in the Amazon Web Services Cloud. Using Amazon EC2 eliminates your need to invest in hardware up front. You can then develop and deploy applications faster. You can use Amazon EC2 to launch as many or

Service	Description
	as few virtual servers as you need, configure security and networking, and manage storage. Systems Manager lets you perform several tasks on EC2 instances. For example you can launch, configure, manage, maintain, troubleshoot, and securely connect to your EC2 instances. You can also use Systems Manager to deploy software, determine compliance status, and gather inventory from your EC2 instances. **Learn more** • Working with managed nodes • Amazon Systems Manager State Manager • Amazon Systems Manager Run Command • Amazon Systems Manager Patch Manager • Amazon Systems Manager Session Manager • Amazon Systems Manager Distributor • Amazon Systems Manager Compliance • Amazon Systems Manager Inventory

Service	Description
Amazon EC2 Auto Scaling	Auto Scaling helps you make sure that you have the correct number of EC2 instances available to handle the load for your applicati on. You create collections of EC2 instances, called Auto Scaling groups. Systems Manager lets you automate common procedures like patching the Amazon Machine Image (AMI) used in your Auto Scaling template for your Auto Scaling group. **Learn more** Updating AMIs for Auto Scaling groups
Amazon Elastic Container Service (Amazon ECS)	Amazon ECS is a highly scalable, fast, container management service that allows you to run, stop, and manage Docker containers on a cluster. Systems Manager lets you manage container instances remotely and inject sensitive data into your containers. Store your sensitive data in Parameter Store parameters and reference them in your container definition. **Learn more** • Manage container instances remotely using Amazon Systems Manager • Specifying sensitive data using Systems Manager Parameter Store

Service	Description
Amazon Lambda	Lambda is a compute service that lets you run code without provisioning or managing servers. Lambda runs your code only when needed and scales automatically, from a few requests per day to thousands per second. Systems Manager lets you use Lambda functions within Automation runbook content by using the `aws:invokeLambdaFunction` action. To use parameters from Parameter Store in Amazon Lambda functions, you can use the Amazon Parameters and Secrets Lambda Extension to retrieve parameter values and cache them for future use. **Learn more** Update a golden AMI using Automation, Amazon Lambda, and Parameter Store Using Parameter Store parameters in Amazon Lambda functions

Internet of Things (IoT)

Service	Description
Amazon IoT Greengrass core devices	Amazon IoT Greengrass is an open source IoT edge runtime and cloud service that helps you build, deploy and manage IoT applications on your devices. Systems Manager offers native support for Amazon IoT Greengrass core devices.

Service	Description
	Learn more Managing edge devices with Systems Manager
Amazon IoT core devices	Amazon IoT provides the cloud services that connect your IoT devices to other devices and Amazon cloud services. Amazon IoT provides device software that can help you integrate your IoT devices into Amazon IoT-based solutions. If your devices can connect to Amazon IoT, Amazon IoT can connect them to the cloud services that Amazon provides. Systems Manager supports Amazon IoT core devices as long as those devices are configure d as *managed nodes* in a hybrid and multiclou d environment. **Learn more** Managing nodes in hybrid and multicloud environments with Systems Manager

Storage

Service	Description
Amazon Simple Storage Service (Amazon S3)	Amazon S3 is storage for the Internet. It's designed to make web-scale computing easier for developers. Amazon S3 has a simple web services interface that you can use to store and retrieve any amount of data, at any time, from anywhere on the web. Systems Manager lets you run remote scripts and SSM documents that are stored in Amazon S3. Distributor uses Amazon S3 to

Service	Description
	store packages. You can also send output to Amazon S3 for Run Command and Session Manager, tools in Amazon Systems Manager. **Learn more** • Running scripts from Amazon S3 • Running documents from remote locations • Amazon Systems Manager Distributor • Logging session data using Amazon S3 (console)

Developer Tools

Service	Description
Amazon CodeBuild	CodeBuild is a fully managed build service in the cloud. CodeBuild compiles your source code, runs unit tests, and produces artifacts that are ready to deploy. CodeBuild eliminates the need to provision, manage, and scale your own build servers. Parameter Store lets you store sensitive information for your build specifications and projects. **Learn more** • Build specification reference for CodeBuild • Create a build project in Amazon CodeBuild
Amazon CDK	The Amazon Cloud Development Kit (Amazon CDK) is a framework for defining cloud infrastructure as code, with programming

Service	Description
	languages, and deploying it through Amazon CloudFormation. Application Manager lets you view your CDK constructs grouped as applications, view the application structure including the underlyin g resources, view alerts, investigate and remediate operational issues, and track costs in the Application Manager console. **Learn more** • Viewing overview information about an application • Viewing application resources

Security, Identity, and Compliance

Service	Description
Amazon Identity and Access Management (IAM)	IAM is a web service that helps you securely control access to Amazon resources. You use IAM to control who is authenticated (signed in) and authorized (has permissions) to use resources. Systems Manager lets you control access to services using IAM. **Learn more** • How Amazon Systems Manager works with IAM • Actions, resources, and condition keys for Amazon Systems Manager

Service	Description
	• Configure instance permissions required for Systems Manager
Amazon Secrets Manager	Secrets Manager provides easier managemen t of secrets. Secrets can be database credentia ls, passwords, third-party API keys, and even arbitrary text. Parameter Store lets you retrieve Secrets Manager secrets when using other Amazon Web Services services that already support references to Parameter Store parameters. **Learn more** Referencing Amazon Secrets Manager secrets from Parameter Store parameters

Service	Description
Amazon Security Hub CSPM	Security Hub CSPM gives you a comprehensive view of your high-priority security alerts and compliance status across Amazon Web Services accounts. Security Hub CSPM aggregates, organizes, and prioritizes your security alerts, or findings, from multiple Amazon Web Services services. When you turn on integration between Security Hub CSPM and Patch Manager, a tool in Amazon Systems Manager, Security Hub CSPM monitors the patching status of your fleets from a security standpoint. Patch compliance details are automatically exported to Security Hub CSPM. This lets you use a single view to centrally monitor your patch compliance status and to track other security findings. You can receive alerts when nodes in your fleet go out of patch compliance and review patch compliance findings in the Security Hub CSPM console. You can also integrate Security Hub CSPM with Explorer and OpsCenter, tools in Amazon Systems Manager. Integration with Security Hub CSPM lets you receive findings from Security Hub CSPM in Explorer and OpsCenter. Security Hub CSPM findings provide security information that you can use in Explorer and OpsCenter to aggregate and take action on your security, performance, and operational issues in Amazon Systems Manager.

Service	Description
	There is a charge to use Security Hub CSPM. For more information, see Security Hub CSPM pricing. **Learn more** • Receiving findings from Amazon Security Hub CSPM in Explorer • Understanding OpsCenter integration with Amazon Security Hub CSPM • Integrating Patch Manager with Amazon Security Hub CSPM

Cryptography and PKI

Service	Description
Amazon Key Management Service (Amazon KMS)	Amazon KMS is a managed service that lets you create and control customer managed keys, the encryption keys used to encrypt your data. Systems Manager lets you use Amazon KMS to create `SecureString` parameters and encrypt Session Manager session data. **Learn more** • Amazon KMS encryption for Amazon Systems Manager Parameter Store SecureString parameters • Turn on KMS key encryption of session data (console)

Management and Governance

Service	Description
Amazon CloudFormation	Amazon CloudFormation is a service that helps you model and set up your Amazon Web Services resources so that you can spend less time managing those resources and more time focusing on your applications that run in Amazon. Parameter Store is a source for dynamic references. Dynamic references provide a compact, powerful way for you to specify external values that are stored and managed in other services in your Amazon CloudForm ation stack templates. **Learn more** Using dynamic references to specify template values
Amazon CloudTrail	CloudTrail is an Amazon Web Services service that helps you authorize governance, compliance, and operational and risk auditing of your Amazon Web Services account. Actions taken by a user, role, or an Amazon Web Services service are recorded as events in CloudTrail. Events include actions taken in the Amazon Web Services Management Console, Amazon Command Line Interface (Amazon CLI), and Amazon SDKs and APIs. Systems Manager integrates with CloudTrai l which captures most Systems Manager API calls as events. These include API calls initiated

Service	Description
	from the Systems Manager console and calls made to the Systems Manager APIs. **Learn more** Logging Amazon Systems Manager API calls with Amazon CloudTrail
Amazon CloudWatch Logs	Amazon CloudWatch Logs allows you to centralize the logs from all of your systems, applications, and Amazon Web Services services that you use. You can then view them, search them for specific error codes or patterns, filter them based on specific fields, or archive them securely for future analysis. Systems Manager supports sending logs for the SSM Agent, Run Command, and Session Manager to CloudWatch Logs. **Learn more** • Sending node logs to unified CloudWatch Logs (CloudWatch agent) • Configuring Amazon CloudWatch Logs for Run Command • Logging session data using Amazon CloudWatch Logs (console)

Service	Description
Amazon EventBridge	EventBridge delivers a near real-time stream of system events that describes changes in Amazon Web Services resources. Using simple rules that you can quickly set up, you can match events and route them to one or more target functions or streams. EventBridge becomes aware of operational changes as they occur. EventBridge responds to these operational changes and takes corrective action as necessary. These actions include sending messages to respond to the environment, activating functions, and capturing state information. Systems Manager has multiple events that are supported by EventBridge allowing you to take actions based on the content of those events. **Learn more** Monitoring Systems Manager events with Amazon EventBridge **Note** Amazon EventBridge is the preferred way to manage your events. CloudWatch Events and EventBrid ge are the same underlying service and API, but EventBridge provides more features. Changes you make in either CloudWatch or EventBridge are reflected in each console. For more

Service	Description
	information, see the *Amazon EventBridge User Guide*.
Amazon Config	Amazon Config provides a detailed view of the configuration of Amazon resources in your Amazon Web Services account. This includes how the resources are related to one another and how they were configured. This lets you see how the configurations and relationships change over time. Systems Manager is integrated with Amazon Config, providing multiple rules that help you gain visibility into your EC2 instances. These rules help you identify which EC2 instances are managed by Systems Manager, operating system configurations, system-level updates, installed applications, network configurations, and more. **Learn more** • Amazon Config supported resource types • Recording software configuration for managed instances • Viewing inventory history and change tracking

Service	Description
Amazon Trusted Advisor	Trusted Advisor is an online tool that provides real-time guidance to help you provision your resources following Amazon best practices. Systems Manager hosts Trusted Advisor and you can view Trusted Advisor data in Explorer. **Learn more** • Amazon Systems Manager Explorer • Getting started with Amazon Trusted Advisor

Service	Description
Amazon Organizations	Organizations is an account management service that lets you consolidate multiple Amazon Web Services accounts into an organization that you create and centrally manage. Organizations includes account management and consolidated billing capabilities that allow you to better meet the budgetary, security, and compliance needs of your business. Integration between Change Manager and Organizations makes it possible to use a delegated administrator account to manage change requests, change templates, and approvals for your entire organization through this single account. Organizations integration with Inventory , a tool in Amazon Systems Manager, and Explorer lets you aggregate inventory and operations data (OpsData) from multiple Amazon Web Services Regions and Amazon Web Services accounts. Integration between Quick Setup and Organizations automates common service setup tasks, and deploys service configura tions based on best practices across your organizational units (OUs).

Networking and Content Delivery

Service	Description
Amazon PrivateLink	Amazon PrivateLink lets you privately connect your virtual private cloud (VPC) to supported Amazon Web Services services and VPC endpoint services without requiring an internet gateway, NAT device, VPN connection, or Amazon Direct Connect connection. Systems Manager supports managed nodes connecting to Systems Manager APIs using Amazon PrivateLink. This improves the security posture of your managed nodes because Amazon PrivateLink restricts all network traffic between your managed nodes, Systems Manager, and Amazon EC2 to the Amazon network. This means that managed nodes aren't required to have access to the internet. **Learn more** Improve the security of EC2 instances by using VPC endpoints for Systems Manager

Analytics

Service	Description
Amazon Athena	Athena is an interactive query service that allows you to analyze data directly in Amazon Simple Storage Service (Amazon S3) using standard SQL. With a few actions in the Amazon Web Services Management Console,

Service	Description
	you can point Athena at your data stored in Amazon S3 and begin using standard SQL to run one-time queries and get results in seconds. Systems Manager Inventory integrates with Athena to help you query inventory data from multiple Amazon Web Services Regions and Amazon Web Services accounts. Athena integration uses resource data sync so that you can view inventory data from all managed nodes on the **Detailed View** page in the Systems Manager Inventory console. **Learn more** • Querying inventory data from multiple Regions and accounts • Walkthrough: Using resource data sync to aggregate inventory data
Amazon Glue	Amazon Glue is a fully managed ETL (extract, transform, and load) service that makes it simple and cost-effective to categorize your data, clean it, enrich it, and move it reliably between various data stores and data streams. Systems Manager uses Amazon Glue to crawl the Inventory data in your S3 bucket. **Learn more** Querying inventory data from multiple Regions and accounts

Service	Description
Amazon Quick	Quick is a business analytics service you can use to build visualizations, perform one-time analysis, and get business insights from your data. It can automatically discover Amazon data sources and also works with your data sources. Systems Manager resource data sync sends inventory data collected from all of your managed nodes to a single S3 bucket. You can use Quick to query and analyze the aggregate d data. **Learn more** • Creating a resource data sync for Inventory • Walkthrough: Using resource data sync to aggregate inventory data

Application Integration

Service	Description
Amazon Simple Notification Service (Amazon SNS)	Amazon SNS is a web service that coordinat es and manages the delivery or sending of messages to subscribing endpoints or clients. Systems Manager generates statuses for multiple services that can be captured by Amazon SNS notifications. **Learn more** • Monitoring Systems Manager status changes using Amazon SNS notifications

Service	Description
	• Setting up notifications or triggering actions based on Parameter Store events

Amazon Web Services Management Console

Service	Description
Amazon Resource Groups	Resource Groups organize your Amazon resources. Resource groups make it easier to manage, monitor, and automate tasks on large numbers of resources at one time. Systems Manager resource types like managed nodes, SSM documents, maintenance windows, Parameter Store parameters, and patch baselines can be added to resource groups. **Learn more** What are Amazon Resource Groups?

Topics

- Running scripts from Amazon S3
- Referencing Amazon Secrets Manager secrets from Parameter Store parameters
- Amazon KMS encryption for Amazon Systems Manager Parameter Store SecureString parameters
- Use Parameter Store parameters in Amazon Elastic Kubernetes Service
- Using Parameter Store parameters in Amazon Lambda functions

Running scripts from Amazon S3

This section describes how to download and run scripts from Amazon Simple Storage Service (Amazon S3). The following topic includes information and terminology relating to Amazon S3. To learn more about Amazon S3, see What is Amazon S3? You can run different types of scripts, including Ansible Playbooks, Python, Ruby, Shell, and PowerShell.

You can also download a directory that includes multiple scripts. When you run the primary script in the directory, Amazon Systems Manager also runs any referenced scripts that are included in the directory.

Note the following important details about running scripts from Amazon S3:

- Systems Manager doesn't verify that your script is capable of running on an node. Before you download and run the script, verify that the required software is installed on the node. Or, you can create a composite document that installs the software by using either Run Command or State Manager, tools in Amazon Systems Manager, and then downloads and runs the script.
- Verify that your user, role, or group has been granted the Amazon Identity and Access Management (IAM) permissions needed to read from the S3 bucket.
- Make sure that the instance profile on your Amazon Elastic Compute Cloud (Amazon EC2) instances has `s3:ListBucket` and `s3:GetObject` permissions. If the instance profile doesn't have these permissions, the system fails to download your script from the S3 bucket. For more information, see Using instance profiles in the *IAM User Guide*.

Run shell scripts from Amazon S3

This following information includes procedures to help you run scripts from Amazon Simple Storage Service (Amazon S3) by using either the Amazon Systems Manager console or the Amazon Command Line Interface (Amazon CLI). Though shell scripts are used in the examples, other types of scripts can be substituted.

Run a shell script from Amazon S3 (console)

Run a shell script from Amazon S3

1. Open the Amazon Systems Manager console at https://console.amazonaws.cn/systems-manager/.
2. In the navigation pane, choose **Run Command**.

3. Choose **Run command**.
4. In the **Command document** list, choose **`AWS-RunRemoteScript`**.
5. In **Command parameters**, do the following:

   - In **Source Type**, select **S3**.
   - In the **Source Info** text box, enter the required information to access the source in the following format. Replace each *`example resource placeholder`* with your own information.

     > **Note**
     >
     > Replace https://s3.*`aws-api-domain`* with the URL for your bucket. You can copy your bucket URL in Amazon S3 on the **Objects** tab.

     ```
     {"path":"https://s3.aws-api-domain/path to script"}
     ```

     The following is an example.

     ```
     {"path":"https://amzn-s3-demo-bucket.s3.us-east-2.amazonaws.com/scripts/shell/
     helloWorld.sh"}
     ```

   - In the **Command Line** field, enter parameters for the script execution. Here is an example.

     ```
     helloWorld.sh argument-1 argument-2
     ```

   - (Optional) In the **Working Directory** field, enter the name of a directory on the node where you want to download and run the script.
   - (Optional) In **Execution Timeout**, specify the number of seconds for the system to wait before failing the script command execution.
6. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   > **Tip**
   >
   > If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

7. For **Other parameters**:

   - For **Comment**, enter information about this command.
   - For **Timeout (seconds)**, specify the number of seconds for the system to wait before failing the overall command execution.

8. For **Rate control**:

   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

     > **Note**
     >
     > If you selected targets by specifying tags applied to managed nodes or by specifying Amazon resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

   - For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

9. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

   > **Note**
   >
   > The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different Amazon Web Services account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

10. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

    For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

11. Choose **Run**.

Run a shell script from Amazon S3 (command line)

1. Install and configure the Amazon Command Line Interface (Amazon CLI), if you haven't already.

   For information, see Installing or updating the latest version of the Amazon CLI.

2. Run the following command. Replace each *example resource placeholder* with your own information.

   > **Note**
   >
   > Replace https://s3.*aws-api-domain*/*script path* with the URL for your bucket. You can copy your bucket URL in Amazon S3 on the **Objects** tab.

   Linux & macOS

   ```
   aws ssm send-command \
       --document-name "AWS-RunRemoteScript" \
       --output-s3-bucket-name "amzn-s3-demo-bucket" \
       --output-s3-key-prefix "key-prefix" \
       --targets "Key=InstanceIds,Values=instance-id" \
       --parameters '{"sourceType":["S3"],"sourceInfo":["{\"path\":\"https://
   s3.aws-api-domain/script path\"}"],"commandLine":["script name and arguments"]}'
   ```

   Windows

   ```
   aws ssm send-command ^
       --document-name "AWS-RunRemoteScript" ^
       --output-s3-bucket-name "amzn-s3-demo-bucket" ^
       --output-s3-key-prefix "key-prefix" ^
       --targets "Key=InstanceIds,Values=instance-id" ^
   ```

```
    --parameters "sourceType"="S3",sourceInfo='{\"path\":\"https://s3.aws-api-
domain/script path\"}',"commandLine"="script name and arguments"
```

PowerShell

```
Send-SSMCommand `
    -DocumentName "AWS-RunRemoteScript" `
    -OutputS3BucketName "amzn-s3-demo-bucket" `
    -OutputS3KeyPrefix "key-prefix" `
    -Target @{Key="InstanceIds";Values=@("instance-id")} `
    -Parameter @{
        sourceType = "S3";
        sourceInfo = '{"path": "s3://bucket-name/path/to/script"}';
        commandLine = "script name and arguments"
    }
```

Referencing Amazon Secrets Manager secrets from Parameter Store parameters

Amazon Secrets Manager helps you organize and manage important configuration data such as credentials, passwords, and license keys. Parameter Store is integrated with Secrets Manager so that you can retrieve Secrets Manager secrets when using other Amazon Web Services services that already support references to Parameter Store parameters. These services include Amazon Elastic Compute Cloud (Amazon EC2), Amazon Elastic Container Service (Amazon ECS), Amazon Lambda, Amazon CloudFormation, Amazon CodeBuild, Amazon CodeDeploy, and other Systems Manager tools. By using Parameter Store to reference Secrets Manager secrets, you create a consistent and secure process for calling and using secrets and reference data in your code and configuration scripts.

For more information about Secrets Manager, see What Is Amazon Secrets Manager? in the *Amazon Secrets Manager User Guide*.

Restrictions

Note the following restrictions when using Parameter Store to reference Secrets Manager secrets:

- You can only retrieve Secrets Manager secrets by using the GetParameter and GetParameters API operations. Modification operations and advance querying API operations, such as DescribeParameters and GetParametersByPath, aren't supported for Secrets Manager.

- You can use the Amazon Command Line Interface (Amazon CLI), Amazon Tools for Windows PowerShell, and the SDKs to retrieve a secret by using Parameter Store.
- Secrets Manager secrets in Parameter Store must have a prefix of `/aws/reference/secretsmanager`. The following are examples:

  `/aws/reference/secretsmanager/CFCreds1`

  `/aws/reference/secretsmanager/myapp/db/password`
- Parameter Store honors Amazon Identity and Access Management (IAM) policies attached to Secrets Manager secrets. For example, if User 1 doesn't have access to Secret A, then User 1 can't retrieve Secret A by using Parameter Store.
- Parameters that reference Secrets Manager secrets can't use the Parameter Store versioning or history features.
- Parameter Store honors Secrets Manager version stages. If you reference a version stage, it uses letters, numbers, a period (.), a hyphen (-), or an underscore (_). All other symbols specified in the version stage cause the reference to fail.

How to reference a Secrets Manager secret by using Parameter Store

The following procedure describes how to reference a Secrets Manager secret by using Parameter Store APIs. The procedure references other procedures in the *Amazon Secrets Manager User Guide*.

> **Note**
>
> Before you begin, verify that you have permission to reference Secrets Manager secrets in Parameter Store parameters. If you have administrator permissions in Secrets Manager and Systems Manager, then you can reference or retrieve secrets by using Parameter Store APIs. If you reference a Secrets Manager secret in a Parameter Store parameter, and you don't have permission to access that secret, then the reference fails. For more information, see Authentication and access control for Amazon Secrets Manager in the *Amazon Secrets Manager User Guide*.

> **Important**
>
> Parameter Store functions as a pass-through service for references to Secrets Manager secrets. Parameter Store doesn't retain data or metadata about secrets. The reference is stateless.

To reference a Secrets Manager secret by using Parameter Store

1. Create a secret in Secrets Manager. For more information, see Create and manage secrets with Amazon Secrets Manager.
2. Reference a secret by using the Amazon CLI, Amazon Tools for Windows PowerShell, or the SDK. When you reference a Secrets Manager secret, the name must begin with the following reserved path: `/aws/reference/secretsmanager/`. By specifying this path, Systems Manager knows to retrieve the secret from Secrets Manager instead of Parameter Store. Here are some example names that correctly reference the Secrets Manager secrets, `CFCreds1` and `DBPass`, using Parameter Store.

   - `/aws/reference/secretsmanager/CFCreds1`
   - `/aws/reference/secretsmanager/DBPass`

   Here is a Java code example that references an access key and a secret key that are stored in Secrets Manager. This code example sets up an Amazon DynamoDB client. The code retrieves configuration data and credentials from Parameter Store. The configuration data is stored as a string parameter in Parameter Store and the credentials are stored in Secrets Manager. Even though the configuration data and credentials are stored in separate services, both sets of data can be accessed from Parameter Store by using the `GetParameter` API.

```
/**
* Initialize Systems Manager client with default credentials
*/
AWSSimpleSystemsManagement ssm =
 AWSSimpleSystemsManagementClientBuilder.defaultClient();

...

/**
* Example method to launch DynamoDB client with credentials different from default
```

```
* @return DynamoDB client
*/
AmazonDynamoDB getDynamoDbClient() {
    //Getting AWS credentials from Secrets Manager using GetParameter
    BasicAWSCredentials differentAWSCreds = new BasicAWSCredentials(
            getParameter("/aws/reference/secretsmanager/access-key"),
            getParameter("/aws/reference/secretsmanager/secret-key"));

    //Initialize the DynamoDB client with different credentials
    final AmazonDynamoDB client = AmazonDynamoDBClient.builder()
            .withCredentials(new AWSStaticCredentialsProvider(differentAWSCreds))
            .withRegion(getParameter("region")) //Getting configuration from
 Parameter Store
            .build();
    return client;
}

/**
* Helper method to retrieve parameter value
* @param parameterName identifier of the parameter
* @return decrypted parameter value
*/
public GetParameterResult getParameter(String parameterName) {
    GetParameterRequest request = new GetParameterRequest();
    request.setName(parameterName);
    request.setWithDecryption(true);
    return ssm.newGetParameterCall().call(request).getParameter().getValue();
}
```

Here are some Amazon CLI examples. Use the `aws secretsmanager list-secrets` command to find the names of your secrets.

Amazon CLI Example 1: Reference by using the name of the secret

Linux & macOS

```
aws ssm get-parameter \
    --name /aws/reference/secretsmanager/s1-secret \
    --with-decryption
```

Windows

```
aws ssm get-parameter ^
    --name /aws/reference/secretsmanager/s1-secret ^
    --with-decryption
```

The command returns information like the following.

```
{
    "Parameter": {
        "Name": "/aws/reference/secretsmanager/s1-secret",
        "Type": "SecureString",
        "Value": "Fl*MEishm!al875",
        "Version": 0,
        "SourceResult":
              "{
                   \"CreatedDate\": 1526334434.743,
                   \"Name\": \"s1-secret\",
                   \"VersionId\": \"aaabbbccc-1111-222-333-123456789\",
                   \"SecretString\": \"Fl*MEishm!al875\",
                   \"VersionStages\": [\"AWSCURRENT\"],
                   \"ARN\": \"arn:aws:secretsmanager:us-
east-2:123456789012:secret:s1-secret-E18LRP\"
               }"
        "LastModifiedDate": 2018-05-14T21:47:14.743Z,
        "ARN": "arn:aws:secretsmanager:us-east-2:123456789012:secret:s1-secret-
               E18LRP",
      }
}
```

Amazon CLI Example 2: Reference that includes the version ID

Linux & macOS

```
aws ssm get-parameter \
    --name /aws/reference/secretsmanager/s1-secret:11111-aaa-bbb-ccc-123456789 \
    --with-decryption
```

Windows

```
aws ssm get-parameter ^
    --name /aws/reference/secretsmanager/s1-secret:11111-aaa-bbb-ccc-123456789 ^
    --with-decryption
```

The command returns information like the following.

```
{
    "Parameter": {
        "Name": "/aws/reference/secretsmanager/s1-secret",
        "Type": "SecureString",
        "Value": "Fl*MEishm!al875",
        "Version": 0,
        "SourceResult":
              "{
                   \"CreatedDate\": 1526334434.743,
                   \"Name\": \"s1-secret\",
                   \"VersionId\": \"11111-aaa-bbb-ccc-123456789\",
                   \"SecretString\": \"Fl*MEishm!al875\",
                   \"VersionStages\": [\"AWSCURRENT\"],
                   \"ARN\": \"arn:aws:secretsmanager:us-
east-2:123456789012:secret:s1-secret-E18LRP\"
               }"
        "Selector": ":11111-aaa-bbb-ccc-123456789"
      }
        "LastModifiedDate": 2018-05-14T21:47:14.743Z,
        "ARN": "arn:aws:secretsmanager:us-east-2:123456789012:secret:s1-secret-
               E18LRP",
}
```

Amazon CLI Example 3: Reference that includes the version stage

Linux & macOS

```
aws ssm get-parameter \
    --name /aws/reference/secretsmanager/s1-secret:AWSCURRENT \
    --with-decryption
```

Windows

```
aws ssm get-parameter ^
    --name /aws/reference/secretsmanager/s1-secret:AWSCURRENT ^
    --with-decryption
```

The command returns information like the following.

```
{
    "Parameter": {
        "Name": "/aws/reference/secretsmanager/s1-secret",
        "Type": "SecureString",
        "Value": "Fl*MEishm!al875",
        "Version": 0,
        "SourceResult":
              "{
                   \"CreatedDate\": 1526334434.743,
                   \"Name\": \"s1-secret\",
                   \"VersionId\": \"11111-aaa-bbb-ccc-123456789\",
                   \"SecretString\": \"Fl*MEishm!al875\",
                   \"VersionStages\": [\"AWSCURRENT\"],
                   \"ARN\": \"arn:aws:secretsmanager:us-
east-2:123456789012:secret:s1-secret-E18LRP\"
               }"
        "Selector": ":AWSCURRENT"
      }
      "LastModifiedDate": 2018-05-14T21:47:14.743Z,
      "ARN": "arn:aws:secretsmanager:us-east-2:123456789012:secret:s1-secret-
                E18LRP",
}
```

Amazon KMS encryption for Amazon Systems Manager Parameter Store SecureString parameters

With Amazon Systems Manager Parameter Store, you can create SecureString parameters, which are parameters that have a plaintext parameter name and an encrypted parameter value. Parameter Store uses Amazon KMS to encrypt and decrypt the parameter values of `SecureString` parameters.

With Parameter Store, you can create, store, and manage data as parameters with values. You can create a parameter in Parameter Store and use it in multiple applications and services subject to policies and permissions that you design. When you need to change a parameter value, you change one instance, rather than managing error-prone changes to numerous sources. Parameter Store supports a hierarchical structure for parameter names. You can then qualify a parameter for specific uses.

To manage sensitive data, you can create `SecureString` parameters. Parameter Store uses Amazon KMS keys to encrypt the parameter values of `SecureString` parameters when you create or change them. It also uses KMS keys to decrypt the parameter values when you access them. You can use the Amazon managed key that Parameter Store creates for your account or specify your own customer managed key.

> **Important**
>
> Parameter Store supports only symmetric KMS keys. You cannot use an asymmetric KMS key to encrypt your parameters. For help determining whether a KMS key is symmetric or asymmetric, see Identify different key types in the *Amazon Key Management Service Developer Guide*.

Parameter Store supports two tiers of `SecureString` parameters: *standard* and *advanced*. Standard parameters, which cannot exceed 4096 bytes, are encrypted and decrypted directly under the KMS key that you specify. To encrypt and decrypt advanced `SecureString` parameters, Parameter Store uses envelope encryption with the Amazon Encryption SDK. You can convert a standard `SecureString` parameter to an advanced parameter, but you cannot convert an advanced parameter to a standard one. For more information about the difference between standard and advanced `SecureString` parameters, see Choosing parameter tiers in Parameter Store.

Protecting standard SecureString parameters

Parameter Store does not perform any cryptographic operations. Instead, it relies on Amazon KMS to encrypt and decrypt `SecureString` parameter values. When you create or change a standard `SecureString` parameter value, Parameter Store calls the Amazon KMS Encrypt operation. This operation uses a symmetric encryption KMS key directly to encrypt the parameter value instead of using the KMS key to generate a data key.

You can select the KMS key that Parameter Store uses to encrypt the parameter value. If you do not specify a KMS key, Parameter Store uses the Amazon managed key that Systems Manager automatically creates in your account. This KMS key has the `aws/ssm` alias.

To view the default `aws/ssm` KMS key for your account, use the DescribeKey operation in the Amazon KMS API. The following example uses the `describe-key` command in the Amazon Command Line Interface (Amazon CLI) with the `aws/ssm` alias name.

```
aws kms describe-key \
    --key-id alias/aws/ssm
```

To create a standard `SecureString` parameter, use the PutParameter operation in the Systems Manager API. Omit the `Tier` parameter or specify a value of `Standard`, which is the default. Include a `Type` parameter with a value of `SecureString`. To specify a KMS key, use the `KeyId` parameter. The default is the Amazon managed key for your account, `aws/ssm`.

Parameter Store then calls the Amazon KMS `Encrypt` operation with the KMS key and the plaintext parameter value. Amazon KMS returns the encrypted parameter value, which Parameter Store stores with the parameter name.

The following example uses the Systems Manager put-parameter command and its `--type` parameter in the Amazon CLI to create a `SecureString` parameter. Because the command omits the optional `--tier` and `--key-id` parameters, Parameter Store creates a standard `SecureString` parameter and encrypts it under the Amazon managed key.

```
aws ssm put-parameter \
    --name MyParameter \
    --value "secret_value" \
    --type SecureString
```

The following similar example uses the `--key-id` parameter to specify a customer managed key. The example uses a KMS key ID to identify the KMS key. However, you can use any valid KMS key identifier. Because the command omits the `Tier` parameter (`--tier`), Parameter Store creates a standard `SecureString` parameter, not an advanced one.

```
aws ssm put-parameter \
    --name param1 \
    --value "secret" \
```

```
    --type SecureString \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

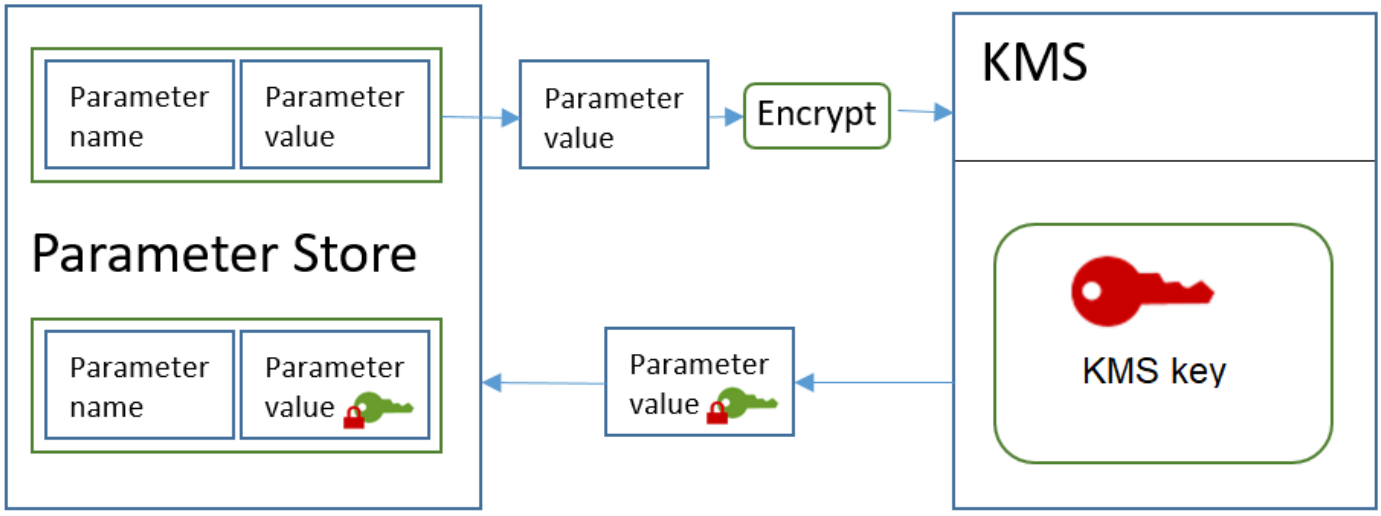
When you get a `SecureString` parameter from Parameter Store, its value is encrypted. To get a parameter, use the GetParameter operation in the Systems Manager API.

The following example uses the Systems Manager get-parameter command in the Amazon CLI to get the `MyParameter` parameter from Parameter Store without decrypting its value.

```
aws ssm get-parameter --name MyParameter
```

```
{
    "Parameter": {
        "Type": "SecureString",
        "Name": "MyParameter",
        "Value": "AQECAHgnOkMROh5LaLXkA4j0+vYi6tmM17Lg"
    }
}
```

To decrypt the parameter value before returning it, set the `WithDecryption` parameter of `GetParameter` to `true`. When you use `WithDecryption`, Parameter Store calls the Amazon KMS Decrypt operation on your behalf to decrypt the parameter value. As a result, the `GetParameter` request returns the parameter with a plaintext parameter value, as shown in the following example.



```
aws ssm get-parameter \
    --name MyParameter \
    --with-decryption
```

```
{
    "Parameter": {
        "Type": "SecureString",
        "Name": "MyParameter",
        "Value": "secret_value"
    }
}
```

The following workflow shows how Parameter Store uses a KMS key to encrypt and decrypt a standard `SecureString` parameter.

Encrypt a standard parameter

1. When you use `PutParameter` to create a `SecureString` parameter, Parameter Store sends an `Encrypt` request to Amazon KMS. That request includes the plaintext parameter value, the KMS key that you chose, and the Parameter Store encryption context. During transmission to Amazon KMS, the plaintext value in the `SecureString` parameter is protected by Transport Layer Security (TLS).
2. Amazon KMS encrypts the parameter value with the specified KMS key and encryption context. It returns the ciphertext to Parameter Store, which stores the parameter name and its encrypted value.

Decrypt a standard parameter

1. When you include the `WithDecryption` parameter in a `GetParameter` request, Parameter Store sends a `Decrypt` request to Amazon KMS with the encrypted `SecureString` parameter value and the Parameter Store encryption context.
2. Amazon KMS uses the same KMS key and the supplied encryption context to decrypt the encrypted value. It returns the plaintext (decrypted) parameter value to Parameter Store. During transmission, the plaintext data is protected by TLS.
3. Parameter Store returns the plaintext parameter value to you in the `GetParameter` response.

Protecting advanced SecureString parameters

When you use `PutParameter` to create an advanced `SecureString` parameter, Parameter Store uses envelope encryption with the Amazon Encryption SDK and a symmetric encryption Amazon KMS key to protect the parameter value. Each advanced parameter value is encrypted under a unique data key, and the data key is encrypted under a KMS key. You can use the Amazon managed key for the account (`aws/ssm`) or any customer managed key.

The Amazon Encryption SDK is an open-source, client-side library that helps you to encrypt and decrypt data using industry standards and best practices. It's supported on multiple platforms and in multiple programming languages, including a command-line interface. You can view the source code and contribute to its development in GitHub.

For each `SecureString` parameter value, Parameter Store calls the Amazon Encryption SDK to encrypt the parameter value using a unique data key that Amazon KMS generates (GenerateDataKey). The Amazon Encryption SDK returns to Parameter Store an encrypted message that includes the encrypted parameter value and an encrypted copy of the unique data key. Parameter Store stores the entire encrypted message in the `SecureString` parameter value. Then, when you get an advanced `SecureString` parameter value, Parameter Store uses the Amazon Encryption SDK to decrypt the parameter value. This requires a call to Amazon KMS to decrypt the encrypted data key.

To create an advanced `SecureString` parameter, use the PutParameter operation in the Systems Manager API. Set the value of `Tier` parameter to `Advanced`. Include a `Type` parameter with a value of `SecureString`. To specify a KMS key, use the `KeyId` parameter. The default is the Amazon managed key for your account, `aws/ssm`.

```
aws ssm put-parameter \
    --name MyParameter \
    --value "secret_value" \
    --type SecureString \
    --tier Advanced
```

The following similar example uses the `--key-id` parameter to specify a customer managed key. The example uses the Amazon Resource Name (ARN) of the KMS key. However, you can use any valid KMS key identifier.

```
aws ssm put-parameter \
    --name MyParameter \
```

```
    --value "secret_value" \
    --type SecureString \
    --tier Advanced \
    --key-id arn:aws:kms:us-
east-2:987654321098:key/1234abcd-12ab-34cd-56ef-1234567890ab
```

When you get a `SecureString` parameter from Parameter Store, its value is the encrypted message that the Amazon Encryption SDK returned. To get a parameter, use the GetParameter operation in the Systems Manager API.

The following example uses the Systems Manager `GetParameter` operation to get the `MyParameter` parameter from Parameter Store without decrypting its value.

```
aws ssm get-parameter --name MyParameter
```

```
{
    "Parameter": {
        "Type": "SecureString",
        "Name": "MyParameter",
        "Value": "AQECAHgnOkMROh5LaLXkA4j0+vYi6tmM17Lg"
    }
}
```

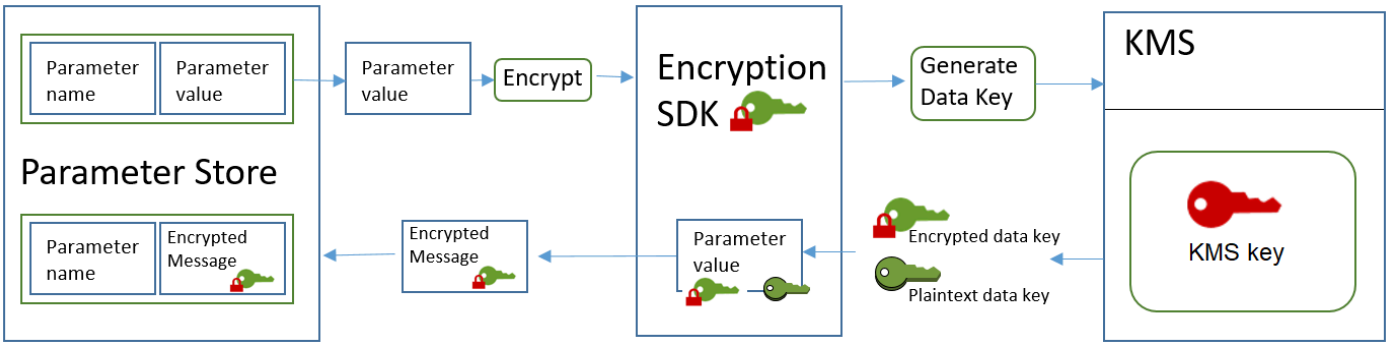
To decrypt the parameter value before returning it, set the `WithDecryption` parameter of `GetParameter` to `true`. When you use `WithDecryption`, Parameter Store calls the Amazon KMS Decrypt operation on your behalf to decrypt the parameter value. As a result, the `GetParameter` request returns the parameter with a plaintext parameter value, as shown in the following example.

```
aws ssm get-parameter \
    --name MyParameter \
    --with-decryption
```

```
{
    "Parameter": {
        "Type": "SecureString",
        "Name": "MyParameter",
        "Value": "secret_value"
    }
```

```
}
```

You cannot convert an advanced `SecureString` parameter to a standard one. However, you can convert a standard `SecureString` to an advanced one. To convert a standard `SecureString` parameter to an advanced `SecureString`, use the `PutParameter` operation with the `Overwrite` parameter. The `Type` must be `SecureString` and the `Tier` value must be `Advanced`. The `KeyId` parameter, which identifies a customer managed key is optional. If you omit it, Parameter Store uses the Amazon managed key for the account. You can specify any KMS key that the principal has permission to use, even if you used a different KMS key to encrypt the standard parameter.



When you use the `Overwrite` parameter, Parameter Store uses the Amazon Encryption SDK to encrypt the parameter value. Then it stores the newly encrypted message in Parameter Store.

```
aws ssm put-parameter \
    --name myStdParameter \
    --value "secret_value"  \
    --type SecureString \
    --tier Advanced \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --overwrite
```

The following workflow shows how Parameter Store uses a KMS key to encrypt and decrypt an advanced `SecureString` parameter.

Encrypt an advanced parameter

1. When you use `PutParameter` to create an advanced `SecureString` parameter, Parameter Store uses the Amazon Encryption SDK and Amazon KMS to encrypt the parameter value. Parameter Store calls the Amazon Encryption SDK with the parameter value, the KMS key that you specified, and the Parameter Store encryption context.
2. The Amazon Encryption SDK sends a GenerateDataKey request to Amazon KMS with the identifier of the KMS key that you specified and the Parameter Store encryption context. Amazon KMS returns two copies of the unique data key: one in plaintext and one encrypted under the KMS key. (The encryption context is used when encrypting the data key.)
3. The Amazon Encryption SDK uses the plaintext data key to encrypt the parameter value. It returns an encrypted message that includes the encrypted parameter value, the encrypted data key, and other data, including the Parameter Store encryption context.
4. Parameter Store stores the encrypted message as the parameter value.

Decrypt an advanced parameter

1. You can include the `WithDecryption` parameter in a `GetParameter` request to get an advanced `SecureString` parameter. When you do, Parameter Store passes the encrypted message from the parameter value to a decryption method of the Amazon Encryption SDK.
2. The Amazon Encryption SDK calls the Amazon KMS Decrypt operation. It passes in the encrypted data key and the Parameter Store encryption context from the encrypted message.
3. Amazon KMS uses the KMS key and the Parameter Store encryption context to decrypt the encrypted data key. Then it returns the plaintext (decrypted) data key to the Amazon Encryption SDK.
4. The Amazon Encryption SDK uses the plaintext data key to decrypt the parameter value. It returns the plaintext parameter value to Parameter Store.
5. Parameter Store verifies the encryption context and returns the plaintext parameter value to you in the `GetParameter` response.

Setting permissions to encrypt and decrypt parameter values

To encrypt a standard `SecureString` parameter value, the user needs `kms:Encrypt` permission. To encrypt an advanced `SecureString` parameter value, the user needs `kms:GenerateDataKey` permission. To decrypt either type of `SecureString` parameter value, the user needs `kms:Decrypt` permission.

You can use Amazon Identity and Access Management (IAM) policies to allow or deny permission for a user to call the Systems Manager `PutParameter` and `GetParameter` operations.

If you are using customer managed keys to encrypt your `SecureString` parameter values, you can use IAM policies and key policies to manage encrypt and decrypt permissions. However, you cannot

establish access control policies for the default `aws/ssm` KMS key. For detailed information about controlling access to customer managed keys, see KMS key access and permissions in the *Amazon Key Management Service Developer Guide*.

The following example shows an IAM policy designed for standard `SecureString` parameters. It allows the user to call the Systems Manager `PutParameter` operation on all parameters in the `FinancialParameters` path. The policy also allows the user to call the Amazon KMS `Encrypt` operation on an example customer managed key.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ssm:PutParameter"
            ],
            "Resource": "arn:aws-cn:ssm:us-east-1:111122223333:parameter/
FinancialParameters/*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "kms:Encrypt"
            ],
            "Resource": "arn:aws-cn:kms:us-
east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
        }
    ]
}
```

The next example shows an IAM policy that is designed for advanced `SecureString` parameters. It allows the user to call the Systems Manager `PutParameter` operation on all parameters in the `ReservedParameters` path. The policy also allows the user to call the Amazon KMS `GenerateDataKey` operation on an example customer managed key.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ssm:PutParameter"
            ],
            "Resource": "arn:aws-cn:ssm:us-east-1:111122223333:parameter/
ReservedParameters/*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "kms:GenerateDataKey"
            ],
            "Resource": "arn:aws-cn:kms:us-east-1:111122223333:key/key-id"
        }
    ]
}
```

The final example also shows an IAM policy that can be used for standard or advanced `SecureString` parameters. It allows the user to call the Systems Manager `GetParameter` operations (and related operations) on all parameters in the `ITParameters` path. The policy also allows the user to call the Amazon KMS `Decrypt` operation on an example customer managed key.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ssm:GetParameter*"
            ],
            "Resource": "arn:aws-cn:ssm:us-east-1:111122223333:parameter/
ITParameters/*"
```

```
        },
        {
            "Effect": "Allow",
            "Action": [
                "kms:Decrypt"
            ],
            "Resource": "arn:aws-cn:kms:us-
east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
        }
    ]
}
```

Parameter Store encryption context

An *encryption context* is a set of key–value pairs that contain arbitrary nonsecret data. When you include an encryption context in a request to encrypt data, Amazon KMS cryptographically binds the encryption context to the encrypted data. To decrypt the data, you must pass in the same encryption context.

You can also use the encryption context to identify a cryptographic operation in audit records and logs. The encryption context appears in plaintext in logs, such as Amazon CloudTrail logs.

The Amazon Encryption SDK also takes an encryption context, although it handles it differently. Parameter Store supplies the encryption context to the encryption method. The Amazon Encryption SDK cryptographically binds the encryption context to the encrypted data. It also includes the encryption context in plain text in the header of the encrypted message that it returns. However, unlike Amazon KMS, the Amazon Encryption SDK decryption methods do not take an encryption context as input. Instead, when it decrypts data, the Amazon Encryption SDK gets the encryption context from the encrypted message. Parameter Store verifies that the encryption context includes the value that it expects before returning the plaintext parameter value to you.

Parameter Store uses the following encryption context in its cryptographic operations:

- Key: `PARAMETER_ARN`
- Value: The Amazon Resource Name (ARN) of the parameter that is being encrypted.

The format of the encryption context is as follows:

```
"PARAMETER_ARN":"arn:aws:ssm:region-id:account-id:parameter/parameter-name"
```

For example, Parameter Store includes this encryption context in calls to encrypt and decrypt the `MyParameter` parameter in an example Amazon Web Services account and region.

```
"PARAMETER_ARN":"arn:aws:ssm:us-east-2:111122223333:parameter/MyParameter"
```

If the parameter is in a Parameter Store hierarchical path, the path and name are included in the encryption context. For example, this encryption context is used when encrypting and decrypting the `MyParameter` parameter in the `/ReadableParameters` path in an example Amazon Web Services account and region.

```
"PARAMETER_ARN":"arn:aws:ssm:us-east-2:111122223333:parameter/ReadableParameters/
MyParameter"
```

You can decrypt an encrypted `SecureString` parameter value by calling the Amazon KMS `Decrypt` operation with the correct encryption context and the encrypted parameter value that the Systems Manager `GetParameter` operation returns. However, we encourage you to decrypt Parameter Store parameter values by using the `GetParameter` operation with the `WithDecryption` parameter.

You can also include the encryption context in an IAM policy. For example, you can permit a user to decrypt only one particular parameter value or set of parameter values.

The following example IAM policy statement allows the user to the get value of the `MyParameter` parameter and to decrypt its value using the specified KMS key. However the permissions apply only when the encryption context matches specified string. These permissions do not apply to any other parameter or KMS key, and the call to `GetParameter` fails if the encryption context does not match the string.

Before using a policy statement like this one, replace the *`example ARNs`* with valid values.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
```

```
            "Action": [
                "ssm:GetParameter*"
            ],
            "Resource": "arn:aws-cn:ssm:us-
east-1:111122223333:parameter/MyParameter"
        },
        {
            "Effect": "Allow",
            "Action": [
                "kms:Decrypt"
            ],
            "Resource": "arn:aws-cn:kms:us-east-1:111122223333:key/key-id",
            "Condition": {
                "StringEquals": {
                    "kms:EncryptionContext:PARAMETER_ARN":"arn:aws-cn:ssm:us-
east-1:111122223333:parameter/MyParameter"
                }
            }
        }
    ]
}
```

Troubleshooting KMS key issues in Parameter Store

To perform any operation on a `SecureString` parameter, Parameter Store must be able to use the Amazon KMS KMS key that you specify for your intended operation. Most of the Parameter Store failures related to KMS keys are caused by the following problems:

- The credentials that an application is using do not have permission to perform the specified action on the KMS key.

  To fix this error, run the application with different credentials or revise the IAM or key policy that is preventing the operation. For help with Amazon KMS IAM and key policies, see KMS key access and permissions in the *Amazon Key Management Service Developer Guide*.

- The KMS key is not found.

  This typically happens when you use an incorrect identifier for the KMS key. Find the correct identifiers for the KMS key and try the command again.

- The KMS key is not enabled. When this occurs, Parameter Store returns an InvalidKeyId exception with a detailed error message from Amazon KMS. If the KMS key state is `Disabled`, enable it. If

it is `Pending Import`, complete the import procedure. If the key state is `Pending Deletion`, cancel the key deletion or use a different KMS key.

To find the key state of a KMS key, use the DescribeKey operation.

Use Parameter Store parameters in Amazon Elastic Kubernetes Service

To show parameters from Parameter Store, a tool of Amazon Systems Manager, as files mounted in Amazon EKS Pods, you can use the Amazon Secrets and Configuration Provider for the Kubernetes Secrets Store CSI Driver. The ASCP works with Amazon Elastic Kubernetes Service 1.17+ running an Amazon EC2 node group. Amazon Fargate node groups are not supported.

With the ASCP, you can store and manage your parameter in Parameter Store and then retrieve them through your workloads running on Amazon EKS. If your parameter contains multiple key-value pairs in JSON format, you can choose which ones to mount in Amazon EKS. The ASCP uses JMESPath syntax to query the key-value pairs in your secret. The ASCP also works with Amazon Secrets Manager secrets.

The ASCP offers two methods of authentication with Amazon EKS The first approach uses IAM Roles for Service Accounts (IRSA). The second approach uses Pod Identities. Each approach has its benefits and use cases.

ASCP with IAM Roles for Service Accounts (IRSA)

The ASCP with IAM Roles for Service Accounts (IRSA) lets you mount parameters from Parameter Store as files in your Amazon EKS Pods. This approach is suitable when:

- You need to mount parameters as files in your Pods.
- You're using Amazon EKS version 1.17 or later with Amazon EC2 node groups.
- You want to retrieve specific key-value pairs from JSON-formatted parameters.

For more information, see Use Amazon Secrets and Configuration Provider CSI with IAM Roles for Service Accounts (IRSA).

ASCP with Pod Identity

ASCP with EKS Pod Identity

The ASCP with Pod Identity method enhances security and simplifies configuration for accessing parameters in Parameter Store. This approach is beneficial when:

- You need more granular permission management at the Pod level.
- You're using Amazon EKS version 1.24 or later.
- You want improved performance and scalability.

For more information, see Use Amazon Secrets and Configuration Provider CSI with Pod Identity for Amazon EKS.

Choosing the right approach

Consider the following factors when deciding between ASCP with IRSA and ASCP with Pod Identity:

- Amazon EKSversion: Pod Identity requires Amazon EKS 1.24+, while CSI driver works with Amazon EKS 1.17+.
- Security requirements: Pod Identity offers more granular control at the Pod level.
- Performance: Pod Identity generally performs better in high-scale environments.
- Complexity: Pod Identity simplifies setup by eliminating the need for separate service accounts.

Choose the method that best aligns with your specific requirements and Amazon EKS environment.

Install ASCP for Amazon EKS

This section explains how to install the Amazon Secrets and Configuration Provider for Amazon EKS. With ASCP, you can mount parameters from Parameter Store and secrets from Amazon Secrets Manager as files in Amazon EKS Pods.

Prerequisites

- An Amazon EKS cluster
  - Version 1.24 or later for Pod Identity
  - Version 1.17 or later for IRSA
- The Amazon CLI installed and configured
- kubectl installed and configured for your Amazon EKS cluster
- Helm (version 3.0 or later)

Install and configure the ASCP

The ASCP is available on GitHub in the secrets-store-csi-provider-aws repository. The repo also contains example YAML files for creating and mounting a secret by changing the `objectType` value from `secretsmanager` to `ssmparameter`.

During installation, you can configure the ASCP to use a FIPS endpoint. For a list of Systems Manager endpoints, see Systems Manager service endpoints in the *Amazon Web Services General Reference*.

To install the ASCP by using Helm

1. To make sure the repo is pointing to the latest charts, use `helm repo update`.
2. Add the Secrets Store CSI Driver chart.

```
helm repo add secrets-store-csi-driver https://kubernetes-sigs.github.io/secrets-store-csi-driver/charts
```

3. Install the chart. To configure throttling, add the following flag: `--set-json 'k8sThrottlingParams={"qps": "number of queries per second", "burst": "number of queries per second"}'`

```
helm install -n kube-system csi-secrets-store secrets-store-csi-driver/secrets-store-csi-driver
```

4. Add the ASCP chart.

```
helm repo add aws-secrets-manager https://aws.github.io/secrets-store-csi-driver-provider-aws
```

5. Install the chart. To use a FIPS endpoint, add the following flag: `--set useFipsEndpoint=true`

```
helm install -n kube-system secrets-provider-aws aws-secrets-manager/secrets-store-csi-driver-provider-aws
```

To install by using the YAML in the repo

- Use the following commands.

```
helm repo add secrets-store-csi-driver https://kubernetes-sigs.github.io/secrets-
store-csi-driver/charts
helm install -n kube-system csi-secrets-store secrets-store-csi-driver/secrets-
store-csi-driver
kubectl apply -f https://raw.githubusercontent.com/aws/secrets-store-csi-driver-
provider-aws/main/deployment/aws-provider-installer.yaml
```

Verify the installations

To verify the installations of your EKS cluster, Secrets Store CSI driver, and ASCP plugin, follow these steps:

1. Verify the EKS cluster:

   ```
   eksctl get cluster --name clusterName
   ```

   This command should return information about your cluster.

2. Verify the Secrets Store CSI driver installation:

   ```
   kubectl get pods -n kube-system -l app=secrets-store-csi-driver
   ```

   You should see Pods running with names like `csi-secrets-store-secrets-store-csi-driver-xxx`.

3. Verify the ASCP plugin installation:

   YAML installation

   ```
   $ kubectl get pods -n kube-system -l app=csi-secrets-store-provider-aws
   ```

   Example output:

   ```
   NAME                                     READY   STATUS    RESTARTS   AGE
   csi-secrets-store-provider-aws-12345      1/1     Running   0          2m
   ```

Helm installation

```
$  kubectl get pods -n kube-system -l app=secrets-store-csi-driver-provider-aws
```

Example output:

```
NAME                                                READY   STATUS    RESTARTS
 AGE
secrets-provider-aws-secrets-store-csi-driver-provider-67890       1/1
 Running   0          2m
```

You should see Pods in the Running state.

After running these commands, if everything is set up correctly, you should see all components running without any errors. If you encounter any issues, you may need to troubleshoot by checking the logs of the specific Pods that are having problems.

Troubleshooting

1. To check the logs of the ASCP provider, run:

   ```
   kubectl logs -n kube-system -l app=csi-secrets-store-provider-aws
   ```

2. Check the status of all pods in the kube-system namespace.

   Replace the *default placeholder text* with your own pod ID:

   ```
   kubectl -n kube-system get pods
   ```

   ```
   kubectl -n kube-system logs pod/pod-id
   ```

   All Pods related to the CSI driver and ASCP should be in the 'Running' state.

3. Check the CSI driver version:

   ```
   kubectl get csidriver secrets-store.csi.k8s.io -o yaml
   ```

   This command should return information about the installed CSI driver.

Additional resources

For more information about using ASCP with Amazon EKS, see the following resources:

- Using Pod Identity with Amazon EKS
- Amazon Secrets Store CSI Driver on GitHub

Use Amazon Secrets and Configuration Provider CSI with Pod Identity for Amazon EKS

The Amazon Secrets and Configuration Provider integration with the Pod Identity Agent for Amazon Elastic Kubernetes Service provides enhanced security, simplified configuration, and improved performance for applications running on Amazon EKS. Pod Identity simplifies Amazon Identity and Access Management (IAM) authentication for Amazon EKS when retrieving parameters from Amazon Systems Manager Parameter Store or secrets from Secrets Manager.

Amazon EKS Pod Identity streamlines the process of configuring IAM permissions for Kubernetes applications by allowing permissions to be set up directly through Amazon EKS interfaces, reducing the number of steps and eliminating the need to switch between Amazon EKS and IAM services. Pod Identity enables the use of a single IAM role across multiple clusters without updating trust policies and supports role session tags for more granular access control. This approach not only simplifies policy management by allowing reuse of permission policies across roles but also enhances security by enabling access to Amazon resources based on matching tags.

How it works

1. Pod Identity assigns an IAM role to the Pod.
2. ASCP uses this role to authenticate with Amazon Web Services services.
3. If authorized, ASCP retrieves the requested parameters and makes them available to the Pod.

For more information, see Understand how Amazon EKS Pod Identity works in the *Amazon EKS User Guide*.

Prerequisites

> **Important**
>
> Pod Identity is supported only for Amazon EKS in the cloud. It is not supported for Amazon EKS Anywhere, Red Hat OpenShift Service on Amazon, or self-managed Kubernetes clusters on Amazon EC2 instances.

- Amazon EKS cluster (version 1.24 or later)
- Access to Amazon CLI and Amazon EKS cluster through `kubectl`
- (Optional) Access to two Amazon Web Services accounts for cross-account access

Install the Amazon EKS Pod Identity Agent

To use Pod Identity with your cluster, you must install the Amazon EKS Pod Identity Agent add-on.

To install the Pod Identity Agent

- Install the Pod Identity Agent add-on on your cluster.

  Replace the *default placeholder text* with your own values:

  ```
  eksctl create addon \
    --name eks-pod-identity-agent \
    --cluster clusterName \
    --region region
  ```

Set up ASCP with Pod Identity

1. Create a permissions policy that grants `ssm:GetParameters` and `ssm:DescribeParameters` permission to the parameters that the Pod needs to access.
2. Create an IAM role that can be assumed by the Amazon EKS service principal for Pod Identity:

   JSON

   ```
   {
       "Version":"2012-10-17",
   ```

```
    "Statement": [
      {
        "Effect": "Allow",
        "Principal": {
          "Service": "pods.eks.amazonaws.com"
        },
        "Action": [
          "sts:AssumeRole",
          "sts:TagSession"
        ]
      }
    ]
  }
```

Attach the IAM policy to the role.

Replace the *default placeholder text* with your own values:

```
aws iam attach-role-policy \
  --role-name MY_ROLE \
  --policy-arn POLICY_ARN
```

3. Create a Pod Identity association. For an example, see Create a Pod Identity association in the *Amazon EKS User Guide*
4. Create the `SecretProviderClass` that specifies which parameters or secrets to mount in the Pod:

```
kubectl apply -f kubectl apply -f https://raw.githubusercontent.com/aws/
secrets-store-csi-driver-provider-aws/main/examples/ExampleSecretProviderClass-
PodIdentity.yaml
```

The key difference in `SecretProviderClass` between IRSA and Pod Identity is the optional parameter `usePodIdentity`. It is an optional field that determines the authentication approach. When not specified, it defaults to using IAM Roles for Service Accounts (IRSA).

- To use EKS Pod Identity, use any of these values: `"true", "True", "TRUE", "t", "T"`.
- To explicitly use IRSA, set to any of these values: `"false", "False", "FALSE", "f", or "F"`.

5. Deploy the Pod that mounts the parameters or secrets under `/mnt/secrets-store`:

```
kubectl apply -f kubectl apply -f https://raw.githubusercontent.com/aws/secrets-
store-csi-driver-provider-aws/main/examples/ExampleDeployment-PodIdentity.yaml
```

6. If you use a private Amazon EKS cluster, make sure the VPC that the cluster is in has an Amazon STS endpoint. For information about creating an endpoint, see Interface VPC endpoints in the *Amazon Identity and Access Management User Guide*.

Verify the secret mount

To verify that the parameter or secret is mounted properly, run the following command.

Replace the *default placeholder text* with your own values:

```
kubectl exec -it $(kubectl get pods | awk '/pod-identity-deployment/{print $1}' | head
 -1) -- cat /mnt/secrets-store/MyParameter
```

To set up Amazon EKS Pod Identity to access to parameters in Parameter Store

1. Create a permissions policy that grants `ssm:GetParameters` and `ssm:DescribeParameters` permission to the parameters that the Pod needs to access.
2. Create a parameter in Parameter Store if you do not already have one. For information, see Creating Parameter Store parameters in Systems Manager.

Troubleshoot

You can view most errors by describing the Pod deployment.

To see error messages for your container

1. Get a list of Pod names with the following command. If you aren't using the default namespace, use `-n` *namespace*.

   ```
   kubectl get pods
   ```

2. To describe the Pod, in the following command, for *pod-id* use the Pod ID from the Pods you found in the previous step. If you aren't using the default namespace, use `-n` *NAMESPACE*.

   ```
   kubectl describe pod/pod-id
   ```

To see errors for the ASCP

- To find more information in the provider logs, in the following command, for *PODID* use the ID of the *csi-secrets-store-provider-aws* Pod.

```
kubectl -n kube-system get pods
kubectl -n kube-system logs pod/pod-id
```

Use Amazon Secrets and Configuration Provider CSI with IAM Roles for Service Accounts (IRSA)

Prerequisites

- Amazon EKS cluster (version 1.17 or later)
- Access to Amazon CLI and Amazon EKS cluster through `kubectl`

Set up access control

The ASCP retrieves the Amazon EKS Pod Identity and exchanges it for an IAM role. You set permissions in an IAM policy for that IAM role. When the ASCP assumes the IAM role, it gets access to the parameters you authorized. Other containers can't access the parameters unless you also associate them with the IAM role.

To grant your Amazon EKS Pod access to parameters in Parameter Store

1. Create a permissions policy that grants `ssm:GetParameters` and `ssm:DescribeParameters` permission to the parameters that the Pod needs to access.
2. Create an IAM OpenID Connect (OIDC) provider for the cluster if you don't already have one. For more information, see Create an IAM OIDC provider for your cluster in the *Amazon EKS User Guide*.
3. Create an IAM role for service account and attach the policy to it. For more information, see Create an IAM role for a service account in the *Amazon EKS User Guide*.
4. If you use a private Amazon EKS cluster, make sure the VPC that the cluster is in has an Amazon STS endpoint. For information about creating an endpoint, see Interface VPC endpoints in the *Amazon Identity and Access Management User Guide*.

Identify which parameters to mount

To determine which parameters the ASCP mounts in Amazon EKS as files on the filesystem, you create a SecretProviderClass YAML file. The `SecretProviderClass` lists the parameters to mount and the file name to mount them as. The `SecretProviderClass` must be in the same namespace as the Amazon EKS Pod it references.

Mount the parameters as files

The following instructions show how to mount parameters as files using example YAML files ExampleSecretProviderClass.yaml and ExampleDeployment.yaml.

To mount parameters in Amazon EKS

1. Apply the `SecretProviderClass` to the Pod:

```
kubectl apply -f ExampleSecretProviderClass.yaml
```

2. Deploy your Pod:

```
kubectl apply -f ExampleDeployment.yaml
```

3. The ASCP mounts the files.

Troubleshoot

You can view most errors by describing the Pod deployment.

To see error messages for your container

1. Get a list of Pod names with the following command. If you aren't using the default namespace, use `-n` *`name-space`*.

```
kubectl get pods
```

2. To describe the Pod, in the following command, for *`pod-id`* use the Pod ID from the Pods you found in the previous step. If you aren't using the default namespace, use `-n` *`nameSpace`*.

```
kubectl describe pod/pod-id
```

To see errors for the ASCP

- To find more information in the provider logs, in the following command, for *pod-id* use the ID of the *csi-secrets-store-provider-aws* Pod.

```
kubectl -n kube-system get pods
kubectl -n kube-system logs Pod/pod-id
```

- **Verify that the `SecretProviderClass` CRD is installed:**

```
kubectl get crd secretproviderclasses.secrets-store.csi.x-k8s.io
```

  This command should return information about the `SecretProviderClass` custom resource definition.

- **Verify that the SecretProviderClass object was created.**

```
kubectl get secretproviderclass SecretProviderClassName -o yaml
```

Amazon Secrets and Configuration Provider code examples

ASCP authentication and access control examples

Example: IAM policy allowing Amazon EKS Pod Identity service (pods.eks.amazonaws.com) to assume the role and tag the session:

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "pods.eks.amazonaws.com"
      },
      "Action": [
        "sts:AssumeRole",
```

```
        "sts:TagSession"
      ]
    }
  ]
}
```

SecretProviderClass

You use YAML to describe which parameters to mount in Amazon EKS using the ASCP. For examples, see SecretProviderClass usage.

SecretProviderClass YAML structure

```
apiVersion: secrets-store.csi.x-k8s.io/v1
kind: SecretProviderClass
metadata:
   name: name
spec:
  provider: aws
  parameters:
    region:
    failoverRegion:
    pathTranslation:
    usePodIdentity:
    preferredAddressType:
    objects:
```

The parameters field contains the details of the mount request:

region

(Optional) The Amazon Web Services Region of the parameter. If you don't use this field, the ASCP looks up the Region from the annotation on the node. This lookup adds overhead to mount requests, so we recommend that you provide the Region for clusters that use large numbers of Pods.

If you also specify `failoverRegion`, the ASCP tries to retrieve the parameter from both Regions. If either Region returns a `4xx` error, for example for an authentication issue, the ASCP does not mount either parameter. If the parameter is retrieved successfully from `region`, then the ASCP mounts that parameter value. If the parameter is not retrieved successfully from

`region`, but it is retrieved successfully from `failoverRegion`, then the ASCP mounts that parameter value.

`failoverRegion`

(Optional) If you include this field, the ASCP tries to retrieve the parameter from the Regions defined in `region` and this field. If either Region returns a `4xx` error, for example for an authentication issue, the ASCP does not mount either parameter. If the parameter is retrieved successfully from `region`, then the ASCP mounts that parameter value. If the parameter is not retrieved successfully from `region`, but it is retrieved successfully from `failoverRegion`, then the ASCP mounts that parameter value. For an example of how to use this field, see Multi-Region parameter failover.

pathTranslation

(Optional) A single substitution character to use if the file name in Amazon EKS will contain the path separator character, such as slash (/) on Linux. The ASCP can't create a mounted file that contains a path separator character. Instead, the ASCP replaces the path separator character with a different character. If you don't use this field, the replacement character is underscore (_), so for example, `My/Path/Parameter` mounts as `My_Path_Parameter`.

To prevent character substitution, enter the string `False`.

`usePodIdentity`

(Optional) Determines the authentication approach. When not specified, it defaults to IAM Roles for Service Accounts (IRSA) (IRSA).

- To use EKS Pod Identity, use any of these values: `"true""`, `"True"`, `"TRUE"`, `"t"`, or `"T"`.
- To explicitly use IRSA, set to any of these values: `"false"`, `"False"`, `"FALSE"`, `"f"`, or `"F""=`.

`preferredAddressType`

(Optional) Specifies the preferred IP address type for Pod Identity Agent endpoint communication. The field is only applicable when using EKS Pod Identity feature and will be ignored when using IAM Roles for Service Accounts.Values are case-insensitive. Valid values are:

- `"ipv4"`, `"IPv4""`, or `"IPV4"` – Force the use of Pod Identity Agent IPv4 endpoint
- `"ipv6"`, `"IPv6"`, or `"IPV6"` – Force the use of Pod Identity Agent IPv6 endpoint
- not specified – Use auto endpoint selection, trying IPv4 endpoint first and falling back to IPv6 endpoint if IPv4 fails

objects

A string containing a YAML declaration of the secrets to be mounted. We recommend using a YAML multi-line string or pipe (|) character.

objectName

Required. Specifies the name of the parameter or secret to be fetched. For Parameter Store, this is the `Name` of the parameter and can be either the name or full ARN of the parameter. For Secrets Manager this is the `SecretId` parameter and can be either the friendly name or full ARN of the secret.

objectType

Required if you don't use a Secrets Manager ARN for `objectName`. For Parameter Store, use `ssmparameter`. For Secrets Manager, use `secretsmanager`.

objectAlias

(Optional) The file name of the secret in the Amazon EKS Pod. If you don't specify this field, the `objectName` appears as the file name.

objectVersion

(Optional) The version ID of the parameter. Not recommended because you must update the version ID every time you update the parameter. By default the most recent version is used. If you include a `failoverRegion`, this field represents the primary `objectVersion`.

objectVersionLabel

(Optional) The alias for the version. The default is the most recent version `AWSCURRENT`. If you include a `failoverRegion`, this field represents the primary `objectVersionLabel`.

jmesPath

(Optional) A map of the keys in the parameter to the files to be mounted in Amazon EKS. To use this field, your parameter value must be in JSON format.

The following example shows what a JSON encoded parameter looks like.

```
{
    "username" : "myusername",
    "password" : "mypassword"
}
```

The keys are `username` and `password`. The value associated with `username` is `myusername`, and the value associated with `password` is `mypassword`.

If you use this field, you must include the subfields `path` and `objectAlias`.

path

A key from a key-value pair in the JSON of the parameter value. If the field contains a hyphen, use single quotes to escape it, for example: `path: '"hyphenated-path"'`

objectAlias

The file name to be mounted in the Amazon EKS Pod. If the field contains a hyphen, use single quotes to escape it, for example: `objectAlias: '"hyphenated-alias"'`

`failoverObject`

(Optional) If you specify this field, the ASCP tries to retrieve both the parameter specified in the primary `objectName` and the parameter specified in the `failoverObject` `objectName` sub-field. If either returns a `4xx` error, for example for an authentication issue, the ASCP does not mount either parameter. If the parameter is retrieved successfully from the primary `objectName`, then the ASCP mounts that parameter value. If the parameter is not retrieved successfully from the primary `objectName`, but it is retrieved successfully from the failover `objectName`, then the ASCP mounts that parameter value. If you include this field, you must include the field `objectAlias`. For an example of how to use this field, see Failover to a different parameter.

You typically use this field when the failover parameter isn't a replica. For an example of how to specify a replica, see Multi-Region parameter failover.

objectName

The name or full ARN of the failover parameter. If you use an ARN, the Region in the ARN must match the field `failoverRegion`.

objectVersion

(Optional) The version ID of the parameter. Must match the primary `objectVersion`. Not recommended because you must update the version ID every time you update the parameter. By default the most recent version is used.

objectVersionLabel

(Optional) The alias for the version. The default is the most recent version `AWSCURRENT`.

Create a basic SecretProviderClass configuration to mount parameters in your Amazon EKS Pods.

Pod Identity

SecretProviderClass to use a parameter in the same Amazon EKS cluster:

```
apiVersion: secrets-store.csi.x-k8s.io/v1
kind: SecretProviderClass
metadata:
  name: aws-parameter-store
spec:
  provider: aws
  parameters:
    objects: |
      - objectName: "MyParameter"
        objectType: "ssmparameter"
    usePodIdentity: "true"
```

IRSA

```
apiVersion: secrets-store.csi.x-k8s.io/v1
kind: SecretProviderClass
metadata:
  name: deployment-aws-parameter
spec:
  provider: aws
  parameters:
    objects: |
        - objectName: "MyParameter"
          objectType: "ssmparameter"
```

SecretProviderClass usage

Use these examples to create `SecretProviderClass` configurations for different scenarios.

Example: Mount parameters by name or ARN

This example shows how to mount three different types of parameters:

- A parameter specified by full ARN
- A parameter specified by name

- A parameter version of a secret

```
apiVersion: secrets-store.csi.x-k8s.io/v1
kind: SecretProviderClass
metadata:
  name: aws-parameters
spec:
  provider: aws
  parameters:
    objects: |
      - objectName: "arn:aws-cn:ssm:us-west-2:777788889999:parameter:MyParameter2-
d4e5f6"
      - objectName: "MyParameter3"
        objectType: "ssmparameter"
      - objectName: "MyParameter4"
        objectType: "ssmparameter"
        objectVersionLabel: "AWSCURRENT"
```

Example: Mount key-value pairs from a parameter

This example shows how to mount specific key-value pairs from a JSON-formatted parameter:

```
apiVersion: secrets-store.csi.x-k8s.io/v1
kind: SecretProviderClass
metadata:
  name: aws-parameters
spec:
  provider: aws
  parameters:
    objects: |
      - objectName: "arn:aws-cn:ssm:us-west-2:777788889999:parameter:MyParameter-
a1b2c3"
        jmesPath:
            - path: username
              objectAlias: dbusername
            - path: password
              objectAlias: dbpassword
```

Example: Failover configuration examples

These examples show how to configure failover for parameters.

Multi-Region parameter failover

This example shows how to configure automatic failover for a parameter replicated across multiple Regions:

```
apiVersion: secrets-store.csi.x-k8s.io/v1
kind: SecretProviderClass
metadata:
  name: aws-parameters
spec:
  provider: aws
  parameters:
    region: us-east-1
    failoverRegion: us-east-2
    objects: |
      - objectName: "MyParameter"
```

Failover to a different parameter

This example shows how to configure failover to a different parameter (not a replica):

```
apiVersion: secrets-store.csi.x-k8s.io/v1
kind: SecretProviderClass
metadata:
  name: aws-parameters
spec:
  provider: aws
  parameters:
    region: us-east-1
    failoverRegion: us-east-2
    objects: |
      - objectName: "arn:aws-cn:ssm:us-east-1:777788889999:parameter:MyParameter-
a1b2c3"
        objectAlias: "MyMountedParameter"
        failoverObject:
          - objectName: "arn:aws-cn:ssm:us-
east-2:777788889999:parameter:MyFailoverParameter-d4e5f6"
```

Using Parameter Store parameters in Amazon Lambda functions

Parameter Store enables you to securely store, organize, and retrieve configuration data at scale. It supports a wide range of use cases, from managing plain-text configuration values – such as database connection strings and application settings – to handling sensitive data like secrets for low-risk environments. Parameter Store is designed to simplify configuration management across environments, allowing teams to standardize how applications access critical data without hardcoding values or relying on fragmented storage solutions.

If you manage credentials that require automatic rotation, cross-account access, or fine-grained audit logging, we recommend using Amazon Secrets Manager. Secrets Manager is purpose-built for managing secrets such as database credentials, API keys, and supported third-party software-vended secrets. For more information, see What is Amazon Secrets Manager? in the *Amazon Secrets Manager User Guide*.

To use Parameter Store parameters in Amazon Lambda functions without using an SDK, you can use the Amazon Parameters and Secrets Lambda Extension. This extension retrieves parameter values and caches them for future use. Using the Lambda extension can reduce your costs by reducing the number of API calls to Parameter Store. Using the extension can also improve latency because retrieving a cached parameter is faster than retrieving it from Parameter Store.

A Lambda extension is a companion process that augments the capabilities of a Lambda function. An extension is like a client that runs in parallel to a Lambda invocation. This parallel client can interface with your function at any point during its lifecycle. For more information about Lambda extensions, see Lambda Extensions API in the *Amazon Lambda Developer Guide*.

The Amazon Parameters and Secrets Lambda Extension works for both Parameter Store and Amazon Secrets Manager. To learn how to use the Lambda extension with secrets from Secrets Manager, see Use Amazon Secrets Manager secrets in Amazon Lambda functions in the *Amazon Secrets Manager User Guide*.

How the extension works

To use parameters in a Lambda function *without* the Lambda extension, you must configure your Lambda function to receive configuration updates by integrating with the `GetParameter` API action for Parameter Store.

When you use the Amazon Parameters and Secrets Lambda Extension, the extension retrieves the parameter value from Parameter Store and stores it in the local cache. Then, the cached value is used for further invocations until it expires. Cached values expire after they pass their time-to-live (TTL). You can configure the TTL value using the `SSM_PARAMETER_STORE_TTL` environment variable, as explained later in this topic.

If the configured cache TTL has not expired, the cached parameter value is used. If the time has expired, the cached value is invalidated and the parameter value is retrieved from Parameter Store.

Also, the system detects parameter values that are used frequently and maintains them in the cache while clearing those that are expired or unused.

Implementation details

Use the following details to help you configure the Amazon Parameters and Secrets Lambda Extension.

Authentication

To authorize and authenticate Parameter Store requests, the extension uses the same credentials as those used to run the Lambda function itself. Therefore, the Amazon Identity and Access Management (IAM) role used to run the function must have the following permissions to interact with Parameter Store:

- `ssm:GetParameter` – Required to retrieve parameters from Parameter Store
- `kms:Decrypt` – Required if you are retrieving `SecureString` parameters from Parameter Store

For more information, see Amazon Lambda execution role in the *Amazon Lambda Developer Guide*.

Instantiation

For most Lambda functions, Lambda creates separate instances corresponding to the concurrency level that your function requires. Each instance is isolated and maintains its own local cache of your configuration data. For more information about Lambda instances and concurrency, see Configuring reserved concurrency in the *Amazon Lambda Developer Guide*.

For functions that use Lambda Managed Instances, a single execution environment serves multiple concurrent invocations, so those invocations share one instance of the extension and one local cache. For more information, see Lambda Managed Instances in the *Amazon Lambda Developer Guide*.

No SDK dependence

The Amazon Parameters and Secrets Lambda Extension works independently of any Amazon SDK language library. An Amazon SDK is not required to make GET requests to Parameter Store. However, we recommend using an Amazon SDK to retrieve the session token for the request header, as described later in this topic.

Localhost port

Use `localhost` in your GET requests. The extension makes requests to localhost port 2773. You do not need to specify an external or internal endpoint to use the extension. You can configure the port by setting the environment variable `PARAMETERS_SECRETS_EXTENSION_HTTP_PORT`.

For example, in Python, your GET URL might look something like the following example.

```
parameter_url = ('http://localhost:' + port + '/systemsmanager/parameters/get/?
name=' + ssm_parameter_path)
```

Changes to a parameter value before TTL expires

The extension doesn't detect changes to the parameter value and doesn't perform an auto-refresh before the TTL expires. If you change a parameter value, operations that use the cached parameter value might fail until the cache is next refreshed. If you expect frequent changes to a parameter value, we recommend setting a shorter TTL value.

Header requirement

To retrieve parameters from the extension cache, the header of your GET request must include an `X-Aws-Parameters-Secrets-Token` reference. Set the token to your function's session token. For most functions, this is provided in the `AWS_SESSION_TOKEN` environment variable. However, Lambda doesn't set this environment variable in all initialization modes. For example, if your function uses SnapStart, it obtains credentials from a container endpoint instead. To retrieve the session token reliably across all initialization modes, read the token from the credential provider chain of an Amazon SDK instead of from the environment variable. This header indicates that the request originates from within the Lambda environment.

Example

The following example in Python demonstrates a basic request to retrieve the value of a cached parameter. Resolve the session token inside the handler function, not at initialization time, so the token stays fresh after a SnapStart restore.

```
import urllib.request
import urllib.error
import json
import boto3

def lambda_handler(event, context):
    # Resolve the session token from the credential provider chain so that this
    # works across all initialization modes, including SnapStart.
    credentials = boto3.Session().get_credentials()
    if credentials is None:
        raise RuntimeError('Failed to resolve AWS credentials')
    session_token = credentials.get_frozen_credentials().token

    # Retrieve /my/parameter from Parameter Store using extension cache
    req = urllib.request.Request('http://localhost:2773/systemsmanager/parameters/
get?name=%2Fmy%2Fparameter')
    req.add_header('X-Aws-Parameters-Secrets-Token', session_token)
    try:
        config = urllib.request.urlopen(req).read()
    except urllib.error.URLError as e:
        raise RuntimeError('Failed to retrieve parameter') from e

    return json.loads(config)
```

ARM support

The extension supports the ARM architecture in most Amazon Web Services Regions where the x86_64 and x86 architectures are supported. If you are using the ARM architecture, we suggest you verify your architecture is supported. For complete lists of extension ARNs, see Amazon Parameters and Secrets Lambda Extension ARNs.

Logging

Lambda logs execution information about the extension along with the function by using Amazon CloudWatch Logs. By default, the extension logs a minimal amount of information to CloudWatch. To log more details, set the environment variable `PARAMETERS_SECRETS_EXTENSION_LOG_LEVEL` to `DEBUG`.

Adding the extension to a Lambda function

To use the Amazon Parameters and Secrets Lambda Extension, you add the extension to your Lambda function as a layer.

Use one of the following methods to add the extension to your function.

Amazon Web Services Management Console (Add layer option)

1. Open the Amazon Lambda console at https://console.amazonaws.cn/lambda/.
2. Choose your function. In the **Layers** area, choose **Add a layer**.
3. In the **Choose a layer** area, choose the **Amazon layers** option.
4. For **Amazon layers**, choose **Amazon-Parameters-and-Secrets-Lambda-Extension**, choose a version, and then choose **Add**.

Amazon Web Services Management Console (Specify ARN option)

1. Open the Amazon Lambda console at https://console.amazonaws.cn/lambda/.
2. Choose your function. In the **Layers** area, choose **Add a layer**.
3. In the **Choose a layer** area, choose the **Specify an ARN** option.
4. For **Specify an ARN**, enter the extension ARN for your Amazon Web Services Region and architecture, and then choose **Add**.

Amazon Command Line Interface

Run the following command in the Amazon CLI. Replace each *example resource placeholder* with your own information.

```
aws lambda update-function-configuration \
    --function-name function-name \
    --layers layer-ARN
```

Amazon Parameters and Secrets Lambda Extension environment variables

You can configure the extension by changing the following environment variables. To see the current settings, set PARAMETERS_SECRETS_EXTENSION_LOG_LEVEL to DEBUG. For more information, see Using Amazon Lambda environment variables in the *Amazon Lambda Developer Guide*.

Note

Amazon Lambda records operation details about the Lambda extension and Lambda function in Amazon CloudWatch Logs.

Environment variable	Details	Required	Valid values	Default value
`SSM_PARAMETER_STORE_TIMEOUT_MILLIS`	Timeout, in milliseconds, for requests to Parameter Store. A value of 0 (zero) indicates no timeout.	No	All whole numbers	0 (zero)
`SECRETS_MANAGER_TIMEOUT_MILLIS`	Timeout, in milliseconds, for requests to Secrets Manager. A value of 0 (zero) indicates no timeout.	No	All whole numbers	0 (zero)
`SSM_PARAMETER_STORE_TTL`	Maximum valid lifetime, in seconds, of a parameter in the cache before it is invalidated. A value of 0 (zero) indicates that the cache should	No	0 (zero) to 300 s (Five minutes)	300 s (Five minutes)

Environment variable	Details	Required	Valid values	Default value
	be bypassed. This variable is ignored if the value for PARAMETERS_SECRETS_EXTENSION_CACHE_SIZE is 0 (zero).			
SECRETS_MANAGER_TTL	Maximum valid lifetime, in seconds, of a secret in the cache before it is invalidated. A value of 0 (zero) indicates that the cache is bypassed. This variable is ignored if the value for PARAMETERS_SECRETS_EXTENSION_CACHE_SIZE is 0 (zero).	No	0 (zero) to 300 s (Five minutes)	300 s (5 minutes)

Environment variable	Details	Required	Valid values	Default value
PARAMETERS_SECRETS_EXTENSION_CACHE_ENABLED	Determines whether the cache for the extension is enabled. Value values: TRUE | FALSE	No	TRUE | FALSE	TRUE
PARAMETERS_SECRETS_EXTENSION_CACHE_SIZE	The maximum size of the cache in terms of number of items. A value of 0 (zero) indicates that the cache is bypassed. This variable is ignored if both cache TTL values are 0 (zero).	No	0 (zero) to 1000	1000
PARAMETERS_SECRETS_EXTENSION_HTTP_PORT	The port for the local HTTP server.	No	1 - 65535	2773

Environment variable	Details	Required	Valid values	Default value
PARAMETERS_SECRETS_EXTENSION_MAX_CONNECTIONS	Maximum number of connections for the HTTP clients that the extension uses to make requests to Parameter Store or Secrets Manager. This is a per-client configuration for the number of connections that both the Secrets Manager client and Parameter Store client make to the backend services.	No	Minimum of 1; No maximum limit.	3

Environment variable	Details	Required	Valid values	Default value
PARAMETERS_SECRETS_EXTENSION_LOG_LEVEL	The level of detail reported in logs for the extension. We recommend using DEBUG for the most detail about your cache configuration as you set up and test the extension. Logs for Lambda operations are automatically pushed to an associated CloudWatch Logs log group.	No	DEBUG | WARN | ERROR | NONE | INFO	INFO

Sample commands for using the Amazon Systems Manager Parameter Store and Amazon Secrets Manager Extension

The examples in this section demonstrate API actions for use with the Amazon Systems Manager Parameter Store and Amazon Secrets Manager extension.

Sample commands for Parameter Store

The Lambda extension uses read-only access to the **GetParameter** API action.

To call this action, make an HTTP GET call similar to the following. This command format provides access to parameters in the standard parameter tier.

```
GET http://localhost:port/systemsmanager/parameters/get?name=parameter-
name&version=version&label=label&withDecryption={true|false}
```

In this example, *parameter-name* represents the full parameter name. For a parameter not in a hierarchy, use a name like `MyParameter`. For a hierarchical parameter, use the URL-encoded path, such as `%2FDev%2FProduction%2FEast%2FProject-ABC%2FMyParameter` for `/Dev/Production/East/Project-ABC/MyParameter`.

> **Note**
>
> When using GET calls, parameter values must be encoded for HTTP to preserve special characters. For example, instead of formatting a hierarchical path like `/a/b/c`, encode characters that could be interpreted as part of the URL, such as `%2Fa%2Fb%2Fc`.

version and *label* are the selectors available for use with the `GetParameter` action.

```
GET http://localhost:port/systemsmanager/parameters/get/?name=MyParameter&version=5
```

To call a parameter in a hierarchy, make an HTTP GET call similar to the following.

```
GET http://localhost:port/systemsmanager/parameters/get?name=%2Fa%2Fb%2F&label=release
```

To call a public (global) parameter, make an HTTP GET call similar to the following.

```
GET http://localhost:port/systemsmanager/parameters/get/?name=%2Faws%2Fservice%20list
%2F…
```

To make an HTTP GET call to a Secrets Manager secret by using Parameter Store references, make an HTTP GET call similar to the following.

```
GET http://localhost:port/systemsmanager/parameters/get?name=%2Faws%2Freference
%2Fsecretsmanager%2F…
```

To make a call using the Amazon Resource Name (ARN) for a parameter, make an HTTP GET call similar to the following.

```
GET http://localhost:port/systemsmanager/parameters/get?name=arn:aws:ssm:us-
east-1:123456789012:parameter/MyParameter
```

To make a call that accesses a `SecureString` parameter with decryption, make an HTTP GET call similar to the following.

```
GET http://localhost:port/systemsmanager/parameters/get?
name=MyParameter&withDecryption=true
```

You can specify that parameters aren't decrypted by omitting `withDecryption` or explicitly setting it to `false`. You can also specify either a version or a label, but not both. If you do, only the first of these that is placed after question mark (?) in the URL is used.

Amazon Parameters and Secrets Lambda Extension ARNs

The latest Amazon Resource Name (ARN) for the Lambda extension is published as a public parameter in Systems Manager Parameter Store for each supported architecture. You can retrieve the latest ARN programmatically using the Amazon CLI or Amazon CloudFormation to make sure that your application always references the most recent extension version without manual updates. This section explains how to retrieve the ARN programmatically and provides tables listing the current ARN values for each architecture for manual reference.

Retrieving the latest Lambda extension ARN version

The latest Lambda extension ARN versions are stored as public parameters in the following locations. You can reference these public parameters in your code to retrieve them:

- **x86_64**: /aws/service/aws-parameters-and-secrets-lambda-extension/x86/latest
- **arm64**: /aws/service/aws-parameters-and-secrets-lambda-extension/arm64/latest

Amazon CLI

To retrieve the latest ARN versions using the Amazon CLI, run the following commands.

x86_64

```
aws ssm get-parameter --name "/aws/service/aws-parameters-and-secrets-lambda-extension/
x86/latest" --query "Parameter.Value" --output text
```

arm64

```
aws ssm get-parameter --name "/aws/service/aws-parameters-and-secrets-lambda-extension/
arm64/latest" --query "Parameter.Value" --output text
```

Amazon CloudFormation

When deploying Lambda functions using Amazon CloudFormation, you can resolve parameters directly during stack creation and updates, as shown in the following example YAML templates. This method ensures your function always uses the latest extension version without requiring manual updates.

x86_64

```
Resources:
  MyFunction:
    Type: AWS::Lambda::Function
    Properties:
      FunctionName: my-function
      Runtime: python3.11
      Handler: index.handler
      Code:
        ZipFile: |
          def handler(event, context):
              return {'statusCode': 200}
      Layers:
        - !Sub '{{resolve:ssm:/aws/service/aws-parameters-and-secrets-lambda-extension/
x86/latest}}'
      Role: !GetAtt MyFunctionRole.Arn
```

arm64

```
Layers:
  - !Sub '{{resolve:ssm:/aws/service/aws-parameters-and-secrets-lambda-extension/arm64/
latest}}'
```

> **Note**
>
> The `{{resolve:ssm:parameter-name}}` syntax automatically retrieves the parameter value during stack operations. This ensures you always deploy with the current ARN.

Latest extension ARNs

The following tables provide extension ARNs for supported architectures and Regions.

Topics

- Extension ARNs for the x86_64 and x86 architectures
- Extension ARNs for ARM64 and Mac with Apple silicon architectures

Extension ARNs for the x86_64 and x86 architectures

Integration with other products and services

Amazon Systems Manager has built-in integration for the products and services shown in the following table.

Service	Description
Ansible	Ansible is an IT automation platform that makes your applications and systems easier to deploy. Systems Manager provides the Systems Manager document (SSM document) `AWS-ApplyAnsiblePlaybooks` which lets you create State Manager associations that run Ansible playbooks. **Learn more**

Service	Description
	Creating associations that run Ansible playbooks
Chef	Chef is an IT automation tool that makes your applications and systems easier to deploy. Systems Manager provides the `AWS-ApplyChefRecipes` SSM document, which lets you create associations in State Manager, a tool in Amazon Systems Manager, that run Chef recipes. **Learn more** Creating associations that run Chef recipes Systems Manager also integrates with Chef InSpec profiles, allowing you to run compliance scans and view compliant and noncompliant nodes. **Learn more** Using Chef InSpec profiles with Systems Manager Compliance

Service	Description
GitHub	GitHub provides hosting for software development version control and collaboration. Systems Manager provides the SSM document `AWS-RunDocument`, which lets you run other SSM documents stored in GitHub, and the SSM document `AWS-RunRemoteScript`, which lets you run scripts stored in GitHub. **Learn more** • Running documents from remote locations • Running scripts from GitHub
Jenkins	Jenkins is an open-source automation server that allows developers to reliably build, test, and deploy their software. Automation can be used as a post-build step to pre-install application releases into Amazon Machine Images (AMIs). **Learn more** Updating AMIs using Automation and Jenkins

Service	Description
ServiceNow	ServiceNow is an enterprise service management system that lets you manage your IT services and operations. Automation, Change Manager, Incident Manager, and OpsCenter, all tools in Systems Manager, integrate with ServiceNow by using the Amazon Service Management Connector . With this integration, you can view, create, update, add correspondence, and resolve Amazon Web Services Support cases from ServiceNow. **Learn more** Integrating with ServiceNow

Service	Description
Terraform	HashiCorp Terraform is an open-source *infrastructure as code* (IaC) software tool that provides a command line interface (CLI) workflow to manage various cloud services. For Systems Manager, you can use Terraform to manage or provision the following: **Resources** • aws_ssm_activation • aws_ssm_association • aws_ssm_default_patch_baseline • aws_ssm_document • aws_ssm_maintenance_window • aws_ssm_maintenance_window_target • aws_ssm_maintenance_window_task • aws_ssm_parameter • aws_ssm_patch_baseline • aws_ssm_patch_group • aws_ssm_resource_data_sync • aws_ssm_service_setting **Data sources** • aws_ssm_document • aws_ssm_instances • ssm_maintenance_windows • aws_ssm_parameter • aws_ssm_parameters_by_path • aws_ssm_patch_baseline

Topics

- Running scripts from GitHub
- Using Chef InSpec profiles with Systems Manager Compliance
- Integrating with ServiceNow

Running scripts from GitHub

This topic describes how to use the pre-defined Systems Manager document (SSM document) `AWS-RunRemoteScript` to download scripts from GitHub, including Ansible Playbooks, Python, Ruby, and PowerShell scripts. By using this SSM document, you no longer need to manually port scripts into Amazon Elastic Compute Cloud (Amazon EC2) or wrap them in SSM documents. Amazon Systems Manager integration with GitHub promotes *infrastructure as code*, which reduces the time it takes to manage nodes while standardizing configurations across your fleet.

You can also create custom SSM documents that allow you to download and run scripts or other SSM documents from remote locations. For more information, see Creating composite documents.

You can also download a directory that includes multiple scripts. When you run the primary script in the directory, Systems Manager also runs any referenced scripts that are included in the directory.

Note the following important details about running scripts from GitHub.

- Systems Manager doesn't verify that your script is capable of running on a node. Before you download and run the script, verify that the required software is installed on the node. Or, you can create a composite document that installs the software by using either Run Command or State Manager,tools in Amazon Systems Manager, and then downloads and runs the script.
- You're responsible for ensuring that all GitHub requirements are met. This includes refreshing your access token, as needed. Make sure that you don't surpass the number of authenticated or unauthenticated requests. For more information, see the GitHub documentation.
- GitHub Enterprise repositories are not supported.

Run Ansible Playbooks from GitHub

This section includes procedures to help you run Ansible Playbooks from GitHub by using either the console or the Amazon Command Line Interface (Amazon CLI).

Before you begin

If you plan to run a script stored in a private GitHub repository, create an Amazon Systems Manager `SecureString` parameter for your GitHub security access token. You can't access a script in a private GitHub repository by manually passing your token over SSH. The access token must be passed as a Systems Manager `SecureString` parameter. For more information about creating a `SecureString` parameter, see Creating Parameter Store parameters in Systems Manager.

Run an Ansible Playbook from GitHub (console)

Run an Ansible Playbook from GitHub

1. Open the Amazon Systems Manager console at https://console.amazonaws.cn/systems-manager/.
2. In the navigation pane, choose **Run Command**.
3. Choose **Run command**.
4. In the **Command document** list, choose **`AWS-RunRemoteScript`**.
5. In **Command parameters**, do the following:

   - In **Source Type**, select **GitHub**.
   - In the **Source Info** box, enter the required information to access the source in the following format.

   ```
   {
     "owner": "owner_name",
     "repository": "repository_name",
     "getOptions": "branch:branch_name",
     "path": "path_to_scripts_or_directory",
     "tokenInfo": "{{ssm-secure:SecureString_parameter_name}}"
   }
   ```

   This example downloads a file named `webserver.yml`.

   ```
   {
       "owner": "TestUser1",
       "repository": "GitHubPrivateTest",
       "getOptions": "branch:myBranch",
       "path": "scripts/webserver.yml",
       "tokenInfo": "{{ssm-secure:mySecureStringParameter}}"
   ```

```
}
```

> **Note**
>
> `"branch"` is required only if your SSM document is stored in a branch other than `master`.
>
> To use the version of your scripts that are in a particular *commit* in your repository, use `commitID` with `getOptions` instead of `branch`. For example: `"getOptions": "commitID:bbc1ddb94...b76d3bEXAMPLE",`

- In the **Command Line** field, enter parameters for the script execution. Here is an example.

  `ansible-playbook -i \\"localhost,\\" --check -c local webserver.yml`

- (Optional) In the **Working Directory** field, enter the name of a directory on the node where you want to download and run the script.
- (Optional) In **Execution Timeout**, specify the number of seconds for the system to wait before failing the script command execution.

6. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

> **Tip**
>
> If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

7. For **Other parameters**:

   - For **Comment**, enter information about this command.
   - For **Timeout (seconds)**, specify the number of seconds for the system to wait before failing the overall command execution.

8. For **Rate control**:

   - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

> **Note**
>
> If you selected targets by specifying tags applied to managed nodes or by specifying Amazon resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

9. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

> **Note**
>
> The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different Amazon Web Services account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

10. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

    For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

11. Choose **Run**.

Run an Ansible Playbook from GitHub by using the Amazon CLI

1. Install and configure the Amazon Command Line Interface (Amazon CLI), if you haven't already.

   For information, see Installing or updating the latest version of the Amazon CLI.
2. Run the following command to download and run a script from GitHub.

```
aws ssm send-command \
    --document-name "AWS-RunRemoteScript" \
    --instance-ids "instance-IDs"\
    --parameters '{"sourceType":["GitHub"],"sourceInfo":["{\"owner
\":\"owner_name\", \"repository\": \"repository_name\", \"path
\": \"path_to_file_or_directory\", \"tokenInfo\":\"{{ssm-
secure:name_of_your_SecureString_parameter}}\" }"],"commandLine":
["commands_to_run"]}'
```

   Here is an example command to run on a local Linux machine.

```
aws ssm send-command \
    --document-name "AWS-RunRemoteScript" \
    --instance-ids "i-02573cafcfEXAMPLE" \
    --parameters '{"sourceType":["GitHub"],"sourceInfo":["{\"owner\":\"TestUser1\",
 \"repository\": \"GitHubPrivateTest\", \"path\": \"scripts/webserver.yml\",
 \"tokenInfo\":\"{{ssm-secure:mySecureStringParameter}}\" }"],"commandLine":
["ansible-playbook -i \\"localhost,\\" --check -c local webserver.yml"]}'
```

Run Python scripts from GitHub

This section includes procedures to help you run Python scripts from GitHub by using either the Amazon Systems Manager console or the Amazon Command Line Interface (Amazon CLI).

Run a Python script from GitHub (console)

Run a Python script from GitHub

1. Open the Amazon Systems Manager console at https://console.amazonaws.cn/systems-manager/.
2. In the navigation pane, choose **Run Command**.
3. Choose **Run command**.

4. In the **Command document** list, choose **AWS-RunRemoteScript**.
5. For **Command parameters**, do the following:

   - In **Source Type**, select **GitHub**.
   - In the **Source Info** box, enter the required information to access the source in the following format:

     ```
     {
         "owner": "owner_name",
         "repository": "repository_name",
         "getOptions": "branch:branch_name",
         "path": "path_to_document",
         "tokenInfo": "{{ssm-secure:SecureString_parameter_name}}"
     }
     ```

     The following example downloads a directory of scripts named *complex-script*.

     ```
     {
         "owner": "TestUser1",
         "repository": "SSMTestDocsRepo",
         "getOptions": "branch:myBranch",
         "path": "scripts/python/complex-script",
         "tokenInfo": "{{ssm-secure:myAccessTokenParam}}"
     }
     ```

     Note

     `"branch"` is required only if your scripts are stored in a branch other than `master`. To use the version of your scripts that are in a particular *commit* in your repository, use `commitID` with `getOptions` instead of `branch`. For example: `"getOptions": "commitID:bbc1ddb94...b76d3bEXAMPLE",`

   - For **Command Line**, enter parameters for the script execution. Here is an example.

     ```
     mainFile.py argument-1 argument-2
     ```

     This example runs `mainFile.py`, which can then run other scripts in the `complex-script` directory.

- (Optional) For **Working Directory**, enter the name of a directory on the node where you want to download and run the script.
- (Optional) For **Execution Timeout**, specify the number of seconds for the system to wait before failing the script command execution.

6. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

> **Tip**
>
> If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

7. For **Other parameters**:

- For **Comment**, enter information about this command.
- For **Timeout (seconds)**, specify the number of seconds for the system to wait before failing the overall command execution.

8. For **Rate control**:

- For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

> **Note**
>
> If you selected targets by specifying tags applied to managed nodes or by specifying Amazon resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

- For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

9. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

> **Note**
>
> The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different Amazon Web Services account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

10. In the **SNS notifications** section, if you want notifications sent about the status of the command execution, select the **Enable SNS notifications** check box.

    For more information about configuring Amazon SNS notifications for Run Command, see Monitoring Systems Manager status changes using Amazon SNS notifications.

11. Choose **Run**.

Run a Python script from GitHub by using the Amazon CLI

1. Install and configure the Amazon Command Line Interface (Amazon CLI), if you haven't already.

   For information, see Installing or updating the latest version of the Amazon CLI.

2. Run the following command to download and run a script from GitHub.

```
aws ssm send-command --document-name "AWS-RunRemoteScript" --instance-
ids "instance-IDs" --parameters '{"sourceType":["GitHub"],"sourceInfo":
["{\"owner\":\"owner_name\", \"repository\":\"repository_name\", \"path\":
 \"path_to_script_or_directory\"}"],"commandLine":["commands_to_run"]}'
```

   Here is an example.

```
aws ssm send-command --document-name "AWS-RunRemoteScript" --instance-ids
 "i-02573cafcfEXAMPLE" --parameters '{"sourceType":["GitHub"],"sourceInfo":
["{\"owner\":\"TestUser1\", \"repository\":\"GitHubTestPublic\", \"path\":
```

```
\"scripts/python/complex-script\"}"],"commandLine":["mainFile.py argument-1
argument-2 "]}'
```

This example downloads a directory of scripts called `complex-script`. The `commandLine` entry runs `mainFile.py`, which can then run other scripts in the `complex-script` directory.

Using Chef InSpec profiles with Systems Manager Compliance

Amazon Systems Manager integrates with Chef InSpec. Chef InSpec is an open-source testing framework that lets you create human-readable profiles to store in GitHub or Amazon Simple Storage Service (Amazon S3). Then you can use Systems Manager to run compliance scans and view compliant and noncompliant nodes. A *profile* is a security, compliance, or policy requirement for your computing environment. For example, you can create profiles that perform the following checks when you scan your nodes with Compliance, a tool in Amazon Systems Manager:

- Check if specific ports are open or closed.
- Check if specific applications are running.
- Check if certain packages are installed.
- Check Windows Registry keys for specific properties.

You can create InSpec profiles *only* for Amazon Elastic Compute Cloud (Amazon EC2) instances that you manage with Systems Manager. On-premises servers or virtual machines (VMs) are not supported. The following sample Chef InSpec profile checks if port 22 is open.

```
control 'Scan Port' do
impact 10.0
title 'Server: Configure the service port'
desc 'Always specify which port the SSH server should listen to.
Prevent unexpected settings.'
describe sshd_config do
its('Port') { should eq('22') }
end
end
```

InSpec includes a collection of resources that help you quickly write checks and auditing controls. InSpec uses the InSpec Domain-specific Language (DSL) for writing these controls in Ruby. You can also use profiles created by a large community of InSpec users. For example, the DevSec chef-os-

hardening project on GitHub includes dozens of profiles to help you secure your nodes. You can author and store profiles in GitHub or Amazon S3.

How it works

Here is how the process of using InSpec profiles with Compliance works:

1. Either identify predefined InSpec profiles that you want to use, or create your own. You can use predefined profiles on GitHub to get started. For information about how to create your own InSpec profiles, see ChefChef InSpec Profiles.
2. Store profiles in either a public or private GitHub repository, or in an S3 bucket.
3. Run Compliance with your InSpec profiles by using the Systems Manager document (SSM document) `AWS-RunInspecChecks`. You can begin a Compliance scan by using Run Command, for on-demand scans, or you can schedule regular Compliance scans by using State Manager, a tool in Amazon Systems Manager.
4. Identify noncompliant nodes by using the Compliance API or the Compliance console.

> **Note**
>
> Note the following information.
>
> - Chef uses a client on your nodes to process the profile. You don't need to install the client. When Systems Manager runs the SSM document `AWS-RunInspecChecks`, the system checks if the client is installed. If not, Systems Manager installs the Chef client during the scan, and then uninstalls the client after the scan is completed.
> - Running the SSM document `AWS-RunInspecChecks`, as described in this topic, assigns a compliance entry of type `Custom:Inspec` to each targeted node. To assign this compliance type, the document calls the PutComplianceItems API operation.

Running an InSpec compliance scan

This section includes information about how to run an InSpec compliance scan by using the Systems Manager console and the Amazon Command Line Interface (Amazon CLI). The console procedure shows how to configure State Manager to run the scan. The Amazon CLI procedure shows how to configure Run Command to run the scan.

Running an InSpec compliance scan with State Manager (console)

To run an InSpec compliance scan with State Manager by using the Amazon Systems Manager console

1. Open the Amazon Systems Manager console at https://console.amazonaws.cn/systems-manager/.
2. In the navigation pane, choose **State Manager**.
3. Choose **Create association**.
4. In the **Provide association details** section, enter a name.
5. In the **Document** list, choose **AWS-RunInspecChecks**.
6. In the **Document version** list, choose **Latest at runtime**.
7. In the **Parameters** section, in the **Source Type** list, choose either **GitHub** or **S3**.

   If you choose **GitHub**, then enter the path to an InSpec profile in either a public or private GitHub repository in the **Source Info** field. Here is an example path to a public profile provided by the Systems Manager team from the following location: https://github.com/awslabs/amazon-ssm/tree/master/Compliance/InSpec/PortCheck.

   ```
   {"owner":"awslabs","repository":"amazon-ssm","path":"Compliance/InSpec/
   PortCheck","getOptions":"branch:master"}
   ```

   If you choose **S3**, then enter a valid URL to an InSpec profile in an S3 bucket in the **Source Info** field.

   For more information about how Systems Manager integrates with GitHub and Amazon S3, see Running scripts from GitHub.
8. In the **Targets** section, choose the managed nodes on which you want to run this operation by specifying tags, selecting instances or edge devices manually, or specifying a resource group.

   > **Tip**
   >
   > If a managed node you expect to see isn't listed, see Troubleshooting managed node availability for troubleshooting tips.

9. In the **Specify schedule** section, use the schedule builder options to create a schedule that specifies when you want the Compliance scan to run.

10. For **Rate control**:

    - For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

      > **Note**
      >
      > If you selected targets by specifying tags applied to managed nodes or by specifying Amazon resource groups, and you aren't certain how many managed nodes are targeted, then restrict the number of targets that can run the document at the same time by specifying a percentage.

    - For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Managed nodes still processing the command might also send errors.

11. (Optional) For **Output options**, to save the command output to a file, select the **Write command output to an S3 bucket** box. Enter the bucket and prefix (folder) names in the boxes.

    > **Note**
    >
    > The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile (for EC2 instances) or IAM service role (hybrid-activated machines) assigned to the instance, not those of the IAM user performing this task. For more information, see Configure instance permissions required for Systems Manager or Create an IAM service role for a hybrid environment. In addition, if the specified S3 bucket is in a different Amazon Web Services account, make sure that the instance profile or IAM service role associated with the managed node has the necessary permissions to write to that bucket.

12. Choose **Create Association**. The system creates the association and automatically runs the Compliance scan.

13. Wait several minutes for the scan to complete, and then choose **Compliance** in the navigation pane.

14. In **Corresponding managed instances**, locate nodes where the **Compliance Type** column is **Custom:Inspec**.

15. Choose a node ID to view the details of noncompliant statuses.

Running an InSpec compliance scan with Run Command (Amazon CLI)

1. Install and configure the Amazon Command Line Interface (Amazon CLI), if you haven't already.

   For information, see Installing or updating the latest version of the Amazon CLI.

2. Run one of the following commands to run an InSpec profile from either GitHub or Amazon S3.

   The command takes the following parameters:

   - **sourceType**: GitHub or Amazon S3
   - **sourceInfo**: URL to the InSpec profile folder either in GitHub or an S3 bucket. The folder must contain the base InSpec file (*.yml) and all related controls (*.rb).

   #### GitHub

   ```
   aws ssm send-command --document-name "AWS-RunInspecChecks" --targets
    '[{"Key":"tag:tag_name","Values":["tag_value"]}]' --parameters '{"sourceType":
   ["GitHub"],"sourceInfo":["{\"owner\":\"owner_name\", \"repository\":
   \"repository_name\", \"path\": \"Inspec.yml_file"}"]}'
   ```

   Here is an example.

   ```
   aws ssm send-command --document-name "AWS-RunInspecChecks" --targets
    '[{"Key":"tag:testEnvironment","Values":["webServers"]}]' --parameters
    '{"sourceType":["GitHub"],"getOptions":"branch:master","sourceInfo":["{\"owner\":
   \"awslabs\", \"repository\":\"amazon-ssm\", \"path\": \"Compliance/InSpec/PortCheck
   \"}"]}'
   ```

   #### Amazon S3

   ```
   aws ssm send-command --document-name "AWS-RunInspecChecks" --targets
    '[{"Key":"tag:tag_name","Values":["tag_value"]}]' --parameters'{"sourceType":
   ["S3"],"sourceInfo":["{\"path\":\"https://s3.aws-api-domain/amzn-s3-demo-
   bucket/Inspec.yml_file\"}"]}'
   ```

Here is an example.

```
aws ssm send-command --document-name "AWS-RunInspecChecks" --targets
 '[{"Key":"tag:testEnvironment","Values":["webServers"]}]' --
parameters'{"sourceType":["S3"],"sourceInfo":["{\"path\":\"https://s3.aws-api-
domain/amzn-s3-demo-bucket/InSpec/PortCheck.yml\"}"]}'
```

3. Run the following command to view a summary of the Compliance scan.

```
aws ssm list-resource-compliance-summaries --filters
 Key=ComplianceType,Values=Custom:Inspec
```

4. Run the following command to see details of a node that isn't compliant.

```
aws ssm list-compliance-items --resource-ids node_ID --resource-type
 ManagedInstance --filters Key=DocumentName,Values=AWS-RunInspecChecks
```

Integrating with ServiceNow

ServiceNow provides a cloud-based service management system to create and manage organization-level workflows, such as for IT services, ticketing systems, and support. The Amazon Service Management Connector integrates ServiceNow with Systems Manager to provision, manage, and operate Amazon resources from ServiceNow. You can use the Amazon Service Management Connector to integrate ServiceNow with Automation, Change Manager, Incident Manager, and OpsCenter, all tools in Amazon Systems Manager.

You can perform the following tasks using ServiceNow:

- Run automation playbooks from Systems Manager.
- View, update, and resolve incidents from Systems Manager OpsItems.
- View and manage operational items, such as incidents, through Systems Manager OpsCenter.
- View and run Systems Manager change requests from a curated list of pre-approved change templates.
- Manage and resolve incidents involving Amazon hosted applications by integrating with Incident Manager.

Note

For information about how to integrate with ServiceNow, see Configuring Amazon service integrations in the *Amazon Service Management Connector Administrator Guide*.

Amazon Systems Manager reference

The following information and topics can help you better implement Amazon Systems Manager solutions.

Principal

In Amazon Identity and Access Management (IAM), you can grant or deny a service access to resources using the Principal policy element. The Principal policy element value for Systems Manager is `ssm.amazonaws.com.cn`.

Supported Amazon Web Services Regions and endpoints

See Systems Manager service endpoints in the *Amazon Web Services General Reference*.

Service Quotas

See Systems Manager service quotas in the *Amazon Web Services General Reference*.

API Reference

See *Amazon Systems Manager API Reference*.

Amazon CLI Command Reference

See Amazon Systems Manager section of the Amazon CLI Command Reference.

Amazon Tools for PowerShell Cmdlet Reference

See Amazon Systems Manager section of the Amazon Tools for PowerShell Cmdlet Reference.

SSM Agent Repository on GitHub

See aws/amazon-ssm-agent.

Reference: Amazon S3 buckets for patching operations

In the course of performing various Patch Manager patching operations, Amazon Systems Manager Agent (SSM Agent) accesses certain Amazon Simple Storage Service (Amazon S3) buckets that are owned and maintained by Amazon Web Services (Amazon). These S3 buckets are publicly accessible, and by default, SSM Agent connects to them using HTTP calls.

However, if you're using a virtual private cloud (VPC) endpoint in your Systems Manager operations, you must provide explicit permission in an Amazon Elastic Compute Cloud (Amazon

EC2) instance profile for Systems Manager, or in a service role for non-EC2 machines in a hybrid and multicloud environment. Otherwise, your resources can't access these public buckets.

This reference topic lists the patching-related buckets for each supported Amazon Web Services Region.

For information about specifying these S3 buckets in EC2 instance profiles, see SSM Agent communications with Amazon managed S3 buckets.

For information about using VPC endpoints with Systems Manager, see Improve the security of EC2 instances by using VPC endpoints for Systems Manager.

Buckets containing Amazon managed patch baseline snapshots

Buckets with the format `patch-baseline-snapshot-`*`region`* or `patch-baseline-snapshot-`*`region`*`-`*`unique-suffix`* contain Amazon managed patch baseline snapshots. Access to this S3 bucket is required if you use any of the following SSM documents:

- `AWS-RunPatchBaseline`
- `AWS-RunPatchBaselineAssociation`
- `AWS-RunPatchBaselineWithHooks`
- `AWS-ApplyPatchBaseline` (a legacy SSM Document)

Region name	Region code	patch-baseline-snapshot-* bucket
US East (Ohio)	us-east-2	patch-baseline-snapshot-us-east-2
US East (N. Virginia)	us-east-1	patch-baseline-snapshot-us-east-1

Reference: Amazon EventBridge event patterns and types for Systems Manager

> **Note**
>
> Amazon EventBridge is the preferred way to manage your events. CloudWatch Events and EventBridge are the same underlying service and API, but EventBridge provides more features. Changes you make in either CloudWatch or EventBridge are reflected in each console. For more information, see the *Amazon EventBridge User Guide*.

Using Amazon EventBridge, you can create *rules* that match incoming *events* and route them to *targets* for processing.

An event indicates a change in an environment in your own applications, software as a service (SaaS) applications, or an Amazon Web Services service. Events are produced on a best effort basis. After an event type that is specified in a rule is detected, EventBridge routes it to a specified target for processing. Targets can include Amazon Elastic Compute Cloud (Amazon EC2) instances,

Amazon Lambda functions, Amazon Kinesis streams, Amazon Elastic Container Service (Amazon ECS) tasks, Amazon Step Functions state machines, Amazon Simple Notification Service (Amazon SNS) topics, Amazon Simple Queue Service (Amazon SQS) queues, built-in targets and many more.

For information about creating EventBridge rules, see the following topics:

- Monitoring Systems Manager events with Amazon EventBridge
- Amazon EventBridge event examples for Systems Manager
- Getting started with Amazon EventBridge in the *Amazon EventBridge User Guide*

The remainder of this topic describes the types of Systems Manager events that you can include in your EventBridge rules.

Event type: Automation

Event type name	Description of events you can add to a rule
EC2 Automation Execution Status-change Notification	The overall status of an Automation workflow changes. You can add one or more of the following status changes to an event rule: • Approved • Canceled • Failed • PendingApproval • PendingChangeCalendarOverride • Rejected • Scheduled • Success • TimedOut
EC2 Automation Step Status-change Notification	The status of a specific step in an Automation workflow changes. You can add one or more of the following status changes to an event rule:

Event type name	Description of events you can add to a rule
	• Canceled • Failed • Success • TimedOut

Event type: Change Calendar

Event type name	Description of events you can add to a rule
Calendar State Change	The state of a Change Calendar changes. You can add one or both of the following state changes to an event rule: • OPEN • CLOSED State changes for calendars shared from other Amazon Web Services accounts aren't supported.

Event type: Change Manager

Change Manager availability change

Amazon Systems Manager Change Manager will no longer be open to new customers starting November 7, 2025. If you would like to use Change Manager, sign up prior to that date. Existing customers can continue to use the service as normal. For more information, see Amazon Systems Manager Change Manager availability change.

Event type name	Description of events you can add to a rule
Change Request Status Update	The state of a Change Manager change request. You can use the following states in an event rule: • Approved • Rejected • InProgress

Event type: Configuration Compliance

Event type name	Description of events you can add to a rule
Configuration Compliance State Change	The state of a managed node changes, for either association compliance or patch compliance. You can add one or more of the following state changes to an event rule: • compliant • non_compliant

Event type: Inventory

Event type name	Description of events you can add to a rule
Inventory Resource State Change	The deletion of custom inventory and a PutInventory call that uses an old schema version. You can add one or more of the following state changes to an event rule: • Custom inventory type deleted event on a specific node. EventBridge sends one event per node per custom InventoryType.

Event type name	Description of events you can add to a rule
	• Custom inventory type deleted event for all nodes. • PutInventory call with old schema version event. EventBridge sends this event when the schema version is less than the current schema. This event applies to all inventory types. For more information, see Using EventBridge to monitor Inventory events.

Event type: Maintenance Window

Event type name	Description of events you can add to a rule
Maintenance Window Status-change Notification	The overall status of one or more maintenance windows changes. You can add one or more of the following state changes to an event rule: • DISABLED • ENABLED
Maintenance Window Target Registration Notification	The status of one or more maintenance window targets changes. You can add one or more of the following state changes to an event rule: • DEREGISTERED • REGISTERED • UPDATED
Maintenance Window Execution State-change Notification	The overall status of a maintenance window changes while it's running. You can add one

Event type name	Description of events you can add to a rule
	or more of the following state changes to an event rule: • CANCELLED • CANCELLING • FAILED • IN_PROGRESS • PENDING • SKIPPED_OVERLAPPING • SUCCESS • TIMED_OUT
Maintenance Window Task Execution State-change Notification	The state of a task in a maintenance window changes while it's running. You can add one or more of the following state changes to an event rule: • CANCELLED • CANCELLING • FAILED • IN_PROGRESS • SUCCESS • TIMED_OUT

Event type name	Description of events you can add to a rule
Maintenance Window Task Target Invocation State-change Notification	The state of a maintenance window task on a specific target changes. This notification is fully supported only for Run Command tasks. For this type of task, you can add one or more of the following state changes to an event rule: • CANCELLED • CANCELLING • FAILED • IN_PROGRESS • SUCCESS • TIMED_OUT For Automation, Amazon Lambda, and Amazon Step Functions tasks, EventBridge reports only the states `IN_PROGRESS` and `COMPLETE`. `COMPLETE` is reported whether the task is successful or not.
Maintenance Window Task Registration Notification	The state of one or more maintenance window tasks changes. You can add one or more of the following state changes to an event rule: • DEREGISTERED • REGISTERED • UPDATED

Event type: OpsCenter

Event type name	Description of events you can add to a rule
OpsItem Create	Occurs when an OpsItem is created. You can add rules for one of the following OpsItem types: • /aws/issue • /aws/task • /aws/insight • /aws/actionitem
OpsItem Update	Occurs when an OpsItem is updated. You can add rules for one of the following OpsItem types: • /aws/issue • /aws/task • /aws/insight • /aws/actionitem

Event type: Parameter Store

Event type name	Description of events you can add to a rule
Parameter Store Change	The state of a parameter changes. You can add one or more of the following state changes to an event rule: • Create • Update • Delete • LabelParameterVersion

Event type name	Description of events you can add to a rule
	For more information, see Configuring EventBridge rules for parameters and parameter policies.
Parameter Store Policy Action	A condition of an advanced parameter policy change is met. You can add one or more of the following status changes to an event rule: • Expiration • ExpirationNotification • NoChangeNotification For more information, see Configuring EventBridge rules for parameters and parameter policies.

Event type: Run Command

Event type name	Description of events you can add to a rule
EC2 Command Invocation Status-change Notification	The status of a command sent to an individua l managed instance changes. You can add one or more of the following status changes to an event rule: • Success • InProgress • TimedOut • Canceled • Failed
EC2 Command Status-change Notification	The overall status of a command changes. You can add one or more of the following status changes to an event rule:

Event type name	Description of events you can add to a rule
	• Success • InProgress • TimedOut • Canceled • Failed

Event type: State Manager

Event type name	Description of events you can add to a rule
EC2 State Manager Association State Change	The *overall* state of an Association changes as it's being applied. You can add one or more of the following state changes to an event rule: • Failed • Pending • Success
EC2 State Manager Instance Association State Change	The state of a *single* managed instance that is targeted by an Association changes. You can add one or more of the following state changes to an event rule: • Failed • Pending • Success

Reference: Cron and rate expressions for Systems Manager

When you create a State Manager association or a maintenance window in Amazon Systems Manager, you specify a schedule for when the window or the association should run. You can specify a schedule as either a time-based entry, called a *cron expression*, or a frequency-based entry, called a *rate expression*.

General information about cron and rate expressions

The following information applies to cron and rate expressions for both maintenance windows and associations.

Single-run schedules

When you create an association or a maintenance window, you can specify a timestamp in Coordinated Universal Time (UTC) format so that it runs once at the specified time. For example: `"at(2020-07-07T15:55:00)"`

Schedule offsets

Associations and maintenance windows support *schedule offsets* for cron expressions only. A schedule offset is the number of days to wait after the date and time specified by a cron expression before running the association or maintenance window.

Maintenance window example

In the following command, the cron expression schedules a maintenance window to run the third Tuesday of every month at 11:30 PM. However, because the schedule offset is 2, the maintenance window won't run until 11:30 PM two days later.

```
aws ssm create-maintenance-window \
    --name "My-Cron-Offset-Maintenance-Window" \
    --allow-unassociated-targets \
    --schedule "cron(30 23 ? * TUE#3 *)" \
    --duration 4 \
    --cutoff 1 \
    --schedule-offset 2
```

Association example

In the following command, the cron expression schedules an association to run the second Thursday of each month. However, because the schedule offset is 3, the assocation won't run until the next Sunday, three days later.

```
aws ssm create-association \
    --name "AWS-UpdateSSMAgent" \
    --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f" \
    --schedule-expression "cron(0 0 ? * THU#2 *)"  \
    --schedule-offset 3
```

```
    --apply-only-at-cron-interval
```

> **Note**
>
> To use an offset with an assocation, you must specify the `--apply-only-at-cron-interval` option. This option tells the system not to run an association immediately after you create it.

If you create an association or a maintenance window with a cron expression that targets a day that has already passed in the current period, but add a schedule offset date that falls in the future, the association or maintenance window won't run in the period. It will go into effect in the following period. For example, if you specify a cron expression that would have run a maintenance window yesterday and add a schedule offset of two days, the maintenance window won't run tomorrow.

Required fields

Cron expressions for maintenance windows have six required fields. Cron expressions for associations have five. (State Manager doesn't currently support specifying months in cron expressions for associations.) An additional field, the `Seconds` field (the first in a cron expression), is optional. Fields are separated by a space.

Cron expression examples

Minutes	Hours	Day of month	Month	Day of week	Year	Meaning
0	10	*	*	?	*	Run at 10:00 am (UTC) every day
15	12	*	*	?	*	Run at 12:15 PM (UTC) every day
0	18	?	*	MON-FRI	*	Run at 6:00 PM

Minutes	Hours	Day of month	Month	Day of week	Year	Meaning
						(UTC) every Monday through Friday (maintenance windows only)
0	8	1	*	?	*	Run at 8:00 AM (UTC) every 1st day of the month

> **Note**
>
> Day-of-week ranges (such as `MON-FRI`) and comma-separated day lists (such as `MON,TUE,WED`) are supported for maintenance windows only. For associations, you must specify a single day (such as `MON`) or use `*` for every day.

Supported values

The following table shows supported values for required cron entries.

Supported values for cron expressions

Field	Values	Wildcards
Minutes	`0-59`	`, - * /`
Hours	`0-23`	`, - * /`

Field	Values	Wildcards
Day-of-month	1-31	, - * ? / L W
Month (maintenance windows only)	1-12 or JAN-DEC	, - * /
Day-of-week	1-7 or SUN-SAT	, - * ? / L #
Year	1970-2199	, - * /

> **Note**
>
> You can't specify a value in the day-of-month and in the day-of-week fields in the same cron expression. If you specify a value in one of the fields, use a ? (question mark) in the other field.

Wildcards for cron expressions

The following table shows the wildcard values that cron expressions support.

> **Note**
>
> Systems Manager doesn't support cron expressions that lead to rates faster than 5 minutes for maintenance windows. For State Manager associations, you must use a scheduling interval of at least 30 minutes. For more information about association scheduling limitations, see Cron and rate expressions for associations. Support for specifying both a day-of-week and a day-of-month value isn't complete. Use the question mark (?) character in one of these fields.

Supported wildcards for cron expressions

Wildcard	Description
,	The , (comma) wildcard includes additiona l values. In the Month field, JAN,FEB,MAR would include January, February, and March.
-	The - (dash) wildcard specifies ranges. In the Day field, 1-15 would include days 1 through 15 of the specified month.
*	The * (asterisk) wildcard includes all values in the field. In the Hours field, * would include every hour.
/	The / (forward slash) wildcard specifies increments. In the Minutes field, you could enter 1/10 to specify every tenth minute, starting from the first minute of the hour. So 1/10 specifies the first, 11th, 21st, and 31st minute, and so on.
?	The ? (question mark) wildcard specifies one or another. In the Day-of-month field you could enter 7 and if you didn't care what day of the week the 7th was, you could enter ? in the Day-of-week field.
L	The L wildcard in the Day-of-month or Day-of-week fields specifies the last day of the month or week.
W	The W wildcard in the Day-of-month field specifies a weekday. In the Day-of-month field, 3W specifies the day closest to the third weekday of the month.

Wildcard	Description
#	The # wildcard in the day-of-week field followed by a number between one and five specifies a given day of the month. 5#3 specifies the 3rd Thursday of the month.

Rate expressions

Rate expressions have the following two required fields. Fields are separated by spaces.

Required fields for rate expressions

Field	Values
Value	positive number, such as 1 or 15

Unit	`minute`
	`minutes`
	`hour`
	`hours`
	`day`
	`days`

If the value is equal to 1, then the unit must be singular. Similarly, for values greater than 1, the unit must be plural. For example, `rate(1 hours)` and `rate(5 hour)` aren't valid, but `rate(1 hour)` and `rate(5 hours)` are valid.

Topics

- Cron and rate expressions for associations
- Cron and rate expressions for maintenance windows

Cron and rate expressions for associations

This section includes examples of cron and rate expressions for State Manager associations. Before you create one of these expressions, be aware of the following information:

> **Important**
>
> For State Manager associations, you must use a scheduling interval of at least 30 minutes. You can't use cron or rate expressions that result in intervals shorter than 30 minutes. For example, you can't use `cron(0/5 * * * ? *)` (every 5 minutes) or `rate(15 minutes)`. The 5-minute minimum described in the general cron expressions section applies to maintenance windows only, not to associations.

- Associations support the following cron expressions: Every 1/2, 1, 2, 4, 8, or 12 hours; every day, every week, or every specified day and time of the week; a specific day in a specific week of the month, or the last `x` day of the month at a specific time.
- Associations support the following rate expressions: intervals of 30 minutes or greater and less than 31 days.
- If you specify the optional `Seconds` field, its value can be 0 (zero). For example: `cron(0 */30 * * * ? *)`
- For an association that collects metadata for Inventory, we recommend using a rate expression.
- State Manager doesn't currently support specifying months in cron expressions for associations.

Associations support cron expressions that include a day of the week and the number sign (#) to designate the *n*th day of a month to run an association. Here is an example that runs a cron schedule on the third Tuesday of every month at 23:30 UTC:

```
cron(30 23 ? * TUE#3 *)
```

Here is an example that runs on the second Thursday of every month at midnight UTC:

```
cron(0 0 ? * THU#2 *)
```

Associations also support the (L) sign to indicate the last *X* day of the month. Here is an example that runs a cron schedule on the last Tuesday of every month at midnight UTC:

```
cron(0 0 ? * 3L *)
```

To further control when an association runs, for example if you want to run an association two days after patch Tuesday, you can specify an offset. An *offset* defines how many days to wait after the scheduled day to run an association. For example, if you specified a cron schedule of `cron(0 0 ? * THU#2 *)`, you could specify the number 3 in the **Schedule offset** field to run the association each Sunday after the second Thursday of the month.

To use offsets, you must either choose the **Apply association only at the next specified Cron interval** option in the console or you must specify the use `--apply-only-at-cron-interval` parameter from the command line. This option tells State Manager not to run an association immediately after you create it.

The following table presents cron examples for associations.

Cron examples for associations

Example	Details
cron(0/30 * * * ? *)	Every 30 minutes
cron(0 0/1 * * ? *)	Every hour
cron(0 0/2 * * ? *)	Every 2 hours
cron(0 0/4 * * ? *)	Every 4 hours
cron(0 0/8 * * ? *)	Every 8 hours
cron(0 0/12 * * ? *)	Every 12 hours
cron(15 13 ? * * *)	Every day at 1:15 PM
cron(15 13 ? * MON *)	Every Monday at 1:15 PM
cron(30 23 ? * TUE#3 *)	The third Tuesday of every month at 11:30 PM

Here are some rate examples for associations.

Rate examples for associations

Example	Details
rate(30 minutes)	Every 30 minutes
rate(1 hour)	Every hour
rate(5 hours)	Every 5 hours
rate(15 days)	Every 15 days

Amazon CLI examples for associations

To create State Manager associations using the Amazon CLI, you include the `--schedule-expression` parameter with a cron or rate expression. The following examples use the Amazon CLI on a local Linux machine.

> **Note**
>
> By default, when you create a new association, the system runs it immediately after it's created and then according to the schedule you specified. Specify `--apply-only-at-cron-interval` so that the association doesn't run immediately after you create it. This parameter isn't supported for rate expressions.

```
aws ssm create-association \
    --association-name "My-Cron-Association" \
    --schedule-expression "cron(0 2 ? * SUN *)" \
    --targets Key=tag:ServerRole,Values=WebServer \
    --name AWS-UpdateSSMAgent
```

```
aws ssm create-association \
    --association-name "My-Rate-Association" \
    --schedule-expression "rate(7 days)" \
    --targets Key=tag:ServerRole,Values=WebServer \
    --name AWS-UpdateSSMAgent
```

```
aws ssm create-association \
```

```
    --association-name "My-Rate-Association" \
    --schedule-expression "at(2020-07-07T15:55:00)" \
    --targets Key=tag:ServerRole,Values=WebServer \
    --name AWS-UpdateSSMAgent \
    --apply-only-at-cron-interval
```

Cron and rate expressions for maintenance windows

This section includes examples of cron and rate expressions for maintenance windows.

Unlike State Manager associations, maintenance windows support all cron and rate expressions. This includes support for values in the seconds field.

For example, the following 6-field cron expression runs a maintenance window at 9:30 AM every day.

```
cron(30 09 ? * * *)
```

By adding a value to the Seconds field, the following 7-field cron expression runs a maintenance window at 9:30:24 AM every day.

```
cron(24 30 09 ? * * *)
```

The following table provides additional 6-field cron examples for maintenance windows.

Cron examples for maintenance windows

Example	Details
cron(0 2 ? * THU#3 *)	02:00 AM the third Thursday of every month
cron(15 10 ? * * *)	10:15 AM every day
cron(15 10 ? * MON-FRI *)	10:15 AM every Monday, Tuesday, Wednesday, Thursday and Friday
cron(0 2 L * ? *)	02:00 AM on the last day of every month
cron(15 10 ? * 6L *)	10:15 AM on the last Friday of every month

The following table provides rate examples for maintenance windows.

Rate examples for maintenance windows

Example	Details
rate(30 minutes)	Every 30 minutes
rate(1 hour)	Every hour
rate(5 hours)	Every 5 hours
rate(25 days)	Every 25 days

Amazon CLI examples for maintenance windows

To create maintenance windows using the Amazon CLI, you include the `--schedule` parameter with a cron or rate expression or a timestamp. The following examples use the Amazon CLI on a local Linux machine.

```
aws ssm create-maintenance-window \
    --name "My-Cron-Maintenance-Window" \
    --allow-unassociated-targets \
    --schedule "cron(0 16 ? * TUE *)" \
    --schedule-timezone "America/Los_Angeles" \
    --start-date 2021-01-01T00:00:00-08:00 \
    --end-date 2021-06-30T00:00:00-08:00 \
    --duration 4 \
    --cutoff 1
```

```
aws ssm create-maintenance-window \
    --name "My-Rate-Maintenance-Window" \
    --allow-unassociated-targets \
    --schedule "rate(7 days)" \
    --duration 4 \
    --schedule-timezone "America/Los_Angeles" \
    --cutoff 1
```

```
aws ssm create-maintenance-window \
    --name "My-TimeStamp-Maintenance-Window" \
    --allow-unassociated-targets \
    --schedule "at(2021-07-07T13:15:30)" \
```

```
    --duration 4 \
    --schedule-timezone "America/Los_Angeles" \
    --cutoff 1
```

More info

CRON expression at the *Wikipedia website*

Reference: ec2messages, ssmmessages, and other API operations

If you monitor API operations, you might see calls to the following operations:

- `ec2messages:AcknowledgeMessage`
- `ec2messages:DeleteMessage`
- `ec2messages:FailMessage`
- `ec2messages:GetEndpoint`
- `ec2messages:GetMessages`
- `ec2messages:SendReply`
- `ssmmessages:CreateControlChannel`
- `ssmmessages:CreateDataChannel`
- `ssmmessages:OpenControlChannel`
- `ssmmessages:OpenDataChannel`
- `ssm:DescribeDocumentParameters`
- `ssm:DescribeInstanceProperties`
- `ssm:GetCalendar`
- `ssm:GetManifest`
- `ssm:ListInstanceAssociations`
- `ssm:PutCalendar`
- `ssm:PutConfigurePackageResult`
- `ssm:RegisterManagedInstance`
- `ssm:RequestManagedInstanceRoleToken`

- ssm:UpdateInstanceAssociationStatus
- ssm:UpdateInstanceInformation
- ssm:UpdateManagedInstancePublicKey

These are special operations used by Amazon Systems Manager, as described in the rest of this topic.

Agent-related API operations (ssmmessages and ec2messages endpoints)

ssmmessages API operations

Systems Manager uses the ssmmessages endpoint for the following types of API operations:

- Operations from Systems Manager Agent (SSM Agent) to the Systems Manager service in the cloud.
- Operations from SSM Agent to Session Manager in the cloud. This endpoint is needed to create and delete session channels with the Session Manager service in the cloud.

  If connectivity is allowed, SSM Agent receives Command documents through Amazon Message Gateway Service. If connectivity is not allowed, SSM Agent receives Command documents through Amazon Message Delivery Service. For more information, see Actions, resources, and condition keys for Amazon Message Gateway Service.

  > **Note**
  >
  > If the ssmmessages:OpenControlChannel permission is removed from policies attached to your IAM instance profile or IAM service role,SSM Agent on the managed node loses connectivity to the Systems Manager service in the cloud. However, it can take up to 1 hour for a connection to be terminated after the permission is removed. This is the same behavior as when the IAM instance role or IAM service role is deleted.
  > The ssmmessages:OpenControlChannel permission is included in the managed policy AmazonSSMManagedInstanceCore, which is used in the instructions for creating an IAM instance profile for EC2 instances and for creating an IAM service role for non-EC2 instances.

- Operations from Run Command.

ec2messages API operations

`ec2messages:*` API operations are made to the Amazon Message Delivery Service endpoint. Systems Manager uses this endpoint for API operations from Systems Manager Agent (SSM Agent) to the Systems Manager service in the cloud.

> **Important**
>
> `ec2messages:*` API operations are supported only in Amazon Web Services Regions that launched before 2024. In Regions launched in 2024 and later, only `ssmmessages:*` API operations are supported.

Endpoint connection precedence

Beginning with version 3.3.40.0 of SSM Agent, Systems Manager began using the `ssmmessages:*` endpoint (Amazon Message Gateway Service) whenever available instead of the `ec2messages:*` endpoint (Amazon Message Delivery Service).

If you provide access to `ssmmessages:*` in your Amazon Identity and Access Management (IAM) permission policies, SSM Agent connects to the `ssmmessages:*` endpoint. This applies even if your IAM instance profile is configured to allow both endpoints. This includes policies for IAM instance profiles and IAM service roles you have created yourself, and for IAM instance profiles created by the Quick Setup Host management configuration and Default Host Management Configuration.

If you have provided permissions for both endpoints and monitor API operations using, for example, CloudWatch Metrics, you see no calls to `ec2messages:*`.

For Amazon Web Services Regions launched before 2024: You can safely remove `ec2messages:*` permissions from your policies currently.

Endpoint connection failover

The following failover behavior applies to Amazon Web Services Regions launched before 2024 only.

If your IAM instance profile provides only `ec2messages:*` permissions when the agent starts, SSM Agent connects to the `ec2messages:*` endpoint.

If your IAM instance profile provides both `ssmmessages:*` and `ec2messages:*` permissions when the agent starts, but you later remove `ssmmessages:*`, SSM Agent switches to the `ec2messages:*` endpoint.

For Regions launched in 2024 and later, only the `ssmmessages:*` endpoint is supported.

For more information about the `ssmmessages` and `ec2messages:*` endpoints, see the following topics in the *Amazon Service Authorization Reference*.

- Actions, resources, and condition keys for Amazon Message Gateway Service (`ssmmessages`).
- Actions, resources, and condition keys for Amazon Message Delivery Service (`ec2messages:*`)

`ssm:*` namespace instance-related API operations

`DescribeDocumentParameters`

Systems Manager runs this API operation to render specific nodes in the Amazon EC2 console. Results of the `DescribeDocumentParameters` operation are displayed in the Documents node.

`DescribeInstanceProperties`

Systems Manager runs this API operation to render specific nodes in the Amazon EC2 console. Results of the `DescribeInstanceProperties` operation are displayed in the Fleet Manager node.

`GetCalendar`

Systems Manager runs this API operation to render Change Calendar type documents in the Change Calendar console.

`GetManifest`

SSM Agent runs this API operation to determine system requirements for installing or updating a specified version of an Amazon Systems Manager Distributor package. This is a legacy API operation and not available in Amazon Web Services Regions launched after 2017.

`ListInstanceAssociations`

SSM Agent runs this API operation to see if a new State Manager association is available. This API operation is required for State Manager to function.

`PutCalendar`

Systems Manager runs this API operation to update Change Calendar type documents in the Change Calendar console.

`PutConfigurePackageResult`

SSM Agent runs this API operation to publish installation error and latency metrics for public Distributor packages to the package owner's account.

`RegisterManagedInstance`

SSM Agent runs this API operation for the following scenarios:

- To register an on-premises server or virtual machine (VM) with Systems Manager as a managed instance using an activation code and ID.
- To register Amazon IoT Greengrass Version 2 credentials.

This operation is also called by Amazon EC2 instances running SSM Agent version 3.1.x or later.

`RequestManagedInstanceRoleToken`

SSM Agent runs this API operation to retrieve temporary credentials to access the managed node.

`UpdateInstanceAssociationStatus`

SSM Agent runs this API operation to update an association. This API operation is required for State Manager to function.

`UpdateInstanceInformation`

SSM Agent calls the Systems Manager service in the cloud every 5 minutes to provide heartbeat information. This call is necessary to maintain a heartbeat with the agent so that the service knows the agent is functioning as expected.

`UpdateManagedInstancePublicKey`

SSM Agent runs this API operation to provide the public key after rotating the key pair on the managed node. The public key is used to authenticate the requests, signed with the private key, to get temporary credentials from Systems Manager.

ssm:* namespace other API operations

`ExecuteApi`

Systems Manager delegated administrators who manage OpsItems in OpsCenter require access to this API action so they can view related resource details about OpsItems across multiple Amazon Web Services accounts. Specifically, this API gives a delegated administrator permission to view the following OpsItem details in the Amazon Web Services Management Console: the OpsItem description, tags, Amazon CloudFormation template, Amazon Config changes, CloudWatch Logs alarms, and Amazon CloudTrail events. For more information about working with OpsItems across accounts, see (Optional) Manually set up OpsCenter to centrally manage OpsItems across accounts. For more information about related resource details for OpsItems, see Adding related resources to an OpsItem.

Reference: Date and time string formats for Systems Manager

Amazon Systems Manager API operations accept filters to limit the number of results returned by a request. Some of these API operations accept filters that require a formatted string to represent a specific date and time. For example, the `DescribeSessions` API operation accepts the `InvokedAfter` and `InvokedBefore` keys as some valid values for a `SessionFilter` object. Another example is the `DescribeAutomationExecutions` API operation, which accepts the `StartTimeBefore` and `StartTimeAfter` keys as some valid values for an `AutomationExecutionFilter` object. The values you provide for these keys when filtering your requests must match the ISO 8601 standard. For information about ISO 8601, see ISO 8601.

These formatted date and time strings aren't limited to filters. There are also API operations that require an ISO 8601 formatted string to represent a specific date and time when providing a value for a request parameter. For example, the `AtTime` request parameter for the `GetCalendarState` operation. These strings are difficult to create. Use the examples in this topic to create formatted date and time strings to use with Systems Manager API operations.

Formatting date and time strings for Systems Manager

The following is an example of an ISO 8601 formatted date and time string.

```
2024-05-08T15:16:43Z
```

This represents May 8, 2024 at 15:16 Coordinated Universal Time (UTC). The calendar date portion of the string is represented by a four-digit year, two-digit month, and two-digit day separated by hyphens. This can be represented in the following format.

```
YYYY-MM-DD
```

The time portion of the string begins with the letter "T" as a delimiter, and then is represented by a two-digit hour, two-digit minute, and two-digit second separated by colons. This can be represented in the following format.

```
hh:mm:ss
```

The time portion of the string ends with the letter "Z", denoting the UTC standard.

Creating custom date and time strings for Systems Manager

You can create custom date and time strings from your local machine using your preferred command line tool. The syntax you use to create an ISO 8601 formatted date and time string differs depending on your local machine's operating system. The following are examples of how you can use `date` from GNU's coreutils on Linux, or PowerShell on Windows to create an ISO 8601 formatted date and time string.

coreutils

```
date '+%Y-%m-%dT%H:%M:%SZ'
```

PowerShell

```
(Get-Date).ToString("yyyy-MM-ddTH:mm:ssZ")
```

When working with Systems Manager API operations, you might need to create historical date and time strings for reporting or troubleshooting purposes. The following are examples of how you can create and use custom historical ISO 8601 formatted date and time strings for the Amazon Tools for PowerShell and Amazon Command Line Interface (Amazon CLI).

Amazon CLI

- Retrieve the last week of command history for an SSM document.

```
lastWeekStamp=$(date '+%Y-%m-%dT%H:%M:%SZ' -d '7 days ago')

docFilter='{"key":"DocumentName","value":"AWS-RunPatchBaseline"}'
timeFilter='{"key":"InvokedAfter","value":'\"$lastWeekStamp\"'}'

commandFilters=[$docFilter,$timeFilter]

aws ssm list-commands \
    --filters $commandFilters
```

- Retrieve the last week of automation execution history.

```
lastWeekStamp=$(date '+%Y-%m-%dT%H:%M:%SZ' -d '7 days ago')

aws ssm describe-automation-executions \
    --filters Key=StartTimeAfter,Values=$lastWeekStamp
```

- Retrieve the last month of session history.

```
lastWeekStamp=$(date '+%Y-%m-%dT%H:%M:%SZ' -d '30 days ago')

aws ssm describe-sessions \
    --state History \
    --filters key=InvokedAfter,value=$lastWeekStamp
```

Amazon Tools for PowerShell

- Retrieve the last week of command history for an SSM document.

```
$lastWeekStamp = (Get-Date).AddDays(-7).ToString("yyyy-MM-ddTH:mm:ssZ")

$docFilter = @{
    Key="DocumentName"
    Value="AWS-InstallWindowsUpdates"
}
$timeFilter = @{
    Key="InvokedAfter"
    Value=$lastWeekStamp
}

$commandFilters = $docFilter,$timeFilter
```

```
Get-SSMCommand `
    -Filters $commandFilters
```

- Retrieve the last week of automation execution history.

```
$lastWeekStamp = (Get-Date).AddDays(-7).ToString("yyyy-MM-ddTH:mm:ssZ")

Get-SSMAutomationExecutionList `
    -Filters @{Key="StartTimeAfter";Values=$lastWeekStamp}
```

- Retrieve the last month of session history.

```
$lastWeekStamp = (Get-Date).AddDays(-30).ToString("yyyy-MM-ddTH:mm:ssZ")

Get-SSMSession `
    -State History `
    -Filters @{Key="InvokedAfter";Value=$lastWeekStamp}
```

Use cases and best practices

This topic lists common use cases and best practices for Amazon Systems Manager tools. If available, this topic also includes links to relevant blog posts and technical documentation.

For information about cleaning up resources, see Deleting Systems Manager resources and artifacts.

> **Note**
>
> The title of each section here is an active link to the corresponding section in the technical documentation.

Automation

- Create self-service Automation runbooks for infrastructure.
- Use Automation to simplify creating Amazon Machine Images (AMIs) from the Amazon Web Services Marketplace or custom AMIs, using public Systems Manager documents (SSM documents) or by authoring your own workflows.
- Build and maintain AMIs using the `AWS-UpdateLinuxAmi` and `AWS-UpdateWindowsAmi` Automation runbooks, or using custom Automation runbooks that you create.

Compliance

- As a security best practice, we recommend that you update the Amazon Identity and Access Management (IAM) role used by your managed nodes to restrict the node's ability to use the PutComplianceItems API action. This API action registers a compliance type and other compliance details on a designated resource, such as an Amazon EC2 instance or a managed node. For more information, see Configuring permissions for Compliance.

Inventory

- Use Inventory with Amazon Config to audit your application configurations over time.

Maintenance Windows

- Define a schedule to perform potentially disruptive actions on your nodes such as operating system (OS) patching, driver updates, or software installations.
- For information about the differences between State Manager and Maintenance Windows, tools of Amazon Systems Manager, see Choosing between State Manager and Maintenance Windows.

Parameter Store

- Use Parameter Store to centrally manage global configuration settings.
- How Amazon Systems Manager Parameter Store uses Amazon KMS.
- Reference Amazon Secrets Manager secrets from Parameter Store parameters.

Patch Manager

- Use Patch Manager to roll out patches at scale and increase fleet compliance visibility across your nodes.
- Integrate Patch Manager with Amazon Security Hub CSPM to receive alerts when nodes in your fleet go out of compliance and monitor the patching status of your fleets from a security point of view. There is a charge to use Security Hub CSPM. For more information, see Pricing.
- Use only one method at a time for scanning managed nodes for patch compliance to avoid unintentionally overwriting compliance data.

Run Command

- Manage Instances at Scale without SSH Access Using EC2 Run Command.
- Audit all API calls made by or on behalf of Run Command using Amazon CloudTrail.
- When you send a command using Run Command, don't include sensitive information formatted as plaintext, such as passwords, configuration data, or other secrets. All Systems Manager API activity in your account is logged in an S3 bucket for Amazon CloudTrail logs. This means that any user with access to S3 bucket can view the plaintext values of those secrets. For this reason, we recommend creating and using `SecureString` parameters to encrypt sensitive data you use in your Systems Manager operations.

  For more information, see Managing access to Parameter Store parameters using IAM policies.

> **Note**
>
> By default, the log files delivered by CloudTrail to your bucket are encrypted by Amazon server-side encryption with Amazon S3-managed encryption keys (SSE-S3). To provide a security layer that is directly manageable, you can instead use server-side encryption with Amazon KMS–managed keys (SSE-KMS) for your CloudTrail log files.
> For more information, see Encrypting CloudTrail log files with Amazon KMS–managed keys (SSE-KMS) in the *Amazon CloudTrail User Guide*.

- Use the targets and rate control features in Run Command to perform a staged command operation.
- Use fine-grained access permissions for Run Command (and all Systems Manager tools) by using Amazon Identity and Access Management (IAM) policies.

Session Manager

- Log session activity in your Amazon Web Services account using Amazon CloudTrail.
- Log session data in your Amazon Web Services account using Amazon CloudWatch Logs or Amazon S3.
- Control user session access to instances.
- Restrict access to commands in a session.
- Turn off or turn on ssm-user account administrative permissions.

State Manager

- Update SSM Agent at least once a month using the pre-configured `AWS-UpdateSSMAgent` document.
- (Windows) Upload the PowerShell or DSC module to Amazon Simple Storage Service (Amazon S3), and use `AWS-InstallPowerShellModule`.
- Use tags to create application groups for your nodes. And then target nodes using the `Targets` parameter instead of specifying individual node IDs.
- Automatically remediate findings generated by Amazon Inspector by using Systems Manager.
- Use a centralized configuration repository for your SSM documents, and share documents across your organization.

- For information about the differences between State Manager and Maintenance Windows, see Choosing between State Manager and Maintenance Windows.

Managed nodes

- Systems Manager requires accurate time references to perform its operations. If your node's date and time aren't set correctly, they might not match the signature date of your API requests. This might lead to errors or incomplete functionality. For example, nodes with incorrect time settings won't be included in your lists of managed nodes.

  For information about setting the time on your nodes, see Set the time for your Amazon EC2 instance.
- On Linux managed nodes, verify the signature of SSM Agent.

More info

- Security best practices for Systems Manager

Deleting Systems Manager resources and artifacts

We recommend that you delete Systems Manager resources and artifacts that you no longer need. The following table lists each Systems Manager tool or artifact with a link to more information about deleting those resources.

Capability or artifact	Details
Application Manager	You can't delete an application in Applicati on Manager. However, you can remove an application from the service by deleting the underlying tags, Resource Groups, or Amazon CloudFormation stacks.
Automation	If you create Amazon resources by using Systems Manager Automation, you must manually delete those resources by using the corresponding Amazon Web Services Management Console. If you created a custom

Capability or artifact	Details
	runbook, you can delete the underlying SSM document. For more information, see Deleting custom SSM documents.
Change Calendar	You can delete a change calendar and a change calendar event. For more information, see Deleting a change calendar and Deleting a Change Calendar event.
Change Manager	You can delete a change template. For more information, see Deleting change templates.
Compliance	Systems Manager Compliance automatically displays compliance data about Patch Manager patching and State Manager associations. You can't delete this data. If you configured a resource data sync to centralize compliance data in an S3 bucket, you can delete the sync. For more information, see Deleting a resource data sync for Compliance.
Distributor	You can delete packages in Distributor. For more information, see Delete a Distributor package.

Capability or artifact	Details
Explorer	You can disconnect from the sources from which Explorer collects OpsData. For more information, see Editing Systems Manager Explorer data sources. You can also delete a resource data sync used by Explorer to aggregate OpsData and OpsItems from multiple Amazon Web Services Regions and accounts to a single Amazon Simple Storage Service (Amazon S3) bucket. For more information, see Deleting a Systems Manager Explorer resource data sync. For information about deleting an S3 bucket, see Deleting a bucket in the *Amazon Simple Email Service Developer Guide*.
Fleet Manager	You can't delete a managed node by using Fleet Manager. You must use Amazon Elastic Compute Cloud (Amazon EC2). For more information, see Terminate your instance (Linux) and Terminate your instance (Windows) .

Capability or artifact	Details
Inventory	You can stop Inventory data collection by deleting the State Manager associations that define the schedule and the resources from which to collect metadata. For more informati on, see Stopping data collection and deleting inventory data. If you no longer want to use Amazon Systems Manager Inventory to view metadata about your Amazon resources, then we also recommend deleting resource data syncs used for inventory data collection. For more information, see Deleting an Inventory resource data sync.
Maintenance Windows	You can delete a maintenance window, a maintenance window target, and a maintenan ce window task. For more information, see Update or delete maintenance window resources using the console.
OpsCenter	You can delete an individual OpsItem by calling the DeleteOpsItem API operation using the Amazon Command Line Interface or the Amazon SDK. You can't delete an OpsItem in the Amazon Web Services Management Console. For more information, see Delete OpsItems.
Parameter Store	You can delete a parameter that you have created. For more information, see Deleting parameters from Parameter Store.
Patch Manager	You can delete a custom patch baseline. For more information, see Updating or deleting a custom patch baseline.

Capability or artifact	Details
Quick Setup	You can delete associations created by Quick Setup. The associations are stored and processed by State Manager. For more information, see Deleting associations.
Run Command	After a command finishes processin g, information about it is stored in the **Command history** tab. You can't delete information from the **Command history** tab.
Automation	After an automation finishes processing, information about it is stored in the **Execution s** tab. You can't delete information from the **Executions** tab.
Service-linked role	Systems Manager automatically creates service-linked roles for some tools. You can delete these roles. For more information, see Deleting the `AWSServiceRoleForA mazonSSM` service-linked role for Systems Manager.
Session Manager	Session Manager doesn't retain data about your resources after you terminate a session. To terminate a session, see End a session.
SSM Agent	You can manually uninstall SSM Agent from your nodes. For more information, see the following topics. • Linux: Manually installing and uninstalling SSM Agent on EC2 instances for Linux • macOS: Manually installing and uninstalling SSM Agent on EC2 instances for macOS • Windows Server: Open **Control panel** and then choose **Add/remove programs**.

Capability or artifact	Details
State Manager	You can delete an association. For more information, see Deleting associations.
Systems Manager document service	You can't delete runbooks provided by Amazon or Amazon Web Services Support, but you can delete custom runbooks. For more information, see Deleting custom SSM documents.

Choosing between State Manager and Maintenance Windows

State Manager and Maintenance Windows, both tools in Amazon Systems Manager, can perform some similar types of updates on your managed nodes. Which one you choose depends on whether you need to automate system compliance or perform high-priority, time-sensitive tasks during periods you specify.

State Manager and Maintenance Windows: Key use cases

State Manager sets and maintains the targeted state configuration for managed nodes and Amazon resources within your Amazon Web Services account. You can define combinations of configurations and targets as association objects. Use State Manager if you want to maintain a consistent state across all managed nodes, use Amazon EC2 Auto Scaling to generate new nodes, or have strict compliance reporting requirements.

The main use cases for State Manager are as follows:

- **Auto Scaling scenarios:** State Manager can monitor all new nodes launched within an account either manually or through Auto Scaling groups. If there are any associations in the account targeting that new node (through tags or all nodes), then that particular association is automatically applied to the new node.
- **Compliance reporting:** State Manager can drive compliance reporting of required states for resources in your account.
- **Supporting all nodes:** State Manager can target all nodes within a given account.

A **maintenance window** takes one or more actions on Amazon resources within a given time window. You can define a single maintenance window with start and end times. You can specify multiple tasks to run within this maintenance window. Use Maintenance Windows if your priorities include patching managed nodes, running multiple task types during an update period, or controlling when updates run.

The main use cases for Maintenance Windows are as follows:

- **Running multiple documents:** Maintenance windows can run multiple tasks. Each task can use a different document type. As a result, you can build complex workflows using different tasks within a single maintenance window.
- **Patching:** A maintenance window can provide patching support for all managed nodes in a single Region that are tagged with a specific tag or resource group. Patching usually involves removing nodes from a load balancer, applying patches, and putting nodes back into production. You can achieve this as a series of tasks within a patch time window.

  > **Note**
  >
  > Using a maintenance window, your patching operation is limited to a single Region in a single account. Using a patch policy created in Quick Setup, a tool in Systems Manager, you can instead configure patching for some or all accounts and Regions in an organization created in Amazon Organizations. For more information, see Patch policy configurations in Quick Setup.

- **Window actions:** Maintenance windows can make one or more sets of actions start within a specific time window. Maintenance windows won't start outside of that window. Actions already started continue until finished, even if they finish outside of the time window.

The following table compares the main features of State Manager and Maintenance Windows.

Feature	State Manager	Maintenance Windows
Amazon CloudFormation integration	Amazon CloudFormation templates support State Manager associations.	Amazon CloudFormation templates support maintenance windows, window targets, and window tasks.

Feature	State Manager	Maintenance Windows
Compliance	Every State Manager association reports compliance against the required state of the targeted resource. You can use the Compliance Dashboard to aggregate and view the reported compliance.	Not applicable.
Configuration Management integration	State Manager supports external targeted state solutions such as Microsoft PowerShell Desired State Configuration (DSC), Ansible playbooks, and Chef recipes. You can use State Manager associations to test that the Configuration Management solutions work and to apply their configuration changes to your nodes when you're ready.	Not applicable.
Documents	State Manager configurations can be defined as Policy documents (for gathering inventory information), Automation runbooks, for Amazon resources such as Amazon Simple Storage Service (Amazon S3) buckets, or Systems Manager Command documents (SSM documents) for managed nodes.	Maintenance Windows configurations can be defined as automation documents (multi-step actions with optional approval workflows) or SSM documents (required state for managed nodes).

Feature	State Manager	Maintenance Windows
Monitoring	State Manager monitors changes in the configura tion, association, or state of a node (for example, new nodes coming online). When State Manager detects these changes, the given associati on is re-applied to the nodes originally targeted with that association.	Not applicable.
Priorities within tasks	Not applicable.	Tasks within a maintenan ce window can be assigned a priority. All tasks with the same priority are run in parallel. Tasks with lower priorities are run after tasks with higher priorities reach a final state. There is no way to conditionally run tasks. After a higher priority task reaches its final state, the next priority task runs, regardless of the state of the previous task.

Feature	State Manager	Maintenance Windows
Safety controls	State Manager supports two safety controls when deploying configurations across a large fleet. You can use maximum concurrency to define how many concurrent nodes or resources should have the configuration applied. You can define a maximum error rate which can be used to pause the State Manager association if a certain number or percentage of errors occur across the fleet.	Maintenance windows support two safety controls when deploying configurations across a large fleet. You can use maximum concurrency to define how many concurrent nodes or resources should have the configuration applied. You can define a maximum error rate which can be used to pause the actions in a maintenance window if a certain number or percentage of errors occur across the fleet.

Feature	State Manager	Maintenance Windows
Scheduling	You can run State Manager associations on demand, at a particular cron interval, at a given rate, or after they're created. This is useful if you want to maintain the required state of your resources in a consistent and timely manner. **Important** Cron expressions for State Manager associations do not support the months field, such as `03` or `MAR` for the month of March. If you require monthly or quarterly configuration updates, a maintenance window can best meet your needs. For more information, see Reference: Cron and rate expressions for Systems Manager.	Maintenance windows support several scheduling options including `at` expressions (for example, `"at(2021-07-07T13:15:30)"`), cron and rate expressions, cron with offsets, and start and end times for when maintenance windows should run, and cutoff times to specify when to stop scheduling within a given time window.

Feature	State Manager	Maintenance Windows
Targeting	State Manager associations can target one or more nodes by using node ID, tag, or resource group. State Manager can target all managed nodes within a given account.	Maintenance windows can target one or more nodes using node IDs, tags, or resource groups.
Tasks within maintenance windows	Not applicable.	Maintenance windows can support one or more tasks where each task targets a specific Automation runbook or Command document action. All tasks within a maintenance window run in parallel unless different priorities are set for different tasks. Overall, maintenance windows support four task types: • Amazon Systems Manager Run Command commands • Amazon Systems Manager Automation workflows • Amazon Lambda functions • Amazon Step Functions tasks

Related information

The following related resources can help you as you work with this service.

Pricing

Some Systems Manager tools charge a fee. For more information, see Amazon Systems Manager pricing.

Amazon Blog & Podcast

Read blog posts about Systems Manager in the Amazon Management Tools Category, and other posts tagged with #Systems Manager.

Service quotas

Review Systems Manager service quotas in the *Amazon Web Services General Reference*. Unless otherwise noted, each quota applies to a single Region in an Amazon Web Services account.

Service Authorization Reference for Systems Manager

In the *Amazon Service Authorization Reference*, view information about the actions, resources, and condition context keys you can use in Amazon Identity and Access Management (IAM) policies for Systems Manager.

Amazon Systems Manager Service Level Agreement

The Amazon Systems Manager Service Level Agreement (SLA) is a policy governing the use of Systems Manager and applies separately to each Amazon Web Services account using Systems Manager.

General Amazon resources

The following general resources can help you as you work with Amazon.

- Getting Started Resource Center – Learn how to set up your Amazon Web Services account, join the Amazon community, and launch your first application.
- Amazon Web Services Support Center – The hub for creating and managing your Amazon Web Services Support cases. Also includes links to other helpful resources, such as forums, technical FAQs, service health status, and Amazon Trusted Advisor.
- Amazon Web Services Support – The primary webpage for information about Amazon Web Services Support, a one-on-one, fast-response support channel to help you build and run applications in the cloud.
- Contact Us – A central contact point for inquiries concerning Amazon billing, account, events, abuse, and other issues.
- Amazon Site Terms – Detailed information about our copyright and trademark; your account, license, and site access; and other topics.

Document history

The following table describes the important changes to the documentation since the last release of Amazon Systems Manager. For notification about updates to this documentation, you can subscribe to an RSS feed.

Change	Description	Date
Added new parameter data types	Parameter Store now validates parameter values against new data types, such as `integer`, `boolean`, `ipv4-address` , and `json`, which are described in Parameter data types in Parameter Store.	November 4, 2026
SSM Agent and Patch Manager now support Ubuntu Server 26.04, SLES 16, Debian Server 13, Rocky Linux 10, and macOS 26	You can now manage Ubuntu Server 26.04 LTS, SUSE Linux Enterprise Server 16, Debian Server 13, Rocky Linux 10, and macOS 26 machines with Systems Manager, including patching managed nodes using Patch Manager. For complete lists of supported OSs and versions, see the following topics: • Supported operating systems for Systems Manager • Supported operating systems for Patch Manager	October 23, 2026

Updated Amazon Parameters and Secrets Lambda Extension ARNs	Updated the ARNs for the Amazon Parameters and Secrets Lambda Extension to the latest available versions for all supported Amazon Web Services Regions. For more information, see Using Parameter Store parameters in Lambda functions.	October 21, 2026
Amazon CloudWatch dashboards topic removed	Amazon CloudWatch dashboards hosted by Systems Manager is no longer available, so the topic that described it has been removed. You can continue to view, create, and manage your dashboards in the CloudWatch console. For more information, see Using Amazon CloudWatch dashboards in the *Amazon CloudWatch User Guide*.	October 15, 2026

Updated IAM guidance for restricting access to Parameter Store parameters	Explained how Parameter Store authorizes each parameter retrieval operation , so that you can write IAM policies that restrict access to parameters and parameter paths as you intend. For more information, see the following topics: • How Parameter Store authorizes parameter retrieval • Restricting access to specific parameters and paths • Restricting decryption of `SecureString` parameter values	September 21, 2026
Amazon Parameters and Secrets Lambda Extension supports the `INIT` phase	The Amazon Parameters and Secrets Lambda Extension can now be called during the `INIT` phase of a Lambda function, in addition to the `INVOKE` phase. The documentation no longer states that calls are limited to the `INVOKE` phase. For more information, see Using Parameter Store parameters in Lambda functions.	September 21, 2026

Updated Amazon Parameters and Secrets Lambda Extension ARNs	Updated the ARNs for the Amazon Parameters and Secrets Lambda Extension to the latest available versions for all supported Amazon Web Services Regions. For more information, see Using Parameter Store parameters in Lambda functions.	August 21, 2026
Amazon Systems Manager Application Manager availability change	Amazon Systems Manager Application Manager is no longer open to new customers. For capabilities similar to Amazon Systems Manager Application Manager, explore alternatives here.	July 30, 2026
Amazon Parameters and Secrets Lambda Extension adds support for SnapStart and Lambda Managed Instances	The Amazon Parameters and Secrets Lambda Extension now works with Lambda SnapStart and Lambda Managed Instances. To retrieve the session token for the `X-Aws-Parameters-Secrets-Token` header reliably in all initialization modes, use the credential provider chain of an Amazon SDK instead of the `AWS_SESSION_TOKEN` environment variable. For more information, see Using Parameter Store parameters in Lambda functions.	July 28, 2026

Updated Amazon Parameters and Secrets Lambda Extension ARNs	Updated the ARNs for the Amazon Parameters and Secrets Lambda Extension to the latest available versions for all supported Amazon Web Services Regions. For more information, see Using Parameter Store parameters in Lambda functions.	July 21, 2026
Automation now uses execution identity for CloudWatch alarm monitoring	Systems Manager Automation now uses your runbook execution identity for CloudWatch alarm monitoring. It no longer uses the SSM service-linked role for this operation. Make sure your execution identity has the required permissions. For more information, see Configuring CloudWatch alarm monitoring for Automation.	July 8, 2026

Advanced-instances tier removed	The advanced-instances tier has been removed. There is no longer a 1,000-instance limit for hybrid managed nodes, and you no longer need to enable a paid tier to use Session Manager on non-EC2 machines. Instead, Session Manager and Run Command use pay-as-you-go pricing when used on hybrid managed nodes. For more information about pricing, see Amazon Systems Manager Pricing.	July 1, 2026
Amazon Systems Manager Application Manager availability change	Amazon Systems Manager Application Manager will no longer be open to new customers starting on July 30, 2026. To use the service, sign up before July 30, 2026. For capabilities similar to Amazon Systems Manager Application Manager, learn more here.	June 30, 2026
Updated Amazon Parameters and Secrets Lambda Extension ARNs	Updated the ARNs for the Amazon Parameters and Secrets Lambda Extension to the latest available versions for all supported Amazon Web Services Regions. For more information, see Using Parameter Store parameters in Lambda functions.	June 19, 2026

Updated managed policy AWSQuickSetupManagedInstanceProfileExecutionPolicy	Systems Manager has updated the managed policy `AWSQuickSetupManagedInstanceProfileExecutionPolicy` to support Quick Setup PatchPolicy migration from Amazon CloudFormation inline policies to managed policies. The update adds automation execution capabilities including instance discovery, role updates, role tagging, and expanded PassRole permissions to Systems Manager. For information, see Systems Manager updates to Amazon managed policies.	June 3, 2026
New managed policy AWSQuickSetupPatchPolicyTagManagementExecutionPolicy	Systems Manager has released a new managed policy `AWSQuickSetupPatchPolicyTagManagementExecutionPolicy` to enable Quick Setup patch policy configurations to track which instances are managed through automated tagging and inventory collection. For information, see Systems Manager updates to Amazon managed policies.	June 3, 2026

New managed policy AWSQuickSetupPatchPolicyLambdaExecutionPolicy	Systems Manager has released a new managed policy `AWSQuickSetupPatchPolicyLambdaExecutionPolicy` that grants permissions to manage State Manager associations for automated cleanup operations when Quick Setup configurations are deleted. For information, see Systems Manager updates to Amazon managed policies.	June 3, 2026
Updated Amazon Parameters and Secrets Lambda Extension ARNs	Updated the ARNs for the Amazon Parameters and Secrets Lambda Extension to the latest available versions for all supported Amazon Web Services Regions. For more information, see Using Parameter Store parameters in Lambda functions.	May 14, 2026
Updated Amazon Parameters and Secrets Lambda Extension ARNs	Updated the ARNs for the Amazon Parameters and Secrets Lambda Extension to the latest available versions for all supported Amazon Web Services Regions. For more information, see Using Parameter Store parameters in Lambda functions.	May 6, 2026

Updated managed policy AmazonSSMAutomationRole	Systems Manager has updated the managed policy `AmazonSSMAutomationRole` to add the `cloudformation:TagResource` and `cloudformation:UntagResource` permissions. These permissions allow Automation runbooks that create CloudFormation stacks to add and remove tags from resources. For information, see Systems Manager updates to Amazon managed policies.	March 20, 2026
New section for programmatically retrieving the latest Lambda Extension ARNs	The latest Amazon Resource Name (ARN) for the Lambda extension is published as a public parameter in Systems Manager Parameter Store for each supported architecture. You can retrieve the latest ARN programmatically using the Amazon CLI or Amazon CloudFormation to make sure that your application always references the most recent extension version without manual updates. For more information, see Amazon Parameters and Secrets Lambda Extension ARNs.	March 10, 2026

Updated managed policy AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy	Systems Manager has updated the managed policy `AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy` to add additional EC2 and SSM permissions for enhanced diagnosis capabilities. For information, see Systems Manager updates to Amazon managed policies.	December 19, 2025
Updated managed policy AWSQuickSetupDeploymentRolePolicy	Systems Manager has updated the managed policy `AWSQuickSetupDeploymentRolePolicy` to add support for two additional SSM documents: `AWSQuickSetupType-ConfigureDevOpsGuru` and `AWSQuickSetupType-DeployConformancePack`. These additions enable Quick Setup to deploy DevOps Guru configurations and conformance packs through the policy. For information, see Systems Manager updates to Amazon managed policies.	December 15, 2025

Amazon Systems Manager Change Manager is no longer open to new customers.	Amazon Systems Manager Change Manager is no longer open to new customers. Existing customers can continue to use the service as normal. For more information, see Amazon Systems Manager Change Manager availability change.	November 7, 2025
New versions of the Amazon Parameters and Secrets Lambda Extension	New versions of the Amazon Parameters and Secrets Lambda Extension are now available for all previousl y supported Regions and architectures. In addition, ARM64 and Mac with Apple silicon architecture support has been added for the Asia Pacific (New Zealand) Region (ap-southeast-6).	October 22, 2025
Updated Python and PowerShell runtime support	We've updated "Supporte d" lists and examples with the runtimes now officiall y supported by Systems Manager, which include Python 3.10, Python 3.11, and PowerShell 7.4 (dotnet8) . Previous versions are no longer supported.	October 16, 2025

Patch Manager support for IPv6 environments	Patch Manager now provides support for Internet Protocol version 6 (IPv6) environments. For information, see Improve the security of EC2 instances by using VPC endpoints for Systems Manager and Patching a server in an IPv6 only environment.	October 15, 2025
Amazon Systems Manager Change Manager will no longer be open to new customers starting November 7, 2025.	Amazon Systems Manager Change Manager will no longer be open to new customers starting November 7, 2025. If you would like to use Change Manager, sign up before that date. Existing customers can continue to use the service as normal. For more informati on, see Amazon Systems Manager Change Manager availability change.	October 7, 2025
New versions of the Amazon Parameters and Secrets Lambda Extension	New versions of the Amazon Parameters and Secrets Lambda Extension are now available for all previousl y supported Regions and architectures. In addition, support has been added for the Asia Pacific (New Zealand) Region (ap-southeast-6), for the x86_64 and x86 architect ures only.	September 30, 2025

Updated managed policy AWSSystemsManagerJustInTimeAccessTokenPolicy	Systems Manager has updated the managed policy `AWSSystemsManagerJustInTimeAccessTokenPolicy` to provide data channel permissions for session management. For information, see Systems Manager updates to Amazon managed policies.	September 25, 2025
Updated managed policy: AWSQuickSetupStartStopInstancesExecutionPolicy	Systems Manager has updated the managed policy `AWSQuickSetupStartStopInstancesExecutionPolicy` to refine permissions for Quick Setup scheduler configuration. The policy now provides more specific permissions for starting and stopping Amazon EC2 instances, accessing change calendars, and executing automation documents with enhanced security conditions. For information, see Systems Manager updates to Amazon managed policies.	September 12, 2025

Updated managed policy: AWSQuickSetupStartSSMAssociationsExecutionPolicy	Systems Manager has updated the managed policy `AWSQuickSetupStartSSMAssociationsExecutionPolicy` to change the automation document from `AWSQuickSetupType-StartSSMAssociations` to `AWSQuickSetupType-Scheduler-ChangeCalendarState`. This update changes the policy's purpose from starting SSM associations to managing change calendar states for scheduled operations. For information, see Systems Manager updates to Amazon managed policies.	September 12, 2025

Three updated managed policies	Systems Manager has updated three managed policies to enable Quick Setup to start Automation executions on additional Systems Manager resources: `AWSQuickSetupSSMLifecycleManagementExecutionPolicy`, `AWSQuickSetupPatchPolicyPermissionsBoundary`, and `AWSQuickSetupManagedInstanceProfileExecutionPolicy`. For information, see Systems Manager updates to Amazon managed policies.	September 12, 2025
Updated managed policy: AmazonSSMAutomationRole	Systems Manager has updated the managed policy `AmazonSSMAutomationRole` to add the `ssmmessages:OpenDataChannel` permission. This permission allows Automation runbooks to establish communication channels for session-based operations. For information, see Systems Manager updates to Amazon managed policies.	September 11, 2025

New topic: Understanding SSM Agent hibernation	This new topic explains that hibernation is an operational mode that occurs when the agent can't maintain proper communication with the Systems Manager service. During hibernation, the agent reduces its communication frequency and enters a standby state. For details about agent hibernation, see Understanding SSM Agent hibernation.	September 2, 2025
Updated managed policy: AWSSystemsManagerJustInTimeAccessServicePolicy	Systems Manager has updated the managed policy `AWSSystemsManagerJustInTimeAccessServicePolicy` to add automation execution tagging permissions, making it possible for customers to scope down operator permissions to specific tags. For information, see Systems Manager updates to Amazon managed policies.	August 25, 2025

Updated descriptions for node detail tabs (unified console)	We've updated the descriptions of content on the tabs on the node details page in the unified console (Tabs: **Tags**, **Inventory**, **Association**, **Patches**, **Configuration compliance**). For information, see What is the unified console?.	August 20, 2025
New security best practice topic for installing SSM Agent	The new topic SSM Agent installation best practices explains the importance of using the correct method for installing the agent depending on the machine type, EC2 instance or hybrid-activated machine.	August 18, 2025

New console-based Automation features	Amazon Systems Manager Automation has introduced enhanced execution capabilities with automatic retry for throttled operations and the ability to rerun automation executions. The automatic throttling retry feature helps ensure reliable automation execution at scale by automatically retrying API calls that encounter throttling limits, with configurable time limits up to 3600 seconds. (All Automation actions except aws:executeScript automatic throttling retry. Additionally, you can now easily rerun completed automation executions with identical or modified parameters, streamlining repeated tasks and reducing operational overhead without manually recreating configurations. For more information, see the following topics: • Configuring automatic retry for throttled operations • Rerunning automation executions • Running automations in multiple Amazon Web Services Regions and accounts	August 14, 2025

Updates for the AWSQuickSetupDeploymentRolePolicy managed policy	Systems Manager has updated the `AWSQuickSetupDeploymentRolePolicy` managed policy to grant association-related permissions to additional `AWSQuickSetupType-*` Automation runbooks and to allow Quick Setup to attach and detach additional IAM policies. In addition, we have updated the documentation for `AWSQuickSetupDeploymentRolePolicy` to provide more detailed descriptions of the permissions granted for Quick Setup configuration management operations. For information, see Systems Manager updates to Amazon managed policies.	August 12, 2025

New topic: Data perimeters in Amazon Systems Manager	You can configure data perimeter policies for Amazon service-owned resources that Systems Manager accesses. Data perimeters in Amazon Systems Manager describes the purpose of the Systems Manager managed `ssm-document-categories-` *`region`* S3 bucket. This bucket contains metadata about document categories that help organize and classify SSM Documents in the console.	August 12, 2025
New managed policy for Quick Setup scheduler : AWSQuickSetupStartStopInstancesExecutionPolicy	Systems Manager has released a new managed policy, `AWSQuickSetupStartStopInstancesExecutionPolicy` , that provides permissions for Quick Setup to start and stop Amazon EC2 instances on a schedule. For information, see Systems Manager updates to Amazon managed policies.	August 12, 2025

New Amazon managed policy for Quick Setup: AWSQuickSetupStartSSMAssociationsExecutionPolicy	Systems Manager has released a new managed policy `AWSQuickSetupStartSSMAssociationsExecutionPolicy` that allows Quick Setup to run the `AWSQuickSetupType-StartSSMAssociations` Automation runbook. For information, see Systems Manager updates to Amazon managed policies.	August 12, 2025
New troubleshooting guidance for zypper package lock dependency failures on SLES managed nodes	Added comprehensive troubleshooting guidance for resolving zypper package lock dependency failures that occur during Patch Manager `Install` operations on SUSE Linux Enterprise Server managed nodes. The new section Issue: Zypper package lock dependency failures on SLES managed nodes provides detailed information about identifying, diagnosing, and resolving package lock conflicts that prevent successful patch installation.	July 28, 2025

Enhanced troubleshooting guidance for skipped inventory associations	Updated the Skipped troubleshooting section to provide comprehensive guidance on inventory association priority handling. The enhanced documentation now includes detailed information about Quick Setup inventory associations, explicit targeting scenarios, and step-by-step resolution procedures for managing conflicting inventory associations. Key improvements include: • Explanation of inventory association priority order (Quick Setup, explicit, and global associations) • Common scenarios with specific examples and expected outcomes • Detailed resolution steps for removing Quick Setup configurations when using custom inventory associations • Important notes about data collection behavior and association precedence	July 24, 2025

Updated managed policy: AWS-SSM-RemediationAutomation-ExecutionRolePolicy	Systems Manager has updated the managed policy `AWS-SSM-RemediationAutomation-ExecutionRolePolicy` to improve the security posture of the ssm:StartAutomationExecution API by requiring permissions for both "document" and "automation-execution" resource types. This update is being made to improve the security posture of the ssm:StartAutomationExecution API by requiring permissions for both "document" and "automation-execution" resource types, providing more comprehensive and detailed permissions for remediation automation execution. For information, see Systems Manager updates to Amazon managed policies.	July 16, 2025

Updated managed policy: AWS-SSM-RemediationAutomation-AdministrationRolePolicy	Systems Manager has updated the managed policy `AWS-SSM-RemediationAutomation-AdministrationRolePolicy` to support API authorization improvements for remediation automation operations. The updated policy enhances permissions for executing activities defined within Automation documents, with improved security controls and resource access patterns for remediation workflows. For information, see Systems Manager updates to Amazon managed policies.	July 16, 2025

Updated managed policy: AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy	Systems Manager has updated the managed policy `AWS-SSM-DiagnosisAutomation-ExecutionRolePolicy` to provide more detailed and accurate permissions for diagnosis automation execution. The updated policy includes enhanced descriptions for Amazon EC2 and Amazon VPC resource access, more specific SSM automation permissions, and improved Amazon KMS and IAM permission descriptions with proper resource restrictions. For information, see Systems Manager updates to Amazon managed policies.	July 16, 2025

Updated managed policy: AWS-SSM-DiagnosisAutomation-AdministrationRolePolicy	Systems Manager has updated the managed policy `AWS-SSM-DiagnosisAutomation-AdministrationRolePolicy` to include more specific permissions and security conditions for diagnosis automation operations. The updated policy provides enhanced security controls for Amazon KMS key usage, Amazon S3 bucket access, and role assumptions, with stricter resource-based conditions and account-level restrictions. For information, see Systems Manager updates to Amazon managed policies.	July 16, 2025
Added documentation for AmazonSSMAutomationRole managed policy	Systems Manager has updated the documentation for the existing managed policy `AmazonSSMAutomationRole` . For information, see Systems Manager updates to Amazon managed policies.	July 15, 2025

Enhanced security for SSM documents with environment variable interpolation	Amazon Systems Manager Command documents now support environment variable interpolation when processin g parameters. This feature, available in schema version 2.2 and with SSM Agent version 3.3.2746.0 or higher, helps prevent command injection attacks by treating parameter values as literal strings rather than potential ly executable commands. When set to `ENV_VAR`, the agent creates an environment variable named in the format `SSM_`*`parameter-name`* that contains the parameter's value. For more information, see the following topics: • Document components • Secure parameter handling examples • Data elements and parameters • Command document plugin reference	July 14, 2025

Explorer resource data sync available in four opt-in Amazon Web Services Regions	By default, Explorer cross-account/cross-Region resource data syncs don't support data aggregation in opt-in Regions. Support was added for the following opt-in Regions on June 30, 2025. • Europe (Milan) • Africa (Cape Town) • Middle East (Bahrain) • Asia Pacific (Hong Kong) Note that you can't use a delegated administrator account to create a resource data sync in opt-in Regions. You must use an Amazon Organizations management account. For more information, see Understanding multiple account and Region resource data syncs.	June 30, 2025
New versions of the Amazon Parameters and Secrets Lambda Extension	New versions of the Amazon Parameters and Secrets Lambda Extension are now available for all supported Regions and architectures. In addition, support has been added for the Asia Pacific (Taipei) Region (ap-east-2).	June 26, 2025

New topic: Change Calendar integration with Amazon EventBridge	The topic Change Calendar integration with Amazon EventBridge provides information about this integration in the following categories: • Event timing and reliability • Event modifications and timing considerations • Adjacent and overlapping events • Best practices	June 25, 2025
Runtime support update for Automation action 'aws:executeScript'	The `Runtime` parameter in the Automation action aws:executeScript now supports PowerShell 7.4 (`dotnet8`) scripts.	June 24, 2025
SSM Agent and Patch Manager now support RHEL 10 and Ubuntu Server 25.04	You can now manage Red Hat Enterprise Linux 10 and Ubuntu Server 25.04 machines with Systems Manager, including patching managed nodes using Patch Manager. For complete lists of supported OSs and versions, see the following topics: • Supported operating systems for Systems Manager • Supported operating systems for Patch Manager	June 23, 2025

Updates to just-in-time node access topics	We've made the following updates to content in the Just-in-time node access using Systems Manager chapter: • Clarified authentication support for just-in-time node access. For informati on, see Setting up just-in-time access with Systems Manager. • Clarified the requireme nt to tag the Amazon KMS keys used for Session Manager encryption and RDP recording in just-in-time node access with the tag key `SystemsMa nagerJustInTimeNod eAccessManaged` and tag value `true`. For information, see Update just-in-time node access session preferences and Configuring S3 bucket encryption for RDP recordings. • Updated Configure notificat ions for just-in-time access requests with additional configuration details.	June 17, 2025

Enhanced RDP recording for just-in-time node access	Amazon Systems Manager just-in-time node access now provides additional informati on about RDP recording configurations. When using Amazon KMS encryption on S3 buckets where recordings are stored, you must provide access to the KMS key used for bucket encryption to the `ssm-guiconnect` service principal. This release also introduces a new recording status, `ProcessingError` , which indicates intermedi ate failures during video processing that could be due to service dependency failures or missing permissio ns.For more information, see Recording RDP connections.	June 13, 2025
Updated information about patch selection and installat ion in Patch Manager	Added information to explain how Patch Manager handles obsolete packages during patch selection and installat ion. For more information, see How security patches are selected and How patches are installed.	June 12, 2025

Updated managed policy for Quick Setup: AWSQuickSetupDeploymentRolePolicy	Systems Manager has updated the managed policy `AWSQuickSetupDeploymentRolePolicy` so that Quick Setup can create associations using this managed policy instead of inline policies. For information, see Systems Manager updates to Amazon managed policies.	June 10, 2025
Expanded introduction to Patch Manager	To better introduce Patch Manager to potential customers and users, we have added the following three sections to the Patch Manager chapter: • How can Patch Manager benefit my organization? • Who should use Patch Manager? • What are the main features of Patch Manager?	May 21, 2025

Updated managed policy for Quick Setup: AWSQuickSetupSSMDeploymentRolePolicy	Systems Manager has updated the managed policy `AWSQuickSetupSSMDeploymentRolePolicy` to provide permissions to tag IAM roles and Lambda resources created for the unified console. For information, see Systems Manager updates to Amazon managed policies.	May 7, 2025
Feature configuration options for the unified console	Systems Manager now provides feature configuration options when setting up the unified console. These feature configurations allow you to choose whether to set up Default Host Management Configuration (DHMC), inventory metadata collection, and automatic SSM Agent updates. For more information, see Setting up Systems Manager unified console for an organization and Setting up Systems Manager unified console for a single account and Region.	May 7, 2025

Updated managed policy for Quick Setup: AWSSystemsManagerJustInTimeNodeAccessRolePropagationPolicy	Systems Manager has updated the managed policy `AWSSystemsManagerJustInTimeNodeAccessRolePropagationPolicy` to provide permissions to tag a resource shared by Amazon Resource Access Manager for just-in-time node access. For information, see Systems Manager updates to Amazon managed policies.	April 29, 2025
Updated managed policy for Quick Setup: AWSQuickSetupManageJITNAResourcesExecutionPolicy	Systems Manager has updated the managed policy `AWSQuickSetupManageJITNAResourcesExecutionPolicy` to provide permissions to tag IAM roles created for just-in-time node access. For information, see Systems Manager updates to Amazon managed policies.	April 29, 2025

Systems Manager introduces just-in-time node access	Amazon Systems Manager now supports a just-in-time access method of connecting to managed nodes. This new method of connecting to managed nodes helps improve the security of your nodes by providing temporary, time-bound access to nodes only when needed, eliminating the need for long-standing permissions. Additionally, Systems Manager provides session recording for RDP sessions to Windows Server nodes to help you meet compliance requirements, perform root cause analysis, and more. For more information, see Just-in-time node access using Systems Manager.	April 29, 2025
New managed policies for just-in-time node access	Systems Manager has released several new managed policies to support just-in-time node access. For information, see Systems Manager updates to Amazon managed policies.	April 29, 2025
New versions of the Amazon Parameters and Secrets Lambda Extension	New versions of the Amazon Parameters and Secrets Lambda Extension are now available for all supported Regions and architectures.	April 23, 2025

New topic: "What is compliance in Patch Manager?"	Patch compliance for the managed nodes in your fleet is not defined by Amazon or other third parties. The new topic What is compliance in Patch Manager? clarifies that patch compliance for a node managed by Systems Manager means that all patches have been installed on the node that meet the approval criteria specified in the associated patch baseline. Compliance is defined by you, in the rules you configure in a patch baseline, or in a predefined patch baseline provided by Amazon that you choose for your patching operations.	April 11, 2025
New versions of the Amazon Parameters and Secrets Lambda Extension	New versions of the Amazon Parameters and Secrets Lambda Extension are now available. In addition, extension support has been added for the following Regions: • Asia Pacific (Thailand) (ap-southeast-7) • Mexico (Central) (mx-central-1)	April 3, 2025

New topic: Configuring permissions for Compliance	As a security best practice, we recommend that you update the Amazon Identity and Access Management (IAM) role used by your managed nodes to restrict the node's ability to use the PutComplianceItems API action. This API action registers a compliance type and other compliance details on a designated resource, such as an Amazon EC2 instance or a managed node. For more information, see Configuring permissions for Compliance.	March 11, 2025
Updated topic: Reviewing node insights	In the unified console for Systems Manager, the **Review node insights** page reports the number of managed and unmanaged EC2 instances in your organization or account. We have clarified that Systems Manager includes an EC2 instance in the "Unmanaged" count when it is in a `Stopped` state. For more information, see What is an unmanaged instance?.	February 25, 2025

Updated topic: Verify the signature of SSM Agent	The Amazon Systems Manager Agent (SSM Agent) RPM and Debian installer packages for Linux instances are cryptographically signed. You can use a public key to verify that the agent package is original and unmodified. If the files are damaged or have been altered, the verificat ion fails. You can verify the signature of the installer package using either RPM or GPG. The topic includes a new public key for SSM Agent. For more information, see Verify the signature of SSM Agent.	February 14, 2025
New topic: Verify the signature of the Session Manager plugin	The Session Manager plugin RPM and Debian installer packages for Linux instances are cryptographically signed. You can use a public key to verify that the plugin binary and package is original and unmodified. If the file is altered or damaged, the verification fails. You can verify the signature of the installer package using the GNU Privacy Guard (GPG) tool. For more information, see Verify the signature of the Session Manager plugin.	February 13, 2025

Session Manager plugin updated	The Session Manager plugin was recently updated with the following enhancements: Upgraded the Go version to 1.23 in the Dockerfile. Updated the version configuration step in the README. For more information about the Session Manager plugin, see Install the Session Manager plugin for the Amazon CLI.	February 6, 2025
TPS quotas published for Automation API actions	We have published the transaction per second (TPS) quotas, formerly known as limited, for several Systems Manager Automation-related API actions. For information, see Systems Manager service quotas in the *Amazon Web Services General Reference*.	January 21, 2025
Terminology change: Systems Manager capabilities renamed as "tools"	Until now, the functional units that make up Systems Manager have been called *capabilities*, such as the Automation capability, the Parameter Store capability, and so on. These functional units are now referred to as *tools*, such as the Automation tool and the Parameter Store tool. This user guide has been updated to reflect the change.	January 10, 2025

Patch Manager support for additional macOS versions (Amazon EC2 AMIs)	Patch Manager now supports macOS versions 12.7, 13.6 and 13.7, and 15.*x*. For complete lists of OSs and versions supported by Patch Manager, see Supported operating systems for Patch Manager.	January 8, 2025
SSM Agent and Patch Manager support for additional versions: CentOS Stream, Ubuntu Server, and Windows Server	Patch Manager now supports CentOS Stream 9, Ubuntu Server 24.10, and Windows Server 2025. SSM Agent now supports Ubuntu Server 24.10 and Windows Server 2025. (Agent support for CentOS Stream 9 was previousl y released.) For complete lists of supported OSs and versions, see the following topics: • Supported operating systems for Systems Manager • Supported operating systems for Patch Manager	November 22, 2024

New topic: Amazon KMS encryption for Parameter Store SecureString parameters	Learn how Amazon Systems Manager Parameter Store uses Amazon Key Management Service to encrypt the values of `SecureString` parameters in Parameter Store in the following topic: • Amazon KMS encryption for SecureString parameters in Parameter Store	November 22, 2024
New and updated managed policies for Systems Manager	To support new features for Systems Manager, we are releasing multiple new managed policies to support new Systems Manager configurations and operations, and updating other managed policies. For more information, see Systems Manager updates to Amazon managed policies.	November 21, 2024

A new, simplified node management experience for Systems Manager	Amazon Systems Manager has released a new unified console experience for managing nodes at scale across accounts and Regions. You can now see all managed and unmanaged nodes across your organizations' Amazon Web Services accounts and Regions from a single place. You can also identify, diagnose, and remediate unmanaged nodes. Systems Manager is also now integrate d with Amazon Q Developer (Amazon Q), which extends your ability to see and control your nodes from anywhere in the Amazon Web Services Management Console by entering natural language prompts. With this release, you can also now use Amazon Organizations to allow a delegated administrator account to manage nodes across the organization from a central viewpoint. For more information, see the following topics: • What is Amazon Systems Manager? • Setting up Amazon Systems Manager	November 21, 2024

	• Complete node tasks with Amazon Systems Manager	
Session Manager plugin bug fix	The Session Manager plugin was recently updated with the following bug fix: Rolled back change that added credentials to OpenDataC hannel requests.	November 20, 2024
Session Manager plugin enhancements	**This version was deprecated on 11/20/2024.** The Session Manager plugin was recently updated with the following enhancements. • Added credentials to OpenDataChannel requests. • Upgraded the `testify` and `objx` dependent packages.	November 6, 2024
Additional OS version support for macOS	Systems Manager now supports version 15.*x* (Sequoia) of the macOS operating system (EC2 instances only). For a list of all supported OSs and versions, see Supported operating systems for Systems Manager.	November 6, 2024

Patch Manager: Updates to supportd package name formats for Approved and Rejected lists	For several operating systems, we have updated and expanded the lists of formats for package names that you can specify in **Approved patches** and **Rejected patches** lists in your patch baselines. For information, see Package name formats for Amazon Linux 1, Amazon Linux 2, , Amazon Linux 2023, CentOS, Oracle Linux, and Red Hat Enterprise Linux (RHEL).	November 1, 2024
Additional operating version support for Patch Manager	Patch Manager now supports additional versions of Oracle Linux (8.10 and 9.4) and Ubuntu Server (23.10 and 24.04). For lists of all supported operating systems and versions, see the following topics: • Supported operating systems for Systems Manager • Supported operating systems for Patch Manager	November 1, 2024

SSM Agent support for additional versions: CentOS Stream, Oracle Linux, and Ubuntu Server	SSM Agent now supports CentOS Stream 9, Oracle Linux 8.10 and 9.4, and Ubuntu Server 24.04 LTS, besides earlier supported versions. For complete lists of supported OSs and versions for Systems Manager, see Supported operating systems for Systems Manager.	October 25, 2024
Session Manager plugin enhancement	Added support for passing the plugin version with OpenDataChannel requests.	October 10, 2024
New: View details about RDP connections made using Fleet Manager	You can now view informati on about Remote Desktop Protocol connections that have been made by users in your Amazon Web Services account. For information, see Viewing information about current and completed connections.	October 10, 2024
Patch Manager now supports SLES version 15.6	Patching support for SUSE Linux Enterprise Server (SLES) 15.6 has been released. You can now patch SLES 15.6 machines using Patch Manager. For a full list of operating systems and versions supportd by Patch Manager, see Supported operating systems for Patch Manager.	September 29, 2024

New versions of the Amazon Parameters and Secrets Lambda Extension	New versions of the Amazon Parameters and Secrets Lambda Extension are now available. Support for all architectures has been introduced for the Asia Pacific (Malaysia) Region (ap-southeast-5). In addition, ARM64 and Mac with Apple silicon architecture extension support has been added for the following Regions: • Asia Pacific (Hyderabad) (ap-south-2) • Asia Pacific (Melbourne) (ap-southeast-4) • Canada West (Calgary) (ca-west-1) • Europe (Zurich) (eu-central-2) • Europe (Spain) (eu-south-2) • Middle East (UAE) (me-central-) • China (Beijing) (cn-north-1) • China (Ningxia) (cn-northwest-1) • Israel (Tel Aviv) (il-central-1) • Amazon GovCloud (US-East) (us-gov-east-1) • Amazon GovCloud (US-West) (us-gov-west-1)	September 19, 2024

New topic: Configuring permissions for maintenance windows using the Amazon CLI	The topic Configuring permissions for maintenance windows using the Amazon CLI provides instructions for creating a custom service role (and its policies) for running maintenance window tasks on a user's behalf.	August 19, 2024
SSM Agent and Patch Manager support for additional versions: AlmaLinux, Oracle Linux, and Rocky Linux	SSM Agent and Patch Manager now support versions 8.10, 9.3, and 9.4 of AlmaLinux and Rocky Linux, and version 9.3 of Oracle Linux, besides earlier supported versions. For complete lists of supported OSs and versions, see the following topics: • Supported operating systems for Systems Manager • Supported operating systems for Patch Manager	August 14, 2024

New IAM policy condition for Parameter Store support: ssm:Policies	Using `ssm:Policies` , a newly supported condition for IAM policies, you can prevent Entities from creating or updating parameter that include a parameter policy. For more information, see the following topics: • ssm:Policies: Prevent creation or updates to parameters that use parameter policies • Condition keys for Amazon Systems Manager in the *Service Authorization Reference*.	August 14, 2024
Updated managed policy for Quick Setup: SSMQuickSetupRolePolicy	Systems Manager has updated the managed policy `SSMQuickSetupRolePolicy` to provide access to additional Amazon CloudFormation stack sets. For information, see Systems Manager updates to Amazon managed policies.	August 13, 2024

Support for provisioning and managing Systems Manager resources using Terraform	We have added HashiCorp Terraform to the list of supported third-party integrations with Systems Manager. Terraform is an open-source *infrastructure as code* (IaC) software tool that provides a command line interface (CLI) workflow to manage various cloud services. You can use Terraform to provision and manage several commonly used Systems Manager resources and data sources. For information about this and other third-party integrations with Systems Manager, see Integration with other products and services.	August 1, 2024

New Quick Setup console experience and API	Systems Manager Quick Setup has released a new console experience and API. Now you can interact with this API using the console, Amazon CLI, Amazon CloudFormation, and SDKs. You can opt in to the new console using the Quick Setup console. For more information about onboarding to the new Quick Setup experience, see Getting started with Quick Setup. For more details about the API operations available through the Quick Setup API, see the Quick Setup API Reference.	August 1, 2024

New topic: Rejected patch list options in custom patch baselines	For patching operations that use a custom patch baseline in Patch Manager, we have clarified the behavior when a patch added to the **Rejected patch** list is assigned the action `Allow as dependency` . Because Windows Server doesn't support the concept of patch dependencies, patches not already installed on a managed node are skipped. Patches that are already installed on the node are assigned the status `INSTALLED_REJECTED` . For more information, see Rejected patch list options in custom patch baselines and Patch compliance values for other operating systems.	July 23, 2024
New topic: Configuring SSM Agent for use with the Federal Information Processing Standard (FIPS)	We have provided instructions for configuring SSM Agent for use with the Federal Information Processing Standard (FIPS). For information, see Configuring SSM Agent for use with the Federal Information Processing Standard (FIPS).	July 22, 2024

Update: Clarified support for @ symbol in Fleet Manager user names	If an IAM Identity Center user name contains one or more @ symbols, Fleet Manager RDP disregards the first @ symbol and all characters that follow it, whether the @ introduces the domain portion of an email address. For more informati on about supported character s for user names in Fleet Manager RDP connections, see Authenticating Remote Desktop connections.	July 21, 2024
Updated managed policy: AmazonSSMManagedEC 2InstanceDefaultPolicy	Systems Manager has updated the managed policy `AmazonSSMManagedEC 2InstanceDefaultPo licy` by providing inline statement IDs (Sids) to clarify the purpose of each policy statment. For information, see Systems Manager updates to Amazon managed policies.	July 18, 2024

Name changes to Amazon managed buckets for Patch Manager patching operations	Amazon owns and maintains several Amazon S3 buckets that SSM Agent accesses in the course of performin g various Patch Manager patching operations. These S3 buckets are publicly accessible, and by default, SSM Agent connects to them using HTTP calls. However, if you're using a virtual private cloud (VPC) endpoint in your Systems Manager operation s, you must provide explicit permission in an Amazon EC2 instance profile for Systems Manager, or in a service role for non-EC2 machines in a hybrid and multicloud environment. Otherwise, your resources can't access these public buckets. Usually, we are changing the names of these buckets. For example, for patching operations, the bucket `aws-patch manager-macos-us-e ast-2` is replaced by `aws-patchmanager-macos-us-east-2-552881074` , and the bucket `aws-ssm-us-east-2` is replaced by `aws-patch-manager-us-east-2-552881074` . For more information, see the following topics:	July 18, 2024

	• SSM Agent communications with Amazon managed S3 buckets • Reference: Amazon S3 buckets for patching operations	
New service-linked role for Quick Setup	Systems Manager has released a new service-linked role, `AWSServiceRoleForSSMQuickSetup`. Systems Manager uses this role to check configuration health of resources set up using Quick Setup to make sure consistent use of parameters and provisioned resources, and to remediate resources when drift is detected. The managed policy associated with this role is `SSMQuickSetupRolePolicy`. For more information, see AWSServiceRoleForSSMQuickSetup service-linked role permissions for Systems Manager.	July 3, 2024
New managed policies for Quick Setup configuration types	Systems Manager has released an additional 12 new managed policies to support various Quick Setup configuration types and processes. For information, see Systems Manager updates to Amazon managed policies.	July 3, 2024

Support for RHEL 8.10 and 9.4	Systems Manager and Patch Manager now support Red Hat Enterprise Linux versions 8.10 and 9.4. For more information, see Supported operating systems and machine types and Supported operating systems for Patch Manager.	June 26, 2024
Patch Manager support for 8.8 and 8.9 versions: AlmaLinux, Oracle Linux, and Rocky Linux	Patch Manager now supports versions 8.8 and 8.9 of AlmaLinux, Oracle Linux, and Rocky Linux, besides earlier 8.x versions. For complete lists of supported OSs and versions for Patch Manager, see Supported operating systems for Patch Manager.	June 17, 2024

New public parameters for macOS Amazon EC2 AMIs	Public parameters have been released to support Amazon Machine Images for macOS Amazon Elastic Compute Cloud instances. For more information, see the following topics. • Finding public parameters • Calling AMI public parameters for macOS • Launch a Mac instance in the *Amazon EC2 User Guide* • Amazon EC2 Mac instances in the *Amazon EC2 User Guide* • Use Amazon Systems Manager parameters instead of AMI IDs in launch templates in the *Amazon EC2 Auto Scaling User Guide*	June 17, 2024

Update: Regional availability of the `/aws/service/global-infrastructure` parameter path	We have clarified which commercial Regions the `/aws/service/global-infrastructure` public parameter path can be queried from, and how to run a query for the path if you are working in a different commerical Amazon Web Services Region. For information, see Calling public parameters for Amazon services, Regions, endpoints, Availability Zones, local zones, and Wavelength Zones.	June 12, 2024
New: Code examples chapter	A new chapter, Code examples for Systems Manager using Amazon SDKs, provides examples in different SDK languages for how to work with the Systems Manager service.	May 8, 2024

Changes to `ec2messages:*` endpoint support	For Amazon Web Services Regions launching in 2024 or later, the `ec2messages:*` endpoints are not supported by SSM Agent for sending status and execution information back to the Systems Manager service. Accounts in these Regions must use `ssmmessages:*`. In Regions launched before 2024, both `ssmmessages:*` and `ec2messages:*` are still supported, but we recommend using only the `ssmmessages:*` endpoint (Amazon Message Gateway Service) now. You can safely remove `ec2messages:*` permissions from your policies at this time. For more information, see Working with SSM Agent and Agent-related API operations (ssmmessages and ec2messages endpoints).	May 3, 2024
Additional runtimes available for running scripts in Automation runbooks	The `aws:executeScript` action now supports the Python 3.9, 3.10, and 3.11 runtimes. For more information about how to use this action, see `aws:executeScript`.	April 23, 2024

Support for 8.8 and 8.9 versions: AlmaLinux, Oracle Linux, and Rocky Linux	Systems Manager now supports versions 8.8 and 8.9 of AlmaLinux, Oracle Linux, and Rocky Linux, besides earlier 8.x versions. For complete lists of supported OSs and versions, see Supported operating systems for Systems Manager.	April 22, 2024
Patch Manager: Change to patching status 'INSTALLED_PENDING_REBOOT'	Previously, only patches installed by Patch Manager could be marked as `INSTALLED_PENDING_REBOOT`. Patches installed outside of Patch Manager were never given this status. Now, `INSTALLED_PENDING_REBOOT` can apply to any patch that has been applied to a managed node since it was last rebooted. This includes patches installed by Patch Manager with the `NoReboot` option selected, and to patches installed outside of Patch Manager after the node's most recent reboot. For descriptions of all Patch Manager patching status values, see Understanding patch compliance state values.	April 16, 2024

Support for RHEL 8.9 and 9.3	Systems Manager, including Patch Manager, now supports Red Hat Enterprise Linux (RHEL) versions 8.9 and 9.3, besides earlier 8.x and 9.x versions.	March 26, 2024
Topic update: Amazon managed policies for Amazon Systems Manager	The topic Amazon managed policies for Amazon Systems Manager has provided information about the four managed policies for Systems Manager that have been introduced or updated since March 12, 2021. We have added a section to this topic with information about the 12 other managed policies for use with Systems Manager that were created or last updated before that date. For details, see Additional managed policies for Systems Manager.	March 1, 2024

Parameter Store now supports cross-account sharing	You can now share advanced parameters securely and efficiently across Amazon Web Services accounts or within your Amazon Organization by setting up resource sharing. Resource sharing lets you centralize application configuration management and reduce the operational overhead of sharing the parameters with every single account you own. Parameters can be shared across accounts using the Parameter Store console, the Amazon RAM console, or the Amazon CLI. For more information, see Working with shared parameters.	February 21, 2024
Automation action enhancement	You can now use the `onFailure` and `isCritical` properties with the `aws:approve` action. For more information about the `aws:approve` action, see aws:approve – Pause an automation for manual approval.	February 12, 2024

Additional operating version support for Patch Manager	We have added to the list of supported operating system versions for Patch Manager. Support has been added for the following: • Debian Server 11.x and 12.x • macOS 14.x (Sonoma) • SUSE Linux Enterprise Server (SLES) 15.5 • Ubuntu Server 23.04	January 4, 2024
Configure automated SSM Agent updates using the Application Manager console	You can now use the Applicati on Manager console to automate SSM Agent updates for your application instances . For more information, see Working with your application instances.	December 21, 2023
Updated process for registeri ng non Amazon EC2 machines in hybrid and multicloud environments	Systems Manager now provides the `ssm-setup-cli` to help you register non Amazon Elastic Compute Cloud (Amazon EC2) machines in hybrid and multicloud environments. For more information, see How to install the SSM Agent on hybrid Linux nodes and How to install the SSM Agent on hybrid Windows nodes.	December 20, 2023

Manage Amazon EBS volumes using Fleet Manager	You can now use Fleet Manager, a tool in Amazon Systems Manager, to manage Amazon Elastic Block Store volumes on your managed instances. For example, you can initialize an EBS volume, format a partition, and mount the volume to make it available for use. For more information, see EBS volume management.	December 14, 2023
Session Manager plugin enhancement	Added support for passing a StartSession API response as an environment variable to session-manager-plugin.	December 4, 2023
New visual design experience for Automation runbooks	You can now create and edit runbooks using a new visual design experienc e developed by Systems Manager Automation. The visual design experience provides a low-code, drag-and-drop interface so you can create and edit runbooks more easily. For more information, see Visual design experience for Automation runbooks.	November 26, 2023

New Systems Manager Automation actions, data element, and functional enhancements for runbooks	You can now loop over multiple actions in a runbook using the `aws:loop` action. This new action supports `do while` and `for each` style loops. Additionally, using the new *variables* data element, you can define, reference and update values dynamically within the context of a runbook. To update the value of a variable in your runbook, use the new `aws:updateVariable` action. Automation has also added support for dynamic data type conversions for outputs. This means that if the value of an output doesn't match the data type you've specified, Automation tries to convert the data type. For example, if the value returned is an `Integer`, but the `Type` specified is `String`, the final output value is a `String` value. Lastly, Automation now supports JSONPath filter expressions for selectors. For more information, see the following topics: • aws:loop – Iterate over steps in an automation	November 17, 2023

	• aws:updateVariable – Updates a value for a runbook variable • Data elements and parameters – Top-level data elements • Using action outputs as inputs. • Using JSONPath in runbooks.	
Updated Region support for Remote Desktop Protocol (RDP) connections	Fleet Manager Remote Desktop, which is powered by Amazon DCV, provides you with secure connectivity to your Windows Server instances directly from the Systems Manager console. The following three additional Regions have been enabled for Fleet Manager Remote Desktop connections: • Africa (Cape Town) (af-south-1) • Asia Pacific (Jakarta) (ap-southeast-3) • Israel (Tel Aviv) (il-central-1)	November 15, 2023

Patch Manager: Expanded OS version support for RHEL and macOS	Patch Manager now supports the following additional operating system versions: • Red Hat Enterprise Linux: version 8.8 • macOS: 11.5–11:7 (Big Sur) • macOS: 12.0–12.6 (Monterey) • macOS: 13.0–13.5 (Ventura)	October 23, 2023
New OpsCenter API - DeleteOpsItem	OpsCenter now offers the DeleteOpsItem API for deleting individual OpsItems. For more information, see DeleteOpsItem in the *Amazon Systems Manager API Reference*.	October 20, 2023
New Quick Setup configuration type: SSM Agent updates for entire organization	The new configuration type **Default Host Management Configuration** makes it possible for an organization administrator, as defined in Amazon Organizations, to prompt automatic check and updates of SSM Agent on *all* EC2 instances in the organization's accounts and Regions. For more information, see Default Host Management for an organization.	October 16, 2023

New title and description format for OpsItems created by CloudWatch Application Insights	The title and description for OpsItems created by CloudWatch Application Insights is changing to an improved format on October 16, 2023. To view the new format, see Amazon CloudWatch Application Insights.	September 29, 2023
Support for multiple display resolutions in Fleet Manager RDP connections	When you connect to Windows Server managed nodes using the Remote Desktop protocol (RDP) option in Fleet Manager, you can now choose the display resolution. Previously, all connections used a fixed 720P (1366 x 768) resolution. You can now choose from the following for each connectio n: • **Adapt Automatically** (determines optimum resolution based on your detected screen size) • **1920 x 1080** • **1400 x 900** • **1366 x 768** • **800 x 600** For information, see Connect to a managed node using Remote Desktop.	September 22, 2023

New topic: Random patch baseline IDs in patch policy operations	We have added content to describe how Quick Setup patch policies use the `BaselineOverride` parameter in the `AWS-RunPatchBaseline` SSM Command document to generate random IDs for patch baselines each time a patch policy operation is run. For information, see Random patch baseline IDs in patch policy operations.	September 22, 2023
A new operational insight for managing OpsItems	OpsCenter now includes an operational insight called **Resources generating the most OpsItems**. An insight of this type is generated when an Amazon resource has more than 10 open OpsItems. Use this insight to locate problematic resources. Use the `AWS-BulkResolveOpsItems` runbook from within an insight to quickly resolve OpsItems associated with a resource. For more informati on, see Analyzing operational insights to reduce OpsItems.	September 22, 2023
GPG public key updated	A new public key has been created to verify the signature of SSM Agent. For more information, see Verifying the signature of SSM Agent.	September 5, 2023

Support added for additional versions of AlmaLinux, Oracle Linux, RHEL, and Rocky Linux	The lists of supported operating systems for Amazon Systems Manager and Patch Manager have been updated to reflect support the following additional OS versions: • AlmaLinux: 9.2 • Oracle Linux: 8.7 and 9.2 • Red Hat Enterprise Linux (RHEL): 8.7, 9.1, and 9.2 • Rocky Linux: 8.6 and 8.7, 9.0–9.2	August 30, 2023
OpsCenter added support for Markdown formatting in the OpsItem description field.	OpsCenter now supports Markdown formatting in the OpsItem description field. The following types of Markdown formatting are supported: • Paragraphs • Line spacing • Horizontal Lines • Headings • Text Formatting • Links • Lists For more information, see Using Markdown in the Console in the *Getting Started with the Amazon Web Services Management Console Getting Started Guide.*	August 18, 2023

New versions of the Amazon Parameters and Secrets Lambda Extension	New versions of the Amazon Parameters and Secrets Lambda Extension are now available. In addition, extension support has been added for the Asia Pacific (Melbourne) (ap-southeast-4) and Israel (Tel Aviv) (il-central-1) Regions (x86_64 and x86 architectures only.) For more information, see Using Parameter Store parameters in Amazon Lambda functions.	August 16, 2023

Update: Added information about required permissions for Quick Setup patch policy buckets	When you create a patch policy, Quick Setup creates an Amazon S3 bucket that contains a file named `baseline_overrides.json` . This file stores information about the patch baselines that you specified for your patch policy. When configuring the patch policy, you have the option of selecting an **Add required IAM policies to existing instance profiles attached to your instances** check box. If you choose not to select this option, then you must manually provide certain resources with permissions to access this bucket or your policy operations might fail. For more information, see the following topics: • Permissions for the patch policy S3 bucket • Issue: "Invoke-PatchBaselineOperation : Access Denied" error or "Unable to download file from S3" error for `baseline_overrides.json`	July 6, 2023

Use Quick Setup to configure OpsCenter for multi-account OpsItem management	Quick Setup for OpsCenter helps you complete the following tasks for managing OpsItems across accounts: • Specifying the delegated administrator account • Creating required Amazon Identity and Access Management (IAM) policies and roles • Specifying an Amazon Organizations organizat ion, or a subset of member accounts, where a delegated administrator can manage OpsItems across accounts For more information, see (Optional) Configure OpsCenter to manage OpsItems across accounts by using Quick Setup.	June 19, 2023
Update Amazon EC2 launch agents using Quick Setup	You can now allow Systems Manager to check every 30 days for a new version of the launch agent installed on your instance. If a new version is available, Systems Manager updates the agent on your instance. For more informati on, see Quick Setup Host Management.	June 19, 2023

Patch Manager now supports Ubuntu Server 22.04 LTS	You can now use Patch Manager to patch Ubuntu Server 22.04 LTS nodes. Like other supported versions of Ubuntu Server, version 22.04 LTS, uses the Amazon managed `AWS-UbuntuDefaultPatchBaseline` patch baseline.	May 15, 2023
Systems Manager now supports AlmaLinux, including Patch Manager	You can now use Systems Manager to manage AlmaLinux 8.3-8.7; 9.0-9.1 nodes. Many of the rules that apply to RHEL 8 for patching also apply to AlmaLinux. AlmaLinux uses the new `AWS-DefaultAlmaLinuxPatchBaseline`. For more information, see the following topics: • Manually install SSM Agent on AlmaLinux instances • How security patches are selected • How patches are installed • How patch baseline rules work on AlmaLinux, RHEL, and Rocky Linux.	May 8, 2023

Deploy the EC2Launch v2 agent using Quick Setup	You can now deploy the EC2Launch v2 agent using Quick Setup. For more information, see Deploy Distributor packages with Quick Setup.	April 13, 2023
Systems Manager now supports Amazon Linux 2023	Systems Manager now supports the new Amazon Linux 2023 (AL2023) EC2 instance type, including support for Patch Manager operations. Many of the rules for patching that apply to Amazon Linux 2 also apply to Amazon Linux 2023. (Patch Manager also continues to support the preview release .) For more information, see the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on Amazon Linux 1, Amazon Linux 2, , and Amazon Linux 2023	March 23, 2023

Revised setting up content for Amazon EC2 instances	We have revised the setting up content for Amazon EC2 instances. It is now recommended to use the newly released Default Host Management Configuration for instance permissions. For more information, see Configure instance permissions required for Systems Manager.	February 15, 2023
Automatic instance management with the Default Host Management Configuration	You can now automatically manage Amazon EC2 instances in an entire Amazon Web Services Region using Systems Manager. For more information, see Default Host Management Configuration.	February 15, 2023
Add SSM documents to your favorites	To help you find frequently used SSM documents, you can now add documents to your favorites. You can favorite up to 20 documents per document type, per Amazon Web Services account and Amazon Web Services Region. You can choose, modify, and view your favorites from the Systems Manager **Documents** console. For more information, see Adding documents to your favorites.	February 7, 2023

Implement change controls for Automation using Change Calendar	By integrating Automation with Change Calendar, you can now implement change controls to all automations in your Amazon Web Services account. For more informati on, see Implement change controls for Automation.	January 24, 2023
New Change Manager approval workflow	The Change Manager approval workflow now supports *per-level* approvals instead of *per-line approvals* . Previously, every approver you added to an approval level had to approve a change request. Otherwise, the level was not approved. Now, you specify how many approvals are required for the level and can add that many or more approvers. For example, you can require three approvals for a level but specify up to five approvers. Approvals from any three of those approvers are sufficien t to approve the level. For more information, see About approvals in your change templates.	January 23, 2023

New: Configure patching for an entire organization using a patch policy in Quick Setup	With Quick Setup, a tool in Systems Manager, you can now create *patch policies* powered by Patch Manager. A patch policy defines the schedule and patch baseline to use when automatically patching your managed nodes. Using a single patch policy configuration, you can define patching for all accounts in all Regions in your organization, for only the accounts and Regions you choose, or for a single account-Region pair. For more information, see the following topics. • Using Quick Setup patch policies • Automate organization-wide patching using a Quick Setup patch policy	December 22, 2022

Application Manager integrates with Amazon EC2 to display information about your instances in the context of an application.	Application Manager displays instance state, status, and Amazon EC2 Auto Scaling health for a selected application in a graphical format. The **Instances** tab also includes a table with the following information for each instance in your application.
	• Instance state (Pending, Stopping, Running, Stopped)
	• Ping status for SSM Agent
	• Status and name of the last Systems Manager Automation runbook processed on the instance
	• A count of Amazon CloudWatch Logs alarms per state.
	  • `ALARM` – The metric or expression is outside of the defined threshold.
	  • `OK` – The metric or expression is within the defined threshold.
	  • `INSUFFICIENT_DATA` – The alarm has just started, the metric is not available, or not enough data is available for the metric to determine the alarm state.
		December 22, 2022

	• Auto Scaling group health for the parent and individua l autoscaling groups	
Schedule the starting and stopping of your Amazon EC2 instances using Quick Setup	You can now deploy the Resource Scheduler solution to automate the starting and stopping of your Amazon EC2 instances using Quick Setup. For more information, see Resource Scheduler.	December 19, 2022

OpsCenter now supports working with OpsItems across accounts	OpsCenter supports working with OpsItems from a management account (either an Amazon Organizations management account or a Systems Manager delegated administrator account) and a member account during a session. Once configure d, users can perform the following types of actions: • Create, view, and update OpsItems in a member account • View detailed information about Amazon resources specified in OpsItems in a member account • Start Systems Manager Automation runbooks to remediate issues with Amazon resources in a member account For more information, see Setting up OpsCenter to work with OpsItems across accounts.	November 16, 2022

Track details of Change Manager change requests using Amazon CloudTrail Lake	You can now use an event data store in Amazon CloudTrail Lake to capture and review details about the change requests that are run in Change Manager for your organization or account. This information includes auditable details about the user identity that created the change request, the IP address from which the request was made, the Amazon Web Services Regions in which the changes were made, the targeted resources , and more. For information, see Monitoring your change request events and Reviewing change request details, tasks, and timelines.	November 11, 2022

Additional Systems Manager Automation task controls using CloudWatch alarms	You can now implement additional control when running automations across multiple accounts and Regions by using CloudWatch alarms. By applying a metric or composite CloudWatc h alarm to an automation, you can control when an automation stops based on the metrics you define. For more information about applying a CloudWatch alarm to an automation running across multiple accounts and Regions see Run an automatio n in multiple Regions and accounts (console)	November 9, 2022
Updated: 'Using Parameter Store parameters in Amazon Lambda functions'	We have provided additiona l information to help you use the Amazon Parameters and Secrets Lambda Extension to retrieve parameter values and cache them for future use in Lambda functions. Using the Lambda extension can reduce your costs by reducing the number of API calls to Parameter Store. For information, see Using Parameter Store parameters in Amazon Lambda functions.	October 25, 2022

Additional Systems Manager task controls using CloudWatch alarms	You can now implement additional control when running automations and commands by using CloudWatch alarms. A CloudWatch alarm can also be added to an automation or command when it is registered with a State Manager association or maintenance window task. By applying a composite CloudWatch alarm to an automation or command, you can control when an automation or command stops based on the metric you define. For more information about applying a CloudWatch alarm to an automation or command see the following procedures: • How security patches are selected • How patches are installed • How patch baseline rules work on Amazon Linux 1, Amazon Linux 2, and .	September 26, 2022

Additional Systems Manager task controls using CloudWatch alarms	You can now implement additional control when running automations and commands by using CloudWatch alarms. A CloudWatch alarm can also be added to an automation or command when it is registered with a State Manager association or maintenance window task. By applying a composite CloudWatch alarm to an automation or command, you can control when an automation or command stops based on the metric you define. For more information about applying a CloudWatch alarm to an automation or command see the following procedures: • Running a simple automation • Running commands from the console • Create an association • Assign tasks to a maintenance window	September 26, 2022
Clarifying advanced-instances tier requirements	Based on customer feedback, we have clarified the scenarios that require you to activate the advanced-instances tier in Configuring instance tiers.	September 21, 2022

Deploy the Amazon CloudWatch Agent using Quick Setup	You can now deploy the Amazon CloudWatch agent using Quick Setup. For more information, see Deploy Distributor packages with Quick Setup.	September 20, 2022
'PatchGroup' key now supported for patch groups when EC2 instance metadata is allowed	When you allow tags in EC2 instance metadata, the tag keys you create must not contain any spaces. Previously, this prevented customers from adding some of their EC2 instances to patch groups in Patch Manager because the tag key `Patch Group` had to be applied to the instances. Patch Manager now supports both `Patch Group` (with a space) and `PatchGroup` (without a space) as the tag key for identifying instances for a patch group. EC2 instances where tags are allowed in instance metadata can now be added to patch groups in Patch Manager. For information, see About patch groups.	August 31, 2022

New topic: "How package release dates and update dates are calculated"	In patch baselines managed by Amazon, new patches are auto-approved 7 days after they are released or updated. In custom patch baselines you create, you can optionall y specify how many days to wait after they are released or updated to auto-approve their installation. For Amazon Linux 1 and Amazon Linux 2, various factors influence how the latest release dates and update dates are calculated. To help you avoid unexpecte d results when choosing auto-approval delays, these factors are explained in the topic How package release dates and update dates are calculated.	August 24, 2022
Updated content: Patch an AMI and update an Auto Scaling group	We have updated the Updating AMIs for Auto Scaling groups walkthrou gh to use launch templates instead of launch configura tions. Additionally, we've implemented the latest Automation actions and runtimes in the runbook content.	June 22, 2022

Change Manager: Prevent users from creating auto-approvable requests	You can configure change templates in Change Manager to support automatic approvals, meaning that users with the necessary IAM permissions can choose to start the change request without requiring additional approval. Now, you can also restrict individual users, groups, or IAM roles from submitting auto-approval requests, even if a change template supports them. This is achieved through the use of a new IAM condition key, `ssm:AutoApprove` . For more information, see Controlling access to auto-approval runbook workflows	June 15, 2022

Updated guidance for maintenance window task roles	Previously, the Systems Manager console provided you with the ability to choose the Amazon managed IAM service-linked role `AWSServiceRoleForAmazonSSM` to use as the maintenance role for your tasks. Using this role and its associated policy, `AmazonSSMServiceRolePolicy`, for maintenance window tasks is no longer recommended. You should create a custom policy and role for maintenance window tasks instead. For more information, see Setting up Maintenance Windows.	June 9, 2022
Port forwarding to remote hosts support for Session Manager	Session Manager now supports port forwarding sessions to remote hosts. The remote host isn't required to be managed by Systems Manager. For more information, see Starting a session (port forwarding to remote host).	May 25, 2022

Updated content: Instructions for manually installing SSM Agent on Amazon EC2 Linux instances	In response to customer feedback, we have overhauled the topics that provide instructions for manually installing SSM Agent on Amazon EC2 instances. These topics now provide commands using globally available files that you can copy and paste for quick installation on EC2 instances in any Amazon Web Services Region. These topics also provide information to help you creating installation commands that use files available in your own working Region. The latter approach is recommended when you are installing the agent on multiple instances using a script or template. For more information, see the instructions for your Linux operating system in the section Manually installing SSM Agent on EC2 instances for Linux.	May 9, 2022

New topic: Amazon Machine Images (AMIs) with SSM Agent preinstalled	In response to customer feedback, we have centralized information about which Amazon managed AMIs include SSM Agent preinstalled. This topic also provides instructions for how to verify that an Amazon EC2 instance created from these AMIs was successfully installed and is running. For rare cases where the agent might not install successfully, or install but not start, we also provide information about starting or manually installing the agent on these instances. For details, see Amazon Machine Images (AMIs) with SSM Agent preinstalled.	May 8, 2022
URLs for SSM Agent installation in the China Regions moved to the 'Getting Started with Amazon in China' guide (China Regions)	The URLs to download the SSM Agent installation in the Beijing and Ningxia Regions have been moved to the *Getting Started with Amazon in China* guide. URLs are now provided for both the China (Beijing) Region and China (Ningxia) Region, for all supported operating systems. For information, see SSM Agent installation files in the Beijing and Ningxia Regions in the *Getting Started with Amazon in China* guide.	May 7, 2022

New State Manager section	Added a new section that describes the details of when State Manager runs associations. For more information, see About association scheduling.	April 27, 2022
Patch Manager now supports Rocky Linux	You can now use Patch Manager to patch Rocky Linux nodes. Many of the rules that apply to RHEL 8 for patching also apply to Rocky Linux. Rocky Linux 8 uses the new `AWS-DefaultRockyLinuxPatchBaseline` . For more information, see the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on RHEL, CentOS Stream, and Rocky Linux.	April 14, 2022

Patch Manager now supports CentOS Stream 8	You can now use Patch Manager to patch CentOS Stream 8 instances and Red Hat Enterprise Linux (RHEL) 4.4-4.5 instances. Many of the rules that apply to RHEL 8 for patching also apply CentOS Stream 8. CentOS Stream 8 uses the `AWS-DefaultCentOSPatchBaseline` . For more information, see the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on RHEL and CentOS Stream	April 4, 2022

Create an assume role for Change Manager	A new section clarifies the requirements for creating and implementing an *assume role* for Change Manager. An assume role is an Amazon Identity and Access Management (IAM) service role that enables Change Manager to securely run the runbook workflows specified in an approved change request on your behalf. The role grants Amazon Systems Manager (Amazon STS) `AssumeRole` trust to Change Manager. For information, see Configuring roles and permissions for Change Manager.	March 18, 2022
Approve or reject Change Manager change requests in bulk	In the Systems Manager console, you can now select multiple change requests to approve or reject in a single operation. For information, see Reviewing and approving or rejecting change requests (console).	March 8, 2022

Support for Rocky Linux and Windows Server 2022 managed nodes	Systems Manager supports Rocky Linux and Windows Server 2022 managed nodes, including edge devices and hybrid machines located on-premises or with other cloud providers. To use Systems Manager with these operating systems, you must complete all required Systems Manager set up procedure s, including procedures for hybrid environments or edge devices, if applicable. For more information, see Setting up Systems Manager. For Rocky Linux machines, you must also manually install SSM Agent. For more information, see Manually install SSM Agent on Rocky Linux instances. For Windows Server 2022 Amazon Elastic Compute Cloud (Amazon EC2) instances, SSM Agent is installed by default.	March 1, 2022

Allow Automation to adapt to your concurrency needs and view Automation usage metrics	You can now allow Automation to automatically adjust your concurrent automation quota, and view Automation usage metrics that are published to CloudWatch. For more information about adaptive concurrency, see Allowing Automation to adapt to your concurrency needs. For more information about how to view Automation usage metrics, see Monitoring Automation metrics using Amazon CloudWatch.	January 27, 2022
Allow Automation to adapt to your concurrency needs and view Automation usage metrics	You can now allow Automation to automatically adjust your concurrent automation quota, and view Automation usage metrics that are published to CloudWatch. For more information about adaptive concurrency, see Allowing Automation to adapt to your concurrency needs. For more information about how to view Automation usage metrics, see Monitoring Automation metrics using Amazon CloudWatch.	January 27, 2022

Systems Manager documents organized by categories	Amazon owned Systems Manager documents are now organized by type and categories to help you find the documents you need.	January 13, 2022
Create and invoke integrations for Automation	You can now send messages using webhooks during an automation by creating an integration. Integrations can be invoked during an automation using the new `aws:invokeWebhook` action in your runbook. For more information about creating integrations, see Creating webhook integrations for Automation. To learn more about the `aws:invokeWebhook` action, see aws:invokeWebhook – Invoke an Automation webhook integration.	January 13, 2022
Capabilities not available in new Amazon Web Services Region	The following Systems Manager tools currently aren't available in the new Asia Pacific (Jakarta) Region. • Application Manager • Change Calendar • Change Manager • Explorer • Fleet Manager • Incident Manager • Quick Setup	December 13, 2021

View resource cost details for an application	Application Manager is integrated with Amazon Billing and Cost Managemen t through the **Cost Explorer** widget. After you enable Cost Explorer in the Billing and Cost Management console, the Cost Explorer widget in Application Manager shows cost data for a specific non-container application or application component. You can use filters in the widget to view cost data according to different time periods, granularities, and cost types in either a bar or line chart. For more information, see Viewing overview information about an application.	December 7, 2021
Manage processes using Fleet Manager	You can now use Fleet Manager to manage processes on your nodes. For more information, see Working with processes.	December 6, 2021

Terminology change: managed instances are now managed nodes	With support for Amazon IoT Greengrass core devices, the phrase *managed instance* has been changed to *managed node* in most of the Systems Manager documentation. The Systems Manager console, API calls, error messages, and SSM documents still use the term instance.	November 29, 2021

Support for edge devices	Systems Manager supports the following edge device configurations. • **Amazon IoT Greengrass**: Systems Manager now supports any device that is configured for Amazon IoT Greengrass and runs the Amazon IoT Greengrass Core software. To onboard your Amazon IoT Greengrass core devices, you must create an Amazon Identity and Access Management (IAM) service role. You must also use the Amazon IoT Greengrass console to deploy SSM Agent as a Amazon IoT Greengrass component on your devices. For more information, see Setting up Amazon Systems Manager for edge devices. • **Edge devices in a hybrid environment**: Systems Manager also supports Amazon IoT Core devices and non-Amazon IoT devices after you configure them as on-premises machines. To onboard your devices, you must create an IAM service role, create a managed-node activation for a hybrid environme	November 29, 2021

	nt, and manually install SSM Agent on your devices. For more information, see Setting up Amazon Systems Manager for hybrid environments	
Connect to managed instances using Remote Desktop	You can now use Fleet Manager to connect to managed Windows instances using the Remote Desktop Protocol (RDP). These Remote Desktop sessions powered by Amazon DCV provide secure connections to your instances directly from your browser. For more informati on, see Connect using Remote Desktop.	November 23, 2021
Specify a maximum session duration and provide reasons for sessions	You can now specify a maximum session duration for all Session Manager sessions in an Amazon Web Services Region in your Amazon Web Services account. When a session reaches reaches the duration you specify, it's terminated. You can now also optionally add a reason when starting a session. For more information, see Specify maximum session duration.	November 16, 2021

Patch Manager now supports the Raspberry Pi OS operating system	You can now use Patch Manager to patch Raspberry Pi OS instances. Patch Manager supports patching Raspberry Pi OS 9 (Stretch) and 10 (Buster). Because the Raspberry Pi OS is Debian-based OS, many of the same patching rules apply to it as to Debian Server. For more information, see the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on Debian Server	November 16, 2021
Access the Red Hat Knowledgebase portal	Use Fleet Manager to access the RHEL Knowledgebase portal to find solutions, articles, documentation, and videos about using Red Hat products. For more informati on, see Accessing the Red Hat Knowledge base portal.	November 3, 2021
Bulk edit OpsItems	OpsCenter now supports bulk editing OpsItems. You can select multiple OpsItems and edit one of the following fields: **Status**, **Priority**, **Severity**, **Category**. For more information, see Editing OpsItems.	October 15, 2021

Create input parameters that populate Amazon resources	You can now create input parameters in Automatio n runbooks that populate Amazon resources in the Amazon Web Services Management Console. For information, see Creating input parameters that populate Amazon resources.	October 14, 2021
New task invocation cutoff option for maintenance windows	You can now choose to block any new task invocatio ns from starting after the cutoff time specified for a maintenance window is reached. For information, see Assign tasks to a maintenance window (console).	October 13, 2021
Patch Manager support for macOS 11.3.1 and 11.4 (Big Sur)	Amazon Elastic Compute Cloud (Amazon EC2) instances for macOS 11.3.1 and 11.4 (Big Sur) can now be patched using Patch Manager. This is besides existing support for macOS 10.14.x (Mojave) and 10.15.x (Catalina). For informati on about working with Patch Manager, see Amazon Systems Manager Patch Manager.	October 1, 2021

Application insights in Application Manager	Application Manager integrates with Amazon CloudWatch Application Insights. Application Insights identifies and sets up key metrics, logs, and alarms across your application resources and technology stack. Application Insights continually monitors metrics and logs to detect and correlate anomalies and errors. When the system detects errors or anomalies, Application Insights generates CloudWatch Events that you can use to set up notificat ions or take actions. You can enable and view Applicati on Insights on the **Overview** and **Monitoring** tabs in Application Manager. For more information about Application Insights, see What is Amazon CloudWatc h Application Insights in the *Amazon CloudWatch User Guide*.	September 21, 2021

Import events from other calendars into Change Calendar	You can now import the events from a third-party calendar into a calendar in Change Calendar. Previously, each event had to be entered manually into a calendar. After you export a calendar from a supported third-par ty calendar provider to an iCalendar (`.ics`) file, import it into Change Calendar, and its events are included in the rules for your open or closed calendar in Systems Manager. Supported providers include iCloud Calendar, Google Calendar, and Microsoft Outlook. For more informati on, see Importing and managing events from third-party calendars.	September 8, 2021

New tagging and runbook features in Application Manager	Tagging enhancements include the ability to add tags to or delete tags from a specific resource or all resources in an Applicati on Manager application. Runbook enhancements include the ability to view a filtered list of runbooks for a specific resource type or initiate a runbook on all resources of the same type. For more information, see Working with tags in Applicati on Manager and Working with runbooks in Application Manager.	August 31, 2021
New example: Create a change request using the Amazon CLI	An example of creating a change request with the Amazon CLI has been added to the Change Manager chapter. The example uses the sample `AWS-Hello WorldChangeTemplate` change template and `AWS-HelloWorld runbook` : • Creating change requests (Amazon CLI)	August 20, 2021

New section: Use parameters in Amazon EKS	A new section has been added to the Parameter Store chapter. This topic is a walkthrough on how to use your parameters in Amazon EKS clusters. For more information, see Use Parameter Store parameters in Amazon Elastic Kubernetes Service.	August 19, 2021
Updated Patch Manager lifecycle hooks	Patch Manager now provides a lifecycle hook–the ability to run a Systems Manager Command document–for an additional point during a **Patch now** patching operation. If you schedule instance reboots after running **Patch now**, you can specify a lifecycle hook to run after the reboot is complete. For more information, see Using 'Patch now' lifecycle hooks and About the `AWS-RunPatchBaselineWithHooks` SSM document.	August 9, 2021

Auto-approvals now supported for Change Manager requests	You can now configure change templates in Change Manager to support automatic approvals, meaning that users with the necessary IAM permissions can choose to start the change request without requiring additiona l approval. Users who have access to auto-approval templates can still choose to specify approvers if they choose. To help you control your Change Manager processes, approvals are still required for all requests during change freeze periods. For more information, see the following topics: • Creating change templates • Creating change requests • Try out the Amazon managed `Hello World` change template	July 30, 2021

OpsCenter operational insights	OpsCenter automatically analyzes OpsItems in your account and generates *insights*. An insight includes information to help you understand how many duplicate OpsItems are in your account and which sources are creating them. Insights also provide recommended best practices and Automation runbooks to help you resolve duplicate OpsItems. For more informati on, see Working with operational insights.	July 13, 2021
View stopped instances in Fleet Manager	You can now view which instances are `running` and which instances are `stopped` from the Fleet Manager console. For more informati on, see Amazon Systems Manager Fleet Manager.	July 12, 2021
New topic: Authoring Automation runbooks	A new topic, Authoring Automation runbooks, provides guidance and narrative examples of how to author content for custom Automation runbooks.	July 8, 2021

Amazon CloudFormation stack and template creation in Application Manager	Application Manager helps you provision and manage resources for your applicati ons by integrating with CloudFormation. You can create, edit, and delete Amazon CloudFormation templates and stacks in Application Manager. Application Manager also includes a template library where you can clone, create, and store templates. Applicati on Manager and CloudForm ation display the same information about the current status of a stack. Templates and template updates are stored in Systems Manager until you provision the stack, at which time the changes are also displayed in CloudForm ation. For more information, see Working with Amazon CloudFormation Stacks in Application Manager.	July 8, 2021
New topic: Automatically rotate private keys for SSM Agent on hybrid instances	A new topic, Setting up private key auto rotation, provides instructions on how to strengthen your security posture by configuring SSM Agent to rotate the hybrid environment private key automatically.	June 15, 2021

Session Manager plugin for the Amazon CLI version 1.2.205.0	A new version of the Session Manager plugin for the Amazon CLI has been released. For more informati on, see Session Manager plugin latest version and release history.	June 10, 2021
New IAM service-linked role	When you enable OpsCenter operational insights, Systems Manager creates a new Amazon Identity and Access Management (IAM) service-linked role called `AWSSSMOpsInsightsS erviceRolePolicy` . For more information about this role, see Using roles to create operational insight OpsItems in Systems Manager OpsCenter: `AWSSSMOps InsightsServiceRol ePolicy` .	June 9, 2021
New Patch Manager troublesh ooting content for Linux	A new topic, Errors when running `AWS-RunPa tchBaseline` on Linux, provides descriptions and solutions for several issues that might be encountered when patching managed instances with Linux operating systems.	June 8, 2021

Improved support for maintenance window tasks that don't require specified targets (console)	You can now create maintenance window tasks in the console without having to specify a target in the task if one isn't required. Previously, this option was available only when using the Amazon CLI or API. This option applies to Automatio n, Amazon Lambda, and Amazon Step Functions task types. For example, if you create an Automation task and the resources to update are specified in the Automatio n document parameters, you no longer need to specify a target in the task itself. For more information, see Registering maintenance window tasks without targets, Assign tasks to a maintenan ce window (console), and Schedule automations with maintenance windows.	May 28, 2021
Automation Runbook Reference relocated	The Automation Runbook Reference has been moved to a new location. For more information, see Systems Manager Automation Runbook Reference.	May 10, 2021

Amazon Systems Manager Incident Manager launch	Incident Manager is an incident management console designed to help users mitigate and recover from incidents affecting their Amazon hosted applications. For more information, see the Amazon Systems Manager Incident Manager User Guide.	May 10, 2021
State Manager supports Change Calendar	You can now specify Change Calendar names or Amazon Resource Names (ARNs) when you create or update a State Manager association. State Manager applies associati ons only when the change calendar is open, not when it's closed. For more information, see Creating associations and Editing and creating a new version of an association.	May 6, 2021
Clone Systems Manager documents	Using the Systems Manager Documents console, you can now copy content from an existing document to a new document that you can modify. To learn more, see Cloning an SSM document.	May 4, 2021

Integrate Security Hub CSPM with Explorer and OpsCenter	You can now integrate Explorer and OpsCenter with Amazon Security Hub CSPM. Security Hub CSPM provides a comprehensive view of your security state in Amazon and helps you check your environment against security industry standards and best practices. When integrate d with Explorer, you can view security findings in the Security Hub CSPM widget on the Explorer dashboard. When integrated with OpsCenter , you can create OpsItems for Security Hub CSPM findings. For more informati on, see Receiving findings from Amazon Security Hub CSPM in Explorer and Receiving findings from Amazon Security Hub CSPM in OpsCenter.	April 27, 2021
New topic: Document conventions	We've added a new topic to help users understand the common typographical conventions for the *Amazon Systems Manager User Guide*. For more information, see Document conventions.	April 21, 2021

Updated topic: About patching applications released by Microsoft on Windows Server	The topic About patching applications released by Microsoft on Windows Server now clarifies that, for Patch Manager to be able to patch applications released by Microsoft on your Windows Server managed instances, the Windows update option **Give me updates for other Microsoft products when I update Windows** must be allowed on the instance.	April 12, 2021
Automation Runbook Reference reorganization	To help you find the runbooks you need and navigate the reference more efficiently, we reorganized the content in the Automation Runbook Reference by the relevant Amazon Web Services service. To view these changes, see Systems Manager Automation Runbook Reference.	April 12, 2021

Patch Manager: Generate .csv patch compliance reports	Patch Manager now supports the ability to generate patch compliance reports for your instances and save the report in an S3 bucket of your choice, in .csv format. Then, using a tool like Amazon Quick, you can analyze the patch compliance report data. You can generate a patch compliance report for a single instance, or for all instances in your Amazon Web Services account. You can generate a one-time report on demand, or set up a schedule for reports to be created automatic ally. You can also specify an Amazon Simple Notificat ion Service topic to provide notifications when a report is generated. For more informati on, see Generating CSV patch compliance reports.	April 9, 2021
Delete Parameter Store parameter labels	You can now delete Parameter Store parameter labels by using either the Systems Manager console or the Amazon CLI. For more information, see Working with parameter labels.	April 6, 2021

Schedule instance reboots when using Patch Now	Patch Manager now supports scheduling a time for your instances to reboot after patches are installed using the Patch Now feature. This is besides existing options to reboot instances only if needed to complete a patch installation or to skip all rebooting after the patching operation. For information, see Patching instances on demand.	April 1, 2021
New topic: Discover public parameters	Parameter Store public parameters can now be found using the Amazon CLI or Systems Manager console. For more information, see Finding public parameters.	April 1, 2021

Patch now updates: Store logs in S3 & and run lifecycle hooks	When you run the Patch Manager **Patch now** operation, you can choose an S3 bucket in which to automatically store patching logs. In addition, you can choose to run Systems Manager Command documents (SSM documents) as lifecycle hooks at three points during the operation : *Before installation*, *After installation*, and *On exit*. For more information, see Patching instances on demand.	March 31, 2021
Systems Manager now reports changes to its Amazon managed policies	Beginning March 24, 2021, changes to managed policies are reported in the topic Systems Manager updates to Amazon managed policies. The first change listed is the addition of support for the Explorer tool to report OpsData and OpsItems from multiple accounts and Regions.	March 24, 2021

Explorer automatically allows all OpsData sources for resource data syncs based on accounts in Amazon Organizations	When you create a resource data sync, if you choose one of the Amazon Organizations options, Systems Manager automatically allows all OpsData sources in the selected Amazon Web Services Regions for all Amazon Web Services accounts in your organization (or in the selected organization units). This means, for example, that even if you haven't allowed Explorer in an Amazon Web Services Region if you select an Amazon Organizations option for your resource data sync, then Systems Manager automatically collects OpsData from that Region. For more information, see About multiple account and Region resource data syncs.	March 24, 2021
Systems Manager Automation provides a new system variable for your runbooks	With the new `global:AWS_PARTITION` system variable, you can specify the Amazon partition a resource is located in when authoring your runbooks. For more information, see Automation system variables.	March 18, 2021

Allow multiple levels of approval for Change Manager change requests	When you create a Change Manager change template, you can now require that more than one level of approvers grant permissio n for a change request to run. For example, you might require technical reviewers to approve a change request created from a change template first, and then require a second level of approvals from one or more managers. For more informati on, see Creating change templates.	March 4, 2021
Patch Manager now supports Oracle Linux 8.x	You can now use Patch Manager to patch Oracle Linux 8.x instances, through version 8.3. For more information, see the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on Oracle Linux	March 1, 2021

OpsCenter displays other OpsItems for a selected resource	To help you investigate issues and provide context for a problem, you can view a list of OpsItems for a specific Amazon resource. The list displays the status, severity, and title of each OpsItem. The list also includes deep links to each OpsItem. For more information, see Viewing other OpsItems for a specific resource.	March 1, 2021
Define patching preferences at runtime	You can now define patching preferences at runtime using the baseline override feature. For information more, see Using the BaselineOverride parameter.	February 25, 2021
New Systems Manager document type	Amazon CloudFormation templates can now be stored as Systems Manager documents. Storing CloudFormation templates as Systems Manager documents lets you benefit from Systems Manager document features like versioning, comparing version content, and sharing with accounts. For more information, see Amazon Systems Manager documents.	February 9, 2021

Patch instances using optional hooks	The new SSM document `AWS-RunPatchBaselineWithHooks` provides hooks you can use to run SSM documents at three points during the instance patching cycle. For information about `AWS-RunPatchBaselineWithHooks`, see About the `AWS-RunPatchBaselineWithHooks` SSM document. For a sample walkthrough of a patching operation that uses all three hooks, see Walkthrough: Update application dependencies, patch an instance, and perform an application-specific health check.	February 2, 2021

New topic: Validating on-premises servers and virtual machines using a hardware fingerprint	SSM Agent verifies the identify of on-premises servers and virtual machines and VMs that you register with the service by using a computed *fingerprint*. The fingerprint is an opaque string, stored in the *Vault* that the agent passes to certain Systems Manager APIs. For information about the hardware fingerprint and instructions for configuri ng a *similarity threshold* to assist in machine verification, see Validating on-premises servers and virtual machines using a hardware fingerprint.	January 25, 2021
New topic: SSM Agent technical reference	The topic SSM Agent technical reference brings together information to help you implement Amazon Systems Manager SSM Agent and understand how the agent works. This topic includes an all-new section, SSM Agent rolling updates by Amazon Web Services Regions.	January 21, 2021

SSM Agent on Windows Server 2008	As of January 14, 2020, Windows Server 2008 is no longer supported for feature or security updates from Microsoft. Windows Server 2008 AMIs do include SSM Agent, but the agent is no longer updated for this operating system.	January 5, 2021
Improved support for maintenance window tasks that don't require specified targets (Amazon CLI and API only)	You can now create maintenance window tasks without having specify a target in the task if one isn't required (Amazon CLI and API only). This applies to Automation, Amazon Lambda and Amazon Step Functions task types. For example, if you create an Automation task and the resources to update are specified in the Automatio n runbook parameters, you no longer need to specify a target in the task itself. For more information, see Registering maintenance window tasks without targets and Schedule automations with maintenance windows.	December 23, 2020

New Automation features	A new shared property has been added to Systems Manager Automation runbooks. The `onCancel` property lets you specify which step the automation should go to if a user cancels the automation. For more information, see Properties shared by all actions.	December 21, 2020
New topic: Working with associations using IAM	A new topic has been added to the Systems Manager State Manager chapter that describes the best practices for creating associations using IAM. For more information, see Working with associations using IAM.	December 18, 2020
State Manager now supports multi-regions and multi-accounts	Associations can now be created or updated with multiple regions or accounts. For more information, see Creating associations.	December 15, 2020

New tool: Fleet Manager	Fleet Manager, a tool in Amazon Systems Manager, is a unified user interface (UI) experience that helps you remotely manage your server fleet running on Amazon, or on-premises. With Fleet Manager, you can view the health and performance status of your entire server fleet from one console. You can also gather data from individual instances to perform common troublesh ooting and management tasks from the console. For information, see Amazon Systems Manager Fleet Manager.	December 15, 2020

New tool: Change Manager	Amazon Web Services has released Change Manager, an enterprise change management framework for requesting, approving, implementing, and reporting on operational changes to your application configura tion and infrastructure. From a single *delegated administrator account*, if you use Amazon Organizations, you can manage changes across multiple Amazon Web Services accounts in multiple Amazon Web Services Regions. Alternati vely, using a *local account*, you can manage changes for a single Amazon Web Services account. Use Change Manager for managing changes to both Amazon resources and on-premises resources. For information, see Amazon Systems Manager Change Manager.	December 15, 2020

New tool: Application Manager	Application Manager helps you investigate and remediate issues with your Amazon resources in the context of your applications. Application Manager aggregates operations information from multiple Amazon Web Services services and Systems Manager tools to a single Amazon Web Services Management Console. For information, see Amazon Systems Manager Application Manager.	December 15, 2020

Amazon Systems Manager supports Amazon EC2 instances for macOS	In tandem with the release of Amazon Elastic Compute Cloud (Amazon EC2) support for macOS instances, Systems Manager now supports many operations on EC2 instances for macOS. Supported versions include macOS 10.14.x (Mojave) and 10.15.x (Catalina). For more informati on, see the following topics. • For information about installing SSM Agent on EC2 instances for macOS, see Installing and configuri ng SSM Agent on EC2 instances for macOS.. • For information about patching EC2 instances for macOS, see How patches are installed, and Creating a custom patch baseline (macOS). • For general information about support for EC2 instances for macOS, see Amazon EC2 Mac instances in the *Amazon EC2 User Guide*.	November 30, 2020

Maintenance window pseudo parameters: New resource type supported for {{TARGET_ID}} and {{RESOURCE_ID}}	An additional resource type is now available for use with the pseudo parameters {{TARGET_ID}} and {{RESOURCE_ID}}. You can now use the resource type AWS::RDS::DBCluster with both these pseudo parameters. For information about maintenance window pseudo parameters, see Using pseudo parameters when registering maintenance window tasks.	November 27, 2020
Session Manager plugin for the Amazon CLI version 1.2.30.0	A new version of the Session Manager plugin for the Amazon CLI has been released. For more information, see Session Manager plugin latest version and release history.	November 24, 2020
New topic: Comparing SSM document versions	You can now compare the differences in content between versions of SSM documents in the Systems Manager Documents console. For more information, see Comparing SSM document versions.	November 24, 2020

Systems Manager now supports VPC endpoint policies	You can now create policies for VPC interface endpoints for Systems Manager. For more information, see Create an interface VPC endpoint policy.	November 18, 2020
New topic: Specify an idle session timeout value	You can now specify the amount of time to allow a user to be inactive before a session ends with Session Manager. For more informati on, see Specify an idle session timeout value.	November 18, 2020
New Session Manager logging feature	You can now send a continual stream of JSON-formatted session data logs to Amazon CloudWatch Logs. For more information, see Streaming session data using Amazon CloudWatch Logs.	November 18, 2020
New topic: Verify the signature of the SSM Agent	You can now verify the cryptographic signature of the installer package for the SSM Agent on Linux instances . For more information, see SSM document schemas and features.	November 17, 2020

New topic: Understanding automation statuses	A new topic has been added to the Systems Manager Automation chapter that describes the statuses for actions and automations. For more information, see Understanding automation statuses.	November 17, 2020
New source types for the `aws:downloadContent` plugin	Git and HTTP are now supported as source types for the `aws:downloadContent` plugin. For more information, see `aws:downloadContent`.	November 17, 2020
New Systems Manager document (SSM document) schema feature	In SSM documents with schema version 2.2 or later, the `precondition` parameter now supports referencing your document's input parameters. For more information, see SSM document schemas and features.	November 17, 2020

New data source in Explorer: Amazon Config	Explorer now displays information about Amazon Config compliance, including an overall summary of compliant and non-compliant Amazon Config rules, the number of compliant and non-compliant resources, and specific details about each (when you drill down into a non-compliant rule or resource). For more information, see Editing Systems Manager Explorer data sources.	November 11, 2020
New topic: Running Auto Scaling groups with associations	A new section has been added to State Manager that describes the best practices for creating associations to run Auto Scaling groups. For more information, see Running Auto Scaling groups with associations.	November 10, 2020
Quick Setup now supports targeting a resource group	Quick Setup now supports choosing a resource group as a target for the local setup type. For more information, see Choosing Targets for Quick Setup.	November 5, 2020

Patch Manager adds support for Debian Server 10 LTS, Oracle Linux 7.9 LTS, and Ubuntu Server 20.10 STR	You can now use Patch Manager to patch Debian Server 10 LTS, Oracle Linux 7.9 LTS, and Ubuntu Server 20.10 STR instances. For more information, see the following topics: • Patch Manager prerequisites • How security patches are selected • How patches are installed • How patch baseline rules work on Debian Server • How patch baseline rules work on Oracle Linux • How patch baseline rules work on Ubuntu Server	November 4, 2020

New EventBridge support for Amazon Systems Manager Change Calendar	Amazon EventBridge now provides support for Change Calendar events events in event rules. When the state of a calendar changes, EventBridge can initiate the target action you defined an EventBridge rule. For information about working with EventBridge and Systems Manager events, see the following topics. • Configuring EventBridge for Systems Manager events • Reference: Amazon EventBridge event patterns and types for Systems Manager	November 4, 2020
Configure CloudWatch to create OpsItems from alarms	You can configure Amazon CloudWatch to automatically create an OpsItem in Systems Manager OpsCenter when an alarm enters the `ALARM` state. Doing so lets you quickly diagnose and remediate issues with Amazon resources from a single console. For more information, see Configuring CloudWatch to create OpsItems from alarms.	November 4, 2020

Support for Ubuntu Server 20.10	Amazon Systems Manager now supports Ubuntu Server 20.10 short-term release (STR). For more information, see the following topics: • Supported operating systems • Install SSM Agent for a hybrid environment (Linux) • Manually install SSM Agent on Ubuntu Server instances • Checking SSM Agent status and starting the agent	October 22, 2020
New topic: Allow configurable shell profiles	You can now allow configurable shell profiles with Session Manager. By allowing configurable shell profiles, you can customize preferences within sessions such as shell preferences, environment variables, working directories, and running multiple commands when a session is started. For more information, see Allow configurable shell profiles.	October 21, 2020

Patch compliance results now report which CVEs are resolved by which patches	For most supported Linux systems, when you view patch compliance results for your managed instances , the details you can view now report which Common Vulnerabilities and Exposure (CVE) bulletin issues are resolved by which available patches. This information can help you determine how urgently you need to install a missing or failed patch. For more information, see Viewing patch compliance results.	October 20, 2020

Expanded support for Linux patch metadata	You can now view many details about available Linux patches in Patch Manager. You can choose to view patch data such as architecture, epoch, version, CVE ID, Advisory ID, Bugzilla ID, repository, and more. In addition, the DescribeAvailablePatches API operation has been updated to support Linux operating systems and filtering according to these newly available patch metadata types. For more information, see the following topics: • Viewing available patches • DescribeAvailablePatches and Patch in the *Amazon Systems Manager API Reference* • describe-available-patches in the *Amazon Systems Manager section of the Amazon CLI Command Reference*	October 16, 2020
Session Manager plugin for the Amazon CLI version 1.2.7.0	A new version of the Session Manager plugin for the Amazon CLI has been released. For more information, see Session Manager plugin latest version and release history.	October 15, 2020

New topic: Session document schema	The new topic Session document schema describes the schema elements for a Session document. This information can help you create custom Session documents where you specify preferences for the types of sessions you use with Session Manager.	October 15, 2020
New topic: Free text search for SSM documents	The search box on the Systems Manager **Documents** page now supports free text search. Free text search compares the search term or terms that you enter against the document name in each SSM document. For more information, see Using free text search.	October 15, 2020
New topic: Troubleshooting Amazon EC2 managed instance availability	The new topic Troublesh ooting Amazon EC2 managed instance availability helps you investigate why an Amazon EC2 instance that you have confirmed is running isn't available in lists of available managed instances in Systems Manager.	October 6, 2020

Parameter Store chapter reorganization	To help you find the informati on you need more efficiently, we reorganized content in the Parameter Store chapter of the *Amazon Systems Manager User Guide*. Most content is now organized in the sections Setting up Parameter Store and Working with Parameter Store. In addition, the topic Amazon Systems Manager Parameter Store has been expanded to include the following sections: • How can Parameter Store benefit my organization? • Who should use Parameter Store? • What are the features of Parameter Store? • What is a parameter?	October 1, 2020

New patch compliance-related topics	The following topics have been added to help you identify managed instances that are out of patch compliance, understand the different types of patch compliance scans, and take the appropriate steps to bring your instances into compliance. • Identifying noncompliant instances • Patching noncompliant instances • Viewing patch compliance results	September 24, 2020
SSM Agent version 3.0	Systems Manager launched a new version of SSM Agent.	September 21, 2020

New and updated topics: Amazon EventBridge replaces CloudWatch Events for event management	CloudWatch Events and EventBridge are the same underlying service and API, but EventBridge provides more features and is now the preferred way to manage your events in Amazon. (Changes you make in either CloudWatch or EventBridge are reflected in each console.) References to CloudWatch Events and existing procedure s throughout the *Amazon Systems Manager User Guide* have been updated to reflect EventBridge support. In addition, the following new topics have been added. • Monitoring Systems Manager events • Configuring EventBridge for Systems Manager events • Systems Manager target type examples • Reference: Amazon EventBridge event patterns and types for Systems Manager	September 18, 2020

Integrating Amazon Security Hub CSPM and Patch Manager	You can now integrate Patch Manager with Amazon Security Hub CSPM. Security Hub CSPM provides a comprehensive view of your security state in Amazon and helps you check your environment against security industry standards and best practices. When integrated with Patch Manager, Security Hub CSPM monitors the patching status of your fleets from a security point of view. For more information, see Integrating Patch Manager with Amazon Security Hub CSPM.	September 17, 2020

Maintenance window pseudo parameters: New resource types supported for {{TARGET_ID}} and {{RESOURCE_ID}}	When you register a maintenance window task, you use the `--task-invocation-parameters` option to specify the parameters that are unique to each of the four task types. You can also reference certain values using *pseudo parameter* syntax, such as {{TARGET_ID}} and {{RESOURCE_ID}}. When the maintenance window task runs, it passes the correct values instead of the pseudo parameter placeholders. Two additional resource types are now available for use with the pseudo parameters {{TARGET_ID}} and {{RESOURCE_ID}}. You can now use the resources types `AWS::RDS::DBInstance` and `AWS::SSM::ManagedInstance` with both these pseudo parameters. For information about maintenance window pseudo parameters, see Using pseudo parameters when registering maintenance window tasks.	September 14, 2020

Patch instances on demand with new '**Patch now**' option	You can now use the Systems Manager console to patch instances, or scan for missing patches, at any time. You can do this without having to create or modify a schedule, or specify full patching configuration options to accommodate an immediate patching need. You need only specify whether to scan or install patches and identify the target instances for the operation. Patch Manager automatically applies the current default patch baseline for your instance types and applies best practice options for how many instances are patched at once, and how many errors are permitted before the operation fails. For more information, see Patching instances on demand.	September 9, 2020
New topic: Checking SSM Agent status and starting the agent	The new topic Checking SSM Agent status and starting the agent provides commands to check whether SSM Agent is running on each supportin g operating system. It also provides the commands to start the agent if it isn't running.	September 7, 2020

Patch Manager now supports Ubuntu Server 20.04 LTS	You can now use Patch Manager to patch Ubuntu Server 20.04 LTS instances. For more information, see the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on Ubuntu Server	August 31, 2020
New topic for Use cases and best practices	We've added a new topic to help users quickly understand the differences between Maintenance Windows and State Manager. For more information, see Choosing between State Manager and Maintenance Windows.	August 28, 2020
New OpsCenter features	OpsCenter include new features to help you quickly locate and run Automation runbooks to remediate issues. For more information, see Automation runbook features in OpsCenter.	August 19, 2020

New data source in Explorer: Amazon Web Services Support cases	Explorer now displays information about Amazon Web Services Support cases. You must have either an Enterprise or Business account set up with Amazon Web Services Support. For more information, see Editing Systems Manager Explorer data sources.	August 13, 2020
Distributor now provides a third-party package from Trend Micro.	Distributor now includes a third-party package from Trend Micro. You can use Distributor to install the Trend Micro Cloud One agent on your managed instances. Trend Micro Cloud One helps you secure your workloads in the cloud. For more informati on, see AmazonDistributor.	August 12, 2020
The `aws:configurePackage` document plugin now includes the additionalArguments parameter.	The Systems Manager Command document plugin `aws:configurePackage` now supports providing additional parameters to your scripts (install, uninstall, and update) with the new `additionalArguments` parameter. For more information, see the topic `aws:configurePackage`.	August 11, 2020

AppConfig content moved into a separate user guide	Information about Amazon AppConfig has been moved into a separate user guide. For more information, see What Is AmazonAppConfig? AppConfig also has a separate documentation landing page with links to the user guide, the AppConfig API reference , and a new AppConfig workshop.	August 3, 2020
Quick Setup now supports Amazon Organizations	Quick Setup now supports Amazon Organizations allowing you to quickly configure required security roles and commonly used Systems Manager tools across multiple accounts and Regions. For more informati on, see Amazon Systems Manager Quick Setup.	July 23, 2020
New data source in Explorer: association compliance	Explorer now displays association compliance data from State Manager. For more information, see Editing Systems Manager Explorer data sources .	July 23, 2020

New Systems Manager Command document to turn on and turn off Kernel Live Patching	The document `AWS-ConfigureKernelLivePatching` is now available to use with Run Command when you want to turn on or turn off Kernel Live Patching on Amazon Linux 2 instances. This document replaces the need for creating your own custom Command documents for these tasks. For more information, see Use Kernel Live Patching on Amazon Linux 2 instances	July 22, 2020
Updated Automation quotas	Service quotas for Automation have been updated including a separate queue for rate control automations. For more information, see Amazon Systems Manager Automation.	July 20, 2020

Specify the number of schedule offset days for a maintenance window using the console	Using the Systems Manager console, you can now specify several days to wait after the date and time specified by a CRON expression before running a maintenance window. (Previously, this option was available only when using an Amazon SDK or a command line tool.) For example, if your CRON expression schedules a maintenance window to run on the third Tuesday of every month at 11:30 PM – `cron(0 30 23 ? * TUE#3 *)` – and you specify a schedule offset of 2, the window won't run until two days later at 11:30 PM. For more information, see Cron and rate expressions for Systems Manager and Specify the number of schedule offset days for a maintenance window.	July 17, 2020
Update PowerShell using Run Command	To help you update PowerShell to version 5.1 on your Windows Server 2012 and 2012 R2 instances , we added a walkthrough to the Amazon Systems Manager User Guide. For more information, see Update PowerShell using Run Command.	June 30, 2020

Patch Manager now supports CentOS 8.0 and 8.1	You can now use Patch Manager to patch CentOS 8.0 and 8.1 instances. For more information, see the the following topics: • How security patches are selected • How patches are installed • How to install the SSM Agent on hybrid Linux nodes	June 27, 2020

AppConfig integrates with Amazon CodePipeline	AppConfig is an integrated deploy action for Amazon CodePipeline (CodePipeline). CodePipeline is a fully managed continual delivery service that helps you automate your release pipelines for fast and reliable application and infrastructure updates. CodePipeline automates the build, test, and deploy phases of your release process every time there is a code change, based on the release model you define. The integration of AppConfig with CodePipeline offers the following benefits. For more information, see AppConfig integration with CodePipeline. • Customers who use CodePipeline to manage orchestration now have a lightweight means of deploying configuration changes to their applications without having to deploy their entire codebase. • Customers who want to use AppConfig to manage configuration deployments but are limited because AppConfig doesn't support their current code or	June 25, 2020

	configuration store, now have additional options. CodePipeline supports Amazon CodeCommit, GitHub, and BitBucket (to name a few).	
New chapter: Product and service integrations	To help you understand how Systems Manager integrates with Amazon Web Services services and other products and services, a new chapter has been added to the Amazon Systems Manager User Guide. For more information, see Product and service integrations with Systems Manager.	June 23, 2020
Automation chapter reorganization	To help you find what you need, we reorganized topics in the Automation chapter of the *Amazon Systems Manager User Guide*. For example, the Automation actions and Automation runbooks references are now top-level sections in the chapter. For more information, see Amazon Systems Manager Automation.	June 23, 2020

Specify the number of schedule offset days for a maintenance window	Using a command line tool or Amazon SDK, you can now specify several days to wait after the date and time specified by a CRON expression before running a maintenance window. For example, if your CRON expression schedules a maintenance window to run on the third Tuesday of every month at 11:30 PM – `cron(0 30 23 ? * TUE#3 *)` – and you specify a schedule offset of 2, the window won't run until two days later at 11:30 PM. For more information, see Cron and rate expressions for Systems Manager and Specify the number of schedule offset days for a maintenance window.	June 19, 2020
Patch Manager support for Kernel Live Patching on Amazon Linux 2 instances	Kernel Live Patching for Amazon Linux 2 lets you apply security vulnerability and critical bug patches to a running Linux kernel, without reboots or disruptions to running applications. You can now allow the feature and apply kernel live patches using Patch Manager. For information, see Use Kernel Live Patching on Amazon Linux 2 instances.	June 16, 2020

Patch Manager increases Oracle Linux version support	Previously, Patch Manager supported only version 7.6 of Oracle Linux. As listed in Patch Manager prerequisites, support now covers versions 7.5-7.8.	June 16, 2020
Sample scenario for using the `InstallOverrideList` parameter in patching operations	The new topic Sample scenario for using the `InstallOverrideList` parameter describes a strategy for using the `InstallOverrideList` parameter in the `AWS-RunPatchBaseline` document to apply different types of patches to a target group, on different maintenance window schedules, while still using a single patch baseline.	June 11, 2020
Predefined deployment strategies for AppConfig	AppConfig now offers predefined deployment strategies. For more information, see Creating a deployment strategy.	June 10, 2020

Patch Manager now supports Red Hat Enterprise Linux (RHEL) 7.8-8.2	You can now use Patch Manager to patch RHEL 7.8–8.2 instances. For more information, see the the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on RHEL • Manually install SSM Agent on Red Hat Enterprise Linux instances • How to install the SSM Agent on hybrid Linux nodes	June 9, 2020

Explorer supports delegated administration	If you aggregate Explorer data from multiple Amazon Web Services Regions and Amazon Web Services accounts by using resource data sync with Amazon Organizations, then we recommend that you configure a delegated administrator for Explorer. A delegated administrator improves Explorer security by limiting the number of Explorer administrators who can create or delete multi-account and Region resource data syncs to only one individual. You also no longer need to be logged into the Amazon Organizat ions management account to administer resource data syncs in Explorer. For more information, see Configuring a Delegated Administrator.	June 3, 2020
Apply State Manager associati on only at the next specified Cron interval	If you don't want a State Manager association to run immediately after you create it, you can choose the **Apply association only at the next specified Cron interval** option in the Systems Manager console. For more information, see Creating associations.	June 3, 2020

New data source in Explorer: Amazon Compute Optimizer	Explorer now displays data from Amazon Compute Optimizer. This includes a count of **Under provisioned** and **Over provisioned** EC2 instances, optimization findings, on-demand pricing details, and recommendations for instance type and price. For more information, see the details for setting up Amazon Compute Optimizer in Setting up related services.	May 26, 2020
Install Windows Service Packs and Linux minor version upgrades using Patch Manager	The new topic Tutorial: Create a patch baseline for installing Windows Service Packs (console) demonstrates how you can create a patch baseline devoted exclusively to installing Windows Service Packs. The topic Create a custom patch baseline (Linux) has been updated with information about including minor version upgrades for Linux operating systems in patch baselines.	May 21, 2020

Parameter Store chapter reorganization	All topics that deal with configuring or setting options for Parameter Store operations have been consolidated into the Setting up Parameter Store section. This includes the topics Managing parameter tiers and Increasing Parameter Store throughput, which have been relocated from other parts of the chapter.	May 18, 2020
New topic for creating date and time strings for interacting with Systems Manager API operations.	The new topic Creating formatted date and time strings for Systems Manager describes how to create formatted date and time strings for interacting with Systems Manager API operations.	May 13, 2020
About permissions for encrypting SecureString parameters	The new topic Restricting access to Systems Manager parameters using IAM policies explains the difference between encrypting your `SecureString` parameters using an Amazon KMS key and using the Amazon managed key provided by Amazon.	May 13, 2020

Patch Manager now supports the Debian Server and Oracle Linux 7.6 operating systems	You can now use Patch Manager to patch Debian Server and Oracle Linux instances. Patch Manager supports patching Debian Server 8.x and 9.x and Oracle Linux 7.6 versions. For more information, see the following topics: • How security patches are selected • How patches are installed • How patch baseline rules work on Debian Server • How patch baseline rules work on Oracle Linux	May 7, 2020
Create State Manager associations that target Amazon Resource Groups	Besides targeting tags, individual instances, and all instances in your Amazon Web Services account, you can now create State Manager associations that target instances in Amazon Resource Groups. For more informati on, see About targets and rate controls in State Manager associations	May 7, 2020

New `aws:ec2:image` data type in Parameter Store to validate AMI IDs	When you create a `String` parameter, you can now specify a *data type* as `aws:ec2:image` to make sure that the parameter value you enter is a valid Amazon Machine Image (AMI) ID format. Support for AMI ID formats means you don't have to update all your scripts and templates with a new ID each time the AMI that you want to use in your processes changes. You can create a parameter with the data type `aws:ec2:image` , and for its value, enter the ID of an AMI. This is the AMI from which you want new instances to be created. You then reference this parameter in your templates, commands. When you're ready to use a different AMI, update the parameter value. Parameter Store validates the new AMI ID, and you don't need to update your scripts and templates. For more informati on, see Native parameter support for Amazon Machine Image IDs.	May 5, 2020

Managing exit codes in Run Command commands	Run Command lets you define how exit codes are handled in your scripts. By default, the exit code of the last command run in a script is reported as the exit code for the entire script. However, you can include a shell conditional statement to exit the script if any command before the final one fails using the following approach. For examples, see the new topic Managing exit codes in Run Command commands.	May 5, 2020
New public parameters released for availability zones and local zones	Public parameters have been released to make informati on about Amazon *availabil ity zones* and *local zones* available programmatically. These are besides existing global infrastructure public parameters for Amazon Web Services services and Amazon Web Services Regions. For more information, see Calling public parameters for Amazon Web Services services, Regions, endpoints, Availabil ity Zones, local zones, and Wavelength Zones .	May 4, 2020

New data source in Explorer: Amazon Trusted Advisor	Explorer now displays data from Amazon Trusted Advisor. This includes the status of best practice checks and recommendations in the following areas: cost optimization, security, fault tolerance, performance, and service quotas. For more information, see the details for setting up Trusted Advisor in Setting up related services.	May 4, 2020

Create State Manager associations that run Chef recipes	You can create State Manager associations that run Chef cookbooks and recipes by using the `AWS-ApplyChefRecipes` document. This document offers the following benefits for running Chef recipes: • Supports multiple releases of Chef (Chef 11 through Chef 14). • Automatically installs the Chef client software on target instances. • Optionally runs Systems Manager compliance checks on target instances , and stores the results of compliance checks in an S3 bucket. • Runs multiple cookbooks and recipes in a single run of the document. • Optionally runs recipes in `why-run` mode, to show which recipes will change on target instances without making changes. • Optionally applies custom JSON attributes to `chef-client` runs.	March 19, 2020

	For more information, see Creating associations that run Chef recipes	
Synchronize inventory data from multiple Amazon Web Services accounts to a central Amazon S3 bucket	You can synchronize Systems Manager Inventory data from multiple Amazon Web Services accounts to a central S3 bucket. The accounts must be defined in Amazon Organizations. For more information, see Creating an Inventory resource data sync for multiple accounts defined in Amazon Organizations.	March 16, 2020
Store AppConfig configurations in Amazon S3	Previously, AppConfig only supported application configurations that were stored in Systems Manager (SSM) documents or Parameter Store parameters. Besides these options, AppConfig now supports storing configurations in Amazon S3. For more information, see About configurations stored in Amazon S3.	March 13, 2020
SSM Agent installed by default on Amazon ECS-optimized AMIs	SSM Agent is now installed by default on Amazon ECS-Optimized AMIs. For more information, see Working with SSM Agent.	February 25, 2020

Create AppConfig configurations in the console	AppConfig now lets you create an application configuration in the console at the time you create a configuration profile. For more information, see Creating a configuration and a configuration profile.	February 13, 2020
Auto-approve only patches released up to a specified date	Besides the option for automatically approving patches for installation a specified number of days after they're released, Patch Manager now supports the ability to auto-approve only patches released on or before a date that you specify. For example, if you specify July 7, 2020, as the cutoff date in your patch baseline, no patches released on or after July 8, 2020, are installed automatically. For more information, see About custom baselines and Working with custom patch baselines (console).	February 12, 2020

Use the {{RESOURCE_ID}} pseudo parameter in maintenance window tasks	When you register a maintenance window task, you specify the parameters that are unique to the task type. You can reference certain values using pseudo parameter syntax, such as `{{TARGET_ID}}`, `{{TARGET_TYPE}}`, and `{{WINDOW_TARGET_ID}}`. When the maintenance window task runs, it passes the correct values instead of the pseudo parameter placeholders. To support resources that are part of a resource group as a target, you can use the `{{RESOURCE_ID}}` pseudo parameter to pass values for resources such as DynamoDB tables, S3 buckets, and other supported types. For more information, see the following topics in Tutorial: Create and configure a maintenance window (Amazon CLI): • Using pseudo parameters when registering maintenance window tasks • Examples: Register tasks with a maintenance window	February 6, 2020

Quickly rerun commands	Systems Manager includes two options to help you rerun a command from the **Run Command** page in the Amazon Systems Manager console. **Rerun**: This button lets you run the same command without making changes to it. **Copy to new**: This button copies the settings of one command to a new command and gives you the option to edit those settings before you run it. For more information, see Rerunning commands.	February 5, 2020

Reverting from the advanced-instances tier to the standard-instances tier	If you previously configured all on-premises instances running in your hybrid environment to use the advanced-instances tier, you can now quickly configure those instances to use the standard-instance tier. Reverting to the standard-instances tier applies to all hybrid instances in an Amazon Web Services account and a single Amazon Web Services Region. Reverting to the standard-instances tier impacts the availability of some Systems Manager tools. For more information, see Reverting from the advanced-instances tier to the standard-instances tier.	January 16, 2020

New option to skip instance reboots after patch installation	Previously, managed instances were always rebooted after Patch Manager installed patches on them. A new `RebootOption` parameter in the SSM document `AWS-RunPatchBaseline` lets you specify whether you want your instances to reboot automatically after new patches are installed. For more information, see Parameter name: RebootOption in the topic About the SSM document `AWS-RunPatchBaseline`.	January 15, 2020
New topic: 'Running PowerShell scripts on Linux instances'	A new topic that describes how to use Run Command to run PowerShell scripts on Linux instances. For more information, see Running PowerShell scripts on Linux instances.	January 10, 2020
Updates to 'configure SSM Agent to use a proxy'	The values to specify when configuring SSM Agent to use a proxy have been updated to reflect options for both HTTP proxy servers and HTTPS proxy servers. For more information, see Configure SSM Agent to use a proxy.	January 9, 2020

New "Security" chapter outlines practices for securing Systems Manager resources	A new Security chapter in the *Amazon Systems Manager User Guide* helps you understand how to apply the shared responsibility model when using Systems Manager. Topics in the chapter show you how to configure Systems Manager to meet your security and compliance objectives. You also learn how to use other Amazon Web Services services that help you to monitor and secure your Systems Manager resources. **Note** As part of this update, the user guide chapter "Authentication and Access Control" has been replaced by a new, simpler section, Identity and access management for Amazon Systems Manager.	December 24, 2019

New sample custom Automation runbooks	A set of sample custom Automation runbooks has been added to the user guide. These samples show how to use various Automation actions to simplify deployment, troubleshooting, and maintenance tasks, and are intended to help you write your own custom Automation runbooks. For more information, see Custom Automation runbook samples. You can also view Amazon managed Automation runbook content in the Systems Manager console. For more information, see Systems Manager Automation Runbook Reference.	December 23, 2019
Support for the Oracle Linux	Systems Manager now supports Oracle Linux 7.5 and 7.7. For information about manually installing SSM Agent on EC2 instances for Oracle Linux instances, see Oracle Linux. For information about installing SSM Agent on Oracle Linux servers in a hybrid environment, see How to install the SSM Agent on hybrid Linux nodes.	December 19, 2019

Launch Session Manager sessions from the Amazon EC2 console	You can now start Session Manager sessions from the Amazon Elastic Compute Cloud (Amazon EC2) console. Working with session-related tasks from the Amazon EC2 console requires different IAM permissions for both users and administrators. You can provide permissions for using the Session Manager console and Amazon CLI only, for using the Amazon EC2 console only, or for using all three tools. For more information, see the following topics. • Quickstart default IAM policies for Session Manager • Starting a session (Amazon EC2 console)	December 18, 2019

CloudWatch support for Run Command metrics and alarms	Amazon Systems Manager now publishes metrics about the status of Run Command commands to CloudWatch, allowing you to set alarms based on those metrics. The terminal status values for commands for which you can track metrics include `Success`, `Failed`, and `Delivery Timed Out`. For more information, see Monitoring Run Command metrics using Amazon CloudWatch.	December 17, 2019
New Systems Manager tool: Change Calendar	Use Systems Manager Change Calendar to specify periods of time (events) during which you want to limit or prevent code changes (such as from Systems Manager Automation runbooks or Amazon Lambda functions) to resources. A change calendar is a new Systems Manager document type that stores iCalendar 2.0 data in plaintext format. For more information, see Amazon Systems Manager Change Calendar.	December 11, 2019

New Systems Manager tool: Amazon AppConfig	Use AppConfig to create, manage, and quickly deploy application configurations. AppConfig supports controlled deployments to applications of any size. You can use AppConfig with applications hosted on EC2 instances, Amazon Lambda, containers, mobile applications, or IoT devices. To prevent errors when deploying application configurations, AppConfig includes validators. A validator provides a syntactic or semantic check to make sure that the configuration you want to deploy works as intended. During a configuration deployment, AppConfig monitors the application to make sure that the deployment is successful. If the system encounters an error or if the deployment starts an alarm, AppConfig rolls back the change to minimize impact for your application users. For more information, see AmazonAppConfig.	November 25, 2019

New Systems Manager tool: Systems Manager Explorer	Amazon Systems Manager Explorer is a customizable operations dashboard that reports information about your Amazon resources. Explorer displays an aggregated view of operations data (OpsData) for your Amazon Web Services accounts and across Amazon Web Services Regions. In Explorer, OpsData includes metadata about your EC2 instances, patch compliance details, and operational work items (OpsItems). Explorer provides context about how OpsItems are distributed across your business units or applications, how they trend over time, and how they vary by category. You can group and filter information in Explorer to focus on items that are relevant to you and that require action. When you identify high priority issues, you can use Systems Manager OpsCenter to run Automation runbooks and quickly resolve those issues. For information see, Amazon Systems Manager Explorer.	November 18, 2019

Note

Set up for Systems Manager OpsCenter is integrated with set up for Explorer. If you already set up OpsCenter, you still need to complete Integrated Setup to verify settings and options. If you haven't set up OpsCenter , then you can use Integrated Setup to get started with both tools. For more information, see Getting started with Explorer and OpsCenter.

Improved parameter search capabilities	The tools for searching for parameters now make it easier to find parameters when you have large number of them in your account or when you don't remember the exact name of a parameter . With the search tool, you filter by `contains`. Previousl y, the search tools supported searching for parameter names only by `equals` and `begins-with` . For more information, see Searching for Systems Manager parameters.	November 15, 2019

New console-based Document Builder for Automation | Support for running scripts in Automation steps	You can now use Systems Manager Automation to build and share standardized operational playbooks to ensure consistency across users, Amazon Web Services accounts, and Amazon Web Services Regions. With this ability to run scripts and add inline documentation to your Automation runbooks using Markdown, you can reduce errors and eliminate manual steps such as navigating written procedures in wikis and running terminal commands. For more information, see the following topics. • Walkthrough: Using Document Builder to create a custom Automation runbook • `aws:executeScript` (Automation actions reference) • Creating Automation runbooks using Document Builder • New Automation Features In Systems Manager on the *Amazon News Blog*	November 14, 2019

Perform an in-place package update using Distributor	Previously, when you wanted to install an update to a package using Distribut or, your only choice was to uninstall the entire package and reinstall the new version. Now you can choose to perform an in-place update instead. During an in-place update, Distributor installs only files that are new or changed since the last installation, according to the *update script* you include in your package. With this option, your package applicati on can remain available and not be taken offline during the update. For more information, see the following topics. • Create a package • Install or update packages	November 11, 2019

New SSM Agent auto update feature	With a single action, you can configure all instances in your Amazon Web Services account to automatically check for and download new versions of SSM Agent. To do this, choose **Agent auto update** on the **Managed instances** page in the Amazon Systems Manager console. For information, see Automate updates to SSM Agent.	November 5, 2019
Restrict Session Manager access using Amazon-supplied tags	A second method for controlling user access to session actions is now available. With this new method, you create IAM access policies using Amazon-supplied session tags instead of using the `{aws:username}` variable. Using these Amazon-supplied session tags makes it possible for organizations that use federated IDs to control user access to sessions. For information, see Allow a user to terminate only sessions they started.	October 2, 2019

New SSM Command document to apply Ansible Playbooks	You can create State Manager associations that run Ansible Playbooks by using the `AWS-ApplyAnsiblePlaybooks` document. This document offers the following benefits for running Playbooks: • Support for running complex Playbooks • Support for downloading Playbooks from GitHub and Amazon Simple Storage Service (Amazon S3) • Support for compressed Playbook structure • Enhanced logging • Ability to specify which Playbook to run when Playbooks are bundled For more information, see Creating associations that run Ansible playbooks	September 24, 2019

Port forwarding support for Session Manager	Session Manager now supports port forwarding sessions. Port forwarding lets you securely create tunnels between your instances deployed in private subnets, without the need to start the SSH service on the server, to open the SSH port in the security group, or to use a bastion host. Similar to SSH tunnels, port forwarding lets you forward traffic between your laptop to open ports on your instance. Once port forwarding is configured, you can connect to the local port and access the server application running inside the instance. For more informati on, see the following topics: • Port Forwarding Using Amazon Systems Manager Session Manager on the *Amazon News Blog* • Starting a session (port forwarding)	August 29, 2019

Specify a default parameter tier or automate tier selection	You can now specify a default parameter tier to use for requests to create or update a parameter that don't specify a tier. You can set the default tier to standard parameters, advanced parameters, or a new option, Intelligent-Tiering. Intelligent-Tiering evaluates each PutParameter request and creates an advanced parameter only when required. (Advanced parameters are required if the size of the parameter value is more than 4 KB, a parameter policy is associated with the parameter, or the maximum 10,000 parameters supported for the standard tier are already created.) For more information about specifying a default tier and using Intelligent-Tiering, see Specifying a default parameter tier.	August 27, 2019
Working with associations section updated with CLI and PowerShell procedures	The Working with Associations section has been updated to include procedural documentation for managing associations using the Amazon CLI or Amazon Tools for PowerShell. For information see, Working with associations in Systems Manager.	August 26, 2019

Working with Automation executions section updated with CLI and PowerShell procedures	The Working with Automation Executions section has been updated to include procedural documentation for running Automation workflows using the Amazon CLI or Amazon Tools for PowerShell. For information see, Working with Automation executions.	August 20, 2019
OpsCenter integrates with application insights	OpsCenter integrates with Amazon CloudWatch Application Insights for .NET and SQL Server. This means you can automatically create OpsItems for problems detected in your applications. For information about how to configure Application Insights to create OpsItems, see Set up, configure, and manage your application for monitoring in the *Amazon CloudWatch User Guide*.	August 7, 2019

New console feature: Amazon Systems Manager Quick Setup	Quick Setup is a new feature in the Systems Manager console that helps you quickly configure several Systems Manager components on your EC2 instances. Specifically, Quick Setup helps you configure the following components on the instances you choose or target by using tags: • An Amazon Identity and Access Management (IAM) instance profile role for Systems Manager. • A scheduled, bi-monthly update of SSM Agent. • A scheduled collection of Inventory metadata every 30 minutes. • A daily scan of your instances to identify missing patches. • A one-time installation and configuration of the Amazon CloudWatch agent. • A scheduled, monthly update of the CloudWatch agent. For more information, see Amazon Systems Manager Quick Setup.	August 7, 2019

Register a resource group as a maintenance window target	Besides registering managed instances as the target of a maintenance window, you can now register a resource group as a maintenance window target. Maintenance Windows supports all the Amazon resource types that are supported by Amazon Resource Groups including `AWS::EC2::Instance`, `AWS::DynamoDB::Table`, `AWS::OpsWorks::Instance`, `AWS::Redshift::Cluster`, and more. With this release you can also send commands to a resource group, for example by using the Run Command console or the Amazon CLI send-command command. For more information, see the following topics: • Assign targets to a maintenance window (console) • Examples: Register targets with a maintenance window • Using targets and rate controls to send commands to a fleet	July 23, 2019

Simplified package creation and versioning with Amazon Systems Manager Distributor	Distributor has a new, simplified package creation workflow that can generate a package manifest, scripts, and file hashes for you. You can also use the simplifie d workflow when you add a version to an existing package.	July 22, 2019
New document categories pane for Systems Manager Automation	Systems Manager includes a new Document categorie s pane when you run an Automation in the console. Use this pane to filter Automation runbooks based on their purpose.	July 18, 2019
Support for starting Session Manager sessions using operating system user credentials	By default, Session Manager sessions are launched using the credentials of a system-generated `ssm-user` account that is created on a managed instance. On Linux machines, you can now instead launch sessions using the credentia ls of an operating system account. For information, see Turn on Run As support for Linux instances.	July 9, 2019

Support for starting Session Manager sessions using SSH	You can now use the Amazon CLI to start an SSH session on a managed instance using Session Manager. For information about allowing SSH sessions with Session Manager, see (Optional) Turn on SSH Session Manager sessions. For information about starting an SSH session using Session Manager, see Starting a session (SSH).	July 9, 2019
Support for changing passwords on managed instances	You can now reset passwords on machines that you manage using Systems Manager (managed instances). You can reset the password using the Systems Manager console or the Amazon CLI. For informati on, see Resetting passwords on managed instances.	July 9, 2019
Revisions to "What is Amazon Systems Manager?"	The introductory content in What is Amazon Systems Manager? has been expanded to provide a broader introduct ion to the service and reflect Systems Manager tools that have been released recently. In addition, other content in the section has been moved into individual topics for better discoverability.	June 10, 2019

New Systems Manager tool: OpsCenter	OpsCenter provides a central location where operations engineers and IT professionals can view, investigate, and resolve operational work items (OpsItems) related to Amazon resources. OpsCenter is designed to reduce mean time to resolution for issues impacting Amazon resources. This Systems Manager tool aggregates and standardizes OpsItems across services while providing contextual investigation data about each OpsItem, related OpsItems, and related resources. OpsCenter also provides Systems Manager Automation runbooks that you can use to quickly resolve issues. You can specify searchable, custom data for each OpsItem. You can also view automatically-generated summary reports about OpsItems by status and source. For more information, see Amazon Systems Manager OpsCenter.	June 6, 2019

Changes to Systems Manager left navigation pane in the Amazon Web Services Management Console	The Systems Manager left navigation pane in the Amazon Web Services Management Console includes new headings, including a new heading for Ops Center, that provide a more logical grouping of Systems Manager tools.	June 6, 2019

Revised tutorial for creating and configuring a maintenance window using the Amazon CLI	Tutorial: Create and configure a maintenance window (Amazon CLI) has been overhauled to provide a simple path through the practice steps. You create a single maintenance window, identify a single target, and set up a simple task for the maintenance window to run. Along the way, we provide information and examples you can use to create your own task registration commands, including information for using pseudo parameters such as `{{TARGET_ID}}` . For additional information and examples, see the following topics: • Examples: Register targets with a maintenance window • Examples: Register tasks with a maintenance window • About register-task-with-maintenance-windows options • Using pseudo parameters when registering maintenance window tasks	May 31, 2019

Notifications about SSM Agent updates	To be notified about SSM Agent updates, subscribe to the SSM Agent Release Notes page on GitHub.	May 24, 2019
Receive notifications or trigger actions based on changes in Parameter Store	The topic Set up notifications or trigger actions based on Parameter Store events now helps you set up Amazon EventBridge rules to respond to changes in Parameter Store. You can receive notifications or trigger other actions when any of the following occur: • A parameter is created, updated, or deleted. • A parameter label version is created, updated, or deleted. • A parameter expires, is going to expire, or hasn't changed in a specified period of time.	May 22, 2019

Major revisions to setting up and getting started content	We have expanded and reorganized the *Setting Up* and *Getting Started* content in the *Amazon Systems Manager User Guide*. *Setting Up* content has been divided into two sections. One section focuses on tasks for setting up Systems Manager to configure and manage your EC2 instances. The other focuses on tasks for setting up Systems Manager to configure and manage your on-premises servers and virtual machines (VMs) in a hybrid environment. Both sections now present all setup topics as major numbered steps, in the recommend ed order of completion. A new *Getting Started* chapter focuses on helping end-users get started with Systems Manager after account and service configuration tasks have been completed. • Setting up Amazon Systems Manager • Setting up Amazon Systems Manager for hybrid environments • Getting started with Amazon Systems Manager	May 15, 2019

Include patches for applications released by Microsoft in patch baselines (Windows)	Patch Manager now supports patch updates for applications released by Microsoft on Windows Server instances. Previously, only patches for the Windows Server operating system were supported. Patch Manager provides two predefined patch baselines for Windows Server instances. The patch baseline `AWS-WindowsPredefinedPatchBaseline-OS` applies to operating system patches only. `AWS-WindowsPredefinedPatchBaseline-OS-Applications` applies to both the Windows Server operating system and applications released by Microsoft on Windows. For information about creating a custom patch baseline that includes patches for applications released by Microsoft, see the first procedure in Create a custom patch baseline. Also, as part of this update, the names of Amazon-provided predefined patch baselines are being changed. For more information, see Predefined baselines.	May 7, 2019

Examples for registering maintenance window targets using the Amazon CLI	The new topic Examples: Register targets with a maintenance window provides three sample commands to demonstrate different ways you can specify the targets for a maintenance window when you use the Amazon CLI. The topic also explains the best use case for each of the sample commands.	May 3, 2019
Updates to patch group topics	The topic About patch groups has been updated to include a section on how managed instances determine the appropriate patch baseline to use during patching operations. Additionally, instructions have been added for using the Amazon CLI or Systems Manager console to add **Patch Group** or **PatchGroup** tags to your managed instances, and how to add a **Patch Group** or **PatchGroup** to a patch baseline. (You must use **`PatchGroup`** , without a space, if you have allowed tags in EC2 instance metadata.) For more information see Create a patch group and Add a patch group to a patch baseline.	May 1, 2019

New Parameter Store features	Parameter Store offers the following new features: • **Advanced parameters:** Parameter Store now lets you individually configure parameters to use either a standard-parameter tier (the default tier) or an advanced-parameter tier. Advanced parameters offer a larger size quota for the parameter value, a higher quota for the number of parameters you can create per Amazon Web Services account and Amazon Web Services Region, and the ability to use parameter policies. For more information about advanced parameters, see About Systems Manager advanced parameters. • **Parameter policies:** Parameter policies help you manage a growing set of parameters by allowing you to assign specific criteria to a parameter, such as an expiration date or *time to live*. Parameter policies are especially helpful in forcing you to update or delete passwords and configuration data stored in	April 25, 2019

	Parameter Store. Parameter policies are only available for parameters that use the advanced-parameter tier. For more information, see Working with parameter policies. • **Higher throughput:** You can now increase the Parameter Store throughput quota to a maximum of 1,000 transactions per second. For more information, see Increasing Parameter Store throughput.	
Updates to the Automation section	The Automation section has been updated for improved discoverability. In addition, three new topics have been added to the Automation section: • Run an automation step by step • Run an automation that requires approvals • Scheduling automations with State Manager associations	April 17, 2019

Encrypt session data using an Amazon KMS key	By default, Session Manager uses TLS 1.2 to encrypt session data transmitted between the local machines of users in your account and your EC2 instances. Now you can choose to further encrypt that data using an Amazon KMS key that has been created in Amazon Key Management Service. You can use a KMS key that has been created in your Amazon Web Services account or one that has been shared with you from another account. For information about specifyin g a KMS key to encrypt session data, see Turn on Amazon KMS key encryptio n of session data (console) , Create Session Manager preferences (Amazon CLI), or Update Session Manager preferences (Amazon CLI).	April 4, 2019

Configuring Amazon SNS notifications for Amazon Systems Manager	Added instructions for using the Amazon CLI or Systems Manager console to configure Amazon SNS notifications for Run Command and Run Command tasks registered to a maintenance window. For more information see Configuring Amazon SNS notifications for Amazon Systems Manager.	March 6, 2019

Advanced instances for servers and VMs in hybrid environments	Amazon Systems Manager offers a standard-instances tier and an advanced-instances tier for servers and VMs in your hybrid environment. The standard-instances tier allows you to register a maximum of 1,000 servers or VMs per Amazon Web Services account per Amazon Web Services Region. If you need to register more than 1,000 servers or VMs in a single account and Region, then use the advanced-instances tier. You can create as many instances as you like in the advanced-instances tier, but all instances configured for Systems Manager are available on a pay-per-use basis. Advanced instances also allow you to connect to your hybrid machines by using Amazon Systems Manager Session Manager. Session Manager provides interactive shell access to your instances. For more information about allowing advanced instances, see Using the advanced-instances tier.	March 4, 2019

Create State Manager associations that use shared SSM documents	You can create State Manager associations that use SSM Command and Automation runbooks shared from other Amazon Web Services accounts. Creating associations by using shared SSM documents helps to keep your Amazon EC2 and hybrid infrastructure in a consistent state even when instances aren't in the same account. For information about sharing SSM documents, see Amazon Systems Manager Documents. For information about creating a State Manager association, see Create an association.	February 28, 2019
View lists of Systems Manager events supported for Amazon EventBridge rules	The new topic Monitoring Systems Manager events with Amazon EventBridge provides a summary of the various events emitted by Systems Manager for which you can set up event monitoring rules in EventBridge.	February 25, 2019

Add tags when you create Systems Manager resources	Systems Manager now supports the ability to add tags to certain resource types when you create them. The resources you can tag when you create them with the Amazon CLI or an SDK include maintenance windows, patch baselines, Parameter Store parameters, and SSM documents. You can also assign tags to a managed instance when you create an activation for it. When you use the Systems Manager console, you can add tags to maintenance windows, patch baselines, and parameters.	February 24, 2019

Automatic IAM role creation for Systems Manager Inventory	Previously you had to create an Amazon Identity and Access Management (IAM) role and attach separate policies to this role to view inventory data on the **Inventory Detail View** page in the console. You no longer need to create this role or attach policies to it. When you choose a Remote Data Sync on the **Inventory Detail View** page, Systems Manager automatically creates the `Amazon-GlueService PolicyForSSM` role and assigns the **Amazon-GlueServicePolicyForSSM-{*S3 bucket name*}** policy and the **AWSGlueServiceRole** policy to it. For more information, see Querying inventory data from multiple Regions and accounts.	February 14, 2019
Maintenance Windows walkthroughs to update SSM Agent	Added two new walkthroughs to the Maintenance Windows documentation. The walkthroughs detail how to use the Systems Manager console or the Amazon CLI to create a maintenance window that keeps SSM Agent up-to-date automatically. For more information, see Maintenance Windows walkthroughs.	February 11, 2019

Using Parameter Store public parameters	Added short section describing Parameter Store public parameters. For more information, see Using Systems Manager public parameters.	January 31, 2019
Use the Amazon CLI to create Session Manager preferences	Added instructions for using the Amazon CLI to create Session Manager preferences, such as CloudWatch Logs, S3 bucket logging options, and session encryption settings. For more information, see Use the Amazon CLI to create Session Manager preferences.	January 22, 2019
Executing Systems Manager automation workflows by using State Manager	Amazon Systems Manager State Manager now supports creating associations that use SSM Automation runbooks. State Manager previously supported only `command` and `policy` documents, which meant that you could only create associations that targeted managed instances . With support for SSM Automation runbooks, you can now create associations that target different types of Amazon resources. For more information, see Executing Systems Manager Automation workflows by using State Manager.	January 22, 2019

Reference updates for cron and rate expressions and maintenance window scheduling options	The reference topic Cron and rate expressions for Systems Manager has been revised. The new version provides more examples and improved explanations of how to use cron and rate expressions to schedule your maintenance windows and State Manager associations. In addition, the new topic Maintenance Windows scheduling and active period options explains how the various schedule-related options for maintenance windows (Start date, End date, Time zone, Schedule frequency) relate to one another.	December 6, 2018
Turn on SSM Agent debug logging	You can turn on SSM Agent debug logging by editing the seelog.xml.template file on the managed instance. For more information, see Turn on SSM Agent debug logging.	November 30, 2018

Support for ARM64 processor architectures	Amazon Systems Manager now supports ARM64 versions of the Amazon Linux 2, Red Hat Enterprise Linux 7.6, and Ubuntu Server (18.04 LTS and 16.04 LTS) operating systems. For more information, see the instructions for installing Amazon Linux 2, RHEL, and Ubuntu Server 18.04 and 16.04 LTS with Snap packages. For more information about the A1 instance type, see General purpose instances in the *Amazon EC2 User Guide*.	November 26, 2018

Create and deploy packages by using Amazon Systems Manager Distributor	Using Amazon Systems Manager Distributor, you package your own software —or find Amazon-provided agent software packages, such as `AmazonCloudWatchAgent` —to install on Amazon Systems Manager managed instances. Distributor publishes resources, such as software packages, to Amazon Systems Manager managed instances. Publishing a package advertises specific versions of the package's document—a Systems Manager document that you create when you add the package in Distributor—to managed instances that you identify by managed instance IDs, Amazon Web Services account IDs, tags, or an Amazon Web Services Region. For more information, see Amazon Systems ManagerDistributor.	November 20, 2018

Concurrently run Amazon Systems Manager Automation workflows across multiple Amazon Web Services Regions and Amazon Web Services accounts from a central account	You can concurrently run Amazon Systems Manager automation workflows across multiple Amazon Web Services Regions and Amazon Web Services accounts or Amazon Organizational Units (OUs) from an Automation management account. Concurrently executing Automations in multiple Regions and accounts or OUs reduces the time required to administer your Amazon resources while enhancing the security of your computing environment. For more information see Executing Automation workflows in multiple Amazon Web Services Regions and Amazon Web Services accounts.	November 19, 2018

Query inventory data from multiple Amazon Web Services Regions and Amazon Web Services accounts	Systems Manager Inventory integrates with Amazon Athena to help you query inventory data from multiple Amazon Web Services Regions and Amazon Web Services accounts. Athena integration uses resource data sync so that you can view inventory data from all of your managed instances on the **Inventory Detail View** page in the Amazon Systems Manager console. For more information see Querying Inventory data from multiple Regions and accounts.	November 15, 2018

Create State Manager associations that run MOF files	You can run Managed Object Format (MOF) files to enforce a targeted state on Windows Server managed instances with State Manager by using the `AWS-ApplyDSCMofs` SSM document. The `AWS-ApplyDSCMofs` document has two execution modes. With the first mode, you can configure the associati on to scan and report if the managed instances are currently in the targeted state defined in the specified MOF files. In the second mode, you can run the MOF files and change the configuration of your instances based on the resources and their values defined in the MOF files. The `AWS-ApplyDSCMofs` document lets you download and run MOF configuration files from Amazon Simple Storage Service (Amazon S3), a local share, or from a secure web site with an HTTPS domain. For more informati on, see Creating associations that run MOF files.	November 15, 2018

Restrict administrative access in Session Manager sessions	Session Manager sessions are launched using the credentials of a user account that is created with default root or administrator permissions called `ssm-user`. Information about restricting administrative control for this account is now available in the topic Turn on or turn off ssm-user account administrative permissions.	November 13, 2018
YAML examples in Automation actions reference	The Automations actions reference now includes a YAML sample for each action that already includes a JSON sample.	October 31, 2018
Assign compliance severity levels to associations	You can now assign compliance severity levels to State Manager associations. These severity levels are reported in the Compliance Dashboard and can also be used to filter your compliance reports. The severity levels you can assign include Critical, High, Medium, Low, and Unspecified. For more information, see Create an association (console).	October 26, 2018

Use targets and rate controls with Automation and State Manager	Control the execution of Automations and State Manager associations across your fleet of resources by using targets, concurrency, and error thresholds. For more information see Using targets and rate controls to run Automation workflows on a fleet and Using targets and rate controls with State Manager associations.	October 23, 2018
Specify active time ranges and international time zones for maintenance windows	You can also specify dates that a maintenance window shouldn't run before or after (start date and end date). You can specify the international time zone on which to base the maintenance window schedule. For more informati on see Create a maintenance window (console) and Update a maintenance window (Amazon CLI).	October 9, 2018

Maintain a custom list of patches for your patch baseline in an S3 bucket	With the new 'InstallOverrideList' parameter in the SSM command document `AWS-RunPatchBaseline`, you can specify an https URL or an Amazon Simple Storage Service (Amazon S3) path-style URL to a list of patches to be installed. This patch installation list, which you maintain in an S3 bucket in YAML format, overrides the patches specified by the default patch baseline. For more information, see Parameter name: InstallOverrideList.	October 5, 2018
Expanded control over whether patch dependencies are installed	Previously, if a patch in your Rejected patches list was identified as a dependency of another patch, it would still be installed. Now you can choose whether to install these dependencies or block them from being installed. For more information, see Create a patch baseline.	October 5, 2018

Create dynamic automation workflows with conditional branching	The `aws:branch` Automation action lets you create a dynamic Automation workflow that evaluates multiple choices in a single step and then jumps to a different step in the Automation runbook based on the results of that evaluation. For more information, see Using conditional statements in runbooks.	September 26, 2018
Use the Amazon CLI to update Session Manager preferences	Instructions for using the CLI to update Session Manager preferences, such as CloudWatch Logs and S3 bucket logging options, have been added to the *Amazon Systems Manager User Guide*. For information, see Use the Amazon CLI to update Session Manager preferences.	September 25, 2018
Updated SSM Agent requirement for Session Manager	Session Manager now requires SSM Agent version 2.3.68.0 or later. For more information about Session Manager prerequisites, see Complete Session Manager prerequisites.	September 17, 2018

Manage instances without opening inbound ports or maintaining bastion hosts using Session Manager	Using Session Manager, a fully managed tool in Amazon Systems Manager, you can manage your EC2 instances through an interacti ve browser-based shell or through the Amazon CLI. Session Manager provides secure and auditable instance management without the need to open inbound ports, maintain bastion hosts, or manage SSH keys. Session Manager also lets you comply with corporate policies that require controlled access to instances, strict security practices, and fully auditable logs with instance access details, while still providing end users with simple single-step cross-platform access to your EC2 instances. For more information, see Learn more about Session Manager.	September 11, 2018
Invoking other Amazon Web Services services from a Systems Manager Automation workflow	You can invoke other Amazon Web Services services and other Systems Manager tools in your Automation workflow by using three new Automatio n actions (or plugins) in your Automation runbooks. For more information, see For more information, see Using action outputs as inputs.	August 28, 2018

Use Systems Manager-specific condition keys in IAM policies	The topic Specifying conditions in a policy has been updated to list the IAM condition keys for Systems Manager that you can incorporate in policies. You can use these keys to specify the conditions under which a policy should take effect. The topic also includes links to example policies and other related topics.	August 18, 2018
Aggregate inventory data with groups to see which instances are and aren't configured to collect an inventory type	Groups allow you to quickly see a count of which managed instances are and aren’t configured to collect one or more Inventory types. With groups, you specify one or more Inventory types and a filter that uses the `exists` operator. For more informati on, see Aggregating Inventory data.	August 16, 2018

View history and change tracking for Inventory and Configuration Compliance	You can now view history and change tracking for Inventory collected from your managed instances. You can also viewing history and changing tracking for Patch Manager patching and State Manager associations reported by Configuration Compliance. For more information, see Viewing Inventory history and change tracking.	August 9, 2018

Parameter Store integrates with Secrets Manager	Parameter Store is now integrated with Amazon Secrets Manager so that you can retrieve Secrets Manager secrets when using other Amazon Web Services services that already support references to Parameter Store parameters. These services include Amazon EC2, Amazon Elastic Container Service, Amazon Lambda, Amazon CloudFormation, Amazon CodeBuild, Amazon CodeDeploy, and other Systems Manager tools. By using Parameter Store to reference Secrets Manager secrets, you create a consisten t and secure process for calling and using secrets and reference data in your code and configuration scripts. For information, see Referenci ng Amazon Secrets Manager secrets from Parameter Store parameters.	July 26, 2018

Attach labels to Parameter Store parameters	A parameter label is a user-defined alias to help you manage different versions of a parameter. When you modify a parameter, Systems Manager automatically saves a new version and increments the version number by one. A label can help you remember the purpose of a parameter version when there are multiple versions. For information, see Labeling parameters.	July 26, 2018
Create dynamic Automation workflows	By default, the steps (or actions) that you define in the mainSteps section of an Automation runbook run in sequential order. After one action is complete, the next action specified in the mainSteps section begins. With this release, you can now create Automation workflows that perform *conditional branching*. This means that you can create Automation workflows that dynamically respond to condition changes and jump to a specified step. For information, see Using conditional statements in runbooks.	July 18, 2018

SSM Agent now pre-installed on Ubuntu Server 16.04 AMIs using Snap	Beginning with instances created from Ubuntu Server 16.04 AMIs identified with `20180627`, the SSM Agent is pre-installed using Snap packages. On instances created from earlier AMIs, you should continue using deb installer packages. For information, see About SSM Agent installations on 64-bit Ubuntu Server 16.04 instances.	July 7, 2018
Review minimum S3 permissions required by SSM Agent	The new topic Minimum S3 bucket permissions for SSM Agent provides information about the Amazon Simple Storage Service (Amazon S3) buckets that resources might need to access to perform Systems Manager operations. You can specify these buckets in a custom policy if you want to limit S3 bucket access for an instance profile or VPC endpoint to the minimum required to use Systems Manager.	July 5, 2018
View complete execution history for a specific State Manager association ID	The new topic Viewing association histories describes how to view all executions for a specific association ID and then view execution details for one or more resources.	July 2, 2018

Patch Manager introduces support for Amazon Linux 2	You can now use Patch Manager to apply patches to Amazon Linux 2 instances . For general informati on about Patch Manager operating system support, see Patch Manager prerequis ites. For information about the supported key-value pairs for Amazon Linux 2 when defining a patch filter, see PatchFilter in the *Amazon Systems Manager API Reference*.	June 26, 2018
Send command output to Amazon CloudWatch Logs	The new topic Configuring Amazon CloudWatch Logs for Run Command describes how to send Run Command output to CloudWatch Logs.	June 18, 2018

Quickly create or delete resource data sync for Inventory by using Amazon CloudFormation	You can use Amazon CloudFormation to create or delete a resource data sync for Systems Manager Inventory. To use Amazon CloudFormation, add the AWS::SSM::ResourceDataSync resource to your Amazon CloudFormation template. For more information, see Working with Amazon CloudFormation Templates in the *Amazon CloudFormation User Guide*. You can also manually create a resource data sync for Inventory as described in Creating a resource data sync for Inventory.	June 11, 2018
Amazon Systems Manager User Guide update notifications now available through RSS	The HTML version of the Systems Manager User Guide now supports an RSS feed of updates that are documented in the Systems Manager Documentation update history page. The RSS feed includes updates made in June, 2018, and later. Previously announced updates are still available in the **Systems Manager documentation update history** page. Use the RSS button in the top menu panel to subscribe to the feed.	June 6, 2018

Specify an exit code in scripts to reboot managed instances	The new topic Rebooting managed instances from scripts describes how to instruct Systems Manager to reboot managed instances by specifying an exit code in scripts that you run with Run Command.	June 3, 2018
Create an event in Amazon EventBridge whenever custom inventory is deleted	The new topic Viewing inventory delete actions in EventBridge describes how to configure Amazon EventBridge to create an event anytime a user deletes custom Inventory.	June 1, 2018

Updates before June 2018

The following table describes important changes in each release of the *Amazon Systems Manager User Guide* before June 2018.

Change	Description	Release date
Inventory all managed instances in your Amazon Web Services account	You can inventory all managed instances in your Amazon Web Services account by creating a global inventory association. For more information, see Inventory all managed nodes in your Amazon Web Services account. **Note** Global inventory associations are available in SSM Agent version 2.0.790.0 or later. For informati on about how to update SSM Agent on your	May 3, 2018

Change	Description	Release date
	instances, see Updating the SSM Agent using Run Command.	
SSM Agent installed by default on Ubuntu Server 18	SSM Agent is installed, by default, on Ubuntu Server 18.04 LTS 64-bit and 32-bit AMIs.	May 2, 2018
New topic	The new topic Running commands using a specific document version describes how to use the document-version parameter to specify which version of an SSM document to use when the command runs.	May 1, 2018
New topic	The new topic Deleting custom inventory describes how to delete custom Inventory data from Amazon S3 by using the Amazon CLI. The topic also describes how to use the `SchemaDeleteOption` to manage custom inventory by turning off or deleting a custom inventory type. This new feature uses the DeleteInventory API operation.	April 19, 2018
Amazon SNS notifications for SSM Agent	You can subscribe to an Amazon SNS topic to receive notifications when a new version of SSM Agent is available. For more information, see Subscribing to SSM Agent notifications.	April 9, 2018
CentOS patching support	Systems Manager now supports patching CentOS instances. For information about supported CentOS versions, see Patch Manager prerequisites. For more information about how patching works, see How Patch Manager operations work.	March 29, 2018

Change	Description	Release date
New section	To provide a single source for reference information in the Amazon Systems Manager User Guide, a new section has been introduced, Amazon Systems Manager reference . Additional content will be added to this section as it becomes available.	March 15, 2018
New topic	The new topic Package name formats for approved and rejected patch lists details the package name formats you can enter in the lists of approved patches and rejected patches for a custom patch baseline. Sample formats are provided for each operating system type supported by Patch Manager.	March 9, 2018
New topic	Systems Manager now integrates with ChefChef InSpec. InSpec is an open-source, runtime framework that lets you create human-readable profiles on GitHub or Amazon S3. Then you can use Systems Manager to run complianc e scans and view compliant and noncompliant instances. For more information, see Using Chef InSpec profiles with Systems Manager Compliance.	March 7, 2018
New topic	The new topic Using service-linked roles for Systems Manager describes how to use an Amazon Identity and Access Management (IAM) service-linked role with Systems Manager. Currently, service-linked roles are only required when using Systems Manager Inventory to collect metadata about tags and Resource Groups.	February 27, 2018

Change	Description	Release date
New and updated topics	You can now use Patch Manager to install patches that are in a different source repository than the default one configured on the instance. This is useful for patching instances with updates not related to security; with the content of Personal Package Archives (PPA) for Ubuntu Server; with updates for internal corporate applications; and so on. You specify alternative patch source repositor ies when you create a custom patch baseline. For more information, see the following topics: • How to specify an alternative patch source repository (Linux) • Working with custom patch baselines • Create a patch baseline with custom repositories for different OS versions	February 6, 2018
New topic	The new topic SSM Command documents for patching managed nodes describes the seven SSM documents available to help you keep your managed instances patched with the latest security-related updates.	January 10, 2018
Important updates regarding Linux support	Updated various topics with the following information: • SSM Agent is installed, by default, on Amazon Linux 1 *base* AMIs dated 2017.09 and later. • Manually install SSM Agent on other versions of Linux, including non-base images like *Amazon ECS-Optimized AMIs*.	January 9, 2018

Change	Description	Release date
New topic	A new topic, SSM Command document for patching: `AWS-RunPatchBaseline`, provides details of how this SSM document operates on both Windows and Linux systems. It also provides information about the two available parameters in the `AWS-RunPatchBaseline` document, `Operation` and `Snapshot ID`.	January 5, 2018
New topics	A new section, How Patch Manager operations work, provides technical details that explain how Patch Manager determines which security patches to install and how it installs them on each supported operating system. It also provides information about how patch baseline rules work on different distributions of the Linux operating system	January 2, 2018
Retitled and moved the Systems Manager Automation Actions Reference	Based on customer feedback, the Automation actions reference is now called the Systems Manager Automation Runbook Reference. Furthermore, we moved the reference into the Shared Resources > Documents node so it is closer to the Command document plugin reference. For more information, see Systems Manager Automation actions reference.	December 20, 2017
New Monitoring chapter and content	A new chapter, Logging and monitoring in Amazon Systems Manager, provides instructions for sending metrics and log data to Amazon CloudWatch Logs. A new topic, Sending node logs to unified CloudWatch Logs (CloudWatch agent), provides instructions for migrating on-instance monitoring tasks, on 64-bit Windows Server instances only, from SSM Agent to the CloudWatch agent.	December 14, 2017

Change	Description	Release date
New chapter	A new chapter, Identity and access management for Amazon Systems Manager, provides comprehensive information about using Amazon Identity and Access Management (IAM) and Amazon Systems Manager to help secure access to your resources through the use of credentials. These credentials provide the permissions required to access Amazon resources, such as accessing data stored in S3 buckets and sending commands to and reading the tags on EC2 instances.	December 11, 2017
Changes to the left navigation	We changed the headings in the left navigation of this user guide to match the headings in the new Amazon Systems Manager console.	December 8, 2017
Multiple changes for re:Invent 2017	• **Official launch of Amazon Systems Manager**: Amazon Systems Manager (formerly Amazon EC2 Systems Manager) is a unified interface that lets you centraliz e operational data and automate tasks across your Amazon resources. You can access the new Amazon Systems Manager console here. For more information, see What is Amazon Systems Manager? • **YAML Support**: You can create SSM documents in YAML. For more information, see Amazon Systems Manager Documents.	November 29, 2017

Change	Description	Release date
Using Run Command to Take VSS-Enabled Snapshots of EBS Volumes	Using Run Command, you can take application-consistent snapshots of all Amazon Elastic Block Store (Amazon EBS) volumes attached to your Amazon EC2 Windows instances. The snapshot process uses the Windows Volume Shadow Copy Service (VSS) to take image-level backups of VSS-aware applications, including data from pending transactions between these applications and the disk. Furthermore, you don't need to shut down your instances or disconnect them when you need to back up all attached volumes. For more information, see Take Microsoft VSS-Enabled Snapshots Using Amazon Systems Manager in the *Amazon EC2 User Guide*.	November 20, 2017
Enhanced Systems Manager Security Available By Using VPC Endpoints	You can improve the security posture of your managed instances (including managed instances in your hybrid environment) by configuring Systems Manager to use an interface VPC endpoint. Interface endpoints are powered by PrivateLink, a technology that allows you to privately access Amazon EC2 and Systems Manager APIs by using private IP addresses. PrivateLink restricts all network traffic between your managed instances, Systems Manager, and EC2 to the Amazon network (managed instances don't have access to the Internet). Also, you don't need an Internet gateway, a NAT device, or a virtual private gateway. For more information, see Improve the security of EC2 instances by using VPC endpoints for Systems Manager.	November 7, 2017

Change	Description	Release date
Inventory Support for Files, Services, Windows Roles, and the Windows Registry	SSM Inventory now supports gathering the following information from your managed instances. • **Files**: Name, size, version, installed date, modification and last accessed times, and so on. • **Services**: Name, display name, status, dependent services, service type, start type, and so on. • **Windows Registry**: Registry key path, value name, value type, and value. • **Windows roles**: Name, display name, path, feature type, installed state, and so on. Before you attempt to collect information for these inventory types, update SSM Agent on the instances you want to inventory. By running the latest version of SSM Agent, you make sure that you can collect metadata for all supported inventory types. For information about how to update SSM Agent by using State Manager, see Walkthrough: Automatically update SSM Agent with the Amazon CLI. For more information Inventory, see Learn more about Systems Manager Inventory.	November 6, 2017
Updates to Automation documentation	Fixed several issues in the information about setting up and configuring access for Systems Manager Automation. For more information, see Setting up Automation.	October 31, 2017

Change	Description	Release date
GitHub and Amazon S3 Integration	**Run remote scripts**: Systems Manager now supports downloading and running scripts from a private or public GitHub repository, and from Amazon S3. Using either the `AWS-RunRemoteScript` pre-defined SSM document or the `aws:downloadContent` plugin in a custom SSM document, you can run Ansible Playbooks and scripts in Python, Ruby, or PowerShell, to name a few. These changes further enhance *infrastructure as code* when you use Systems Manager to automate configuration and deployment of EC2 instances and on-premises managed instances in your hybrid environment. For more informati on, see Running scripts from GitHub and Running scripts from Amazon S3. **Create composite SSM documents**: Systems Manager now supports running one or more secondary SSM documents from a primary SSM document. These primary documents that run other documents are called *composite* documents. Composite documents allow you to create and share a standard set of secondary SSM documents across Amazon Web Services accounts for common tasks such as boot-strapping anti-virus software or domain-joining instances. You can run composite and secondary documents stored in Systems Manager, GitHub, or Amazon S3. After you create a composite document, you can run it by using the `AWS-RunDocument` pre-defin ed SSM document. For more information, see Creating composite documents and Running documents from remote locations. **SSM document plugin reference**: For easier access, we moved the SSM Plugin Reference for SSM documents out of the Systems Manager API Reference and into the User	October 26, 2017

Change	Description	Release date
	Guide. For more information, see Command document plugin reference.	
Support for Parameter Versions in Parameter Store	When you edit a parameter, Parameter Store now automatically iterates the version number by 1. You can specify a parameter name and a specific version number in API calls and SSM documents. If you don't specify a version number, the system automatically uses the latest version. Parameter versions provide a layer of protection if a parameter is accidentally changed. You can view the values of all versions, and reference older versions if necessary. You can also use parameter versions to see how many times a parameter changed over a period of time. For more information, see Working with parameter versions in Parameter Store.	October 24, 2017
Support for Tagging Systems Manager Documents	You can now use the AddTagsToResource API, the Amazon CLI, or the Amazon Tools for PowerShell to tag Systems Manager documents with key-value pairs. Tagging helps you quickly identify specific resources based on the tags you've assigned to them. This is besides existing tagging support for managed instances, maintenance windows, Parameter Store parameters, and patch baselines.	October 3, 2017

Change	Description	Release date
Various Documentation Updates to Fix Errors or Update Content Based on Feedback	• Updated Managing nodes in hybrid and multicloud environments with Systems Manager with information for Raspbian Linux. • Updated Managing EC2 instances with Systems Manager with new requirement for Windows Server instances. SSM Agent requires Windows PowerShell 3.0 or later to run certain SSM Documents on Windows Server instances (for example, the legacy `AWS-ApplyPatchBaseline` SSM document). Verify that your Windows Server instances are running Windows Management Framework 3.0 or later. The framework includes PowerShell. For more information, see Windows Management Framework 3.0.	October 2, 2017
Troubleshoot Unreachable Windows Instances by Using the EC2Rescue Automation Workflow	EC2Rescue can help you diagnose and troubleshoot problems on Amazon EC2 Windows Server instances. You can run the tool as a Systems Manager Automation workflow by using the **AWSSupport-ExecuteEC2Rescue** document. The **AWSSupport-ExecuteEC2Rescue** document is designed to perform a combination of Systems Manager actions, Amazon CloudFormation actions, and Lambda functions that automate the steps normally required to use EC2Rescue. For more information, see Run the EC2Rescue tool on unreachable instances.	September 29, 2017
SSM Agent Installed By Default on Amazon Linux	SSM Agent is installed, by default, on Amazon Linux AMIs dated 2017.09 and later. Manually install SSM Agent on other versions of Linux, as described in Working with SSM Agent on EC2 instances for Linux.	September 27, 2017

Change	Description	Release date
Run Command Enhancements	Run Command includes the following enhancements. • You can restrict command execution to specific instances by creating and assigning an IAM policy that includes a condition that the user can only run commands on instances that are tagged with specific Amazon EC2 tags. For more information, see Restricting Run Command access based on tags. • You have more options for targeting instances by using Amazon EC2 tags. You can now specify multiple tag keys and multiple tag values when sending commands. For more information, see Run commands at scale.	September 12, 2017
Systems Manager Supported on Raspbian	Systems Manager can now run on Raspbian Jessie and Raspbian Stretch devices, including Raspberry Pi (32-Bit).	September 7, 2017
Automatically Send SSM Agent Logs to Amazon CloudWatch Logs	You can now make a simple configuration change on your instances to have SSM Agent send log files to CloudWatch. For more information, see Sending SSM Agent logs to CloudWatch Logs.	September 7, 2017
Encrypt resource data sync	With Systems Manager resource data sync, you can aggregate Inventory data collected on dozens or hundreds of managed instance in a central S3 bucket. You can now encrypt resource data sync by using an Amazon Key Management Service key. For more information, see Walkthrough: Using resource data sync to aggregate inventory data.	September 1, 2017

Change	Description	Release date
New State Manager Walkthroughs	Added two new walkthroughs to the State Manager documentation: Walkthrough: Automatically update SSM Agent with the Amazon CLI Walkthrough: Automatically update PV drivers on EC2 instances for Windows Server	August 31, 2017
Systems Manager Configuration Compliance	Use Configuration Compliance to scan your fleet of managed instances for patch compliance and configuration inconsistencies. You can collect and aggregate data from multiple Amazon Web Services accounts and Amazon Web Services Regions, and then drill down into specific resources that aren't compliant. By default, Configuration Compliance displays compliance data about Patch Manager patching and State Manager associations. You can also customize the service and create your own compliance types based on your IT or business requirements. For more information, see Amazon Systems Manager Compliance.	August 28, 2017
New Automation Action: `aws:executeAutomation`	Runs a secondary Automation workflow by calling a secondary Automation runbook. With this action, you can create Automation runbooks for your most common workflows, and reference those documents during an Automation execution. This action can simplify your Automation runbooks by removing the need to duplicate steps across similar runbooks. For more information, see `aws:executeAutomation` – Run another automation.	August 22, 2017

Change	Description	Release date
Automation as the Target of a CloudWatch Event	You can start an Automation workflow by specifying an Automation runbook as the target of an Amazon CloudWatch event. You can start workflows according to a schedule, or when a specific Amazon system event occurs. For more information, see Run automations based on EventBridge events.	August 21, 2017
State Manager Association Versioning and General Updates	You can now create different State Manager associati on versions. There is a quota of 1,000 versions for each association. You can also specify names for your associati ons. Also, the State Manager documentation has been updated to address outdated information and inconsist encies. For more information, see Amazon Systems Manager State Manager.	August 21, 2017

Change	Description	Release date
Changes to Maintenance Windows	Maintenance Windows include the following changes or enhancements: • Previously, Maintenance Windows could only perform tasks by using Run Command. You can now perform tasks by using Systems Manager Automation, Amazon Lambda, and Amazon Step Functions. • You can edit the targets of a maintenance window, specify a target name, description, and owner. • You can edit tasks in a maintenance window, including specifying a new SSM document for Run Command and Automation tasks. • All Run Command parameters are now supported , including DocumentHash, DocumentHashType, TimeoutSeconds, Comment, and NotificationConfig. • You can now use a `safe` flag when you attempt to deregister a target. If turned on, the system returns an error if the target is referenced by any task. For more information, see Amazon Systems Manager Maintenance Windows.	August 16, 2017
New Automation Action: `aws:approve`	This new action for Automation runbooks temporarily pauses an Automation execution until designated principals either approve or reject the action. After the required number of approvals is reached, the Automation execution resumes. For more information, see Systems Manager Automation actions reference.	August 10, 2017

Change	Description	Release date
Automation assume role no longer required	Automation previously required that you specify a service role (or *assume role*) so that the service had permission to perform actions on your behalf. Automation no longer requires this role because the service now operates by using the context of the user who invoked the execution. However, the following situations still require that you specify a service role for Automation: • When you want to restrict a user's permissions on a resource, but you want the user to run an Automatio n workflow that requires elevated permissions. In this scenario, you can create a service role with elevated permissions and allow the user to run the workflow. • Operations that you expect to run longer than 12 hours require a service role. For more information, see Setting up Automation.	August 3, 2017
Configuration Compliance	Use Amazon EC2 Systems Manager Configuration Compliance to scan your fleet of managed instances for patch compliance and configuration inconsistencies. You can collect and aggregate data from multiple Amazon Web Services accounts and Amazon Web Services Regions, and then drill down into specific resources that aren't compliant. For more information, see Amazon Systems Manager Compliance.	August 8, 2017

Change	Description	Release date
SSM Document Enhancements	SSM Command and Policy documents now offer cross-platform support. This means that a single SSM document can process plugins for Windows and Linux operating systems. Cross-platform support lets you consolidate the number of documents you manage. Cross-platform support is offered in SSM documents that use schema version 2.2 or later. SSM Command documents that use schema version 2.0 or later can now include multiple plugins of the same type. For example, you can create a Command document that calls the `aws:runRunShellScript` plugin multiple times. For more information about schema version 2.2 changes, see Amazon Systems Manager documents. For more information about SSM plugins, see Command document plugin reference.	July 12, 2017

Change	Description	Release date
Linux Patching	Patch Manager can now patch the following Linux distributions: **64-bit and 32-bit systems** • Amazon Linux 2014.03, 2014.09, or later • Ubuntu Server 16.04 LTS, 14.04 LTS, or 12.04 LTS • Red Hat Enterprise Linux (RHEL) 6.5 or later **64-bit systems only** • Amazon Linux 2015.03, 2015.09, or later • Red Hat Enterprise Linux (RHEL) 7.x or later For more information, see Amazon Systems Manager Patch Manager. **Note** • To patch Linux instances, your instances must be running SSM Agent version 2.0.834.0 or later. For information about updating the agent, see the section titled *Example: Update SSM Agent* in Running commands from the console. • The `AWS-ApplyPatchBaseline` SSM document is being replaced by the `AWS-RunPatchBaseline` document.	July 6, 2017

Change	Description	Release date
Resource data sync	You can use Systems Manager resource data sync to send Inventory data collected from all of your managed instances to a single Amazon S3 bucket. Resource data sync then automatically updates the centralized data when new Inventory data is collected. With all Inventory data stored in a target S3 bucket, you can use services like Amazon Athena and Amazon Quick to query and analyze the aggregated data.For more information, see Creating a resource data sync for Inventory. For an example of how to work with resource data sync, see Walkthrough: Using resource data sync to aggregate inventory data.	June 29, 2017
Systems Manager Parameter Hierarchies	Managing dozens or hundreds of Systems Manager parameters as a flat list is time-consuming and prone to errors. You can use parameter hierarchies to help you organize and manage Systems Manager parameters. A hierarchy is a parameter name that includes a path that you define by using forward slashes. Here is an example that uses three hierarchy levels in the name to identify the following: /Environment/Type of computer/Application/Data `/Dev/DBServer/MySQL/db-string13` For more information, see Working with parameter hierarchies in Parameter Store.	June 22, 2017
SSM Agent Support for SUSE Linux Enterprise Server	You can install SSM Agent on 64-bit SUSE Linux Enterprise Server (SLES). For more information, see Working with SSM Agent on EC2 instances for Linux.	June 14, 2017

Document conventions

The following are common typographical conventions for the *Amazon Systems Manager User Guide*.

Differentiated examples for local operating systems or command line languages

We use tabs to present different examples of commands based on a user's local operating system type. For Linux and macOS examples, we use the backslash (\ ) character to break long commands into multiple lines. For Windows Server examples, we use the caret (^) character to break commands into multiple lines.

Example:

Linux & macOS

```
aws ssm send-command \
    --document-name "AWS-RunShellScript" \
    --targets "Key=instanceids,Values=i-02573cafcfEXAMPLE" \
    --parameters "commands=echo HelloWorld"
```

Windows

```
aws ssm send-command ^
    --document-name "AWS-RunShellScript" ^
    --targets "Key=instanceids,Values=i-02573cafcfEXAMPLE" ^
    --parameters "commands=echo HelloWorld"
```
