Hello Amazon S3

The following code examples show how to get started using Amazon S3.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Code for the CMakeLists.txt CMake file.

```
# Set the minimum required version of CMake for this project.
cmake_minimum_required(VERSION 3.13)

# Set the AWS service components used by this project.
set(SERVICE_COMPONENTS s3)

# Set this project's name.
project("hello_s3")

# Set the C++ standard to use to build this target.
# At least C++ 11 is required for the AWS SDK for C++.
set(CMAKE_CXX_STANDARD 11)

# Use the MSVC variable to determine if this is a Windows build.
set(WINDOWS_BUILD ${MSVC})

if (WINDOWS_BUILD) # Set the location where CMake can find the installed
 libraries for the AWS SDK.
    string(REPLACE ";" "/aws-cpp-sdk-all;" SYSTEM_MODULE_PATH
 "${CMAKE_SYSTEM_PREFIX_PATH}/aws-cpp-sdk-all")
    list(APPEND CMAKE_PREFIX_PATH ${SYSTEM_MODULE_PATH})
endif ()

# Find the AWS SDK for C++ package.
find_package(AWSSDK REQUIRED COMPONENTS ${SERVICE_COMPONENTS})

if (WINDOWS_BUILD AND AWSSDK_INSTALL_AS_SHARED_LIBS)
    # Copy relevant AWS SDK for C++ libraries into the current binary directory
 for running and debugging.
```

```
    # set(BIN_SUB_DIR "/Debug") # if you are building from the command line you
 may need to uncomment this
    # and set the proper subdirectory to the executables' location.

    AWSSDK_CPY_DYN_LIBS(SERVICE_COMPONENTS ""
 ${CMAKE_CURRENT_BINARY_DIR}${BIN_SUB_DIR})
endif ()

add_executable(${PROJECT_NAME}
        hello_s3.cpp)

target_link_libraries(${PROJECT_NAME}
        ${AWSSDK_LINK_LIBRARIES})
```

Code for the hello_s3.cpp source file.

```
#include <aws/core/Aws.h>
#include <aws/s3/S3Client.h>
#include <iostream>
#include <aws/core/auth/AWSCredentialsProviderChain.h>
using namespace Aws;
using namespace Aws::Auth;

/*
 *  A "Hello S3" starter application which initializes an Amazon Simple Storage
 Service (Amazon S3) client
 *  and lists the Amazon S3 buckets in the selected region.
 *
 *  main function
 *
 *  Usage: 'hello_s3'
 *
 */

int main(int argc, char **argv) {
    Aws::SDKOptions options;
    // Optionally change the log level for debugging.
//   options.loggingOptions.logLevel = Utils::Logging::LogLevel::Debug;
    Aws::InitAPI(options); // Should only be called once.
    int result = 0;
    {
        Aws::Client::ClientConfiguration clientConfig;
```

```
        // Optional: Set to the AWS Region (overrides config file).
        // clientConfig.region = "us-east-1";

        // You don't normally have to test that you are authenticated. But the
 S3 service permits anonymous requests, thus the s3Client will return "success"
 and 0 buckets even if you are unauthenticated, which can be confusing to a new
 user.
        auto provider =
 Aws::MakeShared<DefaultAWSCredentialsProviderChain>("alloc-tag");
        auto creds = provider->GetAWSCredentials();
        if (creds.IsEmpty()) {
            std::cerr << "Failed authentication" << std::endl;
        }

        Aws::S3::S3Client s3Client(clientConfig);
        auto outcome = s3Client.ListBuckets();

        if (!outcome.IsSuccess()) {
            std::cerr << "Failed with error: " << outcome.GetError() <<
 std::endl;
            result = 1;
        } else {
            std::cout << "Found " << outcome.GetResult().GetBuckets().size()
                      << " buckets\n";
            for (auto &bucket: outcome.GetResult().GetBuckets()) {
                std::cout << bucket.GetName() << std::endl;
            }
        }
    }

    Aws::ShutdownAPI(options); // Should only be called once.
    return result;
}
```

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Learn the basics of Amazon S3 with an Amazon SDK

The following code examples show how to:

- Create a bucket and upload a file to it.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the bucket objects and the bucket.

A scenario example.

```
import java.io.IOException;
import java.util.Scanner;
import java.util.UUID;
import java.util.concurrent.CompletableFuture;
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.services.s3.model.PutObjectResponse;
import software.amazon.awssdk.services.s3.model.S3Exception;

/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 *
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-
started.html
 *
 * This Java code example performs the following tasks:
 *
 * 1. Creates an Amazon S3 bucket.
```

```
 * 2. Uploads an object to the bucket.
 * 3. Downloads the object to another local file.
 * 4. Uploads an object using multipart upload.
 * 5. List all objects located in the Amazon S3 bucket.
 * 6. Copies the object to another Amazon S3 bucket.
 * 7. Copy the object to another Amazon S3 bucket using multi copy.
 * 8. Deletes the object from the Amazon S3 bucket.
 * 9. Deletes the Amazon S3 bucket.
 */

            Amazon S3 is a highly scalable and durable object storage
            service provided by Amazon Web Services (AWS). It is designed to
store and retrieve
            any amount of data, from anywhere on the web, at any time.

            The `S3AsyncClient` interface in the AWS SDK for Java 2.x provides a
set of methods to
            programmatically interact with the Amazon S3 (Simple Storage Service)
service. This allows
            developers to automate the management and manipulation of S3 buckets
and objects as
            part of their application deployment pipelines. With S3, teams can
focus on building
            and deploying their applications without having to worry about the
underlying storage
            infrastructure required to host and manage large amounts of data.

            This scenario walks you through how to perform key operations for
this service.
            Let's get started...

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

First, import all the necessary modules.

```
// Used to check if currently running file is this file.
import { fileURLToPath } from "node:url";
import { readdirSync, readFileSync, writeFileSync } from "node:fs";

// Local helper utils.
import { dirnameFromMetaUrl } from "@aws-doc-sdk-examples/lib/utils/util-fs.js";
import { Prompter } from "@aws-doc-sdk-examples/lib/prompter.js";
import { wrapText } from "@aws-doc-sdk-examples/lib/utils/util-string.js";

import {
  S3Client,
  CreateBucketCommand,
```

```
  PutObjectCommand,
  ListObjectsCommand,
  CopyObjectCommand,
  GetObjectCommand,
  DeleteObjectsCommand,
  DeleteBucketCommand,
} from "@aws-sdk/client-s3";
```

The preceding imports reference some helper utilities. These utilities are local to the GitHub repository linked at the start of this section. For your reference, see the following implementations of those utilities.

```
export const dirnameFromMetaUrl = (metaUrl) =>
  fileURLToPath(new URL(".", metaUrl));

import { select, input, confirm, checkbox, password } from "@inquirer/prompts";

export class Prompter {
  /**
   * @param {{ message: string, choices: { name: string, value: string }[]}}
 options
   */
  select(options) {
    return select(options);
  }

  /**
   * @param {{ message: string }} options
   */
  input(options) {
    return input(options);
  }

  /**
   * @param {{ message: string }} options
   */
  password(options) {
    return password({ ...options, mask: true });
  }

  /**
   * @param {string} prompt
```

```
   */
  checkContinue = async (prompt = "") => {
    const prefix = prompt && `${prompt} `;
    const ok = await this.confirm({
      message: `${prefix}Continue?`,
    });
    if (!ok) throw new Error("Exiting...");
  };

  /**
   * @param {{ message: string }} options
   */
  confirm(options) {
    return confirm(options);
  }

  /**
   * @param {{ message: string, choices: { name: string, value: string }[]}}
 options
   */
  checkbox(options) {
    return checkbox(options);
  }
}

export const wrapText = (text, char = "=") => {
  const rule = char.repeat(80);
  return `${rule}\n    ${text}\n${rule}\n`;
};
```

Objects in S3 are stored in 'buckets'. Let's define a function for creating a new bucket.

```
export const createBucket = async () => {
  const bucketName = await prompter.input({
    message: "Enter a bucket name. Bucket names must be globally unique:",
  });
  const command = new CreateBucketCommand({ Bucket: bucketName });
  await s3Client.send(command);
  console.log("Bucket created successfully.\n");
  return bucketName;
};
```

Buckets contain 'objects'. This function uploads the contents of a directory to your bucket as objects.

```
export const uploadFilesToBucket = async ({ bucketName, folderPath }) => {
  console.log(`Uploading files from ${folderPath}\n`);
  const keys = readdirSync(folderPath);
  const files = keys.map((key) => {
    const filePath = `${folderPath}/${key}`;
    const fileContent = readFileSync(filePath);
    return {
      Key: key,
      Body: fileContent,
    };
  });

  for (const file of files) {
    await s3Client.send(
      new PutObjectCommand({
        Bucket: bucketName,
        Body: file.Body,
        Key: file.Key,
      }),
    );
    console.log(`${file.Key} uploaded successfully.`);
  }
};
```

After uploading objects, check to confirm that they were uploaded correctly. You can use ListObjects for that. You'll be using the 'Key' property, but there are other useful properties in the response also.

```
export const listFilesInBucket = async ({ bucketName }) => {
  const command = new ListObjectsCommand({ Bucket: bucketName });
  const { Contents } = await s3Client.send(command);
  const contentsList = Contents.map((c) => ` • ${c.Key}`).join("\n");
  console.log("\nHere's a list of files in the bucket:");
  console.log(`${contentsList}\n`);
};
```

Sometimes you might want to copy an object from one bucket to another. Use the CopyObject command for that.

```
export const copyFileFromBucket = async ({ destinationBucket }) => {
  const proceed = await prompter.confirm({
    message: "Would you like to copy an object from another bucket?",
  });

  if (!proceed) {
    return;
  }
  const copy = async () => {
    try {
      const sourceBucket = await prompter.input({
        message: "Enter source bucket name:",
      });
      const sourceKey = await prompter.input({
        message: "Enter source key:",
      });
      const destinationKey = await prompter.input({
        message: "Enter destination key:",
      });

      const command = new CopyObjectCommand({
        Bucket: destinationBucket,
        CopySource: `${sourceBucket}/${sourceKey}`,
        Key: destinationKey,
      });
      await s3Client.send(command);
      await copyFileFromBucket({ destinationBucket });
    } catch (err) {
      console.error("Copy error.");
      console.error(err);
      const retryAnswer = await prompter.confirm({ message: "Try again?" });
      if (retryAnswer) {
        await copy();
      }
    }
  };
  await copy();
};
```

There's no SDK method for getting multiple objects from a bucket. Instead, you'll create a list of objects to download and iterate over them.

```
export const downloadFilesFromBucket = async ({ bucketName }) => {
  const { Contents } = await s3Client.send(
    new ListObjectsCommand({ Bucket: bucketName }),
  );
  const path = await prompter.input({
    message: "Enter destination path for files:",
  });

  for (const content of Contents) {
    const obj = await s3Client.send(
      new GetObjectCommand({ Bucket: bucketName, Key: content.Key }),
    );
    writeFileSync(
      `${path}/${content.Key}`,
      await obj.Body.transformToByteArray(),
    );
  }
  console.log("Files downloaded successfully.\n");
};
```

It's time to clean up your resources. A bucket must be empty before it can be deleted. These two functions empty and delete the bucket.

```
export const emptyBucket = async ({ bucketName }) => {
  const listObjectsCommand = new ListObjectsCommand({ Bucket: bucketName });
  const { Contents } = await s3Client.send(listObjectsCommand);
  const keys = Contents.map((c) => c.Key);

  const deleteObjectsCommand = new DeleteObjectsCommand({
    Bucket: bucketName,
    Delete: { Objects: keys.map((key) => ({ Key: key })) },
  });
  await s3Client.send(deleteObjectsCommand);
  console.log(`${bucketName} emptied successfully.\n`);
};

export const deleteBucket = async ({ bucketName }) => {
  const command = new DeleteBucketCommand({ Bucket: bucketName });
  await s3Client.send(command);
```

```
  console.log(`${bucketName} deleted successfully.\n`);
};
```

The 'main' function pulls everything together. If you run this file directly the main function will be called.

```
const main = async () => {
  const OBJECT_DIRECTORY = `${dirnameFromMetaUrl(
    import.meta.url,
  )}../../../../resources/sample_files/.sample_media`;

  try {
    console.log(wrapText("Welcome to the Amazon S3 getting started example."));
    console.log("Let's create a bucket.");
    const bucketName = await createBucket();
    await prompter.confirm({ message: continueMessage });

    console.log(wrapText("File upload."));
    console.log(
      "I have some default files ready to go. You can edit the source code to
 provide your own.",
    );
    await uploadFilesToBucket({
      bucketName,
      folderPath: OBJECT_DIRECTORY,
    });

    await listFilesInBucket({ bucketName });
    await prompter.confirm({ message: continueMessage });

    console.log(wrapText("Copy files."));
    await copyFileFromBucket({ destinationBucket: bucketName });
    await listFilesInBucket({ bucketName });
    await prompter.confirm({ message: continueMessage });

    console.log(wrapText("Download files."));
    await downloadFilesFromBucket({ bucketName });

    console.log(wrapText("Clean up."));
    await emptyBucket({ bucketName });
    await deleteBucket({ bucketName });
  } catch (err) {
```

```
    console.error(err);
  }
};
```

Code for the binary crate which runs the scenario.

```
#![allow(clippy::result_large_err)]

//!  Purpose
//!  Shows how to use the AWS SDK for Rust to get started using
//!  Amazon Simple Storage Service (Amazon S3). Create a bucket, move objects
 into and out of it,
//!  and delete all resources at the end of the demo.
//!
//!  This example follows the steps in "Getting started with Amazon S3" in the
 Amazon S3
//!  user guide.

- For API details, see the following topics in *Amazon SDK for Swift API reference*.
  - CopyObject
  - CreateBucket
  - DeleteBucket

- DeleteObjects
- GetObject
- ListObjectsV2
- PutObject

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Actions for Amazon S3 using Amazon SDKs

The following code examples demonstrate how to perform individual Amazon S3 actions with Amazon SDKs. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

These excerpts call the Amazon S3 API and are code excerpts from larger programs that must be run in context. You can see actions in context in Scenarios for Amazon S3 using Amazon SDKs .

The following examples include only the most commonly used actions. For a complete list, see the Amazon Simple Storage Service API Reference.

Examples

- Use AbortMultipartUpload with an Amazon SDK or CLI
- Use CompleteMultipartUpload with an Amazon SDK or CLI
- Use CopyObject with an Amazon SDK or CLI
- Use CreateBucket with an Amazon SDK or CLI
- Use CreateMultiRegionAccessPoint with an Amazon SDK
- Use CreateMultipartUpload with an Amazon SDK or CLI
- Use DeleteBucket with an Amazon SDK or CLI
- Use DeleteBucketAnalyticsConfiguration with a CLI
- Use DeleteBucketCors with an Amazon SDK or CLI
- Use DeleteBucketEncryption with a CLI
- Use DeleteBucketInventoryConfiguration with a CLI
- Use DeleteBucketLifecycle with an Amazon SDK or CLI
- Use DeleteBucketMetricsConfiguration with a CLI

- Use DeleteBucketPolicy with an Amazon SDK or CLI
- Use DeleteBucketReplication with a CLI
- Use DeleteBucketTagging with a CLI
- Use DeleteBucketWebsite with an Amazon SDK or CLI
- Use DeleteObject with an Amazon SDK or CLI
- Use DeleteObjectTagging with a CLI
- Use DeleteObjects with an Amazon SDK or CLI
- Use DeletePublicAccessBlock with a CLI
- Use GetBucketAccelerateConfiguration with a CLI
- Use GetBucketAcl with an Amazon SDK or CLI
- Use GetBucketAnalyticsConfiguration with a CLI
- Use GetBucketCors with an Amazon SDK or CLI
- Use GetBucketEncryption with an Amazon SDK or CLI
- Use GetBucketInventoryConfiguration with a CLI
- Use GetBucketLifecycleConfiguration with an Amazon SDK or CLI
- Use GetBucketLocation with an Amazon SDK or CLI
- Use GetBucketLogging with a CLI
- Use GetBucketMetricsConfiguration with a CLI
- Use GetBucketNotification with a CLI
- Use GetBucketPolicy with an Amazon SDK or CLI
- Use GetBucketPolicyStatus with a CLI
- Use GetBucketReplication with an Amazon SDK or CLI
- Use GetBucketRequestPayment with a CLI
- Use GetBucketTagging with a CLI
- Use GetBucketVersioning with a CLI
- Use GetBucketWebsite with an Amazon SDK or CLI
- Use GetObject with an Amazon SDK or CLI
- Use GetObjectAcl with an Amazon SDK or CLI
- Use GetObjectAttributes with an Amazon SDK or CLI
- Use GetObjectLegalHold with an Amazon SDK or CLI

- Use GetObjectLockConfiguration with an Amazon SDK or CLI
- Use GetObjectRetention with an Amazon SDK or CLI
- Use GetObjectTagging with a CLI
- Use GetPublicAccessBlock with a CLI
- Use HeadBucket with an Amazon SDK or CLI
- Use HeadObject with an Amazon SDK or CLI
- Use ListBucketAnalyticsConfigurations with a CLI
- Use ListBucketInventoryConfigurations with a CLI
- Use ListBuckets with an Amazon SDK or CLI
- Use ListMultipartUploads with an Amazon SDK or CLI
- Use ListObjectVersions with an Amazon SDK or CLI
- Use ListObjects with a CLI
- Use ListObjectsV2 with an Amazon SDK or CLI
- Use PutBucketAccelerateConfiguration with an Amazon SDK or CLI
- Use PutBucketAcl with an Amazon SDK or CLI
- Use PutBucketCors with an Amazon SDK or CLI
- Use PutBucketEncryption with an Amazon SDK or CLI
- Use PutBucketLifecycleConfiguration with an Amazon SDK or CLI
- Use PutBucketLogging with an Amazon SDK or CLI
- Use PutBucketNotification with a CLI
- Use PutBucketNotificationConfiguration with an Amazon SDK or CLI
- Use PutBucketPolicy with an Amazon SDK or CLI
- Use PutBucketReplication with an Amazon SDK or CLI
- Use PutBucketRequestPayment with a CLI
- Use PutBucketTagging with a CLI
- Use PutBucketVersioning with an Amazon SDK or CLI
- Use PutBucketWebsite with an Amazon SDK or CLI
- Use PutObject with an Amazon SDK or CLI
- Use PutObjectAcl with an Amazon SDK or CLI
- Use PutObjectLegalHold with an Amazon SDK or CLI

- Use PutObjectLockConfiguration with an Amazon SDK or CLI
- Use PutObjectRetention with an Amazon SDK or CLI
- Use RestoreObject with an Amazon SDK or CLI
- Use SelectObjectContent with an Amazon SDK or CLI
- Use UploadPart with an Amazon SDK or CLI
- Use UploadPartCopy with an Amazon SDK or CLI

Use `AbortMultipartUpload` with an Amazon SDK or CLI

The following code examples show how to use `AbortMultipartUpload`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Delete incomplete multipart uploads
- Work with Amazon S3 object integrity

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
//! Abort a multipart upload to an S3 bucket.
/*!
    \param bucket: The name of the S3 bucket where the object will be uploaded.
    \param key: The unique identifier (key) for the object within the S3 bucket.
    \param uploadID: An upload ID string.
    \param client: The S3 client instance used to perform the upload operation.
    \return bool: Function succeeded.
*/

bool AwsDoc::S3::abortMultipartUpload(const Aws::String &bucket,
                                      const Aws::String &key,
```

```
                                        const Aws::String &uploadID,
                                        const Aws::S3::S3Client &client) {
    Aws::S3::Model::AbortMultipartUploadRequest request;
    request.SetBucket(bucket);
    request.SetKey(key);
    request.SetUploadId(uploadID);

    Aws::S3::Model::AbortMultipartUploadOutcome outcome =
            client.AbortMultipartUpload(request);

    if (outcome.IsSuccess()) {
        std::cout << "Multipart upload aborted." << std::endl;
    } else {
        std::cerr << "Error aborting multipart upload: " <<
 outcome.GetError().GetMessage() << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see AbortMultipartUpload in *Amazon SDK for C++ API Reference*.

CLI

Amazon CLI

To abort the specified multipart upload

The following `abort-multipart-upload` command aborts a multipart upload for the key `multipart/01` in the bucket `amzn-s3-demo-bucket`.

```
aws s3api abort-multipart-upload \
    --bucket amzn-s3-demo-bucket \
    --key multipart/01 \
    --upload-
id dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P
```

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

- For API details, see AbortMultipartUpload in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command aborts multipart uploads created earlier than 5 days ago.

```
Remove-S3MultipartUpload -BucketName amzn-s3-demo-bucket -DaysBefore 5
```

Example 2: This command aborts multipart uploads created earlier than January 2nd, 2014.

```
Remove-S3MultipartUpload -BucketName amzn-s3-demo-bucket -InitiatedDate
 "Thursday, January 02, 2014"
```

Example 3: This command aborts multipart uploads created earlier than January 2nd, 2014, 10:45:37.

```
Remove-S3MultipartUpload -BucketName amzn-s3-demo-bucket -InitiatedDate
 "2014/01/02 10:45:37"
```

- For API details, see AbortMultipartUpload in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command aborts multipart uploads created earlier than 5 days ago.

```
Remove-S3MultipartUpload -BucketName amzn-s3-demo-bucket -DaysBefore 5
```

Example 2: This command aborts multipart uploads created earlier than January 2nd, 2014.

```
Remove-S3MultipartUpload -BucketName amzn-s3-demo-bucket -InitiatedDate
 "Thursday, January 02, 2014"
```

Example 3: This command aborts multipart uploads created earlier than January 2nd, 2014, 10:45:37.

```
Remove-S3MultipartUpload -BucketName amzn-s3-demo-bucket -InitiatedDate
 "2014/01/02 10:45:37"
```

Use `CompleteMultipartUpload` with an Amazon SDK or CLI

The following code examples show how to use `CompleteMultipartUpload`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Perform a multipart copy
- Use checksums
- Work with Amazon S3 object integrity

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
//! Complete a multipart upload to an S3 bucket.
```

```
/*!
    \param bucket: The name of the S3 bucket where the object will be uploaded.
    \param key: The unique identifier (key) for the object within the S3 bucket.
    \param uploadID: An upload ID string.
    \param parts: A vector of CompleteParts.
    \param client: The S3 client instance used to perform the upload operation.
    \return CompleteMultipartUploadOutcome: The request outcome.
*/
Aws::S3::Model::CompleteMultipartUploadOutcome
 AwsDoc::S3::completeMultipartUpload(const Aws::String &bucket,

  const Aws::String &key,

  const Aws::String &uploadID,

  const Aws::Vector<Aws::S3::Model::CompletedPart> &parts,

  const Aws::S3::S3Client &client) {
    Aws::S3::Model::CompletedMultipartUpload completedMultipartUpload;
    completedMultipartUpload.SetParts(parts);

    Aws::S3::Model::CompleteMultipartUploadRequest request;
    request.SetBucket(bucket);
    request.SetKey(key);
    request.SetUploadId(uploadID);
    request.SetMultipartUpload(completedMultipartUpload);

    Aws::S3::Model::CompleteMultipartUploadOutcome outcome =
            client.CompleteMultipartUpload(request);

    if (!outcome.IsSuccess()) {
        std::cerr << "Error completing multipart upload: " <<
 outcome.GetError().GetMessage() << std::endl;
    }
    return outcome;
}
```

- For API details, see CompleteMultipartUpload in *Amazon SDK for C++ API Reference*.

CLI

Amazon CLI

The following command completes a multipart upload for the key `multipart/01` in the bucket `amzn-s3-demo-bucket`:

```
aws s3api complete-multipart-upload --multipart-upload file://
mpustruct --bucket amzn-s3-demo-bucket --key 'multipart/01' --upload-
id dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P
```

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

The multipart upload option in the above command takes a JSON structure that describes the parts of the multipart upload that should be reassembled into the complete file. In this example, the `file://` prefix is used to load the JSON structure from a file in the local folder named `mpustruct`.

mpustruct:

```
{
  "Parts": [
    {
      "ETag": "e868e0f4719e394144ef36531ee6824c",
      "PartNumber": 1
    },
    {
      "ETag": "6bb2b12753d66fe86da4998aa33fffb0",
      "PartNumber": 2
    },
    {
      "ETag": "d0a0112e841abec9c9ec83406f0159c8",
      "PartNumber": 3
    }
  ]
}
```

The ETag value for each part is upload is output each time you upload a part using the `upload-part` command and can also be retrieved by calling `list-parts` or calculated by taking the MD5 checksum of each part.

Output:

```
{
    "ETag": "\"3944a9f7a4faab7f78788ff6210f63f0-3\"",
    "Bucket": "amzn-s3-demo-bucket",
    "Location": "https://amzn-s3-demo-bucket.s3.amazonaws.com/multipart%2F01",
    "Key": "multipart/01"
}
```

- For API details, see CompleteMultipartUpload in *Amazon CLI Command Reference*.

Copy an object using an S3Client.

```
   /**
    * Asynchronously copies an object from one S3 bucket to another.
    *
    * @param fromBucket the name of the source S3 bucket
    * @param objectKey  the key (name) of the object to be copied
    * @param toBucket   the name of the destination S3 bucket
    * @return a {@link CompletableFuture} that completes with the copy result as
a {@link String}
    * @throws RuntimeException if the URL could not be encoded or an S3
exception occurred during the copy
    */
   public CompletableFuture<String> copyBucketObjectAsync(String fromBucket,
String objectKey, String toBucket) {
       CopyObjectRequest copyReq = CopyObjectRequest.builder()
           .sourceBucket(fromBucket)
           .sourceKey(objectKey)
           .destinationBucket(toBucket)
           .destinationKey(objectKey)
           .build();

       CompletableFuture<CopyObjectResponse> response =
getAsyncClient().copyObject(copyReq);
```

```
        response.whenComplete((copyRes, ex) -> {
            if (copyRes != null) {
                logger.info("The " + objectKey + " was copied to " + toBucket);
            } else {
                throw new RuntimeException("An S3 exception occurred during
 copy", ex);
            }
        });

        return response.thenApply(CopyObjectResponse::copyObjectResult)
            .thenApply(Object::toString);
    }
```

Use an S3TransferManager to copy an object from one bucket to another. View the complete file and test.

PowerShell

Tools for PowerShell V4

Example 1: This command copies the object "sample.txt" from bucket "test-files" to the same bucket but with a new key of "sample-copy.txt".

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -DestinationKey
 sample-copy.txt
```

Example 2: This command copies the object "sample.txt" from bucket "test-files" to the bucket "backup-files" with a key of "sample-copy.txt".

```
Copy-S3Object -BucketName amzn-s3-demo-source-bucket -Key sample.txt -
DestinationKey sample-copy.txt -DestinationBucket amzn-s3-demo-destination-bucket
```

Example 3: This command downloads the object "sample.txt" from bucket "test-files" to a local file with name "local-sample.txt".

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -LocalFile local-
sample.txt
```

Example 4: Downloads the single object to the specified file. The downloaded file will be found at c:\downloads\data\archive.zip

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -Key data/archive.zip -LocalFolder
 c:\downloads
```

Example 5: Downloads all objects that match the specified key prefix to the local folder. The relative key hierarchy will be preserved as subfolders in the overall download location.

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -KeyPrefix data -LocalFolder c:
\downloads
```

- For API details, see CopyObject in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command copies the object "sample.txt" from bucket "test-files" to the same bucket but with a new key of "sample-copy.txt".

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -DestinationKey
 sample-copy.txt
```

Example 2: This command copies the object "sample.txt" from bucket "test-files" to the bucket "backup-files" with a key of "sample-copy.txt".

```
Copy-S3Object -BucketName amzn-s3-demo-source-bucket -Key sample.txt -
DestinationKey sample-copy.txt -DestinationBucket amzn-s3-demo-destination-bucket
```

Example 3: This command downloads the object "sample.txt" from bucket "test-files" to a local file with name "local-sample.txt".

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -LocalFile local-
sample.txt
```

Example 4: Downloads the single object to the specified file. The downloaded file will be found at c:\downloads\data\archive.zip

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -Key data/archive.zip -LocalFolder
 c:\downloads
```

Example 5: Downloads all objects that match the specified key prefix to the local folder. The relative key hierarchy will be preserved as subfolders in the overall download location.

```
Copy-S3Object -BucketName amzn-s3-demo-bucket -KeyPrefix data -LocalFolder c:
\downloads
```

- For API details, see CopyObject in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

Copy an object.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectCopyWrapper
  attr_reader :source_object

  # @param source_object [Aws::S3::Object] An existing Amazon S3 object. This is
 used as the source object for
  #                                        copy actions.
  def initialize(source_object)
    @source_object = source_object
  end

  # Copy the source object to the specified target bucket and rename it with the
 target key.
  #
  # @param target_bucket [Aws::S3::Bucket] An existing Amazon S3 bucket where the
 object is copied.
  # @param target_object_key [String] The key to give the copy of the object.
  # @return [Aws::S3::Object, nil] The copied object when successful; otherwise,
 nil.
  def copy_object(target_bucket, target_object_key)
    @source_object.copy_to(bucket: target_bucket.name, key: target_object_key)
    target_bucket.object(target_object_key)
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't copy #{@source_object.key} to #{target_object_key}. Here's
 why: #{e.message}"
  end
end

# Example usage:
```

```
def run_demo
  source_bucket_name = "amzn-s3-demo-bucket1"
  source_key = "my-source-file.txt"
  target_bucket_name = "amzn-s3-demo-bucket2"
  target_key = "my-target-file.txt"

  source_bucket = Aws::S3::Bucket.new(source_bucket_name)
  wrapper = ObjectCopyWrapper.new(source_bucket.object(source_key))
  target_bucket = Aws::S3::Bucket.new(target_bucket_name)
  target_object = wrapper.copy_object(target_bucket, target_key)
  return unless target_object

  puts "Copied #{source_key} from #{source_bucket_name} to
 #{target_object.bucket_name}:#{target_object.key}."
end

run_demo if $PROGRAM_NAME == __FILE__
```

Copy an object and add server-side encryption to the destination object.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectCopyEncryptWrapper
  attr_reader :source_object

  # @param source_object [Aws::S3::Object] An existing Amazon S3 object. This is
 used as the source object for
  #                                        copy actions.
  def initialize(source_object)
    @source_object = source_object
  end

  # Copy the source object to the specified target bucket, rename it with the
 target key, and encrypt it.
  #
  # @param target_bucket [Aws::S3::Bucket] An existing Amazon S3 bucket where the
 object is copied.
  # @param target_object_key [String] The key to give the copy of the object.
  # @return [Aws::S3::Object, nil] The copied object when successful; otherwise,
 nil.
  def copy_object(target_bucket, target_object_key, encryption)
```

```
    @source_object.copy_to(bucket: target_bucket.name, key: target_object_key,
 server_side_encryption: encryption)
    target_bucket.object(target_object_key)
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't copy #{@source_object.key} to #{target_object_key}. Here's
 why: #{e.message}"
  end
end

# Example usage:
def run_demo
  source_bucket_name = "amzn-s3-demo-bucket1"
  source_key = "my-source-file.txt"
  target_bucket_name = "amzn-s3-demo-bucket2"
  target_key = "my-target-file.txt"
  target_encryption = "AES256"

  source_bucket = Aws::S3::Bucket.new(source_bucket_name)
  wrapper = ObjectCopyEncryptWrapper.new(source_bucket.object(source_key))
  target_bucket = Aws::S3::Bucket.new(target_bucket_name)
  target_object = wrapper.copy_object(target_bucket, target_key,
 target_encryption)
  return unless target_object

  puts "Copied #{source_key} from #{source_bucket_name} to
 #{target_object.bucket_name}:#{target_object.key} and "\
       "encrypted the target with #{target_object.server_side_encryption}
 encryption."
end

run_demo if $PROGRAM_NAME == __FILE__
```

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `CreateBucket` with an Amazon SDK or CLI

The following code examples show how to use `CreateBucket`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Manage large messages using S3
- Work with versioned objects

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
bool AwsDoc::S3::createBucket(const Aws::String &bucketName,
                              const Aws::S3::S3ClientConfiguration &clientConfig)
 {
    Aws::S3::S3Client client(clientConfig);
    Aws::S3::Model::CreateBucketRequest request;
    request.SetBucket(bucketName);

    if (clientConfig.region != "us-east-1") {
        Aws::S3::Model::CreateBucketConfiguration createBucketConfig;
        createBucketConfig.SetLocationConstraint(

 Aws::S3::Model::BucketLocationConstraintMapper::GetBucketLocationConstraintForName(
                        clientConfig.region));
        request.SetCreateBucketConfiguration(createBucketConfig);
    }

    Aws::S3::Model::CreateBucketOutcome outcome = client.CreateBucket(request);
    if (!outcome.IsSuccess()) {
        auto err = outcome.GetError();
        std::cerr << "Error: createBucket: " <<
                  err.GetExceptionName() << ": " << err.GetMessage() <<
 std::endl;
    } else {
        std::cout << "Created bucket " << bucketName <<
                  " in the specified AWS Region." << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see CreateBucket in *Amazon SDK for C++ API Reference*.

CLI

Amazon CLI

Example 1: To create a bucket

The following `create-bucket` example creates a bucket named `amzn-s3-demo-bucket`:

```
aws s3api create-bucket \
```

```
    --bucket amzn-s3-demo-bucket \
    --region us-east-1
```

Output:

```
{
    "Location": "/amzn-s3-demo-bucket"
}
```

For more information, see Creating a bucket in the *Amazon S3 User Guide*.

Example 2: To create a bucket with owner enforced

The following `create-bucket` example creates a bucket named `amzn-s3-demo-bucket` that uses the bucket owner enforced setting for S3 Object Ownership.

```
aws s3api create-bucket \
    --bucket amzn-s3-demo-bucket \
    --region us-east-1 \
    --object-ownership BucketOwnerEnforced
```

Output:

```
{
    "Location": "/amzn-s3-demo-bucket"
}
```

For more information, see Controlling ownership of objects and disabling ACLs in the *Amazon S3 User Guide*.

Example 3: To create a bucket outside of the ``us-east-1`` region

The following `create-bucket` example creates a bucket named `amzn-s3-demo-bucket` in the `eu-west-1` region. Regions outside of `us-east-1` require the appropriate `LocationConstraint` to be specified in order to create the bucket in the desired region.

```
aws s3api create-bucket \
    --bucket amzn-s3-demo-bucket \
    --region eu-west-1 \
    --create-bucket-configuration LocationConstraint=eu-west-1
```

Output:

```
{

Use `CreateMultiRegionAccessPoint` with an Amazon SDK

The following code example shows how to use `CreateMultiRegionAccessPoint`.

Kotlin

SDK for Kotlin

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Configure the S3 control client to send request to the us-west-2 Region.

```
        suspend fun createS3ControlClient(): S3ControlClient {
            // Configure your S3ControlClient to send requests to US West
(Oregon).
            val s3Control = S3ControlClient.fromEnvironment {
                region = "us-west-2"
            }
            return s3Control
        }
```

Create the Multi-Region Access Point.

```
    suspend fun createMrap(
        s3Control: S3ControlClient,
```

```
        accountIdParam: String,
        bucketName1: String,
        bucketName2: String,
        mrapName: String,
    ): String {
        println("Creating MRAP ...")
        val createMrapResponse: CreateMultiRegionAccessPointResponse =
            s3Control.createMultiRegionAccessPoint {
                accountId = accountIdParam
                clientToken = UUID.randomUUID().toString()
                details {
                    name = mrapName
                    regions = listOf(
                        Region {

Use `CreateMultipartUpload` with an Amazon SDK or CLI

The following code examples show how to use `CreateMultipartUpload`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Perform a multipart copy
- Use checksums
- Work with Amazon S3 object integrity

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
//! Create a multipart upload.
/*!
    \param bucket: The name of the S3 bucket where the object will be uploaded.
    \param key: The unique identifier (key) for the object within the S3 bucket.
    \param client: The S3 client instance used to perform the upload operation.
    \return Aws::String: Upload ID or empty string if failed.
*/
Aws::String
AwsDoc::S3::createMultipartUpload(const Aws::String &bucket, const Aws::String
 &key,
                                  Aws::S3::Model::ChecksumAlgorithm
 checksumAlgorithm,
                                  const Aws::S3::S3Client &client) {
    Aws::S3::Model::CreateMultipartUploadRequest request;
    request.SetBucket(bucket);
    request.SetKey(key);

    if (checksumAlgorithm != Aws::S3::Model::ChecksumAlgorithm::NOT_SET) {
        request.SetChecksumAlgorithm(checksumAlgorithm);
    }

    Aws::S3::Model::CreateMultipartUploadOutcome outcome =
            client.CreateMultipartUpload(request);
```

```
    Aws::String uploadID;
    if (outcome.IsSuccess()) {
        uploadID = outcome.GetResult().GetUploadId();
    } else {
        std::cerr << "Error creating multipart upload: " <<
 outcome.GetError().GetMessage() << std::endl;
    }

    return uploadID;
}
```

- For API details, see CreateMultipartUpload in *Amazon SDK for C++ API Reference*.

CLI

Amazon CLI

The following command creates a multipart upload in the bucket `amzn-s3-demo-bucket` with the key `multipart/01`:

```
aws s3api create-multipart-upload --bucket amzn-s3-demo-bucket --key
 'multipart/01'
```

Output:

```
{
    "Bucket": "amzn-s3-demo-bucket",
    "UploadId":
 "dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3
    "Key": "multipart/01"
}
```

The completed file will be named `01` in a folder called `multipart` in the bucket `amzn-s3-demo-bucket`. Save the upload ID, key and bucket name for use with the `upload-part` command.

- For API details, see CreateMultipartUpload in *Amazon CLI Command Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteBucketAnalyticsConfiguration` with a CLI

The following code examples show how to use `DeleteBucketAnalyticsConfiguration`.

CLI

Amazon CLI

To delete an analytics configuration for a bucket

The following `delete-bucket-analytics-configuration` example removes the analytics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-analytics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1
```

This command produces no output.

- For API details, see DeleteBucketAnalyticsConfiguration in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: The command removes the analytics filter with name 'testfilter' in the given S3 bucket.

```
Remove-S3BucketAnalyticsConfiguration -BucketName 'amzn-s3-demo-bucket' -
AnalyticsId 'testfilter'
```

- For API details, see DeleteBucketAnalyticsConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: The command removes the analytics filter with name 'testfilter' in the given S3 bucket.

```
Remove-S3BucketAnalyticsConfiguration -BucketName 'amzn-s3-demo-bucket' -
AnalyticsId 'testfilter'
```

- For API details, see DeleteBucketAnalyticsConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteBucketCors` with an Amazon SDK or CLI

The following code examples show how to use `DeleteBucketCors`.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
        /// <summary>
        /// Deletes a CORS configuration from an Amazon S3 bucket.
        /// </summary>
        /// <param name="client">The initialized Amazon S3 client object used
        /// to delete the CORS configuration from the bucket.</param>
        private static async Task DeleteCORSConfigurationAsync(AmazonS3Client
client)
        {
            DeleteCORSConfigurationRequest request = new
DeleteCORSConfigurationRequest()
            {
                BucketName = BucketName,
            };
            await client.DeleteCORSConfigurationAsync(request);
        }
```

- For API details, see DeleteBucketCors in *Amazon SDK for .NET API Reference*.

CLI

Amazon CLI

The following command deletes a Cross-Origin Resource Sharing configuration from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-bucket-cors --bucket amzn-s3-demo-bucket
```

- For API details, see DeleteBucketCors in *Amazon CLI Command Reference*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
 Boto3
                       that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def delete_cors(self):
        """
        Delete the CORS rules from the bucket.

        :param bucket_name: The name of the bucket to update.
        """
        try:
            self.bucket.Cors().delete()
            logger.info("Deleted CORS from bucket '%s'.", self.bucket.name)
        except ClientError:
            logger.exception("Couldn't delete CORS from bucket '%s'.",
 self.bucket.name)
            raise
```

- For API details, see DeleteBucketCors in *Amazon SDK for Python (Boto3) API Reference*.

Ruby

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 bucket CORS configuration.
class BucketCorsWrapper
  attr_reader :bucket_cors

  # @param bucket_cors [Aws::S3::BucketCors] A bucket CORS object configured with
 an existing bucket.
  def initialize(bucket_cors)
    @bucket_cors = bucket_cors
  end

  # Deletes the CORS configuration of a bucket.
  #
  # @return [Boolean] True if the CORS rules were deleted; otherwise, false.
  def delete_cors
    @bucket_cors.delete
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't delete CORS rules for #{@bucket_cors.bucket.name}. Here's why:
 #{e.message}"
    false
  end

end
```

- For API details, see DeleteBucketCors in *Amazon SDK for Ruby API Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteBucketEncryption` with a CLI

The following code examples show how to use `DeleteBucketEncryption`.

CLI

Amazon CLI

To delete the server-side encryption configuration of a bucket

The following `delete-bucket-encryption` example deletes the server-side encryption configuration of the specified bucket.

```
aws s3api delete-bucket-encryption \
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

- For API details, see DeleteBucketEncryption in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This disables the encryption enabled for the S3 bucket provided.

```
Remove-S3BucketEncryption -BucketName 'amzn-s3-demo-bucket'
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketEncryption (DeleteBucketEncryption)" on
 target "s3casetestbucket".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is
 "Y"): Y
```

- For API details, see DeleteBucketEncryption in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This disables the encryption enabled for the S3 bucket provided.

```
Remove-S3BucketEncryption -BucketName 'amzn-s3-demo-bucket'
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketEncryption (DeleteBucketEncryption)" on
 target "s3casetestbucket".
```

```
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is
 "Y"): Y
```

- For API details, see DeleteBucketEncryption in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteBucketInventoryConfiguration` with a CLI

The following code examples show how to use `DeleteBucketInventoryConfiguration`.

CLI

Amazon CLI

To delete the inventory configuration of a bucket

The following `delete-bucket-inventory-configuration` example deletes the inventory configuration with ID 1 for the specified bucket.

```
aws s3api delete-bucket-inventory-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1
```

This command produces no output.

- For API details, see DeleteBucketInventoryConfiguration in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command removes the invventory named 'testInventoryName' corresponding to the given S3 bucket.

```
Remove-S3BucketInventoryConfiguration -BucketName 'amzn-s3-demo-bucket' -
InventoryId 'testInventoryName'
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketInventoryConfiguration
 (DeleteBucketInventoryConfiguration)" on target "amzn-s3-demo-bucket".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is
 "Y"): Y
```

- For API details, see DeleteBucketInventoryConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command removes the invventory named 'testInventoryName' corresponding to the given S3 bucket.

```
Remove-S3BucketInventoryConfiguration -BucketName 'amzn-s3-demo-bucket' -
InventoryId 'testInventoryName'
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketInventoryConfiguration
 (DeleteBucketInventoryConfiguration)" on target "amzn-s3-demo-bucket".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is
 "Y"): Y
```

- For API details, see DeleteBucketInventoryConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteBucketLifecycle` with an Amazon SDK or CLI

The following code examples show how to use `DeleteBucketLifecycle`.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
        /// <summary>
        /// This method removes the Lifecycle configuration from the named
        /// S3 bucket.
        /// </summary>
        /// <param name="client">The S3 client object used to call
        /// the RemoveLifecycleConfigAsync method.</param>
        /// <param name="bucketName">A string representing the name of the
        /// S3 bucket from which the configuration will be removed.</param>
        public static async Task RemoveLifecycleConfigAsync(IAmazonS3 client,
string bucketName)
        {
            var request = new DeleteLifecycleConfigurationRequest()
            {
                BucketName = bucketName,
            };
            await client.DeleteLifecycleConfigurationAsync(request);
        }
```

- For API details, see DeleteBucketLifecycle in *Amazon SDK for .NET API Reference*.

CLI

Amazon CLI

The following command deletes a lifecycle configuration from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-bucket-lifecycle --bucket amzn-s3-demo-bucket
```

- For API details, see DeleteBucketLifecycle in *Amazon CLI Command Reference*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
 Boto3
                       that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def delete_lifecycle_configuration(self):
        """
        Remove the lifecycle configuration from the specified bucket.
        """
        try:
            self.bucket.LifecycleConfiguration().delete()
            logger.info(
                "Deleted lifecycle configuration for bucket '%s'.",
 self.bucket.name
            )
        except ClientError:
            logger.exception(
                "Couldn't delete lifecycle configuration for bucket '%s'.",
                self.bucket.name,
            )
            raise
```

- For API details, see DeleteBucketLifecycle in *Amazon SDK for Python (Boto3) API Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteBucketMetricsConfiguration` with a CLI

The following code examples show how to use `DeleteBucketMetricsConfiguration`.

CLI

Amazon CLI

To delete a metrics configuration for a bucket

The following `delete-bucket-metrics-configuration` example removes the metrics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-metrics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 123
```

This command produces no output.

- For API details, see DeleteBucketMetricsConfiguration in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: The command removes the metrics filter with name 'testmetrics' in the given S3 bucket.

```
Remove-S3BucketMetricsConfiguration -BucketName 'amzn-s3-demo-bucket' -MetricsId
 'testmetrics'
```

- For API details, see DeleteBucketMetricsConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: The command removes the metrics filter with name 'testmetrics' in the given S3 bucket.

```
Remove-S3BucketMetricsConfiguration -BucketName 'amzn-s3-demo-bucket' -MetricsId
 'testmetrics'
```

- For API details, see DeleteBucketMetricsConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteBucketPolicy` with an Amazon SDK or CLI

The following code examples show how to use `DeleteBucketPolicy`.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
bool AwsDoc::S3::deleteBucketPolicy(const Aws::String &bucketName,
                                    const Aws::S3::S3ClientConfiguration
 &clientConfig) {
    Aws::S3::S3Client client(clientConfig);

    Aws::S3::Model::DeleteBucketPolicyRequest request;
    request.SetBucket(bucketName);

    Aws::S3::Model::DeleteBucketPolicyOutcome outcome =
 client.DeleteBucketPolicy(request);

    if (!outcome.IsSuccess()) {
```

```
        const Aws::S3::S3Error &err = outcome.GetError();
        std::cerr << "Error: deleteBucketPolicy: " <<
                  err.GetExceptionName() << ": " << err.GetMessage() <<
 std::endl;
    } else {
        std::cout << "Policy was deleted from the bucket." << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see DeleteBucketPolicy in *Amazon SDK for C++ API Reference*.

CLI

Amazon CLI

The following command deletes a bucket policy from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-bucket-policy --bucket amzn-s3-demo-bucket
```

- For API details, see DeleteBucketPolicy in *Amazon CLI Command Reference*.

Java

SDK for Java 2.x

Use `DeleteBucketReplication` with a CLI

The following code examples show how to use `DeleteBucketReplication`.

CLI

Amazon CLI

The following command deletes a replication configuration from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-bucket-replication --bucket amzn-s3-demo-bucket
```

- For API details, see DeleteBucketReplication in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: Deletes the replication configuration associated with the bucket named 'amzn-s3-demo-bucket'. Note that this operation requires permission for the s3:DeleteReplicationConfiguration action. You will be prompted for confirmation before the operation proceeds - to suppress confirmation, use the -Force switch.

```
Remove-S3BucketReplication -BucketName amzn-s3-demo-bucket
```

- For API details, see DeleteBucketReplication in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: Deletes the replication configuration associated with the bucket named 'amzn-s3-demo-bucket'. Note that this operation requires permission for the s3:DeleteReplicationConfiguration action. You will be prompted for confirmation before the operation proceeds - to suppress confirmation, use the -Force switch.

```
Remove-S3BucketReplication -BucketName amzn-s3-demo-bucket
```

- For API details, see DeleteBucketReplication in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteBucketTagging` with a CLI

The following code examples show how to use `DeleteBucketTagging`.

CLI

Amazon CLI

The following command deletes a tagging configuration from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-bucket-tagging --bucket amzn-s3-demo-bucket
```

- For API details, see DeleteBucketTagging in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command removes all the tags associated with the given S3 bucket.

```
Remove-S3BucketTagging -BucketName 'amzn-s3-demo-bucket'
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketTagging (DeleteBucketTagging)" on target
 "amzn-s3-demo-bucket".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is
 "Y"): Y
```

- For API details, see DeleteBucketTagging in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command removes all the tags associated with the given S3 bucket.

```
Remove-S3BucketTagging -BucketName 'amzn-s3-demo-bucket'
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3BucketTagging (DeleteBucketTagging)" on target
 "amzn-s3-demo-bucket".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is
 "Y"): Y
```

- For API details, see DeleteBucketTagging in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteBucketWebsite` with an Amazon SDK or CLI

The following code examples show how to use `DeleteBucketWebsite`.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
bool AwsDoc::S3::deleteBucketWebsite(const Aws::String &bucketName,
                                     const Aws::S3::S3ClientConfiguration
 &clientConfig) {
    Aws::S3::S3Client client(clientConfig);
    Aws::S3::Model::DeleteBucketWebsiteRequest request;
    request.SetBucket(bucketName);

    Aws::S3::Model::DeleteBucketWebsiteOutcome outcome =
```

```
            client.DeleteBucketWebsite(request);

    if (!outcome.IsSuccess()) {
        auto err = outcome.GetError();
        std::cerr << "Error: deleteBucketWebsite: " <<

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteObject` with an Amazon SDK or CLI

The following code examples show how to use `DeleteObject`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Work with Amazon S3 object integrity
- Work with versioned objects

.NET

Use `DeleteObjectTagging` with a CLI

The following code examples show how to use `DeleteObjectTagging`.

CLI

Amazon CLI

To delete the tag sets of an object

The following `delete-object-tagging` example deletes the tag with the specified key from the object `doc1.rtf`.

```
aws s3api delete-object-tagging \
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf
```

This command produces no output.

- For API details, see DeleteObjectTagging in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command removes all the tags associated with the object with key 'testfile.txt' in the given S3 Bucket.

```
Remove-S3ObjectTagSet -Key 'testfile.txt' -BucketName 'amzn-s3-demo-bucket' -
Select '^Key'
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3ObjectTagSet (DeleteObjectTagging)" on target
 "testfile.txt".
```

```
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is
 "Y"): Y
testfile.txt
```

- For API details, see DeleteObjectTagging in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command removes all the tags associated with the object with key 'testfile.txt' in the given S3 Bucket.

```
Remove-S3ObjectTagSet -Key 'testfile.txt' -BucketName 'amzn-s3-demo-bucket' -
Select '^Key'
```

Output:

```
Confirm
Are you sure you want to perform this action?
Performing the operation "Remove-S3ObjectTagSet (DeleteObjectTagging)" on target
 "testfile.txt".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend  [?] Help (default is
 "Y"): Y
testfile.txt
```

- For API details, see DeleteObjectTagging in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `DeleteObjects` with an Amazon SDK or CLI

The following code examples show how to use `DeleteObjects`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Delete all objects in a bucket

.NET

Amazon SDK for .NET

CLI

Amazon CLI

The following command deletes an object from a bucket named `amzn-s3-demo-bucket`:

```
aws s3api delete-objects --bucket amzn-s3-demo-bucket --delete file://delete.json
```

`delete.json` is a JSON document in the current directory that specifies the object to delete:

```
{
  "Objects": [
    {
      "Key": "test1.txt"
    }
  ],
  "Quiet": false
}
```

Output:

```
{
    "Deleted": [
        {
            "DeleteMarkerVersionId": "mYAT5Mc6F7aeUL8SS7FAAqUPO1koHwzU",
            "Key": "test1.txt",
            "DeleteMarker": true
        }
    ]
}
```

- For API details, see DeleteObjects in *Amazon CLI Command Reference*.

Delete a set of objects from a list of keys.

```
        $s3client = new Aws\S3\S3Client(['region' => 'us-west-2']);

        try {
            $objects = [];
            foreach ($contents['Contents'] as $content) {
                $objects[] = [
                    'Key' => $content['Key'],
                ];
            }
            $this->s3client->deleteObjects([
                'Bucket' => $this->bucketName,
                'Delete' => [
                    'Objects' => $objects,
                ],
            ]);
            $check = $this->s3client->listObjectsV2([
                'Bucket' => $this->bucketName,
            ]);
            if (count($check) <= 0) {
                throw new Exception("Bucket wasn't empty.");
            }
            echo "Deleted all objects and folders from $this->bucketName.\n";
        } catch (Exception $exception) {
```

```
            echo "Failed to delete $fileName from $this->bucketName with error:
 " . $exception->getMessage();
            exit("Please fix error with object deletion before continuing.");
        }
```

- For API details, see DeleteObjects in *Amazon SDK for PHP API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command removes the object "sample.txt" from bucket "test-files". You are prompted for confirmation before the command executes; to suppress the prompt use the -Force switch.

```
Remove-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt
```

Example 2: This command removes the specified version of object "sample.txt" from bucket "test-files", assuming the bucket has been configured to enable object versions.

```
Remove-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -VersionId
 HLbxnx6V9omT6AQYVpks8mmFKQcejpqt
```

Example 3: This command removes objects "sample1.txt", "sample2.txt" and "sample3.txt" from bucket "test-files" as a single batch operation. The service response will list all keys processed, regardless of the success or error status of the deletion. To obtain only errors for keys that were not able to be processed by the service add the -ReportErrorsOnly parameter (this parameter can also be specified with the alias -Quiet.

```
Remove-S3Object -BucketName amzn-s3-demo-bucket -KeyCollection @( "sample1.txt",
 "sample2.txt", "sample3.txt" )
```

Example 4: This example uses an inline expression with the -KeyCollection parameter to obtain the keys of the objects to delete. Get-S3Object returns a collection of Amazon.S3.Model.S3Object instances, each of which has a Key member of type string identifying the object.

```
Remove-S3Object -bucketname "amzn-s3-demo-bucket" -KeyCollection (Get-S3Object
 "test-files" -KeyPrefix "prefix/subprefix" | select -ExpandProperty Key)
```

Example 5: This example obtains all objects that have a key prefix "prefix/subprefix" in the bucket and deletes them. Note that the incoming objects are processed one at a time. For large collections consider passing the collection to the cmdlet's -InputObject (alias -S3ObjectCollection) parameter to enable the deletion to occur as a batch with a single call to the service.

```
Get-S3Object -BucketName "amzn-s3-demo-bucket" -KeyPrefix "prefix/subprefix" |
 Remove-S3Object -Force
```

Example 6: This example pipes a collection of Amazon.S3.Model.S3ObjectVersion instances that represent delete markers to the cmdlet for deletion. Note that the incoming objects are processed one at a time. For large collections consider passing the collection to the cmdlet's -InputObject (alias -S3ObjectCollection) parameter to enable the deletion to occur as a batch with a single call to the service.

```
(Get-S3Version -BucketName "amzn-s3-demo-bucket").Versions | Where
 {$_.IsDeleteMarker -eq "True"} | Remove-S3Object -Force
```

Example 7: This script shows how to perform a batch delete of a set of objects (in this case delete markers) by constructing an array of objects to be used with the -KeyAndVersionCollection parameter.

```
$keyVersions = @()
$markers = (Get-S3Version -BucketName $BucketName).Versions | Where
 {$_.IsDeleteMarker -eq "True"}
foreach ($marker in $markers) { $keyVersions += @{ Key = $marker.Key; VersionId =
 $marker.VersionId } }
Remove-S3Object -BucketName $BucketName -KeyAndVersionCollection $keyVersions -
Force
```

- For API details, see DeleteObjects in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command removes the object "sample.txt" from bucket "test-files". You are prompted for confirmation before the command executes; to suppress the prompt use the -Force switch.

```
Remove-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt
```

Example 2: This command removes the specified version of object "sample.txt" from bucket "test-files", assuming the bucket has been configured to enable object versions.

```
Remove-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -VersionId
 HLbxnx6V9omT6AQYVpks8mmFKQcejpqt
```

Example 3: This command removes objects "sample1.txt", "sample2.txt" and "sample3.txt" from bucket "test-files" as a single batch operation. The service response will list all keys processed, regardless of the success or error status of the deletion. To obtain only errors for keys that were not able to be processed by the service add the -ReportErrorsOnly parameter (this parameter can also be specified with the alias -Quiet.

```
Remove-S3Object -BucketName amzn-s3-demo-bucket -KeyCollection @( "sample1.txt",
 "sample2.txt", "sample3.txt" )
```

Example 4: This example uses an inline expression with the -KeyCollection parameter to obtain the keys of the objects to delete. Get-S3Object returns a collection of Amazon.S3.Model.S3Object instances, each of which has a Key member of type string identifying the object.

```
Remove-S3Object -bucketname "amzn-s3-demo-bucket" -KeyCollection (Get-S3Object
 "test-files" -KeyPrefix "prefix/subprefix" | select -ExpandProperty Key)
```

Example 5: This example obtains all objects that have a key prefix "prefix/subprefix" in the bucket and deletes them. Note that the incoming objects are processed one at a time. For large collections consider passing the collection to the cmdlet's -InputObject (alias -S3ObjectCollection) parameter to enable the deletion to occur as a batch with a single call to the service.

```
Get-S3Object -BucketName "amzn-s3-demo-bucket" -KeyPrefix "prefix/subprefix" |
 Remove-S3Object -Force
```

Example 6: This example pipes a collection of Amazon.S3.Model.S3ObjectVersion instances that represent delete markers to the cmdlet for deletion. Note that the incoming objects are processed one at a time. For large collections consider passing the

collection to the cmdlet's -InputObject (alias -S3ObjectCollection) parameter to enable the deletion to occur as a batch with a single call to the service.

```
(Get-S3Version -BucketName "amzn-s3-demo-bucket").Versions | Where
 {$_.IsDeleteMarker -eq "True"} | Remove-S3Object -Force
```

Example 7: This script shows how to perform a batch delete of a set of objects (in this case delete markers) by constructing an array of objects to be used with the -KeyAndVersionCollection parameter.

```
$keyVersions = @()
$markers = (Get-S3Version -BucketName $BucketName).Versions | Where
 {$_.IsDeleteMarker -eq "True"}
foreach ($marker in $markers) { $keyVersions += @{ Key = $marker.Key; VersionId =
 $marker.VersionId } }
Remove-S3Object -BucketName $BucketName -KeyAndVersionCollection $keyVersions -
Force
```

Use `DeletePublicAccessBlock` with a CLI

The following code examples show how to use `DeletePublicAccessBlock`.

CLI

Amazon CLI

To delete the block public access configuration for a bucket

The following `delete-public-access-block` example removes the block public access configuration on the specified bucket.

```
aws s3api delete-public-access-block \
    --bucket amzn-s3-demo-bucket
```

This command produces no output.

- For API details, see DeletePublicAccessBlock in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command turns off the block public access setting for the given bucket.

```
Remove-S3PublicAccessBlock -BucketName 'amzn-s3-demo-bucket' -Force -Select
 '^BucketName'
```

Output:

```
amzn-s3-demo-bucket
```

- For API details, see DeletePublicAccessBlock in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command turns off the block public access setting for the given bucket.

```
Remove-S3PublicAccessBlock -BucketName 'amzn-s3-demo-bucket' -Force -Select
 '^BucketName'
```

Output:

```
amzn-s3-demo-bucket
```

- For API details, see DeletePublicAccessBlock in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketAccelerateConfiguration` with a CLI

The following code examples show how to use `GetBucketAccelerateConfiguration`.

CLI

Amazon CLI

To retrieve the accelerate configuration of a bucket

The following `get-bucket-accelerate-configuration` example retrieves the accelerate configuration for the specified bucket.

```
aws s3api get-bucket-accelerate-configuration \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Status": "Enabled"
}
```

- For API details, see GetBucketAccelerateConfiguration in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the value Enabled, if the transfer acceleration settings is enabled for the bucket specified.

```
Get-S3BucketAccelerateConfiguration -BucketName 'amzn-s3-demo-bucket'
```

Output:

```
Value
-----
Enabled
```

- For API details, see GetBucketAccelerateConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the value Enabled, if the transfer acceleration settings is enabled for the bucket specified.

```
Get-S3BucketAccelerateConfiguration -BucketName 'amzn-s3-demo-bucket'
```

Output:

```
Value
-----
Enabled
```

- For API details, see GetBucketAccelerateConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketAcl` with an Amazon SDK or CLI

The following code examples show how to use `GetBucketAcl`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Check if a bucket exists
- Manage access control lists (ACLs)

>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Get the ACL permissions.

```
import {
  GetBucketAclCommand,
  S3Client,
  S3ServiceException,
} from "@aws-sdk/client-s3";

/**
 * Retrieves the Access Control List (ACL) for an S3 bucket.
 * @param {{ bucketName: string }}
 */
export const main = async ({ bucketName }) => {
  const client = new S3Client({});
```

```
  try {
    const response = await client.send(
      new GetBucketAclCommand({
        Bucket: bucketName,
      }),
    );
    console.log(`ACL for bucket "${bucketName}":`);
    console.log(JSON.stringify(response, null, 2));
  } catch (caught) {
    if (
      caught instanceof S3ServiceException &&
      caught.name === "NoSuchBucket"
    ) {
      console.error(
        `Error from S3 while getting ACL for ${bucketName}. The bucket doesn't
 exist.`,
      );
    } else if (caught instanceof S3ServiceException) {
      console.error(
        `Error from S3 while getting ACL for ${bucketName}. ${caught.name}:
 ${caught.message}`,
      );
    } else {
      throw caught;
    }
  }
};
```

- For more information, see Amazon SDK for JavaScript Developer Guide.
- For API details, see GetBucketAcl in *Amazon SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V5

Example 1: The command gets the details of the object owner of the S3 object.

```
(Get-S3BucketACL -BucketName 'amzn-s3-demo-bucket' -Select *).Owner
```

Output:

```
DisplayName Id
----------- --
testusername
 9988776a6554433d22f1100112e334acb45566778899009e9887bd7f66c5f544
```

Use `GetBucketAnalyticsConfiguration` with a CLI

The following code examples show how to use `GetBucketAnalyticsConfiguration`.

CLI

Amazon CLI

To retrieve the analytics configuration for a bucket with a specific ID

The following `get-bucket-analytics-configuration` example displays the analytics configuration for the specified bucket and ID.

```
aws s3api get-bucket-analytics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1
```

Output:

```
{
    "AnalyticsConfiguration": {
        "StorageClassAnalysis": {},
        "Id": "1"
    }
}
```

- For API details, see GetBucketAnalyticsConfiguration in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the details of the analytics filter with the name 'testfilter' in the given S3 bucket.

```
Get-S3BucketAnalyticsConfiguration -BucketName 'amzn-s3-demo-bucket' -AnalyticsId
 'testfilter'
```

- For API details, see GetBucketAnalyticsConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the details of the analytics filter with the name 'testfilter' in the given S3 bucket.

```
Get-S3BucketAnalyticsConfiguration -BucketName 'amzn-s3-demo-bucket' -AnalyticsId
 'testfilter'
```

- For API details, see GetBucketAnalyticsConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketCors` with an Amazon SDK or CLI

The following code examples show how to use `GetBucketCors`.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
        /// <summary>
        /// Retrieve the CORS configuration applied to the Amazon S3 bucket.
        /// </summary>
        /// <param name="client">The initialized Amazon S3 client object used
        /// to retrieve the CORS configuration.</param>
        /// <returns>The created CORS configuration object.</returns>
        private static async Task<CORSConfiguration>
RetrieveCORSConfigurationAsync(AmazonS3Client client)
        {
            GetCORSConfigurationRequest request = new
GetCORSConfigurationRequest()
            {
                BucketName = BucketName,
            };
            var response = await client.GetCORSConfigurationAsync(request);
            var configuration = response.Configuration;
            PrintCORSRules(configuration);
            return configuration;
        }
```

- For API details, see GetBucketCors in *Amazon SDK for .NET API Reference*.

CLI

Amazon CLI

The following command retrieves the Cross-Origin Resource Sharing configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-cors --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "CORSRules": [
        {
            "AllowedHeaders": [
                "*"
            ],
```

```
            "ExposeHeaders": [
                "x-amz-server-side-encryption"
            ],
            "AllowedMethods": [
                "PUT",
                "POST",
                "DELETE"
            ],
            "MaxAgeSeconds": 3000,
            "AllowedOrigins": [
                "http://www.example.com"
            ]
        },
        {
            "AllowedHeaders": [
                "Authorization"
            ],
            "MaxAgeSeconds": 3000,

```
require 'aws-sdk-s3'

# Wraps Amazon S3 bucket CORS configuration.
class BucketCorsWrapper
  attr_reader :bucket_cors

  # @param bucket_cors [Aws::S3::BucketCors] A bucket CORS object configured with
 an existing bucket.
  def initialize(bucket_cors)
    @bucket_cors = bucket_cors
  end

  # Gets the CORS configuration of a bucket.
  #
```

```
  # @return [Aws::S3::Type::GetBucketCorsOutput, nil] The current CORS
 configuration for the bucket.
  def cors
    @bucket_cors.data
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't get CORS configuration for #{@bucket_cors.bucket.name}. Here's
 why: #{e.message}"
    nil
  end

end
```

- For API details, see GetBucketCors in *Amazon SDK for Ruby API Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketEncryption` with an Amazon SDK or CLI

The following code examples show how to use `GetBucketEncryption`.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
    /// <summary>
    /// Get and print the encryption settings of a bucket.
    /// </summary>
    /// <param name="bucketName">Name of the bucket.</param>
    /// <returns>Async task.</returns>
    public static async Task GetEncryptionSettings(string bucketName)
    {
        // Check and print the bucket encryption settings.
```

```
        Console.WriteLine($"Getting encryption settings for bucket
{bucketName}.");

        try
        {
            var settings =
                await _s3Client.GetBucketEncryptionAsync(
                    new GetBucketEncryptionRequest() { BucketName =
bucketName });

            foreach (var encryptionSettings in
settings?.ServerSideEncryptionConfiguration?.ServerSideEncryptionRules!)
            {
                Console.WriteLine(
                    $"\tAlgorithm:
{encryptionSettings.ServerSideEncryptionByDefault.ServerSideEncryptionAlgorithm}");
                Console.WriteLine(
                    $"\tKey:
{encryptionSettings.ServerSideEncryptionByDefault.ServerSideEncryptionKeyManagementServi
            }
        }
        catch (AmazonS3Exception ex)
        {
            Console.WriteLine(ex.ErrorCode == "InvalidBucketName"
                ? $"Bucket {bucketName} was not found."
                : $"Unable to get bucket encryption for bucket {bucketName},
{ex.Message}");
        }
    }
```

- For API details, see GetBucketEncryption in *Amazon SDK for .NET API Reference*.

CLI

Amazon CLI

To retrieve the server-side encryption configuration for a bucket

The following `get-bucket-encryption` example retrieves the server-side encryption configuration for the bucket `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-encryption \
```

```
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "ServerSideEncryptionConfiguration": {
        "Rules": [
            {
                "ApplyServerSideEncryptionByDefault": {
                    "SSEAlgorithm": "AES256"
                }
            }
        ]
    }
}
```

- For API details, see GetBucketEncryption in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns all the server side encryption rules associated with the given bucket.

```
Get-S3BucketEncryption -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see GetBucketEncryption in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns all the server side encryption rules associated with the given bucket.

```
Get-S3BucketEncryption -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see GetBucketEncryption in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketInventoryConfiguration` with a CLI

The following code examples show how to use `GetBucketInventoryConfiguration`.

CLI

Amazon CLI

To retrieve the inventory configuration for a bucket

The following `get-bucket-inventory-configuration` example retrieves the inventory configuration for the specified bucket with ID 1.

```
aws s3api get-bucket-inventory-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 1
```

Output:

```
{
    "InventoryConfiguration": {
        "IsEnabled": true,
        "Destination": {
            "S3BucketDestination": {
                "Format": "ORC",
                "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
                "AccountId": "123456789012"
            }
        },
        "IncludedObjectVersions": "Current",
        "Id": "1",
        "Schedule": {
            "Frequency": "Weekly"
        }
    }
}
```

- For API details, see GetBucketInventoryConfiguration in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the details of the inventory named 'testinventory' for the given S3 bucket.

```
Get-S3BucketInventoryConfiguration -BucketName 'amzn-s3-demo-bucket' -InventoryId
 'testinventory'
```

- For API details, see GetBucketInventoryConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the details of the inventory named 'testinventory' for the given S3 bucket.

```
Get-S3BucketInventoryConfiguration -BucketName 'amzn-s3-demo-bucket' -InventoryId
 'testinventory'
```

- For API details, see GetBucketInventoryConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketLifecycleConfiguration` with an Amazon SDK or CLI

The following code examples show how to use `GetBucketLifecycleConfiguration`.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
        /// <summary>
        /// Returns a configuration object for the supplied bucket name.
        /// </summary>
        /// <param name="client">The S3 client object used to call
        /// the GetLifecycleConfigurationAsync method.</param>
        /// <param name="bucketName">The name of the S3 bucket for which a
        /// configuration will be created.</param>
        /// <returns>Returns a new LifecycleConfiguration object.</returns>
        public static async Task<LifecycleConfiguration>
RetrieveLifecycleConfigAsync(IAmazonS3 client, string bucketName)
        {
            var request = new GetLifecycleConfigurationRequest()
            {
                BucketName = bucketName,
            };
            var response = await client.GetLifecycleConfigurationAsync(request);
            var configuration = response.Configuration;
            return configuration;
        }
```

- For API details, see GetBucketLifecycleConfiguration in *Amazon SDK for .NET API Reference*.

CLI

Amazon CLI

The following command retrieves the lifecycle configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-lifecycle-configuration --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Rules": [
        {
            "ID": "Move rotated logs to Glacier",
```

```
            "Prefix": "rotated/",
            "Status": "Enabled",
            "Transitions": [
                {
                    "Date": "2015-11-10T00:00:00.000Z",
                    "StorageClass": "GLACIER"
                }
            ]
        },
        {
            "Status": "Enabled",
            "Prefix": "",
            "NoncurrentVersionTransitions": [
                {
                    "NoncurrentDays": 0,
                    "StorageClass": "GLACIER"
                }
            ],
            "ID": "Move old versions to Glacier"
        }
    ]
}
```

- For API details, see GetBucketLifecycleConfiguration in *Amazon CLI Command Reference*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
 Boto3
```

```
                    that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def get_lifecycle_configuration(self):
        """
        Get the lifecycle configuration of the bucket.

        :return: The lifecycle rules of the specified bucket.
        """
        try:
            config = self.bucket.LifecycleConfiguration()
            logger.info(
                "Got lifecycle rules %s for bucket '%s'.",
                config.rules,
                self.bucket.name,
            )
        except:
            logger.exception(
                "Couldn't get lifecycle rules for bucket '%s'.", self.bucket.name
            )
            raise
        else:
            return config.rules
```

- For API details, see GetBucketLifecycleConfiguration in *Amazon SDK for Python (Boto3) API Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketLocation` with an Amazon SDK or CLI

The following code examples show how to use `GetBucketLocation`.

CLI

Amazon CLI

The following command retrieves the location constraint for a bucket named `amzn-s3-demo-bucket`, if a constraint exists:

```
aws s3api get-bucket-location --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "LocationConstraint": "us-west-2"
}
```

- For API details, see GetBucketLocation in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the location constraint for the bucket 'amzn-s3-demo-bucket', if a constraint exists.

```
Get-S3BucketLocation -BucketName 'amzn-s3-demo-bucket'
```

Output:

```
Value
-----
ap-south-1
```

- For API details, see GetBucketLocation in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the location constraint for the bucket 'amzn-s3-demo-bucket', if a constraint exists.

```
Get-S3BucketLocation -BucketName 'amzn-s3-demo-bucket'
```

Output:

```
Value
-----
ap-south-1
```

- For API details, see GetBucketLocation in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

Rust

SDK for Rust

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
async fn show_buckets(
    strict: bool,
    client: &Client,
    region: BucketLocationConstraint,
) -> Result<(), S3ExampleError> {
    let mut buckets = client.list_buckets().into_paginator().send();

    let mut num_buckets = 0;
    let mut in_region = 0;

    while let Some(Ok(output)) = buckets.next().await {
        for bucket in output.buckets() {
            num_buckets += 1;
            if strict {
                let r = client
                    .get_bucket_location()
                    .bucket(bucket.name().unwrap_or_default())
                    .send()
                    .await?;
```

```
                if r.location_constraint() == Some(&region) {
                    println!("{}", bucket.name().unwrap_or_default());
                    in_region += 1;
                }
            } else {
                println!("{}", bucket.name().unwrap_or_default());
            }
        }
    }

    println!();
    if strict {
        println!(
            "Found {} buckets in the {} region out of a total of {} buckets.",
            in_region, region, num_buckets
        );
    } else {
        println!("Found {} buckets in all regions.", num_buckets);
    }

    Ok(())
}
```

- For API details, see GetBucketLocation in *Amazon SDK for Rust API reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketLogging` with a CLI

The following code examples show how to use `GetBucketLogging`.

CLI

Amazon CLI

To retrieve the logging status for a bucket

The following `get-bucket-logging` example retrieves the logging status for the specified bucket.

```
aws s3api get-bucket-logging \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "LoggingEnabled": {
        "TargetPrefix": "",
        "TargetBucket": "amzn-s3-demo-bucket-logs"
          }
}
```

- For API details, see GetBucketLogging in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the logging status for the specified bucket.

```
Get-S3BucketLogging -BucketName 'amzn-s3-demo-bucket'
```

Output:

```
TargetBucketName   Grants TargetPrefix
----------------   ------ ------------
testbucket1        {}     testprefix
```

- For API details, see GetBucketLogging in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the logging status for the specified bucket.

```
Get-S3BucketLogging -BucketName 'amzn-s3-demo-bucket'
```

Output:

```
TargetBucketName   Grants TargetPrefix
```

```
----------------   ------ ------------
testbucket1        {}     testprefix
```

- For API details, see GetBucketLogging in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketMetricsConfiguration` with a CLI

The following code examples show how to use `GetBucketMetricsConfiguration`.

CLI

Amazon CLI

To retrieve the metrics configuration for a bucket with a specific ID

The following `get-bucket-metrics-configuration` example displays the metrics configuration for the specified bucket and ID.

```
aws s3api get-bucket-metrics-configuration \
    --bucket amzn-s3-demo-bucket \
    --id 123
```

Output:

```
{
    "MetricsConfiguration": {
        "Filter": {
            "Prefix": "logs"
        },
        "Id": "123"
    }
}
```

- For API details, see GetBucketMetricsConfiguration in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the details about the metrics filter named 'testfilter' for the given S3 bucket.

```
Get-S3BucketMetricsConfiguration -BucketName 'amzn-s3-demo-bucket' -MetricsId
 'testfilter'
```

- For API details, see GetBucketMetricsConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the details about the metrics filter named 'testfilter' for the given S3 bucket.

```
Get-S3BucketMetricsConfiguration -BucketName 'amzn-s3-demo-bucket' -MetricsId
 'testfilter'
```

- For API details, see GetBucketMetricsConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketNotification` with a CLI

The following code examples show how to use `GetBucketNotification`.

CLI

Amazon CLI

The following command retrieves the notification configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-notification --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "TopicConfiguration": {
        "Topic": "arn:aws:sns:us-west-2:123456789012:my-notification-topic",
        "Id": "YmQzMmEwM2EjZWVlI0NGItNzVtZjI1MC00ZjgyLWZDBiZWNl",
        "Event": "s3:ObjectCreated:*",
        "Events": [
            "s3:ObjectCreated:*"
        ]
    }
}
```

- For API details, see GetBucketNotification in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example retrieves notification configuration of the given bucket

```
Get-S3BucketNotification -BucketName amzn-s3-demo-bucket | select -ExpandProperty
 TopicConfigurations
```

Output:

```
Id   Topic
--   -----
mimo arn:aws:sns:eu-west-1:123456789012:topic-1
```

- For API details, see GetBucketNotification in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example retrieves notification configuration of the given bucket

```
Get-S3BucketNotification -BucketName amzn-s3-demo-bucket | select -ExpandProperty
 TopicConfigurations
```

Output:

```
Id   Topic
--   -----
```

```
mimo arn:aws:sns:eu-west-1:123456789012:topic-1
```

- For API details, see GetBucketNotification in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketPolicy` with an Amazon SDK or CLI

The following code examples show how to use `GetBucketPolicy`.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
bool AwsDoc::S3::getBucketPolicy(const Aws::String &bucketName,
                                 const Aws::S3::S3ClientConfiguration
 &clientConfig) {
    Aws::S3::S3Client s3Client(clientConfig);

    Aws::S3::Model::GetBucketPolicyRequest request;
    request.SetBucket(bucketName);

    Aws::S3::Model::GetBucketPolicyOutcome outcome =
            s3Client.GetBucketPolicy(request);

    if (!outcome.IsSuccess()) {
        const Aws::S3::S3Error &err = outcome.GetError();
        std::cerr << "Error: getBucketPolicy: "
                  << err.GetExceptionName() << ": " << err.GetMessage() <<
 std::endl;
    } else {
        Aws::StringStream policy_stream;
```

```
        Aws::String line;

        outcome.GetResult().GetPolicy() >> line;
        policy_stream << line;

        std::cout << "Retrieve the policy for bucket '" << bucketName << "':\n\n"
 <<
                  policy_stream.str() << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see GetBucketPolicy in *Amazon SDK for C++ API Reference*.

CLI

Amazon CLI

The following command retrieves the bucket policy for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-policy --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Policy": "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Sid\":\"\",\"Effect
\":\"Allow\",\"Principal\":\"*\",\"Action\":\"s3:GetObject\",\"Resource\":
\"arn:aws:s3:::amzn-s3-demo-bucket/*\"},{\"Sid\":\"\",\"Effect\":\"Deny\",
\"Principal\":\"*\",\"Action\":\"s3:GetObject\",\"Resource\":\"arn:aws:s3:::amzn-
s3-demo-bucket/secret/*\"}]}"
}
```

Get and put a bucket policyThe following example shows how you can download an Amazon S3 bucket policy, make modifications to the file, and then use `put-bucket-policy` to apply the modified bucket policy. To download the bucket policy to a file, you can run:

```
aws s3api get-bucket-policy --bucket amzn-s3-demo-bucket --query Policy --output
 text > policy.json
```

You can then modify the `policy.json` file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

`policy.json` file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

```
aws s3api put-bucket-policy --bucket amzn-s3-demo-bucket --policy file://
policy.json
```

- For API details, see GetBucketPolicy in *Amazon CLI Command Reference*.

Get the bucket policy.

```
import {
  GetBucketPolicyCommand,
  S3Client,
  S3ServiceException,
} from "@aws-sdk/client-s3";

/**
 * Logs the policy for a specified bucket.
 * @param {{ bucketName: string }}
 */
export const main = async ({ bucketName }) => {
  const client = new S3Client({});

  try {
```

```
    const { Policy } = await client.send(
      new GetBucketPolicyCommand({
        Bucket: bucketName,
      }),
    );
    console.log(`Policy for "${bucketName}":\n${Policy}`);
  } catch (caught) {
    if (
      caught instanceof S3ServiceException &&
      caught.name === "NoSuchBucket"
    ) {
      console.error(
        `Error from S3 while getting policy from ${bucketName}. The bucket
 doesn't exist.`,
      );
    } else if (caught instanceof S3ServiceException) {
      console.error(
        `Error from S3 while getting policy from ${bucketName}.  ${caught.name}:
 ${caught.message}`,
      );
    } else {
      throw caught;
    }
  }
};
```

Use `GetBucketPolicyStatus` with a CLI

The following code examples show how to use `GetBucketPolicyStatus`.

CLI

Amazon CLI

To retrieve the policy status for a bucket indicating whether the bucket is public

The following `get-bucket-policy-status` example retrieves the policy status for the bucket `amzn-s3-demo-bucket`.

```
aws s3api get-bucket-policy-status \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "PolicyStatus": {
        "IsPublic": false
    }
}
```

- For API details, see GetBucketPolicyStatus in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns policy status for the given S3 bucket, indicating whether the bucket is public.

```
Get-S3BucketPolicyStatus -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see GetBucketPolicyStatus in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns policy status for the given S3 bucket, indicating whether the bucket is public.

```
Get-S3BucketPolicyStatus -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see GetBucketPolicyStatus in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketReplication` with an Amazon SDK or CLI

The following code examples show how to use `GetBucketReplication`.

CLI

Amazon CLI

The following command retrieves the replication configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-replication --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "ReplicationConfiguration": {
        "Rules": [
            {
                "Status": "Enabled",
                "Prefix": "",
                "Destination": {
                    "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket-backup",
                    "StorageClass": "STANDARD"
                },
                "ID": "ZmUwNzE4ZmQ4tMjVhOS00MTlkLOGI4NDkzZTIWJjNTUtYTA1"
            }
```

```
        ],
        "Role": "arn:aws:iam::123456789012:role/s3-replication-role"
    }
}
```

- For API details, see GetBucketReplication in *Amazon CLI Command Reference*.

Java

SDK for Java 2.x

```
    /**
     * Retrieves the replication details for the specified S3 bucket.
     *
     * @param s3Client           the S3 client used to interact with the S3
service
     * @param sourceBucketName   the name of the S3 bucket to retrieve the
replication details for
     *
     * @throws S3Exception if there is an error retrieving the replication
details
     */
    public static void getReplicationDetails(S3Client s3Client, String
sourceBucketName) {
        GetBucketReplicationRequest getRequest =
GetBucketReplicationRequest.builder()
            .bucket(sourceBucketName)
            .build();

        try {
            ReplicationConfiguration replicationConfig =
s3Client.getBucketReplication(getRequest).replicationConfiguration();
            ReplicationRule rule = replicationConfig.rules().get(0);
            System.out.println("Retrieved destination bucket: " +
rule.destination().bucket());
            System.out.println("Retrieved priority: " + rule.priority());
```

```
            System.out.println("Retrieved source-bucket replication rule status:
" + rule.status());

        } catch (S3Exception e) {
            System.err.println("Failed to retrieve replication details: " +
e.awsErrorDetails().errorMessage());
        }
    }
```

- For API details, see GetBucketReplication in *Amazon SDK for Java 2.x API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: Returns the replication configuration information set on the bucket named 'amzn-s3-demo-bucket'.

```
Get-S3BucketReplication -BucketName amzn-s3-demo-bucket
```

- For API details, see GetBucketReplication in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: Returns the replication configuration information set on the bucket named 'amzn-s3-demo-bucket'.

```
Get-S3BucketReplication -BucketName amzn-s3-demo-bucket
```

- For API details, see GetBucketReplication in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketRequestPayment` with a CLI

The following code examples show how to use `GetBucketRequestPayment`.

CLI

Amazon CLI

To retrieve the request payment configuration for a bucket

The following `get-bucket-request-payment` example retrieves the requester pays configuration for the specified bucket.

```
aws s3api get-bucket-request-payment \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Payer": "BucketOwner"
}
```

- For API details, see GetBucketRequestPayment in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: Returns the request payment configuration for the bucket named 'amzn-s3-demo-bucket'. By default, the bucket owner pays for downloads from the bucket.

```
Get-S3BucketRequestPayment -BucketName amzn-s3-demo-bucket
```

- For API details, see GetBucketRequestPayment in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: Returns the request payment configuration for the bucket named 'amzn-s3-demo-bucket'. By default, the bucket owner pays for downloads from the bucket.

```
Get-S3BucketRequestPayment -BucketName amzn-s3-demo-bucket
```

- For API details, see GetBucketRequestPayment in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketTagging` with a CLI

The following code examples show how to use `GetBucketTagging`.

CLI

Amazon CLI

The following command retrieves the tagging configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-tagging --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "TagSet": [
        {
            "Value": "marketing",
            "Key": "organization"
        }
    ]
}
```

- For API details, see GetBucketTagging in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns all the tags associated with the given bucket.

```
Get-S3BucketTagging -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see GetBucketTagging in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns all the tags associated with the given bucket.

```
Get-S3BucketTagging -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see GetBucketTagging in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketVersioning` with a CLI

The following code examples show how to use `GetBucketVersioning`.

CLI

Amazon CLI

The following command retrieves the versioning configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-versioning --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Status": "Enabled"
}
```

- For API details, see GetBucketVersioning in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the status of versioning with respect to the given bucket.

```
Get-S3BucketVersioning -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see GetBucketVersioning in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the status of versioning with respect to the given bucket.

```
Get-S3BucketVersioning -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see GetBucketVersioning in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetBucketWebsite` with an Amazon SDK or CLI

The following code examples show how to use `GetBucketWebsite`.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
            // Get the website configuration.
            GetBucketWebsiteRequest getRequest = new
GetBucketWebsiteRequest()
            {
                BucketName = bucketName,
            };
```

```
                GetBucketWebsiteResponse getResponse = await
client.GetBucketWebsiteAsync(getRequest);
                Console.WriteLine($"Index document:
{getResponse.WebsiteConfiguration.IndexDocumentSuffix}");
                Console.WriteLine($"Error document:
{getResponse.WebsiteConfiguration.ErrorDocument}");
```

- For API details, see GetBucketWebsite in *Amazon SDK for .NET API Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
bool AwsDoc::S3::getWebsiteConfig(const Aws::String &bucketName,
                                  const Aws::S3::S3ClientConfiguration
&clientConfig) {
   Aws::S3::S3Client s3Client(clientConfig);

   Aws::S3::Model::GetBucketWebsiteRequest request;
   request.SetBucket(bucketName);

   Aws::S3::Model::GetBucketWebsiteOutcome outcome =
           s3Client.GetBucketWebsite(request);

   if (!outcome.IsSuccess()) {
       const Aws::S3::S3Error &err = outcome.GetError();

       std::cerr << "Error: GetBucketWebsite: "
                 << err.GetMessage() << std::endl;
   } else {
       Aws::S3::Model::GetBucketWebsiteResult websiteResult =
outcome.GetResult();

       std::cout << "Success: GetBucketWebsite: "
```

```
                  << std::endl << std::endl
                  << "For bucket '" << bucketName << "':"
                  << std::endl
                  << "Index page : "
                  << websiteResult.GetIndexDocument().GetSuffix()
                  << std::endl
                  << "Error page: "
                  << websiteResult.GetErrorDocument().GetKey()
                  << std::endl;
    }

    return outcome.IsSuccess();
}
```

- For API details, see GetBucketWebsite in *Amazon SDK for C++ API Reference*.

CLI

Amazon CLI

The following command retrieves the static website configuration for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-bucket-website --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "IndexDocument": {
        "Suffix": "index.html"
    },
    "ErrorDocument": {
        "Key": "error.html"
    }
}
```

- For API details, see GetBucketWebsite in *Amazon CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>

Get the website configuration.

```
import {
  GetBucketWebsiteCommand,
  S3Client,
  S3ServiceException,
} from "@aws-sdk/client-s3";

/**
 * Log the website configuration for a bucket.
 * @param {{ bucketName }}
 */
export const main = async ({ bucketName }) => {
  const client = new S3Client({});

  try {
    const response = await client.send(
      new GetBucketWebsiteCommand({
        Bucket: bucketName,
      }),
    );
    console.log(
      `Your bucket is set up to host a website with the following configuration:
\n${JSON.stringify(response, null, 2)}`,
    );
  } catch (caught) {
    if (
      caught instanceof S3ServiceException &&
      caught.name === "NoSuchWebsiteConfiguration"
    ) {
      console.error(
        `Error from S3 while getting website configuration for ${bucketName}. The
 bucket isn't configured as a website.`,
```

```
      );
    } else if (caught instanceof S3ServiceException) {
      console.error(
        `Error from S3 while getting website configuration for ${bucketName}.
 ${caught.name}: ${caught.message}`,
      );
    } else {
      throw caught;
    }
  }
};
```

- For API details, see GetBucketWebsite in *Amazon SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the details of the static website configurations of the given S3 bucket.

```
Get-S3BucketWebsite -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see GetBucketWebsite in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the details of the static website configurations of the given S3 bucket.

```
Get-S3BucketWebsite -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see GetBucketWebsite in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetObject` with an Amazon SDK or CLI

The following code examples show how to use `GetObject`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Get an object from a bucket if it has been modified
- Get an object from a Multi-Region Access Point
- Get started with encryption
- Make conditional requests
- Track uploads and downloads

CLI

Amazon CLI

The following example uses the `get-object` command to download an object from Amazon S3:

```
aws s3api get-object --bucket text-content --key dir/
my_images.tar.bz2 my_images.tar.bz2
```

Note that the outfile parameter is specified without an option name such as "--outfile". The name of the output file must be the last parameter in the command.

The example below demonstrates the use of `--range` to download a specific byte range from an object. Note the byte ranges needs to be prefixed with "bytes=":

```
aws s3api get-object --bucket text-content --key dir/my_data --
range bytes=8888-9999 my_data_range
```

For more information about retrieving objects, see Getting Objects in the *Amazon S3 Developer Guide*.

- For API details, see GetObject in *Amazon CLI Command Reference*.

Read data as a byte array using an S3Client.

```
    /**
     * Asynchronously retrieves the bytes of an object from an Amazon S3 bucket
 and writes them to a local file.
     *
     * @param bucketName the name of the S3 bucket containing the object
     * @param keyName    the key (or name) of the S3 object to retrieve
     * @param path       the local file path where the object's bytes will be
 written
     * @return a {@link CompletableFuture} that completes when the object bytes
 have been written to the local file
     */
```

```
   public CompletableFuture<Void> getObjectBytesAsync(String bucketName, String
keyName, String path) {
       GetObjectRequest objectRequest = GetObjectRequest.builder()
           .key(keyName)
           .bucket(bucketName)
           .build();

       CompletableFuture<ResponseBytes<GetObjectResponse>> response =
getAsyncClient().getObject(objectRequest, AsyncResponseTransformer.toBytes());
       return response.thenAccept(objectBytes -> {
           try {
               byte[] data = objectBytes.asByteArray();
               Path filePath = Paths.get(path);
               Files.write(filePath, data);
               logger.info("Successfully obtained bytes from an S3 object");
           } catch (IOException ex) {
               throw new RuntimeException("Failed to write data to file", ex);
           }
       }).whenComplete((resp, ex) -> {
           if (ex != null) {
               throw new RuntimeException("Failed to get object bytes from S3",
ex);
           }
       });
   }
```

Use an S3TransferManager to download an object in an S3 bucket to a local file. View the complete file and test.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;

Get an object.

```
        $s3client = new Aws\S3\S3Client(['region' => 'us-west-2']);

        try {
            $file = $this->s3client->getObject([
                'Bucket' => $this->bucketName,
                'Key' => $fileName,
            ]);
            $body = $file->get('Body');
            $body->rewind();
            echo "Downloaded the file and it begins with: {$body->read(26)}.\n";
        } catch (Exception $exception) {
            echo "Failed to download $fileName from $this->bucketName with error:
" . $exception->getMessage();
            exit("Please fix error with file downloading before continuing.");
        }
```

- For API details, see GetObject in *Amazon SDK for PHP API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command retrieves item "sample.txt" from bucket "test-files" and saves it to a file named "local-sample.txt" in the current location. The file "local-sample.txt" does not have to exist before this command is called.

```
Read-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -File local-
sample.txt
```

Example 2: This command retrieves virtual directory "DIR" from bucket "test-files" and saves it to a folder named "Local-DIR" in the current location. The folder "Local-DIR" does not have to exist before this command is called.

```
Read-S3Object -BucketName amzn-s3-demo-bucket -KeyPrefix DIR -Folder Local-DIR
```

Example 3: Downloads all objects with keys ending in '.json' from buckets with 'config' in the bucket name to files in the specified folder. The object keys are used to set the filenames.

```
Get-S3Bucket | ? { $_.BucketName -like '*config*' } | Get-S3Object | ? { $_.Key -
like '*.json' } | Read-S3Object -Folder C:\ConfigObjects
```

- For API details, see GetObject in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command retrieves item "sample.txt" from bucket "test-files" and saves it to a file named "local-sample.txt" in the current location. The file "local-sample.txt" does not have to exist before this command is called.

```
Read-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt -File local-
sample.txt
```

Example 2: This command retrieves virtual directory "DIR" from bucket "test-files" and saves it to a folder named "Local-DIR" in the current location. The folder "Local-DIR" does not have to exist before this command is called.

```
Read-S3Object -BucketName amzn-s3-demo-bucket -KeyPrefix DIR -Folder Local-DIR
```

Example 3: Downloads all objects with keys ending in '.json' from buckets with 'config' in the bucket name to files in the specified folder. The object keys are used to set the filenames.

```
Get-S3Bucket | ? { $_.BucketName -like '*config*' } | Get-S3Object | ? { $_.Key -
like '*.json' } | Read-S3Object -Folder C:\ConfigObjects
```

- For API details, see GetObject in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

Ruby

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Get an object.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectGetWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  # Gets the object directly to a file.
  #
  # @param target_path [String] The path to the file where the object is
 downloaded.
  # @return [Aws::S3::Types::GetObjectOutput, nil] The retrieved object data if
 successful; otherwise nil.
  def get_object(target_path)
    @object.get(response_target: target_path)
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't get object #{@object.key}. Here's why: #{e.message}"
  end
end

# Example usage:
def run_demo
  bucket_name = "amzn-s3-demo-bucket"
  object_key = "my-object.txt"
  target_path = "my-object-as-file.txt"

  wrapper = ObjectGetWrapper.new(Aws::S3::Object.new(bucket_name, object_key))
  obj_data = wrapper.get_object(target_path)
  return unless obj_data

  puts "Object #{object_key} (#{obj_data.content_length} bytes} downloaded to
 #{target_path}."
end

run_demo if $PROGRAM_NAME == __FILE__
```

Get an object and report its server-side encryption state.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectGetEncryptionWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  # Gets the object into memory.
  #
  # @return [Aws::S3::Types::GetObjectOutput, nil] The retrieved object data if
 successful; otherwise nil.
  def object
    @object.get
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't get object #{@object.key}. Here's why: #{e.message}"
  end
end

# Example usage:
def run_demo
  bucket_name = "amzn-s3-demo-bucket"
  object_key = "my-object.txt"

  wrapper = ObjectGetEncryptionWrapper.new(Aws::S3::Object.new(bucket_name,
 object_key))
  obj_data = wrapper.get_object
  return unless obj_data

  encryption = obj_data.server_side_encryption.nil? ? 'no' :
 obj_data.server_side_encryption
  puts "Object #{object_key} uses #{encryption} encryption."
end

run_demo if $PROGRAM_NAME == __FILE__
```

CLI

Amazon CLI

The following command retrieves the access control list for an object in a bucket named `amzn-s3-demo-bucket`:

```
aws s3api get-object-acl --bucket amzn-s3-demo-bucket --key index.html
```

Output:

```
{
    "Owner": {
        "DisplayName": "my-username",
        "ID": "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
    },
    "Grants": [
        {
            "Grantee": {
                "DisplayName": "my-username",
                "ID":
 "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
            },
            "Permission": "FULL_CONTROL"
        },
        {
            "Grantee": {
                "URI": "http://acs.amazonaws.com/groups/global/AllUsers"
            },
            "Permission": "READ"
        }
    ]
}
```

 parts." <<
                          outcome.GetError().GetMessage() << std::endl;
                return false;
            }
        }
    }

    return true;
}
```

- For API details, see [GetObjectAttributes](#) in *Amazon SDK for C++ API Reference*.

CLI

Amazon CLI

To retrieves metadata from an object without returning the object itself

The following `get-object-attributes` example retrieves metadata from the object `doc1.rtf`.

```
aws s3api get-object-attributes \
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf \
    --object-attributes "StorageClass" "ETag" "ObjectSize"
```

Output:

```
{
    "LastModified": "2022-03-15T19:37:31+00:00",
    "VersionId": "IuCPjXTDzHNfldAuitVBIKJpF2p1fg4P",
    "ETag": "b662d79adeb7c8d787ea7eafb9ef6207",
    "StorageClass": "STANDARD",
    "ObjectSize": 405
}
```

For more information, see GetObjectAttributes in the Amazon S3 API Reference.

- For API details, see GetObjectAttributes in *Amazon CLI Command Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetObjectLegalHold` with an Amazon SDK or CLI

The following code examples show how to use `GetObjectLegalHold`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Lock Amazon S3 objects

.NET

Amazon SDK for .NET

> **Note**

```
    /// <summary>
    /// Get the legal hold details for an S3 object.
    /// </summary>
    /// <param name="bucketName">The bucket of the object.</param>
    /// <param name="objectKey">The object key.</param>
    /// <returns>The object legal hold details.</returns>
    public async Task<ObjectLockLegalHold> GetObjectLegalHold(string bucketName,
        string objectKey)
    {
        try
        {
            var request = new GetObjectLegalHoldRequest()
            {
                BucketName = bucketName,
                Key = objectKey
            };

            var response = await _amazonS3.GetObjectLegalHoldAsync(request);
            Console.WriteLine($"\tObject legal hold for {objectKey} in
{bucketName}: " +
                              $"\n\tStatus: {response.LegalHold.Status}");
            return response.LegalHold;
        }
        catch (AmazonS3Exception ex)
        {
            Console.WriteLine($"\tUnable to fetch legal hold: '{ex.Message}'");
            return new ObjectLockLegalHold();
        }
    }
```

- For API details, see GetObjectLegalHold in *Amazon SDK for .NET API Reference*.

CLI

Amazon CLI

Retrieves the Legal Hold status of an object

The following `get-object-legal-hold` example retrieves the Legal Hold status for the specified object.

```
aws s3api get-object-legal-hold \
    --bucket amzn-s3-demo-bucket-with-object-lock \
    --key doc1.rtf
```

Output:

```
{
    "LegalHold": {
        "Status": "ON"
    }
}
```

- For API details, see GetObjectLegalHold in *Amazon CLI Command Reference*.

  }
}
```

- For API details, see GetObjectRetention in *Amazon SDK for JavaScript API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: The command returns the mode and date till the object would be retained.

```
Get-S3ObjectRetention -BucketName 'amzn-s3-demo-bucket' -Key 'testfile.txt'
```

- For API details, see GetObjectRetention in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: The command returns the mode and date till the object would be retained.

```
Get-S3ObjectRetention -BucketName 'amzn-s3-demo-bucket' -Key 'testfile.txt'
```

- For API details, see GetObjectRetention in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetObjectTagging` with a CLI

The following code examples show how to use `GetObjectTagging`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Get started with tags

CLI

Amazon CLI

To retrieve the tags attached to an object

The following `get-object-tagging` example retrieves the values for the specified key from the specified object.

```
aws s3api get-object-tagging \
    --bucket amzn-s3-demo-bucket \
    --key doc1.rtf
```

Output:

```
{
    "TagSet": [
        {
            "Value": "confidential",
            "Key": "designation"
        }
    ]
}
```

The following `get-object-tagging` example tries to retrieve the tag sets of the object `doc2.rtf`, which has no tags.

```
aws s3api get-object-tagging \
    --bucket amzn-s3-demo-bucket \
    --key doc2.rtf
```

Output:

```
{
    "TagSet": []
}
```

The following `get-object-tagging` example retrieves the tag sets of the object `doc3.rtf`, which has multiple tags.

```
aws s3api get-object-tagging \
```

```
    --bucket amzn-s3-demo-bucket \
    --key doc3.rtf
```

Output:

```
{
    "TagSet": [
        {
            "Value": "confidential",
            "Key": "designation"
        },
        {
            "Value": "finance",
            "Key": "department"
        },
        {
            "Value": "payroll",
            "Key": "team"
        }
    ]
}
```

- For API details, see GetObjectTagging in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: The sample returns the tags associated with the object present on the given S3 bucket.

```
Get-S3ObjectTagSet -Key 'testfile.txt' -BucketName 'amzn-s3-demo-bucket'
```

Output:

```
Key  Value
---  -----
test value
```

- For API details, see GetObjectTagging in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: The sample returns the tags associated with the object present on the given S3 bucket.

```
Get-S3ObjectTagSet -Key 'testfile.txt' -BucketName 'amzn-s3-demo-bucket'
```

Output:

```
Key  Value
---  -----
test value
```

- For API details, see GetObjectTagging in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `GetPublicAccessBlock` with a CLI

The following code examples show how to use `GetPublicAccessBlock`.

CLI

Amazon CLI

To set or modify the block public access configuration for a bucket

The following `get-public-access-block` example displays the block public access configuration for the specified bucket.

```
aws s3api get-public-access-block \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
```

```
    "PublicAccessBlockConfiguration": {
        "IgnorePublicAcls": true,
        "BlockPublicPolicy": true,
        "BlockPublicAcls": true,
        "RestrictPublicBuckets": true
    }
}
```

- For API details, see GetPublicAccessBlock in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: The command returns the public access block configuration of the given S3 bucket.

```
Get-S3PublicAccessBlock -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see GetPublicAccessBlock in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: The command returns the public access block configuration of the given S3 bucket.

```
Get-S3PublicAccessBlock -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see GetPublicAccessBlock in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `HeadBucket` with an Amazon SDK or CLI

The following code examples show how to use `HeadBucket`.

Bash

Amazon CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
##############################################################################
# function bucket_exists
#
# This function checks to see if the specified bucket already exists.
#
# Parameters:
#       $1 - The name of the bucket to check.
#
# Returns:
#       0 - If the bucket already exists.
#       1 - If the bucket doesn't exist.
##############################################################################
function bucket_exists() {
  local bucket_name
  bucket_name=$1

  # Check whether the bucket already exists.
  # We suppress all output - we're interested only in the return code.

  if aws s3api head-bucket \
    --bucket "$bucket_name" \
    >/dev/null 2>&1; then
    return 0 # 0 in Bash script means true.
  else
    return 1 # 1 in Bash script means false.
  fi
}
```

- For API details, see HeadBucket in *Amazon CLI Command Reference*.

CLI

Amazon CLI

The following command verifies access to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api head-bucket --bucket amzn-s3-demo-bucket
```

If the bucket exists and you have access to it, no output is returned. Otherwise, an error message will be shown. For example:

```
A client error (404) occurred when calling the HeadBucket operation: Not Found
```

- For API details, see HeadBucket in *Amazon CLI Command Reference*.

Go

SDK for Go V2

> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class BucketWrapper:
    """Encapsulates S3 bucket actions."""

    def __init__(self, bucket):
        """
        :param bucket: A Boto3 Bucket resource. This is a high-level resource in
 Boto3
                       that wraps bucket actions in a class-like structure.
        """
        self.bucket = bucket
        self.name = bucket.name

    def exists(self):
        """
        Determine whether the bucket exists and you have access to it.

        :return: True when the bucket exists; otherwise, False.
        """
        try:
            self.bucket.meta.client.head_bucket(Bucket=self.bucket.name)
            logger.info("Bucket %s exists.", self.bucket.name)
            exists = True
        except ClientError:
            logger.warning(
                "Bucket %s doesn't exist or you don't have access to it.",
                self.bucket.name,
            )
            exists = False
        return exists
```

- For API details, see HeadBucket in *Amazon SDK for Python (Boto3) API Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `HeadObject` with an Amazon SDK or CLI

The following code examples show how to use `HeadObject`.

CLI

Amazon CLI

The following command retrieves metadata for an object in a bucket named `amzn-s3-demo-bucket`:

```
aws s3api head-object --bucket amzn-s3-demo-bucket --key index.html
```

Output:

```
{
    "AcceptRanges": "bytes",
    "ContentType": "text/html",
    "LastModified": "Thu, 16 Apr 2015 18:19:14 GMT",
    "ContentLength": 77,
    "VersionId": "null",
    "ETag": "\"30a6ec7e1a9ad79c203d05a589c8b400\"",
    "Metadata": {}
}
```

- For API details, see HeadObject in *Amazon CLI Command Reference*.

Java

SDK for Java 2.x

Ruby

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectExistsWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An Amazon S3 object.
```

```
  def initialize(object)
    @object = object
  end

  # Checks whether the object exists.
  #
  # @return [Boolean] True if the object exists; otherwise false.
  def exists?
    @object.exists?
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't check existence of object
 #{@object.bucket.name}:#{@object.key}. Here's why: #{e.message}"
    false
  end
end

# Example usage:
def run_demo
  bucket_name = "amzn-s3-demo-bucket"
  object_key = "my-object.txt"

  wrapper = ObjectExistsWrapper.new(Aws::S3::Object.new(bucket_name, object_key))
  exists = wrapper.exists?

  puts "Object #{object_key} #{exists ? 'does' : 'does not'} exist."
end

run_demo if $PROGRAM_NAME == __FILE__
```

Use `ListBucketAnalyticsConfigurations` with a CLI

The following code examples show how to use `ListBucketAnalyticsConfigurations`.

CLI

Amazon CLI

To retrieve a list of analytics configurations for a bucket

The following `list-bucket-analytics-configurations` retrieves a list of analytics configurations for the specified bucket.

```
aws s3api list-bucket-analytics-configurations \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "AnalyticsConfigurationList": [
        {
            "StorageClassAnalysis": {},
            "Id": "1"
        }
    ],
    "IsTruncated": false
}
```

- For API details, see ListBucketAnalyticsConfigurations in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the first 100 analytics configurations of the given S3 bucket.

```
Get-S3BucketAnalyticsConfigurationList -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see ListBucketAnalyticsConfigurations in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the first 100 analytics configurations of the given S3 bucket.

```
Get-S3BucketAnalyticsConfigurationList -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see ListBucketAnalyticsConfigurations in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `ListBucketInventoryConfigurations` with a CLI

The following code examples show how to use `ListBucketInventoryConfigurations`.

CLI

Amazon CLI

To retrieve a list of inventory configurations for a bucket

The following `list-bucket-inventory-configurations` example lists the inventory configurations for the specified bucket.

```
aws s3api list-bucket-inventory-configurations \
    --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "InventoryConfigurationList": [
        {
            "IsEnabled": true,
            "Destination": {
                "S3BucketDestination": {
                    "Format": "ORC",
                    "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket",
                    "AccountId": "123456789012"
                }
            },
            "IncludedObjectVersions": "Current",

```

- For API details, see ListBucketInventoryConfigurations in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command returns the first 100 inventory configurations of the given S3 bucket.

```
Get-S3BucketInventoryConfigurationList -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see ListBucketInventoryConfigurations in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command returns the first 100 inventory configurations of the given S3 bucket.

```
Get-S3BucketInventoryConfigurationList -BucketName 'amzn-s3-demo-bucket'
```

- For API details, see ListBucketInventoryConfigurations in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `ListBuckets` with an Amazon SDK or CLI

The following code examples show how to use `ListBuckets`.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
namespace ListBucketsExample
{
    using System;
    using System.Collections.Generic;
    using System.Threading.Tasks;
    using Amazon.S3;
    using Amazon.S3.Model;

    /// <summary>
    /// This example uses the AWS SDK for .NET to list the Amazon Simple Storage
    /// Service (Amazon S3) buckets belonging to the default account.
    /// </summary>
    public class ListBuckets
    {
        private static IAmazonS3 _s3Client;

        /// <summary>
        /// Get a list of the buckets owned by the default user.
        /// </summary>
        /// <param name="client">An initialized Amazon S3 client object.</param>
```

```
        /// <returns>The response from the ListingBuckets call that contains a
        /// list of the buckets owned by the default user.</returns>
        public static async Task<ListBucketsResponse> GetBuckets(IAmazonS3
 client)
        {
            return await client.ListBucketsAsync();
        }

        /// <summary>
        /// This method lists the name and creation date for the buckets in
        /// the passed List of S3 buckets.
        /// </summary>
        /// <param name="bucketList">A List of S3 bucket objects.</param>
        public static void DisplayBucketList(List<S3Bucket> bucketList)
        {
            bucketList
                .ForEach(b => Console.WriteLine($"Bucket name: {b.BucketName},
 created on: {b.CreationDate}"));
        }

        public static async Task Main()
        {
            // The client uses the AWS Region of the default user.
            // If the Region where the buckets were created is different,
            // pass the Region to the client constructor. For example:
            // _s3Client = new AmazonS3Client(RegionEndpoint.USEast1);
            _s3Client = new AmazonS3Client();
            var response = await GetBuckets(_s3Client);
            DisplayBucketList(response.Buckets);
        }
    }
}
```

- For API details, see ListBuckets in *Amazon SDK for .NET API Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
bool AwsDoc::S3::listBuckets(const Aws::S3::S3ClientConfiguration &clientConfig)
 {
    Aws::S3::S3Client client(clientConfig);

    auto outcome = client.ListBuckets();

    bool result = true;
    if (!outcome.IsSuccess()) {
        std::cerr << "Failed with error: " << outcome.GetError() << std::endl;
        result = false;
    } else {
        std::cout << "Found " << outcome.GetResult().GetBuckets().size() << "
 buckets\n";
        for (auto &&b: outcome.GetResult().GetBuckets()) {
            std::cout << b.GetName() << std::endl;
        }
    }

    return result;
}
```

- For API details, see ListBuckets in *Amazon SDK for C++ API Reference*.

CLI

Amazon CLI

The following command uses the `list-buckets` command to display the names of all your Amazon S3 buckets (across all regions):

```
aws s3api list-buckets --query "Buckets[].Name"
```

The query option filters the output of `list-buckets` down to only the bucket names.

For more information about buckets, see Working with Amazon S3 Buckets in the *Amazon S3 Developer Guide*.

- For API details, see ListBuckets in *Amazon CLI Command Reference*.

Go

Swift

SDK for Swift

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
import AWSS3

    /// Return an array containing information about every available bucket.
    ///
    /// - Returns: An array of ``S3ClientTypes.Bucket`` objects describing
    ///   each bucket.
    public func getAllBuckets() async throws -> [S3ClientTypes.Bucket] {
        return try await client.listBuckets(input: ListBucketsInput())
    }
```

- For API details, see ListBuckets in *Amazon SDK for Swift API reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `ListMultipartUploads` with an Amazon SDK or CLI

The following code examples show how to use `ListMultipartUploads`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Delete incomplete multipart uploads

CLI

Amazon CLI

The following command lists all of the active multipart uploads for a bucket named `amzn-s3-demo-bucket`:

```
aws s3api list-multipart-uploads --bucket amzn-s3-demo-bucket
```

Output:

```
{
    "Uploads": [
        {
            "Initiator": {
                "DisplayName": "username",
                "ID": "arn:aws:iam::0123456789012:user/username"
            },
            "Initiated": "2015-06-02T18:01:30.000Z",
            "UploadId":
 "dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3
            "StorageClass": "STANDARD",
            "Key": "multipart/01",
            "Owner": {
                "DisplayName": "aws-account-name",
                "ID":
 "100719349fc3b6dcd7c820a124bf7aecd408092c3d7b51b38494939801fc248b"
            }
        }
    ],
    "CommonPrefixes": []
}
```

In progress multipart uploads incur storage costs in Amazon S3. Complete or abort an active multipart upload to remove its parts from your account.

- For API details, see ListMultipartUploads in *Amazon CLI Command Reference*.

CLI

Amazon CLI

The following command retrieves version information for an object in a bucket named `amzn-s3-demo-bucket`:

```
aws s3api list-object-versions --bucket amzn-s3-demo-bucket --prefix index.html
```

Output:

```
{
    "DeleteMarkers": [
        {
            "Owner": {
                "DisplayName": "my-username",
```

```
                "ID":
"7009a8971cd660687538875e7c86c5b672fe116bd438f46db45460ddcd036c32"
            },
            "IsLatest": true,
            "VersionId": "B2VsEK5saUNNHKcOAJj7hIE86RozToyq",
            "Key": "index.html",

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `ListObjects` with a CLI

The following code examples show how to use `ListObjects`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Create a web page that lists Amazon S3 objects

CLI

Amazon CLI

The following example uses the `list-objects` command to display the names of all the objects in the specified bucket:

```
aws s3api list-objects --bucket text-content --query 'Contents[].{Key: Key, Size: Size}'
```

The example uses the `--query` argument to filter the output of `list-objects` down to the key value and size for each object

For more information about objects, see Working with Amazon S3 Objects in the *Amazon S3 Developer Guide*.

- For API details, see ListObjects in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command retrieves the information about all of the items in the bucket "test-files".

```
Get-S3Object -BucketName amzn-s3-demo-bucket
```

Example 2: This command retrieves the information about the item "sample.txt" from bucket "test-files".

```
Get-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt
```

Example 3: This command retrieves the information about all items with the prefix "sample" from bucket "test-files".

```
Get-S3Object -BucketName amzn-s3-demo-bucket -KeyPrefix sample
```

- For API details, see ListObjects in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command retrieves the information about all of the items in the bucket "test-files".

```
Get-S3Object -BucketName amzn-s3-demo-bucket
```

Example 2: This command retrieves the information about the item "sample.txt" from bucket "test-files".

```
Get-S3Object -BucketName amzn-s3-demo-bucket -Key sample.txt
```

Example 3: This command retrieves the information about all items with the prefix "sample" from bucket "test-files".

```
Get-S3Object -BucketName amzn-s3-demo-bucket -KeyPrefix sample
```

- For API details, see ListObjects in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `ListObjectsV2` with an Amazon SDK or CLI

The following code examples show how to use `ListObjectsV2`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Delete all objects in a bucket

        }
    }
```

- For API details, see PutBucketAccelerateConfiguration in *Amazon SDK for .NET API Reference*.

CLI

Amazon CLI

To set the accelerate configuration of a bucket

The following `put-bucket-accelerate-configuration` example enables the accelerate configuration for the specified bucket.

```
aws s3api put-bucket-accelerate-configuration \
    --bucket amzn-s3-demo-bucket \
    --accelerate-configuration Status=Enabled
```

This command produces no output.

- For API details, see PutBucketAccelerateConfiguration in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command enables the transfer acceleration for the given S3 bucket.

```
$statusVal = New-Object Amazon.S3.BucketAccelerateStatus('Enabled')
```

```
Write-S3BucketAccelerateConfiguration -BucketName 'amzn-s3-demo-bucket' -
AccelerateConfiguration_Status $statusVal
```

- For API details, see PutBucketAccelerateConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command enables the transfer acceleration for the given S3 bucket.

```
$statusVal = New-Object Amazon.S3.BucketAccelerateStatus('Enabled')
Write-S3BucketAccelerateConfiguration -BucketName 'amzn-s3-demo-bucket' -
AccelerateConfiguration_Status $statusVal
```

- For API details, see PutBucketAccelerateConfiguration in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `PutBucketAcl` with an Amazon SDK or CLI

The following code examples show how to use `PutBucketAcl`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Manage access control lists (ACLs)

.NET

```

- For API details, see PutBucketAcl in *Amazon SDK for C++ API Reference*.

CLI

Amazon CLI

This example grants `full control` to two Amazon users (*user1@example.com* and *user2@example.com*) and `read` permission to everyone:

```
aws s3api put-bucket-acl --bucket amzn-s3-demo-bucket --grant-full-
control emailaddress=user1@example.com,emailaddress=user2@example.com --grant-
read uri=http://acs.amazonaws.com/groups/global/AllUsers
```

See http://docs.aws.amazon.com/AmazonS3/latest/API/RESTBucketPUTacl.html for details on custom ACLs (the s3api ACL commands, such as `put-bucket-acl`, use the same shorthand argument notation).

- For API details, see PutBucketAcl in *Amazon CLI Command Reference*.

Put the bucket ACL.

```
import {
  PutBucketAclCommand,
  S3Client,
  S3ServiceException,
} from "@aws-sdk/client-s3";

/**
 * Grant read access to a user using their canonical AWS account ID.
 *
```

```
 * Most Amazon S3 use cases don't require the use of access control lists (ACLs).
 * We recommend that you disable ACLs, except in unusual circumstances where
 * you need to control access for each object individually. Consider a policy
 instead.
 * For more information see https://docs.aws.amazon.com/AmazonS3/latest/
userguide/bucket-policies.html.
 * @param {{ bucketName: string, granteeCanonicalUserId: string,
 ownerCanonicalUserId }}
 */
export const main = async ({
  bucketName,
  granteeCanonicalUserId,
  ownerCanonicalUserId,
}) => {
  const client = new S3Client({});
  const command = new PutBucketAclCommand({
    Bucket: bucketName,
    AccessControlPolicy: {
      Grants: [
        {
          Grantee: {
            // The canonical ID of the user. This ID is an obfuscated form of
 your AWS account number.
            // It's unique to Amazon S3 and can't be found elsewhere.
            // For more information, see https://docs.aws.amazon.com/AmazonS3/
latest/userguide/finding-canonical-user-id.html.
            ID: granteeCanonicalUserId,
            Type: "CanonicalUser",
          },
          // One of FULL_CONTROL | READ | WRITE | READ_ACP | WRITE_ACP
          // https://docs.aws.amazon.com/AmazonS3/latest/API/
API_Grant.html#AmazonS3-Type-Grant-Permission
          Permission: "READ",
        },
      ],

```

- For API details, see PutBucketAcl in *Amazon SDK for Python (Boto3) API Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `PutBucketCors` with an Amazon SDK or CLI

The following code examples show how to use `PutBucketCors`.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
        /// <summary>
        /// Add CORS configuration to the Amazon S3 bucket.
        /// </summary>
        /// <param name="client">The initialized Amazon S3 client object used
        /// to apply the CORS configuration to an Amazon S3 bucket.</param>
        /// <param name="configuration">The CORS configuration to apply.</param>
        private static async Task PutCORSConfigurationAsync(AmazonS3Client
client, CORSConfiguration configuration)
```

```
        {
            PutCORSConfigurationRequest request = new
 PutCORSConfigurationRequest()
            {
                BucketName = BucketName,
                Configuration = configuration,
            };

            _ = await client.PutCORSConfigurationAsync(request);
        }
```

- For API details, see PutBucketCors in *Amazon SDK for .NET API Reference*.

CLI

Amazon CLI

The following example enables PUT, POST, and DELETE requests from *www.example.com*, and enables GET requests from any domain:

```
aws s3api put-bucket-cors --bucket amzn-s3-demo-bucket --cors-
configuration file://cors.json

cors.json:
{
  "CORSRules": [
    {
      "AllowedOrigins": ["http://www.example.com"],
      "AllowedHeaders": ["*"],
      "AllowedMethods": ["PUT", "POST", "DELETE"],
      "MaxAgeSeconds": 3000,
      "ExposeHeaders": ["x-amz-server-side-encryption"]
    },
    {
      "AllowedOrigins": ["*"],
      "AllowedHeaders": ["Authorization"],
      "AllowedMethods": ["GET"],
      "MaxAgeSeconds": 3000
    }
```

```
  ]
}
```

- For API details, see PutBucketCors in *Amazon CLI Command Reference*.

Add a CORS rule.

```
import {
  PutBucketCorsCommand,
  S3Client,
  S3ServiceException,
} from "@aws-sdk/client-s3";

/**
 * Allows cross-origin requests to an S3 bucket by setting the CORS
 configuration.
 * @param {{ bucketName: string }}
 */
export const main = async ({ bucketName }) => {
  const client = new S3Client({});

  try {
    await client.send(
      new PutBucketCorsCommand({
        Bucket: bucketName,
        CORSConfiguration: {
          CORSRules: [
```

```
            {
              // Allow all headers to be sent to this bucket.
              AllowedHeaders: ["*"],
              // Allow only GET and PUT methods to be sent to this bucket.
              AllowedMethods: ["GET", "PUT"],
              // Allow only requests from the specified origin.
              AllowedOrigins: ["https://www.example.com"],
              // Allow the entity tag (ETag) header to be returned in the
 response. The ETag header
              // The entity tag represents a specific version of the object. The
 ETag reflects
              // changes only to the contents of an object, not its metadata.
              ExposeHeaders: ["ETag"],
              // How long the requesting browser should cache the preflight
 response. After
              // this time, the preflight request will have to be made again.
              MaxAgeSeconds: 3600,
            },
          ],
        },
      }),
    );
    console.log(`Successfully set CORS rules for bucket: ${bucketName}`);
  } catch (caught) {
    if (
      caught instanceof S3ServiceException &&
      caught.name === "NoSuchBucket"
    ) {
      console.error(
        `Error from S3 while setting CORS rules for ${bucketName}. The bucket
 doesn't exist.`,
      );
    } else if (caught instanceof S3ServiceException) {

Use `PutBucketEncryption` with an Amazon SDK or CLI

The following code examples show how to use `PutBucketEncryption`.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
    /// <summary>
    /// Set the bucket server side encryption to use AWSKMS with a customer-
managed key id.
    /// </summary>
    /// <param name="bucketName">Name of the bucket.</param>
```

```
   /// <param name="kmsKeyId">The Id of the KMS Key.</param>
   /// <returns>True if successful.</returns>
   public static async Task<bool> SetBucketServerSideEncryption(string
bucketName, string kmsKeyId)
   {
       var serverSideEncryptionByDefault = new ServerSideEncryptionConfiguration
       {
           ServerSideEncryptionRules = new List<ServerSideEncryptionRule>
           {
               new ServerSideEncryptionRule
               {
                   ServerSideEncryptionByDefault = new
ServerSideEncryptionByDefault
                   {
                       ServerSideEncryptionAlgorithm =
ServerSideEncryptionMethod.AWSKMS,
                       ServerSideEncryptionKeyManagementServiceKeyId = kmsKeyId
                   }
               }
           }
       };
       try
       {
           var encryptionResponse = await _s3Client.PutBucketEncryptionAsync(new
PutBucketEncryptionRequest
           {
               BucketName = bucketName,
               ServerSideEncryptionConfiguration =
serverSideEncryptionByDefault,
           });

           return encryptionResponse.HttpStatusCode == HttpStatusCode.OK;
       }
       catch (AmazonS3Exception ex)
       {
           Console.WriteLine(ex.ErrorCode == "AccessDenied"
               ? $"This account does not have permission to set encryption on
{bucketName}, please try again."
               : $"Unable to set bucket encryption for bucket {bucketName},
{ex.Message}");
       }
       return false;
   }
```

- For API details, see PutBucketEncryption in *Amazon SDK for .NET API Reference*.

CLI

Amazon CLI

To configure server-side encryption for a bucket

The following `put-bucket-encryption` example sets AES256 encryption as the default for the specified bucket.

```
aws s3api put-bucket-encryption \
    --bucket amzn-s3-demo-bucket \
    --server-side-encryption-configuration '{"Rules":
 [{"ApplyServerSideEncryptionByDefault": {"SSEAlgorithm": "AES256"}}]}'
```

This command produces no output.

- For API details, see PutBucketEncryption in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command enables default AES256 server side encryption with Amazon S3 Managed Keys(SSE-S3) on the given bucket.

```
$Encryptionconfig = @{ServerSideEncryptionByDefault =
 @{ServerSideEncryptionAlgorithm = "AES256"}}
Set-S3BucketEncryption -BucketName 'amzn-s3-demo-bucket' -
ServerSideEncryptionConfiguration_ServerSideEncryptionRule $Encryptionconfig
```

- For API details, see PutBucketEncryption in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command enables default AES256 server side encryption with Amazon S3 Managed Keys(SSE-S3) on the given bucket.

```
$Encryptionconfig = @{ServerSideEncryptionByDefault =
 @{ServerSideEncryptionAlgorithm = "AES256"}}
Set-S3BucketEncryption -BucketName 'amzn-s3-demo-bucket' -
ServerSideEncryptionConfiguration_ServerSideEncryptionRule $Encryptionconfig
```

- For API details, see PutBucketEncryption in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `PutBucketLifecycleConfiguration` with an Amazon SDK or CLI

The following code examples show how to use `PutBucketLifecycleConfiguration`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Delete incomplete multipart uploads
- Manage large messages using S3
- Work with versioned objects

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
        /// <summary>
        /// Adds lifecycle configuration information to the S3 bucket named in
        /// the bucketName parameter.
        /// </summary>
```

```
        /// <param name="client">The S3 client used to call the
        /// PutLifecycleConfigurationAsync method.</param>
        /// <param name="bucketName">A string representing the S3 bucket to
        /// which configuration information will be added.</param>
        /// <param name="configuration">A LifecycleConfiguration object that
        /// will be applied to the S3 bucket.</param>
        public static async Task AddExampleLifecycleConfigAsync(IAmazonS3 client,
 string bucketName, LifecycleConfiguration configuration)
        {
            var request = new PutLifecycleConfigurationRequest()
            {
                BucketName = bucketName,
                Configuration = configuration,
            };
            var response = await client.PutLifecycleConfigurationAsync(request);
        }
```

- For API details, see PutBucketLifecycleConfiguration in *Amazon SDK for .NET API Reference*.

CLI

Amazon CLI

The following command applies a lifecycle configuration to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-lifecycle-configuration --bucket amzn-s3-demo-bucket --
lifecycle-configuration  file://lifecycle.json
```

The file `lifecycle.json` is a JSON document in the current folder that specifies two rules:

```
{
    "Rules": [
        {
            "ID": "Move rotated logs to Glacier",
            "Prefix": "rotated/",
            "Status": "Enabled",
            "Transitions": [
                {
```

```
                    "Date": "2015-11-10T00:00:00.000Z",
                    "StorageClass": "GLACIER"
                }
            ]
        },
        {
            "Status": "Enabled",
            "Prefix": "",
            "NoncurrentVersionTransitions": [
                {
                    "NoncurrentDays": 2,
                    "StorageClass": "GLACIER"
                }
            ],
            "ID": "Move old versions to Glacier"
        }
    ]
}
```

The first rule moves files with the prefix `rotated` to Glacier on the specified date. The second rule moves old object versions to Glacier when they are no longer current. For information on acceptable timestamp formats, see Specifying Parameter Values in the *Amazon CLI User Guide*.

- For API details, see PutBucketLifecycleConfiguration in *Amazon CLI Command Reference*.

        public static void LoadConfig()
        {
            _configuration = new ConfigurationBuilder()
                .SetBasePath(Directory.GetCurrentDirectory())
                .AddJsonFile("settings.json") // Load settings from .json file.
                .AddJsonFile("settings.local.json", true) // Optionally, load
 local settings.
                .Build();
```

```
        }
    }
```

- For API details, see PutBucketLogging in *Amazon SDK for .NET API Reference*.

CLI

Amazon CLI

Example 1: To set bucket policy logging

The following `put-bucket-logging` example sets the logging policy for *amzn-s3-demo-bucket*. First, grant the logging service principal permission in your bucket policy using the `put-bucket-policy` command.

```
aws s3api put-bucket-policy \
    --bucket amzn-s3-demo-bucket \
    --policy file://policy.json
```

Contents of `policy.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "S3ServerAccessLogsPolicy",
            "Effect": "Allow",
            "Principal": {"Service": "logging.s3.amazonaws.com"},
            "Action": "s3:PutObject",
            "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/Logs/*",
            "Condition": {
                "ArnLike": {"aws:SourceARN": "arn:aws:s3:::SOURCE-BUCKET-NAME"},
                "StringEquals": {"aws:SourceAccount": "SOURCE-AWS-ACCOUNT-ID"}
            }
        }
    ]
}
```

To apply the logging policy, use `put-bucket-logging`.

```
aws s3api put-bucket-logging \
    --bucket amzn-s3-demo-bucket \
    --bucket-logging-status file://logging.json
```

Contents of `logging.json`:

```
{
     "LoggingEnabled": {
         "TargetBucket": "amzn-s3-demo-bucket",
         "TargetPrefix": "Logs/"
     }
 }
```

The `put-bucket-policy` command is required to grant `s3:PutObject` permissions to the logging service principal.

For more information, see Amazon S3 Server Access Logging in the *Amazon S3 User Guide*.

Example 2: To set a bucket policy for logging access to only a single user

The following `put-bucket-logging` example sets the logging policy for *amzn-s3-demo-bucket*. The Amazon user *bob@example.com* will have full control over the log files, and no one else has any access. First, grant S3 permission with `put-bucket-acl`.

```
aws s3api put-bucket-acl \
    --bucket amzn-s3-demo-bucket \
    --grant-write URI=http://acs.amazonaws.com/groups/s3/LogDelivery \
    --grant-read-acp URI=http://acs.amazonaws.com/groups/s3/LogDelivery
```

Then apply the logging policy using `put-bucket-logging`.

```
aws s3api put-bucket-logging \
    --bucket amzn-s3-demo-bucket \
    --bucket-logging-status file://logging.json
```

Contents of `logging.json`:

```
{
    "LoggingEnabled": {
```

```
        "TargetBucket": "amzn-s3-demo-bucket",
        "TargetPrefix": "amzn-s3-demo-bucket-logs/",
        "TargetGrants": [
            {
                "Grantee": {
                    "Type": "AmazonCustomerByEmail",
                    "EmailAddress": "bob@example.com"
                },
                "Permission": "FULL_CONTROL"
            }
        ]
    }
}
```

the `put-bucket-acl` command is required to grant S3's log delivery system the necessary permissions (write and read-acp permissions).

For more information, see Amazon S3 Server Access Logging in the *Amazon S3 Developer Guide*.

- For API details, see PutBucketLogging in *Amazon CLI Command Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `PutBucketNotification` with a CLI

The following code examples show how to use `PutBucketNotification`.

CLI

Amazon CLI

The applies a notification configuration to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-notification --bucket amzn-s3-demo-bucket --notification-
configuration file://notification.json
```

The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor:

```
{
  "TopicConfiguration": {
    "Event": "s3:ObjectCreated:*",
    "Topic": "arn:aws:sns:us-west-2:123456789012:s3-notification-topic"
  }
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it:

```
{
 "Version": "2008-10-17",
 "Id": "example-ID",
 "Statement": [
  {
   "Sid": "example-statement-ID",
   "Effect": "Allow",
   "Principal": {
     "Service": "s3.amazonaws.com"
   },
   "Action": [
    "SNS:Publish"
   ],
   "Resource": "arn:aws:sns:us-west-2:123456789012:amzn-s3-demo-bucket",
   "Condition": {
      "ArnLike": {
      "aws:SourceArn": "arn:aws:s3:*:*:amzn-s3-demo-bucket"
    }
   }
  }
 ]
}
```

- For API details, see PutBucketNotification in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This example configures the SNS topic configuration for the S3 event ObjectRemovedDelete and enables notification for the given s3 bucket

```
$topic =  [Amazon.S3.Model.TopicConfiguration] @{
```

```
  Id = "delete-event"
  Topic = "arn:aws:sns:eu-west-1:123456789012:topic-1"
  Event = [Amazon.S3.EventType]::ObjectRemovedDelete
}

Write-S3BucketNotification -BucketName amzn-s3-demo-bucket -TopicConfiguration
 $topic
```

Example 2: This example enables notifications of ObjectCreatedAll for the given bucket sending it to Lambda function.

```
$lambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
  Events = "s3:ObjectCreated:*"
  FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:rdplock"
  Id = "ObjectCreated-Lambda"
  Filter = @{
    S3KeyFilter = @{
      FilterRules = @(
        @{Name="Prefix";Value="dada"}
        @{Name="Suffix";Value=".pem"}
      )
    }
  }
}

Write-S3BucketNotification -BucketName amzn-s3-demo-bucket -
LambdaFunctionConfiguration $lambdaConfig
```

Example 3: This example creates 2 different Lambda configuration on the basis of different key-suffix and configured both in a single command.

```
#Lambda Config 1

$firstLambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
  Events = "s3:ObjectCreated:*"
  FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:verifynet"
  Id = "ObjectCreated-dada-ps1"
  Filter = @{
    S3KeyFilter = @{
      FilterRules = @(
        @{Name="Prefix";Value="dada"}
        @{Name="Suffix";Value=".ps1"}
```

```
      )
    }
  }
}

#Lambda Config 2

$secondlambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
  Events = [Amazon.S3.EventType]::ObjectCreatedAll
  FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:verifyssm"
  Id = "ObjectCreated-dada-json"
  Filter = @{
    S3KeyFilter = @{
      FilterRules = @(
        @{Name="Prefix";Value="dada"}
        @{Name="Suffix";Value=".json"}
      )
    }
  }
}

Write-S3BucketNotification -BucketName amzn-s3-demo-bucket -
LambdaFunctionConfiguration $firstLambdaConfig,$secondlambdaConfig
```

- For API details, see PutBucketNotification in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example configures the SNS topic configuration for the S3 event ObjectRemovedDelete and enables notification for the given s3 bucket

```
$topic =  [Amazon.S3.Model.TopicConfiguration] @{
  Id = "delete-event"
  Topic = "arn:aws:sns:eu-west-1:123456789012:topic-1"
  Event = [Amazon.S3.EventType]::ObjectRemovedDelete
}

Write-S3BucketNotification -BucketName amzn-s3-demo-bucket -TopicConfiguration
 $topic
```

Example 2: This example enables notifications of ObjectCreatedAll for the given bucket sending it to Lambda function.

```
$lambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
  Events = "s3:ObjectCreated:*"
  FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:rdplock"
  Id = "ObjectCreated-Lambda"
  Filter = @{
    S3KeyFilter = @{
      FilterRules = @(
        @{Name="Prefix";Value="dada"}
        @{Name="Suffix";Value=".pem"}
      )
    }
  }
}

Write-S3BucketNotification -BucketName amzn-s3-demo-bucket -
LambdaFunctionConfiguration $lambdaConfig
```

Example 3: This example creates 2 different Lambda configuration on the basis of different key-suffix and configured both in a single command.

```
#Lambda Config 1

$firstLambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
  Events = "s3:ObjectCreated:*"
  FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:verifynet"
  Id = "ObjectCreated-dada-ps1"
  Filter = @{
    S3KeyFilter = @{
      FilterRules = @(
        @{Name="Prefix";Value="dada"}
        @{Name="Suffix";Value=".ps1"}
      )
    }
  }
}

#Lambda Config 2

$secondlambdaConfig = [Amazon.S3.Model.LambdaFunctionConfiguration] @{
  Events = [Amazon.S3.EventType]::ObjectCreatedAll
  FunctionArn = "arn:aws:lambda:eu-west-1:123456789012:function:verifyssm"
  Id = "ObjectCreated-dada-json"
  Filter = @{
```

```
    S3KeyFilter = @{
      FilterRules = @(
        @{Name="Prefix";Value="dada"}
        @{Name="Suffix";Value=".json"}
      )
    }
  }
}

Write-S3BucketNotification -BucketName amzn-s3-demo-bucket -
LambdaFunctionConfiguration $firstLambdaConfig,$secondlambdaConfig
```

- For API details, see PutBucketNotification in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `PutBucketNotificationConfiguration` with an Amazon SDK or CLI

The following code examples show how to use `PutBucketNotificationConfiguration`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Process S3 event notifications
- Send event notifications to EventBridge

            string bucketName,
            string snsTopic,
            string sqsQueue)
        {
            try
            {
                // The bucket for which we are setting up notifications.
```

```
                var request = new PutBucketNotificationRequest()
                {
                    BucketName = bucketName,
                };

                // Defines the topic to use when sending a notification.
                var topicConfig = new TopicConfiguration()
                {
                    Events = new List<EventType> { EventType.ObjectCreatedCopy },
                    Topic = snsTopic,
                };
                request.TopicConfigurations = new List<TopicConfiguration>
                {
                    topicConfig,
                };
                request.QueueConfigurations = new List<QueueConfiguration>
                {
                    new QueueConfiguration()
                    {
                        Events = new List<EventType>
{ EventType.ObjectCreatedPut },
                        Queue = sqsQueue,
                    },
                };

                // Now apply the notification settings to the bucket.
                PutBucketNotificationResponse response = await
client.PutBucketNotificationAsync(request);
            }
            catch (AmazonS3Exception ex)
            {
                Console.WriteLine($"Error: {ex.Message}");
            }
        }
    }
```

- For API details, see PutBucketNotificationConfiguration in *Amazon SDK for .NET API Reference*.

CLI

Amazon CLI

To enable the specified notifications to a bucket

The following `put-bucket-notification-configuration` example applies a notification configuration to a bucket named `amzn-s3-demo-bucket`. The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor.

```
aws s3api put-bucket-notification-configuration \
    --bucket amzn-s3-demo-bucket \
    --notification-configuration file://notification.json
```

Contents of `notification.json`:

```
{
    "TopicConfigurations": [
        {
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:s3-notification-
topic",
            "Events": [
                "s3:ObjectCreated:*"
            ]
        }
    ]
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it.

```
{
    "Version": "2008-10-17",
    "Id": "example-ID",
    "Statement": [
        {
            "Sid": "example-statement-ID",
            "Effect": "Allow",
            "Principal": {
                "Service": "s3.amazonaws.com"
            },
            "Action": [
```

```
                "SNS:Publish"
            ],
            "Resource": "arn:aws:sns:us-west-2:123456789012::s3-notification-
topic",
            "Condition": {
                "ArnLike": {
                    "aws:SourceArn": "arn:aws:s3:*:*:amzn-s3-demo-bucket"
                }
            }
        }
    ]
}
```

- For API details, see PutBucketNotificationConfiguration in *Amazon CLI Command Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `PutBucketPolicy` with an Amazon SDK or CLI

The following code examples show how to use `PutBucketPolicy`.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
bool AwsDoc::S3::putBucketPolicy(const Aws::String &bucketName,
                                 const Aws::String &policyBody,
                                 const Aws::S3::S3ClientConfiguration
 &clientConfig) {
    Aws::S3::S3Client s3Client(clientConfig);

    std::shared_ptr<Aws::StringStream> request_body =
```

```
            Aws::MakeShared<Aws::StringStream>("");
    *request_body << policyBody;

    Aws::S3::Model::PutBucketPolicyRequest request;
    request.SetBucket(bucketName);
    request.SetBody(request_body);

    Aws::S3::Model::PutBucketPolicyOutcome outcome =
            s3Client.PutBucketPolicy(request);

    if (!outcome.IsSuccess()) {
        std::cerr << "Error: putBucketPolicy: "
                  << outcome.GetError().GetMessage() << std::endl;
    } else {
        std::cout << "Set the following policy body for the bucket '" <<
                  bucketName << "':" << std::endl << std::endl;
        std::cout << policyBody << std::endl;
    }

    return outcome.IsSuccess();
}

//! Build a policy JSON string.
/*!
  \param userArn: Aws user Amazon Resource Name (ARN).
      For more information, see https://docs.aws.amazon.com/IAM/latest/UserGuide/
reference_identifiers.html#identifiers-arns.
  \param bucketName: Name of a bucket.
  \return String: Policy as JSON string.
*/

Aws::String getPolicyString(const Aws::String &userArn,
                            const Aws::String &bucketName) {
    return
            "{\n"
            "   \"Version\":\"2012-10-17\",\n"
            "   \"Statement\":[\n"
            "       {\n"
            "           \"Sid\": \"1\",\n"
            "           \"Effect\": \"Allow\",\n"
            "           \"Principal\": {\n"
            "               \"AWS\": \""
            + userArn +
```

```
            "\"\n""           },\n"
            "           \"Action\": [ \"s3:getObject\" ],\n"
            "           \"Resource\": [ \"arn:aws:s3:::"
            + bucketName +
            "/*\" ]\n"
            "       }\n"
            "   ]\n"
            "}";
}
```

- For API details, see PutBucketPolicy in *Amazon SDK for C++ API Reference*.

CLI

Amazon CLI

This example allows all users to retrieve any object in *amzn-s3-demo-bucket* except those in the *MySecretFolder*. It also grants `put` and `delete` permission to the root user of the Amazon account `1234-5678-9012`:

```
aws s3api put-bucket-policy --bucket amzn-s3-demo-bucket --policy file://
policy.json

policy.json:
{
   "Statement": [
      {
         "Effect": "Allow",
         "Principal": "*",
         "Action": "s3:GetObject",
         "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/*"
      },
      {
         "Effect": "Deny",
         "Principal": "*",
         "Action": "s3:GetObject",
         "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/MySecretFolder/*"
      },
      {
         "Effect": "Allow",
         "Principal": {
```

```
            "AWS": "arn:aws:iam::123456789012:root"
         },
         "Action": [
            "s3:DeleteObject",
            "s3:PutObject"
         ],
         "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/*"
      }

   ]
}
```

- For API details, see PutBucketPolicy in *Amazon CLI Command Reference*.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Add the policy.

```
import {
  PutBucketPolicyCommand,
  S3Client,
  S3ServiceException,
} from "@aws-sdk/client-s3";

/**
 * Grant an IAM role GetObject access to all of the objects
 * in the provided bucket.
 * @param {{ bucketName: string, iamRoleArn: string }}
 */
export const main = async ({ bucketName, iamRoleArn }) => {
  const client = new S3Client({});
```

```
  const command = new PutBucketPolicyCommand({
    // This is a resource-based policy. For more information on resource-based
 policies,
    // see https://docs.aws.amazon.com/IAM/latest/UserGuide/
access_policies.html#policies_resource-based.
    Policy: JSON.stringify({
      Version: "2012-10-17",
      Statement: [
        {
          Effect: "Allow",
          Principal: {
            AWS: iamRoleArn,
          },
          Action: "s3:GetObject",
          Resource: `arn:aws:s3:::${bucketName}/*`,
        },
      ],
    }),
    // Apply the preceding policy to this bucket.
    Bucket: bucketName,
  });

  try {
    await client.send(command);
    console.log(
      `GetObject access to the bucket "${bucketName}" was granted to the provided
 IAM role.`,
    );
  } catch (caught) {
    if (
      caught instanceof S3ServiceException &&
      caught.name === "MalformedPolicy"
    ) {
      console.error(
        `Error from S3 while setting the bucket policy for the bucket
 "${bucketName}". The policy was malformed.`,
      );
    } else if (caught instanceof S3ServiceException) {
      console.error(
        `Error from S3 while setting the bucket policy for the bucket
 "${bucketName}". ${caught.name}: ${caught.message}`,
      );
    } else {
      throw caught;
```

```
    }
  }
};
```

Ruby

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
# Wraps an Amazon S3 bucket policy.
class BucketPolicyWrapper
  attr_reader :bucket_policy

  # @param bucket_policy [Aws::S3::BucketPolicy] A bucket policy object
 configured with an existing bucket.
  def initialize(bucket_policy)
    @bucket_policy = bucket_policy
  end

  # Sets a policy on a bucket.
  #
  def policy(policy)
    @bucket_policy.put(policy: policy)
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't set the policy for #{@bucket_policy.bucket.name}. Here's why:
 #{e.message}"
    false
  end
```

```
end
```

- For API details, see PutBucketPolicy in *Amazon SDK for Ruby API Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `PutBucketReplication` with an Amazon SDK or CLI

The following code examples show how to use `PutBucketReplication`.

CLI

Amazon CLI

To configure replication for an S3 bucket

The following `put-bucket-replication` example applies a replication configuration to the specified S3 bucket.

```
aws s3api put-bucket-replication \
    --bucket amzn-s3-demo-bucket1 \
    --replication-configuration file://replication.json
```

Contents of `replication.json`:

```
{
    "Role": "arn:aws:iam::123456789012:role/s3-replication-role",
    "Rules": [
        {
            "Status": "Enabled",
            "Priority": 1,
            "DeleteMarkerReplication": { "Status": "Disabled" },
            "Filter" : { "Prefix": ""},
            "Destination": {
                "Bucket": "arn:aws:s3:::amzn-s3-demo-bucket2"
            }
        }
    ]
}
```

The destination bucket must have versioning enabled. The specified role must have permission to write to the destination bucket and have a trust relationship that allows Amazon S3 to assume the role.

Example role permission policy:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetReplicationConfiguration",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket1"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObjectVersion",
                "s3:GetObjectVersionAcl",
                "s3:GetObjectVersionTagging"
            ],
            "Resource": [
                "arn:aws:s3:::amzn-s3-demo-bucket1/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:ReplicateObject",
                "s3:ReplicateDelete",
                "s3:ReplicateTags"
            ],
            "Resource": "arn:aws:s3:::amzn-s3-demo-bucket2/*"
        }
    ]
}
```

Example trust relationship policy:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "s3.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

This command produces no output.

For more information, see This is the topic title in the *Amazon Simple Storage Service Console User Guide*.

- For API details, see PutBucketReplication in *Amazon CLI Command Reference*.

Java

SDK for Java 2.x

PowerShell

Tools for PowerShell V4

Example 1: This example sets a replication configuration with a single rule enabling replication to the 'amzn-s3-demo-bucket' bucket any new objects created with the key name prefix "TaxDocs" in the bucket 'amzn-s3-demo-bucket'.

```
$rule1 = New-Object Amazon.S3.Model.ReplicationRule
$rule1.ID = "Rule-1"
$rule1.Status = "Enabled"
$rule1.Prefix = "TaxDocs"
$rule1.Destination = @{ BucketArn = "arn:aws:s3:::amzn-s3-demo-destination-
bucket" }

$params = @{
    BucketName = "amzn-s3-demo-bucket"
    Configuration_Role = "arn:aws:iam::35667example:role/
CrossRegionReplicationRoleForS3"
    Configuration_Rule = $rule1
}
```

```
Write-S3BucketReplication @params
```

Example 2: This example sets a replication configuration with multiple rules enabling replication to the 'amzn-s3-demo-bucket' bucket any new objects created with either the key name prefix "TaxDocs" or "OtherDocs". The key prefixes must not overlap.

```
$rule1 = New-Object Amazon.S3.Model.ReplicationRule
$rule1.ID = "Rule-1"
$rule1.Status = "Enabled"
$rule1.Prefix = "TaxDocs"
$rule1.Destination = @{ BucketArn = "arn:aws:s3:::amzn-s3-demo-destination-
bucket" }

$rule2 = New-Object Amazon.S3.Model.ReplicationRule
$rule2.ID = "Rule-2"
$rule2.Status = "Enabled"
$rule2.Prefix = "OtherDocs"
$rule2.Destination = @{ BucketArn = "arn:aws:s3:::amzn-s3-demo-destination-
bucket" }

$params = @{
    BucketName = "amzn-s3-demo-bucket"
    Configuration_Role = "arn:aws:iam::35667example:role/
CrossRegionReplicationRoleForS3"
    Configuration_Rule = $rule1,$rule2
}

Write-S3BucketReplication @params
```

Example 3: This example updates the replication configuration on the specified bucket to disable the rule controlling replication of objects with the key name prefix "TaxDocs" to the bucket 'amzn-s3-demo-bucket'.

```
$rule1 = New-Object Amazon.S3.Model.ReplicationRule
$rule1.ID = "Rule-1"
$rule1.Status = "Disabled"
$rule1.Prefix = "TaxDocs"
$rule1.Destination = @{ BucketArn = "arn:aws:s3:::amzn-s3-demo-destination-
bucket" }

$params = @{
```

```
    BucketName = "amzn-s3-demo-bucket"
    Configuration_Role = "arn:aws:iam::35667example:role/
CrossRegionReplicationRoleForS3"
    Configuration_Rule = $rule1
}

Write-S3BucketReplication @params
```

- For API details, see PutBucketReplication in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example sets a replication configuration with a single rule enabling replication to the 'amzn-s3-demo-bucket' bucket any new objects created with the key name prefix "TaxDocs" in the bucket 'amzn-s3-demo-bucket'.

```
$rule1 = New-Object Amazon.S3.Model.ReplicationRule
$rule1.ID = "Rule-1"
$rule1.Status = "Enabled"
$rule1.Prefix = "TaxDocs"
$rule1.Destination = @{ BucketArn = "arn:aws:s3:::amzn-s3-demo-destination-
bucket" }

$params = @{

}

Write-S3BucketReplication @params
```

- For API details, see PutBucketReplication in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `PutBucketRequestPayment` with a CLI

The following code examples show how to use `PutBucketRequestPayment`.

CLI

Amazon CLI

Example 1: To enable ``requester pays`` configuration for a bucket

The following `put-bucket-request-payment` example enables `requester pays` for the specified bucket.

```
aws s3api put-bucket-request-payment \
    --bucket amzn-s3-demo-bucket \
    --request-payment-configuration '{"Payer":"Requester"}'
```

This command produces no output.

Example 2: To disable ``requester pays`` configuration for a bucket

The following `put-bucket-request-payment` example disables `requester pays` for the specified bucket.

```
aws s3api put-bucket-request-payment \
    --bucket amzn-s3-demo-bucket \
    --request-payment-configuration '{"Payer":"BucketOwner"}'
```

This command produces no output.

- For API details, see PutBucketRequestPayment in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: Updates the request payment configuration for the bucket named 'amzn-s3-demo-bucket' so that the person requesting downloads from the

bucket will be charged for the download. By default the bucket owner pays for downloads. To set the request payment back to the default use 'BucketOwner' for the RequestPaymentConfiguration_Payer parameter.

```
Write-S3BucketRequestPayment -BucketName amzn-s3-demo-bucket -
RequestPaymentConfiguration_Payer Requester
```

- For API details, see PutBucketRequestPayment in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: Updates the request payment configuration for the bucket named 'amzn-s3-demo-bucket' so that the person requesting downloads from the bucket will be charged for the download. By default the bucket owner pays for downloads. To set the request payment back to the default use 'BucketOwner' for the RequestPaymentConfiguration_Payer parameter.

```
Write-S3BucketRequestPayment -BucketName amzn-s3-demo-bucket -
RequestPaymentConfiguration_Payer Requester
```

- For API details, see PutBucketRequestPayment in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `PutBucketTagging` with a CLI

The following code examples show how to use `PutBucketTagging`.

CLI

Amazon CLI

The following command applies a tagging configuration to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-tagging --bucket amzn-s3-demo-bucket --tagging file://
tagging.json
```

The file `tagging.json` is a JSON document in the current folder that specifies tags:

```
{
   "TagSet": [
     {
       "Key": "organization",
       "Value": "marketing"
     }
   ]
}
```

Or apply a tagging configuration to `amzn-s3-demo-bucket` directly from the command line:

```
aws s3api put-bucket-tagging --bucket amzn-s3-demo-bucket --tagging
 'TagSet=[{Key=organization,Value=marketing}]'
```

- For API details, see PutBucketTagging in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: This command applies two tags to a bucket named `cloudtrail-test-2018`: a tag with a key of Stage and a value of Test, and a tag with a key of Environment and a value of Alpha. To verify that the tags were added to the bucket, run `Get-S3BucketTagging -BucketName bucket_name`. The results should show the tags that you applied to the bucket in the first command. Note that `Write-S3BucketTagging` overwrites the entire existing tag set on a bucket. To add or delete individual tags, run the Resource Groups and Tagging API cmdlets, `Add-RGTResourceTag` and `Remove-RGTResourceTag`. Alternatively, use Tag Editor in the Amazon Management Console to manage S3 bucket tags.

```
Write-S3BucketTagging -BucketName amzn-s3-demo-bucket -TagSet @( @{ Key="Stage";
 Value="Test" }, @{ Key="Environment"; Value="Alpha" } )
```

Example 2: This command pipes a bucket named `cloudtrail-test-2018` into the `Write-S3BucketTagging` cmdlet. It applies tags Stage:Production and Department:Finance to the bucket. Note that `Write-S3BucketTagging` overwrites the entire existing tag set on a bucket.

```
Get-S3Bucket -BucketName amzn-s3-demo-bucket | Write-S3BucketTagging
 -TagSet @( @{ Key="Stage"; Value="Production" }, @{ Key="Department";
 Value="Finance" } )
```

- For API details, see PutBucketTagging in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command applies two tags to a bucket named `cloudtrail-test-2018`: a tag with a key of Stage and a value of Test, and a tag with a key of Environment and a value of Alpha. To verify that the tags were added to the bucket, run `Get-S3BucketTagging -BucketName bucket_name`. The results should show the tags that you applied to the bucket in the first command. Note that `Write-S3BucketTagging` overwrites the entire existing tag set on a bucket. To add or delete individual tags, run the Resource Groups and Tagging API cmdlets, `Add-RGTResourceTag` and `Remove-RGTResourceTag`. Alternatively, use Tag Editor in the Amazon Management Console to manage S3 bucket tags.

```
Write-S3BucketTagging -BucketName amzn-s3-demo-bucket -TagSet @( @{ Key="Stage";
 Value="Test" }, @{ Key="Environment"; Value="Alpha" } )
```

Example 2: This command pipes a bucket named `cloudtrail-test-2018` into the `Write-S3BucketTagging` cmdlet. It applies tags Stage:Production and Department:Finance to the bucket. Note that `Write-S3BucketTagging` overwrites the entire existing tag set on a bucket.

```
Get-S3Bucket -BucketName amzn-s3-demo-bucket | Write-S3BucketTagging
 -TagSet @( @{ Key="Stage"; Value="Production" }, @{ Key="Department";
 Value="Finance" } )
```

- For API details, see PutBucketTagging in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

Use `PutBucketVersioning` with an Amazon SDK or CLI

The following code examples show how to use `PutBucketVersioning`.

CLI

Amazon CLI

The following command enables versioning on a bucket named `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-versioning --bucket amzn-s3-demo-bucket --versioning-
configuration Status=Enabled
```

The following command enables versioning, and uses an mfa code

```
aws s3api put-bucket-versioning --bucket amzn-s3-demo-bucket --versioning-
configuration Status=Enabled --mfa "SERIAL 123456"
```

- For API details, see PutBucketVersioning in *Amazon CLI Command Reference*.

Java

SDK for Java 2.x

> **Note**

```
/**
 * Enables bucket versioning for the specified S3 bucket.
 *
 * @param s3Client the S3 client to use for the operation
 * @param bucketName the name of the S3 bucket to enable versioning for
```

```
     */
    public static void enableBucketVersioning(S3Client s3Client, String
bucketName){
        VersioningConfiguration versioningConfiguration =
VersioningConfiguration.builder()
            .status(BucketVersioningStatus.ENABLED)
            .build();

        PutBucketVersioningRequest versioningRequest =
PutBucketVersioningRequest.builder()
            .bucket(bucketName)
            .versioningConfiguration(versioningConfiguration)
            .build();

        s3Client.putBucketVersioning(versioningRequest);
        System.out.println("Bucket versioning has been enabled for "+bucketName);
    }
```

- For API details, see PutBucketVersioning in *Amazon SDK for Java 2.x API Reference*.

PowerShell

Tools for PowerShell V4

Example 1: The command enables versioning for the given S3 bucket.

```
Write-S3BucketVersioning -BucketName 'amzn-s3-demo-bucket' -
VersioningConfig_Status Enabled
```

- For API details, see PutBucketVersioning in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: The command enables versioning for the given S3 bucket.

```
Write-S3BucketVersioning -BucketName 'amzn-s3-demo-bucket' -
VersioningConfig_Status Enabled
```

- For API details, see PutBucketVersioning in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `PutBucketWebsite` with an Amazon SDK or CLI

The following code examples show how to use `PutBucketWebsite`.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
                // Put the website configuration.
                PutBucketWebsiteRequest putRequest = new
PutBucketWebsiteRequest()
                {
                    BucketName = bucketName,
                    WebsiteConfiguration = new WebsiteConfiguration()
                    {
                        IndexDocumentSuffix = indexDocumentSuffix,
                        ErrorDocument = errorDocument,
                    },
                };
                PutBucketWebsiteResponse response = await
client.PutBucketWebsiteAsync(putRequest);
```

- For API details, see PutBucketWebsite in *Amazon SDK for .NET API Reference*.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
bool AwsDoc::S3::putWebsiteConfig(const Aws::String &bucketName,
                                  const Aws::String &indexPage, const Aws::String
 &errorPage,
                                  const Aws::S3::S3ClientConfiguration
 &clientConfig) {
    Aws::S3::S3Client client(clientConfig);

    Aws::S3::Model::IndexDocument indexDocument;
    indexDocument.SetSuffix(indexPage);

    Aws::S3::Model::ErrorDocument errorDocument;
    errorDocument.SetKey(errorPage);

    websiteConfiguration.SetIndexDocument(indexDocument);
    websiteConfiguration.SetErrorDocument(errorDocument);

    Aws::S3::Model::PutBucketWebsiteRequest request;
    request.SetBucket(bucketName);
    request.SetWebsiteConfiguration(websiteConfiguration);

    Aws::S3::Model::PutBucketWebsiteOutcome outcome =
            client.PutBucketWebsite(request);

    if (!outcome.IsSuccess()) {
        std::cerr << "Error: PutBucketWebsite: "
                  << outcome.GetError().GetMessage() << std::endl;
    } else {
        std::cout << "Success: Set website configuration for bucket '"
                  << bucketName << "'." << std::endl;
    }
```

```
    return outcome.IsSuccess();
}
```

- For API details, see PutBucketWebsite in *Amazon SDK for C++ API Reference*.

CLI

Amazon CLI

The applies a static website configuration to a bucket named `amzn-s3-demo-bucket`:

```
aws s3api put-bucket-website --bucket amzn-s3-demo-bucket --website-
configuration file://website.json
```

The file `website.json` is a JSON document in the current folder that specifies index and error pages for the website:

```
{
    "IndexDocument": {
        "Suffix": "index.html"
    },
    "ErrorDocument": {
        "Key": "error.html"
    }
}
```

- For API details, see PutBucketWebsite in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: The command enables website hosting for the given bucket with the index document as 'index.html' and error document as 'error.html'.

```
Write-S3BucketWebsite -BucketName 'amzn-s3-demo-bucket'
 -WebsiteConfiguration_IndexDocumentSuffix 'index.html' -
WebsiteConfiguration_ErrorDocument 'error.html'
```

- For API details, see PutBucketWebsite in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: The command enables website hosting for the given bucket with the index document as 'index.html' and error document as 'error.html'.

```
Write-S3BucketWebsite -BucketName 'amzn-s3-demo-bucket'
 -WebsiteConfiguration_IndexDocumentSuffix 'index.html' -
WebsiteConfiguration_ErrorDocument 'error.html'
```

- For API details, see PutBucketWebsite in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 bucket website actions.
class BucketWebsiteWrapper
  attr_reader :bucket_website

  # @param bucket_website [Aws::S3::BucketWebsite] A bucket website object
 configured with an existing bucket.
  def initialize(bucket_website)
    @bucket_website = bucket_website
  end

  # Sets a bucket as a static website.
  #
  # @param index_document [String] The name of the index document for the
 website.
```

```
  # @param error_document [String] The name of the error document to show for 4XX
 errors.
  # @return [Boolean] True when the bucket is configured as a website; otherwise,
 false.
  def set_website(index_document, error_document)
    @bucket_website.put(
      website_configuration: {
        index_document: { suffix: index_document },
        error_document: { key: error_document }
      }
    )
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't configure #{@bucket_website.bucket.name} as a website. Here's
 why: #{e.message}"
    false
  end
end

# Example usage:
def run_demo
  bucket_name = "amzn-s3-demo-bucket"
  index_document = "index.html"
  error_document = "404.html"

  wrapper = BucketWebsiteWrapper.new(Aws::S3::BucketWebsite.new(bucket_name))
  return unless wrapper.set_website(index_document, error_document)

  puts "Successfully configured bucket #{bucket_name} as a static website."
end

run_demo if $PROGRAM_NAME == __FILE__
```

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `PutObject` with an Amazon SDK or CLI

The following code examples show how to use `PutObject`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Learn the basics
- Make conditional requests
- Track uploads and downloads
- Work with Amazon S3 object integrity

CLI

Amazon CLI

Example 1: Upload an object to Amazon S3

The following `put-object` command example uploads an object to Amazon S3.

```
aws s3api put-object \
    --bucket amzn-s3-demo-bucket \
    --key my-dir/MySampleImage.png \
    --body MySampleImage.png
```

For more information about uploading objects, see Uploading Objects < http://docs.aws.amazon.com/AmazonS3/latest/dev/UploadingObjects.html> in the *Amazon S3 Developer Guide*.

Example 2: Upload a video file to Amazon S3

The following `put-object` command example uploads a video file.

```
aws s3api put-object \
    --bucket amzn-s3-demo-bucket \
    --key my-dir/big-video-file.mp4 \
    --body /media/videos/f-sharp-3-data-services.mp4
```

For more information about uploading objects, see Uploading Objects < http://docs.aws.amazon.com/AmazonS3/latest/dev/UploadingObjects.html> in the *Amazon S3 Developer Guide*.

- For API details, see PutObject in *Amazon CLI Command Reference*.

Upload a file to a bucket using an S3Client.

```
   /**
    * Uploads a local file to an AWS S3 bucket asynchronously.
    *
    * @param bucketName the name of the S3 bucket to upload the file to
    * @param key        the key (object name) to use for the uploaded file
    * @param objectPath the local file path of the file to be uploaded
    * @return a {@link CompletableFuture} that completes with the {@link
PutObjectResponse} when the upload is successful, or throws a {@link
RuntimeException} if the upload fails
    */
   public CompletableFuture<PutObjectResponse> uploadLocalFileAsync(String
bucketName, String key, String objectPath) {
       PutObjectRequest objectRequest = PutObjectRequest.builder()
           .bucket(bucketName)
           .key(key)
           .build();

       CompletableFuture<PutObjectResponse> response =
getAsyncClient().putObject(objectRequest,
AsyncRequestBody.fromFile(Paths.get(objectPath)));
       return response.whenComplete((resp, ex) -> {
           if (ex != null) {
               throw new RuntimeException("Failed to upload file", ex);
           }
       });
   }
```

Use an S3TransferManager to upload a file to a bucket. View the complete file and test.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.transfer.s3.S3TransferManager;

Upload an object to a bucket.

```
        $s3client = new Aws\S3\S3Client(['region' => 'us-west-2']);

        $fileName = __DIR__ . "/local-file-" . uniqid();
        try {
```

```
            $this->s3client->putObject([
                'Bucket' => $this->bucketName,
                'Key' => $fileName,
                'SourceFile' => __DIR__ . '/testfile.txt'
            ]);
            echo "Uploaded $fileName to $this->bucketName.\n";
        } catch (Exception $exception) {
            echo "Failed to upload $fileName with error: " . $exception-
>getMessage();
            exit("Please fix error with file upload before continuing.");
        }
```

PowerShell

Tools for PowerShell V4

Example 1: This command uploads the single file "local-sample.txt" to Amazon S3, creating an object with key "sample.txt" in bucket "test-files".

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Key "sample.txt" -File .\local-
sample.txt
```

Example 2: This command uploads the single file "sample.txt" to Amazon S3, creating an object with key "sample.txt" in bucket "test-files". If the -Key parameter is not supplied, the filename is used as the S3 object key.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -File .\sample.txt
```

Example 3: This command uploads the single file "local-sample.txt" to Amazon S3, creating an object with key "prefix/to/sample.txt" in bucket "test-files".

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Key "prefix/to/sample.txt" -
File .\local-sample.txt
```

Example 4: This command uploads all files in the subdirectory "Scripts" to the bucket "test-files" and applies the common key prefix "SampleScripts" to each object. Each uploaded file will have a key of "SampleScripts/filename" where 'filename' varies.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Folder .\Scripts -KeyPrefix
 SampleScripts\
```

Example 5: This command uploads all *.ps1 files in the local director "Scripts" to bucket "test-files" and applies the common key prefix "SampleScripts" to each object. Each uploaded file will have a key of "SampleScripts/filename.ps1" where 'filename' varies.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Folder .\Scripts -KeyPrefix
 SampleScripts\ -SearchPattern *.ps1
```

Example 6: This command creates a new S3 object containing the specified content string with key 'sample.txt'.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Key "sample.txt" -Content "object
 contents"
```

Example 7: This command uploads the specified file (the filename is used as the key) and applies the specified tags to the new object.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -File "sample.txt" -TagSet
 @{Key="key1";Value="value1"},@{Key="key2";Value="value2"}
```

Example 8: This command recursively uploads the specified folder and applies the specified tags to all the new objects.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Folder . -KeyPrefix "TaggedFiles"
 -Recurse -TagSet @{Key="key1";Value="value1"},@{Key="key2";Value="value2"}
```

- For API details, see PutObject in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This command uploads the single file "local-sample.txt" to Amazon S3, creating an object with key "sample.txt" in bucket "test-files".

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Key "sample.txt" -File .\local-
sample.txt
```

Example 2: This command uploads the single file "sample.txt" to Amazon S3, creating an object with key "sample.txt" in bucket "test-files". If the -Key parameter is not supplied, the filename is used as the S3 object key.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -File .\sample.txt
```

Example 3: This command uploads the single file "local-sample.txt" to Amazon S3, creating an object with key "prefix/to/sample.txt" in bucket "test-files".

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Key "prefix/to/sample.txt" -
File .\local-sample.txt
```

Example 4: This command uploads all files in the subdirectory "Scripts" to the bucket "test-files" and applies the common key prefix "SampleScripts" to each object. Each uploaded file will have a key of "SampleScripts/filename" where 'filename' varies.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Folder .\Scripts -KeyPrefix
 SampleScripts\
```

Example 5: This command uploads all *.ps1 files in the local director "Scripts" to bucket "test-files" and applies the common key prefix "SampleScripts" to each object. Each uploaded file will have a key of "SampleScripts/filename.ps1" where 'filename' varies.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Folder .\Scripts -KeyPrefix
 SampleScripts\ -SearchPattern *.ps1
```

Example 6: This command creates a new S3 object containing the specified content string with key 'sample.txt'.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Key "sample.txt" -Content "object
 contents"
```

Example 7: This command uploads the specified file (the filename is used as the key) and applies the specified tags to the new object.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -File "sample.txt" -TagSet
 @{Key="key1";Value="value1"},@{Key="key2";Value="value2"}
```

Example 8: This command recursively uploads the specified folder and applies the specified tags to all the new objects.

```
Write-S3Object -BucketName amzn-s3-demo-bucket -Folder . -KeyPrefix "TaggedFiles"
 -Recurse -TagSet @{Key="key1";Value="value1"},@{Key="key2";Value="value2"}
```

- For API details, see PutObject in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

Ruby

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Upload a file using a managed uploader (Object.upload_file).

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectUploadFileWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  # Uploads a file to an Amazon S3 object by using a managed uploader.
  #
  # @param file_path [String] The path to the file to upload.
  # @return [Boolean] True when the file is uploaded; otherwise false.
  def upload_file(file_path)
    @object.upload_file(file_path)
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't upload file #{file_path} to #{@object.key}. Here's why:
 #{e.message}"
    false
  end
end

# Example usage:
def run_demo
  bucket_name = "amzn-s3-demo-bucket"
  object_key = "my-uploaded-file"
  file_path = "object_upload_file.rb"
```

```
  wrapper = ObjectUploadFileWrapper.new(Aws::S3::Object.new(bucket_name,
 object_key))
  return unless wrapper.upload_file(file_path)

  puts "File #{file_path} successfully uploaded to #{bucket_name}:#{object_key}."
end

run_demo if $PROGRAM_NAME == __FILE__
```

Upload a file using Object.put.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectPutWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  def put_object(source_file_path)
    File.open(source_file_path, 'rb') do |file|
      @object.put(body: file)
    end
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't put #{source_file_path} to #{object.key}. Here's why:
 #{e.message}"
    false
  end
end

# Example usage:
def run_demo
  bucket_name = "amzn-s3-demo-bucket"
  object_key = "my-object-key"
  file_path = "my-local-file.txt"

  wrapper = ObjectPutWrapper.new(Aws::S3::Object.new(bucket_name, object_key))
  success = wrapper.put_object(file_path)
```

```
  return unless success

  puts "Put file #{file_path} into #{object_key} in #{bucket_name}."
end

run_demo if $PROGRAM_NAME == __FILE__
```

Upload a file using Object.put and add server-side encryption.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectPutSseWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  def put_object_encrypted(object_content, encryption)
    @object.put(body: object_content, server_side_encryption: encryption)
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't put your content to #{object.key}. Here's why: #{e.message}"
    false
  end
end

# Example usage:
def run_demo
  bucket_name = "amzn-s3-demo-bucket"
  object_key = "my-encrypted-content"
  object_content = "This is my super-secret content."
  encryption = "AES256"

  wrapper = ObjectPutSseWrapper.new(Aws::S3::Object.new(bucket_name,
 object_content))
  return unless wrapper.put_object_encrypted(object_content, encryption)

  puts "Put your content into #{bucket_name}:#{object_key} and encrypted it with
 #{encryption}."
```

```
end

run_demo if $PROGRAM_NAME == __FILE__
```

- For API details, see PutObject in *Amazon SDK for Ruby API Reference*.

    return Aws::S3::Model::Type::NOT_SET;
}
```

- For API details, see PutObjectAcl in *Amazon SDK for C++ API Reference*.

CLI

Amazon CLI

The following command grants `full control` to two Amazon users (*user1@example.com* and *user2@example.com*) and `read` permission to everyone:

```
aws s3api put-object-acl --bucket amzn-s3-demo-bucket --key file.txt --grant-
full-control emailaddress=user1@example.com,emailaddress=user2@example.com --
grant-read uri=http://acs.amazonaws.com/groups/global/AllUsers
```

See http://docs.aws.amazon.com/AmazonS3/latest/API/RESTBucketPUTacl.html for details on custom ACLs (the s3api ACL commands, such as `put-object-acl`, use the same shorthand argument notation).

- For API details, see PutObjectAcl in *Amazon CLI Command Reference*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class ObjectWrapper:
    """Encapsulates S3 object actions."""

    def __init__(self, s3_object):

Use `PutObjectLegalHold` with an Amazon SDK or CLI

The following code examples show how to use `PutObjectLegalHold`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Lock Amazon S3 objects

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
    /// <summary>
    /// Set or modify a legal hold on an object in an S3 bucket.
    /// </summary>
    /// <param name="bucketName">The bucket of the object.</param>
    /// <param name="objectKey">The key of the object.</param>
    /// <param name="holdStatus">The On or Off status for the legal hold.</param>
    /// <returns>True if successful.</returns>
    public async Task<bool> ModifyObjectLegalHold(string bucketName,
        string objectKey, ObjectLockLegalHoldStatus holdStatus)
    {
        try
        {
            var request = new PutObjectLegalHoldRequest()
            {
                BucketName = bucketName,
                Key = objectKey,
                LegalHold = new ObjectLockLegalHold()
                {
                    Status = holdStatus
                }
            };

            var response = await _amazonS3.PutObjectLegalHoldAsync(request);
            Console.WriteLine($"\tModified legal hold for {objectKey} in
{bucketName}.");
            return response.HttpStatusCode == System.Net.HttpStatusCode.OK;
        }
        catch (AmazonS3Exception ex)
        {
            Console.WriteLine($"\tError modifying legal hold: '{ex.Message}'");
            return false;
        }
```

```
    }
```

- For API details, see PutObjectLegalHold in *Amazon SDK for .NET API Reference*.

CLI

Amazon CLI

To apply a Legal Hold to an object

The following `put-object-legal-hold` example sets a Legal Hold on the object `doc1.rtf`.

```
aws s3api put-object-legal-hold \
    --bucket amzn-s3-demo-bucket-with-object-lock \
    --key doc1.rtf \
    --legal-hold Status=ON
```

This command produces no output.

- For API details, see PutObjectLegalHold in *Amazon CLI Command Reference*.

CLI

Amazon CLI

To set an object lock configuration on a bucket

The following `put-object-lock-configuration` example sets a 50-day object lock on the specified bucket.

```
aws s3api put-object-lock-configuration \
```

```
    --bucket amzn-s3-demo-bucket-with-object-lock \
    --object-lock-configuration '{ "ObjectLockEnabled": "Enabled", "Rule":
 { "DefaultRetention": { "Mode": "COMPLIANCE", "Days": 50 }}}'
```

This command produces no output.

- For API details, see PutObjectLockConfiguration in *Amazon CLI Command Reference*.

CLI

Amazon CLI

To set an object retention configuration for an object

The following `put-object-retention` example sets an object retention configuration for the specified object until 2025-01-01.

```
aws s3api put-object-retention \
    --bucket amzn-s3-demo-bucket-with-object-lock \
    --key doc1.rtf \
    --retention '{ "Mode": "GOVERNANCE", "RetainUntilDate":
 "2025-01-01T00:00:00" }'
```

This command produces no output.

- For API details, see PutObjectRetention in *Amazon CLI Command Reference*.

PowerShell

Tools for PowerShell V4

Example 1: The command enables governance retention mode untill the date '31st Dec 2019 00:00:00' for 'testfile.txt' object in the given S3 bucket.

```
Write-S3ObjectRetention -BucketName 'amzn-s3-demo-bucket' -Key 'testfile.txt' -
Retention_Mode GOVERNANCE -Retention_RetainUntilDate "2019-12-31T00:00:00"
```

- For API details, see PutObjectRetention in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: The command enables governance retention mode untill the date '31st Dec 2019 00:00:00' for 'testfile.txt' object in the given S3 bucket.

```
Write-S3ObjectRetention -BucketName 'amzn-s3-demo-bucket' -Key 'testfile.txt' -
Retention_Mode GOVERNANCE -Retention_RetainUntilDate "2019-12-31T00:00:00"
```

- For API details, see PutObjectRetention in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Put an object retention.

```
            s3_client.put_object_retention(
                Bucket=bucket,
                Key=key,
                VersionId=version_id,
                Retention={"Mode": "GOVERNANCE", "RetainUntilDate":
far_future_date},
                BypassGovernanceRetention=True,
            )
```

- For API details, see PutObjectRetention in *Amazon SDK for Python (Boto3) API Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `RestoreObject` with an Amazon SDK or CLI

The following code examples show how to use `RestoreObject`.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
    using System;
    using System.Threading.Tasks;
    using Amazon;
    using Amazon.S3;
    using Amazon.S3.Model;

    /// <summary>
    /// This example shows how to restore an archived object in an Amazon
    /// Simple Storage Service (Amazon S3) bucket.
    /// </summary>
    public class RestoreArchivedObject
    {
        public static void Main()
        {
            string bucketName = "amzn-s3-demo-bucket";
            string objectKey = "archived-object.txt";

            // Specify your bucket region (an example region is shown).
            RegionEndpoint bucketRegion = RegionEndpoint.USWest2;

            IAmazonS3 client = new AmazonS3Client(bucketRegion);
            RestoreObjectAsync(client, bucketName, objectKey).Wait();
        }

        /// <summary>
        /// This method restores an archived object from an Amazon S3 bucket.
        /// </summary>
        /// <param name="client">The initialized Amazon S3 client object used to
call
        /// RestoreObjectAsync.</param>
        /// <param name="bucketName">A string representing the name of the
        /// bucket where the object was located before it was archived.</param>
```

```
        /// <param name="objectKey">A string representing the name of the
        /// archived object to restore.</param>
        public static async Task RestoreObjectAsync(IAmazonS3 client, string
bucketName, string objectKey)
        {
            try
            {
                var restoreRequest = new RestoreObjectRequest
                {
                    BucketName = bucketName,
                    Key = objectKey,
                    Days = 2,
                };
                RestoreObjectResponse response = await
client.RestoreObjectAsync(restoreRequest);

                // Check the status of the restoration.
                await CheckRestorationStatusAsync(client, bucketName, objectKey);
            }
            catch (AmazonS3Exception amazonS3Exception)
            {
                Console.WriteLine($"Error: {amazonS3Exception.Message}");
            }
        }

        /// <summary>
        /// This method retrieves the status of the object's restoration.
        /// </summary>
        /// <param name="client">The initialized Amazon S3 client object used to
call
        /// GetObjectMetadataAsync.</param>
        /// <param name="bucketName">A string representing the name of the Amazon
        /// S3 bucket which contains the archived object.</param>
        /// <param name="objectKey">A string representing the name of the
        /// archived object you want to restore.</param>
        public static async Task CheckRestorationStatusAsync(IAmazonS3 client,
string bucketName, string objectKey)
        {
            GetObjectMetadataRequest metadataRequest = new
GetObjectMetadataRequest()
            {
                BucketName = bucketName,
                Key = objectKey,
            };
```

```
            GetObjectMetadataResponse response = await
client.GetObjectMetadataAsync(metadataRequest);

            var restStatus = response.RestoreInProgress ? "in-progress" :
"finished or failed";
            Console.WriteLine($"Restoration status: {restStatus}");
        }
    }
```

- For API details, see RestoreObject in *Amazon SDK for .NET API Reference*.

CLI

Amazon CLI

To create a restore request for an object

The following `restore-object` example restores the specified Amazon S3 Glacier object for the bucket `my-glacier-bucket` for 10 days.

```
aws s3api restore-object \
    --bucket my-glacier-bucket \
    --key doc1.rtf \
    --restore-request Days=10
```

This command produces no output.

- For API details, see RestoreObject in *Amazon CLI Command Reference*.

Use `SelectObjectContent` with an Amazon SDK or CLI

The following code examples show how to use `SelectObjectContent`.

CLI

Amazon CLI

To filter the contents of an Amazon S3 object based on an SQL statement

The following `select-object-content` example filters the object `my-data-file.csv` with the specified SQL statement and sends output to a file.

```
aws s3api select-object-content \
    --bucket amzn-s3-demo-bucket \
    --key my-data-file.csv \
    --expression "select * from s3object limit 100" \
    --expression-type 'SQL' \
    --input-serialization '{"CSV": {}, "CompressionType": "NONE"}' \
    --output-serialization '{"CSV": {}}' "output.csv"
```

This command produces no output.

- For API details, see SelectObjectContent in *Amazon CLI Command Reference*.

Use `UploadPart` with an Amazon SDK or CLI

The following code examples show how to use `UploadPart`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code examples:

- Use checksums
- Work with Amazon S3 object integrity

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
//! Upload a part to an S3 bucket.
/*!
    \param bucket: The name of the S3 bucket where the object will be uploaded.
    \param key: The unique identifier (key) for the object within the S3 bucket.
    \param uploadID: An upload ID string.
    \param partNumber:
    \param checksumAlgorithm: Checksum algorithm, ignored when NOT_SET.
    \param calculatedHash: A data integrity hash to set, depending on the
 checksum algorithm,
                           ignored when it is an empty string.
    \param body: An shared_ptr IOStream of the data to be uploaded.
    \param client: The S3 client instance used to perform the upload operation.
    \return UploadPartOutcome: The outcome.
*/

        }
    }

    return client.UploadPart(request);
}
```

- For API details, see UploadPart in *Amazon SDK for C++ API Reference*.

CLI

Amazon CLI

The following command uploads the first part in a multipart upload initiated with the `create-multipart-upload` command:

```
aws s3api upload-part --bucket amzn-s3-demo-bucket --key
 'multipart/01' --part-number 1 --body part01 --upload-id
  "dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P
```

The body option takes the name or path of a local file for upload (do not use the file:// prefix). The minimum part size is 5 MB. Upload ID is returned by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`. Bucket and key are specified when you create the multipart upload.

Output:

```
{
    "ETag": "\"e868e0f4719e394144ef36531ee6824c\""
}
```

Save the ETag value of each part for later. They are required to complete the multipart upload.

- For API details, see UploadPart in *Amazon CLI Command Reference*.

Rust

SDK for Rust

> **Note**

Use `UploadPartCopy` with an Amazon SDK or CLI

The following code examples show how to use `UploadPartCopy`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Perform a multipart copy

CLI

Amazon CLI

To upload part of an object by copying data from an existing object as the data source

The following `upload-part-copy` example uploads a part by copying data from an existing object as a data source.

```
aws s3api upload-part-copy \
    --bucket amzn-s3-demo-bucket \
    --key "Map_Data_June.mp4" \
```

```
    --copy-source "amzn-s3-demo-bucket/copy_of_Map_Data_June.mp4" \
    --part-number 1 \
    --upload-
id "bq0tdE1CDpWQYRPLHuNG50xAT6pA5D.m_RiBy0ggOH6b13pVRY7QjvLlf75iFdJqp_2wztk5hvpUM2SesXgrz
```

Output:

```
{
    "CopyPartResult": {
        "LastModified": "2019-12-13T23:16:03.000Z",
        "ETag": "\"711470fc377698c393d94aed6305e245\""
    }
}
```

- For API details, see UploadPartCopy in *Amazon CLI Command Reference*.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
   public CompletableFuture<String> performMultiCopy(String toBucket, String
bucketName, String key) {
       CreateMultipartUploadRequest createMultipartUploadRequest =
CreateMultipartUploadRequest.builder()
           .bucket(toBucket)
           .key(key)
           .build();

       getAsyncClient().createMultipartUpload(createMultipartUploadRequest)
           .thenApply(createMultipartUploadResponse -> {
               String uploadId = createMultipartUploadResponse.uploadId();
               System.out.println("Upload ID: " + uploadId);

               UploadPartCopyRequest uploadPartCopyRequest =
UploadPartCopyRequest.builder()
```

```
                    .sourceBucket(bucketName)
                    .destinationBucket(toBucket)
                    .sourceKey(key)
                    .destinationKey(key)
                    .uploadId(uploadId)  // Use the valid uploadId.
                    .partNumber(1)  // Ensure the part number is correct.

exception.getMessage());
                } else {
                    // Successfully completed the upload part copy.
                    System.out.println("Upload Part Copy completed successfully.
ETag: " + uploadPartCopyResponse.copyPartResult().eTag());
                }
            });
        return null;
    }
```

- For API details, see UploadPartCopy in *Amazon SDK for Java 2.x API Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Scenarios for Amazon S3 using Amazon SDKs

The following code examples show you how to implement common scenarios in Amazon S3 with Amazon SDKs. These scenarios show you how to accomplish specific tasks by calling multiple functions within Amazon S3 or combined with other Amazon Web Services services. Each scenario includes a link to the complete source code, where you can find instructions on how to set up and run the code.

Scenarios target an intermediate level of experience to help you understand service actions in context.

Examples

- Check if a bucket exists
- Convert text to speech and back to text using an Amazon SDK
- Create a presigned URL for Amazon S3 using an Amazon SDK
- Create a photo asset management application that lets users manage photos using labels
- A web page that lists Amazon S3 objects using an Amazon SDK
- Create an Amazon Textract explorer application
- Delete all objects in a given Amazon S3 bucket using an Amazon SDK
- Delete incomplete multipart uploads to Amazon S3 using an Amazon SDK
- Detect PPE in images with Amazon Rekognition using an Amazon SDK
- Detect entities in text extracted from an image using an Amazon SDK
- Detect faces in an image using an Amazon SDK
- Detect objects in images with Amazon Rekognition using an Amazon SDK
- Detect people and objects in a video with Amazon Rekognition using an Amazon SDK
- Download S3 'directories' from an Amazon Simple Storage Service (Amazon S3) bucket
- Download all objects in an Amazon Simple Storage Service (Amazon S3) bucket to a local directory
- Download a stream of unknown size from an Amazon S3 object using an Amazon SDK
- Get an Amazon S3 object from a Multi-Region Access Point by using an Amazon SDK
- Get an object from an Amazon S3 bucket using an Amazon SDK, specifying an If-Modified-Since header
- Get started with encryption for Amazon S3 objects using an Amazon SDK
- Get started with tags for Amazon S3 objects using an Amazon SDK
- Work with Amazon S3 object lock features using an Amazon SDK
- Make Amazon S3 conditional requests using an Amazon SDK
- Manage access control lists (ACLs) for Amazon S3 buckets using an Amazon SDK
- Manage large Amazon SQS messages using Amazon S3 with an Amazon SDK
- Manage versioned Amazon S3 objects in batches with a Lambda function using an Amazon SDK
- Parse Amazon S3 URIs using an Amazon SDK

- Perform a multipart copy of an Amazon S3 object using an Amazon SDK
- Receive and process Amazon S3 event notifications by using an Amazon SDK
- Save EXIF and other image information using an Amazon SDK
- Send S3 event notifications to Amazon EventBridge using an Amazon SDK
- Track an Amazon S3 object upload or download using an Amazon SDK
- Transform data for your application with S3 Object Lambda
- Example approaches for unit and integration testing with an Amazon SDK
- Recursively upload a local directory to an Amazon Simple Storage Service (Amazon S3) bucket
- Upload or download large files to and from Amazon S3 using an Amazon SDK
- Upload a stream of unknown size to an Amazon S3 object using an Amazon SDK
- Use checksums to work with an Amazon S3 object using an Amazon SDK
- Work with Amazon S3 object integrity features using an Amazon SDK
- Work with Amazon S3 versioned objects using an Amazon SDK

Check if a bucket exists

The following code example shows how to check if a bucket exists.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

You can use the following `doesBucketExists` method as a replacement for the the SDK for Java V1 AmazonS3Client#doesBucketExistV2(String) method.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.awscore.exception.AwsServiceException;
import software.amazon.awssdk.http.HttpStatusCode;
```

```
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.utils.Validate;

public class DoesBucketExist {
    private static final Logger logger =
 LoggerFactory.getLogger(DoesBucketExist.class);

    public static void main(String[] args) {
        DoesBucketExist doesBucketExist = new DoesBucketExist();

        final S3Client s3SyncClient = S3Client.builder().build();
        final String bucketName = "amzn-s3-demo-bucket"; // Change to the bucket
 name that you want to check.

        boolean exists = doesBucketExist.doesBucketExist(bucketName,
 s3SyncClient);
        logger.info("Bucket exists: {}", exists);
    }

    /**
     * Checks if the specified bucket exists. Amazon S3 buckets are named in a
 global namespace; use this method to
     * determine if a specified bucket name already exists, and therefore can't
 be used to create a new bucket.
     * <p>
     * Internally this method uses the <a
     * href="https://sdk.amazonaws.com/java/api/latest/software/amazon/awssdk/
services/s3/
S3Client.html#getBucketAcl(java.util.function.Consumer)">S3Client.getBucketAcl(String)</
a>
     * operation to determine whether the bucket exists.
     * <p>
     * This method is equivalent to the AWS SDK for Java V1's <a
     * href="https://docs.aws.amazon.com/AWSJavaSDK/latest/javadoc/
com/amazonaws/services/s3/AmazonS3Client.html#doesBucketExistV2-
java.lang.String-">AmazonS3Client#doesBucketExistV2(String)</a>.
     *
     * @param bucketName   The name of the bucket to check.
     * @param s3SyncClient An <code>S3Client</code> instance. The method checks
 for the bucket in the AWS Region
     *                     configured on the instance.
     * @return The value true if the specified bucket exists in Amazon S3; the
 value false if there is no bucket in
     *         Amazon S3 with that name.
```

```
     */
    public boolean doesBucketExist(String bucketName, S3Client s3SyncClient) {
        try {
            Validate.notEmpty(bucketName, "The bucket name must not be null or an
 empty string.", "");
            s3SyncClient.getBucketAcl(r -> r.bucket(bucketName));
            return true;
        } catch (AwsServiceException ase) {
            // A redirect error or an AccessDenied exception means the bucket
 exists but it's not in this region
            // or we don't have permissions to it.
            if ((ase.statusCode() == HttpStatusCode.MOVED_PERMANENTLY) ||
 "AccessDenied".equals(ase.awsErrorDetails().errorCode())) {
                return true;
            }
            if (ase.statusCode() == HttpStatusCode.NOT_FOUND) {
                return false;
            }
            throw ase;
        }
    }
}
```

- For API details, see GetBucketAcl in *Amazon SDK for Java 2.x API Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Convert text to speech and back to text using an Amazon SDK

The following code example shows how to:

- Use Amazon Polly to synthesize a plain text (UTF-8) input file to an audio file.
- Upload the audio file to an Amazon S3 bucket.
- Use Amazon Transcribe to convert the audio file to text.
- Display the text.

Rust

SDK for Rust

Use Amazon Polly to synthesize a plain text (UTF-8) input file to an audio file, upload the audio file to an Amazon S3 bucket, use Amazon Transcribe to convert that audio file to text, and display the text.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Polly
- Amazon S3
- Amazon Transcribe

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Create a presigned URL for Amazon S3 using an Amazon SDK

The following code examples show how to create a presigned URL for Amazon S3 and upload an object.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Generate a presigned URL that can perform an Amazon S3 action for a limited time.

```
using System;
using Amazon;
using Amazon.S3;
```

```
    using Amazon.S3.Model;

    public class GenPresignedUrl
    {
        public static void Main()
        {
            const string bucketName = "amzn-s3-demo-bucket";
            const string objectKey = "sample.txt";

            // Specify how long the presigned URL lasts, in hours
            const double timeoutDuration = 12;

            // Specify the AWS Region of your Amazon S3 bucket. If it is
            // different from the Region defined for the default user,
            // pass the Region to the constructor for the client. For
            // example: new AmazonS3Client(RegionEndpoint.USEast1);

            // If using the Region us-east-1, and server-side encryption with AWS
 KMS, you must specify Signature Version 4.
            // Region us-east-1 defaults to Signature Version 2 unless explicitly
 set to Version 4 as shown below.
            // For more details, see https://docs.aws.amazon.com/AmazonS3/latest/
userguide/UsingAWSSDK.html#specify-signature-version
            // and https://docs.aws.amazon.com/sdkfornet/v3/apidocs/items/Amazon/
TAWSConfigsS3.html
            AWSConfigsS3.UseSignatureVersion4 = true;
            IAmazonS3 s3Client = new AmazonS3Client(RegionEndpoint.USEast1);

            string urlString = GeneratePresignedURL(s3Client, bucketName,
 objectKey, timeoutDuration);
            Console.WriteLine($"The generated URL is: {urlString}.");
        }

        /// <summary>
        /// Generate a presigned URL that can be used to access the file named
        /// in the objectKey parameter for the amount of time specified in the
        /// duration parameter.
        /// </summary>
        /// <param name="client">An initialized S3 client object used to call
        /// the GetPresignedUrl method.</param>
        /// <param name="bucketName">The name of the S3 bucket containing the
        /// object for which to create the presigned URL.</param>
        /// <param name="objectKey">The name of the object to access with the
        /// presigned URL.</param>
```

```
        /// <param name="duration">The length of time for which the presigned
        /// URL will be valid.</param>
        /// <returns>A string representing the generated presigned URL.</returns>
        public static string GeneratePresignedURL(IAmazonS3 client, string
bucketName, string objectKey, double duration)
        {
            string urlString = string.Empty;
            try
            {
                var request = new GetPreSignedUrlRequest()
                {
                    BucketName = bucketName,
                    Key = objectKey,
                    Expires = DateTime.UtcNow.AddHours(duration),
                };
                urlString = client.GetPreSignedURL(request);
            }
            catch (AmazonS3Exception ex)
            {
                Console.WriteLine($"Error:'{ex.Message}'");
            }

            return urlString;
        }
    }
```

Generate a presigned URL and perform an upload using that URL.

```
    using System;
    using System.IO;
    using System.Net.Http;
    using System.Threading.Tasks;
    using Amazon;
    using Amazon.S3;
    using Amazon.S3.Model;

    /// <summary>
    /// This example shows how to upload an object to an Amazon Simple Storage
    /// Service (Amazon S3) bucket using a presigned URL. The code first
    /// creates a presigned URL and then uses it to upload an object to an
    /// Amazon S3 bucket using that URL.
```

```
    /// </summary>

Create functions that wrap S3 presigning actions.

```
import (
 "context"
 "log"
```

```
 "time"

 "github.com/aws/aws-sdk-go-v2/aws"
 v4 "github.com/aws/aws-sdk-go-v2/aws/signer/v4"
 "github.com/aws/aws-sdk-go-v2/service/s3"
)

// Presigner encapsulates the Amazon Simple Storage Service (Amazon S3) presign
 actions
// used in the examples.
// It contains PresignClient, a client that is used to presign requests to Amazon
 S3.
// Presigned requests contain temporary credentials and can be made from any HTTP
 client.
type Presigner struct {
 PresignClient *s3.PresignClient
}

// GetObject makes a presigned request that can be used to get an object from a
 bucket.
// The presigned request is valid for the specified number of seconds.
func (presigner Presigner) GetObject(
 ctx context.Context, bucketName string, objectKey string, lifetimeSecs int64)
 (*v4.PresignedHTTPRequest, error) {
 request, err := presigner.PresignClient.PresignGetObject(ctx,
 &s3.GetObjectInput{
  Bucket: aws.String(bucketName),
  Key:    aws.String(objectKey),
 }, func(opts *s3.PresignOptions) {
  opts.Expires = time.Duration(lifetimeSecs * int64(time.Second))
 })
 if err != nil {
  log.Printf("Couldn't get a presigned request to get %v:%v. Here's why: %v\n",
   bucketName, objectKey, err)
 }
 return request, err
}

// PutObject makes a presigned request that can be used to put an object in a
 bucket.
```

```
// The presigned request is valid for the specified number of seconds.
func (presigner Presigner) PutObject(
 ctx context.Context, bucketName string, objectKey string, lifetimeSecs int64)
 (*v4.PresignedHTTPRequest, error) {
 request, err := presigner.PresignClient.PresignPutObject(ctx,
 &s3.PutObjectInput{

 })
 if err != nil {
  log.Printf("Couldn't get a presigned post request to put %v:%v. Here's why: %v
\n", bucketName, objectKey, err)
 }
 return request, nil
}
```

Run an interactive example that generates and uses presigned URLs to upload, download, and delete an S3 object.

```
import (
 "bytes"
 "context"
 "io"
 "log"
 "mime/multipart"
 "net/http"
 "os"
 "strings"

 "github.com/aws/aws-sdk-go-v2/aws"
 "github.com/aws/aws-sdk-go-v2/service/s3"
 "github.com/awsdocs/aws-doc-sdk-examples/gov2/demotools"
 "github.com/awsdocs/aws-doc-sdk-examples/gov2/s3/actions"
)

// RunPresigningScenario is an interactive example that shows you how to get
 presigned
// HTTP requests that you can use to move data into and out of Amazon Simple
 Storage
// Service (Amazon S3). The presigned requests contain temporary credentials and
 can
// be used by an HTTP client.
```

```
//
// 1. Get a presigned request to put an object in a bucket.
// 2. Use the net/http package to use the presigned request to upload a local
 file to the bucket.
// 3. Get a presigned request to get an object from a bucket.
// 4. Use the net/http package to use the presigned request to download the
 object to a local file.
// 5. Get a presigned request to delete an object from a bucket.
// 6. Use the net/http package to use the presigned request to delete the object.
//
// This example creates an Amazon S3 presign client from the specified sdkConfig
 so that
// you can replace it with a mocked or stubbed config for unit testing.
//
// It uses a questioner from the `demotools` package to get input during the
 example.
// This package can be found in the ..\..\demotools folder of this repo.
//
// It uses an IHttpRequester interface to abstract HTTP requests so they can be
 mocked
// during testing.
func RunPresigningScenario(ctx context.Context, sdkConfig aws.Config, questioner
 demotools.IQuestioner, httpRequester IHttpRequester) {
 defer func() {
  if r := recover(); r != nil {
   log.Println("Something went wrong with the demo.")
   _, isMock := questioner.(*demotools.MockQuestioner)

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

The following shows three example of how to create presigned URLs and use the URLs with HTTP client libraries:

- An HTTP GET request that uses the URL with three HTTP client libraries
- An HTTP PUT request with metadata in headers that uses the URL with three HTTP client libraries
- An HTTP PUT request with query parameters that uses the URL with one HTTP client library

Generate a pre-signed URL for an object, then download it (GET request).

Imports.

```
import com.example.s3.util.PresignUrlUtils;
import org.slf4j.Logger;
import software.amazon.awssdk.http.HttpExecuteRequest;
import software.amazon.awssdk.http.HttpExecuteResponse;
import software.amazon.awssdk.http.SdkHttpClient;
import software.amazon.awssdk.http.SdkHttpMethod;
import software.amazon.awssdk.http.SdkHttpRequest;
import software.amazon.awssdk.http.apache.ApacheHttpClient;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.GetObjectRequest;
import software.amazon.awssdk.services.s3.model.S3Exception;
import software.amazon.awssdk.services.s3.presigner.S3Presigner;
import
 software.amazon.awssdk.services.s3.presigner.model.GetObjectPresignRequest;
import
 software.amazon.awssdk.services.s3.presigner.model.PresignedGetObjectRequest;
import software.amazon.awssdk.utils.IoUtils;

import java.io.ByteArrayOutputStream;
```

```
import java.io.File;
import java.io.IOException;
import java.io.InputStream;
import java.net.HttpURLConnection;
import java.net.URISyntaxException;
import java.net.URL;
import java.net.http.HttpClient;
import java.net.http.HttpRequest;
import java.net.http.HttpResponse;
import java.nio.file.Paths;
import java.time.Duration;
import java.util.UUID;
```

Generate the URL.

```
   /* Create a pre-signed URL to download an object in a subsequent GET request.
*/
   public String createPresignedGetUrl(String bucketName, String keyName) {
       try (S3Presigner presigner = S3Presigner.create()) {

           GetObjectRequest objectRequest = GetObjectRequest.builder()
                   .bucket(bucketName)
                   .key(keyName)
                   .build();

           GetObjectPresignRequest presignRequest =
GetObjectPresignRequest.builder()
                   .signatureDuration(Duration.ofMinutes(10))  // The URL will
expire in 10 minutes.
                   .getObjectRequest(objectRequest)
                   .build();

           PresignedGetObjectRequest presignedRequest =
presigner.presignGetObject(presignRequest);
           logger.info("Presigned URL: [{}]",
presignedRequest.url().toString());
           logger.info("HTTP method: [{}]",
presignedRequest.httpRequest().method());

           return presignedRequest.url().toExternalForm();
       }
   }
```

Download the object by using any one of the following three approaches.

Use JDK `HttpURLConnection` (since v1.1) class to do the download.

```
   /* Use the JDK HttpURLConnection (since v1.1) class to do the download. */
   public byte[] useHttpUrlConnectionToGet(String presignedUrlString) {
       ByteArrayOutputStream byteArrayOutputStream = new
ByteArrayOutputStream(); // Capture the response body to a byte array.

       try {
           URL presignedUrl = new URL(presignedUrlString);
           HttpURLConnection connection = (HttpURLConnection)
presignedUrl.openConnection();
           connection.setRequestMethod("GET");
           // Download the result of executing the request.
           try (InputStream content = connection.getInputStream()) {
               IoUtils.copy(content, byteArrayOutputStream);
           }
           logger.info("HTTP response code is " + connection.getResponseCode());

       } catch (S3Exception | IOException e) {
           logger.error(e.getMessage(), e);
       }
       return byteArrayOutputStream.toByteArray();
   }
```

Use JDK `HttpClient` (since v11) class to do the download.

```
   /* Use the JDK HttpClient (since v11) class to do the download. */
   public byte[] useHttpClientToGet(String presignedUrlString) {
       ByteArrayOutputStream byteArrayOutputStream = new
ByteArrayOutputStream(); // Capture the response body to a byte array.

       HttpRequest.Builder requestBuilder = HttpRequest.newBuilder();
       HttpClient httpClient = HttpClient.newHttpClient();
       try {
           URL presignedUrl = new URL(presignedUrlString);
           HttpResponse<InputStream> response = httpClient.send(requestBuilder
                           .uri(presignedUrl.toURI())
                           .GET()
```

```
                            .build(),
                    HttpResponse.BodyHandlers.ofInputStream());

            IoUtils.copy(response.body(), byteArrayOutputStream);

            logger.info("HTTP response code is " + response.statusCode());

        } catch (URISyntaxException | InterruptedException | IOException e) {
            logger.error(e.getMessage(), e);
        }
        return byteArrayOutputStream.toByteArray();
    }
```

Use the Amazon SDK for Java SdkHttpClient class to do the download.

```
    /* Use the AWS SDK for Java SdkHttpClient class to do the download. */
    public byte[] useSdkHttpClientToPut(String presignedUrlString) {

        ByteArrayOutputStream byteArrayOutputStream = new
ByteArrayOutputStream(); // Capture the response body to a byte array.
        try {
            URL presignedUrl = new URL(presignedUrlString);
            SdkHttpRequest request = SdkHttpRequest.builder()
                    .method(SdkHttpMethod.GET)
                    .uri(presignedUrl.toURI())
                    .build();

            HttpExecuteRequest executeRequest = HttpExecuteRequest.builder()
                    .request(request)
                    .build();

            try (SdkHttpClient sdkHttpClient = ApacheHttpClient.create()) {
                HttpExecuteResponse response =
sdkHttpClient.prepareRequest(executeRequest).call();
                response.responseBody().ifPresentOrElse(
                        abortableInputStream -> {
                            try {
                                IoUtils.copy(abortableInputStream,
byteArrayOutputStream);
                            } catch (IOException e) {
                                throw new RuntimeException(e);
                            }
```

```
                        },
                        () -> logger.error("No response body."));

                logger.info("HTTP Response code is {}",
 response.httpResponse().statusCode());
            }
        } catch (URISyntaxException | IOException e) {
            logger.error(e.getMessage(), e);
        }
        return byteArrayOutputStream.toByteArray();
    }
```

Generate a pre-signed URL with metadata in headers for an upload, then upload a file (PUT request).

presignedRequest.httpRequest().method());

           return presignedRequest.url().toExternalForm();
       }
   }
```

Upload a file object by using any one of the following three approaches.

Use the JDK `HttpURLConnection` (since v1.1) class to do the upload.

```
    /* Use the JDK HttpURLConnection (since v1.1) class to do the upload. */
    public void useHttpUrlConnectionToPut(String presignedUrlString, File
 fileToPut, Map<String, String> metadata) {
        logger.info("Begin [{}] upload", fileToPut.toString());
        try {
            URL presignedUrl = new URL(presignedUrlString);
            HttpURLConnection connection = (HttpURLConnection)
 presignedUrl.openConnection();
            connection.setDoOutput(true);
            metadata.forEach((k, v) -> connection.setRequestProperty("x-amz-
meta-" + k, v));
            connection.setRequestMethod("PUT");
            OutputStream out = connection.getOutputStream();

            try (RandomAccessFile file = new RandomAccessFile(fileToPut, "r");
                 FileChannel inChannel = file.getChannel()) {
                ByteBuffer buffer = ByteBuffer.allocate(8192); //Buffer size is
 8k

                while (inChannel.read(buffer) > 0) {
                    buffer.flip();
                    for (int i = 0; i < buffer.limit(); i++) {
                        out.write(buffer.get());
                    }
                    buffer.clear();
                }
            } catch (IOException e) {
                logger.error(e.getMessage(), e);
            }

            out.close();
            connection.getResponseCode();
            logger.info("HTTP response code is " + connection.getResponseCode());

        } catch (S3Exception | IOException e) {
            logger.error(e.getMessage(), e);
        }
    }
```

Use the JDK `HttpClient` (since v11) class to do the upload.

```
   /* Use the JDK HttpClient (since v11) class to do the upload. */
   public void useHttpClientToPut(String presignedUrlString, File fileToPut,
Map<String, String> metadata) {
       logger.info("Begin [{}] upload", fileToPut.toString());

       HttpRequest.Builder requestBuilder = HttpRequest.newBuilder();

Create a presigned URL to upload an object to a bucket.

```
import https from "node:https";

import { XMLParser } from "fast-xml-parser";
import { PutObjectCommand, S3Client } from "@aws-sdk/client-s3";
import { fromIni } from "@aws-sdk/credential-providers";
import { HttpRequest } from "@smithy/protocol-http";
```

```
import {
  getSignedUrl,
  S3RequestPresigner,
} from "@aws-sdk/s3-request-presigner";
import { parseUrl } from "@smithy/url-parser";
import { formatUrl } from "@aws-sdk/util-format-url";
import { Hash } from "@smithy/hash-node";

const createPresignedUrlWithoutClient = async ({ region, bucket, key }) => {
  const url = parseUrl(`https://${bucket}.s3.${region}.amazonaws.com/${key}`);
  const presigner = new S3RequestPresigner({
    credentials: fromIni(),
    region,
    sha256: Hash.bind(null, "sha256"),
  });

  const signedUrlObject = await presigner.presign(
    new HttpRequest({ ...url, method: "PUT" }),
  );
  return formatUrl(signedUrlObject);
};

const createPresignedUrlWithClient = ({ region, bucket, key }) => {
  const client = new S3Client({ region });
  const command = new PutObjectCommand({ Bucket: bucket, Key: key });
  return getSignedUrl(client, command, { expiresIn: 3600 });
};

/**
 * Make a PUT request to the provided URL.
 *
 * @param {string} url
 * @param {string} data
 */
const put = (url, data) => {
  return new Promise((resolve, reject) => {
    const req = https.request(
      url,
      { method: "PUT", headers: { "Content-Length": new Blob([data]).size } },
      (res) => {
        let responseBody = "";
        res.on("data", (chunk) => {
          responseBody += chunk;
        });
```

```
        res.on("end", () => {
          const parser = new XMLParser();
          if (res.statusCode >= 200 && res.statusCode <= 299) {
            resolve(parser.parse(responseBody, true));
          } else {
            reject(parser.parse(responseBody, true));
          }
        });
      },
    );
    req.on("error", (err) => {
      reject(err);
    });
    req.write(data);
    req.end();
  });
};

/**
 * Create two presigned urls for uploading an object to an S3 bucket.
 * The first presigned URL is created with credentials from the shared INI file
 * in the current environment. The second presigned URL is created using an
 * existing S3Client instance that has already been provided with credentials.
 * @param {{ bucketName: string, key: string, region: string }}
 */
export const main = async ({ bucketName, key, region }) => {
  try {
    const noClientUrl = await createPresignedUrlWithoutClient({
      bucket: bucketName,
      key,
      region,
    });

    const clientUrl = await createPresignedUrlWithClient({
      bucket: bucketName,
      region,
      key,
    });

    // After you get the presigned URL, you can provide your own file
    // data. Refer to put() above.
    console.log("Calling PUT using presigned URL without client");
    await put(noClientUrl, "Hello World");
```

```
    console.log("Calling PUT using presigned URL with client");
    await put(clientUrl, "Hello World");

    console.log("\nDone. Check your S3 console.");
  } catch (caught) {
    if (caught instanceof Error && caught.name === "CredentialsProviderError") {

    } else {
      throw caught;
    }
  }
};
```

Create a presigned URL to download an object from a bucket.

```
import { GetObjectCommand, S3Client } from "@aws-sdk/client-s3";
import { fromIni } from "@aws-sdk/credential-providers";
import { HttpRequest } from "@smithy/protocol-http";
import {
  getSignedUrl,
  S3RequestPresigner,
} from "@aws-sdk/s3-request-presigner";
import { parseUrl } from "@smithy/url-parser";
import { formatUrl } from "@aws-sdk/util-format-url";
import { Hash } from "@smithy/hash-node";

const createPresignedUrlWithoutClient = async ({ region, bucket, key }) => {
  const url = parseUrl(`https://${bucket}.s3.${region}.amazonaws.com/${key}`);
  const presigner = new S3RequestPresigner({
    credentials: fromIni(),
    region,
    sha256: Hash.bind(null, "sha256"),
  });

  const signedUrlObject = await presigner.presign(new HttpRequest(url));
  return formatUrl(signedUrlObject);
};

const createPresignedUrlWithClient = ({ region, bucket, key }) => {
```

```
  const client = new S3Client({ region });
  const command = new GetObjectCommand({ Bucket: bucket, Key: key });
  return getSignedUrl(client, command, { expiresIn: 3600 });
};

/**
 * Create two presigned urls for downloading an object from an S3 bucket.
 * The first presigned URL is created with credentials from the shared INI file
 * in the current environment. The second presigned URL is created using an
 * existing S3Client instance that has already been provided with credentials.
 * @param {{ bucketName: string, key: string, region: string }}
 */
export const main = async ({ bucketName, key, region }) => {
  try {
    const noClientUrl = await createPresignedUrlWithoutClient({
      bucket: bucketName,
      region,
      key,
    });

    const clientUrl = await createPresignedUrlWithClient({
      bucket: bucketName,
      region,
      key,
    });

    console.log("Presigned URL without client");
    console.log(noClientUrl);
    console.log("\n");

    console.log("Presigned URL with client");
    console.log(clientUrl);
  } catch (caught) {
    if (caught instanceof Error && caught.name === "CredentialsProviderError") {
      console.error(
        `There was an error getting your credentials. Are your local credentials
 configured?\n${caught.name}: ${caught.message}`,
      );
    } else {
      throw caught;
    }
  }
};
```

Create a `GetObject` presigned request and use the URL to download an object.

```
suspend fun getObjectPresigned(
    s3: S3Client,
    bucketName: String,
    keyName: String,
): String {
    // Create a GetObjectRequest.
    val unsignedRequest =
        GetObjectRequest {
            bucket = bucketName
            key = keyName
        }

    // Presign the GetObject request.
    val presignedRequest = s3.presignGetObject(unsignedRequest, 24.hours)

    // Use the URL from the presigned HttpRequest in a subsequent HTTP GET
 request to retrieve the object.
    val objectContents = URL(presignedRequest.url.toString()).readText()

    return objectContents
}
```

Create a `GetObject` presigned request with advanced options.

```
suspend fun getObjectPresignedMoreOptions(
    s3: S3Client,
    bucketName: String,
    keyName: String,
): HttpRequest {
    // Create a GetObjectRequest.
    val unsignedRequest =
        GetObjectRequest {
            bucket = bucketName
            key = keyName
        }

    // Presign the GetObject request.
    val presignedRequest =
        s3.presignGetObject(unsignedRequest, signer = CrtAwsSigner) {
            signingDate = Instant.now() + 12.hours // Presigned request can be
 used 12 hours from now.
            algorithm = AwsSigningAlgorithm.SIGV4_ASYMMETRIC
            signatureType = AwsSignatureType.HTTP_REQUEST_VIA_QUERY_PARAMS
            expiresAfter = 8.hours // Presigned request expires 8 hours later.
        }
    return presignedRequest
}
```

Create a `PutObject` presigned request and use it to upload an object.

```
suspend fun putObjectPresigned(
    s3: S3Client,
    bucketName: String,
    keyName: String,
    content: String,
) {
    // Create a PutObjectRequest.
    val unsignedRequest =
        PutObjectRequest {
            bucket = bucketName
            key = keyName
        }

    // Presign the request.
    val presignedRequest = s3.presignPutObject(unsignedRequest, 24.hours)
```

```
    // Use the URL and any headers from the presigned HttpRequest in a subsequent
 HTTP PUT request to retrieve the object.
    // Create a PUT request using the OKHttpClient API.
    val putRequest =
        Request
            .Builder()
            .url(presignedRequest.url.toString())
            .apply {
                presignedRequest.headers.forEach { key, values ->
                    header(key, values.joinToString(", "))
                }
            }.put(content.toRequestBody())
            .build()

    val response = OkHttpClient().newCall(putRequest).execute()
    assert(response.isSuccessful)
}
```

Create a photo asset management application that lets users manage photos using labels

The following code examples show how to create a serverless application that lets users manage photos using labels.

.NET

Amazon SDK for .NET

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For a deep dive into the origin of this example see the post on Amazon Community.

Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

C++

SDK for C++

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For a deep dive into the origin of this example see the post on Amazon Community.

Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition

- Amazon S3
- Amazon SNS

Java

SDK for Java 2.x

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For a deep dive into the origin of this example see the post on Amazon Community.

Services used in this example

- API Gateway
- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3
- Amazon SNS

JavaScript

SDK for JavaScript (v3)

Shows how to develop a photo asset management application that detects labels in images using Amazon Rekognition and stores them for later retrieval.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

For a deep dive into the origin of this example see the post on Amazon Community.

Services used in this example

- API Gateway

- DynamoDB
- Lambda
- Amazon Rekognition
- Amazon S3

A web page that lists Amazon S3 objects using an Amazon SDK

The following code example shows how to list Amazon S3 objects in a web page.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

The following code is the relevant React component that makes calls to the Amazon SDK. A runnable version of the application containing this component can be found at the preceding GitHub link.

```
import { useEffect, useState } from "react";
import {
  ListObjectsCommand,
  type ListObjectsCommandOutput,
  S3Client,
} from "@aws-sdk/client-s3";
import { fromCognitoIdentityPool } from "@aws-sdk/credential-providers";
import "./App.css";

function App() {
  const [objects, setObjects] = useState<
    Required<ListObjectsCommandOutput>["Contents"]
  >([]);

  useEffect(() => {
    const client = new S3Client({
      region: "us-east-1",
      // Unless you have a public bucket, you'll need access to a private bucket.
      // One way to do this is to create an Amazon Cognito identity pool, attach
 a role to the pool,
      // and grant the role access to the 's3:GetObject' action.
      //
      // You'll also need to configure the CORS settings on the bucket to allow
 traffic from
      // this example site. Here's an example configuration that allows all
 origins. Don't
      // do this in production.
      //[
```

```
      //  {
      //    "AllowedHeaders": ["*"],
      //    "AllowedMethods": ["GET"],
      //    "AllowedOrigins": ["*"],
      //    "ExposeHeaders": [],
      //  },
      //]
      //
      credentials: fromCognitoIdentityPool({
        clientConfig: { region: "us-east-1" },
        identityPoolId: "<YOUR_IDENTITY_POOL_ID>",
      }),
    });
    const command = new ListObjectsCommand({ Bucket: "bucket-name" });
    client.send(command).then(({ Contents }) => setObjects(Contents || []));
  }, []);

  return (
    <div className="App">
      {objects.map((o) => (
        <div key={o.ETag}>{o.Key}</div>
      ))}
    </div>
  );
}

export default App;
```

- For API details, see ListObjects in *Amazon SDK for JavaScript API Reference*.

Create an Amazon Textract explorer application

The following code examples show how to explore Amazon Textract output through an interactive application.

JavaScript

SDK for JavaScript (v3)

Shows how to use the Amazon SDK for JavaScript to build a React application that uses Amazon Textract to extract data from a document image and display it in an interactive web page. This example runs in a web browser and requires an authenticated Amazon Cognito identity for credentials. It uses Amazon Simple Storage Service (Amazon S3) for storage, and for notifications it polls an Amazon Simple Queue Service (Amazon SQS) queue that is subscribed to an Amazon Simple Notification Service (Amazon SNS) topic.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Cognito Identity
- Amazon S3
- Amazon SNS
- Amazon SQS
- Amazon Textract

Python

SDK for Python (Boto3)

Shows how to use the Amazon SDK for Python (Boto3) with Amazon Textract to detect text, form, and table elements in a document image. The input image and Amazon Textract output are shown in a Tkinter application that lets you explore the detected elements.

- Submit a document image to Amazon Textract and explore the output of detected elements.
- Submit images directly to Amazon Textract or through an Amazon Simple Storage Service (Amazon S3) bucket.
- Use asynchronous APIs to start a job that publishes a notification to an Amazon Simple Notification Service (Amazon SNS) topic when the job completes.
- Poll an Amazon Simple Queue Service (Amazon SQS) queue for a job completion message and display the results.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Cognito Identity
- Amazon S3
- Amazon SNS
- Amazon SQS
- Amazon Textract

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Delete all objects in a given Amazon S3 bucket using an Amazon SDK

The following code example shows how to delete all of the objects in an Amazon S3 bucket.

JavaScript

SDK for JavaScript (v3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Delete all objects for a given Amazon S3 bucket.

```
import {
  DeleteObjectsCommand,
  paginateListObjectsV2,
  S3Client,
} from "@aws-sdk/client-s3";

/**
 *
```

```
 * @param {{ bucketName: string }} config
 */
export const main = async ({ bucketName }) => {
  const client = new S3Client({});
  try {
    console.log(`Deleting all objects in bucket: ${bucketName}`);

    const paginator = paginateListObjectsV2(
      { client },
      {
        Bucket: bucketName,
      },
    );

    const objectKeys = [];
    for await (const { Contents } of paginator) {
      objectKeys.push(...Contents.map((obj) => ({ Key: obj.Key })));
    }

    const deleteCommand = new DeleteObjectsCommand({
      Bucket: bucketName,
      Delete: { Objects: objectKeys },
    });

    await client.send(deleteCommand);

    console.log(`All objects deleted from bucket: ${bucketName}`);
  } catch (caught) {
    if (caught instanceof Error) {
      console.error(
        `Failed to empty ${bucketName}. ${caught.name}: ${caught.message}`,
      );
    }
  }
};

// Call function if run directly.
import { fileURLToPath } from "node:url";
import { parseArgs } from "node:util";
if (process.argv[1] === fileURLToPath(import.meta.url)) {
  const options = {
    bucketName: {
      type: "string",
    },
```

```
  };

  const { values } = parseArgs({ options });
  main(values);
}
```

- For API details, see the following topics in *Amazon SDK for JavaScript API Reference*.
  - DeleteObjects
  - ListObjectsV2

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Delete incomplete multipart uploads to Amazon S3 using an Amazon SDK

The following code example shows how to how to delete or stop incomplete Amazon S3 multipart uploads.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

To stop multipart uploads that are in-progress or incomplete for any reason, you can get a list uploads and then delete them as shown in the following example.

```
    /**
     * Aborts all incomplete multipart uploads from the specified S3 bucket.
     * <p>
     * This method retrieves a list of all incomplete multipart uploads in the
specified S3 bucket,
     * and then aborts each of those uploads.
     */
```

```
   public static void abortIncompleteMultipartUploadsFromList() {
       ListMultipartUploadsRequest listMultipartUploadsRequest =
ListMultipartUploadsRequest.builder()
           .bucket(bucketName)
           .build();

       ListMultipartUploadsResponse response =
s3Client.listMultipartUploads(listMultipartUploadsRequest);
       List<MultipartUpload> uploads = response.uploads();

       AbortMultipartUploadRequest abortMultipartUploadRequest;
       for (MultipartUpload upload : uploads) {
           abortMultipartUploadRequest = AbortMultipartUploadRequest.builder()
               .bucket(bucketName)
               .key(upload.key())
               .expectedBucketOwner(accountId)
               .uploadId(upload.uploadId())
               .build();

           AbortMultipartUploadResponse abortMultipartUploadResponse =
s3Client.abortMultipartUpload(abortMultipartUploadRequest);
           if (abortMultipartUploadResponse.sdkHttpResponse().isSuccessful()) {
               logger.info("Upload ID [{}] to bucket [{}] successfully
aborted.", upload.uploadId(), bucketName);
           }
       }
   }
```

To delete incomplete multipart uploads that were initiated before or after a date, you can selectively delete multipart uploads based on a point in time as shown in the following example.

```
   static void abortIncompleteMultipartUploadsOlderThan(Instant pointInTime) {
       ListMultipartUploadsRequest listMultipartUploadsRequest =
ListMultipartUploadsRequest.builder()
           .bucket(bucketName)
           .build();

       ListMultipartUploadsResponse response =
s3Client.listMultipartUploads(listMultipartUploadsRequest);
       List<MultipartUpload> uploads = response.uploads();
```

```
        AbortMultipartUploadRequest abortMultipartUploadRequest;
        for (MultipartUpload upload : uploads) {
            logger.info("Found multipartUpload with upload ID [{}], initiated
 [{}]", upload.uploadId(), upload.initiated());
            if (upload.initiated().isBefore(pointInTime)) {
                abortMultipartUploadRequest =
 AbortMultipartUploadRequest.builder()
                    .bucket(bucketName)
                    .key(upload.key())
                    .expectedBucketOwner(accountId)
                    .uploadId(upload.uploadId())
                    .build();

                AbortMultipartUploadResponse abortMultipartUploadResponse =
 s3Client.abortMultipartUpload(abortMultipartUploadRequest);
                if
 (abortMultipartUploadResponse.sdkHttpResponse().isSuccessful()) {
                    logger.info("Upload ID [{}] to bucket [{}] successfully
 aborted.", upload.uploadId(), bucketName);
                }
            }
        }
    }
```

If you have access to the upload ID after you begin a multipart upload, you can delete the in-progress upload by using the ID.

```
    static void abortMultipartUploadUsingUploadId() {
        String uploadId = startUploadReturningUploadId();
        AbortMultipartUploadResponse response = s3Client.abortMultipartUpload(b -
> b
            .uploadId(uploadId)
            .bucket(bucketName)
            .key(key));

        if (response.sdkHttpResponse().isSuccessful()) {
            logger.info("Upload ID [{}] to bucket [{}] successfully aborted.",
 uploadId, bucketName);
        }
    }
```

To consistently delete incomplete multipart uploads older that a certain number of days, set up a bucket lifecycle configuration for the bucket. The following example shows how to create a rule to delete incomplete uploads older than 7 days.

```
   static void abortMultipartUploadsUsingLifecycleConfig() {
       Collection<LifecycleRule> lifeCycleRules =
List.of(LifecycleRule.builder()
           .abortIncompleteMultipartUpload(b -> b.
               daysAfterInitiation(7))
           .status("Enabled")
           .filter(SdkBuilder::build) // Filter element is required.
           .build());

       // If the action is successful, the service sends back an HTTP 200
response with an empty HTTP body.
       PutBucketLifecycleConfigurationResponse response =
s3Client.putBucketLifecycleConfiguration(b -> b
           .bucket(bucketName)
           .lifecycleConfiguration(b1 -> b1.rules(lifeCycleRules)));

       if (response.sdkHttpResponse().isSuccessful()) {
           logger.info("Rule to abort incomplete multipart uploads added to
bucket.");
       } else {
           logger.error("Unsuccessfully applied rule. HTTP status code is [{}]",
response.sdkHttpResponse().statusCode());
       }
   }
```

Detect PPE in images with Amazon Rekognition using an Amazon SDK

The following code example shows how to build an app that uses Amazon Rekognition to detect Personal Protective Equipment (PPE) in images.

Java

SDK for Java 2.x

Shows how to create an Amazon Lambda function that detects images with Personal Protective Equipment.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- DynamoDB
- Amazon Rekognition
- Amazon S3
- Amazon SES

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Detect entities in text extracted from an image using an Amazon SDK

The following code example shows how to use Amazon Comprehend to detect entities in text extracted by Amazon Textract from an image that is stored in Amazon S3.

Python

SDK for Python (Boto3)

Shows how to use the Amazon SDK for Python (Boto3) in a Jupyter notebook to detect entities in text that is extracted from an image. This example uses Amazon Textract to extract text from an image stored in Amazon Simple Storage Service (Amazon S3) and Amazon Comprehend to detect entities in the extracted text.

This example is a Jupyter notebook and must be run in an environment that can host notebooks. For instructions on how to run the example using Amazon SageMaker AI, see the directions in TextractAndComprehendNotebook.ipynb.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Comprehend
- Amazon S3
- Amazon Textract

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Detect faces in an image using an Amazon SDK

The following code example shows how to:

- Save an image in an Amazon S3 bucket.
- Use Amazon Rekognition to detect facial details, such as age range, gender, and emotion (such as smiling).
- Display those details.

Rust

SDK for Rust

Save the image in an Amazon S3 bucket with an **uploads** prefix, use Amazon Rekognition to detect facial details, such as age range, gender, and emotion (smiling, etc.), and display those details.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition

- Amazon S3

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Detect objects in images with Amazon Rekognition using an Amazon SDK

The following code examples show how to build an app that uses Amazon Rekognition to detect objects by category in images.

.NET

Amazon SDK for .NET

Shows how to use Amazon Rekognition .NET API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

Java

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

JavaScript

SDK for JavaScript (v3)

Shows how to use Amazon Rekognition with the Amazon SDK for JavaScript to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

Learn how to:

- Create an unauthenticated user using Amazon Cognito.
- Analyze images for objects using Amazon Rekognition.
- Verify an email address for Amazon SES.
- Send an email notification using Amazon SES.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

Kotlin

SDK for Kotlin

Shows how to use Amazon Rekognition Kotlin API to create an app that uses Amazon Rekognition to identify objects by category in images located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

Python

SDK for Python (Boto3)

Shows you how to use the Amazon SDK for Python (Boto3) to create a web application that lets you do the following:

- Upload photos to an Amazon Simple Storage Service (Amazon S3) bucket.
- Use Amazon Rekognition to analyze and label the photos.
- Use Amazon Simple Email Service (Amazon SES) to send email reports of image analysis.

This example contains two main components: a webpage written in JavaScript that is built with React, and a REST service written in Python that is built with Flask-RESTful.

You can use the React webpage to:

- Display a list of images that are stored in your S3 bucket.
- Upload images from your computer to your S3 bucket.
- Display images and labels that identify items that are detected in the image.
- Get a report of all images in your S3 bucket and send an email of the report.

The webpage calls the REST service. The service sends requests to Amazon to perform the following actions:

- Get and filter the list of images in your S3 bucket.
- Upload photos to your S3 bucket.
- Use Amazon Rekognition to analyze individual photos and get a list of labels that identify items that are detected in the photo.
- Analyze all photos in your S3 bucket and use Amazon SES to email a report.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Detect people and objects in a video with Amazon Rekognition using an Amazon SDK

The following code examples show how to detect people and objects in a video with Amazon Rekognition.

Java

SDK for Java 2.x

Shows how to use Amazon Rekognition Java API to create an app to detect faces and objects in videos located in an Amazon Simple Storage Service (Amazon S3) bucket. The app sends the admin an email notification with the results using Amazon Simple Email Service (Amazon SES).

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES
- Amazon SNS
- Amazon SQS

Python

SDK for Python (Boto3)

Use Amazon Rekognition to detect faces, objects, and people in videos by starting asynchronous detection jobs. This example also configures Amazon Rekognition to notify an Amazon Simple Notification Service (Amazon SNS) topic when jobs complete and subscribes an Amazon Simple Queue Service (Amazon SQS) queue to the topic. When the queue receives a message about a job, the job is retrieved and the results are output.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- Amazon Rekognition
- Amazon S3
- Amazon SES
- Amazon SNS
- Amazon SQS

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Download S3 'directories' from an Amazon Simple Storage Service (Amazon S3) bucket

The following code example shows how to download and filter the contents of Amazon S3 bucket 'directories'.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

This example show how to use the S3TransferManager in the Amazon SDK for Java 2.x to download 'directories' from an Amazon S3 bucket. It also demonstrates how to use DownloadFilters in the request.

```
   /**
    * For standard buckets, S3 provides the illusion of a directory structure
through the use of keys. When you upload
    * an object to an S3 bucket, you specify a key, which is essentially the
"path" to the object. The key can contain
    * forward slashes ("/") to make it appear as if the object is stored in a
directory structure, but this is just a
    * logical representation, not an actual directory.
    * <p><pre>
    * In this example, our S3 bucket contains the following objects:
    *
    * folder1/file1.txt
    * folder1/file2.txt
    * folder1/file3.txt
    * folder2/file1.txt
    * folder2/file2.txt
    * folder2/file3.txt
    * folder3/file1.txt
    * folder3/file2.txt
    * folder3/file3.txt
    *
    * When method `downloadS3Directories` is invoked with
    * `destinationPathURI` set to `/test`, the downloaded
    * directory looks like:
    *
    * |- test
    *    |- folder1
    *       |- file1.txt
    *       |- file2.txt
    *       |- file3.txt
    *    |- folder3
    *       |- file1.txt
    *       |- file2.txt
    *       |- file3.txt
    * </pre>
    *
    * @param transferManager    An S3TransferManager instance.
    * @param destinationPathURI local directory to hold the downloaded S3
'directories' and files.
```

```
    * @param bucketName         The S3 bucket that contains the 'directories' to
 download.
    * @return The number of objects (files, in this case) that were downloaded.
    */
   public Integer downloadS3Directories(S3TransferManager transferManager,
                                        URI destinationPathURI, String
 bucketName) {

       // Define the filters for which 'directories' we want to download.
       DownloadFilter folder1Filter = (S3Object s3Object) ->
 s3Object.key().startsWith("folder1/");
       DownloadFilter folder3Filter = (S3Object s3Object) ->
 s3Object.key().startsWith("folder3/");
       DownloadFilter folderFilter = s3Object ->
 folder1Filter.or(folder3Filter).test(s3Object);

       DirectoryDownload directoryDownload =
 transferManager.downloadDirectory(DownloadDirectoryRequest.builder()

Get an Amazon S3 object from a Multi-Region Access Point by using an Amazon SDK

The following code example shows how to get an object from a Multi-Region Access Point.

Kotlin

SDK for Kotlin

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Configure the S3 client to use the Asymmetric Sigv4 (Sigv4a) signing algorithm.

```
        suspend fun createS3Client(): S3Client {
            // Configure your S3Client to use the Asymmetric SigV4 (SigV4a)
signing algorithm.
            val sigV4aScheme = SigV4AsymmetricAuthScheme(DefaultAwsSigner)
            val s3 = S3Client.fromEnvironment {
                authSchemes = listOf(sigV4aScheme)
            }
            return s3
        }
```

Use the Multi-Region Access Point ARN instead of a bucket name to retrieve the object.

```
    suspend fun getObjectFromMrap(
        s3: S3Client,
        mrapArn: String,
        keyName: String,
    ): String? {
        val request = GetObjectRequest {
            bucket = mrapArn // Use the ARN instead of the bucket name for object
operations.
            key = keyName
        }

        var stringObj: String? = null
```

```
        s3.getObject(request) { resp ->
            stringObj = resp.body?.decodeToString()
            if (stringObj != null) {
                println("Successfully read $keyName from $mrapArn")
            }
        }
        return stringObj
    }
```

- For more information, see Amazon SDK for Kotlin developer guide.
- For API details, see GetObject in *Amazon SDK for Kotlin API reference*.

Work with Amazon S3 object lock features using an Amazon SDK

The following code examples show how to work with S3 object lock features.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Run an interactive scenario demonstrating Amazon S3 object lock features.

```
using Amazon.S3;
using Amazon.S3.Model;
using Microsoft.Extensions.Configuration;
using Microsoft.Extensions.DependencyInjection;
using Microsoft.Extensions.Hosting;
using Microsoft.Extensions.Logging;
using Microsoft.Extensions.Logging.Console;
using Microsoft.Extensions.Logging.Debug;
```

```
namespace S3ObjectLockScenario;

public static class S3ObjectLockWorkflow
{
    /*
    Before running this .NET code example, set up your development environment,
 including your credentials.

    This .NET example performs the following tasks:
        1. Create test Amazon Simple Storage Service (S3) buckets with different
 lock policies.
        2. Upload sample objects to each bucket.
        3. Set some Legal Hold and Retention Periods on objects and buckets.
        4. Investigate lock policies by viewing settings or attempting to delete
 or overwrite objects.
        5. Clean up objects and buckets.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Run an interactive scenario demonstrating Amazon S3 object lock features.

```
import software.amazon.awssdk.services.s3.model.ObjectLockLegalHold;
import software.amazon.awssdk.services.s3.model.ObjectLockRetention;
import java.io.BufferedWriter;
import java.io.IOException;
```

```
import java.util.ArrayList;
import java.util.List;
import java.util.Scanner;
import java.util.stream.Collectors;

/*
 Before running this Java V2 code example, set up your development
 environment, including your credentials.

 For more information, see the following documentation topic:
 https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/setup.html

 This Java example performs the following tasks:
    1. Create test Amazon Simple Storage Service (S3) buckets with different lock
 policies.
    2. Upload sample objects to each bucket.
    3. Set some Legal Hold and Retention Periods on objects and buckets.
    4. Investigate lock policies by viewing settings or attempting to delete or
 overwrite objects.
    5. Clean up objects and buckets.

Make Amazon S3 conditional requests using an Amazon SDK

The following code examples show how to add preconditions to Amazon S3 requests.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Run an interactive scenario demonstrating Amazon S3 conditional request features.

```
using Amazon.S3;
using Microsoft.Extensions.Configuration;
using Microsoft.Extensions.DependencyInjection;
using Microsoft.Extensions.Hosting;
using Microsoft.Extensions.Logging;
using Microsoft.Extensions.Logging.Console;
using Microsoft.Extensions.Logging.Debug;

namespace S3ConditionalRequestsScenario;

public static class S3ConditionalRequestsScenario
{
    /*
```

```
   Before running this .NET code example, set up your development environment,
including your credentials.

   This example demonstrates the use of conditional requests for S3 operations.
   You can use conditional requests to add preconditions to S3 read requests to
return or copy
   an object based on its Entity tag (ETag), or last modified date.
   You can use a conditional write requests to prevent overwrites by ensuring
   there is no existing object with the same key.

Manage versioned Amazon S3 objects in batches with a Lambda function using an Amazon SDK

The following code example shows how to manage versioned S3 objects in batches with a Lambda function.

Python

SDK for Python (Boto3)

Shows how to manipulate Amazon Simple Storage Service (Amazon S3) versioned objects in batches by creating jobs that call Amazon Lambda functions to perform processing. This example creates a version-enabled bucket, uploads the stanzas from the poem *You Are Old, Father William* by Lewis Carroll, and uses Amazon S3 batch jobs to twist the poem in various ways.

Learn how to:

- Create Lambda functions that operate on versioned objects.
- Create a manifest of objects to update.
- Create batch jobs that invoke Lambda functions to update objects.
- Delete Lambda functions.
- Empty and delete a versioned bucket.

This example is best viewed on GitHub. For complete source code and instructions on how to set up and run, see the full example on GitHub.

Receive and process Amazon S3 event notifications by using an Amazon SDK

The following code example shows how to work with S3 event notifications in an object-oriented way.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

This example show how to process S3 notification event by using Amazon SQS.

```
    /**
     * This method receives S3 event notifications by using an SqsAsyncClient.
     * After the client receives the messages it deserializes the JSON payload
 and logs them. It uses
     * the S3EventNotification class (part of the S3 event notification API for
 Java) to deserialize
     * the JSON payload and access the messages in an object-oriented way.
     *
     * @param queueUrl The URL of the AWS SQS queue that receives the S3 event
 notifications.
     * @see <a href="https://sdk.amazonaws.com/java/api/latest/software/amazon/
awssdk/eventnotifications/s3/model/package-summary.html">S3EventNotification
 API</a>.
     * <p>
```

```
    * To use S3 event notification serialization/deserialization to objects, add
the following
    * dependency to your Maven pom.xml file.
    * <dependency>
    * <groupId>software.amazon.awssdk</groupId>
    * <artifactId>s3-event-notifications</artifactId>
    * <version><LATEST></version>
    * </dependency>
    * <p>
    * The S3 event notification API became available with version 2.25.11 of the
Java SDK.
    * <p>
    * This example shows the use of the API with AWS SQS, but it can be used to
process S3 event notifications
    * in AWS SNS or AWS Lambda as well.
    * <p>
    * Note: The S3EventNotification class does not work with messages routed
through AWS EventBridge.
    */
   static void processS3Events(String bucketName, String queueUrl, String
queueArn) {
       try {
           // Configure the bucket to send Object Created and Object Tagging
notifications to an existing SQS queue.

Save EXIF and other image information using an Amazon SDK

The following code example shows how to:

- Get EXIF information from a a JPG, JPEG, or PNG file.
- Upload the image file to an Amazon S3 bucket.
- Use Amazon Rekognition to identify the three top attributes (labels) in the file.
- Add the EXIF and label information to an Amazon DynamoDB table in the Region.

Rust

SDK for Rust

Get EXIF information from a JPG, JPEG, or PNG file, upload the image file to an Amazon S3 bucket, use Amazon Rekognition to identify the three top attributes (*labels* in Amazon Rekognition) in the file, and add the EXIF and label information to a Amazon DynamoDB table in the Region.

For complete source code and instructions on how to set up and run, see the full example on GitHub.

Services used in this example

- DynamoDB
- Amazon Rekognition

Send S3 event notifications to Amazon EventBridge using an Amazon SDK

The following code example shows how to enable a bucket to send S3 event notifications to EventBridge and route notifications to an Amazon SNS topic and Amazon SQS queue.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
   /** This method configures a bucket to send events to AWS EventBridge and
creates a rule
    * to route the S3 object created events to a topic and a queue.
```

```
    *
    * @param bucketName Name of existing bucket
    * @param topicArn ARN of existing topic to receive S3 event notifications
    * @param queueArn ARN of existing queue to receive S3 event notifications
    *
    *  An AWS CloudFormation stack sets up the bucket, queue, topic before the
method runs.
    */
   public static String setBucketNotificationToEventBridge(String bucketName,
String topicArn, String queueArn) {
       try {
           // Enable bucket to emit S3 Event notifications to EventBridge.
           s3Client.putBucketNotificationConfiguration(b -> b
                   .bucket(bucketName)
                   .notificationConfiguration(b1 -> b1
                           .eventBridgeConfiguration(
                                   SdkBuilder::build)
                   ).build()).join();

           // Create an EventBridge rule to route Object Created notifications.
           PutRuleRequest putRuleRequest = PutRuleRequest.builder()
                   .name(RULE_NAME)
                   .eventPattern("""
                           {
                             "source": ["aws.s3"],
                             "detail-type": ["Object Created"],
                             "detail": {
                               "bucket": {

Track an Amazon S3 object upload or download using an Amazon SDK

The following code example shows how to track an Amazon S3 object upload or download.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Track the progress of a file upload.

```
   public void trackUploadFile(S3TransferManager transferManager, String
bucketName,
                               String key, URI filePathURI) {
       UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
               .putObjectRequest(b -> b.bucket(bucketName).key(key))
               .addTransferListener(LoggingTransferListener.create())  // Add
listener.
               .source(Paths.get(filePathURI))
               .build();

       FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);

       fileUpload.completionFuture().join();
       /*
           The SDK provides a LoggingTransferListener implementation of the
TransferListener interface.
           You can also implement the interface to provide your own logic.

           Configure log4J2 with settings such as the following.
               <Configuration status="WARN">
                   <Appenders>
                       <Console name="AlignedConsoleAppender"
target="SYSTEM_OUT">
                           <PatternLayout pattern="%m%n"/>
                       </Console>
                   </Appenders>

                   <Loggers>
                       <logger
name="software.amazon.awssdk.transfer.s3.progress.LoggingTransferListener"
level="INFO" additivity="false">
```

```
                        <AppenderRef ref="AlignedConsoleAppender"/>
                    </logger>
                </Loggers>
            </Configuration>

           Log4J2 logs the progress. The following is example output for a 21.3
MB file upload.
            Transfer initiated...
            |                    | 0.0%
            |====                | 21.1%
            |============        | 60.5%
            |====================| 100.0%
            Transfer complete!
       */
   }
```

Track the progress of a file download.

```
   public void trackDownloadFile(S3TransferManager transferManager, String
bucketName,
                             String key, String downloadedFileWithPath) {
       DownloadFileRequest downloadFileRequest = DownloadFileRequest.builder()
               .getObjectRequest(b -> b.bucket(bucketName).key(key))
               .addTransferListener(LoggingTransferListener.create())  // Add
listener.
               .destination(Paths.get(downloadedFileWithPath))
               .build();

       FileDownload downloadFile =
transferManager.downloadFile(downloadFileRequest);

       CompletedFileDownload downloadResult =
downloadFile.completionFuture().join();
       /*
           The SDK provides a LoggingTransferListener implementation of the
TransferListener interface.
           You can also implement the interface to provide your own logic.

           Configure log4J2 with settings such as the following.
               <Configuration status="WARN">
                   <Appenders>
```

```
                        <Console name="AlignedConsoleAppender"
target="SYSTEM_OUT">
                            <PatternLayout pattern="%m%n"/>
                        </Console>
                    </Appenders>

                    <Loggers>
                        <logger
name="software.amazon.awssdk.transfer.s3.progress.LoggingTransferListener"
level="INFO" additivity="false">
                            <AppenderRef ref="AlignedConsoleAppender"/>
                        </logger>
                    </Loggers>
                </Configuration>

            Log4J2 logs the progress. The following is example output for a 21.3
MB file download.
                Transfer initiated...
                |=======             | 39.4%
                |===============     | 78.8%
                |====================| 100.0%
                Transfer complete!
        */
    }
```

Recursively upload a local directory to an Amazon Simple Storage Service (Amazon S3) bucket

The following code example shows how to upload a local directory recursively to an Amazon Simple Storage Service (Amazon S3) bucket.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Use an S3TransferManager to upload a local directory. View the complete file and test.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.services.s3.model.ObjectIdentifier;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.CompletedDirectoryUpload;
import software.amazon.awssdk.transfer.s3.model.DirectoryUpload;
import software.amazon.awssdk.transfer.s3.model.UploadDirectoryRequest;

import java.net.URI;
import java.net.URISyntaxException;
```

```
import java.net.URL;
import java.nio.file.Paths;
import java.util.UUID;

    public Integer uploadDirectory(S3TransferManager transferManager,
            URI sourceDirectory, String bucketName) {
        DirectoryUpload directoryUpload =
 transferManager.uploadDirectory(UploadDirectoryRequest.builder()
                .source(Paths.get(sourceDirectory))
                .bucket(bucketName)
                .build());

        CompletedDirectoryUpload completedDirectoryUpload =
 directoryUpload.completionFuture().join();
        completedDirectoryUpload.failedTransfers()
                .forEach(fail -> logger.warn("Object [{}] failed to transfer",
 fail.toString()));
        return completedDirectoryUpload.failedTransfers().size();
    }
```

Upload or download large files to and from Amazon S3 using an Amazon SDK

The following code examples show how to upload or download large files to and from Amazon S3.

For more information, see Uploading an object using multipart upload.

.NET

Amazon SDK for .NET

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Call functions that transfer files to and from an S3 bucket using the Amazon S3 TransferUtility.

```
global using System.Text;
global using Amazon.S3;
global using Amazon.S3.Model;
global using Amazon.S3.Transfer;
global using TransferUtilityBasics;

// This Amazon S3 client uses the default user credentials
// defined for this computer.
using Microsoft.Extensions.Configuration;

IAmazonS3 client = new AmazonS3Client();
var transferUtil = new TransferUtility(client);
IConfiguration _configuration;

_configuration = new ConfigurationBuilder()
    .SetBasePath(Directory.GetCurrentDirectory())
    .AddJsonFile("settings.json") // Load test settings from JSON file.
    .AddJsonFile("settings.local.json",
        true) // Optionally load local settings.
    .Build();

// Edit the values in settings.json to use an S3 bucket and files that
// exist on your AWS account and on the local computer where you
// run this scenario.
var bucketName = _configuration["BucketName"];
var localPath =
 $"{Environment.GetFolderPath(Environment.SpecialFolder.ApplicationData)}\
\TransferFolder";

DisplayInstructions();

PressEnter();

Console.WriteLine();

// Upload a single file to an S3 bucket.
DisplayTitle("Upload a single file");
```

```
var fileToUpload = _configuration["FileToUpload"];
Console.WriteLine($"Uploading {fileToUpload} to the S3 bucket, {bucketName}.");

var success = await TransferMethods.UploadSingleFileAsync(transferUtil,
 bucketName, fileToUpload, localPath);
if (success)
{
    Console.WriteLine($"Successfully uploaded the file, {fileToUpload} to
 {bucketName}.");
}

PressEnter();

// Upload a local directory to an S3 bucket.
DisplayTitle("Upload all files from a local directory");

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Call functions that transfer files to and from an S3 bucket using the S3TransferManager.

```
    public Integer downloadObjectsToDirectory(S3TransferManager transferManager,
            URI destinationPathURI, String bucketName) {
        DirectoryDownload directoryDownload =
transferManager.downloadDirectory(DownloadDirectoryRequest.builder()
                .destination(Paths.get(destinationPathURI))
                .bucket(bucketName)
                .build());
        CompletedDirectoryDownload completedDirectoryDownload =
 directoryDownload.completionFuture().join();

        completedDirectoryDownload.failedTransfers()
                .forEach(fail -> logger.warn("Object [{}] failed to transfer",
 fail.toString()));
        return completedDirectoryDownload.failedTransfers().size();
    }
```

Upload an entire local directory.

```
   public Integer uploadDirectory(S3TransferManager transferManager,
           URI sourceDirectory, String bucketName) {
       DirectoryUpload directoryUpload =
transferManager.uploadDirectory(UploadDirectoryRequest.builder()
               .source(Paths.get(sourceDirectory))
               .bucket(bucketName)
               .build());

       CompletedDirectoryUpload completedDirectoryUpload =
directoryUpload.completionFuture().join();
       completedDirectoryUpload.failedTransfers()
               .forEach(fail -> logger.warn("Object [{}] failed to transfer",
fail.toString()));
       return completedDirectoryUpload.failedTransfers().size();
   }
```

Upload a single file.

```
   public String uploadFile(S3TransferManager transferManager, String
bucketName,
                            String key, URI filePathURI) {
       UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
           .putObjectRequest(b -> b.bucket(bucketName).key(key))
           .source(Paths.get(filePathURI))
           .build();

       FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);

       CompletedFileUpload uploadResult = fileUpload.completionFuture().join();
       return uploadResult.response().eTag();
   }
```

The code examples use the following imports.

```

import software.amazon.awssdk.services.s3.model.UploadPartResponse;
import software.amazon.awssdk.services.s3.waiters.S3Waiter;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.FileUpload;
import software.amazon.awssdk.transfer.s3.model.UploadFileRequest;

import java.io.IOException;
import java.io.RandomAccessFile;
import java.net.URISyntaxException;
import java.net.URL;
import java.nio.ByteBuffer;
import java.nio.file.Paths;
import java.util.ArrayList;
import java.util.List;
import java.util.Objects;
import java.util.UUID;
import java.util.concurrent.CompletableFuture;
```

Use the S3 Transfer Manager on top of the Amazon CRT-based S3 client to transparently perform a multipart upload when the size of the content exceeds a threshold. The default threshold size is 8 MB.

```
    /**
     * Uploads a file to an Amazon S3 bucket using the S3TransferManager.
     *
     * @param filePath the file path of the file to be uploaded
     */
    public void multipartUploadWithTransferManager(String filePath) {
        S3TransferManager transferManager = S3TransferManager.create();
        UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
            .putObjectRequest(b -> b
                .bucket(bucketName)
                .key(key))
            .source(Paths.get(filePath))
            .build();
        FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);
```

```
        fileUpload.completionFuture().join();
        transferManager.close();
    }
```

Use the S3Client API to perform a multipart upload.

```
    /**
     * Performs a multipart upload to Amazon S3 using the provided S3 client.
     *
     * @param filePath the path to the file to be uploaded
     */
    public void multipartUploadWithS3Client(String filePath) {

        // Initiate the multipart upload.
        CreateMultipartUploadResponse createMultipartUploadResponse =
s3Client.createMultipartUpload(b -> b
            .bucket(bucketName)
            .key(key));
        String uploadId = createMultipartUploadResponse.uploadId();

        // Upload the parts of the file.
        int partNumber = 1;
        List<CompletedPart> completedParts = new ArrayList<>();
        ByteBuffer bb = ByteBuffer.allocate(1024 * 1024 * 5); // 5 MB byte buffer

        try (RandomAccessFile file = new RandomAccessFile(filePath, "r")) {
            long fileSize = file.length();
            long position = 0;
            while (position < fileSize) {
                file.seek(position);
                long read = file.getChannel().read(bb);

                bb.flip(); // Swap position and limit before reading from the
buffer.
                UploadPartRequest uploadPartRequest = UploadPartRequest.builder()
                    .bucket(bucketName)
                    .key(key)
                    .uploadId(uploadId)
                    .partNumber(partNumber)
                    .build();

                UploadPartResponse partResponse = s3Client.uploadPart(
```

```
                    uploadPartRequest,
                    RequestBody.fromByteBuffer(bb));

                CompletedPart part = CompletedPart.builder()
                    .partNumber(partNumber)
                    .eTag(partResponse.eTag())
                    .build();
                completedParts.add(part);

                bb.clear();
                position += read;
                partNumber++;
            }
        } catch (IOException e) {
            logger.error(e.getMessage());
        }

        // Complete the multipart upload.
        s3Client.completeMultipartUpload(b -> b
            .bucket(bucketName)
            .key(key)
            .uploadId(uploadId)

.multipartUpload(CompletedMultipartUpload.builder().parts(completedParts).build()));
    }
```

Use the S3AsyncClient API with multipart support enabled to perform a multipart upload.

```
    /**
     * Uploads a file to an S3 bucket using the S3AsyncClient and enabling
multipart support.
     *
     * @param filePath the local file path of the file to be uploaded
     */
    public void multipartUploadWithS3AsyncClient(String filePath) {

Upload a stream of unknown size to an Amazon S3 object using an Amazon SDK

The following code examples show how to upload a stream of unknown size to an Amazon S3 object.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Use the Amazon CRT-based S3 Client.

```
import com.example.s3.util.AsyncExampleUtils;
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.async.AsyncRequestBody;
import software.amazon.awssdk.core.async.BlockingInputStreamAsyncRequestBody;
import software.amazon.awssdk.core.exception.SdkException;
import software.amazon.awssdk.services.s3.S3AsyncClient;
import software.amazon.awssdk.services.s3.model.PutObjectResponse;

import java.io.ByteArrayInputStream;
import java.util.UUID;
import java.util.concurrent.CompletableFuture;

    /**
```

```
     * @param s33CrtAsyncClient - To upload content from a stream of unknown
 size, use the AWS CRT-based S3 client. For more information, see
     *                           https://docs.aws.amazon.com/sdk-for-java/latest/
developer-guide/crt-based-s3-client.html.
     * @param bucketName - The name of the bucket.
     * @param key - The name of the object.
     * @return software.amazon.awssdk.services.s3.model.PutObjectResponse -
 Returns metadata pertaining to the put object operation.
     */
    public PutObjectResponse putObjectFromStream(S3AsyncClient s33CrtAsyncClient,
 String bucketName, String key) {

        BlockingInputStreamAsyncRequestBody body =
                AsyncRequestBody.forBlockingInputStream(null); // 'null'
 indicates a stream will be provided later.

        CompletableFuture<PutObjectResponse> responseFuture =
                s33CrtAsyncClient.putObject(r -> r.bucket(bucketName).key(key),
 body);

        // AsyncExampleUtils.randomString() returns a random string up to 100
 characters.
        String randomString = AsyncExampleUtils.randomString();
        logger.info("random string to upload: {}: length={}", randomString,
 randomString.length());

        // Provide the stream of data to be uploaded.
        body.writeInputStream(new ByteArrayInputStream(randomString.getBytes()));

        PutObjectResponse response = responseFuture.join(); // Wait for the
 response.
        logger.info("Object {} uploaded to bucket {}.", key, bucketName);
        return response;
    }
}
```

Use the Amazon S3 Transfer Manager.

```
import com.example.s3.util.AsyncExampleUtils;
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.async.AsyncRequestBody;
```

```
import software.amazon.awssdk.core.async.BlockingInputStreamAsyncRequestBody;
import software.amazon.awssdk.core.exception.SdkException;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.CompletedUpload;
import software.amazon.awssdk.transfer.s3.model.Upload;

import java.io.ByteArrayInputStream;
import java.util.UUID;

    /**
     * @param transferManager - To upload content from a stream of unknown size,
 use the S3TransferManager based on the AWS CRT-based S3 client.
     *                        For more information, see https://
docs.aws.amazon.com/sdk-for-java/latest/developer-guide/transfer-manager.html.
     * @param bucketName - The name of the bucket.
     * @param key - The name of the object.
     * @return - software.amazon.awssdk.transfer.s3.model.CompletedUpload - The
 result of the completed upload.
     */
    public CompletedUpload uploadStream(S3TransferManager transferManager, String
 bucketName, String key) {

        BlockingInputStreamAsyncRequestBody body =
                AsyncRequestBody.forBlockingInputStream(null); // 'null'
 indicates a stream will be provided later.

        Upload upload = transferManager.upload(builder -> builder
                .requestBody(body)
                .putObjectRequest(req -> req.bucket(bucketName).key(key))
                .build());

        // AsyncExampleUtils.randomString() returns a random string up to 100
 characters.
        String randomString = AsyncExampleUtils.randomString();
        logger.info("random string to upload: {}: length={}", randomString,
 randomString.length());

        // Provide the stream of data to be uploaded.
        body.writeInputStream(new ByteArrayInputStream(randomString.getBytes()));

        return upload.completionFuture().join();
    }
}
```

Use checksums to work with an Amazon S3 object using an Amazon SDK

The following code example shows how to use checksums to work with an Amazon S3 object.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

The code examples use a subset of the following imports.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.core.exception.SdkException;
import software.amazon.awssdk.core.sync.RequestBody;
import software.amazon.awssdk.services.s3.S3Client;
import software.amazon.awssdk.services.s3.model.ChecksumAlgorithm;
import software.amazon.awssdk.services.s3.model.ChecksumMode;
import software.amazon.awssdk.services.s3.model.CompletedMultipartUpload;
import software.amazon.awssdk.services.s3.model.CompletedPart;
import software.amazon.awssdk.services.s3.model.CreateMultipartUploadResponse;
import software.amazon.awssdk.services.s3.model.GetObjectResponse;
import software.amazon.awssdk.services.s3.model.UploadPartRequest;
import software.amazon.awssdk.services.s3.model.UploadPartResponse;
import software.amazon.awssdk.services.s3.waiters.S3Waiter;
import software.amazon.awssdk.transfer.s3.S3TransferManager;
import software.amazon.awssdk.transfer.s3.model.FileUpload;
import software.amazon.awssdk.transfer.s3.model.UploadFileRequest;

import java.io.FileInputStream;
import java.io.IOException;
import java.io.RandomAccessFile;
import java.net.URISyntaxException;
import java.net.URL;
import java.nio.ByteBuffer;
import java.nio.file.Paths;
import java.security.DigestInputStream;
import java.security.MessageDigest;
import java.security.NoSuchAlgorithmException;
import java.util.ArrayList;
import java.util.Base64;
```

```
import java.util.List;
import java.util.Objects;
import java.util.UUID;
```

Specify a checksum algorithm for the `putObject` method when you build the `PutObjectRequest`.

```
    public void putObjectWithChecksum() {
        s3Client.putObject(b -> b
                .bucket(bucketName)
                .key(key)
                .checksumAlgorithm(ChecksumAlgorithm.CRC32),
            RequestBody.fromString("This is a test"));
    }
```

Verify the checksum for the `getObject` method when you build the GetObjectRequest.

```
    public GetObjectResponse getObjectWithChecksum() {
        return s3Client.getObject(b -> b
                .bucket(bucketName)
                .key(key)
                .checksumMode(ChecksumMode.ENABLED))
            .response();
    }
```

Pre-calculate a checksum for the `putObject` method when you build the `PutObjectRequest`.

```
    public void putObjectWithPrecalculatedChecksum(String filePath) {
        String checksum = calculateChecksum(filePath, "SHA-256");

        s3Client.putObject((b -> b
                .bucket(bucketName)
                .key(key)
                .checksumSHA256(checksum)),
            RequestBody.fromFile(Paths.get(filePath)));
    }
```

Use the S3 Transfer Manager on top of the Amazon CRT-based S3 client to transparently perform a multipart upload when the size of the content exceeds a threshold. The default threshold size is 8 MB.

You can specify a checksum algorithm for the SDK to use. By default, the SDK uses the CRC32 algorithm.

```
    public void multipartUploadWithChecksumTm(String filePath) {
        S3TransferManager transferManager = S3TransferManager.create();
        UploadFileRequest uploadFileRequest = UploadFileRequest.builder()
            .putObjectRequest(b -> b
                .bucket(bucketName)
                .key(key)
                .checksumAlgorithm(ChecksumAlgorithm.SHA1))
            .source(Paths.get(filePath))
            .build();
        FileUpload fileUpload = transferManager.uploadFile(uploadFileRequest);
        fileUpload.completionFuture().join();
        transferManager.close();
    }
```

Use the S3Client API or (S3AsyncClient API) to perform a multipart upload. If you specify an additional checksum, you must specify the algorithm to use on the initiation of the upload. You must also specify the algorithm for each part request and provide the checksum calculated for each part after it is uploaded.

```
    public void multipartUploadWithChecksumS3Client(String filePath) {
        ChecksumAlgorithm algorithm = ChecksumAlgorithm.CRC32;

        // Initiate the multipart upload.
        CreateMultipartUploadResponse createMultipartUploadResponse =
s3Client.createMultipartUpload(b -> b
            .bucket(bucketName)
            .key(key)
            .checksumAlgorithm(algorithm)); // Checksum specified on initiation.
        String uploadId = createMultipartUploadResponse.uploadId();

        // Upload the parts of the file.
        int partNumber = 1;
        List<CompletedPart> completedParts = new ArrayList<>();
        ByteBuffer bb = ByteBuffer.allocate(1024 * 1024 * 5); // 5 MB byte buffer
```

```
        try (RandomAccessFile file = new RandomAccessFile(filePath, "r")) {
            long fileSize = file.length();
            long position = 0;
            while (position < fileSize) {
                file.seek(position);
                long read = file.getChannel().read(bb);

                bb.flip(); // Swap position and limit before reading from the
buffer.
                UploadPartRequest uploadPartRequest = UploadPartRequest.builder()
                    .bucket(bucketName)
                    .key(key)
                    .uploadId(uploadId)
                    .checksumAlgorithm(algorithm) // Checksum specified on each
part.
                    .partNumber(partNumber)
                    .build();

                UploadPartResponse partResponse = s3Client.uploadPart(
                    uploadPartRequest,
                    RequestBody.fromByteBuffer(bb));

                CompletedPart part = CompletedPart.builder()
                    .partNumber(partNumber)
                    .checksumCRC32(partResponse.checksumCRC32()) // Provide the
calculated checksum.
                    .eTag(partResponse.eTag())
                    .build();
                completedParts.add(part);

                bb.clear();
                position += read;
                partNumber++;
            }
        } catch (IOException e) {
            System.err.println(e.getMessage());
        }

        // Complete the multipart upload.
        s3Client.completeMultipartUpload(b -> b
            .bucket(bucketName)
            .key(key)
            .uploadId(uploadId)
```

```
.multipartUpload(CompletedMultipartUpload.builder().parts(completedParts).build()));
    }
```

Work with Amazon S3 object integrity features using an Amazon SDK

The following code example shows how to work with S3 object integrity features.

C++

SDK for C++

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Run an interactive scenario demonstrating Amazon S3 object integrity features.

```

Work with Amazon S3 versioned objects using an Amazon SDK

The following code example shows how to:

- Create a versioned S3 bucket.
- Get all versions of an object.
- Roll an object back to a previous version.
- Delete and restore a versioned object.
- Permanently delete all versions of an object.

Python

SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Create functions that wrap S3 actions.

```
def create_versioned_bucket(bucket_name, prefix):
    """
    Creates an Amazon S3 bucket, enables it for versioning, and configures a
 lifecycle
    that expires noncurrent object versions after 7 days.

    Adding a lifecycle configuration to a versioned bucket is a best practice.
    It helps prevent objects in the bucket from accumulating a large number of
    noncurrent versions, which can slow down request performance.

    Usage is shown in the usage_demo_single_object function at the end of this
 module.

    :param bucket_name: The name of the bucket to create.
    :param prefix: Identifies which objects are automatically expired under the
                   configured lifecycle rules.
    :return: The newly created bucket.
    """

Serverless examples for Amazon S3

The following code examples show how to use Amazon S3 with Amazon SDKs.

Examples

- Invoke a Lambda function from an Amazon S3 trigger

Invoke a Lambda function from an Amazon S3 trigger

The following code examples show how to implement a Lambda function that receives an event triggered by uploading an object to an S3 bucket. The function retrieves the S3 bucket name and object key from the event parameter and calls the Amazon S3 API to retrieve and log the content type of the object.

.NET

Code examples for Amazon S3 Control using Amazon SDKs

The following code examples show how to use Amazon S3 Control with an Amazon software development kit (SDK).

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Get started

Hello Amazon S3 Control

The following code example shows how to get started using Amazon S3 Control.

Java

SDK for Java 2.x

Learn the basics of Amazon S3 Control with an Amazon SDK

The following code example shows how to learn core operations for Amazon S3 Control.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Learn core operations.

```
package com.example.s3.batch;

import software.amazon.awssdk.services.s3.model.S3Exception;
import java.io.IOException;
import java.util.Map;
import java.util.Scanner;
import java.util.UUID;
import java.util.concurrent.CompletionException;

public class S3BatchScenario {
```

```
   public static final String DASHES = new String(new char[80]).replace("\0",
"-");
   private static final String STACK_NAME = "MyS3Stack";
   public static void main(String[] args) throws IOException {
       S3BatchActions actions = new S3BatchActions();
       String accountId = actions.getAccountId();
       String uuid = java.util.UUID.randomUUID().toString();
       Scanner scanner = new Scanner(System.in);

       System.out.println(DASHES);
       System.out.println("Welcome to the Amazon S3 Batch basics scenario.");
       System.out.println("""
           S3 Batch operations enables efficient and cost-effective processing
of large-scale
           data stored in Amazon S3. It automatically scales resources to handle
varying workloads
           without the need for manual intervention.

           One of the key features of S3 Batch is its ability to perform tagging
operations on objects stored in
           S3 buckets. Users can leverage S3 Batch to apply, update, or remove
tags on thousands or millions of
           objects in a single operation, streamlining the management and
organization of their data.

           This can be particularly useful for tasks such as cost allocation,
lifecycle management, or
           metadata-driven workflows, where consistent and accurate tagging is
essential.
           S3 Batch's scalability and serverless nature make it an ideal
solution for organizations with
           growing data volumes and complex data management requirements.

           This Java program walks you through Amazon S3 Batch operations.

           Let's get started...

           """);

```
        System.out.println("2. Update an existing S3 Batch Operations job's
priority");
        System.out.println("""
             In this step, we modify the job priority value. The higher the
number, the higher the priority.
             So, a job with a priority of `30` would have a higher priority than
a job with
             a priority of `20`. This is a common way to represent the priority
of a task
             or job, with higher numbers indicating a higher priority.

             Ensure that the job status allows for priority updates. Jobs in
certain
             states (e.g., Cancelled, Failed, or Completed) cannot have their
priorities
             updated. Only jobs in the Active or Suspended state typically allow
priority
             updates.
             """);

  - CreateJob
  - DeleteJobTagging
  - DescribeJob
  - GetJobTagging
  - ListJobs
  - PutJobTagging
  - UpdateJobPriority
  - UpdateJobStatus

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Actions for Amazon S3 Control using Amazon SDKs

The following code examples demonstrate how to perform individual Amazon S3 Control actions with Amazon SDKs. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

The following examples include only the most commonly used actions. For a complete list, see the Amazon S3 Control API Reference.

Examples

- Use CreateJob with an Amazon SDK or CLI
- Use DeleteJobTagging with an Amazon SDK
- Use DescribeJob with an Amazon SDK or CLI
- Use GetJobTagging with an Amazon SDK
- Use PutJobTagging with an Amazon SDK
- Use UpdateJobPriority with an Amazon SDK or CLI
- Use UpdateJobStatus with an Amazon SDK or CLI

Use `CreateJob` with an Amazon SDK or CLI

The following code examples show how to use `CreateJob`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

Amazon CLI

To create an Amazon S3 batch operations job

The following `create-job` example creates an Amazon S3 batch operations job to tag objects as `confidential` in the bucket `employee-records`.

```
aws s3control create-job \
    --account-id 123456789012 \
    --operation '{"S3PutObjectTagging": { "TagSet": [{"Key":"confidential",
 "Value":"true"}] }}' \
    --report '{"Bucket":"arn:aws:s3:::employee-records-logs","Prefix":"batch-op-
create-job",
 "Format":"Report_CSV_20180820","Enabled":true,"ReportScope":"AllTasks"}' \
    --manifest '{"Spec":{"Format":"S3BatchOperations_CSV_20180820","Fields":
["Bucket","Key"]},"Location":{"ObjectArn":"arn:aws:s3:::employee-records-logs/
inv-report/7a6a9be4-072c-407e-85a2-
ec3e982f773e.csv","ETag":"69f52a4e9f797e987155d9c8f5880897"}}' \
    --priority 42 \
    --role-arn arn:aws:iam::123456789012:role/S3BatchJobRole
```

Output:

```
{
    "JobId": "93735294-df46-44d5-8638-6356f335324e"
}
```

- For API details, see CreateJob in *Amazon CLI Command Reference*.

Use `DeleteJobTagging` with an Amazon SDK

The following code example shows how to use `DeleteJobTagging`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
   /**
    * Asynchronously deletes the tags associated with a specific batch job.
    *
    * @param jobId     The ID of the batch job whose tags should be deleted.
    * @param accountId The ID of the account associated with the batch job.
    * @return A CompletableFuture that completes when the job tags have been
successfully deleted, or an exception is thrown if the deletion fails.
    */
   public CompletableFuture<Void> deleteBatchJobTagsAsync(String jobId, String
accountId) {
       DeleteJobTaggingRequest jobTaggingRequest =
DeleteJobTaggingRequest.builder()
           .accountId(accountId)
           .jobId(jobId)
           .build();

       return asyncClient.deleteJobTagging(jobTaggingRequest)
           .thenAccept(response -> {
               System.out.println("You have successfully deleted " + jobId + "
tagging.");
           })
           .exceptionally(ex -> {
               System.err.println("Failed to delete job tags: " +
ex.getMessage());
               throw new RuntimeException(ex);
           });
   }
```

Use `DescribeJob` with an Amazon SDK or CLI

The following code examples show how to use `DescribeJob`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

Amazon CLI

To describe an Amazon S3 batch operations job

The following `describe-job` provides configuration parameters and status for the specified batch operations job.

```
aws s3control describe-job \
    --account-id 123456789012 \
    --job-id 93735294-df46-44d5-8638-6356f335324e
```

Output:

```
{
    "Job": {
        "TerminationDate": "2019-10-03T21:49:53.944Z",
        "JobId": "93735294-df46-44d5-8638-6356f335324e",
        "FailureReasons": [],

Use `GetJobTagging` with an Amazon SDK

The following code example shows how to use `GetJobTagging`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
   /**
    * Asynchronously retrieves the tags associated with a specific job in an AWS
account.
    *
    * @param jobId     the ID of the job for which to retrieve the tags
    * @param accountId the ID of the AWS account associated with the job
    * @return a {@link CompletableFuture} that completes when the job tags have
been retrieved, or with an exception if the operation fails
    * @throws RuntimeException if an error occurs while retrieving the job tags
    */
   public CompletableFuture<Void> getJobTagsAsync(String jobId, String
accountId) {
       GetJobTaggingRequest request = GetJobTaggingRequest.builder()
           .jobId(jobId)
           .accountId(accountId)
           .build();

       return asyncClient.getJobTagging(request)
           .thenAccept(response -> {
               List<S3Tag> tags = response.tags();
               if (tags.isEmpty()) {
                   System.out.println("No tags found for job ID: " + jobId);
               } else {
                   for (S3Tag tag : tags) {
                       System.out.println("Tag key is: " + tag.key());
                       System.out.println("Tag value is: " + tag.value());
                   }
               }
           })
           .exceptionally(ex -> {
               System.err.println("Failed to get job tags: " + ex.getMessage());
               throw new RuntimeException(ex); // Propagate the exception
```

```
            });
    }
```

Use `PutJobTagging` with an Amazon SDK

The following code example shows how to use `PutJobTagging`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
    /**
     * Asynchronously adds tags to a job in the system.
     *
     * @param jobId     the ID of the job to add tags to
     * @param accountId the account ID associated with the job
     * @return a CompletableFuture that completes when the tagging operation is
finished
     */
    public CompletableFuture<Void> putJobTaggingAsync(String jobId, String
accountId) {
        S3Tag departmentTag = S3Tag.builder()
```

```
            .key("department")
            .value("Marketing")
            .build();

        S3Tag fiscalYearTag = S3Tag.builder()
            .key("FiscalYear")
            .value("2020")
            .build();

        PutJobTaggingRequest putJobTaggingRequest =
PutJobTaggingRequest.builder()
            .jobId(jobId)
            .accountId(accountId)
            .tags(departmentTag, fiscalYearTag)
            .build();

        return asyncClient.putJobTagging(putJobTaggingRequest)
            .thenRun(() -> {
                System.out.println("Additional Tags were added to job " + jobId);
            })
            .exceptionally(ex -> {
                System.err.println("Failed to add tags to job: " +
ex.getMessage());
                throw new RuntimeException(ex); // Propagate the exception
            });
    }
```

Use `UpdateJobPriority` with an Amazon SDK or CLI

The following code examples show how to use `UpdateJobPriority`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

Amazon CLI

To update the job priority of an Amazon S3 batch operations job

The following `update-job-priority` example updates the specified job to a new priority.

```
aws s3control update-job-priority \
    --account-id 123456789012 \
    --job-id 8d9a18fe-c303-4d39-8ccc-860d372da386 \
    --priority 52
```

Output:

```
{
    "JobId": "8d9a18fe-c303-4d39-8ccc-860d372da386",
    "Priority": 52
}
```

- For API details, see UpdateJobPriority in *Amazon CLI Command Reference*.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
    /**
     * Updates the priority of a job asynchronously.
     *
     * @param jobId     the ID of the job to update
     * @param accountId the ID of the account associated with the job
     * @return a {@link CompletableFuture} that represents the asynchronous
operation, which completes when the job priority has been updated or an error
has occurred
```

```
    */
   public CompletableFuture<Void> updateJobPriorityAsync(String jobId, String
accountId) {
       UpdateJobPriorityRequest priorityRequest =
UpdateJobPriorityRequest.builder()
           .accountId(accountId)
           .jobId(jobId)
           .priority(60)
           .build();

       CompletableFuture<Void> future = new CompletableFuture<>();
       getAsyncClient().updateJobPriority(priorityRequest)
           .thenAccept(response -> {
               System.out.println("The job priority was updated");
               future.complete(null); // Complete the CompletableFuture on
successful execution
           })
           .exceptionally(ex -> {
               System.err.println("Failed to update job priority: " +
ex.getMessage());
               future.completeExceptionally(ex); // Complete the
CompletableFuture exceptionally on error
               return null; // Return null to handle the exception
           });

       return future;
   }
```

- For API details, see UpdateJobPriority in *Amazon SDK for Java 2.x API Reference*.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Use `UpdateJobStatus` with an Amazon SDK or CLI

The following code examples show how to use `UpdateJobStatus`.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

- Learn the basics

CLI

Amazon CLI

To update the status of an Amazon S3 batch operations job

The following `update-job-status` example cancels the specified job which is awaiting approval.

```
aws s3control update-job-status \
    --account-id 123456789012 \
    --job-id 8d9a18fe-c303-4d39-8ccc-860d372da386 \
    --requested-job-status Cancelled
```

Output:

```
{
    "Status": "Cancelled",
    "JobId": "8d9a18fe-c303-4d39-8ccc-860d372da386"
}
```

The following `update-job-status` example confirms and runs the specified which is awaiting approval.

```
aws s3control update-job-status \
    --account-id 123456789012 \
    --job-id 5782949f-3301-4fb3-be34-8d5bab54dbca \
    --requested-job-status Ready

Output::

{
    "Status": "Ready",
    "JobId": "5782949f-3301-4fb3-
be34-8d5bab54dbca"
}
```

The following `update-job-status` example cancels the specified job which is running.

```
 aws s3control update-job-status \
```

```
    --account-id 123456789012 \
    --job-id 5782949f-3301-4fb3-be34-8d5bab54dbca \
    --requested-job-status Cancelled

Output::
{
        "Status": "Cancelling",
        "JobId": "5782949f-3301-4fb3-be34-8d5bab54dbca"
}
```

- For API details, see UpdateJobStatus in *Amazon CLI Command Reference*.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
   /**
    * Cancels a job asynchronously.
    *
    * @param jobId The ID of the job to be canceled.
    * @param accountId The ID of the account associated with the job.
    * @return A {@link CompletableFuture} that completes when the job status has
been updated to "CANCELLED".
    *         If an error occurs during the update, the returned future will
complete exceptionally.
    */
   public CompletableFuture<Void> cancelJobAsync(String jobId, String accountId)
{
       UpdateJobStatusRequest updateJobStatusRequest =
UpdateJobStatusRequest.builder()
           .accountId(accountId)
           .jobId(jobId)
           .requestedJobStatus(String.valueOf(JobStatus.CANCELLED))
           .build();

       return asyncClient.updateJobStatus(updateJobStatusRequest)
```

```
            .thenAccept(updateJobStatusResponse -> {
                System.out.println("Job status updated to: " +
updateJobStatusResponse.status());
            })
            .exceptionally(ex -> {
                System.err.println("Failed to cancel job: " + ex.getMessage());
                throw new RuntimeException(ex); // Propagate the exception
            });
    }
```

Code examples for S3 Directory Buckets using Amazon SDKs

The following code examples show how to use S3 Directory Buckets with an Amazon software development kit (SDK).

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other Amazon Web Services services.

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Get started

Hello Amazon S3 directory buckets

The following code example shows how to get started using Amazon S3 directory buckets.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
package com.example.s3.directorybucket;

import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.s3.S3Client;

- For API details, see the following topics in *Amazon SDK for Java 2.x API Reference*.
  - CreateBucket
  - ListDirectoryBuckets

For a complete list of Amazon SDK developer guides and code examples, see Developing with Amazon S3 using the Amazon SDKs. This topic also includes information about getting started and details about previous SDK versions.

Learn the basics of S3 Directory Buckets with an Amazon SDK

The following code examples show how to:

- Set up a VPC and VPC Endpoint.
- Set up the Policies, Roles, and User to work with S3 directory buckets and the S3 Express One Zone storage class.
- Create two S3 Clients.
- Create two buckets.
- Create an object and copy it over.
- Demonstrate performance difference.
- Populate the buckets to show the lexicographical difference.
- Prompt the user to see if they want to clean up the resources.

Java

SDK for Java 2.x

            7. Populate the buckets to show the lexicographical (alphabetical)
difference
            when object names are listed. Now let's explore how directory buckets
store
            objects in a different manner to regular buckets. The key is in the
name
            "Directory". Where regular buckets store their key/value pairs in a
            flat manner, directory buckets use actual directories/folders.
            This allows for more rapid indexing, traversing, and therefore
            retrieval times!

            The more segmented your bucket is, with lots of
            directories, sub-directories, and objects, the more efficient it
becomes.
            This structural difference also causes `ListObject` operations to
behave
            differently, which can cause unexpected results. Let's add a few
more
            objects in sub-directories to see how the output of
```

```
            ListObjects changes.

            It worked! This is because the S3Client that performed the copy
operation
            is the expressClient using the credentials for the user with
permission to
            work with directory buckets.

            It's important to remember the user permissions when interacting
with
            directory buckets. Instead of validating permissions on every call
as
            regular buckets do, directory buckets utilize the user credentials
and session
            token to validate. This allows for much faster connection speeds on
every call.
            For single calls, this is low, but for many concurrent calls
            this adds up to a lot of time saved.

Run a scenario demonstrating the basics of Amazon S3 directory buckets and S3 Express One Zone.

```
        echo "\n";
        echo "-------------------------------------\n";
        echo "Welcome to the Amazon S3 Express Basics demo using PHP!\n";
        echo "-------------------------------------\n";

        // Change these both of these values to use a different region/
availability zone.
        $region = "us-west-2";
```

```
        $az = "usw2-az1";

        $this->s3Service = new S3Service(new S3Client(['region' => $region]));
        $this->iamService = new IAMService(new IamClient(['region' => $region]));

        $uuid = uniqid();

        echo <<<INTRO
Let's get started! First, please note that S3 Express One Zone works best when
 working within the AWS infrastructure,
specifically when working in the same Availability Zone. To see the best results
 in this example, and when you implement
Directory buckets into your infrastructure, it is best to put your Compute
 resources in the same AZ as your Directory
bucket.\n
INTRO;
        pressEnter();
        // 1. Configure a gateway VPC endpoint. This is the recommended method to
 allow S3 Express One Zone traffic without
        // the need to pass through an internet gateway or NAT device.
        echo "\n";
        echo "1. First, we'll set up a new VPC and VPC Endpoint if this program
 is running in an EC2 instance in the same AZ as your Directory buckets will be.
\n";
        $ec2Choice = testable_readline("Are you running this in an EC2 instance
 located in the same AZ as your intended Directory buckets? Enter Y/y to setup a
 VPC Endpoint, or N/n/blank to skip this section.");

7. Populate the buckets to show the lexicographical difference.

```
Now let's explore how Directory buckets store objects in a different manner to
 regular buckets. The key is in the name
"Directory". Where regular buckets store their key/value pairs in a flat manner,
 Directory buckets use actual
directories/folders. This allows for more rapid indexing, traversing, and
 therefore retrieval times! The more segmented
your bucket is, with lots of directories, sub-directories, and objects, the more
 efficient it becomes. This structural
difference also causes ListObjects to behave differently, which can cause
 unexpected results. Let's add a few more
objects with layered directories to see how the output of ListObjects changes.

Actions for S3 Directory Buckets using Amazon SDKs

The following code examples demonstrate how to perform individual S3 Directory Buckets actions with Amazon SDKs. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

These excerpts call the S3 Directory Buckets API and are code excerpts from larger programs that must be run in context. You can see actions in context in Scenarios for S3 Directory Buckets using Amazon SDKs .

The following examples include only the most commonly used actions. For a complete list, see the Amazon S3 Directory Buckets API Reference.

Examples

- Use AbortMultipartUpload with an Amazon SDK
- Use CompleteMultipartUpload with an Amazon SDK
- Use CopyObject with an Amazon SDK
- Use CreateBucket with an Amazon SDK
- Use CreateMultipartUpload with an Amazon SDK
- Use CreateSession with an Amazon SDK
- Use DeleteBucket with an Amazon SDK
- Use DeleteBucketEncryption with an Amazon SDK
- Use DeleteBucketPolicy with an Amazon SDK
- Use DeleteObject with an Amazon SDK
- Use DeleteObjects with an Amazon SDK
- Use GetBucketEncryption with an Amazon SDK
- Use GetBucketPolicy with an Amazon SDK
- Use GetObject with an Amazon SDK
- Use GetObjectAttributes with an Amazon SDK

- Use HeadBucket with an Amazon SDK
- Use HeadObject with an Amazon SDK
- Use ListDirectoryBuckets with an Amazon SDK
- Use ListMultipartUploads with an Amazon SDK
- Use ListObjectsV2 with an Amazon SDK
- Use ListParts with an Amazon SDK
- Use PutBucketEncryption with an Amazon SDK
- Use PutBucketPolicy with an Amazon SDK
- Use PutObject with an Amazon SDK
- Use UploadPart with an Amazon SDK
- Use UploadPartCopy with an Amazon SDK

Use `AbortMultipartUpload` with an Amazon SDK

The following code example shows how to use `AbortMultipartUpload`.

Java

SDK for Java 2.x

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Abort a multipart upload in a directory bucket.

```
import org.slf4j.Logger;
import org.slf4j.LoggerFactory;
import software.amazon.awssdk.regions.Region;
import software.amazon.awssdk.services.s3.S3Client;

Scenarios for S3 Directory Buckets using Amazon SDKs

The following code examples show you how to implement common scenarios in S3 Directory Buckets with Amazon SDKs. These scenarios show you how to accomplish specific tasks by calling multiple functions within S3 Directory Buckets or combined with other Amazon Web Services services. Each scenario includes a link to the complete source code, where you can find instructions on how to set up and run the code.

Scenarios target an intermediate level of experience to help you understand service actions in context.

Examples

- Create a presigned URL for Amazon S3 directory buckets to get an object using an Amazon SDK

Create a presigned URL for Amazon S3 directory buckets to get an object using an Amazon SDK

The following code example shows how to create a presigned URL for S3 directory buckets and get an object.

Java

SDK for Java 2.x

> **Note**

Authenticating Requests (Amazon Signature Version 4)

Topics

- Authentication Methods
- Introduction to Signing Requests
- Authenticating Requests: Using the Authorization Header (Amazon Signature Version 4)
- Authenticating Requests: Using Query Parameters (Amazon Signature Version 4)
- Examples: Signature Calculations in Amazon Signature Version 4
- Authenticating Requests: Browser-Based Uploads Using POST (Amazon Signature Version 4)
- Amazon S3 Signature Version 4 Authentication Specific Policy Keys

Every interaction with Amazon S3 is either authenticated or anonymous. This section explains request authentication with the Amazon Signature Version 4 algorithm.

> **Note**
>
> If you use the Amazon SDKs (see Sample Code and Libraries) to send your requests, you don't need to read this section because the SDK clients authenticate your requests by using access keys that you provide. Unless you have a good reason not to, you should always use the Amazon SDKs. In Regions that support both signature versions, you can request Amazon SDKs to use specific signature version. For more information, see Sending authenticated requests using the Amazon SDKs. You need to read this section only if you are implementing the Amazon Signature Version 4 algorithm in your custom client.

Authentication with Amazon Signature Version 4 provides some or all of the following, depending on how you choose to sign your request:

- **Verification of the identity of the requester** – Authenticated requests require a signature that you create by using your access keys (access key ID, secret access key). For information about getting access keys, see Understanding and Getting Your Security Credentials in the *Amazon Web Services General Reference*. If you are using temporary security credentials, the signature calculations also require a security token. For more information, see Requesting Temporary Security Credentials in the *IAM User Guide*.

- **In-transit data protection** – In order to prevent tampering with a request while it is in transit, you use some of the request elements to calculate the request signature. Upon receiving the request, Amazon S3 calculates the signature by using the same request elements. If any request component received by Amazon S3 does not match the component that was used to calculate the signature, Amazon S3 will reject the request.
- **Protect against reuse of the signed portions of the request** – The signed portions (using Amazon Signatures) of requests are valid within 15 minutes of the timestamp in the request. An unauthorized party who has access to a signed request can modify the unsigned portions of the request without affecting the request's validity in the 15 minute window. Because of this, we recommend that you maximize protection by signing request headers and body, making HTTPS requests to Amazon S3, and by using the `s3:x-amz-content-sha256` condition key (see Amazon S3 Signature Version 4 Authentication Specific Policy Keys) in Amazon policies to require users to sign Amazon S3 request bodies.

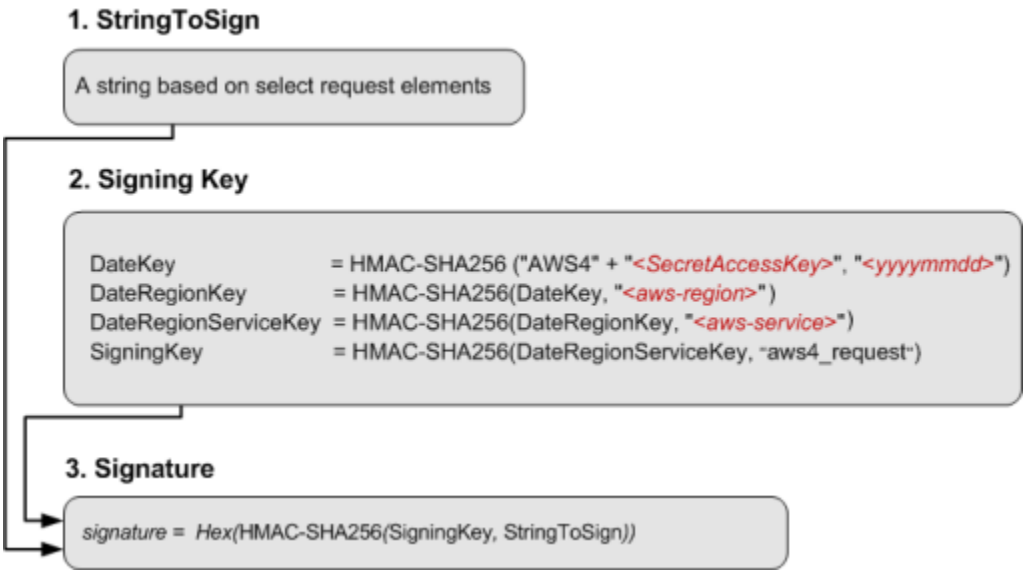
> **Note**
>
> Amazon S3 supports Signature Version 4, a protocol for authenticating inbound API requests to Amazon services, in all Amazon Web Services Regions. At this time, Amazon Web Services Regions created before January 30, 2014 will continue to support the previous protocol, Signature Version 2. Any new Regions after January 30, 2014 will support only Signature Version 4 and therefore all requests to those Regions must be made with Signature Version 4. For more information about Amazon Signature Version 2, see Signing and Authenticating REST Requests in the *Amazon Simple Storage Service User Guide*.

Authentication Methods

You can express authentication information by using one of the following methods:

- **HTTP Authorization header** – Using the HTTP `Authorization` header is the most common method of authenticating an Amazon S3 request. All of the Amazon S3 REST operations (except for browser-based uploads using POST requests) require this header. For more information about the `Authorization` header value, and how to calculate signature and related options, see Authenticating Requests: Using the Authorization Header (Amazon Signature Version 4).

- **Query string parameters** – You can use a query string to express a request entirely in a URL. In this case, you use query parameters to provide request information, including the authentication information. Because the request signature is part of the URL, this type of URL is often referred to as a presigned URL. You can use presigned URLs to embed clickable links, which can be valid for up to seven days, in HTML. For more information, see Authenticating Requests: Using Query Parameters (Amazon Signature Version 4).



Amazon S3 also supports browser-based uploads that use HTTP POST requests. With an HTTP POST request, you can upload content to Amazon S3 directly from the browser. For information about authenticating POST requests, see Browser-Based Uploads Using POST (Amazon Signature Version 4).

Introduction to Signing Requests

Authentication information that you send in a request must include a signature. To calculate a signature, you first concatenate select request elements to form a string, referred to as the *string to sign*. You then use a signing key to calculate the hash-based message authentication code (HMAC) of the string to sign.

In Amazon Signature Version 4, you don't use your secret access key to sign the request. Instead, you first use your secret access key to derive a signing key. The derived signing key is specific to the date, service, and Region. For more information about how to derive a signing key in different programming languages, see Examples of how to derive a signing key for Signature Version 4.

The following diagram illustrates the general process of computing a signature.

The string to sign depends on the request type. For example, when you use the HTTP Authorization header or the query parameters for authentication, you use a varying combination of request elements to create the string to sign. For an HTTP POST request, the POST policy in the request is the string you sign. For more information about computing string to sign, follow links provided at the end of this section.

For signing key, the diagram shows series of calculations, where result of each step you feed into the next step. The final step is the signing key.

Upon receiving an authenticated request, Amazon S3 servers re-create the signature by using the authentication information that is contained in the request. If the signatures match, Amazon S3 processes your request; otherwise, the request is rejected.

For more information about authenticating requests, see the following topics:

- Authenticating Requests: Using the Authorization Header (Amazon Signature Version 4)
- Authenticating Requests: Using Query Parameters (Amazon Signature Version 4)
- Browser-Based Uploads Using POST (Amazon Signature Version 4)

- Signature calculations for trailing headers (chunked uploads) (Amazon Signature Version 4)

Overview

Using the HTTP `Authorization` header is the most common method of providing authentication information. Except for POST requests and requests that are signed by using query parameters, all Amazon S3 operations use the `Authorization` request header to provide authentication information.

The following is an example of the `Authorization` header value. Line breaks are added to this example for readability:

```
Authorization: AWS4-HMAC-SHA256
Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/aws4_request,
SignedHeaders=host;range;x-amz-date,
Signature=fe5f80f77d5fa3beca038a248ff027d0445342fe2855ddc963176630326f1024
```

The following table describes the various components of the `Authorization` header value in the preceding example:

Component	Description
`AWS4-HMAC-SHA256`	The algorithm that was used to calculate the signature. You must provide this value when you use Amazon Signature Version 4 for authentication. The string specifies Amazon Signature Version 4 (`AWS4`) and the signing algorithm (`HMAC-SHA256`).
`Credential`	

Component	Description
	Your access key ID and the scope information, which includes the date, Region, and service that were used to calculate the signature. This string has the following form: `<your-access-key-id> /<date>/<aws-region> /<aws-service> /aws4_request` Where: • *<date>* value is specified using YYYYMMDD format. • *<aws-service>* value is s3 when sending request to Amazon S3.
SignedHeaders	A semicolon-separated list of request headers that you used to compute Signature . The list includes header names only, and the header names must be in lowercase. For example: `host;range;x-amz-date`
Signature	The 256-bit signature expressed as 64 lowercase hexadecimal characters. For example: `fe5f80f77d5fa3beca038a248ff027d0445342fe2855d dc963176630326f1024` Note that the signature calculations vary depending on the option you choose to transfer the payload.

The signature calculations vary depending on the method you choose to transfer the request payload. S3 supports the following options:

- **Transfer payload in a single chunk** – In this case, you have the following signature calculation options:

  - **Signed payload option** – You can optionally compute the entire payload checksum and include it in signature calculation. This provides added security but you need to read your payload twice or buffer it in memory.

    For example, in order to upload a file, you need to read the file first to compute a payload hash for signature calculation and again for transmission when you create the request. For smaller payloads, this approach might be preferable. However, for large files, reading the file twice can be inefficient, so you might want to upload data in chunks instead.

    We recommend you include payload checksum for added security.
  - **Unsigned payload option** – Do not include payload checksum in signature calculation.

  For step-by-step instructions to calculate signature and construct the Authorization header value, see Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (Amazon Signature Version 4).
- **Transfer payload in multiple chunks (chunked upload)** – In this case you transfer payload in chunks. You can transfer a payload in chunks regardless of the payload size.

  You can break up your payload into chunks. These can be fixed or variable-size chunks. By uploading data in chunks, you avoid reading the entire payload to calculate the signature. Instead, for the first chunk, you calculate a seed signature that uses only the request headers. The second chunk contains the signature for the first chunk, and each subsequent chunk contains the signature for the chunk that precedes it. At the end of the upload, you send a final chunk with 0 bytes of data that contains the signature of the last chunk of the payload. For more information, see Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (Amazon Signature Version 4).

When signing your requests, you can use either Amazon Signature Version 4 or Amazon Signature Version 4A. The key difference between the two is determined by how the signature is calculated. With Amazon Signature Version 4A, the signature does not include Region-specific information and is calculated using the `AWS4-ECDSA-P256-SHA256` algorithm.

In addition to these options, you have the option of including a trailer with your request. In order to include a trailer with your request, you need to specify that in the header by setting `x-amz-content-sha256` to the appropriate value. If you are using a trailing header, you must include `x-amz-trailer` in the header and specify the trailing header names as a string in a comma-separated list. All trailing headers are written after the final chunk. If you're uploading the data in multiple chunks, you must send a final chunk with 0 bytes of data before sending the trailing header.

When you send a request, you must tell Amazon S3 which of the preceding options you have chosen in your signature calculation, by adding the `x-amz-content-sha256` header with one of the following values:

Header value	Description
Actual payload checksum value	This value is the actual checksum of your object and is only possible when you are uploading the data in a single chunk.
UNSIGNED-PAYLOAD	Use this when you are uploading the object as a single unsigned chunk.
STREAMING-UNSIGNED-PAYLOAD-TRAILER	Use this when sending an unsigned payload over multiple chunks. In this case you also have a trailing header after the chunk is uploaded.
STREAMING-AWS4-HMAC-SHA256-PAYLOAD	Use this when sending a payload over multiple chunks, and the chunks are signed using `AWS4-HMAC-SHA256` . This produces a SigV4 signature.
STREAMING-AWS4-HMAC-SHA256-PAYLOAD-TRAILER	Use this when sending a payload over multiple chunks, and the chunks are signed using `AWS4-HMAC-SHA256` . This produces a SigV4 signature. In addition, the digest for the chunks is included as a trailing header.
STREAMING-AWS4-ECDSA-P256-SHA256-PAYLOAD	Use this when sending a payload over multiple chunks, and the chunks are signed using `AWS4-ECDSA-P256-SHA256` . This produces a SigV4A signature.

Header value	Description
STREAMING-AWS4-ECDSA-P256-SHA256-PAYLOAD-TRAILER	Use this when sending a payload over multiple chunks, and the chunks are signed using `AWS4-ECDSA-P256-SHA256` . This produces a SigV4A signature. In addition, the digest for the chunks is included as a trailing header.

Upon receiving the request, Amazon S3 re-creates the string to sign using information in the `Authorization` header and the `date` header. It then verifies with authentication service the signatures match. The request date can be specified by using either the HTTP `Date` or the `x-amz-date` header. If both headers are present, `x-amz-date` takes precedence.

If the signatures match, Amazon S3 processes your request; otherwise, your request will fail.

For more information, see the following topics:

Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (Amazon Signature Version 4)

Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (Amazon Signature Version 4)

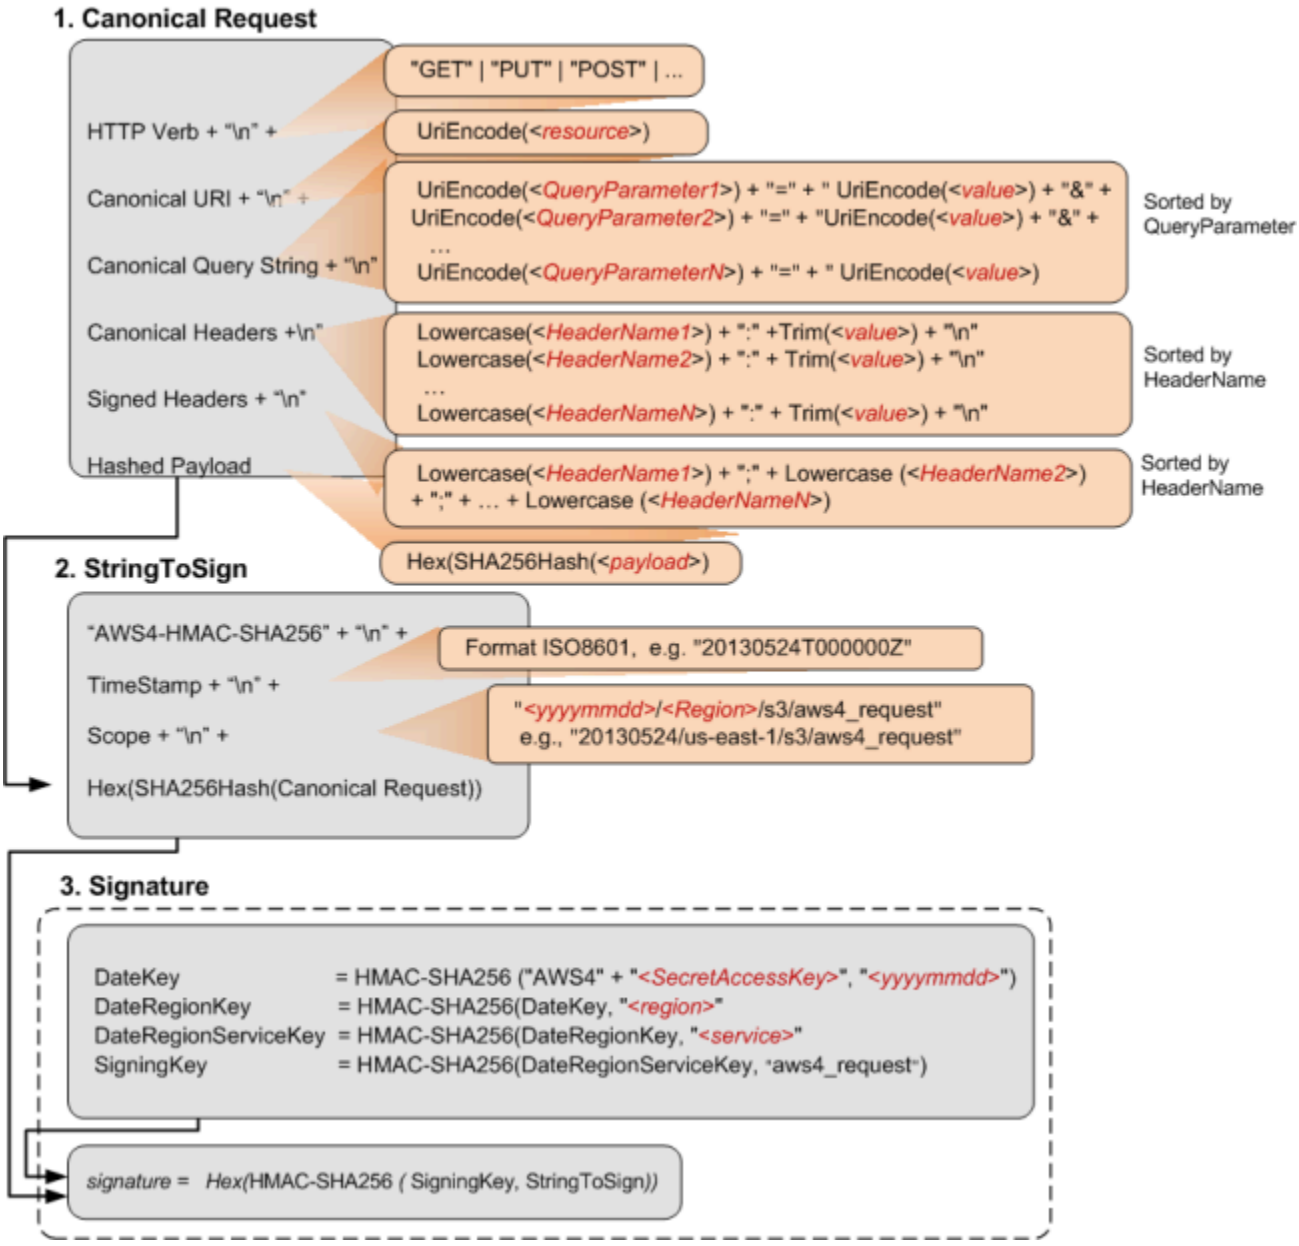
Signature calculations for trailing headers (chunked uploads) (Amazon Signature Version 4)

Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (Amazon Signature Version 4)

When using the `Authorization` header to authenticate requests, the header value includes, among other things, a signature. The signature calculations vary depending on the choice you make for transferring the payload (Overview). This section explains signature calculations when you choose to transfer the payload in a single chunk. The example section (see Examples: Signature Calculations) shows signature calculations and resulting `Authorization` headers that you can use as a test suite to verify your code.

> **Important**
>
> When transferring payload in a single chunk, you can optionally choose to include the payload hash in the signature calculations, referred as *signed payload* (if you don't include

it, the payload is considered *unsigned*). The signing procedure discussed in the following section applies to both, but note the following differences:



- **Signed payload option** – You include the payload hash when constructing the canonical request (that then becomes part of StringToSign, as explained in the signature calculation section). You also specify the same value as the `x-amz-content-sha256` header value when sending the request to S3.
- **Unsigned payload option** – You include the literal string `UNSIGNED-PAYLOAD` when constructing a canonical request, and set the same value as the `x-amz-content-sha256` header value when sending the request to Amazon S3.

When you send your request to Amazon S3, the `x-amz-content-sha256` header value informs Amazon S3 whether the payload is signed or not. Amazon S3 can then create the signature accordingly for verification.
In both cases, because the `x-amz-content-sha256` header value is already part of your `HashedPayload`, you are not required to include the `x-amz-content-sha256` header as a canonical header.

Calculating a Signature

To calculate a signature, you first need a string to sign. You then calculate a `HMAC-SHA256` hash of the string to sign by using a signing key. The following diagram illustrates the process, including the various components of the string that you create for signing

When Amazon S3 receives an authenticated request, it computes the signature and then compares it with the signature that you provided in the request. For that reason, you must compute the signature by using the same method that is used by Amazon S3. The process of putting a request in an agreed-upon form for signing is called canonicalization.

The following table describes the functions that are shown in the diagram. You need to implement code for these functions.

Function	Description
`Lowercase()`	Convert the string to lowercase.
`Hex()`	Lowercase base 16 encoding.
`SHA256Hash()`	Secure Hash Algorithm (SHA) cryptographic hash function.

Function	Description
`HMAC-SHA256()`	Computes HMAC by using the SHA256 algorithm with the signing key provided. This is the final signature.
`Trim()`	Remove any leading or trailing whitespace.
`UriEncode()`	URI encode every byte. UriEncode() must enforce the following rules: • URI encode every byte except the unreserved characters: 'A'-'Z', 'a'-'z', '0'-'9', '-', '.', '_', and '~'. • The space character is a reserved character and must be encoded as "%20" (and not as "+"). • Each URI encoded byte is formed by a '%' and the two-digit hexadecimal value of the byte. • Letters in the hexadecimal value must be uppercase, for example "%1A". • Encode the forward slash character, '/', everywhere except in the object key name. For example, if the object key name is `photos/Jan/sample.jpg` , the forward slash in the key name is not encoded. **Important** The standard UriEncode functions provided by your development platform may not work because of differences in implementation and related ambiguity in the underlying RFCs. We recommend that you write your own custom UriEncode function to ensure that your encoding will work. To see an example of a UriEncode function in Java, see Java Utilities on the GitHub website.

Task 1: Create a Canonical Request

This section provides an overview of creating a canonical request.

The following is the canonical request format that Amazon S3 uses to calculate a signature. For signatures to match, you must create a canonical request in this format:

```
<HTTPMethod>\n
<CanonicalURI>\n
<CanonicalQueryString>\n
<CanonicalHeaders>\n
<SignedHeaders>\n
<HashedPayload>
```

Where:

- *HTTPMethod* is one of the HTTP methods, for example GET, PUT, HEAD, and DELETE.
- *CanonicalURI* is the URI-encoded version of the absolute path component of the URI—everything starting with the "/" that follows the domain name and up to the end of the string or to the question mark character ('?') if you have query string parameters. The URI in the following example, `/examplebucket/myphoto.jpg`, is the absolute path and you don't encode the "/" in the absolute path:

  ```
  http://s3.amazonaws.com/examplebucket/myphoto.jpg
  ```

  Note

  You do not normalize URI paths for requests to Amazon S3. For example, you may have a bucket with an object named "my-object//example//photo.user". Normalizing the path changes the object name in the request to "my-object/example/photo.user". This is an incorrect path for that object.

- *CanonicalQueryString* specifies the URI-encoded query string parameters. You URI-encode name and values individually. You must also sort the parameters in the canonical query string alphabetically by key name. The sorting occurs after encoding. The query string in the following URI example is `prefix=somePrefix&marker=someMarker&max-keys=20`:

```
http://s3.amazonaws.com/examplebucket?prefix=somePrefix&marker=someMarker&max-keys=20
```

The canonical query string is as follows (line breaks are added to this example for readability):

```
UriEncode("marker")+"="+UriEncode("someMarker")+"&"+
UriEncode("max-keys")+"="+UriEncode("20") + "&" +
UriEncode("prefix")+"="+UriEncode("somePrefix")
```

When a request targets a subresource, the corresponding query parameter value will be an empty string (""). For example, the following URI identifies the ACL subresource on the `examplebucket` bucket:

```
http://s3.amazonaws.com/examplebucket?acl
```

The CanonicalQueryString in this case is as follows:

```
UriEncode("acl") + "=" + ""
```

If the URI does not include a '?', there is no query string in the request, and you set the canonical query string to an empty string (""). You will still need to include the "\n".

- *`CanonicalHeaders`* is a list of request headers with their values. Individual header name and value pairs are separated by the newline character ("\n"). Header names must be in lowercase. You must sort the header names alphabetically to construct the string, as shown in the following example:

```
Lowercase(<HeaderName1>)+":"+Trim(<value>)+"\n"
Lowercase(<HeaderName2>)+":"+Trim(<value>)+"\n"
...
Lowercase(<HeaderNameN>)+":"+Trim(<value>)+"\n"
```

The `Lowercase()` and `Trim()` functions used in this example are described in the preceding section.

The *`CanonicalHeaders`* list must include the following:

- HTTP `host` header.
- If the `Content-MD5` header is present in the request, you must add it to the *`CanonicalHeaders`* list.
- Any `x-amz-*` headers that you plan to include in your request must also be added. For example, if you are using temporary security credentials, you need to include `x-amz-security-token` in your request. You must add this header in the list of *`CanonicalHeaders`*.

> **Note**
>
> - The `x-amz-content-sha256` header is required for all Amazon Signature Version 4 requests. It provides a hash of the request payload. However, you are not required to include the `x-amz-content-sha256` as a canonical header because S3 will automatically use its value when calculating the payload hash sent in the request.
> - If there is no payload, you must provide the hash of an empty string.
> - If you do not want S3 to check against the hash of the request, you can use the literal string `"UNSIGNED-PAYLOAD"` instead.

The following are example `CanonicalHeaders` strings. The header names are in lowercase and sorted.

Example 1

```
host:s3.amazonaws.com
x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
x-amz-date:20130708T220855Z
```

Example 2

```
host:s3.amazonaws.com
x-amz-content-sha256:UNSIGNED-PAYLOAD
x-amz-date:20130708T220855Z
```

Example 3

```
host:s3.amazonaws.com
```

```
x-amz-date:20130708T220855Z
```

> **Note**
>
> For the purpose of calculating an authorization signature, the host header and all `x-amz-*` headers, excluding `x-amz-content-sha256`, are required. However, in order to prevent data tampering, you should consider including all the headers in the signature calculation.
>
> Signing the `x-amz-content-sha256` header is optional because S3 will use its value when calculating the received request payload hash.

- *`SignedHeaders`* is an alphabetically sorted, semicolon-separated list of lowercase request header names. The request headers in the list are the same headers that you included in the `CanonicalHeaders` string. In the previous examples, the value of *`SignedHeaders`* would be as follows:

  Examples 1 and 2

  ```
  host;x-amz-content-sha256;x-amz-date
  ```

  Example 3

  ```
  host;x-amz-date
  ```

- *`HashedPayload`* is the hexadecimal value of the SHA256 hash of the request payload.

  ```
  Hex(SHA256Hash(<payload>)
  ```

  If there is no payload in the request, you compute a hash of the empty string as follows:

  ```
  Hex(SHA256Hash(""))
  ```

  The hash returns the following value:

  ```
  e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
  ```

For example, when you upload an object by using a PUT request, you provide object data in the body. When you retrieve an object by using a GET request, you compute the empty string hash.

Task 2: Create a String to Sign

This section provides an overview of creating a string to sign. For step-by-step instructions, see Task 2: Create a String to Sign in the *Amazon Web Services General Reference*.

The string to sign is a concatenation of the following strings:

```
"AWS4-HMAC-SHA256" + "\n" +
timeStampISO8601Format + "\n" +
<Scope> + "\n" +
Hex(SHA256Hash(<CanonicalRequest>))
```

The constant string `AWS4-HMAC-SHA256` specifies the hash algorithm that you are using, HMAC-SHA256. The `timeStamp` is the current UTC time in ISO 8601 format (for example, `20130524T000000Z`).

`Scope` binds the resulting signature to a specific date, an Amazon Web Services Region, and a service. Thus, your resulting signature will work only in the specific Region and for a specific service. The signature is valid for seven days after the specified date.

```
date.Format(<YYYYMMDD>) + "/" + <region> + "/" + <service> + "/aws4_request"
```

For Amazon S3, the service string is `s3`. For a list of *`region`* strings, see Regions and Endpoints in the *Amazon Web Services General Reference*. The Region column in this table provides the list of valid Region strings.

The following scope restricts the resulting signature to the `us-east-1` Region and Amazon S3.

```
20130606/us-east-1/s3/aws4_request
```

> **Note**
>
> Scope must use the same date that you use to compute the signing key, as discussed in the following section.

Task 3: Calculate Signature

In Amazon Signature Version 4, instead of using your Amazon access keys to sign a request, you first create a signing key that is scoped to a specific Region and service. For more information about signing keys, see Introduction to Signing Requests.

```
DateKey              = HMAC-SHA256("AWS4"+"<SecretAccessKey>", "<YYYYMMDD>")
DateRegionKey        = HMAC-SHA256(<DateKey>, "<aws-region>")
DateRegionServiceKey = HMAC-SHA256(<DateRegionKey>, "<aws-service>")
SigningKey           = HMAC-SHA256(<DateRegionServiceKey>, "aws4_request")
```

> **Note**
>
> Some use cases can process signature keys for up to 7 days. For more information see Share an Object with Others.

For a list of Region strings, see Regions and Endpoints in the *Amazon Web Services General Reference*.

Using a signing key enables you to keep your Amazon credentials in one safe place. For example, if you have multiple servers that communicate with Amazon S3, you share the signing key with those servers; you don't have to keep a copy of your secret access key on each server. Signing key is valid for up to seven days. So each time you calculate signing key you will need to share the signing key with your servers. For more information, see Authenticating Requests (Amazon Signature Version 4).

The final signature is the HMAC-SHA256 hash of the string to sign, using the signing key as the key.

```
HMAC-SHA256(SigningKey, StringToSign)
```

For step-by-step instructions on creating a signature, see Task 3: Create a Signature in the *Amazon Web Services General Reference*.

Examples: Signature Calculations

You can use the examples in this section as a reference to check signature calculations in your code. The calculations shown in the examples use the following data:

- Example access keys.

Parameter	Value
`AWSAccessKeyId`	`AKIAIOSFODNN7EXAMPLE`
`AWSSecret AccessKey`	`wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY`

- Request timestamp of 20130524T000000Z (`Fri, 24 May 2013 00:00:00 GMT`).
- Bucket name `examplebucket`.
- The bucket is assumed to be in the US East (N. Virginia) Region. The credential `Scope` and the `Signing Key` calculations use `us-east-1` as the Region specifier. For information about other Regions, see Regions and Endpoints in the *Amazon Web Services General Reference*.
- You can use either path-style or virtual hosted–style requests. The following examples show how to sign a virtual hosted–style request, for example:

```
https://examplebucket.s3.amazonaws.com/photos/photo1.jpg
```

For more information, see Virtual Hosting of Buckets in the *Amazon Simple Storage Service User Guide*.

Example: GET Object

The following example gets the first 10 bytes of an object (test.txt) from `examplebucket`. For more information about the API action, see GetObject.

```
GET /test.txt HTTP/1.1
```

```
Host: examplebucket.s3.amazonaws.com
Authorization: SignatureToBeCalculated
Range: bytes=0-9
x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
x-amz-date: 20130524T000000Z
```

Because this GET request does not provide any body content, the `x-amz-content-sha256` value can either be the hash of the empty request body or the literal string `"UNSIGNED-PAYLOAD"`. The following steps show signature calculations and construction of the `Authorization` header using the hash of an empty string.

1. **StringToSign**

   a. **CanonicalRequest**

   ```
   GET
   /test.txt

   host:examplebucket.s3.amazonaws.com
   range:bytes=0-9
   x-amz-content-
   sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
   x-amz-date:20130524T000000Z

   host;range;x-amz-content-sha256;x-amz-date
   e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
   ```

   In the canonical request string, the last line is the hash of the empty request body. The third line is empty because there are no query parameters in the request.

   b. **StringToSign**

   ```
   AWS4-HMAC-SHA256
   20130524T000000Z
   20130524/us-east-1/s3/aws4_request
   7344ae5b7ee6c3e7e6b0fe0640412a37625d1fbfff95c48bbb2dc43964946972
   ```

2. **SigningKey**

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +
 "<YourSecretAccessKey>","20130524"),"us-east-1"),"s3"),"aws4_request")
```

3. **Signature**

```
f0e8bdb87c964420e857bd35b5d6ed310bd44f0170aba48dd91039c6036bdb41
```

4. **Authorization header**

   The resulting `Authorization` header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/
s3/aws4_request,SignedHeaders=host;range;x-amz-content-sha256;x-amz-
date,Signature=f0e8bdb87c964420e857bd35b5d6ed310bd44f0170aba48dd91039c6036bdb41
```

Example: PUT Object

This example PUT request creates an object (`test$file.text`) in `examplebucket` . The example assumes the following:

- You are requesting `REDUCED_REDUNDANCY` as the storage class by adding the `x-amz-storage-class` request header. For information about storage classes, see Storage Classes in the *Amazon Simple Storage Service User Guide*.
- The content of the uploaded file is a string, `"Welcome to Amazon S3."` The value of `x-amz-content-sha256` in the request is based on this string.

For information about the API action, see PutObject.

```
PUT test$file.text HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Fri, 24 May 2013 00:00:00 GMT
Authorization: SignatureToBeCalculated
x-amz-date: 20130524T000000Z
x-amz-storage-class: REDUCED_REDUNDANCY
```

```
x-amz-content-sha256: 44ce7dd67c959e0d3524ffac1771dfbba87d2b6b4b4e99e42034a8b803f8b072

<Payload>
```

The following steps show signature calculations.

1. **StringToSign**

   a. **CanonicalRequest**

```
PUT
/test%24file.text

date:Fri, 24 May 2013 00:00:00 GMT
host:examplebucket.s3.amazonaws.com
x-amz-content-
sha256:44ce7dd67c959e0d3524ffac1771dfbba87d2b6b4b4e99e42034a8b803f8b072
x-amz-date:20130524T000000Z
x-amz-storage-class:REDUCED_REDUNDANCY

date;host;x-amz-content-sha256;x-amz-date;x-amz-storage-class
44ce7dd67c959e0d3524ffac1771dfbba87d2b6b4b4e99e42034a8b803f8b072
```

   In the canonical request, the third line is empty because there are no query parameters in the request. The `x-amz-content-sha256` canonical header may optionally be signed since its payload hash is already provided at the bottom of the request. The last line is the hash of the body, which should be the same as the `x-amz-content-sha256 header` value sent to S3 in the HTTP request.

   b. **StringToSign**

```
AWS4-HMAC-SHA256
20130524T000000Z
20130524/us-east-1/s3/aws4_request
9e0e90d9c76de8fa5b200d8c849cd5b8dc7a3be3951ddb7f6a76b4158342019d
```

2. **SigningKey**

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +
 "<YourSecretAccessKey>","20130524"),"us-east-1"),"s3"),"aws4_request")
```

3. **Signature**

```
98ad721746da40c64f1a55b78f14c238d841ea1380cd77a1b5971af0ece108bd
```

4. **Authorization header**

   The resulting `Authorization` header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/
aws4_request,SignedHeaders=date;host;x-amz-content-sha256;x-amz-date;x-amz-storage-
class,Signature=98ad721746da40c64f1a55b78f14c238d841ea1380cd77a1b5971af0ece108bd
```

Example: GET Bucket Lifecycle

The following GET request retrieves the lifecycle configuration of `examplebucket`. For information about the API action, see GetBucketLifecycleConfiguration.

```
GET ?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Authorization: SignatureToBeCalculated
x-amz-date: 20130524T000000Z
x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
```

Because the request does not provide any body content, the `x-amz-content-sha256` header value is the hash of the empty request body. The following steps show signature calculations.

1. **StringToSign**

   a. **CanonicalRequest**

```
GET
/
```

```
lifecycle=
host:examplebucket.s3.amazonaws.com
x-amz-content-
sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
x-amz-date:20130524T000000Z

host;x-amz-content-sha256;x-amz-date
e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
```

In the canonical request, the last line is the hash of the empty request body.

b. **StringToSign**

```
AWS4-HMAC-SHA256
20130524T000000Z
20130524/us-east-1/s3/aws4_request
9766c798316ff2757b517bc739a67f6213b4ab36dd5da2f94eaebf79c77395ca
```

2. **SigningKey**

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +
 "<YourSecretAccessKey>","20130524"),"us-east-1"),"s3"),"aws4_request")
```

3. **Signature**

```
fea454ca298b7da1c68078a5d1bdbfbbe0d65c699e0f91ac7a200a0136783543
```

4. **Authorization header**

The resulting `Authorization` header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/
s3/aws4_request,SignedHeaders=host;x-amz-content-sha256;x-amz-
date,Signature=fea454ca298b7da1c68078a5d1bdbfbbe0d65c699e0f91ac7a200a0136783543
```

Example: Get Bucket (List Objects)

The following example retrieves a list of objects from `examplebucket` bucket. For information about the API action, see ListObjects.

```
GET ?max-keys=2&prefix=J HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Authorization: SignatureToBeCalculated
x-amz-date: 20130524T000000Z
x-amz-content-sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
```

Because the request does not provide a body, the value of `x-amz-content-sha256` is the hash of the empty request body. The following steps show signature calculations.

1. **StringToSign**

   a. **CanonicalRequest**

   ```
   GET
   /
   max-keys=2&prefix=J
   host:examplebucket.s3.amazonaws.com
   x-amz-content-
   sha256:e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
   x-amz-date:20130524T000000Z

   host;x-amz-content-sha256;x-amz-date
   e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
   ```

   In the canonical string, the last line is the hash of the empty request body.

   b. **StringToSign**

   ```
   AWS4-HMAC-SHA256
   20130524T000000Z
   20130524/us-east-1/s3/aws4_request
   df57d21db20da04d7fa30298dd4488ba3a2b47ca3a489c74750e0f1e7df1b9b7
   ```

2. **SigningKey**

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +
 "<YourSecretAccessKey>","20130524"),"us-east-1"),"s3"),"aws4_request")
```

3. **Signature**

```
34b48302e7b5fa45bde8084f4b7868a86f0a534bc59db6670ed5711ef69dc6f7
```

4. **Authorization header**

   The resulting `Authorization` header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/
s3/aws4_request,SignedHeaders=host;x-amz-content-sha256;x-amz-
date,Signature=34b48302e7b5fa45bde8084f4b7868a86f0a534bc59db6670ed5711ef69dc6f7
```

Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (Amazon Signature Version 4)

As described in the Overview, when authenticating requests using the `Authorization` header, you have an option of uploading the payload in chunks. You can send data in fixed size or variable size chunks. This section describes the signature calculation process in chunked upload, how you create the chunk body, and how the delayed signing works where you first upload the chunk, and send its signature in the subsequent chunk. The example section (see Example: PUT Object) shows signature calculations and resulting `Authorization` headers that you can use as a test suite to verify your code.

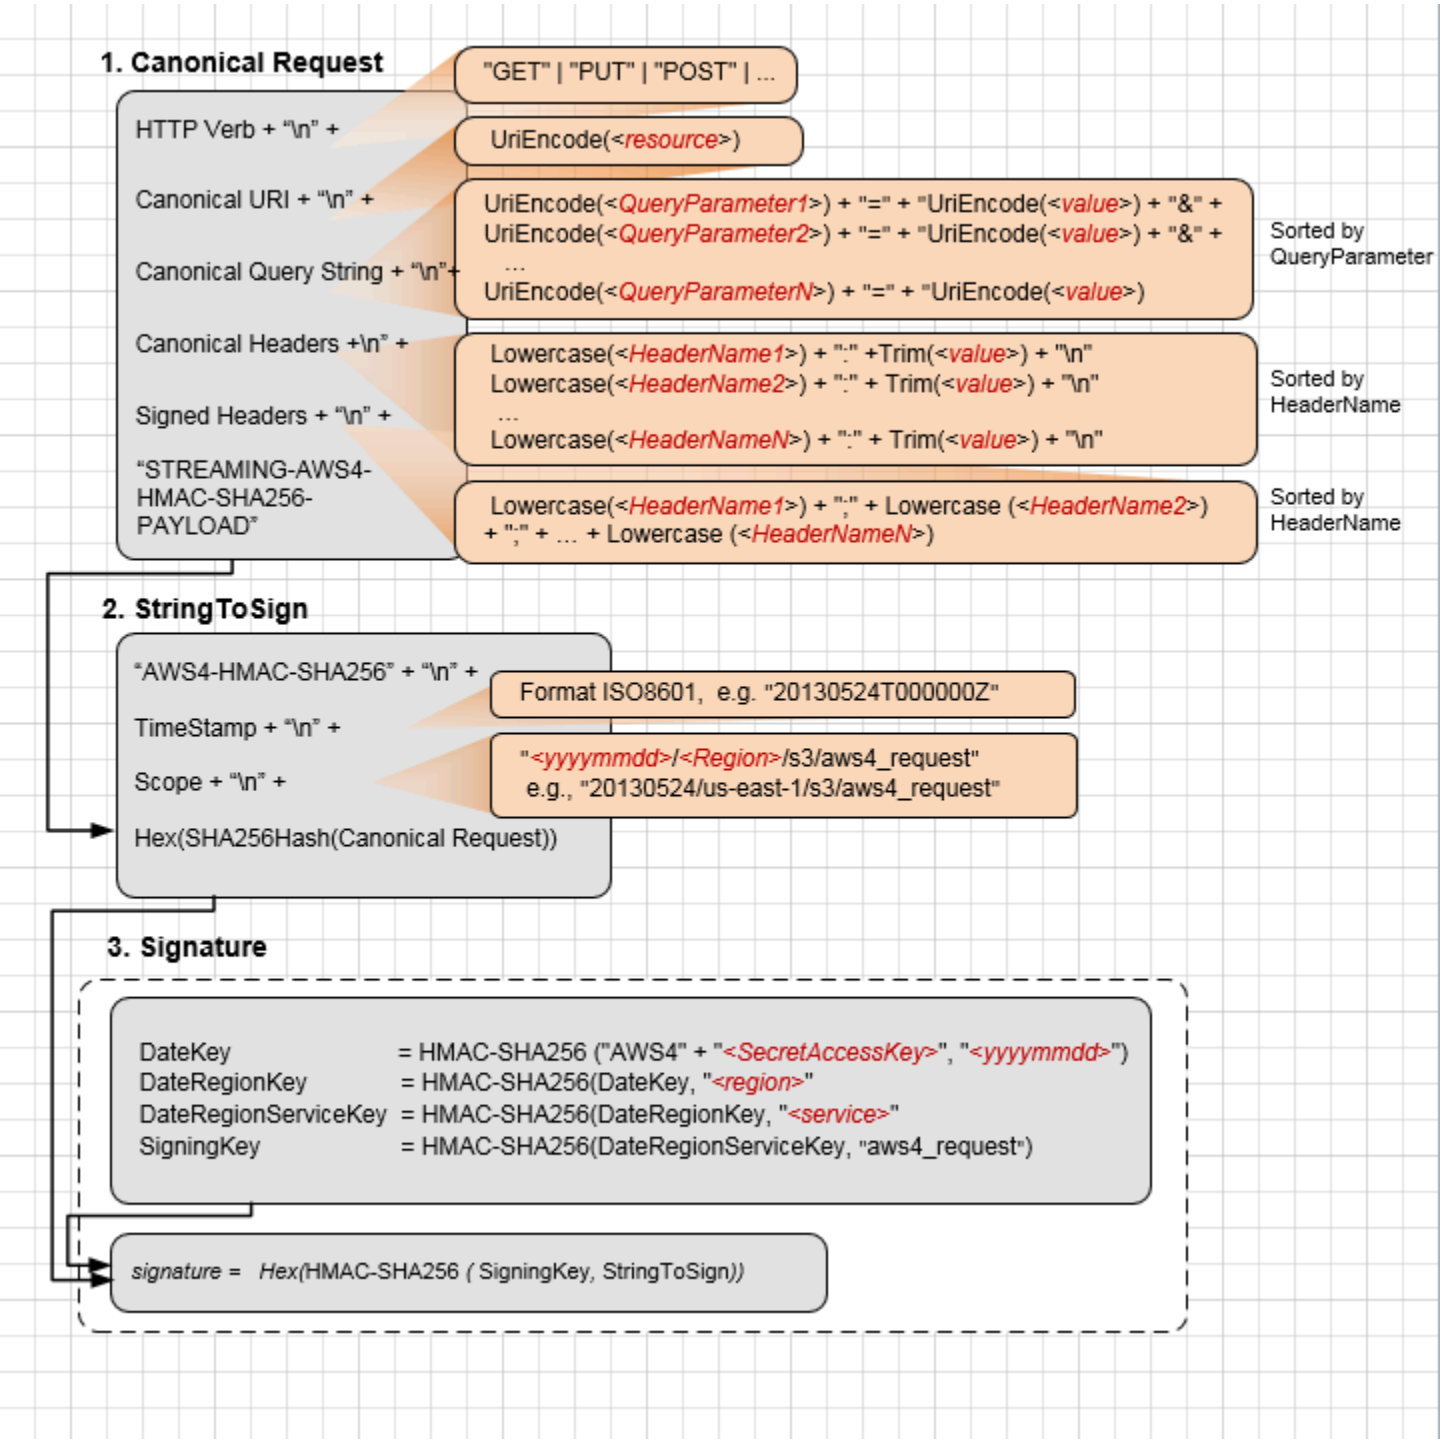
Note

When transferring data in a series of chunks, you must do one of the following:

- Explicitly specify the total content length (object length in bytes plus metadata in each chunk) using the `Content-Length` HTTP header. To do this, you must pre-compute the total length of the payload, including the metadata that you send in each chunk, before starting your request.
- Specify the `Transfer-Encoding` HTTP header. If you include the `Transfer-Encoding` header and specify any value other than `identity`, you must omit the `Content-Length` header.

For all requests, you must include the `x-amz-decoded-content-length` header, specifying the size of the object in bytes.

Each chunk signature calculation includes the signature of the previous chunk. To begin, you create a *seed* signature using only the headers. You use the seed signature in the signature calculation of the first chunk. For each subsequent chunk, you create a chunk signature that includes the signature of the previous chunk. Thus, the chunk signatures are chained together; that is, the signature of chunk *n* is a function *F(chunk n, signature(chunk n-1))*. The chaining ensures that you send the chunks in the correct order.



To perform a chunked upload, do the following:

1. Decide the payload chunk size. You need this when you write the code.

   The chunk size must be at least 8 KB. We recommend a chunk size of a least 64 KB for better performance. This chunk size applies to all chunks except the last one. The last chunk you send can be smaller than 8 KB. If your payload is small and can fit into one chunk, then it can be smaller than the 8 KB.
2. Create the seed signature for inclusion in the first chunk. For more information, see Calculating the Seed Signature.
3. Create the first chunk and stream it. For more information, see Defining the Chunk Body.
4. For each subsequent chunk, calculate the chunk signature that includes the previous signature in the string you sign, construct the chunk, and send it. For more information, see Defining the Chunk Body.
5. Send the final additional chunk, which is the same as the other chunks in the construction, but it has zero data bytes. For more information, see Defining the Chunk Body.

Calculating the Seed Signature

The following diagram illustrates the process of calculating the seed signature.

The following table describes the functions that are shown in the diagram. You need to implement code for these functions.

Function	Description
`Lowercase()`	Convert the string to lowercase.
`Hex()`	Lowercase base 16 encoding.
`SHA256Hash()`	Secure Hash Algorithm (SHA) cryptographic hash function.
`HMAC-SHA256()`	Computes HMAC by using the SHA256 algorithm with the signing key provided. This is the final signature.
`Trim()`	Remove any leading or trailing whitespace.
`UriEncode()`	URI encode every byte. UriEncode() must enforce the following rules: • URI encode every byte except the unreserved characters: 'A'-'Z', 'a'-'z', '0'-'9', '-', '.', '_', and '~'. • The space character is a reserved character and must be encoded as "%20" (and not as "+"). • Each URI encoded byte is formed by a '%' and the two-digit hexadecimal value of the byte. • Letters in the hexadecimal value must be uppercase, for example "%1A". • Encode the forward slash character, '/', everywhere except in the object key name. For example, if the object key name is `photos/Jan/sample.jpg` , the forward slash in the key name is not encoded. **Important** The standard UriEncode functions provided by your development platform may not work because of differences in implementation and related ambiguity in the underlying RFCs. We recommend that you write

Function	Description
	your own custom UriEncode function to ensure that your encoding will work. To see an example of a UriEncode function in Java, see Java Utilities on the GitHub website.

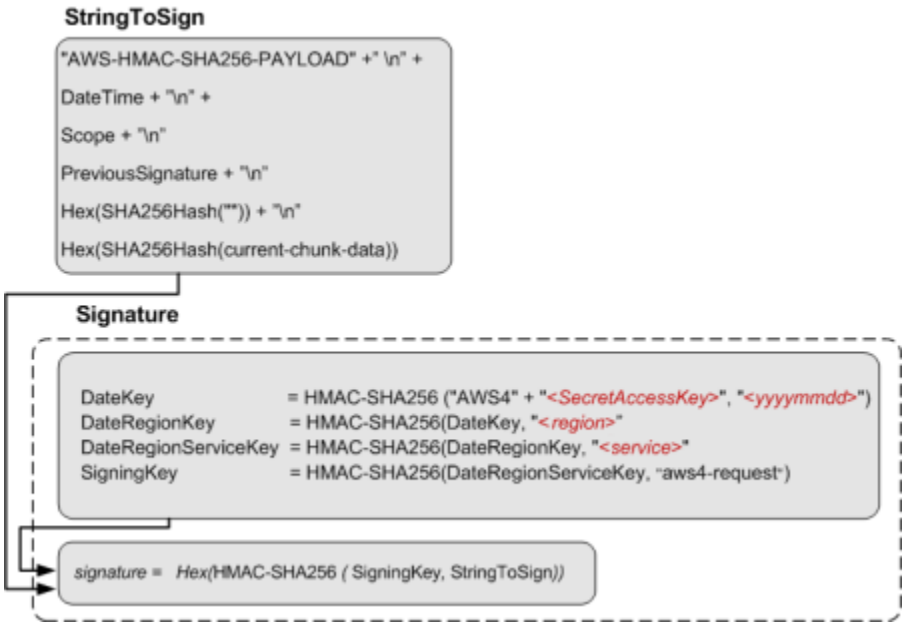
For information about the signing process, see Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (Amazon Signature Version 4). The process is the same, except that the creation of `CanonicalRequest` differs as follows:

- In addition to the request headers you plan to add, you must include the following headers:

Header	Description
`x-amz-content-sha256`	This header is required for all Amazon Signature Version 4 requests. Set the value to `STREAMING-AWS4-HMAC-SHA256-PAYLOAD` to indicate that the signature covers only headers and that there is no payload.

Header	Description
`Content-Encoding`	Set the value to `aws-chunked` . Amazon S3 supports multiple content encoding values. You can specify your custom content-encoding when using the Signature Version 4 streaming API. For example: `Content-Encoding : aws-chunked,gzip` Amazon S3 stores the resulting object without the `aws-chunked` value in the `content-encoding` header. If `aws-chunked` is the only value that you pass in the `content-encoding` header, S3 considers the `content-encoding` header empty and does not return this header when your retrieve the object.
`x-amz-decoded-content-length`	Set the value to the length, in bytes, of the data to be chunked, without counting any metadata. For example, if you are uploading a 4 GB file, set the value to 4294967296. This is the raw size of the object to be uploaded (data you want to store in Amazon S3).
`Content-Length`	Set the value to the actual size of the transmitted HTTP body, which includes the length of your data (value set for `x-amz-decoded-content-length`), plus chunk metadata. Each chunk has metadata, such as the signature of the previous chunk. Chunk calculations are discussed in the following section. If you include the `Transfer-Encoding` header and specify any value other than `identity`, you must not include the `Content-Length` header.

You send the first chunk with the seed signature. You must construct the chunk as described in the following section.



Defining the Chunk Body

All chunks include some metadata. Each chunk must conform to the following structure:

```
string(IntHexBase(chunk-size)) + ";chunk-signature=" + signature + \r\n + chunk-data +
 \r\n
```

Where:

- `IntHexBase()` is a function that you write to convert an integer chunk-size to hexadecimal. For example, if chunk-size is 65536, hexadecimal string is "10000".
- *`chunk-size`* is the size, in bytes, of the chunk-data, without metadata. For example, if you are uploading a 65 KB object and using a chunk size of 64 KB, you upload the data in three chunks: the first would be 64 KB, the second 1 KB, and the final chunk with 0 bytes.
- *`signature`* For each chunk, you calculate the signature using the following string to sign. For the first chunk, you use the seed-signature as the previous signature.

The size of the final chunk data that you send is 0, although the chunk body still contains metadata, including the signature of the previous chunk.

Example: PUT Object

You can use the examples in this section as a reference to check signature calculations in your code. Before you review the examples, note the following:

- The signature calculations in these examples use the following example security credentials.

Parameter	Value
`AWSAccessKeyId`	`AKIAIOSFODNN7EXAMPLE`
`AWSSecret AccessKey`	`wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY`

- All examples use the request timestamp 20130524T000000Z (`Fri, 24 May 2013 00:00:00 GMT`).
- All examples use `examplebucket` as the bucket name.
- The bucket is assumed to be in the US East (N. Virginia) Region, and the credential `Scope` and the `Signing Key` calculations use `us-east-1` as the Region specifier. For more information, see Regions and Endpoints in the *Amazon Web Services General Reference*.
- You can use either path style or virtual-hosted style requests. The following examples use virtual-hosted style requests, for example:

  ```
  https://examplebucket.s3.amazonaws.com/photos/photo1.jpg
  ```

  For more information, see Virtual Hosting of Buckets in the *Amazon Simple Storage Service User Guide*.

The following example sends a `PUT` request to upload an object. The signature calculations assume the following:

- You are uploading a 65 KB text file, and the file content is a one-character string made up of the letter 'a'.

- The chunk size is 64 KB. As a result, the payload is uploaded in three chunks, 64 KB, 1 KB, and the final chunk with 0 bytes of chunk data.
- The resulting object has the key name `chunkObject.txt`.
- You are requesting `REDUCED_REDUNDANCY` as the storage class by adding the `x-amz-storage-class` request header.

For information about the API action, see PutObject. The general request syntax is as follows:

```
PUT /examplebucket/chunkObject.txt HTTP/1.1
Host: s3.amazonaws.com
x-amz-date: 20130524T000000Z
x-amz-storage-class: REDUCED_REDUNDANCY
Authorization: SignatureToBeCalculated
x-amz-content-sha256: STREAMING-AWS4-HMAC-SHA256-PAYLOAD
Content-Encoding: aws-chunked
x-amz-decoded-content-length: 66560
Content-Length: 66824
<Payload>
```

The following steps show signature calculations.

1. **Seed signature — Create String to Sign**

   a. **CanonicalRequest**

```
PUT
/examplebucket/chunkObject.txt

content-encoding:aws-chunked
content-length:66824
host:s3.amazonaws.com
x-amz-content-sha256:STREAMING-AWS4-HMAC-SHA256-PAYLOAD
x-amz-date:20130524T000000Z
x-amz-decoded-content-length:66560
x-amz-storage-class:REDUCED_REDUNDANCY

content-encoding;content-length;host;x-amz-content-sha256;x-amz-date;x-amz-
decoded-content-length;x-amz-storage-class
STREAMING-AWS4-HMAC-SHA256-PAYLOAD
```

In the canonical request, the third line is empty because there are no query parameters in the request. The last line is the constant string provided as the value of the hashed Payload, which should be same as the value of `x-amz-content-sha256 header`.

b. **StringToSign**

```
AWS4-HMAC-SHA256
20130524T000000Z
20130524/us-east-1/s3/aws4_request
cee3fed04b70f867d036f722359b0b1f2f0e5dc0efadbc082b76c4c60e316455
```

> **Note**
>
> For information about each of line in the string to sign, see the diagram that explains seed signature calculation.

2. **SigningKey**

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +
 "<YourSecretAccessKey>","20130524"),"us-east-1"),"s3"),"aws4_request")
```

3. **Seed Signature**

```
4f232c4386841ef735655705268965c44a0e4690baa4adea153f7db9fa80a0a9
```

4. **Authorization header**

The resulting Authorization header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/
aws4_request,SignedHeaders=content-encoding;content-length;host;x-amz-
content-sha256;x-amz-date;x-amz-decoded-content-length;x-amz-storage-
class,Signature=4f232c4386841ef735655705268965c44a0e4690baa4adea153f7db9fa80a0a9
```

5. **Chunk 1: (65536 bytes, with value 97 for letter 'a')**

   a. Chunk string to sign:

```
AWS4-HMAC-SHA256-PAYLOAD
20130524T000000Z
20130524/us-east-1/s3/aws4_request
4f232c4386841ef735655705268965c44a0e4690baa4adea153f7db9fa80a0a9
e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
bf718b6f653bebc184e1479f1935b8da974d701b893afcf49e701f3e2f9f9c5a
```

> **Note**
>
> For information about each line in the string to sign, see the preceding diagram that shows various components of the string to sign (for example, the last three lines are, `previous-signature`, `hash("")`, and `hash(current-chunk-data)`).

   b. Chunk signature:

```
ad80c730a21e5b8d04586a2213dd63b9a0e99e0e2307b0ade35a65485a288648
```

   c. Chunk data sent:

```
10000;chunk-
signature=ad80c730a21e5b8d04586a2213dd63b9a0e99e0e2307b0ade35a65485a288648
<65536-bytes>
```

6. **Chunk 2: (1024 bytes, with value 97 for letter 'a')**

   a. Chunk string to sign:

```
AWS4-HMAC-SHA256-PAYLOAD
20130524T000000Z
20130524/us-east-1/s3/aws4_request
ad80c730a21e5b8d04586a2213dd63b9a0e99e0e2307b0ade35a65485a288648
e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
2edc986847e209b4016e141a6dc8716d3207350f416969382d431539bf292e4a
```

   b. Chunk signature:

```
0055627c9e194cb4542bae2aa5492e3c1575bbb81b612b7d234b86a503ef5497
```

c. Chunk data sent:

```
400;chunk-
signature=0055627c9e194cb4542bae2aa5492e3c1575bbb81b612b7d234b86a503ef5497
<1024 bytes>
```

7. **Chunk 3: (0 byte data)**

a. Chunk string to sign:

```
AWS4-HMAC-SHA256-PAYLOAD
20130524T000000Z
20130524/us-east-1/s3/aws4_request
0055627c9e194cb4542bae2aa5492e3c1575bbb81b612b7d234b86a503ef5497
e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
```

b. Chunk signature:

```
b6c6ea8a5354eaf15b3cb7646744f4275b71ea724fed81ceb9323e279d449df9
```

c. Chunk data sent:

```
0;chunk-
signature=b6c6ea8a5354eaf15b3cb7646744f4275b71ea724fed81ceb9323e279d449df9
```

Signature calculations for trailing headers (chunked uploads) (Amazon Signature Version 4)

When authenticating requests using the `Authorization` header, you can also upload the payload in chunks. When you send the data for the object in chunks, you also have the option of including trailing headers. (For more information, see Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (Amazon Signature Version 4).) This section describes the steps you need to take when you want to include a trailing header at the end of your multiple chunk upload.

> **Important**
>
> When you are including trailing headers, you must send the following in your initial header:
>
> - You must set `x-amz-content-sha256` to an appropriate value that indicates a trailer will be included. To see the acceptable values for `x-amz-content-sha256`, see Authenticating Requests: Using the Authorization Header (Amazon Signature Version 4).
> - You must set `x-amz-trailer` to indicate the contents your are including in your trailing header.

Trailing headers are only sent after the chunks have been uploaded. Previous chunks are sent as normal and signed as described in the previous sections, including sending the final chunk with a payload of 0 bytes. The trailing headers are included as their own chunk and sent after the final chunk with a payload of 0 bytes. For example, if your data ended with a 100 KB chunk, you would send the following:

- Previous data chunks
- 100 KB final chunk of the object
- 0 bytes chunk signifying the end of the object
- Trailing headers chunk

Examples: Checking signature calculations

You can use the examples in this section as a reference to check signature calculations in your code. Before you review the examples, note the following:

- The signature calculations in these examples use the following example security credentials.

Parameter	Value
`AWSAccessKeyId`	`AKIAIOSFODNN7EXAMPLE`
`AWSSecretAccessKey`	`wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY`

- All examples use the request timestamp 20130524T000000Z (`Fri, 24 May 2013 00:00:00 GMT`).
- All examples use `examplebucket` as the bucket name.
- The bucket is assumed to be in the US East (N. Virginia) Region, and the credential `Scope` and the `Signing Key` calculations use `us-east-1` as the Region specifier. For more information, see Regions and endpoints in the *Amazon Web Services General Reference*.
- You can use either path style or virtual-hosted style requests. The following examples use virtual-hosted style requests, for example:

```
https://examplebucket.s3.amazonaws.com/photos/photo1.jpg
```

  For more information, see Virtual Hosting of Buckets in the *Amazon Simple Storage Service User Guide*.

The following example sends a `PUT` request to upload an object. The signature calculations assume the following:

- You are uploading a 65 KB text file, and the file content is a one-character string made up of the letter 'a'.
- The chunk size is 64 KB. As a result, the payload is uploaded in three chunks, 64 KB, 1 KB, and the final chunk with 0 bytes of chunk data.
- The resulting object has the key name `chunkObject.txt`.
- You are requesting `REDUCED_REDUNDANCY` as the storage class by adding the `x-amz-storage-class` request header.
- The transfer is including a CRC32C checksum value as a trailing header.

For information about the API action, see PutObject. The general request syntax is as follows:

```
PUT /examplebucket/chunkObject.txt HTTP/1.1
Host: s3.amazonaws.com
x-amz-date: 20130524T000000Z
x-amz-storage-class: REDUCED_REDUNDANCY
Authorization: SignatureToBeCalculated
x-amz-content-sha256: STREAMING-AWS4-HMAC-SHA256-PAYLOAD-TRAILER
Content-Encoding: aws-chunked
x-amz-decoded-content-length: 66560
x-amz-trailer: x-amz-checksum-crc32c
Content-Length: 66824
<Payload>
```

The following steps show signature calculations.

1. **Seed signature — Create String to Sign**

   a. **CanonicalRequest**

   ```
   PUT
   /examplebucket/chunkObject.txt

   content-encoding:aws-chunked
   host:s3.amazonaws.com
   x-amz-content-sha256:STREAMING-AWS4-HMAC-SHA256-PAYLOAD-TRAILER
   x-amz-date:20130524T000000Z
   x-amz-decoded-content-length:66560
   x-amz-storage-class:REDUCED_REDUNDANCY
   x-amz-trailer:x-amz-checksum-crc32c

   content-encoding;host;x-amz-content-sha256;x-amz-date;x-amz-decoded-content-
   length;x-amz-storage-class;x-amz-trailer
   STREAMING-AWS4-HMAC-SHA256-PAYLOAD-TRAILER
   ```

   In the canonical request, the third line is empty because there are no query parameters in the request. The last line is the constant string provided as the value of the hashed Payload, which should be same as the value of `x-amz-content-sha256 header`.

   b. **StringToSign**

```
AWS4-HMAC-SHA256
20130524T000000Z
20130524/us-east-1/s3/aws4_request
44d48b8c2f70eae815a0198cc73d7a546a73a93359c070abbaa5e6c7de112559
```

> **Note**
>
> For information about each of line in the string to sign, see the diagram that explains seed signature calculation.

2. **SigningKey**

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +
 "<YourSecretAccessKey>","20130524"),"us-east-1"),"s3"),"aws4_request")
```

3. **Seed Signature**

```
106e2a8a18243abcf37539882f36619c00e2dfc72633413f02d3b74544bfeb8e
```

4. **Authorization header**

   The resulting Authorization header is as follows:

```
AWS4-HMAC-SHA256 Credential=AKIAIOSFODNN7EXAMPLE/20130524/us-east-1/s3/
aws4_request,SignedHeaders=content-encoding;content-length;host;x-amz-
content-sha256;x-amz-date;x-amz-decoded-content-length;x-amz-storage-
class,Signature=106e2a8a18243abcf37539882f36619c00e2dfc72633413f02d3b74544bfeb8e
```

5. **Chunk 1: (65536 bytes, with value 97 for letter 'a')**

   a. Chunk string to sign:

```
AWS4-HMAC-SHA256-PAYLOAD
20130524T000000Z
```

```
20130524/us-east-1/s3/aws4_request
106e2a8a18243abcf37539882f36619c00e2dfc72633413f02d3b74544bfeb8e

bf718b6f653bebc184e1479f1935b8da974d701b893afcf49e701f3e2f9f9c5a
```

> **Note**
>
> For information about each line in the string to sign, see the diagram in the preceding topic (Calculating the Seed Signature) that shows various components of the string to sign. For example, the last three lines consist of the following:
>
> - *previous-signature*
> - hash("")
> - hash(*current-chunk-data*)

b. Chunk signature:

```
b474d8862b1487a5145d686f57f013e54db672cee1c953b3010fb58501ef5aa2
```

c. Chunk data sent:

```
10000;chunk-
signature=b474d8862b1487a5145d686f57f013e54db672cee1c953b3010fb58501ef5aa2
<65536-bytes>
```

6. **Chunk 2: (1024 bytes, with value 97 for letter 'a')**

a. Chunk string to sign:

```
AWS4-HMAC-SHA256-PAYLOAD
20130524T000000Z
20130524/us-east-1/s3/aws4_request
b474d8862b1487a5145d686f57f013e54db672cee1c953b3010fb58501ef5aa2
e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
2edc986847e209b4016e141a6dc8716d3207350f416969382d431539bf292e4a
```

b. Chunk signature:

```
1c1344b170168f8e65b41376b44b20fe354e373826ccbbe2c1d40a8cae51e5c7
```

c. Chunk data sent:

```
400;chunk-
signature=1c1344b170168f8e65b41376b44b20fe354e373826ccbbe2c1d40a8cae51e5c7
<1024-bytes>
```

7. **Chunk 3: (0 byte data)**

a. Chunk string to sign:

```
AWS4-HMAC-SHA256-PAYLOAD
20130524T000000Z
20130524/us-east-1/s3/aws4_request
1c1344b170168f8e65b41376b44b20fe354e373826ccbbe2c1d40a8cae51e5c7
e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
e3b0c44298fc1c149afbf4c8996fb92427ae41e4649b934ca495991b7852b855
```

b. Chunk signature:

```
2ca2aba2005185cf7159c6277faf83795951dd77a3a99e6e65d5c9f85863f992
```

c. Chunk data sent:

```
0;chunk-
signature=2ca2aba2005185cf7159c6277faf83795951dd77a3a99e6e65d5c9f85863f992
```

8. **Chunk 4: Trailing headers**

a. Trailer chunk string to sign:

```
AWS4-HMAC-SHA256-TRAILER
20130524T000000Z
20130524/us-east-1/s3/aws4_request
2ca2aba2005185cf7159c6277faf83795951dd77a3a99e6e65d5c9f85863f992
1e376db7e1a34a8ef1c4bcee131a2d60a1cb62503747488624e10995f448d774
```

Note

The last two lines are `previous-signature` (the 0 byte data chunk signature), hash(*`trailing-checksum-header-name`*:*`base64-encoded-trailing-checksum-value`*\n).

The hash is calculated as follows with no whitespace:

- The trailing checksum header name
- A colon (:)
- The base64-encoded trailing checksum value
- A newline character (\n).

In this example, where we are using the `crc32c` hash algorithm, with the base64-encoded checksum value `s008/Q==`, we can represent the computation as follows: `hash('x-amz-checksum-crc32c:s008/Q==\n')`.

b. Chunk signature:

```
63bddb248ad2590c92712055f51b8e78ab024eead08276b24f010b0efd74843f
```

c. Chunk data sent:

```
x-amz-checksum-crc32c:s008/Q==
x-amz-trailer-
signature:63bddb248ad2590c92712055f51b8e78ab024eead08276b24f010b0efd74843f
```

Authenticating Requests: Using Query Parameters (Amazon Signature Version 4)

As described in the authentication overview (see Authentication Methods), you can provide authentication information using query string parameters. Using query parameters to authenticate requests is useful when you want to express a request entirely in a URL. This method is also referred as presigning a URL.

A use case scenario for presigned URLs is that you can grant temporary access to your Amazon S3 resources. For example, you can embed a presigned URL on your website or alternatively use it in command line client (such as Curl) to download objects.

Note

You can also use the Amazon CLI to create presigned URLs. For more information, see `presign` in the *Amazon CLI Command Reference*.

The following is an example presigned URL.

```
https://examplebucket.s3.amazonaws.com/test.txt
?X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=<your-access-key-id>/20130721/us-east-1/s3/aws4_request
&X-Amz-Date=20130721T201207Z
&X-Amz-Expires=86400
&X-Amz-SignedHeaders=host
&X-Amz-Signature=<signature-value>
```

In the example URL, note the following:

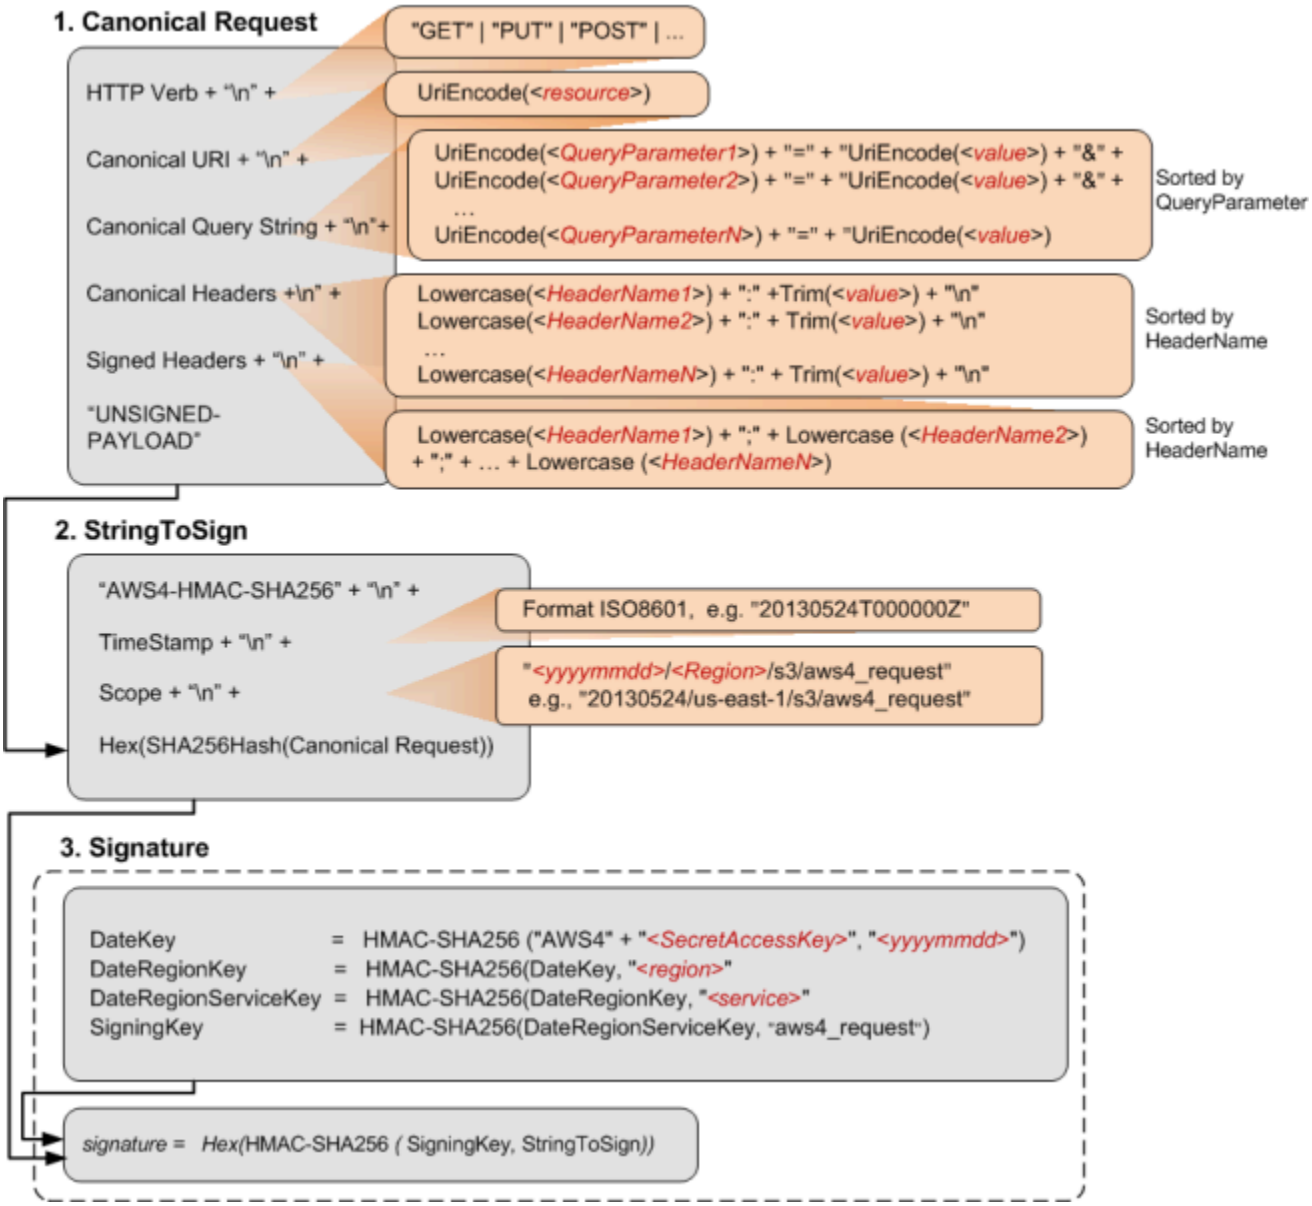
- The line feeds are added for readability.
- The `X-Amz-Credential` value in the URL shows the "/" character only for readability. In practice, it should be encoded as `%2F`. For example:

```
&X-Amz-Credential=<your-access-key-id>%2F20130721%2Fus-east-1%2Fs3%2Faws4_request
```

The following table describes the query parameters in the URL that provide authentication information.

Query String Parameter Name	Example Value
`X-Amz-Algorithm`	Identifies the version of Amazon Signature and the algorithm that you used to calculate the signature. For Amazon Signature Version 4, you set this parameter value to `AWS4-HMAC-SHA256` . This string identifies Amazon Sig

Query String Parameter Name	Example Value
	nature Version 4 (Amazon4) and the HMAC-SHA256 algorithm (HMAC-SHA256).



`X-Amz-Credential`	In addition to your access key ID, this parameter also provides scope (Amazon Web Services Region and service) for which the signature is valid. This value must match the scope you use in signature calculations, discussed in the following section. The general form for this parameter value is as follows:
	
	`<your-access-key-id> /<date>/<Amazon Web Services Region>/<Amazon-service> /aws4_request`
	
	For example:
	
	`AKIAIOSFODNN7EXAMPLE/20130721/us-east-1/s3/aws4_request`
	
	For Amazon S3, the *Amazon-service* string is s3. For a list of S3 AWS-region strings, see Regions and Endpoints in the *Amazon Web Services General Reference*.

`X-Amz-Date`	The date and time format must follow the ISO 8601 standard, and must be formatted with the "*yyyyMMdd*T*HHmmss*Z" format. For example if the date and time was "08/01/2016 15:32:41.982-700" then it must first be converted to UTC (Coordinated Universal Time) and then submitted as "20160801T223241Z".

Query String Parameter Name	Example Value
`X-Amz-Expires`	Provides the time period, in seconds, for which the generated presigned URL is valid. For example, `86400` (24 hours). This value is an integer. The minimum value you can set is 1, and the maximum is 604800 (seven days). A presigned URL can be valid for a maximum of seven days because the signing key you use in signature calculation is valid for up to seven days.
`X-Amz-SignedHeaders`	Lists the headers that you used to calculate the signature. The following headers are required in the signature calculations: • The HTTP `host` header. • Any `x-amz-*` headers that you plan to add to the request. **Note** For added security, you should sign all the request headers that you plan to include in your request.
`X-Amz-Signature`	Provides the signature to authenticate your request. This signature must match the signature Amazon S3 calculates; otherwise, Amazon S3 denies the request. For example, `733255ef022bec3f2a8701cd61d4b371f3f28c9f193a1f02279211d48d5193d7` Signature calculations are described in the following section.
`X-Amz-Security-Token`	Optional credential parameter if using credentials sourced from the STS service.

Calculating a Signature

The following diagram illustrates the signature calculation process.

The following table describes the functions that are shown in the diagram. You need to implement code for these functions.

Function	Description
`Lowercase()`	Convert the string to lowercase.

Function	Description
`Hex()`	Lowercase base 16 encoding.
`SHA256Hash()`	Secure Hash Algorithm (SHA) cryptographic hash function.
`HMAC-SHA256()`	Computes HMAC by using the SHA256 algorithm with the signing key provided. This is the final signature.
`Trim()`	Remove any leading or trailing whitespace.

Function	Description
`UriEncode()`	URI encode every byte. UriEncode() must enforce the following rules: • URI encode every byte except the unreserved characters: 'A'-'Z', 'a'-'z', '0'-'9', '-', '.', '_', and '~'. • The space character is a reserved character and must be encoded as "%20" (and not as "+"). • Each URI encoded byte is formed by a '%' and the two-digit hexadecimal value of the byte. • Letters in the hexadecimal value must be uppercase, for example "%1A". • Encode the forward slash character, '/', everywhere except in the object key name. For example, if the object key name is `photos/Jan/sample.jpg` , the forward slash in the key name is not encoded. **Important** The standard UriEncode functions provided by your development platform may not work because of differences in implementation and related ambiguity in the underlying RFCs. We recommend that you write your own custom UriEncode function to ensure that your encoding will work. To see an example of a UriEncode function in Java, see Java Utilities on the GitHub website.

For more information about the signing process (details of creating a canonical request, string to sign, and signature calculations), see Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (Amazon Signature Version 4). The process is generally the same except that the creation of **CanonicalRequest** in a presigned URL differs as follows:

- You don't include a payload hash in the **Canonical Request**, because when you create a presigned URL, you don't know the payload content because the URL is used to upload an arbitrary payload. Instead, you use a constant string `UNSIGNED-PAYLOAD`.
- The **Canonical Query String** must include all the query parameters from the preceding table except for `X-Amz-Signature`.
- For S3, you must include the `X-Amz-Security-Token` query parameter in the URL if using credentials sourced from the STS service.
- **Canonical Headers** must include the HTTP `host` header. If you plan to include any of the `x-amz-*` headers, these headers must also be added for signature calculation. You can optionally add all other headers that you plan to include in your request. For added security, you should sign as many headers as possible. If you add a signed header that is also a signed query parameter, and they differ in value, you will receive an `InvalidRequest` error as the input is conflicting.

An Example

Suppose you have an object `test.txt` in your `examplebucket` bucket. You want to share this object with others for a period of 24 hours (86400 seconds) by creating a presigned URL.

```
https://examplebucket.s3.amazonaws.com/test.txt
?X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE%2F20130524%2Fus-east-1%2Fs3%2Faws4_request
&X-Amz-Date=20130524T000000Z&X-Amz-Expires=86400&X-Amz-SignedHeaders=host
&X-Amz-Signature=<signature-value>
```

The following steps illustrate first the signature calculations and then construction of the presigned URL. The example makes the following additional assumptions:

- Request timestamp is `Fri, 24 May 2013 00:00:00 GMT`.
- The bucket is in the US East (N. Virginia) region, and the credential `Scope` and the `Signing Key` calculations use `us-east-1` as the region specifier. For more information, see Regions and Endpoints in the *Amazon Web Services General Reference*.

You can use this example as a test case to verify the signature that your code calculates; however, you must use the same bucket name, object key, time stamp, and the following example credentials:

Parameter	Value
AWSAccessKeyId	AKIAIOSFODNN7EXAMPLE
AWSSecret AccessKey	wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY

1. **StringToSign**

   a. **CanonicalRequest**

```
GET
/test.txt
X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE
%2F20130524%2Fus-east-1%2Fs3%2Faws4_request&X-Amz-Date=20130524T000000Z&X-Amz-
Expires=86400&X-Amz-SignedHeaders=host
host:examplebucket.s3.amazonaws.com

host
UNSIGNED-PAYLOAD
```

   b. **StringToSign**

```
AWS4-HMAC-SHA256
20130524T000000Z
20130524/us-east-1/s3/aws4_request
3bfa292879f6447bbcda7001decf97f4a54dc650c8942174ae0a9121cf58ad04
```

2. **SigningKey**

```
signing key = HMAC-SHA256(HMAC-SHA256(HMAC-SHA256(HMAC-SHA256("AWS4" +
 "<YourSecretAccessKey>","20130524"),"us-east-1"),"s3"),"aws4_request")
```

3. **Signature**

```
aeeed9bbccd4d02ee5c0109b86d86835f995330da4c265957d157751f604d404
```

Now you have all information to construct a presigned URL. The resulting URL for this example is shown as follows (you can use this to compare your presigned URL):

```
https://examplebucket.s3.amazonaws.com/test.txt?X-Amz-Algorithm=AWS4-HMAC-SHA256&X-
Amz-Credential=AKIAIOSFODNN7EXAMPLE%2F20130524%2Fus-east-1%2Fs3%2Faws4_request&X-
Amz-Date=20130524T000000Z&X-Amz-Expires=86400&X-Amz-SignedHeaders=host&X-Amz-
Signature=aeeed9bbccd4d02ee5c0109b86d86835f995330da4c265957d157751f604d404
```

Example 2

The following is an example (unrelated to the previous example) showing a presigned URL with the `X-Amz-Security-Token` parameter.

```
https://examplebucket.s3.us-east-1.amazonaws.com/test.txt
?X-Amz-Algorithm=AWS4-HMAC-SHA256
&X-Amz-Credential=AKIAIOSFODNN7EXAMPLE%2F20130524%2Fus-east-1%2Fs3%2Faws4_request
&X-Amz-Date=20200524T000000Z&X-Amz-Expires=86400&X-Amz-SignedHeaders=host
&X-Amz-Security-Token=IQoJb3JpZ2luX2VjEMv%2F%2F%2F%2F%2F%2F%2F%2F%2F
%2FwEaCXVzLWVhc3QtMSJGMEQCIBSUbVdj9YGs2g0HkHsOHFdkwOozjARSKHL987NhhOC8AiBPepRU1obMvIbGU0T

%2Bx5kY6i0s8QE886jJtUWMP5ldMziClGx3p0mN5dzsYlM3GyiJ
%2FO1mWkPQDwg3mtSpOA9oeeuAMPTA7qMqy9RNuTKBDSx9EW27wvPzBum3SJhEfxv48euadKgrIX3Z79ruQFSQOc9LUrDjR
%2B4SoWAJqK%2BGX8Q3vPSjsLxhqhEMWd6U4TXcM7ku3gxMbzqfT8NDg%3D
&X-Amz-Signature=<signature-value>
```

Examples: Signature Calculations in Amazon Signature Version 4

Topics

- Signature Calculation Examples Using Java (Amazon Signature Version 4)
- Examples of Signature Calculations Using C# (Amazon Signature Version 4)

For authenticated requests, unless you are using the Amazon SDKs, you have to write code to calculate signatures that provide authentication information in your requests. Signature calculation in Amazon Signature Version 4 (see Authenticating Requests (Amazon Signature Version 4)) can be a complex undertaking, and we recommend that you use the Amazon SDKs whenever possible.

This section provides examples of signature calculations written in Java and C#. The code samples send the following requests and use the HTTP Authorization header to provide authentication information:

- **PUT object** – Separate examples illustrate both uploading the full payload at once and uploading the payload in chunks. For information about using the Authorization header for authentication, see Authenticating Requests: Using the Authorization Header (Amazon Signature Version 4).
- **GET object** – This example generates a presigned URL to get an object. Query parameters provide the signature and other authentication information. Users can paste a presigned URL in their browser to retrieve the object, or you can use the URL to create a clickable link. For information about using query parameters for authentication, see Authenticating Requests: Using Query Parameters (Amazon Signature Version 4).

The rest of this section describes the examples in Java and C#. The topics include instructions for downloading the samples and for executing them.

Signature Calculation Examples Using Java (Amazon Signature Version 4)

The Java sample that shows signature calculation can be downloaded at https://docs.amazonaws.cn/AmazonS3/latest/API/samples/AWSS3SigV4JavaSamples.zip. Note that these samples use Amazon SDK for Java v1, and we recommend using Amazon SDK for Java v2 for new applications. In `RunAllSamples.java`, the `main()` function executes sample requests to create

an object, retrieve an object, and create a presigned URL for the object. The sample creates an object from the text string provided in the code:

```
PutS3ObjectSample.putS3Object(bucketName, regionName, awsAccessKey, awsSecretKey);
GetS3ObjectSample.getS3Object(bucketName, regionName, awsAccessKey, awsSecretKey);
PresignedUrlSample.getPresignedUrlToS3Object(bucketName, regionName, awsAccessKey,
 awsSecretKey);
PutS3ObjectChunkedSample.putS3ObjectChunked(bucketName, regionName, awsAccessKey,
 awsSecretKey);
```

To test the examples on a Linux-based computer

The following instructions are for the Linux operating system.

1. In a terminal, navigate to the directory that contains `AWSS3SigV4JavaSamples.zip`.
2. Extract the .zip file.
3. In a text editor, open the file `./com/amazonaws/services/s3/samples/RunAllSamples.java`. Update code with the following information:

   - The name of a bucket where the new object can be created.

     > **Note**
     >
     > The examples use a virtual-hosted style request to access the bucket. To avoid potential errors, ensure that your bucket name conforms to the bucket naming rules as explained in Bucket Restrictions and Limitations in the *Amazon Simple Storage Service User Guide*.

   - Amazon Web Services Region where the bucket resides.

     If bucket is in the US East (N. Virginia) region, use us-east-1 to specify the region. For a list of other Amazon Web Services Regions, go to Amazon Simple Storage Service (S3) in the *Amazon Web Services General Reference*.
4. Compile the source code and store the compiled classes into the `bin/` directory.

   ```
   javac -d bin -source 6 -verbose com
   ```
5. Change the directory to `bin/`, and then run `RunAllSamples`.

```
java com.amazonaws.services.s3.sample.RunAllSamples
```

The code runs all the methods in `main()`. For each request, the output will show the canonical request, the string to sign, and the signature.

Examples of Signature Calculations Using C# (Amazon Signature Version 4)

The C# sample that shows signature calculation can be downloaded at https://docs.amazonaws.cn/AmazonS3/latest/API/samples/AmazonS3SigV4_Samples_CSharp.zip. Note that these samples use Amazon SDK for .NET v1, and we recommend using Amazon SDK for .NET v3 for new applications. In `Program.cs`, the `main()` function executes sample requests to create an object, retrieve an object, and create a presigned URL for the object. The code for signature calculation is in the `\Signers` folder.

```
PutS3ObjectSample.Run(awsRegion, bucketName, "MySampleFile.txt");

Console.WriteLine("\n\n***********************************************");
PutS3ObjectChunkedSample.Run(awsRegion, bucketName, "MySampleFileChunked.txt");

Console.WriteLine("\n\n***********************************************");
GetS3ObjectSample.Run(awsRegion, bucketName, "MySampleFile.txt");

Console.WriteLine("\n\n***********************************************");
PresignedUrlSample.Run(awsRegion, bucketName, "MySampleFile.txt");
```

To test the examples with Microsoft Visual Studio 2010 or later

1. Extract the .zip file.
2. Start Visual Studio, and then open the .sln file.
3. Update the App.config file with valid security credentials.
4. Update the code as follows:

- In `Program.cs`, provide the bucket name and the Amazon Web Services Region where the bucket resides. The sample creates an object in this bucket.

5. Run the code.
6. To verify that the object was created, copy the presigned URL that the program creates, and then paste it in a browser window.

Authenticating Requests: Browser-Based Uploads Using POST (Amazon Signature Version 4)

Amazon S3 supports HTTP POST requests so that users can upload content directly to Amazon S3. Using HTTP POST to upload content simplifies uploads and reduces upload latency where users upload data to store in Amazon S3. This section describes how you authenticate HTTP POST requests. For more information about HTTP POST requests, how to create a form, create a POST policy, and an example, see Browser-Based Uploads Using POST (Amazon Signature Version 4).

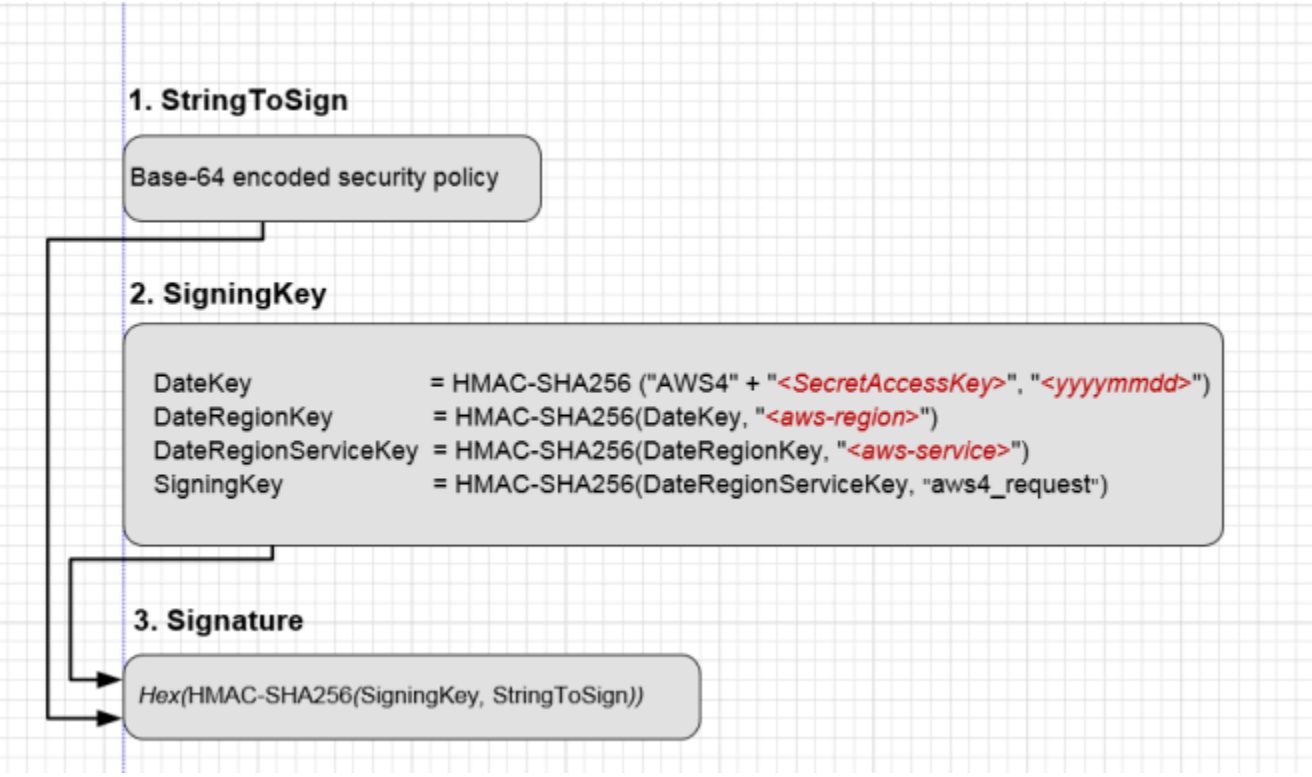
To authenticate an HTTP POST request you do the following:

1. The form must include the following fields to provide signature and relevant information that Amazon S3 can use to re-calculate the signature upon receiving the request:

Element Name	Description
`policy`	The Base64-encoded security policy that describes what is permitted in the request. For signature calculation this policy is the string you sign. Amazon S3 must get this policy so it can re-calculate the signature.
`x-amz-algorithm`	The signing algorithm used. For Amazon Signature Version 4, the value is `AWS4-HMAC-SHA256` .
`x-amz-credential`	In addition to your access key ID, this provides scope information you used in calculating the signing key for signature calculation. It is a string of the following form:

Element Name	Description
	<your-access-key-id> /*<date>*/*<aws-region>* /*<aws-service>* /aws4_request For example: AKIAIOSFODNN7EXAMPLE/20130728/us-east-1/s3/aws4_request . . For Amazon S3, the *aws-service* string is s3. For a list of Amazon S3 aws-region strings, see Regions and Endpoints in the *Amazon Web Services General Reference*.
x-amz-date	It is the date value in ISO8601 format. For example, 20130728T000000Z . It is the same date you used in creating the signing key. This must also be the same value you provide in the policy (x-amz-date) that you signed.
x-amz-signature	(Amazon Signature Version 4) The HMAC-SHA256 hash of the security policy. For more information on options for the signature , see Add the signature to the HTTP request in the *Amazon Web Services General Reference*.

2. The POST policy must include the following elements:



Element Name	Description
x-amz-algorithm	The signing algorithm that you used to calculation the signature. For Amazon Signature Version 4, the value is AWS4-HMAC-SHA256 .

Element Name	Description
x-amz-credential	In addition to your access key ID, this provides scope information you used in calculating the signing key for signature calculation. It is a string of the following form: *<your-access-key-id>* /*<date>*/*<aws-region>* /*<aws-service>* /aws4_request For example, AKIAIOSFODNN7EXAMPLE/20130728/us-east-1/s3/aws4_request . .
x-amz-date	The date value specified in the ISO8601 formatted string. For example, "20130728T000000Z". The date must be the same that you used in creating the signing key for signature calculation.

3. For signature calculation the POST policy is the string to sign.

Calculating a Signature

The following diagram illustrates the signature calculation process.

To Calculate a signature

1. Create a policy using UTF-8 encoding.
2. Convert the UTF-8-encoded policy to Base64. The result is the string to sign.
3. Create the signature as an HMAC-SHA256 hash of the string to sign. You will provide the signing key as key to the hash function.
4. Encode the signature by using hex encoding.

For more information about creating HTML forms, security policies, and an example, see the following subtopics:

- Creating an HTML Form (Using Amazon Signature Version 4)
- POST Policy
- Example: Browser-Based Upload using HTTP POST (Using Amazon Signature Version 4)

Amazon S3 Signature Version 4 Authentication Specific Policy Keys

The following table shows the policy keys related Amazon S3 Signature Version 4 authentication that can be in Amazon S3 policies. In a bucket policy, you can add these conditions to enforce specific behavior when requests are authenticated by using Signature Version 4. For example policies, see Bucket policy examples using Signature Version 4 related condition keys.

Applicable Keys	Description
`s3:signatureversion`	Identifies the version of Amazon Signature that you want to support for authentic ated requests. For authenticated requests, Amazon S3 supports both Signature Version 4 and Signature Version 2. You can add this condition in your bucket policy to require a specific signature version. Valid values: `"AWS"` identifies Signature Version 2 `"AWS4-HMAC-SHA256"` identifies Signature Version 4
`s3:authType`	Amazon S3 supports various methods of authentication (see Authenticating Requests (Amazon Signature Version 4). You can option ally use this condition key to restrict incoming requests to use a specific authentication method. For example, you can allow only the HTTP `Authorization` header to be used in request authentication. Valid values: `REST-HEADER`

Applicable Keys	Description

	`REST-QUERY-STRING`
	
	`POST`

`s3:signatureAge`	The length of time, in milliseconds, that a signature is valid in an authenticated request. This condition works for: • *Presigned URLs* — where the most restricti ve condition wins. For more information, see Working with presigned URLs. • *Presigned POST* — upload files directly to S3 using pre-signed POST. For more informati on, see Amazon S3 POST Policy. In Signature Version 2, this value is always set to 0. In Signature Version 4, the signing key is valid for up to seven days. Therefore, the signature s are also valid for up to seven days. You can use this condition to further limit the signature age. For more information, see Introduction to Signing Requests. Example value: `100`

Applicable Keys	Description
s3:x-amz-content-sha256	You can use this condition key to disallow unsigned content in your bucket. When you use Signature Version 4, for requests that use the Authorization header, you add the x-amz-content-sha256 header in the signature calculation and then set its value to the hash payload. Note that this condition key doesn't support the x-amz-content-sha256 header as a query string parameter. You can use this condition key in your bucket policy to deny any uploads where payloads are not signed. For example, you can deny uploads that use the Authorization header to authenticate requests but don't sign the payload. For more information, see Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (Amazon Signature Version 4). Valid value: UNSIGNED-PAYLOAD

Bucket policy examples using Signature Version 4 related condition keys

The following bucket policy denies any Amazon S3 presigned URL request on objects in examplebucket if the signature is more than ten minutes old.

JSON

```
{
   "Version": "2012-10-17",
   "Statement": [
```

```
      {
         "Sid": "Deny a presigned URL request if the signature is more than 10
 min old",
         "Effect": "Deny",
         "Principal": "*",
         "Action": "s3:*",
         "Resource": "arn:aws-cn:s3:::examplebucket3/*",
         "Condition": {
            "NumericGreaterThan": {
               "s3:signatureAge": 600000
            }
         }
      }
   ]
}
```

The following bucket policy allows only requests that use the `Authorization` header for request authentication. Any POST or presigned URL requests will be denied.

JSON

```
{
   "Version": "2012-10-17",
   "Statement": [
         {
               "Sid": "Allow only requests that use Authorization header for
 request authentication. Deny POST or presigned URL requests.",
               "Effect": "Deny",
               "Principal": "*",
               "Action": "s3:*",
               "Resource": "arn:aws-cn:s3:::examplebucket3/*",
               "Condition": {
                     "StringNotEquals": {
                           "s3:authType": "REST-HEADER"
                     }
               }
         }
   ]
}
```

The following bucket policy denies requests that use presigned URLS for request authentication:

JSON

```
{
   "Version":"2012-10-17",
   "Statement":[
      {
         "Sid":"Deny uploads that use Presigned URL for request authentication.",
         "Effect":"Deny",
         "Principal":"",
         "Action":"s3:",
         "Resource":"arn:aws:s3:::amzn-s3-demo-bucket1/*",
         "Condition":{
            "StringEquals":{
               "s3:authType":"REST-query-string"
            }
         }
      }
   ]
}
```

The following bucket policy denies any uploads with unsigned payloads:

JSON

```
{
   "Version": "2012-10-17",
   "Statement": [
         {
               "Sid": "Deny uploads with unsigned payloads that use the
 Authorization header.",
               "Effect": "Deny",
               "Principal": "*",
               "Action": "s3:*",
               "Resource": "arn:aws-cn:s3:::examplebucket3/*",
               "Condition": {
                     "StringEquals": {
                           "s3:x-amz-content-sha256": "UNSIGNED-PAYLOAD"
                     }
               }
```

```
            }
    ]
}
```

Browser-Based Uploads Using POST (Amazon Signature Version 4)

This section discusses how to upload files directly to Amazon S3 through a browser using HTTP POST requests. It also contains information about how to use the Amazon Amplify JavaScript library for browser-based file uploads to Amazon S3.

Topics

- POST Object
- POST Object restore
- Browser-Based Uploads Using HTTP POST
- Calculating a Signature
- Creating an HTML Form (Using Amazon Signature Version 4)
- POST Policy
- Example: Browser-Based Upload using HTTP POST (Using Amazon Signature Version 4)
- Browser-based uploads to Amazon S3 using the Amazon Amplify library

POST Object

Description

The POST operation adds an object to a specified bucket by using HTML forms. POST is an alternate form of PUT that enables browser-based uploads as a way of putting objects in buckets. Parameters that are passed to PUT through HTTP headers are instead passed as form fields to POST in the multipart/form-data encoded message body. To add an object to a bucket, you must have WRITE access on the bucket. Amazon S3 never stores partial objects. If you receive a successful response, you can be confident that the entire object was stored.

Amazon S3 is a distributed system. Unless you've enabled versioning for a bucket, if Amazon S3 receives multiple write requests for the same object simultaneously, only the last version of the object written is stored.

To ensure that data is not corrupted while traversing the network, use the Content-MD5 form field. When you use this form field, Amazon S3 checks the object against the provided MD5 value. If they do not match, Amazon S3 returns an error. Additionally, you can calculate the MD5 value while posting an object to Amazon S3 and compare the returned ETag to the calculated MD5 value. The ETag reflects only changes to the contents of an object, not its metadata.

> **Note**
>
> To configure your application to send the request headers before sending the request body, use the HTTP status code 100 (Continue). For POST operations, using this status code helps you avoid sending the message body if the message is rejected based on the headers (for example, because of an authentication failure or redirect). For more information about the HTTP status code 100 (Continue), go to Section 8.2.3 of http://www.ietf.org/rfc/rfc2616.txt.

Amazon S3 automatically encrypts all new objects that are uploaded to an S3 bucket. The encryption setting of an uploaded object depends on the default encryption configuration of the destination bucket. By default, all buckets have a default encryption configuration that uses server-side encryption with Amazon S3 managed keys (SSE-S3).

If the destination bucket has an encryption configuration that uses server-side encryption with an Amazon Key Management Service (Amazon KMS) key (SSE-KMS), dual-layer server-side encryption

with an Amazon KMS key (DSSE-KMS), or a customer-provided encryption key (SSE-C), Amazon S3 uses the corresponding KMS key or customer-provided key to encrypt the uploaded object. When uploading an object, if you want to change the encryption setting of the uploaded object, you can specify the type of server-side encryption. You can configure SSE-S3, SSE-KMS, DSSE-KMS, or SSE-C. For more information, see Protecting data using server-side encryption in the *Amazon Simple Storage Service User Guide*.

> **Important**
>
> When constructing your request, make sure that the `file` field is the last field in the form.

Versioning

If you enable versioning for a bucket, POST automatically generates a unique version ID for the object being added. Amazon S3 returns this ID in the response by using the `x-amz-version-id` response header.

If you suspend versioning for a bucket, Amazon S3 always uses `null` as the version ID of the object stored in a bucket.

For more information about returning the versioning state of a bucket, see GET Bucket (Versioning Status).

Amazon S3 is a distributed system. If you enable versioning for a bucket and Amazon S3 receives multiple write requests for the same object simultaneously, all versions of the object are stored.

To see sample requests that use versioning, see Sample Request.

Requests

Syntax

```
POST / HTTP/1.1
Host: destinationBucket.s3.amazonaws.com
User-Agent: browser_data
Accept: file_types
Accept-Language: Regions
Accept-Encoding: encoding
Accept-Charset: character_set
Keep-Alive: 300
```

```
Connection: keep-alive
Content-Type: multipart/form-data; boundary=9431149156168
Content-Length: length

--9431149156168
Content-Disposition: form-data; name="key"

acl
--9431149156168
Content-Disposition: form-data; name="tagging"

<Tagging><TagSet><Tag><Key>Tag Name</Key><Value>Tag Value</Value></Tag></TagSet></
Tagging>

```

```
file_content
--9431149156168
Content-Disposition: form-data; name="submit"

Upload to Amazon S3
--9431149156168--
```

Request Parameters

This implementation of the operation does not use request parameters.

Form Fields

This operation can use the following form fields.

Name	Description	Required
`AWSAccessKeyId`	The Amazon access key ID of the owner of the bucket who grants an Anonymous user access for a request that satisfies the set of constraints in the policy. Type: String Default: None Constraints: Required if a policy document is included with the request.	Conditional
`acl`	The specified Amazon S3 access control list (ACL). If the specified ACL is not valid, an error is generated. For more information about ACLs, see Access control list (ACL) overview in the *Amazon Simple Storage Service User Guide*. Type: String Default: private	No

Name	Description	Required
	Valid Values: `private | public-read | public-read-write | aws-exec-read | authenticated-read | bucket-owner-read | bucket-owner-full-control`	
`Cache-Control` , `Content-Type` , `Content-Disposition` , `Content-Encoding` , `Expires`	The REST-specific headers. For more information, see PutObject. Type: String Default: None	No
`file`	The file or text content. The file or text content must be the last field in the form. You cannot upload more than one file at a time. Type: File or text content Default: None	Yes
`key`	The name of the uploaded key. To use the file name provided by the user, use the `${filename}` variable. For example, if a user named Mary uploads the file `example.jpg` and you specify `/user/mary/${filename}` , the key name is `/user/mary/example.jpg` . For more information, see Object key and metadata in the *Amazon Simple Storage Service User Guide*. Type: String Default: None	Yes

Name	Description	Required
`policy`	The security policy that describes what is permitted in the request. Requests without a security policy are considered anonymous and work only on publicly writable buckets. For more information, see HTML forms and Upload examples in the *Amazon Simple Storage Service User Guide*. Type: String Default: None Constraints: A security policy is required if the bucket is not publicly writable.	Conditional

Name	Description	Required
`success_action_redirect` , `redirect`	The URL to which the client is redirected upon a successful upload. If `success_action_redirect` is not specified , Amazon S3 returns the empty document type specified in the `success_action_status` field. If Amazon S3 cannot interpret the URL, it acts as if the field is not present. If the upload fails, Amazon S3 displays an error and does not redirect the user to a URL. Type: String Default: None **Note** The `redirect` field name is deprecated, and support for the `redirect` field name will be removed in the future.	No

Name	Description	Required
`success_action_status`	If you don't specify `success_action_redirect` , the status code is returned to the client when the upload succeeds. This field accepts the values `200`, `201`, or `204` (the default). If the value is set to `200` or `204`, Amazon S3 returns an empty document with a 200 or 204 status code. If the value is set to `201`, Amazon S3 returns an XML document with a 201 status code. If the value is not set or if it is set to a value that is not valid, Amazon S3 returns an empty document with a 204 status code. Type: String Default: None	No

Name	Description	Required

`tagging`	The specified set of tags to add to the object. To add tags, use the following encoding scheme.
	
	`<Tagging>`
	`  <TagSet>`
	`  <Tag>`
	`  <Key>TagName</Key>`
	`  <Value>TagValue</Value>`
	`  </Tag>`
	`  ...`
	`  </TagSet>`
	`</Tagging>`
	
	For more information, see Object tagging in the *Amazon Simple Storage Service User Guide*.
	
	Type: String
	
	Default: None
		No

`x-amz-storage-class`	The storage class to use for storing the object. If you don't specify a class, Amazon S3 uses the default storage class, STANDARD. Amazon S3 supports other storage classes. For more informati on, see Storage classes in the *Amazon Simple Storage Service User Guide*. Type: String Default: STANDARD Valid values: REDUCED_REDUNDANCY |EXPRESS_ONEZONE |DEEP_ARCHIVE |GLACIER|GLACIER_IR |INTELLIGE NT_TIERING |ONEZONE_IA |STANDARD| STANDARD_IA	No

Name	Description	Required
`x-amz-meta-*`	Headers starting with this prefix are user-defined metadata. Each one is stored and returned as a set of key-value pairs. Amazon S3 doesn't validate or interpret user-defined metadata. For more information, see PutObject. Type: String Default: None	No
`x-amz-security-token`	The Amazon DevPay security token. Each request that uses Amazon DevPay requires two `x-amz-security-token` form fields: one for the product token and one for the user token. Type: String Default: None	No
`x-amz-signature`	(Amazon Signature Version 4) The HMAC-SHA256 hash of the security policy. Type: String Default: None	Conditional

Name	Description	Required

`x-amz-website-redirect-location`	If the bucket is configured as a website, this field redirects requests for this object to another object in the same bucket or to an external URL. Amazon S3 stores the value of this header in the object metadata. For information about object metadata, see Object key and metadata in the *Amazon Simple Storage Service User Guide*.
	
	In the following example, the request header sets the redirect to an object (`anotherPage.html`) in the same bucket:
	
	`x-amz-website-redirect-location: /anotherPage.html`
	
	In the following example, the request header sets the object redirect to another website:
	
	`x-amz-website-redirect-location: http://www.example.com/`
	
	For more information about website hosting in Amazon S3, see Hosting websites on Amazon S3 and How to configure website page redirects in the *Amazon Simple Storage Service User Guide*.
	
	Type: String
	
	Default: None
	
	Constraints: The value must be prefixed by `/`, `http://`, or `https://`. The length of the value is limited to 2 KB.
		No

Additional Checksum Request Form Fields

When uploading an object, you can specify various checksums that you would like to use to verify your data integrity. You can specify one additional checksum algorithm for Amazon S3 to use. For more information about additional checksum values, see Checking object integrity in the *Amazon Simple Storage Service User Guide*.

Name	Description	Required
`x-amz-checksum-algorithm`	Indicates the algorithm used to create the checksum for the object. If a value is specified, you must include the matching checksum header. Otherwise, your request will generate a 400 error. Possible values include `CRC32`, `CRC32C`, `SHA1`, and `SHA256`.	No
`x-amz-checksum-crc32`	Specifies the base64-encoded, 32-bit CRC32 checksum of the object. This parameter is required if the value of `x-amz-checksum-algorithm` is `CRC32`.	Conditional
`x-amz-checksum-crc32c`	Specifies the base64-encoded, 32-bit CRC32C checksum of the object. This parameter is required if the value of `x-amz-checksum-algorithm` is `CRC32C`.	Conditional
`x-amz-checksum-sha1`	Specifies the base64-encoded, 160-bit SHA-1 digest of the object. This parameter is required if the value of `x-amz-checksum-algorithm` is `SHA1`.	Conditional
`x-amz-checksum-sha256`	Specifies the base64-encoded, 256-bit SHA-256 digest of the object. This parameter is required if the value of `x-amz-checksum-algorithm` is `SHA256`.	Conditional

Server-Side Encryption Specific Request Form Fields

Server-side encryption is data encryption at rest. Amazon S3 encrypts your data while writing it to disks in Amazon data centers and decrypts your data when you access it. When uploading an object, you can specify the type of server-side encryption that you want Amazon S3 to use for encrypting the object.

There are four types of server-side encryption:

- **Server-side encryption with Amazon S3 managed keys (SSE-S3)** – Starting May 2022, all Amazon S3 buckets have encryption configured by default. The default option for server-side encryption is with SSE-S3. Each object is encrypted with a unique key. As an additional safeguard, SSE-S3 encrypts the key itself with a root key that it regularly rotates. SSE-S3 uses one of the strongest block ciphers available, 256-bit Advanced Encryption Standard (AES-256), to encrypt your data.
- **Server-side encryption with Amazon KMS keys (SSE-KMS)** – SSE-KMS is provided through an integration of the Amazon KMS service with Amazon S3. With Amazon KMS, you have more control over your keys. For example, you can view separate keys, edit control policies, and follow the keys in Amazon CloudTrail. Additionally, you can create and manage customer managed keys or use Amazon managed keys that are unique to you, your service, and your Region.
- **Dual-layer server-side encryption with Amazon KMS keys (DSSE-KMS)** – Dual-layer server-side encryption with Amazon KMS keys (DSSE-KMS) is similar to SSE-KMS, but applies two individual layers of object-level encryption instead of one layer.
- **Server-side encryption with customer-provided keys (SSE-C)** – With SSE-C, you manage the encryption keys, and Amazon S3 manages the encryption as it writes to disks, and the decryption when you access your objects.

For more information, see Protecting data using server-side encryption in the *Amazon Simple Storage Service User Guide*.

Depending on which type of server-side encryption you want to use, specify the following form fields.

- **Use SSE-S3, SSE-KMS, or DSSE-KMS** – If you want to use these types of server-side encryption, specify the following form fields in the request.

Name	Description	Required
x-amz-server-side-encryption	Specifies the server-side encryption algorithm to use when Amazon S3 creates an object. To use SSE-S3, specify AES256. To use SSE-KMS, specify aws:kms. To use DSSE-KMS, specify aws:kms:dsse . Type: String Valid Value: aws:kms, AES256, aws:kms:dsse	Yes
x-amz-server-side-encryption-aws-kms-key-id	If the x-amz-server-side-encryption header has a valid value of aws:kms or aws:kms:dsse , this header specifies the ID of the Amazon KMS key that was used to encrypt the object. Type: String	Yes, if the value of x-amz-server-side-encryption is aws:kms or aws:kms:dsse
x-amz-server-side-encryption-context	If x-amz-server-side-encryption has a valid value of aws:kms or aws:kms:dsse , this header specifies the encryption context for the object. The value of this header is a base64-encoded UTF-8 string that contains JSON-formatted key-value pairs for the encryption context. Type: String	No

Name	Description	Required
`x-amz-server-side-encryption-bucket-key-enabled`	If `x-amz-server-side-encryption` has a valid value of `aws:kms` or `aws:kms:dsse`, this header specifies whether Amazon S3 should use an S3 Bucket Key with SSE-KMS or DSSE-KMS. Setting this header to `true` causes Amazon S3 to use an S3 Bucket Key for object encryption with SSE-KMS or DSSE-KMS. Type: Boolean	No

> **Note**
>
> If you specify `x-amz-server-side-encryption:aws:kms` or `x-amz-server-side-encryption:aws:kms:dsse`, but do not provide `x-amz-server-side-encryption-aws-kms-key-id`, Amazon S3 uses the Amazon managed key (`aws/S3`) to protect the data.

- **Use SSE-C** – If you want to manage your own encryption keys, you must provide all the following form fields in the request.

> **Note**
>
> If you use SSE-C, the `ETag` value that Amazon S3 returns in the response is not the MD5 of the object.

Name	Description	Required
`x-amz-server-side-encryption-customer-algorithm`	Specifies the algorithm to use to when encrypting the object. Type: String Default: None Valid Value: AES256	Yes

Name	Description	Required
	Constraints: Must be accompanied by valid `x-amz-server-side-encryption-customer-key` and `x-amz-server-side-encryption-customer-key-MD5` fields.	
`x-amz-server-side-encryption-customer-key`	Specifies the customer-provided base64-encoded encryption key for Amazon S3 to use in encrypting data. This value is used to store the object, and then it is discarded. Amazon does not store the encryption key. The key must be appropriate for use with the algorithm specified in the `x-amz-server-side-encryption-customer-algorithm` header. Type: String Default: None Constraints: Must be accompanied by valid `x-amz-server-side-encryption-customer-algorithm` and `x-amz-server-side-encryption-customer-key-MD5` fields.	Yes
`x-amz-server-side-encryption-customer-key-MD5`	Specifies the base64-encoded 128-bit MD5 digest of the encryption key according to RFC 1321. Amazon S3 uses this header for a message-integrity check to ensure that the encryption key was transmitted without error. Type: String Default: None Constraints: Must be accompanied by valid `x-amz-server-side-encryption-customer-algorithm` and `x-amz-server-side-encryption-customer-key` fields.	Yes

Responses

Response Headers

This implementation of the operation can include the following response headers in addition to the response headers common to all responses. For more information, see Common Response Headers.

Name	Description
`x-amz-checksum-crc32`	The base64-encoded, 32-bit CRC32 checksum of the object. Type: String
`x-amz-checksum-crc32c`	The base64-encoded, 32-bit CRC32C checksum of the object. Type: String
`x-amz-checksum-sha1`	The base64-encoded, 160-bit SHA-1 digest of the object. Type: String
`x-amz-checksum-sha256`	The base64-encoded, 256-bit SHA-256 digest of the object. Type: String
`x-amz-expiration`	If an `Expiration` action is configured for the object as part of the bucket's lifecycle configuration, Amazon S3 returns this header. The header value includes an `expiry-date` component and a URL-encoded `rule-id` component. For version-enabled buckets, this header applies only to current versions. Amazon S3 does not provide a header to indicate when a noncurrent version is eligible for permanent deletion. For more information, see PutBucketLifecycleConfiguration.

Name	Description
	Type: String
`success_action_redirect, redirect`	The URL to which the client is redirected on a successful upload. Type: String Ancestor: PostResponse
`x-amz-server-side-encryption`	The server-side encryption algorithm that was used when storing this object in Amazon S3 (for example, AES256, `aws:kms`, `aws:kms:dsse`). Type: String
`x-amz-server-side-encryption-aws-kms-key-id`	If the `x-amz-server-side-encryption` header has a valid value of `aws:kms`, this header specifies the ID of the KMS key that was used to encrypt the object. Type: String
`x-amz-server-side-encryption-bucket-key-enabled`	If `x-amz-server-side-encryption` has a valid value of `aws:kms`, this header indicates whether the object is encrypted with SSE-KMS by using an S3 Bucket Key. If this header is set to `true`, the object uses an S3 Bucket Key with SSE-KMS. Type: Boolean
`x-amz-server-side-encryption-customer-algorithm`	If SSE-C was requested, the response includes this header, which confirms the encryption algorithm that was used. Type: String Valid Values: AES256

Name	Description
x-amz-server-side-encryption-customer-key-MD5	If SSE-C was requested, the response includes this header to verify round-trip message integrity of the customer-provided encryption key. Type: String
x-amz-version-id	Version of the object. Type: String

Response Elements

Name	Description
Bucket	The name of the bucket that the object was stored in. Type: String Ancestor: PostResponse
ETag	The entity tag (ETag) is an MD5 hash of the object that you can use to do conditional GET operations by using the If-Modified request tag with the GET request operation. ETag reflects changes only to the contents of an object, not to its metadata. Type: String Ancestor: PostResponse
Key	The object key name. Type: String Ancestor: PostResponse
Location	The URI of the object.

Name	Description
	Type: String Ancestor: PostResponse

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses.

Examples

Sample Request

```
POST /Neo HTTP/1.1
Content-Length: 4
Host: quotes.s3.amazonaws.com
Date: Wed, 01 Mar  2006 12:00:00 GMT
Authorization: authorization string
Content-Type: text/plain
Expect: the 100-continue HTTP status code

ObjectContent
```

Sample Response with Versioning Suspended

The following is a sample response when bucket versioning is suspended:

```
HTTP/1.1 100 Continue
HTTP/1.1 200 OK
x-amz-id-2: LriYPLdmOdAiIfgSm/F1YsViT1LW94/xUQxMsF7xiEb1a0wiIOIxl+zbwZ163pt7
x-amz-request-id: 0A49CE4060975EAC
x-amz-version-id: default
Date: Wed, 12 Oct 2009 17:50:00 GMT
ETag: "1b2cf535f27731c974343645a3985328"
Content-Length: 0
Connection: close
Server: AmazonS3
```

In this response, the version ID is `null`.

Sample Response with Versioning Enabled

The following is a sample response when bucket versioning is enabled.

```
HTTP/1.1 100 Continue
HTTP/1.1 200 OK
x-amz-id-2: LriYPLdmOdAiIfgSm/F1YsViT1LW94/xUQxMsF7xiEb1a0wiIOIxl+zbwZ163pt7
x-amz-request-id: 0A49CE4060975EAC
x-amz-version-id: 43jfkodU8493jnFJD9fjj3HHNVfdsQUIFDNsidf038jfdsjGFDSIRp
Date: Wed, 01 Mar  2006 12:00:00 GMT
ETag: "828ef3fdfa96f00ad9f27c383fc9ac7f"
Content-Length: 0
Connection: close
Server: AmazonS3
```

POST Object restore

Description

This operation performs the following types of requests:

- `select` – Perform a select query on an archived object
- `restore an archive` – Restore an archived object

To use this operation, you must have permissions to perform the `s3:RestoreObject` and `s3:GetObject` actions. The bucket owner has this permission by default and can grant this permission to others. For more information about permissions, see Permissions Related to Bucket Subresource Operations and Managing Access Permissions to Your Amazon S3 Resources in the *Amazon Simple Storage Service User Guide*.

Querying Archives with Select Requests

You use a select type of request to perform SQL queries on archived objects. The archived objects that are being queried by the select request must be formatted as uncompressed comma-separated values (CSV) files. You can run queries and custom analytics on your archived data without having to restore your data to a hotter Amazon S3 tier. For an overview about select requests, see Querying Archived Objects in the *Amazon Simple Storage Service User Guide*.

When making a select request, do the following:

- Define an output location for the select query's output. This must be an Amazon S3 bucket in the same Amazon Web Services Region as the bucket that contains the archive object that is being queried. The Amazon Web Services account that initiates the job must have permissions to write to the S3 bucket. You can specify the storage class and encryption for the output objects stored in the bucket. For more information about output, see Querying Archived Objects in the *Amazon Simple Storage Service User Guide*.

  For more information about the S3 structure in the request body, see the following:

  - PutObject
  - Managing Access with ACLs in the *Amazon Simple Storage Service User Guide*
  - Protecting Data Using Server-Side Encryption in the *Amazon Simple Storage Service User Guide*

- Define the SQL expression for the `SELECT` type of restoration for your query in the request body's `SelectParameters` structure. You can use expressions like the following examples.
  - The following expression returns all records from the specified object.

    ```
    SELECT * FROM Object
    ```

  - Assuming that you are not using any headers for data stored in the object, you can specify columns with positional headers.

    ```
    SELECT s._1, s._2 FROM Object s WHERE s._3 > 100
    ```

  - If you have headers and you set the `fileHeaderInfo` in the `CSV` structure in the request body to `USE`, you can specify headers in the query. (If you set the `fileHeaderInfo` field to `IGNORE`, the first row is skipped for the query.) You cannot mix ordinal positions with header column names.

    ```
    SELECT s.Id, s.FirstName, s.SSN FROM S3Object s
    ```

For more information about using SQL with S3 Glacier Select restore, see SQL Reference for Amazon S3 Select and S3 Glacier Select in the *Amazon Simple Storage Service User Guide*.

When making a select request, you can also do the following:

- To expedite your queries, specify the `Expedited` tier. For more information about tiers, see "Restoring Archives," later in this topic.
- Specify details about the data serialization format of both the input object that is being queried and the serialization of the CSV-encoded query results.

The following are additional important facts about the select feature:

- The output results are new Amazon S3 objects. Unlike archive retrievals, they are stored until explicitly deleted—manually or through a lifecycle policy.
- You can issue more than one select request on the same Amazon S3 object. Amazon S3 doesn't deduplicate requests, so avoid issuing duplicate requests.
- Amazon S3 accepts a select request even if the object has already been restored. A select request doesn’t return error response `409`.

Restoring Archives

Objects in the GLACIER and DEEP_ARCHIVE storage classes are archived. To access an archived object, you must first initiate a restore request. This restores a temporary copy of the archived object. In a restore request, you specify the number of days that you want the restored copy to exist. After the specified period, Amazon S3 deletes the temporary copy but the object remains archived in the GLACIER or DEEP_ARCHIVE storage class that object was restored from.

To restore a specific object version, you can provide a version ID. If you don't provide a version ID, Amazon S3 restores the current version.

The time it takes restore jobs to finish depends on which storage class the object is being restored from and which data access tier you specify.

When restoring an archived object (or using a select request), you can specify one of the following data access tier options in the `Tier` element of the request body:

- **`Expedited`** - Expedited retrievals allow you to quickly access your data stored in the GLACIER storage class when occasional urgent requests for a subset of archives are required. For all but the largest archived objects (250 MB+), data accessed using Expedited retrievals are typically made available within 1–5 minutes. Provisioned capacity ensures that retrieval capacity for Expedited retrievals is available when you need it. Expedited retrievals and provisioned capacity are not available for the DEEP_ARCHIVE storage class.
- **`Standard`** - Standard retrievals allow you to access any of your archived objects within several hours. This is the default option for the GLACIER and DEEP_ARCHIVE retrieval requests that do not specify the retrieval option. Standard retrievals typically complete within 3-5 hours from the GLACIER storage class and typically complete within 12 hours from the DEEP_ARCHIVE storage class.
- **`Bulk`** - Bulk retrievals are Amazon S3 Glacier's lowest-cost retrieval option, enabling you to retrieve large amounts, even petabytes, of data inexpensively in a day. Bulk retrievals typically complete within 5-12 hours from the GLACIER storage class and typically complete within 48 hours from the DEEP_ARCHIVE storage class.

For more information about archive retrieval options and provisioned capacity for `Expedited` data access, see Restoring Archived Objects in the *Amazon Simple Storage Service User Guide*.

You can use Amazon S3 restore speed upgrade to change the restore speed to a faster speed while it is in progress. You upgrade the speed of an in-progress restoration by issuing another

restore request to the same object, setting a new `Tier` request element. When issuing a request to upgrade the restore tier, you must choose a tier that is faster than the tier that the in-progress restore is using. You must not change any other parameters, such as the `Days` request element. For more information, see Upgrading the Speed of an In-Progress Restore in the *Amazon Simple Storage Service User Guide*.

To get the status of object restoration, you can send a HEAD request. Operations return the `x-amz-restore` header, which provides information about the restoration status, in the response. You can use Amazon S3 event notifications to notify you when a restore is initiated or completed. For more information, see Configuring Amazon S3 Event Notifications in the *Amazon Simple Storage Service User Guide*.

After restoring an archived object, you can update the restoration period by reissuing the request with a new period. Amazon S3 updates the restoration period relative to the current time and charges only for the request—there are no data transfer charges. You cannot update the restoration period when Amazon S3 is actively processing your current restore request for the object.

If your bucket has a lifecycle configuration with a rule that includes an expiration action, the object expiration overrides the life span that you specify in a restore request. For example, if you restore an object copy for 10 days, but the object is scheduled to expire in 3 days, Amazon S3 deletes the object in 3 days. For more information about lifecycle configuration, see PutBucketLifecycleConfiguration and Object Lifecycle Management in *Amazon Simple Storage Service User Guide*.

Requests

Syntax

```
POST /ObjectName?restore&versionId=VersionID HTTP/1.1
Host: BucketName.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (Amazon Signature
 Version
  4))
Content-MD5: MD5

 request body
```

> **Note**
>
> The syntax shows some of the request headers. For a complete list, see "Request Headers," later in this topic.

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

Name	Description	Required
`Content-MD5`	The base64-encoded 128-bit MD5 digest of the data. You must use this header as a message integrity check to verify that the request body was not corrupted in transit. For more information, see RFC 1864. Type: String Default: None	Yes

Request Elements

The following is an XML example of a request body for restoring an archive.

```
<RestoreRequest>
   <Days>2</Days>
   <GlacierJobParameters>
     <Tier>Bulk</Tier>
   </GlacierJobParameters>
</RestoreRequest>
```

The following table explains the XML for archive restoration in the request body.

Name	Description	Required
`RestoreRequest`	Container for restore information. Type: Container	Yes
`Days`	Lifetime of the restored (active) copy. The minimum number of days that you can restore an object from S3 Glacier is 1. After the object copy reaches the specified lifetime, Amazon S3 removes it from the bucket. If you are restoring an archive, this element is required. Do not use this element with a `SELECT` type of request. Type: Positive integer Ancestors: `RestoreRequest`	Yes, if restoring an archive
`GlacierJobParameters`	Container for Glacier job parameters. Do not use this element with a `SELECT` type of request. Type: Container Ancestors: `RestoreRequest`	No
`Tier`	The data access tier to use when restoring the archive. `Standard` is the default. Type: Enum Valid values: `Expedited` | `Standard` | `Bulk` Ancestors: `GlacierJobParameters`	No

The following XML is the request body for a select query on an archived object:

```
<RestoreRequest>
    <Type>SELECT</Type>
    <Tier>Expedited</Tier>
    <Description>Job description</Description>
    <SelectParameters>
          <Expression>Select * from Object</Expression>
          <ExpressionType>SQL</ExpressionType>
          <InputSerialization>
              <CSV>
                  <FileHeaderInfo>IGNORE</FileHeaderInfo>
                  <RecordDelimiter>\n</RecordDelimiter>
                  <FieldDelimiter>,</FieldDelimiter>
                  <QuoteCharacter>"</QuoteCharacter>
                  <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
                  <Comments>#</Comments>
              </CSV>
           </InputSerialization>
         <OutputSerialization>
             <CSV>
                 <QuoteFields>ASNEEDED</QuoteFields>
                 <RecordDelimiter>\n</RecordDelimiter>
                 <FieldDelimiter>,</FieldDelimiter>
                 <QuoteCharacter>"</QuoteCharacter>
                 <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
             </CSV>
         </OutputSerialization>
    </SelectParameters>
    <OutputLocation>
        <S3>
      <BucketName>Name of bucket</BucketName>
            <Prefix>Key prefix</Prefix>
       <CannedACL>Canned ACL string</CannedACL>
       <AccessControlList>
      <Grantee>
          <Type>Grantee Type</Type>
    <ID>Grantee identifier</ID>
    <URI>Grantee URI</URI>
         <Permission>Granted permission</Permission>
                    <DisplayNmae>Display Name</DisplayName>
                    <EmailAddress>email</EmailAddress>
      </Grantee>
       </AccessControlList>
       <Encryption>
```

```
             <EncryptionType>Encryption type</EncryptionType>
       <KMSKeyId>KMS Key ID</KMSKeyId>
       <KMSContext>Base64-encoded JSON<KMSContext>
            </Encryption>
      <UserMetadata>
              <MetadataEntry>
                  <Name>Key</Name>
                  <Value>Value</Value>
              </MetadataEntry>
            </UserMetadata>
            <Tagging>
                <TagSet>
                    <Tag>
                        <Key>Tag name</Key>
                        <Value>Tag value</Value>
                    </Tag>
               </TagSet>
            </Tagging>
            <StorageClass>Storage class</StorageClass>
  </S3>
    </OutputLocation>
</RestoreRequest>
```

The following tables explain the XML for a SELECT type of restoration in the request body.

Name	Description	Required
RestoreRequest	Container for restore information. Type: Container	Yes
Tier	The data access tier to use when restoring the archive. Standard is the default. Type: Enum Valid values: Expedited | Standard | Bulk Ancestors: RestoreRequest	No

Name	Description	Required
`Description`	The optional description for the request. Type: String Ancestors: `RestoreRequest`	No
`SelectParameters`	Describes the parameters for the select job request. Type: Container Ancestors: `RestoreRequest`	Yes, if request type is `SELECT`
`OutputLocation`	Describes the location that receives the results of the select restore request. Type: Container for Amazon S3 Ancestors: `RestoreRequest`	Yes, if request type is `SELECT`

The `SelectParameters` container element contains the following elements.

Name	Description	Required

`Expression`	The SQL expression. For example:
	
	• The following SQL expression retrieves the first column of the data from the object stored in CSV format:
	
	`SELECT s._1 FROM Object s`
	
	• The following SQL expression returns everything from the object:
	
	`SELECT * FROM Object`
		Yes

Name	Description	Required
	Type: String Ancestors: `SelectParameters`	
`ExpressionType`	Identifies the expression type. Type: String Valid values: SQL Ancestors: `SelectParameters`	Yes
`InputSerialization`	Describes the serialization format of the object. Type: Container for CSV Ancestors: `SelectParameters`	Yes
`OutputSerialization`	Describes how the results of the select job are serialized. Type: Container for CSV Ancestors: `SelectParameters`	Yes

The CSV container element in the `InputSerialization` element contains the following elements.

Name	Description	Required
`RecordDelimiter`	A single character used to separate individual records in the input. Instead of the default value, you can specify an arbitrary delimiter. Type: String Default: \n	No

Name	Description	Required
	Ancestors: CSV	
FieldDelimiter	A single character used to separate individual fields in a record. You can specify an arbitrary delimiter. Type: String Default: , Ancestors: CSV	No
QuoteCharacter	A single character used for escaping when the field delimiter is part of the value. Consider this example in a CSV file: "a, b" Wrapping the value in quotation marks makes this value a single field. If you don't use the quotation marks, the comma is a field delimiter (which makes it two separate field values, a and b). Type: String Default: " Ancestors: CSV	No

Name	Description	Required
QuoteEscapeCharacter	A single character used for escaping the quotation mark character inside an already escaped value. For example, the value """ a , b """ is parsed as " a , b ". Type: String Default: " Ancestors: CSV	No
FileHeaderInfo	Describes the first line in the input data. It is one of the ENUM values. • NONE: First line is not a header. • IGNORE: First line is a header, but you can't use the header values to indicate the column in an expression. You can use column position (such as _1, _2, …) to indicate the column (SELECT s._1 FROM OBJECT s). • Use: First line is a header, and you can use the header value to identify a column in an expression (SELECT "name" FROM OBJECT). Type: Enum Valid values: NONE | USE | IGNORE Ancestors: CSV	No

Name	Description	Required
`Comments`	A single character used to indicate that a row should be ignored when the character is present at the start of that row. You can specify any character to indicate a comment line. Type: String Ancestors: `CSV`	No

The CSV container element (in the `OutputSerialization` elements) contains the following elements.

Name	Description	Required
`QuoteFields`	Indicates whether to use quotation marks around output fields. • `ALWAYS`: Always use quotation marks for output fields. • `ASNEEDED`: Use quotation marks for output fields when needed. Type: Enum Valid values: `ALWAYS` | `ASNEEDED` Default: `AsNeeded` Ancestors: `CSV`	No
`RecordDelimiter`	A single character used to separate individual records in the output. Instead of the default value, you can specify an arbitrary delimiter.	No

Name	Description	Required
	Type: String Default: \n Ancestors: CSV	
FieldDelimiter	A single character used to separate individual fields in a record. You can specify an arbitrary delimiter. Type: String Default: , Ancestors: CSV	No
QuoteCharacter	A single character used for escaping when the field delimiter is part of the value. For example, if the value is a, b, Amazon S3 wraps this field value in quotation marks, as follows: " a , b " . Type: String Default: " Ancestors: CSV	No
QuoteEscapeCharacter	A single character used for escaping the quotation mark character inside an already escaped value. For example, if the value is " a , b " , Amazon S3 wraps the value in quotation marks, as follows: """ a , b """. Type: String Ancestors: CSV	No

The S3 container element (in the `OutputLocation` element) contains the following elements.

Name	Description	Required
`AccessControlList`	A list of grants that control access to the staged results. Type: Container for Grant Ancestors: S3	No
`BucketName`	The name of the S3 bucket where the select restore results are stored. The bucket must be in the same Amazon Web Services Region as the bucket that contains the input archive object. Type: String Ancestors: S3	Yes
`CannedACL`	The canned access control list (ACL) to apply to the select restore results. Type: String Valid values: `private | public-read | public-read-write | aws-exec-read | authenticated-read | bucket-owner-read | bucket-owner-full-control` Ancestors: S3	No
`Encryption`	Contains encryption information for the stored results. Type: Container for Encryption Ancestors: S3	No
`Prefix`		Yes

Name	Description	Required
	The prefix that is prepended to the select restore results. The maximum length for the prefix is 512 bytes. Type: String Ancestors: S3	
`StorageClass`	The class of storage used to store the select request results. Type: String Valid values: `STANDARD` | `REDUCED_REDUNDANCY` | `STANDARD_IA` | `ONEZONE_IA` Ancestors: S3	No
`Tagging`	Container for tag information. Type: Tag structure Ancestors: S3	No
`UserMetadata`	Contains a list of metadata to store with the select restore results. Type: MetadataEntry structure Ancestors: S3	No

The Grantee container element (in the `AccessControlList` element) contains the following elements.

Name	Description	Required
`DisplayName`	The screen name of the grantee.	No

Name	Description	Required
	Type: String Ancestors: `Grantee`	
`EmailAddress`	The email address of the grantee. Type: String Ancestors: `Grantee`	No
`ID`	The canonical user ID of the grantee. Type: String Ancestors: `Grantee`	No
`Type`	The type of the grantee. Type: String Ancestors: `Grantee`	No
`URI`	The URI of the grantee group. Type: String Ancestors: `Grantee`	No
`Permission`	Granted permission. Type: String Ancestors: `Grantee`	No

The `Encryption` container element (in S3) contains the following elements.

Name	Description	Required
`EncryptionType`	The server-side encryption algorithm used when storing job results. The default is no encryption. Type: String Valid Values `aws:kms` | `AES256` Ancestors: `Encryption`	No
`KMSContext`	Optional. If the encryption type is `aws:kms`, you can use this value to specify the encryption context for the select restore results. Type: String Ancestors: Encryption	No
`KMSKeyId`	The Amazon Key Management Service (Amazon KMS) key ID to use for object encryption. Type: String Ancestors: `Encryption`	No

The `TagSet` container element (in the `Tagging` element) contains the following element.

Name	Description	Required
`Tag`	Contains tags. Type: Container Ancestors: `TagSet`	No

The Tag container element (in the `TagSet` element) contains the following elements.

Name	Description	Required
`Key`	Name of the tag. Type: String Ancestors: `Tag`	No
`Value`	Value of the tag. Type: String Ancestors: `Tag`	No

The `MetadataEntry` container element (in the `UserMetadata` element) contains the following key-value pair elements to store with an object.

Name	Description	Required
`MetadataKey`	The metadata key. Type: String Ancestors:	No
`MetadataEntry`	The metadata value. Type: String Ancestors:	No

Responses

A successful operation returns either the `200 OK` or `202 Accepted` status code.

- If the object copy is not previously restored, then Amazon S3 returns `202 Accepted` in the response.
- If the object copy is previously restored, Amazon S3 returns `200 OK` in the response.

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers.

Response Elements

This operation does not return response elements.

Special Errors

Error Code	Description	HTTP Status Code	SOAP Fault Code Prefix
`RestoreAlreadyInProgress`	Object restore is already in progress. (This error does not apply to SELECT type requests.)	409 Conflict	Client
`GlacierExpeditedRetrievalNotAvailable`	Glacier expedited retrievals are currently not available. Try again later. (Returned if there is insufficient capacity to process the `Expedited` request. This error applies only to `Expedited` retrievals and not to `Standard` or `Bulk` retrievals.)	503	N/A

Examples

Restore an Object for Two Days Using the Expedited Retrieval Option

The following restore request restores a copy of the `photo1.jpg` object from S3 Glacier for a period of two days using the expedited retrieval option.

```
POST /photo1.jpg?restore HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Mon, 22 Oct 2012 01:49:52 GMT
Authorization: authorization string
Content-Length: content length

<RestoreRequest>
  <Days>2</Days>
  <GlacierJobParameters>
    <Tier>Expedited</Tier>
  </GlacierJobParameters>
</RestoreRequest>
```

If the `examplebucket` does not have a restored copy of the object, Amazon S3 returns the following `202 Accepted` response.

```
HTTP/1.1 202 Accepted
x-amz-id-2: GFihv3y6+kE7KG11GEkQhU7/2/cHR3Yb2fCb2S04nxI423Dqwg2XiQ0B/
UZlzYQvPiBlZNRcovw=
x-amz-request-id: 9F341CD3C4BA79E0
Date: Sat, 20 Oct 2012 23:54:05 GMT
Content-Length: 0
Server: AmazonS3
```

If a copy of the object is already restored, Amazon S3 returns a `200 OK` response, and updates only the restored copy's expiry time.

Query an Archive with a SELECT Request

The following is an example select restore request.

```
POST /object-one.csv?restore HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Date: Date: Sat, 20 Oct 2012 23:54:05 GMT
Authorization: authorization string
Content-Length: content length

<RestoreRequest xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Type>SELECT</Type>
  <Tier>Expedited</Tier>
  <Description>this is a description</Description>
  <SelectParameters>
```

```
    <InputSerialization>
      <CSV>
        <FileHeaderInfo>IGNORE</FileHeaderInfo>
        <Comments>#</Comments>
        <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
        <RecordDelimiter>\n</RecordDelimiter>
        <FieldDelimiter>,</FieldDelimiter>
        <QuoteCharacter>"</QuoteCharacter>
      </CSV>
    </InputSerialization>
    <ExpressionType>SQL</ExpressionType>
    <Expression>select * from object</Expression>
    <OutputSerialization>
      <CSV>
        <QuoteFields>ALWAYS</QuoteFields>
        <QuoteEscapeCharacter>"</QuoteEscapeCharacter>
        <RecordDelimiter>\n</RecordDelimiter>
        <FieldDelimiter>\t</FieldDelimiter>
        <QuoteCharacter>\'</QuoteCharacter>
      </CSV>
    </OutputSerialization>
  </SelectParameters>
  <OutputLocation>
    <S3>
      <BucketName>example-output-bucket</BucketName>
      <Prefix>test-s3</Prefix>
      <AccessControlList>
        <Grant>
          <Grantee xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:type="AmazonCustomerByEmail">
            <EmailAddress>jane-doe@example.com</EmailAddress>
          </Grantee>
          <Permission>FULL_CONTROL</Permission>
        </Grant>
      </AccessControlList>
      <UserMetadata>
        <MetadataEntry>
          <Name>test</Name>
          <Value>test-value</Value>
        </MetadataEntry>
        <MetadataEntry>
          <Name>other</Name>
          <Value>something else</Value>
        </MetadataEntry>
```

```
      </UserMetadata>
      <StorageClass>STANDARD</StorageClass>
    </S3>
  </OutputLocation>
</RestoreRequest>
```

Amazon S3 returns the following `202 Accepted` response.

```
HTTP/1.1 202 Accepted

Browser-Based Uploads Using HTTP POST

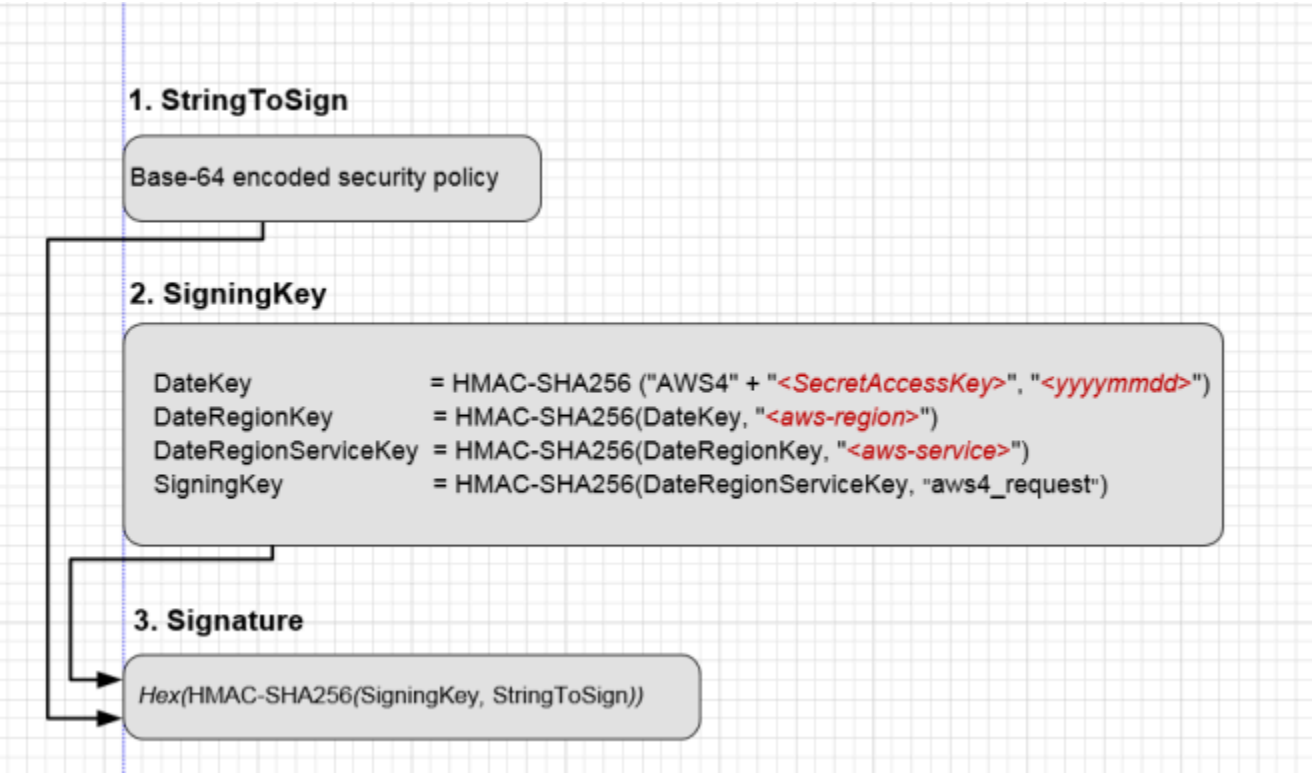
Amazon S3 supports HTTP POST requests so that users can upload content directly to Amazon S3. By using POST, end users can authenticate requests without having to pass data through a secure intermediary node that protects your credentials. Thus, HTTP POST has the potential to reduce latency.

The following figure shows an Amazon S3 upload using a POST request.

1. The user accesses your page from a web browser.
2. Your webpage contains an HTML form that contains all the information necessary for the user to upload content to Amazon S3.
3. The user uploads content to Amazon S3 through the web browser.

The process for sending browser-based POST requests is as follows:

1. Create a security policy specifying conditions that restrict what you want to allow in the request, such as the bucket name where objects can be uploaded, and key name prefixes that you want to allow for the object that is being created.



2. Create a signature that is based on the policy. For authenticated requests, the form must include a valid signature and the policy.
3. Create an HTML form that your users can access in order to upload objects to your Amazon S3 bucket.

The following section describes how to create a signature to authenticate a request. For information about creating forms and security policies, see Creating an HTML Form (Using Amazon Signature Version 4).

Calculating a Signature

For authenticated requests, the HTML form must include fields for a security policy and a signature.

- A security policy (see POST Policy) controls what is allowed in the request.
- The security policy is the `StringToSign` (see Introduction to Signing Requests) in your signature calculation.

To Calculate a signature

1. Create a policy using UTF-8 encoding.
2. Convert the UTF-8-encoded policy bytes to base64. The result is the `StringToSign`.
3. Create a signing key.
4. Use the signing key to sign the `StringToSign` using HMAC-SHA256 signing algorithm.

For more information about creating HTML forms, security policies, and an example, see the following:

- Creating an HTML Form (Using Amazon Signature Version 4)
- POST Policy
- Example: Browser-Based Upload using HTTP POST (Using Amazon Signature Version 4)

Creating an HTML Form (Using Amazon Signature Version 4)

Topics

- HTML Form Declaration
- HTML Form Fields

To allow users to upload content to Amazon S3 by using their browsers (HTTP POST requests), you use HTML forms. HTML forms consist of a form declaration and form fields. The form declaration contains high-level information about the request. The form fields contain detailed request information.

This section describes how to create HTML forms. For a working example of browser-based upload using HTTP POST and related signature calculations for request authentication, see Example: Browser-Based Upload using HTTP POST (Using Amazon Signature Version 4).

The form and policy must be UTF-8 encoded. You can apply UTF-8 encoding to the form by specifying `charset=UTF-8` in the `content` attribute. The following is an example of UTF-8 encoding in the HTML heading.

```
<html>
```

```
  <head>
    ...
    <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />
    ...
  </head>
  <body>
```

Following is an example of UTF-8 encoding in a request header.

```
Content-Type: text/html; charset=UTF-8
```

> **Note**
>
> The form data and boundaries (excluding the contents of the file) cannot exceed 20KB.

HTML Form Declaration

The HTML form declaration has the following three attributes:

- `action` – The URL that processes the request, which must be set to the URL of the bucket. For example, if the name of your bucket is `examplebucket`, the URL is `http://examplebucket.s3.amazonaws.com/`.

  > **Note**
  >
  > The key name is specified in a form field.

- `method` – The method must be POST.
- `enctype` – The enclosure type (`enctype`) must be set to multipart/form-data for both file uploads and text area uploads. For more information about `enctype`, see RFC 1867.

This is a form declaration for the bucket `examplebucket`.

```
<form action="http://examplebucket.s3.amazonaws.com/" method="post"

enctype="multipart/form-data">
```

HTML Form Fields

The following table describes a list of fields that you can use within a form. Among other fields, there is a signature field that you can use to authenticate requests. There are fields for you to specify the signature calculation algorithm (`x-amz-algorithm`), the credential scope (`x-amz-credential`) that you used to generate the signing key, and the date (`x-amz-date`) used to calculate the signature. Amazon S3 uses this information to re-create the signature. If the signatures match, Amazon S3 processes the request.

> **Note**
>
> The variable `${filename}` is automatically replaced with the name of the file provided by the user and is recognized by all form fields. If the browser or client provides a full or partial path to the file, only the text following the last slash (/) or backslash (\) is used (for example, `C:\Program Files\directory1\file.txt` is interpreted as `file.txt`). If no file or file name is provided, the variable is replaced with an empty string.

If you don't provide elements required for authenticated requests, such as the `policy` element, the request is assumed to be anonymous and will succeed only if you have configured the bucket for public read and write.

Element Name	Description	Required
`acl`	An Amazon S3 access control list (ACL). If an invalid ACL is specified, Amazon S3 denies the request. For more information about ACLs, see Using Amazon S3 ACLs. Type: String Default: private Valid Values: `private | public-read | public-read-write | aws-exec-read | authenticated-read`	No

Element Name	Description	Required
	`| bucket-owner-read | bucket-owner-full-control`	

`Cache-Control`
`Content-Type`
`Content-Disposition`
`Content-Encoding`
`Expires`
	REST-specific headers. For more information, see PutObject.	No

`key`	The key name of the uploaded object. To use the file name provided by the user, use the ${filename} variable. For example, if you upload a file `photo1.jpg` and you specify `/user/user1/${filename}` as key name, the file is stored as `/user/user1/photo1.jpg` . For more information, see Object Key and Metadata in the *Amazon Simple Storage Service User Guide*.	Yes
`policy`	The base64-encoded security policy that describes what is permitted in the request. For authenticated requests, a policy is required. Requests without a security policy are considered anonymous and will succeed only on a publicly writable bucket.	Required for authenticated requests

Element Name	Description	Required
`success_action_redirect`	The URL to which the client is redirected upon successful upload. If `success_action_redirect` is not specified, or Amazon S3 cannot interpret the URL, Amazon S3 returns the empty document type that is specified in the `success_action_status` field. If the upload fails, Amazon S3 returns an error and does not redirect the user to another URL.	No

Element Name	Description	Required
`success_action_status`	The status code returned to the client upon successful upload if `success_action_redirect` is not specified. Valid values are `200`, `201`, or `204` (default). If the value is set to 200 or 204, Amazon S3 returns an empty document with the specified status code. If the value is set to 201, Amazon S3 returns an XML document with a 201 status code. For information about the content of the XML document, see POST Object. If the value is not set or is invalid, Amazon S3 returns an empty document with a 204 status code. **Note** Some versions of the Adobe Flash player do not properly handle HTTP responses with an empty body. To support uploads through Adobe Flash, we recommend setting `success_action_status` to 201.	No

Element Name	Description	Required
`x-amz-algorithm`	The signing algorithm used to authenticate the request. For Amazon Signature Version 4, the value is `AWS4-HMAC-SHA256` . This field is required if a policy document is included with the request.	Required for authenticated requests
`x-amz-credential`	In addition to your access key ID, this field also provides scope information identifying region and service for which the signature is valid. This should be the same scope you used in calculating the signing key for signature calculation. It is a string of the following form: *<your-access-key-id>* /*<date>*/*<aws-region>* /*<aws-service>* /aws4_request For example: AKIAIOSFODNN7EXAMPLE/20130728/us-east-1/s3/aws4_request For Amazon S3, the *aws-service* string is s3. For a list of Amazon S3 `aws-region` strings, see Regions and Endpoints in the *Amazon Web Services General Reference*. This is required if a policy document is included with the request.	Required for authenticated requests

Element Name	Description	Required
`x-amz-date`	It is the date value in ISO8601 format. For example, `20130728T000000Z` . It is the same date you used in creating the signing key (for example, 20130728). This must also be the same value you provide in the policy (`x-amz-date`) that you signed. This is required if a policy document is included with the request.	Required for authenticated requests
`x-amz-security-token`	A security token used by Amazon DevPay and session credentials If the request is using Amazon DevPay, it requires two `x-amz-security-token` form fields: one for the product token and one for the user token. For more information, see Using DevPay in the *Amazon Simple Storage Service User Guide*. If the request is using session credentials, it requires one `x-amz-security-token` form. For more information, see Requesting Temporary Security Credentials in the *IAM User Guide*.	No
`x-amz-signature`	(Amazon Signature Version 4) The HMAC-SHA256 hash of the security policy. This field is required if a policy document is included with the request.	Required for authenticated requests

Element Name	Description	Required
`x-amz-meta-*`	Field names starting with this prefix are user-defined metadata. Each one is stored and returned as a set of key-value pairs. Amazon S3 doesn't validate or interpret user-defined metadata. For more information, see PutObject.	No
`x-amz-*`	See POST Object (POST Object for other `x-amz-*` headers.	No
`file`	File or text content. The file or content must be the last field in the form. You cannot upload more than one file at a time.	Yes

Conditional items are required for authenticated requests and are optional for anonymous requests.

Now that you know how to create forms, next you can create a security policy that you can sign. For more information, see POST Policy.

POST Policy

Topics

- Expiration
- Condition Matching
- Conditions
- Character Escaping

The policy required for making authenticated requests using HTTP POST is a UTF-8 and base64-encoded document written in JavaScript Object Notation (JSON) that specifies conditions that the request must meet. Depending on how you design your policy document, you can control the access granularity per-upload, per-user, for all uploads, or according to other designs that meet your needs.

This section describes the POST policy. For example signature calculations using POST policy, see Example: Browser-Based Upload using HTTP POST (Using Amazon Signature Version 4).

> **Note**
>
> Although the policy document is optional, we highly recommend that you use one in order to control what is allowed in the request. If you make the bucket publicly writable, you have no control at all over which users can write to your bucket.

The following is an example of a POST policy document.

```
{ "expiration": "2007-12-01T12:00:00.000Z",
  "conditions": [
    {"acl": "public-read" },
    {"bucket": "johnsmith" },
    ["starts-with", "$key", "user/eric/"],
  ]
}
```

The POST policy always contains the `expiration` and `conditions` elements. The example policy uses two condition matching types (exact matching and starts-with matching). The following sections describe these elements.

Expiration

The `expiration` element specifies the expiration date and time of the POST policy in ISO8601 GMT date format. For example, `2013-08-01T12:00:00.000Z` specifies that the POST policy is not valid after midnight GMT on August 1, 2013.

Condition Matching

Following is a table that describes condition matching types that you can use to specify POST policy conditions (described in the next section). Although you must specify at least one condition

for each form field that you specify in the form, you can create more complex matching criteria by specifying multiple conditions for a form field.

Condition Match Type	Description

Exact Matches	The form field value must match the value specified. This example indicates that the ACL must be set to public-read:
	`{"acl": "public-read" }`
	This example is an alternate way to indicate that the ACL must be set to public-read:
	`[ "eq", "$acl", "public-read" ]`

Starts With	The value must start with the specified value. This example indicates that the object key must start with user/user1: `["starts-with", "$key", "user/user1/"]`

Matching Content-Types in a Comma-Separated List	Content-Types values for a `starts-with` condition that include commas are interpreted as lists. Each value in the list must meet the condition for the whole condition to pass. For example,given the following condition:
	`["starts-with", "$Content-Type", "image/"]`
	The following value would pass the condition:
	`"image/jpg,image/png,image/gif"`
	The following value would not pass the condition:
	`["image/jpg,text/plain"]`

Condition Match Type	Description
	Note Data elements other than `Content-Type` are treated as strings, regardless of the presence of commas.
Matching Any Content	To configure the POST policy to allow any content within a form field, use `starts-with` with an empty value (""). This example allows any value for `success_action_redirect` : `["starts-with", "$success_action_redirect", ""]`
Specifying Ranges	For form fields that accept a range, separate the upper and lower limit with a comma. This example allows a file size from 1 to 10 MiB: `["content-length-range", 1048576, 10485760]`

The specific conditions supported in a POST policy are described in Conditions.

Conditions

The `conditions` in a POST policy is an array of objects, each of which is used to validate the request. You can use these conditions to restrict what is allowed in the request. For example, the preceding policy conditions require the following:

- Request must specify the `johnsmith` bucket name.
- Object key name must have the `user/eric` prefix.
- Object ACL must be set to `public-read`.

Each form field that you specify in a form (except `x-amz-signature`, `file`, `policy`, and field names that have an `x-ignore-` prefix) must appear in the list of conditions.

Note

All variables within the form are expanded prior to validating the POST policy. Therefore, all condition matching should be against the expanded form fields. Suppose that you want to restrict your object key name to a specific prefix (`user/user1`). In this case, you set the key form field to `user/user1/${filename}`. Your POST policy should be `[ "starts-with", "$key", "user/user1/" ]` (do not enter `[ "starts-with", "$key", "user/user1/${filename}" ]`). For more information, see Condition Matching.

Policy document conditions are described in the following table.

Element Name	Description
`acl`	Specifies the ACL value that must be used in the form submission. This condition supports exact matching and `starts-with` condition match type discussed in the following section.
`bucket`	Specifies the acceptable bucket name. This condition supports exact matching condition match type.
`content-length-range`	The minimum and maximum allowable size for the uploaded content. This condition supports `content-length-range` condition match type.

`Cache-Control`
 	
`Content-Type`
 	
`Content-Disposition`
	REST-specific headers. For more information, see POST Object.

Element Name	Description

`Content-Encoding`
 	
`Expires`
	This condition supports exact matching and `starts-with` condition match type.

`key`	The acceptable key name or a prefix of the uploaded object. This condition supports exact matching and `starts-with` condition match type.

`success_action_redirect`
 	
`redirect`
	The URL to which the client is redirected upon successful upload.
	
	This condition supports exact matching and `starts-with` condition match type.

`success_action_status`	The status code returned to the client upon successful upload if `success_action_redirect` is not specified. This condition supports exact matching.
`x-amz-algorithm`	The signing algorithm that must be used during signature calculation. For Amazon Signature Version 4, the value is `AWS4-HMAC-SHA256`. This condition supports exact matching.

Element Name	Description
x-amz-credential	The credentials that you used to calculate the signature. It provides access key ID and scope information identifying region and service for which the signature is valid. This should be the same scope you used in calculating the signing key for signature calculation. It is a string of the following form: *<your-access-key-id>* /*<date>*/*<aws-region>* /*<aws-service>* /aws4_request For example: AKIAIOSFODNN7EXAMPLE/20130728/us-east-1/s3/aws4_request For Amazon S3, the aws-service string is s3. For a list of Amazon S3 aws-region strings, see Regions and Endpoints in the *Amazon Web Services General Reference*. This is required if a POST policy document is included with the request. This condition supports exact matching.
x-amz-date	The date value specified in the ISO8601 formatted string. For example, 20130728T000000Z . The date must be same that you used in creating the signing key for signature calculation. This is required if a POST policy document is included with the request. This condition supports exact matching.

Element Name	Description
`x-amz-security-token`	Amazon DevPay security token. Each request that uses Amazon DevPay requires two `x-amz-security-token` form fields: one for the product token and one for the user token. As a result, the values must be separated by commas. For example, if the user token is `eW91dHViZQ==` and the product token is `b0hnNVNKWVJIQTA=`, you set the POST policy entry to: `{ "x-amz-security-token": "eW91dHViZQ==,b0hnNVNKWVJIQTA=" }`. For more information about Amazon DevPay, see Using DevPay in the *Amazon Simple Storage Service User Guide*.
`x-amz-meta-*`	User-specified metadata. This condition supports exact matching and `starts-with` condition match type.
`x-amz-*`	See POST Object (POST Object for other `x-amz-*` headers. This condition supports exact matching.

Note

If your toolkit adds more form fields (for example, Flash adds `filename`), you must add them to the POST policy document. If you can control this functionality, prefix `x-ignore-` to the field so Amazon S3 ignores the feature and it won't affect future versions of this feature.

Character Escaping

Characters that must be escaped within a POST policy document are described in the following table.

Escape Sequence	Description
\\	Backslash
\$	Dollar symbol
\b	Backspace
\f	Form feed
\n	New line
\r	Carriage return
\t	Horizontal tab
\v	Vertical tab
\u*xxxx*	All Unicode characters

Now that you are acquainted with forms and policies, and understand how signing works, you can try a POST upload example. You need to write the code to calculate the signature. The example provides a sample form, and a POST policy that you can use to test your signature calculations. For more information, see Example: Browser-Based Upload using HTTP POST (Using Amazon Signature Version 4).

Example: Browser-Based Upload using HTTP POST (Using Amazon Signature Version 4)

This section shows an example of using an HTTP POST request to upload content directly to Amazon S3.

For more information on Signature Version 4, see Signature Version 4 Signing Process.

Uploading a File to Amazon S3 Using HTTP POST

This example provides a sample POST policy and a form that you can use to upload a file. The topic uses the example policy and fictitious credentials to show you the workflow and resulting signature and policy hash. You can use this data as test suite to verify your signature calculation code.

The example uses the following example credentials the signature calculations. You can use these credentials to verify your signature calculation code. However, you must then replace these with your own credentials when sending requests to Amazon.

Parameter	Value
AWSAccessKeyId	AKIAIOSFODNN7EXAMPLE
AWSSecretAccessKey	wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY

Sample Policy and Form

The following POST policy supports uploads to Amazon S3 with specific conditions.

```
{ "expiration": "2015-12-30T12:00:00.000Z",
  "conditions": [
    {"bucket": "sigv4examplebucket"},
    ["starts-with", "$key", "user/user1/"],
    {"acl": "public-read"},
    {"success_action_redirect": "http://sigv4examplebucket.s3.amazonaws.com/
successful_upload.html"},
    ["starts-with", "$Content-Type", "image/"],
    {"x-amz-meta-uuid": "14365123651274"},
```

```
    {"x-amz-server-side-encryption": "AES256"},
    ["starts-with", "$x-amz-meta-tag", ""],

    {"x-amz-credential": "AKIAIOSFODNN7EXAMPLE/20151229/us-east-1/s3/aws4_request"},
    {"x-amz-algorithm": "AWS4-HMAC-SHA256"},
    {"x-amz-date": "20151229T000000Z" }
  ]
}
```

This POST policy sets the following conditions on the request:

- The upload must occur before noon UTC on December 30, 2015.
- The content can be uploaded only to the `sigv4examplebucket`. The bucket must be in the region that you specified in the credential scope (`x-amz-credential` form parameter), because the signature you provided is valid only within this scope.
- You can provide any key name that starts with `user/user1`. For example, `user/user1/MyPhoto.jpg`.
- The ACL must be set to `public-read`.
- If the upload succeeds, the user's browser is redirected to `http://sigv4examplebucket.s3.amazonaws.com/successful_upload.html`.
- The object must be an image file.
- The `x-amz-meta-uuid` tag must be set to `14365123651274`.
- The `x-amz-meta-tag` can contain any value.

The following is a Base64-encoded version of this POST policy. You use this value as your StringToSign in signature calculation.

```
eyAiZXhwaXJhdGlvbiI6ICIyMDE1LTEyLTMwVDEyOjAwOjAwLjAwMFoiLA0KICAiY29uZGl0aW9ucyI6IFsNCiAgICB7ImJ
```

When you copy/paste the preceding policy, it should have carriage returns and new lines for your computed hash to match this value (ie. ASCII text, with CRLF line terminators).

Using example credentials to create a signature, the signature value is as follows (in signature calculation, the date is same as the `x-amz-date` in the policy (20151229):

```
8afdbf4008c03f22c2cd3cdb72e4afbb1f6a588f3255ac628749a66d7f09699e
```

The following example form specifies the preceding POST policy and supports a POST request to the `sigv4examplebucket`. Copy/paste the content in a text editor and save it as exampleform.html. You can then upload image files to the specific bucket using the exampleform.html. Your request will succeed if the signature you provide matches the signature Amazon S3 calculates.

> **Note**
>
> You must update the bucket name, dates, credential, policy, and signature with valid values for this to successfully upload to S3.

```
<html>
  <head>

    <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />

  </head>
  <body>

  <form action="http://sigv4examplebucket.s3.amazonaws.com/" method="post"
 enctype="multipart/form-data">
    Key to upload:
    <input type="input"  name="key" value="user/user1/${filename}" /><br />
    <input type="hidden" name="acl" value="public-read" />
    <input type="hidden" name="success_action_redirect" value="http://
sigv4examplebucket.s3.amazonaws.com/successful_upload.html" />
    Content-Type:
    <input type="input"  name="Content-Type" value="image/jpeg" /><br />
    <input type="hidden" name="x-amz-meta-uuid" value="14365123651274" />
    <input type="hidden" name="x-amz-server-side-encryption" value="AES256" />
    <input type="text"   name="X-Amz-Credential" value="AKIAIOSFODNN7EXAMPLE/20151229/
us-east-1/s3/aws4_request" />
    <input type="text"   name="X-Amz-Algorithm" value="AWS4-HMAC-SHA256" />
    <input type="text"   name="X-Amz-Date" value="20151229T000000Z" />

    Tags for File:
    <input type="input"  name="x-amz-meta-tag" value="" /><br />
    <input type="hidden" name="Policy" value='<Base64-encoded policy string>' />
    <input type="hidden" name="X-Amz-Signature" value="<signature-value>" />
    File:
    <input type="file"   name="file" /> <br />
```

```
    <!-- The elements after this will be ignored -->
    <input type="submit" name="submit" value="Upload to Amazon S3" />
  </form>

</html>
```

The post parameters are case insensitive. For example, you can specify `x-amz-signature` or `X-Amz-Signature`.

Browser-based uploads to Amazon S3 using the Amazon Amplify library

This section describes how to upload files to Amazon S3 using the Amazon Amplify JavaScript library.

For information about setting up the Amazon Amplify library, see Amazon Amplify Installation and Configuration.

Using the Amazon Amplify JavaScript library to Upload Files to Amazon S3

The Amazon Amplify library `Storage` module gives a simple browser-based upload mechanism for managing user content in public or private Amazon S3 storage.

Example : Amazon Amplify Manual Setup

The following example shows the manual setup for using the Amazon Amplify Storage module. The default implementation of the Storage module uses Amazon S3.

```
import Amplify from 'aws-amplify';
Amplify.configure(
    Auth: {
        identityPoolId: 'XX-XXXX-X:XXXXXXXX-XXXX-1234-abcd-1234567890ab', //REQUIRED -
 Amazon Cognito Identity Pool ID
        region: 'XX-XXXX-X', // REQUIRED - Amazon Cognito Region
        userPoolId: 'XX-XXXX-X_abcd1234', //OPTIONAL - Amazon Cognito User Pool ID
        userPoolWebClientId: 'XX-XXXX-X_abcd1234', //OPTIONAL - Amazon Cognito Web
 Client ID
    },
    Storage: {
```

```
        bucket: '', //REQUIRED -  Amazon S3 bucket
        region: 'XX-XXXX-X', //OPTIONAL -  Amazon service region
    }
);
```

Example : Put data into Amazon S3

The following example shows how to put public data into Amazon S3.

```
Storage.put('test.txt', 'Hello')
        .then (result => console.log(result))
        .catch(err => console.log(err));
```

The following example shows how to put private data into Amazon S3.

```
Storage.put('test.txt', 'Private Content', {
        level: 'private',
        contentType: 'text/plain'
    })
    .then (result => console.log(result))
    .catch(err => console.log(err));
```

For more information about using the Amazon Amplify Storage module, see Amazon Amplify Storage.

More Info

Amazon Amplify Quick Start

Common request headers

The following table describes headers that can be used by various types of Amazon S3 REST requests.

Header Name	Description
`Authorization`	The information required for request authentication. For more information, go to The Authentication Header in the *Amazon Simple Storage Service Developer Guide*. For anonymous requests this header is not required.
`Access-Control-Request-Method`	A list of HTTP methods that is sent as a pre-flight CORS request. If the pre-flight CORS evaluation is successful, then the specified methods are allowed to be used in the following CORS request.
`Content-Length`	Length of the message (without the headers) according to RFC 2616. This header is required for PUTs and operations that load XML, such as logging and ACLs.
`Content-Type`	The content type of the resource in case the request has content in the body. Example: `text/plain`
`Content-MD5`	The base64 encoded 128-bit MD5 digest of the message (without the headers) according to RFC 1864. This header can be used as a message integrity check to verify that the data is the same data that was originally sent. Although it is optional, we recommend using the Content-MD5 mechanism as an end-to-end integrity check. For more information about REST request authentication, go to REST Authentication in the *Amazon Simple Storage Service Developer Guide*.
`Date`	The date that can be used to create the signature contained in the `Authorization` header. If the `Date` header is to be used for signing it must be specified in the ISO 8601 basic format. In this case, the `x-amz-date` header is not needed.

Header Name	Description
	Note that when `x-amz-date` is present, it always overrides the value of the `Date` header. If the Date header is not used for signing, it can be one of the full date formats specified by RFC 2616, section 3.3. For example, the date/time `Wed, 01 Mar 2006 12:00:00 GMT` is a valid date/time header for use with Amazon S3. If you are using the `Date` header for signing, then it must be in the ISO 8601 basic `YYYYMMDD'T'HHMMSS'Z'` format. If `Date` is specified but is not in ISO 8601 basic format, then you must also include the `x-amz-date` header. If `Date` is specified in ISO 8601 basic format, then this is sufficient for signing requests and you do not need the `x-amz-date` header. For more information, see Handling Dates in Signature Version 4 in the *Amazon Web Services Glossary*.
`Expect`	When your application uses 100-continue, it does not send the request body until it receives an acknowledgment. If the message is rejected based on the headers, the body of the message is not sent. This header can be used only if you are sending a body. Valid Values: 100-continue
`Host`	For path-style requests, the value is `s3.amazonaws.com`. For virtual-style requests, the value is `BucketName.s3.amazonaws.com`. For more information, go to Virtual Hosting in the *Amazon Simple Storage Service User Guide*. This header is required for HTTP 1.1 (most toolkits add this header automatically); optional for HTTP/1.0 requests.
`Origin`	An endpoint that specifies the server name of the initial requester.

Header Name	Description
x-amz-content-sha256	When using signature version 4 to authenticate request, this header provides a hash of the request payload. For more information see Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (Amazon Signature Version 4). When uploading object in chunks, you set the value to STREAMING-AWS4-HMAC-SHA256-PAYLOAD to indicate that the signature covers only headers and that there is no payload. For more information, see Signature Calculations for the Authorization Header: Transferring Payload in Multiple Chunks (Chunked Upload) (Amazon Signature Version 4).
x-amz-date	The date used to create the signature in the Authorization header. The format must be ISO 8601 basic in the YYYYMMDD'T'HHMMSS'Z' format. For example, the date/time 20170210T120000Z is a valid x-amz-date for use with Amazon S3. x-amz-date is optional for all requests; it can be used to override the date used for signing requests. If the Date header is specified in the ISO 8601 basic format, then x-amz-date is not needed. When x-amz-date is present, it always overrides the value of the Date header. For more information, see Handling Dates in Signature Version 4 in the *Amazon Web Services Glossary*.

Header Name	Description
`x-amz-security-token`	This header can be used in the following scenarios: • To provide security tokens for Amazon DevPay operations - Each request that uses Amazon DevPay requires two `x-amz-security-token` headers: one for the product token and one for the user token. When Amazon S3 receives an authenticated request, it compares the computed signature with the provided signature. Improperly formatted multi-value headers that are used to calculate a signature can cause authentication issues. • To provide a security token when using temporary security credentials - When making requests using temporary security credentials that you obtained from IAM, you must provide a security token by using this header. To learn more about temporary security credentials, see Making Requests. This header is required for requests that use Amazon DevPay and requests that are signed by using temporary security credentials.

Common response headers

The following table describes response headers that are common to most Amazon S3 responses.

Name	Description
`Access-Control-Allow-Credentials`	A Boolean that determines if the server allows CORS requests to contain credentials. If the `Access-Control-Allow-Origin` request header is set to `'*'` then the `Access-Control-Allow-Credentials` response header will be omitted, else it is set to `true` when CORS evaluation is successful. Type: Boolean Default: None
`Access-Control-Allow-Headers`	A list of HTTP headers allowed for your CORS requests. The `Access-Control-Allow-Headers` response header is returned for successful CORS evaluations and explicitly specifies all allowed `Access-Control-Request-Headers` . Type: String Default: None
`Access-Control-Allow-Methods`	A list that specifies which HTTP methods are allowed. Amazon S3 will only allow CORS requests from allowed CORS methods when the CORS evaluation is successful. Type: String Default: None
`Access-Control-Allow-Origin`	The location of the allowed origin. Amazon S3 will only send the `Access-Control-Allow-Origin` response header when the CORS evaluation is successful. If the request origin matches `'*'` in the CORS configuration's allowed origins then the `'*'` is returned in this response header instead of the original origin.

Name	Description
	Type: String Default: None
`Access-Control-Expose-Headers`	A list that allows a server to identify a response header that exposes access for applications when the CORS evaluation is successful. Type: String Default: None
`Access-Control-Max-Age`	The time in seconds that your browser can cache the response for a CORS pre-flight request as identified by the resource, the HTTP method, and the origin. The `Access-Control-Max-Age` response header is only returned when the CORS evaluation is successful. Type: Integer Default: None
`Vary`	A list that indicates which request headers the CORS evaluation result varies on. The `Vary` response header is only returned when the CORS evaluation is successful. Type: String Default: None
`Content-Length`	The length in bytes of the body in the response. Type: String Default: None
`Content-Type`	The MIME type of the content. For example, `Content-Type: text/html; charset=utf-8` . Type: String Default: None

Name	Description
`Connection`	A value that specifies whether the connection to the server is open or closed. Type: Enum Valid Values: `open` | `close` Default: None
`Date`	The date and time that Amazon S3 responded; for example, Wed, 01 Mar 2006 12:00:00 GMT. Type: String Default: None

`ETag`	The entity tag (ETag) represents a specific version of the object. The ETag reflects changes only to the contents of an object, not its metadata. The ETag might or might not be an MD5 digest of the object data. Whether or not it is depends on how the object was created and how it is encrypted, as follows:
	
	• Objects created through the Amazon Web Services Management Console or by the PUT Object, `POST Object`, or `Copy` operation:
	  • Objects that are plaintext or encrypted by server-side encryption with Amazon S3 managed keys (SSE-S3) have ETags that are an MD5 digest of their data.
	  • Objects encrypted by server-side encryption with customer-provided keys (SSE-C) or Amazon Key Management Service (Amazon KMS) keys (SSE-KMS) have ETags that are not an MD5 digest of their object data.
	• Objects created by either the Multipart Upload or Upload Part Copy operation have ETags that are not MD5 digests, regardless of the method of encryption.
	
	Type: String

Name	Description
Server	The name of the server that created the response. Type: String Default: AmazonS3
x-amz-delete-marker	A value that specifies whether the object returned was (true) or was not (false) a delete marker. Type: Boolean Valid Values: true | false Default: false
x-amz-id-2	A special token that is used together with the x-amz-request-id header to help Amazon troubleshoot problems. For information about Amazon Web Services Support using these request IDs, see Troubleshooting Amazon S3. Type: String Default: None
x-amz-request-id	A value created by Amazon S3 that uniquely identifies the request. This value is used together with the x-amz-id-2 header to help Amazon troubleshoot problems. For information about Amazon Web Services Support using these request IDs, see Troubleshooting Amazon S3. Type: String Default: None
x-amz-server-side-encryption	The server-side encryption algorithm used when storing this object in Amazon S3 (for example, AES256, aws:kms). Valid Values: AES256 | aws:kms

Name	Description
`x-amz-version-id`	The version of the object. When you enable versioning, Amazon S3 generates a random number for objects added to a bucket. The value is UTF-8 encoded and URL ready. When you PUT an object in a bucket where versioning has been suspended, the version ID is always `null`. Type: String Valid Values: `null` | any URL-ready, UTF-8 encoded string Default: null

Error responses

This section provides reference information about Amazon S3 errors.

Note

- In general, S3 bucket owners are billed for requests with HTTP `200 OK` successful responses and HTTP `4XX` client error responses. Bucket owners aren't billed for HTTP `5XX` server error responses, such as HTTP `503 Slow Down` errors. For more information on S3 error codes under HTTP `3XX` and `4XX` status codes that aren't billed, see Billing for Amazon S3 error responses in the Amazon S3 User Guide. For more information about billing charges if your bucket is configured as a Requester Pays bucket, see How Requester Pays charges work in the Amazon S3 User Guide.
- SOAP support over HTTP is deprecated, but SOAP is still available over HTTPS. New Amazon S3 features are not supported for SOAP. Instead of using SOAP, we recommend that you use either the REST API or the Amazon SDKs.

REST error responses

When an error occurs, the header information contains the following:

- Content-Type: application/xml
- An appropriate 3xx, 4xx, or 5xx HTTP status code

The body of the response also contains information about the error. The following sample error response shows the structure of response elements common to all REST error responses.

```
<?xml version="1.0" encoding="UTF-8"?>
<Error>
  <Code>NoSuchKey</Code>
  <Message>The resource you requested does not exist</Message>
  <Resource>/mybucket/myfoto.jpg</Resource>
  <RequestId>4442587FB7D0A2F9</RequestId>
</Error>
```

The following table explains the REST error response elements.

Name	Description
Code	The error code is a string that uniquely identifies an error condition. It is meant to be read and understood by programs that detect and handle errors by type. For more information, see List of error codes. Type: String Ancestor: `Error`
`Error`	Container for all error elements. Type: Container Ancestor: None
`Message`	The error message contains a generic description of the error condition in English. It is intended for a human audience. Simple programs display the message directly to the end user if they encounter an error condition they

Name	Description
	don't know how or don't care to handle. Sophisticated programs with more exhaustive error handling and proper internationalization are more likely to ignore the error message. Type: String Ancestor: `Error`
`RequestId`	ID of the request associated with the error. Type: String Ancestor: `Error`
`Resource`	The bucket or object that is involved in the error. Type: String Ancestor: `Error`

Many error responses contain additional structured data meant to be read and understood by a developer diagnosing programming errors. For example, if you send a Content-MD5 header with a REST PUT request that doesn't match the digest calculated on the server, you receive a `BadDigest` error. The error response also includes as detail elements the digest that the server calculated, and the digest that you told the server to expect. During development, you can use this information to diagnose the error. In production, a well-behaved program might include this information in its error log.

For information about general response elements, go to Error responses.

List of error codes

The following table lists Amazon S3 error codes.

Error code	Description	HTTP status code	SOAP fault code prefix
AccessControlListNotSupported	The bucket does not allow ACLs.	400 Bad Request	Client
AccessDenied	Access Denied	403 Forbidde	Client
AccessPointAlreadyOwnedByYou	An access point with an identical name already exists in your accoun t.	409 Conflict	Client
AccountProblem	There is a problem with your Amazon Web Services account that prevents the operation from completing successfully. For further assistance, see Contact Us.	403 Forbidde	Client
AllAccessDisabled	All access to this Amazon S3 resource has been disabled. For further assistance, see Contact Us.	403 Forbidde	Client
AmbiguousGrantByEmailAddress	The email address that you provided is associated with more than one account.	400 Bad Request	Client
AuthorizationHeaderMalformed	The authorization header that you provided is not valid.	400 Bad Request	N/A
AuthorizationQueryParametersError	The authorization query parameter s that you provided are not valid.	400 Bad Request	N/A

Error code	Description	HTTP status code	SOAP fault code prefix
BadDigest	The Content-MD5 or checksum value that you specified did not match what the server received.	400 Bad Request	Client
BucketAlreadyExists	The requested bucket name is not available. The bucket namespace is shared by all users of the system. Specify a different name and try again.	409 Conflict	Client
BucketAlreadyOwnedByYou	The bucket that you tried to create already exists, and you own it. Amazon S3 returns this error in all Amazon Web Services Regions except in the US East (N. Virginia) Region (us-east-1). For legacy compatibility, if you re-create an existing bucket that you already own in us-east-1, Amazon S3 returns 200 OK and resets the bucket access control lists (ACLs). For Amazon S3 on Outposts, the bucket that you tried to create already exists in your Outpost and you own it.	409 Conflict (in all Regions except us-east-1)	Client
BucketHasAccessPointsAttached	The bucket you tried to delete has access points attached. Delete your access points before deleting your bucket.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
BucketNotEmpty	The bucket that you tried to delete is not empty.	409 Conflict	Client
ClientTokenConflict	Your Multi-Region Access Point idempotency token was already used for a different request.	409 Conflict	Client
ConnectionClosedBy Requester	Returned to the original caller when an error is encountered while reading the WriteGetObjectResp onse body.	400 Bad Request	Client
ConditionalRequestConflict	A conflicting operation occurred. If using PutObject you can retry the request. If using multipart upload you should initiate another CreateMultipartUpload request and re-upload each part.	409 Conflict	Client
CredentialsNotSupported	This request does not support credentials.	400 Bad Request	Client
CrossLocationLoggi ngProhibited	Cross-Region logging is not allowed. Buckets in one Amazon Web Services Region cannot log information to a bucket in another Region.	403 Forbidde	Client
DeviceNotActiveError	The device is not currently active.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
EndpointNotFound	Direct requests to the correct endpoint.	400 Bad Request	Client
EntityTooSmall	Your proposed upload is smaller than the minimum allowed object size.	400 Bad Request	Client
EntityTooLarge	Your proposed upload exceeds the maximum allowed object size. For more information, see Amazon Simple Storage Service endpoints and quotas in the *Amazon Web Services General Reference*.	400 Bad Request	Client
ExpiredToken	The provided token has expired.	400 Bad Request	Client
IllegalLocationConstraintException	This error might occur for the following reasons: • You are trying to access a bucket from a different Region than where the bucket exists. • You attempt to create a bucket with a location constraint that corresponds to a different region than the regional endpoint the request was sent to.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
IllegalVersioningConfigurationException	The versioning configuration specified in the request is not valid.	400 Bad Request	Client
IncompleteBody	You did not provide the number of bytes specified by the Content-Length HTTP header.	400 Bad Request	Client
IncorrectEndpoint	The specified bucket exists in another Region. Direct requests to the correct endpoint.	400 Bad Request	Client
IncorrectNumberOfFilesInPostRequest	POST requires exactly one file upload per request.	400 Bad Request	Client
InlineDataTooLarge	The inline data exceeds the maximum allowed size.	400 Bad Request	Client
InternalError	An internal error occurred. Try again.	500 Internal Server Error	Server
InvalidAccessKeyId	The Amazon access key ID that you provided does not exist in our records.	403 Forbidde	Client
InvalidAccessPoint	The specified access point name or account is not valid.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
`InvalidAccessPointAliasError`	The specified access point alias name is not valid.	`400 Bad Request`	Client
`InvalidAddressingHeader`	You must specify the Anonymous role.	N/A	Client
`InvalidArgument`	This error might occur for the following reasons: • A ListBuckets request is made to a Regional endpoint that is different from the Region specified in the `bucket-region` parameter. • The specified argument was not valid. • The request was missing a required header. • The specified argument was incomplete or in the wrong format. • The specified argument must have a length greater than or equal to 3.	`400 Bad Request`	Client

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidBucketAclWithObjectOwnership	Bucket cannot have ACLs set with ObjectOwnership's BucketOwnerEnforced setting.	400 Bad Request	Client
InvalidBucketName	The specified bucket is not valid.	400 Bad Request	Client
InvalidBucketOwnerAWSAccountID	The value of the expected bucket owner parameter must be an Amazon Web Services account ID.	400 Bad Request	Client
InvalidBucketState	The request is not valid for the current state of the bucket.	409 Conflict	Client
InvalidDigest	The Content-MD5 or checksum value that you specified is not valid.	400 Bad Request	Client
InvalidEncryptionAlgorithmError	The encryption request that you specified is not valid. The valid value is AES256.	400 Bad Request	Client
InvalidHostHeader	The host headers provided in the request used the incorrect style addressing.	400 Bad Request	Client
InvalidHttpMethod	The request is made using an unexpected HTTP method.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidLocationConstraint	The specified location (Region) constraint is not valid. For more information about selecting a Region for your buckets, see Buckets overview.	400 Bad Request	Client
InvalidObjectState	The operation is not valid for the current state of the object.	403 Forbidde	Client
InvalidPart	One or more of the specified parts could not be found. The part might not have been uploaded, or the specified entity tag might not have matched the part's entity tag.	400 Bad Request	Client
InvalidPartOrder	The list of parts was not in ascending order. The parts list must be specified in order by part number.	400 Bad Request	Client
InvalidPayer	All access to this object has been disabled. For further assistance, see Contact Us.	403 Forbidde	Client
InvalidPolicyDocument	The content of the form does not meet the conditions specified in the policy document.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
`InvalidRange`	The requested range is not valid for the request. Try another range.	`416 Requested Range Not Satisfiable`	Client

Error code	Description	HTTP status code	SOAP fault code prefix
`InvalidRequest`	This error might occur for the following reasons: • An unpaginated ListBuckets request is made from an account that has an approved general purpose bucket quota higher than 10,000. You must make paginated requests to list the buckets in an account with more than 10,000 buckets. • The request is using the wrong signature version. Use `AWS4-HMAC-SHA256` (Signature Version 4). • An access point can be created only for an existing bucket. • The access point is not in a state where it can be deleted. • An access point can be listed only for an existing bucket. • The next token is not valid. • At least one action must be specified in a lifecycle rule. •	`400 Bad Request`	Client

Error code	Description	HTTP status code	SOAP fault code prefix
	At least one lifecycle rule must be specified. • The number of lifecycle rules must not exceed the allowed limit of 1000 rules. • The range for the `MaxResults` parameter is not valid. • SOAP requests must be made over an HTTPS connection. • Amazon S3 Transfer Accelerat ion is not supported for buckets with non-DNS compliant names. • Amazon S3 Transfer Accelerat ion is not supported for buckets with periods (.) in their names. • The Amazon S3 Transfer Acceleration endpoint supports only virtual style requests. • Amazon S3 Transfer Acceleration is not configured on this bucket. • Amazon S3 Transfer Acceleration is disabled on this bucket. •		

Error code	Description	HTTP status code	SOAP fault code prefix
	Amazon S3 Transfer Acceleration is not supported on this bucket. For assistance, contact Amazon Web Services Support. • Amazon S3 Transfer Acceleration cannot be enabled on this bucket. For assistance, contact Amazon Web Services Support. • Conflicting values provided in HTTP headers and query parameters. • Conflicting values provided in HTTP headers and POST form fields. • CopyObject request made on objects larger than 5GB in size.		
`InvalidSessionException`	Returned if the session doesn't exist anymore because it timed out or expired.	`400 Bad Request`	Client
`InvalidSignature`	The request signature that the server calculated does not match the signature that you provided. Check your Amazon secret access key and signing method. For more information, see Signing and authenticating REST requests.	`400 Bad Request`	Client

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidSecurity	The provided security credentials are not valid.	403 Forbidde	Client
InvalidSOAPRequest	The SOAP request body is not valid.	400 Bad Request	Client
InvalidStorageClass	The storage class that you specified is not valid.	400 Bad Request	Client
InvalidTargetBucketForLogging	The target bucket for logging either does not exist, is not owned by you, or does not have the appropriate grants for the log-delivery group.	400 Bad Request	Client
InvalidToken	The provided token is malformed or otherwise not valid.	400 Bad Request	Client
InvalidURI	The specified URI couldn't be parsed.	400 Bad Request	Client
KeyTooLongError	Your key is too long.	400 Bad Request	Client
KMS.DisabledException	The request was rejected because the specified KMS key is not enabled.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
`KMS.InvalidKeyUsageException`	The request was rejected for one of the following reasons: • The KeyUsage value of the KMS key is incompatible with the API operation. • The encryption algorithm or signing algorithm specified for the operation is incompatible with the type of key material in the KMS key (KeySpec). For encrypting, decrypting, re-encrypting, and generating data keys, the KeyUsage must be ENCRYPT_DECRYPT. For signing and verifying messages, the KeyUsage must be SIGN_VERIFY. For generating and verifying message authentication codes (MACs), the KeyUsage must be GENERATE_VERIFY_MAC. For deriving key agreement secrets, the KeyUsage must be KEY_AGREEMENT. To find the KeyUsage of a KMS key, use the DescribeKey operation. To find the encryption or signing algorithms supported for a	`400 Bad Request`	Client

Error code	Description	HTTP status code	SOAP fault code prefix
	particular KMS key, use the DescribeKey operation.		
`KMS.KMSInvalidStateException`	The request was rejected because the state of the specified resource is not valid for this request. This exception means one of the following: • The key state of the KMS key is not compatible with the operation. To find the key state, use the DescribeKey operation. For more information about which key states are compatible with each KMS operation, see Key states of Amazon KMS keys in the *Amazon Key Management Service Developer Guide*. • For cryptographic operations on KMS keys in custom key stores, this exception represents a general failure with many possible causes. To identify the cause, see the error message that accompanies the exception.	`400 Bad Request`	Client

Error code	Description	HTTP status code	SOAP fault code prefix
KMS.NotFoundException	The request was rejected because the specified entity or resource could not be found.	400 Bad Request	Client
MalformedACLError	The ACL that you provided was not well formed or did not validate against our published schema.	400 Bad Request	Client
MalformedPOSTRequest	The body of your POST request is not well-formed multipart/form-data.	400 Bad Request	Client
MalformedXML	The XML that you provided was not well formed or did not validate against our published schema.	400 Bad Request	Client
MaxMessageLengthExceeded	Your request was too large.	400 Bad Request	Client
MaxPostPreDataLengthExceededError	Your POST request fields preceding the upload file were too large.	400 Bad Request	Client
MetadataTooLarge	Your metadata headers exceed the maximum allowed metadata size.	400 Bad Request	Client
MethodNotAllowed	The specified method is not allowed against this resource.	405 Method Not Allowed	Client

Error code	Description	HTTP status code	SOAP fault code prefix
MissingAttachment	A SOAP attachment was expected, but none was found.	400 Bad Request	Client
MissingAuthenticationToken	The request was not signed.	403 Forbidden	Client
MissingContentLength	You must provide the Content-Length HTTP header.	411 Length Required	Client
MissingRequestBodyError	You sent an empty XML document as a request.	400 Bad Request	Client
MissingSecurityElement	The SOAP 1.1 request is missing a security element.	400 Bad Request	Client
MissingSecurityHeader	Your request is missing a required header.	400 Bad Request	Client
NoLoggingStatusForKey	There is no such thing as a logging status subresource for a key.	400 Bad Request	Client
NoSuchAsyncRequest	The specified request was not found.	404 Not Found	Client
NoSuchBucket	The specified bucket does not exist.	404 Not Found	Client

Error code	Description	HTTP status code	SOAP fault code prefix
NoSuchBucketPolicy	The specified bucket does not have a bucket policy.	404 Not Found	Client
NoSuchCORSConfiguration	The specified bucket does not have a CORS configuration.	404 Not Found	Client
NoSuchKey	The specified key does not exist.	404 Not Found	Client
NoSuchLifecycleConfiguration	The specified lifecycle configuration does not exist.	404 Not Found	Client
NoSuchMultiRegionAccessPoint	The specified Multi-Region Access Point does not exist.	404 Not Found	Client
NoSuchObjectLockConfiguration	The specified object does not have an ObjectLock configuration.	404 Not Found	Client
NoSuchWebsiteConfiguration	The specified bucket does not have a website configuration.	404 Not Found	Client
NoSuchTagSet	The specified tag does not exist.	404 Not Found	Client

Error code	Description	HTTP status code	SOAP fault code prefix
NoSuchUpload	The specified multipart upload does not exist. The upload ID might not be valid, or the multipart upload might have been aborted or completed.	404 Not Found	Client
NoSuchVersion	The version ID specified in the request does not match an existing version.	404 Not Found	Client
NotDeviceOwnerError	The device that generated the token is not owned by the authenticated user.	400 Bad Request	Client
NotImplemented	A header that you provided implies functionality that is not implemented.	501 Not Implemened	Server
NotModified	The resource was not changed.	304 Not Modified	Server
NoTransformationDefined	No transformation found for this Object Lambda Access Point.	404 Not Found	Client
NotSignedUp	Your account is not signed up for the Amazon S3 service. You must sign up before you can use Amazon S3. You can sign up at the following URL: http://www.amazonaws.cn/s3	403 Forbidde	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ObjectLockConfigurationNotFoundError	The Object Lock configuration does not exist for this bucket.	404 Not Found	Client
OwnershipControlsNotFoundError	The bucket ownership controls were not found.	404 Not Found	Client
OperationAborted	A conflicting conditional operation is currently in progress against this resource. Try again.	409 Conflict	Client
PermanentRedirect	The bucket that you are attempting to access must be addressed using the specified endpoint. Send all future requests to this endpoint.	301 Moved Permanently	Client
PermanentRedirectControlError	The API operation you are attempting to access must be addressed using the specified endpoint. Send all future requests to this endpoint.	301 Moved Permanently	Client
PreconditionFailed	At least one of the preconditions that you specified did not hold.	412 Precondition Failed	Client
Redirect	Temporary redirect. You are being redirected to the bucket while the Domain Name System (DNS) server is being updated.	307 Temporar Redirect	Client

Error code	Description	HTTP status code	SOAP fault code prefix
RequestHeaderSectionTooLarge	The request header and query parameters used to make the request exceed the maximum allowed size.	400 Bad Request	Client
RequestIsNotMultiPartContent	A bucket POST request must be of the enclosure-type multipart/form-data.	412 Precondition Failed	Client
RequestTimeout	Your socket connection to the server was not read from or written to within the timeout period.	400 Bad Request	Client
RequestTimeTooSkewed	The difference between the request time and the server's time is too large.	403 Forbidde	Client
RequestTorrentOfBucketError	Requesting the torrent file of a bucket is not permitted.	400 Bad Request	Client
ResponseInterrupted	Returned to the original caller when an error is encountered while reading the WriteGetObjectResponse body.	400 Bad Request	Client
RestoreAlreadyInProgress	The object restore is already in progress.	409 Conflict	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ServerSideEncryptionConfigurationNotFoundError	The server-side encryption configuration was not found.	400 Bad Request	Client
ServiceUnavailable	Service is unable to handle request.	503 Service Unavailable	Server
SignatureDoesNotMatch	The request signature that the server calculated does not match the signature that you provided. Check your Amazon secret access key and signing method. For more information, see REST Authentication and SOAP Authentication.	403 Forbidde	Client
SlowDown	Please reduce your request rate.	503 Slow Down	Server
503 SlowDown	Slow Down	503 Slow Down	Server
TemporaryRedirect	You are being redirected to the bucket while the Domain Name System (DNS) server is being updated.	307 Temporar Redirect	Client
TokenCodeInvalidError	The serial number and/or token code you provided is not valid.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
TokenRefreshRequired	The provided token must be refreshed.	400 Bad Request	Client
TooManyAccessPoints	You have attempted to create more access points than are allowed for an account. For more information, see Amazon Simple Storage Service endpoints and quotas in the *Amazon Web Services General Reference*.	400 Bad Request	Client
TooManyBuckets	You have attempted to create more buckets than are allowed for an account. For more information, see Amazon Simple Storage Service endpoints and quotas in the *Amazon Web Services General Reference*.	400 Bad Request	Client
TooManyMultiRegionAccessPointregionsError	You have attempted to create a Multi-Region Access Point with more Regions than are allowed for an account. For more information, see Amazon Simple Storage Service endpoints and quotas in the *Amazon Web Services General Reference*.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
TooManyMultiRegionAccessPoints	You have attempted to create more Multi-Region Access Points than are allowed for an account. For more information, see Amazon Simple Storage Service endpoints and quotas in the *Amazon Web Services General Reference*.	400 Bad Request	Client
UnauthorizedAccessError	Applicable in China Regions only. Returned when a request is made to a bucket that doesn't have an ICP license. For more information, see ICP Recordal.	403 Forbidde	Client
UnexpectedContent	This request contains unsupported content.	400 Bad Request	Client
UnexpectedIPError	Applicable in China Regions only. This request was rejected because the IP was unexpected.	403 Forbidde	Client
UnsupportedArgument	The request contained an unsupported argument.	400 Bad Request	Client
UnsupportedSignature	The provided request is signed with an unsupported STS Token version or the signature version is not supported.	400 Bad Request	Client

Error code	Description	HTTP status code	SOAP fault code prefix
UnresolvableGrantByEmailAddress	The email address that you provided does not match any account on record.	400 Bad Request	Client
UserKeyMustBeSpecified	The bucket POST request must contain the specified field name. If it is specified, check the order of the fields.	400 Bad Request	Client
NoSuchAccessPoint	The specified access point does not exist.	404 Not Found	Client
InvalidTag	Your request contains tag input that is not valid. For example, your request might contain duplicate keys, keys or values that are too long, or system tags.	400 Bad Request	Client
MalformedPolicy	Your policy contains a principal that is not valid.	400 Bad Request	Client

List of SELECT Object Content Error Codes

Important

Amazon S3 Select is no longer available to new customers. Existing customers of Amazon S3 Select can continue to use the feature as usual. Learn more

The following table contains special errors that `SELECT Object Content` might return. For general information about Amazon S3 errors and a list of error codes, see Error responses.

Error code	Description	HTTP status code	SOAP fault code prefix
`AmbiguousFieldName`	The field name matches to multiple fields in the file. Check the SQL expression and the file, and try again.	400	Client
`Busy`	The service is unavailable. Try again later.	503	Client
`CastFailed`	An attempt to convert from one data type to another using `CAST` failed in the SQL expression.	400	Client
`ColumnTooLong`	The length of a column in the result is greater than `maxCharsPerColumn` of 1 MB.	400	Client
`CSVEscapingRecordDelimiter`	A quoted record delimiter was found in the file. To allow quoted record delimiters, set `AllowQuotedRecordDelimiter` to `'TRUE'`.	400	Client
`CSVParsingError`	An error occurred while parsing the CSV file. Check the file and try again.	400	Client
`CSVUnescapedQuote`	An unescaped quote was found while parsing the CSV file. To allow quoted record delimiters, set `AllowQuotedRecordDelimiter` to `'TRUE'`.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
EmptyRequestBody	The request body cannot be empty.	400	Client
EvaluatorBindingDoesNotExist	A column name or a path provided does not exist in the SQL expression.	400	Client
EvaluatorInvalidArguments	There is an incorrect number of arguments in the function call in the SQL expression.	400	Client
EvaluatorInvalidTimestampFormatPattern	The timestamp format string in the SQL expression is not valid.	400	Client
EvaluatorInvalidTimestampFormatPatternSymbol	The timestamp format pattern contains a symbol in the SQL expression that is not valid.	400	Client
EvaluatorInvalidTimestampFormatPatternSymbolForParsing	The timestamp format pattern contains a valid format symbol that cannot be applied to timestamp parsing in the SQL expression.	400	Client
EvaluatorInvalidTimestampFormatPatternToken	The timestamp format pattern contains a token in the SQL expression that is not valid.	400	Client
EvaluatorLikePatternInvalidEscapeSequence	An argument given to the LIKE expression was not valid.	400	Client
EvaluatorNegativeLimit	LIMIT must not be negative.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
EvaluatorTimestampFormatPatternDuplicateFields	The timestamp format pattern contains multiple format specifiers representing the timestamp field in the SQL expression.	400	Client
EvaluatorTimestampFormatPatternHourClockAmPmMismatch	The timestamp format pattern contains a 12-hour hour of day format symbol but doesn't also contain an AM/PM field, or it contains a 24-hour hour of day format specifier and contains an AM/PM field in the SQL expression.	400	Client
EvaluatorUnterminatedTimestampFormatPatternToken	The timestamp format pattern contains an unterminated token in the SQL expression.	400	Client
ExpressionTooLong	The SQL expression is too long. The maximum byte-length for an SQL expression is 256 KB.	400	Client
ExternalEvalException	The query cannot be evaluated. Check the file and try again.	400	Client
IllegalSqlFunctionArgument	An illegal argument was used in the SQL function.	400	Client
IncorrectSqlFunctionArgumentType	An incorrect argument type was specified in a function call in the SQL expression.	400	Client
IntegerOverflow	An integer overflow or underflow occurred in the SQL expression.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
`InternalError`	An internal error occurred.	500	Client
`InvalidCast`	An attempt to convert from one data type to another using `CAST` failed in the SQL expression.	400	Client
`InvalidColumnIndex`	The column index in the SQL expression is not valid.	400	Client
`InvalidCompressionFormat`	The file is not in a supported compression format. Only GZIP and BZIP2 are supported.	400	Client
`InvalidDataSource`	The data source type is not valid. Only CSV, JSON, and Parquet are supported.	400	Client
`InvalidDataType`	The SQL expression contains a data type that is not valid.	400	Client
`InvalidExpressionType`	The `ExpressionType` value is not valid. Only SQL expressions are supported.	400	Client
`InvalidFileHeaderInfo`	The `FileHeaderInfo` value is not valid. Only `NONE`, `USE`, and `IGNORE` are supported.	400	Client
`InvalidJsonType`	The `JsonType` value is not valid. Only `DOCUMENT` and `LINES` are supported.	400	Client
`InvalidKeyPath`	The key path in the SQL expression is not valid.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidQuoteFields	The QuoteFields value is not valid. Only ALWAYS and ASNEEDED are supported.	400	Client
InvalidRequestParameter	The value of a parameter in the SelectRequest element is not valid. Check the service API documentation and try again.	400	Client
InvalidScanRange	The provided scan range is not valid.	400	Client
InvalidTableAlias	The SQL expression contains a table alias that is not valid.	400	Client
InvalidTextEncoding	The encoding type is not valid. Only UTF-8 encoding is supported.	400	Client
JSONParsingError	An error occurred while parsing the JSON file. Check the file and try again.	400	Client
LexerInvalidChar	The SQL expression contains a character that is not valid.	400	Client
LexerInvalidIONLiteral	The SQL expression contains an operator that is not valid.	400	Client
LexerInvalidLiteral	The SQL expression contains an operator that is not valid.	400	Client
LexerInvalidOperator	The SQL expression contains a literal that is not valid.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
LikeInvalidInputs	The argument given to the LIKE clause in the SQL expression is not valid.	400	Client
MalformedXML	The XML provided was not well formed or did not validate against our published schema. Check the service documentation and try again.	400	Client
MaxOperatorsExceeded	Failed to parse SQL expression, try reducing complexity. For example, reduce number of operators used.	400	Client
MethodNotAllowed	The specified method is not allowed against this resource.	405 Method Not Allowed	Client
MissingRequiredParameter	The SelectRequest entity is missing a required parameter. Check the service documentation and try again.	400	Client
MultipleDataSourcesUnsupported	Multiple data sources are not supported.	400	Client
NumberFormatError	An error occurred while parsing a number. This error can be caused by underflow or overflow of integers.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ObjectSerializationConflict	InputSerialization specifies more than one format (CSV, JSON, or Parquet), or OutputSerialization specifies more than one format (CSV or JSON). For InputSerialization and OutputSerialization, you can specify only one format for each.	400	Client
OverMaxColumn	The number of columns in the result is greater than the maximum allowable number of columns.	400	Client
OverMaxParquetBlockSize	The Parquet file is above the max row group size.	400	Client
OverMaxRecordSize	The length of a record in the input or result is greater than the maxCharsPerRecord limit of 1 MB.	400	Client
ParquetParsingError	An error occurred while parsing the Parquet file. Check the file and try again.	400	Client
ParquetUnsupportedCompressionCodec	The specified Parquet compression codec is not supported.	400	Client
ParseAsteriskIsNotAloneInSelectList	Other expressions are not allowed in the SELECT list when * is used without dot notation in the SQL expression.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ParseCannotMixSqbAndWildcardInSelectList	Cannot mix [] and * in the same expression in a SELECT list in the SQL expression.	400	Client
ParseCastArity	The SQL expression CAST has incorrect arity.	400	Client
ParseEmptySelect	The SQL expression contains an empty SELECT clause.	400	Client
ParseExpected2TokenTypes	The expected token in the SQL expression was not found.	400	Client
ParseExpectedArgumentDelimiter	The expected argument delimiter in the SQL expression was not found.	400	Client
ParseExpectedDatePart	The expected date part in the SQL expression was not found.	400	Client
ParseExpectedExpression	The expected SQL expression was not found.	400	Client
ParseExpectedIdentForAlias	The expected identifier for the alias in the SQL expression was not found.	400	Client
ParseExpectedIdentForAt	The expected identifier for AT name in the SQL expression was not found.	400	Client
ParseExpectedIdentForGroupName	GROUP is not supported in the SQL expression.	400	Client
ParseExpectedKeyword	The expected keyword in the SQL expression was not found.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ParseExpectedLeftParenAfterCast	The expected left parenthesis after CAST in the SQL expression was not found.	400	Client
ParseExpectedLeftParenBuiltinFunctionCall	The expected left parenthesis in the SQL expression was not found.	400	Client
ParseExpectedLeftParenValueConstructor	The expected left parenthesis in the SQL expression was not found.	400	Client
ParseExpectedMember	The SQL expression contains an unsupported use of MEMBER.	400	Client
ParseExpectedNumber	The expected number in the SQL expression was not found.	400	Client
ParseExpectedRightParenBuiltinFunctionCall	The expected right parenthesis character in the SQL expression was not found.	400	Client
ParseExpectedTokenType	The expected token in the SQL expression was not found.	400	Client
ParseExpectedTypeName	The expected type name in the SQL expression was not found.	400	Client
ParseExpectedWhenClause	The expected WHEN clause in the SQL expression was not found. CASE is not supported.	400	Client
ParseInvalidContextForWildcardInSelectList	The use of * in the SELECT list in the SQL expression is not valid.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ParseInvalidPathComponent	The SQL expression contains a path component that is not valid.	400	Client
ParseInvalidTypeParam	The SQL expression contains a parameter value that is not valid.	400	Client
ParseMalformedJoin	JOIN is not supported in the SQL expression.	400	Client
ParseMissingIdentAfterAt	The expected identifier after the @ symbol in the SQL expression was not found.	400	Client
ParseNonUnaryAgregateFunctionCall	Only one argument is supported for aggregate functions in the SQL expression.	400	Client
ParseSelectMissingFrom	The SQL expression contains a missing FROM after the SELECT list.	400	Client
ParseUnExpectedKeyword	The SQL expression contains an unexpected keyword.	400	Client
ParseUnexpectedOperator	The SQL expression contains an unexpected operator.	400	Client
ParseUnexpectedTerm	The SQL expression contains an unexpected term.	400	Client
ParseUnexpectedToken	The SQL expression contains an unexpected token.	400	Client
ParseUnknownOperator	The SQL expression contains an operator that is not valid.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
ParseUnsupportedAlias	The SQL expression contains an unsupported use of ALIAS.	400	Client
ParseUnsupportedCallWithStar	Only COUNT with (*) as a parameter is supported in the SQL expression.	400	Client
ParseUnsupportedCase	The SQL expression contains an unsupported use of CASE.	400	Client
ParseUnsupportedCaseClause	The SQL expression contains an unsupported use of CASE.	400	Client
ParseUnsupportedLiteralsGroupBy	The SQL expression contains an unsupported use of GROUP BY .	400	Client
ParseUnsupportedSelect	The SQL expression contains an unsupported use of SELECT.	400	Client
ParseUnsupportedSyntax	The SQL expression contains unsupported syntax.	400	Client
ParseUnsupportedToken	The SQL expression contains an unsupported token.	400	Client
TruncatedInput	Object decompression failed. Check that the object is properly compressed using the format specified in the request.	400	Client
UnauthorizedAccess	You are not authorized to perform this operation.	401	Client
UnrecognizedFormatException	We encountered a record type that is not valid.	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
UnsupportedFunction	We encountered an unsupported SQL function.	400	Client
UnsupportedParquetType	The specified Parquet type is not supported.	400	Client
UnsupportedRangeHeader	A range header is not supported for this operation.	400	Client
UnsupportedScanRangeInput	Scan range queries are not supported on this type of object.	400	Client
UnsupportedSqlOperation	We encountered an unsupported SQL operation.	400	Client
UnsupportedSqlStructure	We encountered an unsupported SQL structure. Check the SQL Reference.	400	Client
UnsupportedStorageClass	We encountered a storage class that is not supported. Only STANDARD, STANDARD_IA , and ONEZONE_IA storage classes are supported.	400	Client
UnsupportedSyntax	We encountered syntax that is not valid.	400	Client
UnsupportedTypeForQuerying	Your query contains an unsupported type for comparison (e.g. verifying that a Parquet INT96 column type is greater than 0).	400	Client
ValueParseFailure	A timestamp parse failure occurred in the SQL expression.	400	Client

List of Replication-related error codes

The following table contains special errors that the `Replication` operation might return. For general information about Amazon S3 errors and a list of error codes, see Error responses.

Error code	Description	HTTP status code	SOAP fault code prefix
`InvalidArgument`	This error might occur for the following reasons: • The `<Account>` element is empty. It must contain a valid account ID. • The Amazon Web Services account specified in the `<Account>` element must match the destination bucket owner. • `ReplicationTime-Status` must contain a value. • `ReplicationTime-ReplicationTimeValue` must contain a value. • `Replication-ReplicationTimeValue-Minutes` value must be 15. • `ReplicationMetrics` must contain a `Status`. •	400	Client

Error code	Description	HTTP status code	SOAP fault code prefix
	`ReplicationMetrics` must contain an `EventThreshold` . • `EventThreshold-ReplicationTimeValue-Minutes` value must be 15. • `Rule ID` must not contain non-ASCII characters.		

Error code	Description	HTTP status code	SOAP fault code prefix
`InvalidRequest`	This error might occur for the following reasons: • The `<Owner>` in `<AccessControlTranslation>` has a value, so the `<Account>` element must be specified. • The `<Account>` element is empty. It must contain a valid account ID. • The replication `destination` must contain both `ReplicationTime` and `Metrics`, or neither. • `ReplicationTime` and `ReplicationMetrics` must have the same status. • S3 Replication Time Control (S3 RTC) is not supported in this Amazon Web Services Region.	400	Client
`ReplicationConfigurationNotFoundError`	There is no replication configuration for this bucket.	404 Not Found	Client

List of Tagging-related error codes

The following table contains special errors that the `TagResource`, `UntagResource`, and `ListTagsForResource` operations might return for Storage Lens groups. For general information about general Amazon S3 errors and a list of error codes, see Error responses.

Error Code	Description	HTTP Status Code	SOAP Fault Code Prefix
`InvalidRequest`	The Amazon Web Services Region in the resource ARN doesn't match the Region that's specified in this request. The Amazon account in the resource ARN doesn't match the account ID that's specified in this request. The Amazon partition in the resourceArn is invalid.	`400 Bad Request`	Not supported
`InvalidTag`	This request contains a tag key or value that isn't valid. Valid characters include the following : `[a-zA-Z+-=._:/]` . Tag keys can contain up to 128 characters. Tag values can contain up to 256 characters. There are duplicate tag keys in your request. User-defined tag keys can't start with `aws:`.	`400 Bad Request`	Not supported
`NoSuchResource`	The specified resource doesn't exist.	`404 Not Found`	Not supported
`TooManyTags`	The number of tags exceeds the limit of 50 tags.	`400 Bad Request`	Not supported

List of Amazon S3 on Outposts error codes

The following table contains special errors that an Amazon S3 on Outposts operation might return. For general information about Amazon S3 errors and a list of error codes, see Error responses.

Error code	Description	HTTP status code	SOAP fault code prefix
BadRequest	The bucket is in a transitional state because of a previous deletion attempt. Try again later.	400 Bad Request	Not supported
InvalidRequest	This error might occur for the following reasons: • Amazon VPC configuration is required. • Public access is not allowed on S3 on Outposts access points.	400 Bad Request	Client
InvalidOutpostState	The request is not valid for the current state of the Outpost.	409 Conflict	Not supported
InvalidRequest	The access point is not in a state where it can be deleted.	400 Bad Request	Not supported
NoSuchOutpost	The specified Outpost does not exist.	404 Not Found	Not supported
UnsupportedOperation	The specified action was not supported.	404 Not Found	Not supported
InsufficientCapacity	Insufficient capacity.	507 Insufficient Storage	Not supported

List of Amazon S3 Storage Lens error codes

The following table contains special errors that Amazon S3 Storage Lens operations might return. For general information about general Amazon S3 errors and a list of error codes, see Error responses.

Error code	Description	HTTP status code	SOAP fault code prefix
`AccessDenied`	This Region is not supported as a home Region for S3 Storage Lens.	`403 Forbidden`	Not supported
`AccountNotAuthorized`	This account not authorized to use Amazon Organizations. Use your management account or delegated administrator account.	`403 Forbidden`	Not supported
`ActivityMetricsMustEnabled`	Activity metrics must be enabled.	400 Bad Request	Not supported
`AWSOrganizationsNotInUseException`	This account is not part of your organization.	`403 Forbidden`	Not supported
`DefaultConfigurationDeleteForbidden`	The Default configuration cannot be deleted.	`403 Forbidden`	Not supported
`DuplicateStorageLensGroupARN`	There are two or more entries of the same Storage Lens group ARN in this configuration.	`400 Bad Request`	Not supported
`EmptyExcludeContainer`	This error occurs for the following reasons: • The exclude container cannot be empty.	400 Bad Request	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
	• The exclude container cannot have zero buckets. • The exclude container cannot have zero Regions.		
EmptyExcludeElement	You must specify a Storage Lens group with your Exclude el ement.	400 Bad Request	Not supported
EmptyIncludeContai ner	This error occurs for the following reasons: • The include container cannot be empty. • The include container cannot have zero buckets. • The include container cannot have zero Regions.	400 Bad Request	Not supported
InvalidAWSOrgArn	There is a malformed Amazon Organizations ARN in the configuration.	400 Bad Request	Not supported
EmptyIncludeElement	You must specify a Storage Lens group with your Include element.	400 Bad Request	Not supported
InvalidBucketFilter	Organization-level configurations do not support bucket filters.	400 Bad Request	Not supported
InvalidConfigId	The configuration ID is not valid.	400 Bad Request	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidDestination	The S3 bucket ARN is malformed.	400 Bad Request	Not supported
InvalidEncryptionMethod	Only one encryption method can be specified.	400 Bad Request	Not supported
InvalidFilterForDefaultConfiguration	The default configuration must not include any filters.	400 Bad Request	Not supported
InvalidIncludeExcludeContainers	You can specify either an Include container or an Exclude container in a configuration. You cannot specify both in a configuration.	400 Bad Request	Not supported
InvalidIncludeExcludeElements	Only one Include or Exclude element is allowed. At least one Include or Exclude element must be present.	400 Bad Request	Not supported
InvalidKMSEncryptionKeyId	The KMS key ID ARN is not valid.	400 Bad Request	Not supported
InvalidMaximumPrefixDepth	MaxDepth must be within the range [1,10].	400 Bad Request	Not supported
InvalidMinimumStorageBytesPercentage	MinStorageBytesPercentage must be within the range [1.00,100.00].	400 Bad Request	Not supported
InvalidOrganizationARN	The Amazon Organizations ARN in the configuration is not valid.	400 Bad Request	Not supported
InvalidOrganizationForDefaultConfiguration	The default configuration does not support organization-level metrics.	400 Bad Request	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidRegionForDefaultConfiguration	The specified Region is not supported for default configuration.	400 Bad Request	Not supported
InvalidRegionName	The Region name is not valid.	400 Bad Request	Not supported
InvalidStorageLensArn	The S3 Storage Lens ARN is not required in input.	400 Bad Request	Not supported
InvalidStorageLensGroupARN	This Storage Lens group ARN isn't valid or only Storage Lens groups in your account are allowed. Additionally, you must follow the Storage Lens group ARN structure: arn::s3:::storage-lens-group/ and adhere to the 64 character limit. Storage Lens group names can also contain only the following characters: a-z, A-Z, 0-9, hyphens (-), and underscores (_).	400 Bad Request	Not supported
MissingAccountLevelActivityMetrics	Activity metrics must be enabled at the account level when activity metrics are enabled at the bucket level.	400 Bad Request	Not supported
MissingBucketLevelActivityMetrics	Activity metrics must be enabled at the bucket level when activity metrics are enabled at the account level.	400 Bad Request	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
MissingEncryptionMethod	The encryption method cannot be blank. Specify either SSE-KMS or SSE-S3.	400 Bad Request	Not supported
MissingPrefixLevelStorageMetrics	Storage metrics at the prefix level are mandatory when the prefix level is enabled.	400 Bad Request	Not supported
OrganizationAccessDenied	This account is not authorized to add Amazon Organizations.	403 Forbidden	Not supported
OrgConfigurationNotSupported	The specified Region does not support Amazon Organizations in the configuration.	403 Forbidden	Not supported
ServiceNotEnabledForOrg	The S3 Storage Lens service-linked role is not enabled for the organization.	403 Forbidden	Not supported
StorageMetricsMustEnabled	Prefix-level storage metrics must be enabled.	400 Bad Request	Not supported
TooManyBuckets	The buckets container cannot have more than 50 buckets.	400 Bad Request	Not supported
TooManyRegions	The Regions container cannot have more than 50 Regions.	400 Bad Request	Not supported
TooManyStorageLensGroups	You can't attach more than 50 Storage Lens groups to your Storage Lens dashboard.	400 Bad Request	Not supported

The following table contains special errors that S3 Storage Lens groups operations might return. For general information about general Amazon S3 errors and a list of error codes, see Error responses.

Error code	Description	HTTP status code	SOAP fault code prefix
AccessDenied	You don't have permission to perform Storage Lens group actions. This Region is not supported as home Region for S3 Storage Lens groups.	403 Forbidden	Not supported
ConfigurationAlreadyExists	The specified configuration already exists.	409 Conflict	Not supported
DuplicateElement	Tags must be unique. The And logical operator includes duplicate tag keys. The Or logical operator includes duplicate tags. Logical operator includes duplicate prefixes or suffixes.	400 Bad Request	Not supported
InvalidAge	DaysLessThan and DaysGreaterThan must be positive numbers.	400 Bad Request	Not supported
InvalidFilter	A filter must include one of the following elements: And, Or, MatchAnyTag , MatchAnyPrefix , MatchAnySuffix , MatchObjectAge , MatchObjectSize .	400 Bad Request	Not supported
InvalidLogicalOperator	At least two sub elements must be present in the logical operators And or Or.	400 Bad Request	Not supported
InvalidMatchAnyPrefix	The MatchAnyPrefix parameter can’t be empty.	400 Bad Request	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
InvalidMatchAnySuffix	The MatchAnySuffix parameter can't be empty.	400 Bad Request	Not supported
InvalidMatchAnyTag	The MatchAnyTag parameter can't be empty.	400 Bad Request	Not supported
InvalidMatchObjectAge	The MatchObjectAge parameter can't be empty.	400 Bad Request	Not supported
InvalidMatchObjectSize	The MatchObjectSize parameter can't be empty.	400 Bad Request	Not supported
InvalidName	Storage Lens group Name parameter must be between 1 and 64 characters. The Storage Lens group Name parameter must use the ^[a-zA-Z0-9\-_]+$ pattern.	400 Bad Request	Not supported
InvalidNumericCombination	This object age or object size combination isn't valid.	400 Bad Request	Not supported
InvalidPrefix	The maximum length of a prefix is 1,024 characters. The prefix string can't be empty.	400 Bad Request	Not supported
InvalidSize	BytesLessThan and BytesGreaterThan must be positive numbers. The maximum object size can't exceed 5 TB. The minimum object size can't be greater than or equal to 5 TB.	400 Bad Request	Not supported

Error code	Description	HTTP status code	SOAP fault code prefix
`InvalidSuffix`	The maximum length of a suffix is 1,024 characters. The suffix string can't be empty.	`400 Bad Request`	Not supported
`InvalidTag`	The object tag key can’t exceed 128 characters. The object tag key string can't be null or empty. The maximum length of a tag value is 256 characters. The object tag key contains characters that aren't valid. The object tag key must contain only a-z, A-Z, 0-9, spaces, and the following characters: `^(_.:/=+\-@]*)$ .`	`400 Bad Request`	Not supported
`MismatchedName`	The name specified in the request doesn't match the Storage Lens group name.	`400 Bad Request`	Not supported
`TooManyConfigurations`	You have attempted to create more Storage Lens group configurations than the 50 allowed.	`400 Bad Request`	Not supported
`TooManyElements`	The `Element` exceeds the maximum number of elements allowed within a logical operator. Only 10 prefixes, suffixes, or tags are allowed.	`400 Bad Request`	Not supported

List of Amazon S3 Object Lambda error codes

The following table contains special errors that S3 Object Lambda might return. For information about general Amazon S3 errors and a list of error codes, see Error responses.

Error responses received from the supporting access points during non-`GetObject` requests are sent to the caller unaltered.

Error code	Description	HTTP status code	
`LambdaInvalidResponse`	Returned to the original caller when `WriteGetObjectResponse` responds with `ValidationError` to Amazon Lambda. See the `ValidationError` message for more details. Not all cases of `ValidationError` result in a `LambdaInvalidResponse` error.	`400 Bad Request`	
`LambdaInvocationFailed`	Lambda function invocation failed. Callers might receive the following error when S3 Object Lambda is unable to successfully invoke the configured Lambda function. The error message might contain details about an eventual error returned by the Amazon Lambda service when invoking the function (for example, status code, error code, error message and request ID).	`400 Bad Request`	
`LambdaNotFound`	The Amazon Lambda function was not found. The configured Lambda function, version, or alias was not found when attempting to invoke it.	`404 Not Found`	

Error code	Description	HTTP status code	
	Ensure that the S3 Object Lambda Access Point configuration points to the correct Lambda function ARN. The error message might contain details about an eventual error returned by the Amazon Lambda service when invoking the function (for example, status code, error code, error message and request ID).		
`LambdaPermissionError`	The caller is not authorized to invoke the Lambda function. The caller must have permission to invoke the Lambda function. Check the policies attached to the caller and ensure that they've been allowed to use `lambda:Invoke` for the configured function. The error message might contain details about an eventual error returned by the Amazon Lambda service when invoking the function (for example, status code, error code, error message and request ID).	`403 Forbidden`	

Error code	Description	HTTP status code
LambdaResponseNotReceived	The Lambda function exited without successfully calling WriteGetObjectResponse . GetObject response data is provided by the Lambda function by calling the WriteGetObjectResponse API operation . The Amazon CloudWatch logs for the function might provide more insight into why the function did not successfully call this API operation despite exiting normally.	500 Internal Service Error
LambdaRuntimeError	The Lambda function failed during execution. An explicit error was received from the Lambda function. For details about the failure, check the Amazon CloudFormation logs.	500 Internal Service Error
LambdaTimeout	The Lambda function did not respond in the allowed time. The Lambda function failed to complete its call to WriteGetObjectResponse within 60 seconds.	500 Internal Service Error

Error code	Description	HTTP status code
`SlowDown`	Reduce your request rate for operations involving Amazon Lambda. The function invocation was throttled by Amazon Lambda, perhaps because it has reached its configured concurrency limitat ion. For more information, see Managing concurrency for a Lambda function in the *Amazon Lambda Developer Guide*. The error message might contain details about an eventual error returned by the Amazon Lambda service when invoking the function (for example, status code, error code, error message and request ID).	`503 Slow Down`
`ValidationError`	Validation errors might be returned from the `WriteGetObjectResp onse` API operation and can occur for numerous reasons. See the error message for more details.	`400 Bad Request`

List of Amazon S3 asynchronous error codes

The following table contains special errors that asynchronous requests might return. For general information about Amazon S3 errors and a list of error codes, see Error responses.

These errors are returned when you query about the state of an asynchronous request, such as by using `DescribeMultiRegionAccessPointOperation`. Because these requests are asynchronous, all of these errors have a status code of `200 OK`.

Error code	Description	HTTP status code
`AccessDenied`	Access denied.	`200 OK`
`InternalErrors`	An internal server error occurred.	`200 OK`
`MalformedPolicy`	The specified policy syntax is not valid.	`200 OK`
`MultiRegionAccessPointAlreadyOwnedByYou`	You already have a Multi-Region Access Point with the same name.	`200 OK`
`MultiRegionAccessPointModifiedByAnotherRequest`	The action failed because another request is modifying the specified resource. Try resubmitting your request after the previous request has been completed.	`200 OK`
`MultiRegionAccessPointNotReady`	The specified Multi-Region Access Point is not ready to be updated.	`200 OK`
`MultiRegionAccessPointSameBucketRegion`	The buckets used to create a Multi-Region Access Point cannot be in the same Region.	`200 OK`
`MultiRegionAccessPointUnsupportedRegion`	One of the buckets supplied to create the Multi-Region Access Point is in a Region that is not supported.	`200 OK`
`NoSuchBucket`	The specified bucket does not exist.	`200 OK`

Error code	Description	HTTP status code
NoSuchMultiRegionAccessPoint	The specified Multi-Region Access Point does not exist.	200 OK

List of Amazon S3 Access Grants error codes

The following table contains special errors that S3 Access Grants requests might return. For general information about Amazon S3 errors and a list of error codes, see Error responses.

Error Code	Description	HTTP Status Code
AccessGrantAlreadyExists	The specified access grant already exists	409
AccessGrantsInstanceAlreadyExists	Access Grants Instance already exists	409
AccessGrantsInstanceNotEmptyError	Please clean up locations before deleting the access grants instance	400
AccessGrantsInstanceNotExistsError	Access Grants Instance does not exist	404
AccessGrantsInstanceResourcePolicyNotExists	Access Grants Instance Resource Policy does not exist	404
AccessGrantsLocationAlreadyExistsError	The specified access grants location already exists	409
AccessGrantsLocationNotEmptyError	Please clean up access grants before deleting access grants location	400

Error Code	Description	HTTP Status Code
AccessGrantsLocationsQuotaExceededError	The access grants location quota has been exceeded. Access Grants Locations Quota: *<value>*. Please reach out to S3 if an increase is required.	409
AccessGrantsQuotaExceededError	The access grants quota has been exceeded. Access Grants Quota: *<value>*. Please reach out to S3 if an increase is required.	409
InvalidTag	There are duplicate tag keys in your request. Remove the duplicate tag keys and try again.	400
InvalidAccessGrant	The specified Access Grant is invalid	400
InvalidAccessGrantsLocation	The specified Access Grants Location is invalid	400
InvalidIamRole	The specified IAM Role is invalid	400
InvalidIdentityCenterInstance	The specified identity center instance is invalid	400
InvalidResourcePolicy	The specified Resource Policy is invalid	400
InvalidResourcePolicy	The specified Resource Policy is invalid	400

Error Code	Description	HTTP Status Code
InvalidTag	This request contains a tag key or value that isn't valid. Valid characters include the following: [a-zA-Z+-=._:/]. Tag keys can contain up to 128 characters. Tag values can contain up to 256 characters.	400
NoSuchAccessGrantError	The specified access grant does not exist	404
NoSuchAccessGrantsLocationError	The specified access grants location does not exist	404
AccessDenied	You do not have *<requested permission>* permissions to the requested S3 Prefix: *<requested target>*	403 Forbidden
StsNotAuthorizedError	An error occurred (StsNotAuthorizedError) when calling the GetDataAccess operation: User: access-grants.s3.amazonaws.com is not authorized to perform: sts:AssumeRole on resource: *<IAM Role ARN>*	403
StsPackedPolicyTooLargeError	An error occurred (StsPackedPolicyTooLargeError) when calling the GetDataAccess operation: Serialized token too large for session	400
StsValidationError	*The error message varies depending on the validation error.*	400

Error Code	Description	HTTP Status Code	
InvalidTags	Tag keys cannot start with Amazon reserved prefix for system tags."	400	
TooManyTags	The number of tags exceeds the limit of 50 tags. Remove some tags and try again.	400	

List of Amazon FSx-related error codes

The following table contains special errors that requests made to Amazon FSx through an Amazon S3 access point might return. For general information about Amazon S3 errors and a list of error codes, see Error responses.

Error Code	Description	HTTP Status Code	
AccessDenied	This error might occur for the following reasons: • Caller is not authorized to preform specified S3 operation. • Caller is not authorized to access the Amazon FSx resource for the specified key.	403 Forbidden	
InsufficientCapacity	Maximum storage capacity of file system has been reached.	507 Insufficient Capacity	
InvalidKey	The specified key is not valid.	400 Bad Request	

Error Code	Description	HTTP Status Code	
SlowDown	Please reduce your request rate.	503 Slow Down	

Amazon S3 error best practices

Many error responses contain additional structured data meant to be read and understood by a developer diagnosing programming errors. For example, if you send a Content-MD5 header with a REST PUT request that doesn't match the digest calculated on the server, you receive a BadDigest error. The error response also includes as detail elements the digest we calculated, and the digest you told us to expect. During development, you can use this information to diagnose the error. In production, a well-behaved program might include this information in its error log.

When designing an application for use with Amazon S3, it is important to handle Amazon S3 errors appropriately. This section describes issues to consider when designing your application.

Retry InternalErrors

Internal errors are errors that occur within the Amazon S3 environment.

Requests that receive an InternalError response might not have processed. For example, if a PUT request returns InternalError, a subsequent GET might retrieve the old value or the updated value.

If Amazon S3 returns an InternalError response, retry the request.

Tune application for repeated SlowDown errors

As with any distributed system, S3 has protection mechanisms which detect intentional or unintentional resource over-consumption and react accordingly. SlowDown errors can occur when a high request rate triggers one of these mechanisms. Reducing your request rate will decrease or eliminate errors of this type. Generally speaking, most users will not experience these errors regularly; however, if you would like more information or are experiencing high or unexpected SlowDown errors, please post to our Amazon S3 developer forum or sign up for Amazon Web Services Support http://www.amazonaws.cn/support-plans/.

Isolate errors

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

Amazon S3 provides a set of error codes that are used by both the SOAP and REST API. The SOAP API returns standard Amazon S3 error codes. The REST API is designed to look like a standard HTTP server and interact with existing HTTP clients (e.g., browsers, HTTP client libraries, proxies, caches, and so on). To ensure the HTTP clients handle errors properly, we map each Amazon S3 error to an HTTP status code.

HTTP status codes are less expressive than Amazon S3 error codes and contain less information about the error. For example, the `NoSuchKey` and `NoSuchBucket` Amazon S3 errors both map to the `HTTP 404 Not Found` status code.

Although the HTTP status codes contain less information about the error, clients that understand HTTP, but not the Amazon S3 API, will usually handle the error correctly.

Therefore, when handling errors or reporting Amazon S3 errors to end users, use the Amazon S3 error code instead of the HTTP status code as it contains the most information about the error. Additionally, when debugging your application, you should also consult the human readable <Details> element of the XML error response.

Amazon Glossary

For the latest Amazon terminology, see the Amazon glossary in the *Amazon Web Services Glossary Reference*.

Amazon S3 Resources

Following is a table that lists related resources that you'll find useful as you work with this service.

Resource	Description
Amazon Simple Storage Service User Guide	The getting started guide provides a quick tutorial of the service based on a simple use case.
Amazon Simple Storage Service User Guide	The developer guide describes how to accomplish tasks using Amazon S3 operations.
Amazon S3 Technical FAQ	The FAQ covers the top 20 questions developers have asked about this product.
Amazon S3 Release Notes	The Release Notes give a high-level overview of the current release. They specifically note any new features, corrections, and known issues.
Tools for Amazon Web Services	A central starting point to find documentation, code samples, release notes, and other information to help you build innovative applications with Amazon SDKs and tools.
Amazon Web Services Management Console	The console allows you to perform most of the functions of Amazon S3 without programming.
Discussion Forums	A community-based forum for developers to discuss technical questions related to Amazon Web Services.
Amazon Web Services Support Center	The home page for Amazon Technical Support, including access to our Developer Forums, Technical FAQs, Service Status page, and Premium Support.
Amazon Web Services Support	The primary web page for information about Amazon Web Services Support, a one-on-one, fast-response support channel to help you build and run applications on Amazon Infrastructure Services.

Resource	Description
Amazon S3 product information	The primary web page for information about Amazon S3.
Contact Us	A central contact point for inquiries concerning Amazon billing, account, events, abuse, etc.
Conditions of Use	Detailed information about the copyright and trademark usage at Amazon.com and other topics.

Document History

The following table describes the important changes in each release of the *Amazon Simple Storage Service API Reference* up to March 27, 2019. For changes after March 27, 2019, see the consolidated Document History in the *Amazon Simple Storage Service User Guide*.

- **API version:** 2006-03-01
- **Latest documentation update:** March 27, 2019

Change	Description	Release Date
New archive storage class	Amazon S3 now offers a new archive storage class, DEEP_ARCHIVE, for storing rarely accessed objects. For more information, see Storage Classes in the *Amazon Simple Storage Service User Guide*.	March 27, 2019
Support for Parquet-formatted Amazon S3 inventory files	Amazon S3 now supports the Apache Parquet (Parquet) format in addition to the Apache optimized row columnar (ORC) and comma-separated values (CSV) file formats for inventory output files. For more information, see Amazon S3 Inventory in the *Amazon Simple Storage Service User Guide*. The following APIs were updated accordingly: • GetBucketInventoryConfiguration • PutBucketInventoryConfiguration	December 04, 2018
PUT directly to the GLACIER storage class	The Amazon S3 PUT and related operations now support specifying GLACIER as the storage class when creating objects. Previously, you had to transition to the GLACIER storage class from another Amazon S3 storage class. For more information about the GLACIER storage class, see	November 26, 2018

Change	Description	Release Date
	Storage Classes in the *Amazon Simple Storage Service User Guide*. The following APIs were updated accordingly: • PutObject • POST Object • CopyObject • CreateMultipartUpload	
Object Lock	Amazon S3 now supports locking objects using a Write Once Read Many (WORM) model. You can lock objects for a definite period of time using a retention period or indefinitely using a legal hold. For more information about Amazon S3 Object Lock, see Locking Objects in the *Amazon Simple Storage Service User Guide*. The following APIs were updated for S3 Object Lock: • PutObject • GetObject • HeadObject • CreateBucket • HeadBucket	November 26, 2018

Change	Description	Release Date
New storage class	Amazon S3 now offers a new storage class named INTELLIGENT_TIERING that is for storing data that has changing or unknown access patterns. For more informati on, see Storage Classes in the *Amazon Simple Storage Service User Guide*. The following APIs were updated accordingly: • PutObject • POST Object • CopyObject • CreateMultipartUpload	November 26, 2018
Block Public Access	Amazon S3 now includes the ability to block public access to buckets and objects on a per-bucket or account-wide basis. For more information, see Using Amazon S3 Block Public Access in the *Amazon Simple Storage Service User Guide*.	November 15, 2018

Change	Description	Release Date
Filtering enhancements in cross-region replication (CRR) rules	In a CRR rule configuration, you can specify an object filter to choose a subset of objects to apply the rule to. Previously, you could filter only on an object key prefix. In this release, you can filter on an object key prefix, one or more object tags, or both. For more information, see Replication Configuration Overview in the *Amazon Simple Storage Service User Guide*. The following APIs are updated accordingly: • PutBucketReplication • GetBucketReplication • DeleteBucketReplication	September 19, 2018
New storage class	Amazon S3 now offers a new storage class, ONEZONE_IA (IA, for infrequent access) for storing objects. For more information, see Storage Classes in the *Amazon Simple Storage Service User Guide*.	April 4, 2018
Amazon S3 Select	Amazon S3 Select is now generally available. This feature retrieves object content based on an SQL expression. For more information, see Selecting Content from Objects in the *Amazon Simple Storage Service User Guide*. The following API has been updated: • SelectObjectContent	April 4, 2018

Change	Description	Release Date
Asia Pacific (Osaka-Local) Region	Amazon S3 is now available in the Asia Pacific (Osaka-Local) Region. For more information about Amazon S3 Regions and endpoints, see Regions and Endpoints in the *Amazon Web Services General Reference*. **Important** You can use the Asia Pacific (Osaka-Local) Region only in conjunction with the Asia Pacific (Tokyo) Region. To request access to Asia Pacific (Osaka-Local) Region, contact your sales representative.	February 12, 2018
Europe (Paris) Region	Amazon S3 is now available in the Europe (Paris) Region. For more information about Amazon S3 regions and endpoints, see Regions and Endpoints in the *Amazon Web Services General Reference*.	December 18, 2017
China (Ningxia) Region	Amazon S3 is now available in the China (Ningxia) Region. For more information about Amazon S3 regions and endpoints, see Regions and Endpoints in the *Amazon Web Services General Reference*.	December 11, 2017
Querying archives with SQL	Amazon S3 now supports querying S3 Glacier data archives with SQL. For more information, see Querying Archived Objects in the *Amazon Simple Storage Service User Guide*. The following API changed: • RestoreObject	November 29, 2017

Change	Description	Release Date
SELECT Object Content (Preview)	Amazon S3 now supports the SELECT Object Content functionality as part of a Preview program. This feature retrieves object content based on an SQL expression. The following API has been added: • SelectObjectContent	November 29, 2017
Support for ORC-formatted Amazon S3 inventory files	Amazon S3 now supports the Apache optimized row columnar (ORC) format in addition to comma-separated values (CSV) file format for inventory output files. For more information, see Amazon S3 Inventory in the *Amazon Simple Storage Service User Guide*. The following APIs are updated accordingly: • GetBucketInventoryConfiguration • PutBucketInventoryConfiguration	November 17, 2017

Change	Description	Release Date
Default encryption for S3 buckets	Amazon S3 default encryption provides a way to set the default encryption behavior for an S3 bucket. You can set default encryption on a bucket so that all objects are encrypted when they are stored in the bucket. The objects are encrypted using server-side encryption with either Amazon S3-managed keys (SSE-S3) or Amazon KMS-managed keys (SSE-KMS). For more information, see Amazon S3 Default Encryption for S3 Buckets in the *Amazon Simple Storage Service User Guide*. The following APIs are updated accordingly: • DeleteBucketEncryption • GetBucketEncryption • PutBucketEncryption	November 06, 2017
Encryption status in Amazon S3 inventory	Amazon S3 now supports including encryption status in Amazon S3 inventory so you can see how your objects are encrypted at rest for compliance auditing or other purposes. You can also configure to encrypt Amazon S3 inventory with server-side encryption (SSE) or SSE-KMS so that all inventory files are encrypted accordingly. For more information, see Amazon S3 Inventory in the *Amazon Simple Storage Service User Guide*. The following APIs are updated accordingly: • GetBucketInventoryConfiguration • PutBucketInventoryConfiguration	November 06, 2017

Change	Description	Release Date
Cross-region replication (CRR) enhancements	Cross-region replication (CRR) now supports the following: • In a cross-account scenario, you can add a CRR configuration to change replica ownership to the Amazon Web Services account that owns the destination bucket. For more information, see CRR: Change Replica Owner in the *Amazon Simple Storage Service User Guide*. • By default, Amazon S3 does not replicate objects in your source bucket that are created using server-side encryption using Amazon KMS-managed keys. In your CRR configuration, you can now direct Amazon S3 to replicate these objects. For more information, see CRR: Replicating Objects Created with SEE Using Amazon KMS-Managed Encryption Keys in the *Amazon Simple Storage Service User Guide*. The following APIs are updated accordingly: • GetBucketReplication • PutBucketReplication	November 06, 2017
Europe (London) Region	Amazon S3 is now available in the Europe (London) Region. For more information about Amazon S3 regions and endpoints, see Regions and Endpoints in the *Amazon Web Services General Reference*.	December 13, 2016

Change	Description	Release Date
Canada (Central) Region	Amazon S3 is now available in the Canada (Central) Region. For more information about Amazon S3 regions and endpoints, see Regions and Endpoints in the *Amazon Web Services General Reference*.	December 8, 2016
Object tagging support	Amazon S3 now supports object tagging. The following new API operations support object tagging: • PutObjectTagging • GetObjectTagging • DeleteObjectTagging In addition, other API operations are updated to support object tagging. For more information, see Object Tagging in the *Amazon Simple Storage Service User Guide*.	November 29, 2016
S3 lifecycle now supports object tag based filter	Amazon S3 now supports tag-based filtering in lifecycle configuration. You can now specify a lifecycle rule, in which you can specify a key prefix, one or more object tags, or a combination of both, to select a subset of objects to which the lifecycle rule applies. For more information, see Object Lifecycle Managementin the *Amazon Simple Storage Service User Guide*. Amazon S3 now supports Expedited and Bulk data retrievals in addition to Standard retrievals when restoring objects archived to S3 Glacier.	November 29, 2016

Change	Description	Release Date
CloudWatch request metrics for buckets	Amazon S3 now supports CloudWatch metrics for requests made on buckets. The following new API operations support configuring request metrics: • DeleteBucketMetricsConfiguration • GetBucketMetricsConfiguration • PutBucketMetricsConfiguration • ListBucketMetricsConfigurations For more information, see Monitoring Metrics with Amazon CloudWatch in the *Amazon Simple Storage Service User Guide*.	November 29, 2016
Amazon S3 Inventory	Amazon S3 now supports storage inventory. Amazon S3 inventory provides a flat-file output of your objects and their corresponding metadata on a daily or weekly basis for an S3 bucket or a shared prefix (that is, objects that have names that begin with a common string). The following new API operations are for storage inventory: • DeleteBucketInventoryConfiguration • GetBucketInventoryConfiguration • PutBucketInventoryConfiguration • ListBucketInventoryConfigurations For more information, see Amazon S3 Storage Inventory in the *Amazon Simple Storage Service User Guide*.	November 29, 2016

Change	Description	Release Date
Amazon S3 Analytics – Storage Class Analysis	The new Amazon S3 analytics – storage class analysis feature observes data access patterns to help you determine when to transition less frequently accessed STANDARD storage to the STANDARD_IA (IA, for infrequent access) storage class. After storage class analysis observes the infrequent access patterns of a filtered set of data over a period of time, you can use the analysis results to help you improve your lifecycle configurations. This feature also includes a detailed dai ly analysis of your storage usage at the specified bucket, prefix, or tag level that you can export to a S3 bucket. The following new API operations are for storage class analysis: • DeleteBucketAnalyticsConfiguration • GetBucketAnalyticsConfiguration • PutBucketAnalyticsConfiguration • ListBucketAnalyticsConfigurations For more information, see Amazon S3 Analytics – Storage Class Analysis in the *Amazon Simple Storage Service User Guide*.	November 29, 2016
Added S3 Glacier retrieval options to RestoreObject	Amazon S3 now supports Expedited and Bulk data retrievals in addition to Standard retrievals when restoring objects archived to S3 Glacier. For more information, see Restoring Archived Objects in the *Amazon Simple Storage Service User Guide*.	November 21, 2016

Change	Description	Release Date
US East (Ohio) Region	Amazon S3 is now available in the US East (Ohio) Region. For more information about Amazon S3 regions and endpoints, see Regions and Endpoints in the *Amazon Web Services General Reference*.	October 17, 2016
Asia Pacific (Mumbai) region	Amazon S3 is now available in the Asia Pacific (Mumbai) region. For more information about Amazon S3 regions and endpoints, see Regions and Endpoints in the *Amazon Web Services General Reference*.	June 27, 2016
GET Bucket (List Objects) API revised	The GET Bucket (List Objects) API has been revised. We recommend that you use the new version, GET Bucket (List Objects) version 2. For more information, see ListObjectsV2.	May 4, 2016
Amazon S3 Transfer Acceleration	Amazon S3 Transfer Acceleration enables fast, easy, and secure transfers of files over long distances between your client and an S3 bucket. Transfer Acceleration takes advantage of Amazon CloudFront's globally distributed edge locations. For more information, see Transfer Acceleration in the *Amazon Simple Storage Service User Guide*. The following new API operations support Transfer Acceleration: GetBucketAccelerateConfiguration and PutBucketAccelerateConfiguration.	April 19, 2016
Lifecycle support to remove expired object delete marker	Lifecycle configuration expiration action now allows you to direct Amazon S3 to remove expired object delete markers in versioned bucket. For more information, see Elements to Describe Lifecycle Actions in the *Amazon Simple Storage Service User Guide*.	March 16, 2016

Change	Description	Release Date
Bucket lifecycle configuration now supports the action to cancel incomplete multipart uploads	Bucket lifecycle configuration now supports the `AbortIncompleteMultipartUpload` action that you can use to direct Amazon S3 to cancel multipart uploads that don't complete within a specified number of days after being initiated. When a multipart upload becomes eligible for an abort operation, Amazon S3 deletes any uploaded parts and cancels the multipart upload. The following API operations have been updated to support the new action: • PutBucketLifecycleConfiguration – The XML configuration now allows you to specify the `AbortIncompleteMultipartUpload` action in a lifecycle configuration rule. • ListParts and CreateMultipartUpload – Both of these API operations now return two additional response headers (`x-amz-abort-date` , and `x-amz-abort-rule-id`) if the bucket has a lifecycle rule that specifies the `AbortIncompleteMultipartUpload` action. These headers in the response indicate when the initiated multipart upload will become eligible for an abort operation and which lifecycle rule is applicable. For conceptual information, see the following topics in the *Amazon Simple Storage Service User Guide*: •	March 16, 2016

Change	Description	Release Date
	Aborting Incomplete Multipart Uploads Using a Bucket Lifecycle configuration • Elements to Describe Lifecycle Actions	
Amazon S3 Signature Version 4 now supports unsigned payloads	Amazon S3 Signature Version 4 now supports unsigned payloads when authenticating requests using the `Authorization` header. Because you don't sign the payload, it does not provide the same security that comes with payload signing, but it provides similar performance characteristics as signature version 2. For more information, see Signature Calculations for the Authorization Header: Transferring Payload in a Single Chunk (Amazon Signature Version 4).	January 15, 2016
Asia Pacific (Seoul) region	Amazon S3 is now available in the Asia Pacific (Seoul) region. For more information about Amazon S3 regions and endpoints, see Regions and Endpoints in the *Amazon Web Services General Reference*.	January 6, 2016
Renamed the US Standard region	Changed the region name string from US Standard to US East (N. Virginia). This is only a region name update, there is no change in the functionality.	December 11, 2015

Change	Description	Release Date
New storage class	Amazon S3 now offers a new storage class, STANDARD_IA (IA, for infrequent access) for storing objects. This storage class is optimized for long-lived and less frequently accessed data. For more information, see Storage Classes in the *Amazon Simple Storage Service User Guide*. Lifecycle configuration feature updates now allow you to transition objects to the STANDARD_IA storage class. For more information, see Object Lifecycle Management in the *Amazon Simple Storage Service User Guide*. Previously, the cross-region replication feature used the storage class of the source object for object replicas. Now, when you configure cross-region replication you can specify a storage class for the object replica created in the destination bucket. For more information, see Cross-Region Replication in the *Amazon Simple Storage Service User Guide*.	September 16, 2015
Event notifications	Amazon S3 event notifications have been updated to add notifications when objects are deleted and to add filtering on object names with prefix and suffix matching. For the relevant API operations, see PutBucketNotificationConfiguration, and GetBucketNotificationConfiguration. For more information, see Configuring Amazon S3 Event Notifications in the *Amazon Simple Storage Service User Guide*.	July 28, 2015

Change	Description	Release Date
Cross-region replication	Amazon S3 now supports cross-region replication. Cross-region replication is the automatic, asynchronous copying of objects across buckets in different Amazon Web Services Regions. For the relevant API operations, see PutBucketReplication, GetBucketReplication and DeleteBucketReplication. For more information, see Enabling Cross-Region Replication in the *Amazon Simple Storage Service User Guide*.	March 24, 2015
Event notifications	Amazon S3 now supports new event types and destinations in a bucket notification configuration. Prior to this release, Amazon S3 supported only the `s3:ReducedRedundancyLostObject` event type and an Amazon SNS topic as the destination. For more information about the new event types, go to Setting Up Notification of Bucket Events in the *Amazon Simple Storage Service User Guide*. For the relevant API operations, see PutBucketNotificationConfiguration and GetBucketNotificationConfiguration.	November 13, 2014

Change	Description	Release Date
Server-side encryption with Amazon Key Management Service (KMS)	Amazon S3 now supports server-side encryption using Amazon Key Management Service (KMS). With server-side encryption with KMS, you manage the envelope key through KMS, and Amazon S3 calls KMS to access the envelope key within the permissions you set. For more information about server-side encryption with KMS, see Protecting Data Using Server-Side Encryption with Amazon Key Management Service in the *Amazon Simple Storage Service User Guide*. The following Amazon S3 REST API operations support headers related to KMS. • PutObject • CopyObject • POST Object • CreateMultipartUpload • UploadPart	November 12, 2014
Europe (Frankfurt) Region	Amazon S3 is now available in the Europe (Frankfurt) Region region.	October 23, 2014

Change	Description	Release Date
Server-side encryption with customer-provided encryption keys	Amazon S3 now supports server-side encryption using customer-provided encryption keys (SSE-C). Server-side encryption enables you to request Amazon S3 to encrypt your data at rest. When using SSE-C, Amazon S3 encrypts your objects with the custom encryption keys that you provide. Since Amazon S3 performs the encryption for you, you get the benefits of using your own encryption keys without the cost of writing or executing your own encryption code. For more information about SSE-C, go to Server-Side Encryption (Using Customer-Provided Encryption Keys) in the *Amazon Simple Storage Service User Guide*. The following Amazon S3 REST API operations support headers related to SSE-C. • GetObject • HeadObject • PutObject • CopyObject • POST Object • CreateMultipartUpload • UploadPart • UploadPartCopy	June 12, 2014

Change	Description	Release Date
Lifecycle support for versioning	Prior to this release lifecycle configuration was supported only on nonversioned buckets. Now you can configure lifecycle on both the nonversioned and versioning-enabled buckets. For more information, go to Object Lifecycle Management in the *Amazon Simple Storage Service User Guide*. The related API operations, see PutBucketLifecycleConfiguration, GetBucketLifecycleConfiguration, and DeleteBucketLifecycle.	May 20, 2014
Amazon S3 now supports Signature Version 4	Amazon S3 now supports Signature Version 4 (SigV4) in all regions, the latest specification for how to sign and authenticate Amazon requests. For more information, see Authenticating Requests (Amazon Signature Version 4).	January 30, 2014
Amazon S3 list actions now support `encoding-type` request parameter	The following Amazon S3 list actions now support `encoding-type` optional request parameter. ListObjects ListObjectVersions ListMultipartUploads ListParts An object key can contain any Unicode character; however, the XML 1.0 parser cannot parse some characters, such as characters with an ASCII value from 0 to 10. For characters that are not supported in XML 1.0, you can add this parameter to request that Amazon S3 encode the keys in the response.	November 1, 2013

Change	Description	Release Date
SOAP Support Over HTTP Deprecated	SOAP support over HTTP is deprecated, but it is still available over HTTPS. New Amazon S3 features will not be supported for SOAP. We recommend that you use ei ther the REST API or the Amazon SDKs.	September 19, 2013
Root domain support for website hosting	Amazon S3 now supports hosting static websites at the root domain. Visitors to your website can access your site from their browser without specifying "www" in the web address (e.g., "example.com"). Many customers already host static websites on Amazon S3 that are accessible from a "www" subdomain (e.g., "www.example.com"). Previously, to support root domain access, you needed to run your own web server to proxy root domain requests from browsers to your website on Amazon S3. Running a web server to proxy requests introduces additional costs, operational burden, and another potential point of failure. Now, you can take advantage of the high availabil ity and durability of Amazon S3 for both "www" and root domain addresses. For an example walkthrough, go to Example: Setting Up a Static Website Using a Custom Domain in the *Amazon Simple Storage Service User Guide*. For conceptua l information, go to Hosting Static Websites on Amazon S3 in the *Amazon Simple Storage Service User Guide*.	December 27, 2012

Change	Description	Release Date
Support for Archiving Data to Amazon Glacier	Amazon S3 now supports a storage option that enables you to utilize Amazon Glacier's low-cost storage service for data archival. To archive objects, you define archival rules identifying objects and a timeline when you want Amazon S3 to archive these objects to S3 Glacier. You can easily set the rules on a bucket using the Amazon S3 console or programmatically using the Amazon S3 API or Amazon SDKs. To support data archival rules, Amazon S3 lifecycle management API has been updated. For more informati on, see PutBucketLifecycleConfiguration. After you archive objects, you must first restore a copy before you can access the data. Amazon S3 offers a new API for you to initiate a restore. For more information, see RestoreObject. For conceptual information, go to Object Lifecycle Management in the *Amazon Simple Storage Service User Guide*.	November 13, 2012

Change	Description	Release Date
Support for Website Page Redirects	For a bucket that is configured as a website, Amazon S3 now supports redirecting a request for an object to another object in the same bucket or to an external URL. You can configure redirect by adding the `x-amz-website-redirect-location` metadata to the object. The object upload API operations PutObject, CreateMultipartUpload, and POST Object allow you to configure the `x-amz-website-redirect-location` object metadata. For conceptual information, go to How to Configure Website Page Redirects in the *Amazon Simple Storage Service User Guide*.	October 4, 2012
Cross-Origin Resource Sharing (CORS) support	Amazon S3 now supports Cross-Origin Resource Sharing (CORS). CORS defines a way in which client web applications that are loaded in one domain can interact with or access resources in a different domain. With CORS support in Amazon S3, you can build rich client-side web applications on top of Amazon S3 and selectively allow cross-domain access to your Amazon S3 resources. For more information, see Enabling Cross-Origin Resource Sharing in the *Amazon Simple Storage Service User Guide*.	August 31, 2012
Cost Allocation Tagging support	Amazon S3 now supports cost allocation tagging, which allows you to label S3 buckets so you can more easily track their cost against projects or other criteria. For more information, see Cost Allocation Tagging in the *Amazon Simple Storage Service User Guide*.	August 21, 2012

Change	Description	Release Date
Object Expiration support	You can use Object Expiration to schedule automatic removal of data after a configured time period. You set object expiration by adding lifecycle configuration to a bucket. For more information, see Transitioning Objects: General Considerations in the *Amazon Simple Storage Service User Guide*.	December 27, 2011
New Region supported	Amazon S3 now supports the South America (São Paulo) region. For more information, see Buckets and Regions in the *Amazon Simple Storage Service User Guide*.	December 14, 2011
Multi-Object Delete	Amazon S3 now supports Multi-Object Delete API that enables you to delete multiple objects in a single request. With this feature, you can remove large numbers of objects from Amazon S3 more quickly than using multiple individual DELETE requests. For more information about the API see, see DeleteObjects. For conceptual information about the delete operation, see Deleting Objects in the *Amazon Simple Storage Service User Guide*.	December 7, 2011
New region supported	Amazon S3 now supports the US West (Oregon) region. For more information, see Buckets and Regions in the *Amazon Simple Storage Service User Guide*.	November 8, 2011

Change	Description	Release Date
Server-side encryption support	Amazon S3 now supports server-side encryption. It enables you to request Amazon S3 to encrypt your data at rest, that is, encrypt your object data when Amazon S3 writes your data to disks in its data centers. To request server-side encryption, you must add the `x-amz-server-side-encryption` header to your request. To learn more about data encryption, go to Using Data Encryption in the *Amazon Simple Storage Service User Guide*.	October 17, 2011
Multipart Upload API extended to enable copying objects up to 5 TB	Prior to this release, Amazon S3 API supported copying objects (see CopyObject) of up to 5 GB in size. To enable copying objects larger than 5 GB, Amazon S3 extends the multipart upload API with a new operation, `Upload Part (Copy)`. You can use this multipart upload operation to copy objects up to 5 TB in size. For conceptual information about multipart upload, go to Uploading Objects Using Multipart Upload in the *Amazon Simple Storage Service User Guide*. To learn more about the new API, see UploadPartCopy.	June 21, 2011
SOAP API calls over HTTP disabled	To increase security, SOAP API calls over HTTP are disabled. Authenticated and anonymous SOAP requests must be sent to Amazon S3 using SSL.	June 6, 2011

Change	Description	Release Date
Support for hosting static websites in Amazon S3	Amazon S3 introduces enhanced support for hosting static websites. This includes support for index documents and custom error documents. When using these features, requests to the root of your bucket or a subfolder (e.g., `http://mywebsite.com/subfolder`) returns your index document instead of the list of objects in your bucket. If an error is encountered, Amazon S3 returns your custom error message instead of an Amazon S3 error message. For API information to configure your bucket as a website, see the following sections: • PutBucketWebsite • GetBucketWebsite • DeleteBucketWebsite For conceptual overview, go to Hosting Websites on Amazon S3 in the *Amazon Simple Storage Service User Guide*.	February 17, 2011
Response Header API Support	The GET Object REST API now allows you to change the response headers of the REST GET Object request for each request. That is, you can alter object metadata in the response, without altering the object itself. For more information, see GetObject.	January 14, 2011

Change	Description	Release Date
Large Object Support	Amazon S3 has increased the maximum size of an object you can store in an S3 bucket from 5 GB to 5 TB. If you are using the REST API you can upload objects of up to 5 GB size in a single PUT operation. For larger objects, you must use the Multipart Upload REST API to upload objects in parts. For conceptual information, go to Uploading Objects Using Multipart Upload in the *Amazon Simple Storage Service User Guide*. For multipart upload API information, see CreateMultipartUpload, UploadPart, CompleteMultipartUpload, ListParts, and ListMultipartUploads	December 9, 2010
Multipart upload	Multipart upload enables faster, more flexible uploads into Amazon S3. It allows you to upload a single object as a set of parts. For conceptual information, go to Uploading Objects Using Multipart Upload in the *Amazon Simple Storage Service User Guide*. For multipart upload API information, see CreateMultipartUpload, UploadPart, CompleteMultipartUpload, ListParts, and ListMultipartUploads	November 10, 2010
Notifications	The Amazon S3 notifications feature enables you to configure a bucket so that Amazon S3 publishes a message to an Amazon Simple Notification Service (SNS) topic when Amazon S3 detects a key event on a bucket. For more information, see GET Bucket notification and PUT Bucket notification.	July 14, 2010
Bucket policies	Bucket policies is an access management system you use to set access permissions on buckets, objects, and sets of objects. This functionality supplements and in many cases replaces access control lists.	July 6, 2010

Change	Description	Release Date
Reduced Redundancy	Amazon S3 now enables you to reduce your storage costs by storing objects in Amazon S3 with reduced redundancy. For more information, see PUT Object.	May 12, 2010
New region supported	Amazon S3 now supports the Asia Pacific (Singapore) region and therefore new location constraints. For more information, see GET Bucket location and PUT Bucket.	April 28, 2010
Object Versioning	This release introduces object Versioning. All objects now have a key and a version. If you enable versioning for a bucket, Amazon S3 gives all objects added to a bucket a unique version ID. This feature enables you to recover from unintended overwrites and deletions. For more information, see GET Object, DELETE Object, PUT Object, PUT Object Copy, or POST Object. The SOAP API does not support versioned objects.	February 8, 2010
New region supported	Amazon S3 now supports the US-West (Northern California) region. The new endpoint is `s3-us-west-1.amazonaws.com.cn`. For more information, see How to Select a Region for Your Buckets in the *Amazon Simple Storage Service User Guide*.	December 2, 2009
C# Library Support	Amazon now provides Amazon S3 C# libraries, sample code, tutorials, and other resources for software developers who prefer to build applications using language-specific API operations instead of REST or SOAP. These libraries provide basic functions (not included in the REST or SOAP APIs), such as request authentication, request retries, and error handling so that it's easier to get started.	November 11, 2009

Change	Description	Release Date
Technical documents reorganized	The API reference has been split out of the *Amazon S3 Developer Guide*. Now, on the documentation landing page, Amazon Simple Storage Service Documentation, you can select the document you want to view. When viewing the documents online, the links in one document will take you, when appropriate, to one of the other guides.	September 16, 2009

Appendix: SelectObjectContent Response

Description

The Amazon S3 Select operation filters the contents of an Amazon S3 object based on a simple structured query language (SQL) statement. Given the response size of this operation is unknown, Amazon S3 Select streams the response as a series of messages and includes a `Transfer-Encoding` header with **chunked** as its value in the response.

For more information about Amazon S3 Select, see Selecting Content from Objects in the *Amazon Simple Storage Service User Guide*.

For more information about using SQL with Amazon S3 Select, see SQL Reference for Amazon S3 Select and S3 Glacier Select in the *Amazon Simple Storage Service User Guide*.

Responses

A successful Amazon S3 Select Operation returns `200 OK` status code.

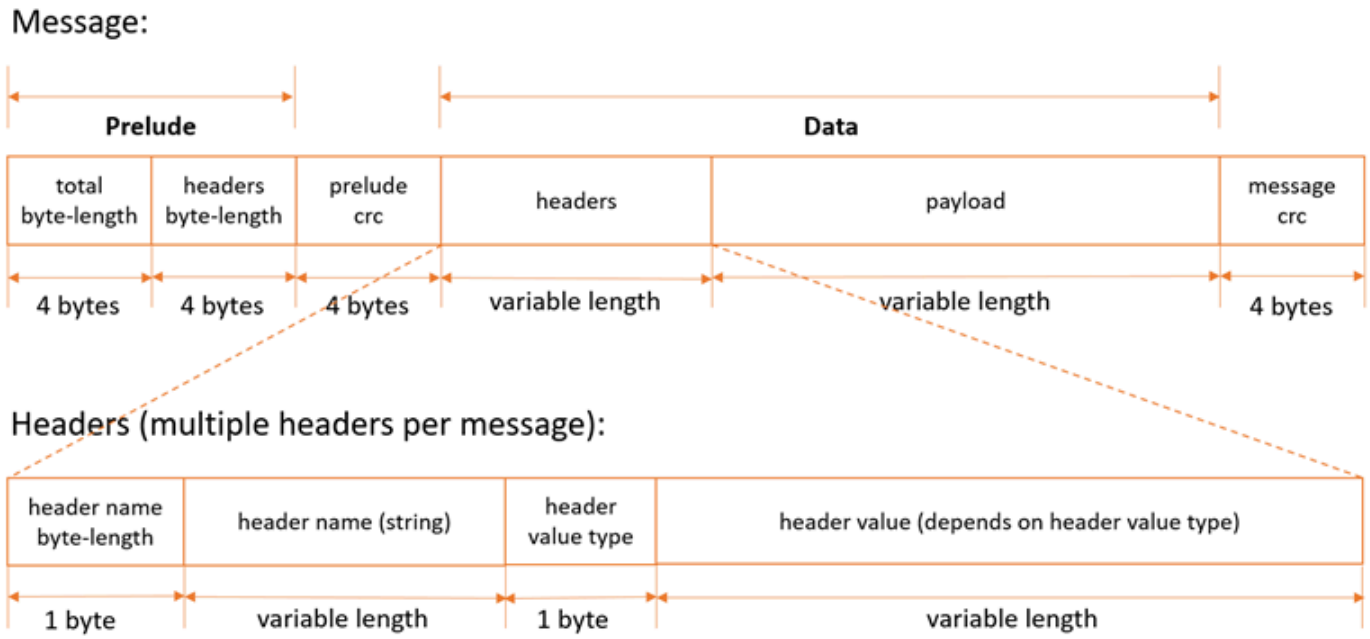
Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers.

Response Body

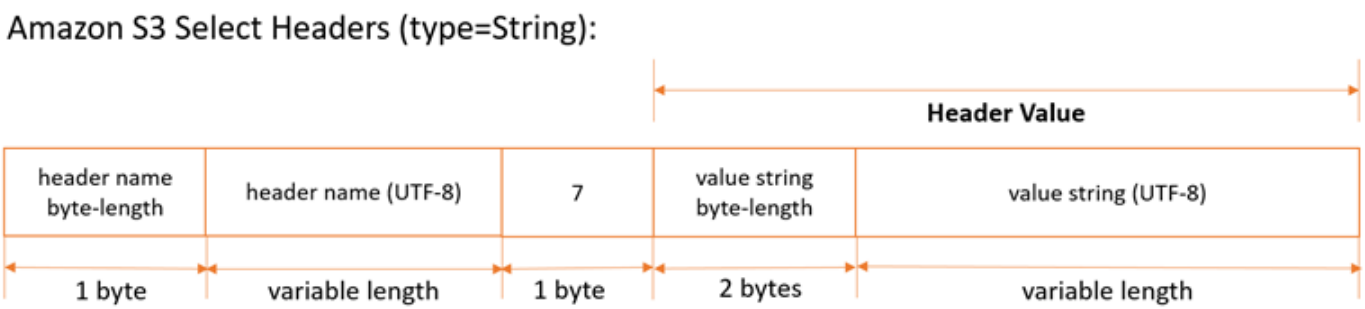
Since the Amazon S3 Select response size is unknown, Amazon S3 streams the response as a series of messages and includes a `Transfer-Encoding` header with **chunked** as its value in the response. The following example shows the response format at the top level:

```
<Message 1>
<Message 2>
<Message 3>
......
<Message n>
```



Each message consists of two sections: the prelude and the data. The prelude section consists of 1) the total byte-length of the message, and 2) the combined byte-length of all the headers. The data section consists of 1) the headers, and 2) a payload.

Each section ends with a 4-byte big-endian integer checksum (CRC). Amazon S3 Select uses CRC32 (often referred to as GZIP CRC32) to calculate both CRCs. For more information about CRC32, see *GZIP file format specification version 4.3*.



Total message overhead including the prelude and both checksums is 16 bytes.

> **Note**
>
> All `integer` values within messages are in network byte order, or big-endian order.

The following diagram shows the components that make up a message and a header. Note that there are multiple headers per message.

> **Note**
>
> For Amazon S3 Select, the header value type is always 7 (type=String). For this type, the header value consists of two components, a 2-byte big-endian integer length, and a UTF-8 string that is of that byte-length. The following diagram shows the components that make up Amazon S3 Select headers.

Payload byte-length calculations (these two calculations are equivalent):

- payload_length = total_length - header_length - sizeOf(total_length) - sizeOf(header_length) - sizeOf(prelude_crc) - sizeOf(message_crc)
- payload_length = total_length - header_length - 16

Each message contains the following components:

- **Prelude**: Always fixed size of 8 bytes (two fields of 4 bytes each):
  - *First four bytes*: Total byte-length: Big-endian integer byte-length of the entire message (including the 4-byte total length field itself).
  - *Second four bytes*: Headers byte-length: Big-endian integer byte-length of the headers portion of the message (excluding the headers length field itself).
- **Prelude CRC**: 4-byte big-endian integer checksum (CRC) for the prelude portion of the message (excluding the CRC itself). The prelude has a separate CRC from the message CRC (see below), to ensure that corrupted byte-length information can be detected immediately, without causing pathological buffering behavior.
- **Headers**: A set of metadata annotating the message, such as the message type, payload format, and so on. Messages can have multiple headers, so this portion of the message can have different byte-lengths depending on the message type. Headers are key-value pairs, where both the key and value are UTF-8 strings. Headers can appear in any order within the headers portion of the message, and any given header type can only appear once.

  For Amazon S3 Select, following is a list of header names and the set of valid values depending on the message type.

  - *MessageType Header*:

    - HeaderName => ":message-type"
    - Valid HeaderValues => "error", "event"
  - *EventType Header*:
    - HeaderName => ":event-type"
    - Valid HeaderValues => "Records", "Cont", "Progress", "Stats", "End"
  - *ErrorCode Header*:
    - HeaderName => ":error-code"
    - Valid HeaderValues => Error Code from the table in the List of SELECT Object Content Error Codes section.
  - *ErrorMessage Header*:
    - HeaderName => ":error-message"
    - Valid HeaderValues => Error message returned by the service, to help diagnose request-level errors.
- **Payload**: Can be anything.
- **Message CRC**: 4-byte big-endian integer checksum (CRC) from the start of the message to the start of the checksum (that is, everything in the message excluding the message CRC itself).

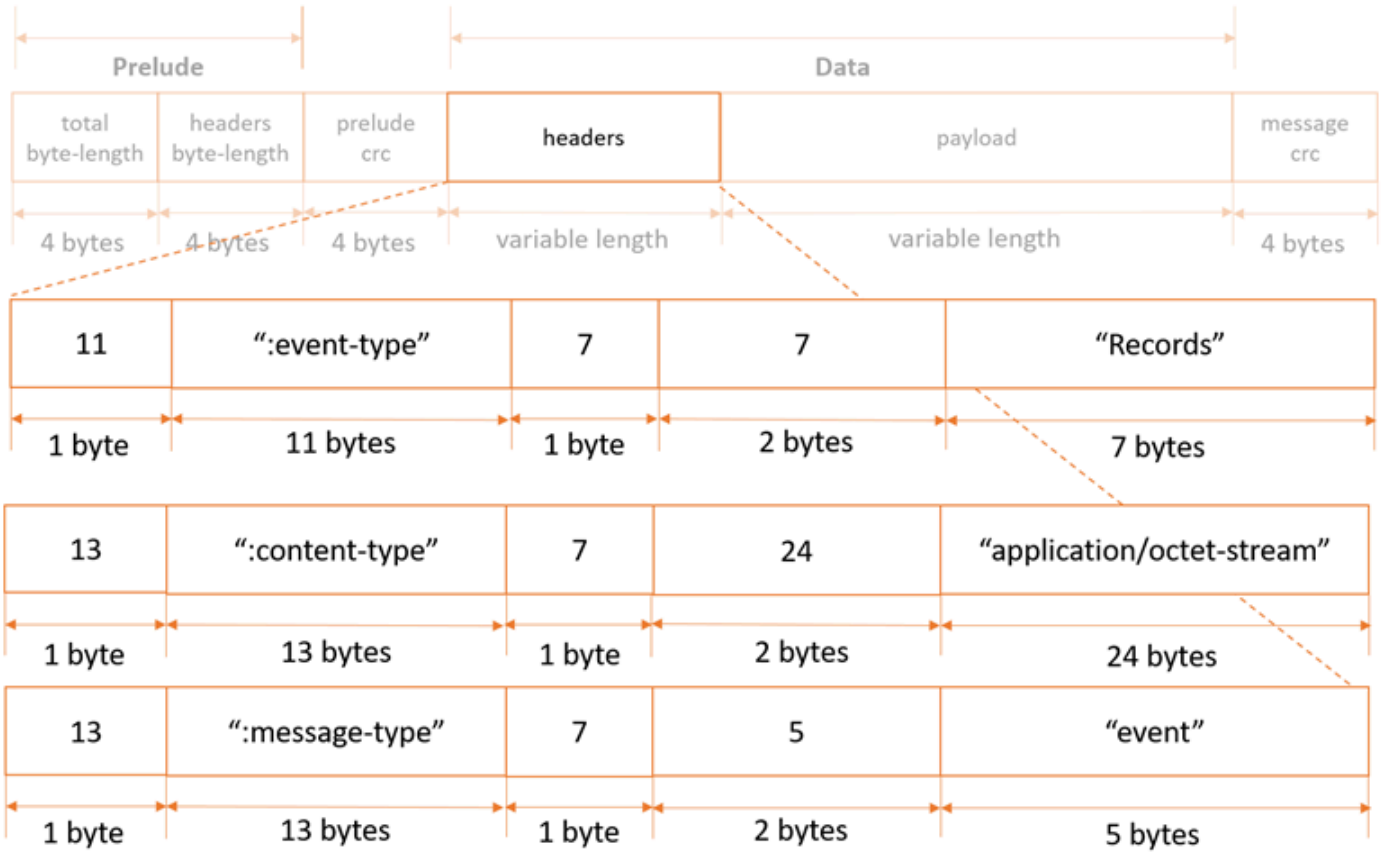
Each header contains the following components. There can be multiple headers per message.

- **Header Name Byte-Length**: Byte-length of the header name.
- **Header Name**: Name of the header, indicating the header type. Valid values: ":message-type" ":event-type" ":error-code" ":error-message"
- **Header Value Type**: Enum indicating the header value type. For Amazon S3 Select, this is always 7.
- **Value String Byte-Length**: (For Amazon S3 Select) Byte-length of the header value string.
- **Header Value String**: (For Amazon S3 Select) Value of the header string. Valid values for this field vary based on the type of the header. See the sections below for valid values for each header type and message type.

For Amazon S3 Select, responses can be messages of the following types:

- **Records message**: Can contain a single record, partial records, or multiple records. Depending on the size of the result, a response can contain one or more of these messages.

- **Continuation message**: Amazon S3 periodically sends this message to keep the TCP connection open. These messages appear in responses at random. The client must detect the message type and process accordingly.
- **Progress message**: Amazon S3 periodically sends this message, if requested. It contains information about the progress of a query that has started but has not yet completed.
- **Stats message**: Amazon S3 sends this message at the end of the request. It contains statistics about the query.
- **End message**: Indicates that the request is complete, and no more messages will be sent. You should not assume that the request is complete until the client receives an End message.
- **RequestLevelError message**: Amazon S3 sends this message if the request failed for any reason. It contains the error code and error message for the failure. If Amazon S3 sends a `RequestLevelError` message, it doesn't send an End message.



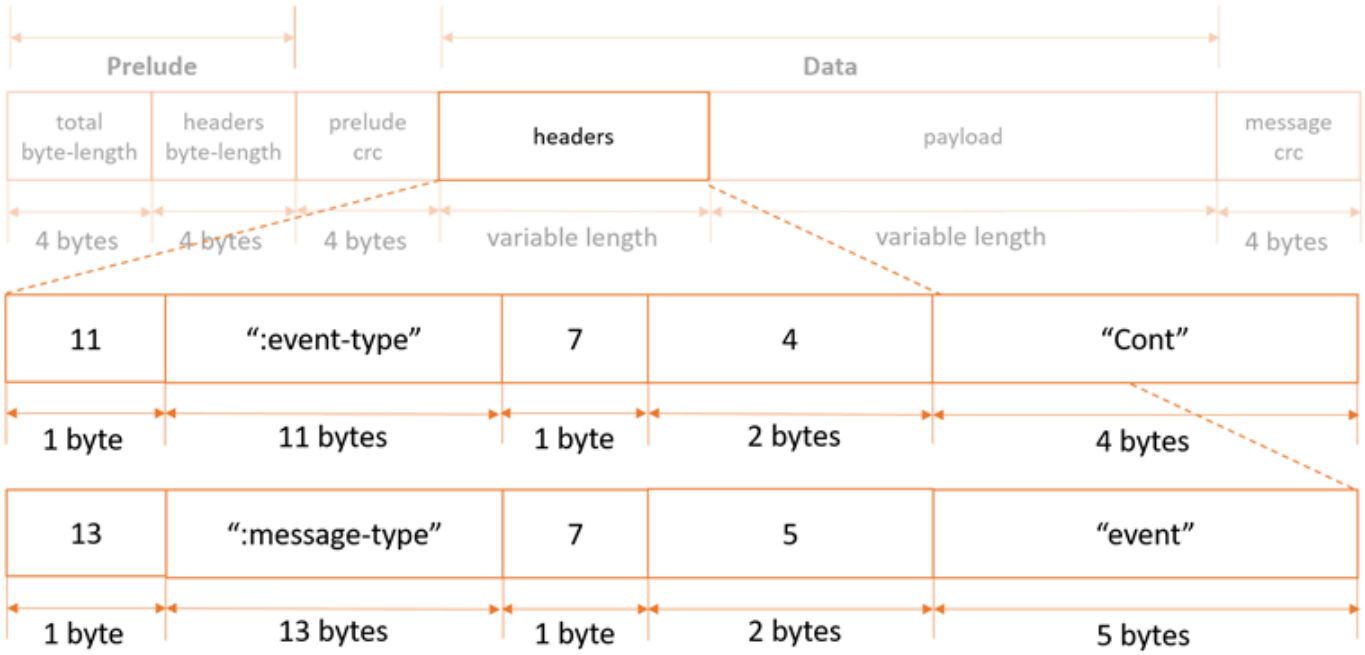
The following sections explain the structure of each message type in more detail.

For sample code and unit tests that use this protocol, see Amazon C Event Stream on the GitHub website.

Records Message

Header specification

Records messages contain three headers, as follows:



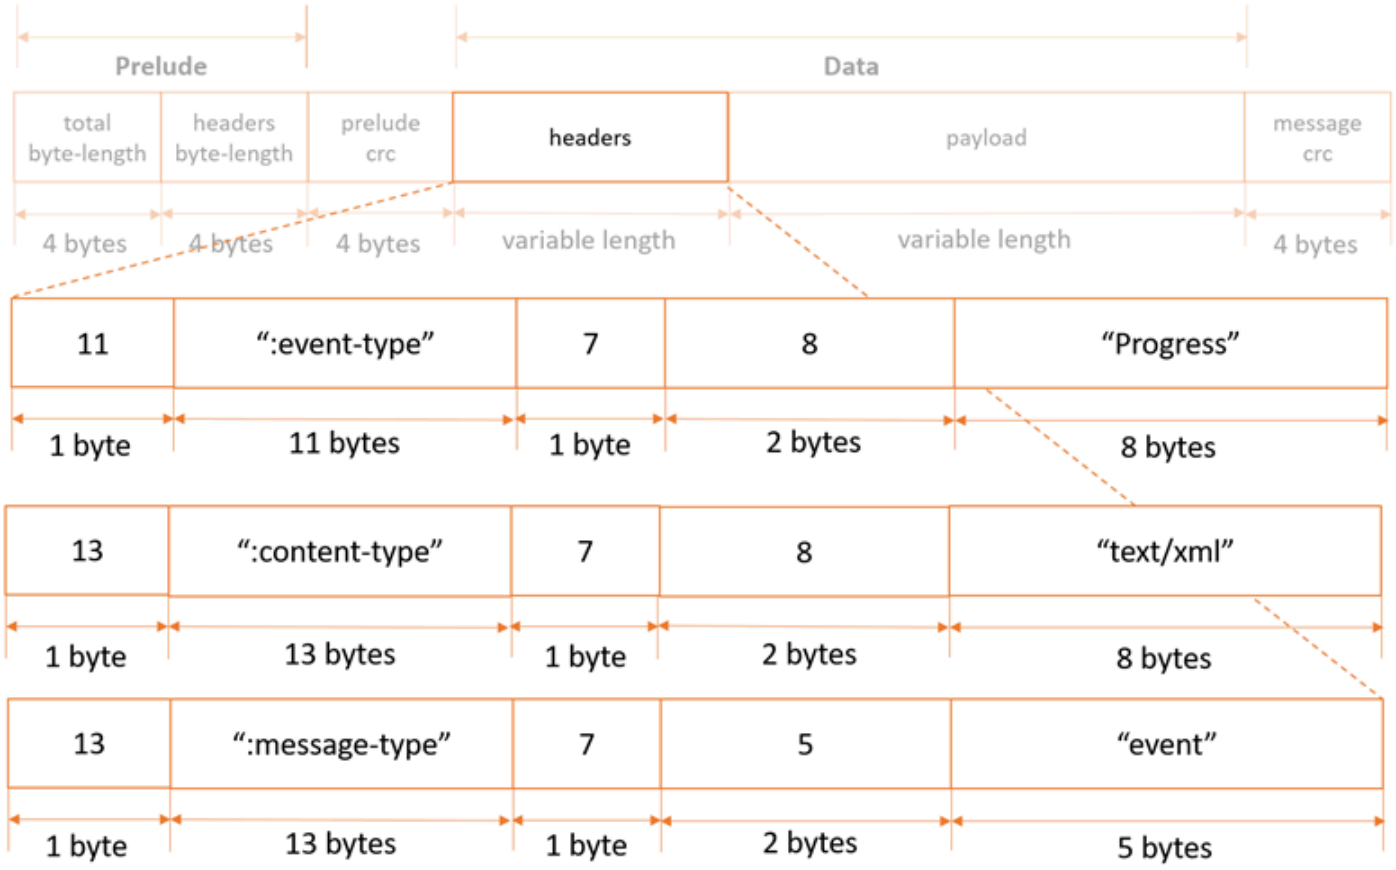
Payload specification

Records message payloads can contain a single record, partial records, or multiple records.

Continuation Message

Header specification

Continuation messages contain two headers, as follows:



Payload specification

Continuation messages have no payload.

Progress Message

Header specification

Progress messages contain three headers, as follows:

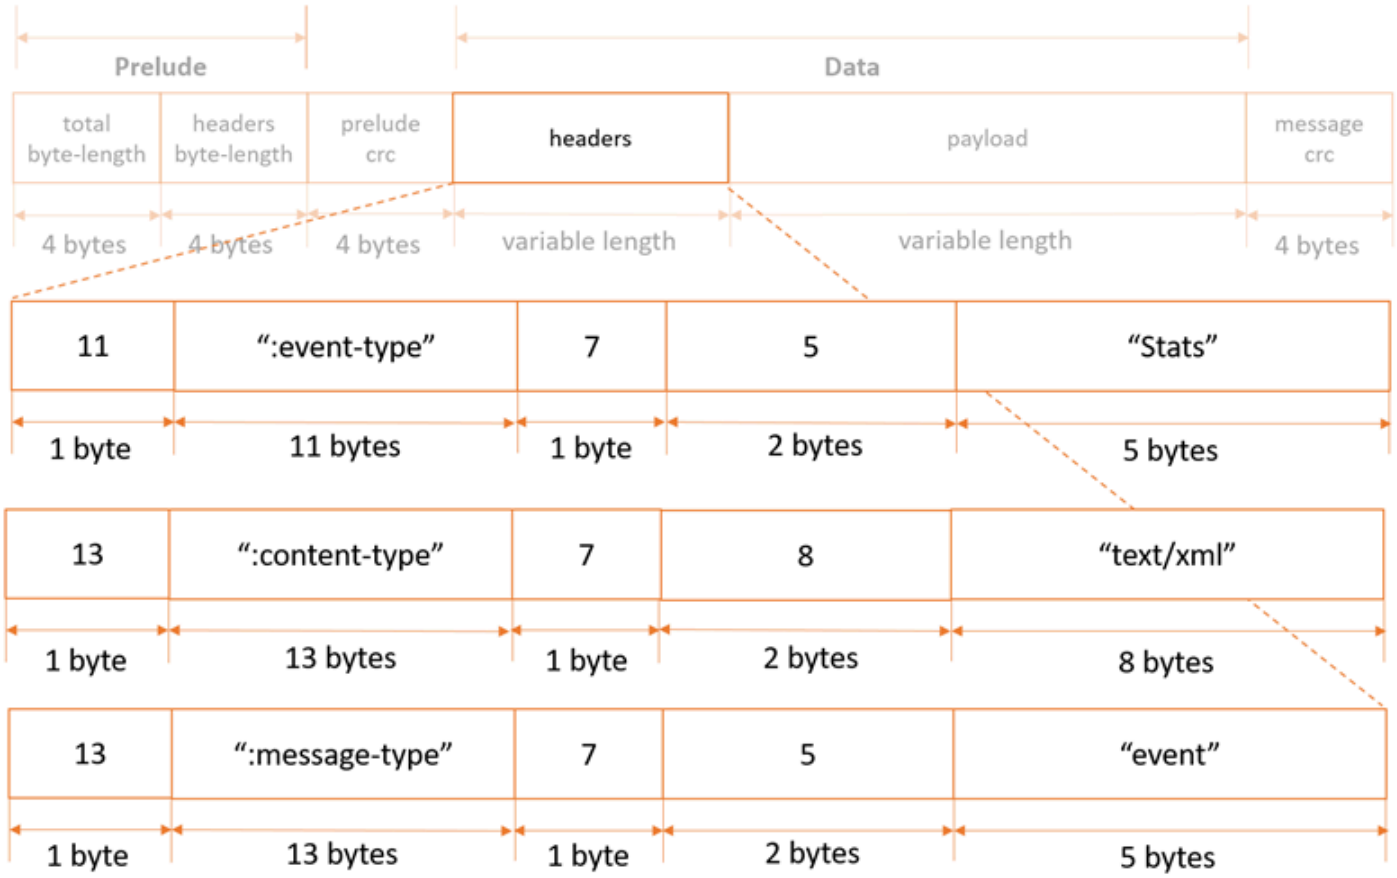
Payload specification

Progress message payload is an XML document containing information about the progress of a request.

- *BytesScanned* => Number of bytes that have been processed before being uncompressed (if the file is compressed).
- *BytesProcessed* => Number of bytes that have been processed after being uncompressed (if the file is compressed).
- *BytesReturned* => Current number of bytes of records payload data returned by Amazon S3.

For uncompressed files, `BytesScanned` and `BytesProcessed` are equal.

Example:



```
<?xml version="1.0" encoding="UTF-8"?>
```

```
<Progress>
      <BytesScanned>512</BytesScanned>
      <BytesProcessed>1024</BytesProcessed>
      <BytesReturned>1024</BytesReturned>
</Progress>
```

Stats Message

Header specification

Stats messages contain three headers, as follows:

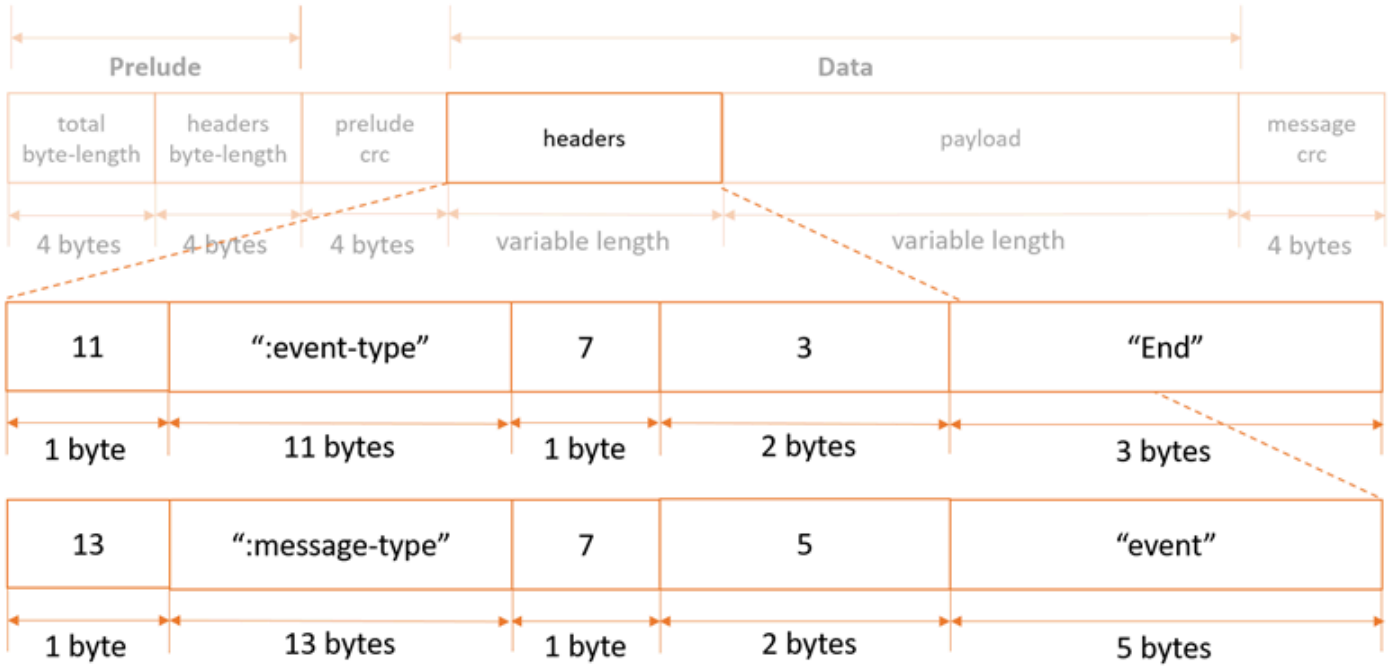
Payload specification

Stats message payload is an XML document containing information about a request's stats when processing is complete.

- *BytesScanned* => Number of bytes that have been processed before being uncompressed (if the file is compressed).

- *BytesProcessed* => Number of bytes that have been processed after being uncompressed (if the file is compressed).
- *BytesReturned* => Total number of bytes of records payload data returned by Amazon S3.

For uncompressed files, `BytesScanned` and `BytesProcessed` are equal.



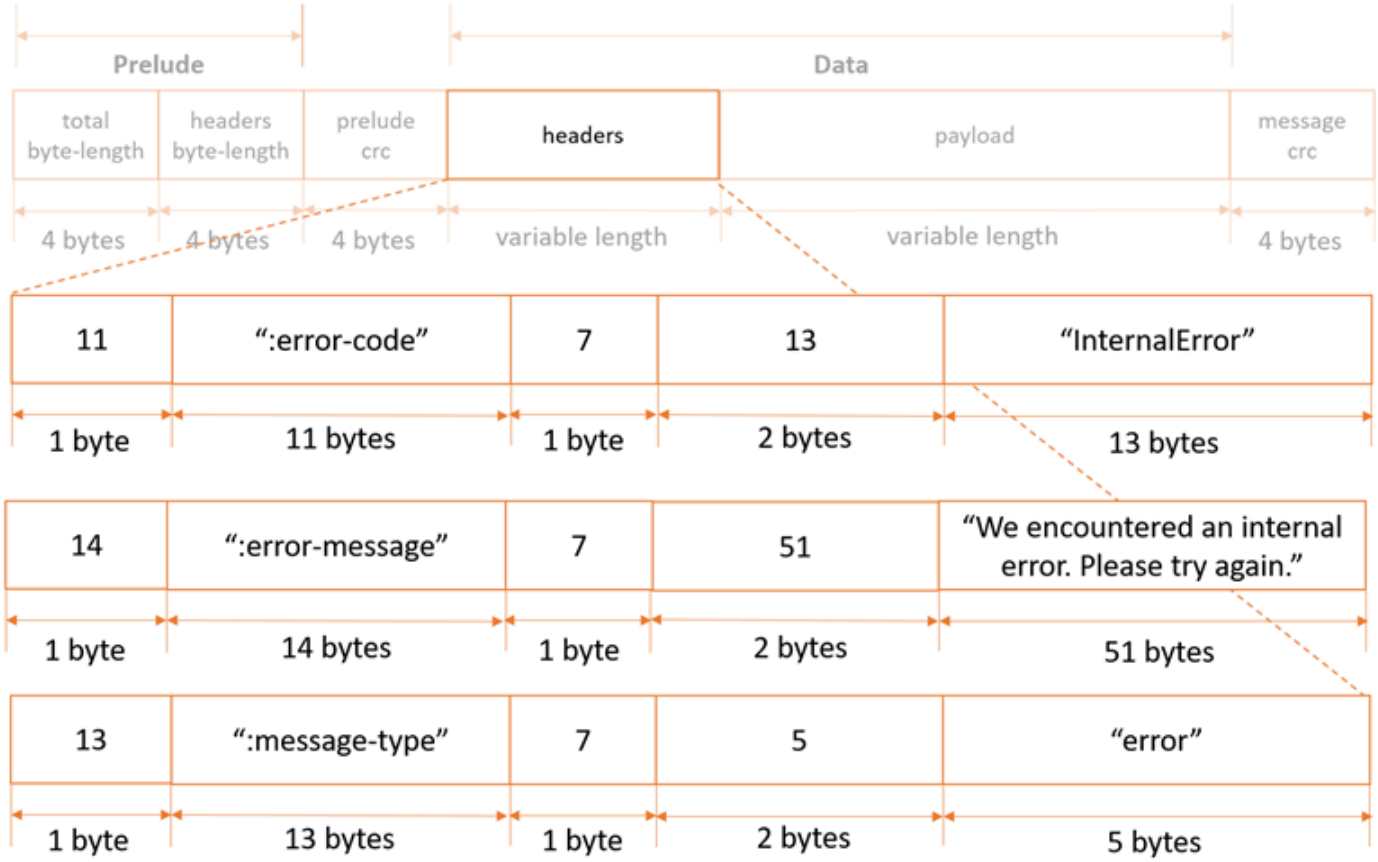
Example:

```
<?xml version="1.0" encoding="UTF-8"?>
<Stats>
     <BytesScanned>512</BytesScanned>
     <BytesProcessed>1024</BytesProcessed>
     <BytesReturned>1024</BytesReturned>
</Stats>
```

End Message

Header specification

End messages contain two headers, as follows:



Payload specification

End messages have no payload.

Request Level Error Message

Header specification

Request-level error messages contain three headers, as follows:

For a list of possible error codes and error messages, see the List of SELECT Object Content Error Codes.

Payload specification

Request-level error messages have no payload.

Appendix: OPTIONS object

Description

A browser can send this preflight request to Amazon S3 to determine if it can send an actual request with the specific origin, HTTP method, and headers.

Amazon S3 supports cross-origin resource sharing (CORS) by enabling you to add a `cors` subresource on a bucket. When a browser sends this preflight request, Amazon S3 responds by evaluating the rules that are defined in the `cors` configuration.

If `cors` is not enabled on the bucket, then Amazon S3 returns a `403 Forbidden` response.

For more information about CORS, go to Enabling Cross-Origin Resource Sharing in the *Amazon Simple Storage Service User Guide*.

Requests

Syntax

```
OPTIONS /ObjectName HTTP/1.1
Host: BucketName.s3.amazonaws.com
Origin: Origin
Access-Control-Request-Method: HTTPMethod
Access-Control-Request-Headers: RequestHeader
```

Request Parameters

This operation does not introduce any specific request parameters, but it may contain any request parameters that are required by the actual request.

Request Headers

Name	Description	Required
`Origin`	Identifies the origin of the cross-origin request to Amazon S3. For example, http://www.example.com. Type: String	Yes

Name	Description	Required
	Default: None	
`Access-Control-Request-Method`	Identifies what HTTP method will be used in the actual request. Type: String Default: None	Yes
`Access-Control-Request-Headers`	A comma-delimited list of HTTP headers that will be sent in the actual request. For example, to put an object with server-side encryption, this preflight request will determine if it can include the `x-amz-server-side-encryption` header with the request. Type: String Default: None	No

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

Header	Description
`Access-Control-Allow-Origin`	The origin you sent in your request. If the origin in your request is not allowed, Amazon S3 will not include this header in the response.

Header	Description
	Type: String
`Access-Control-Max-Age`	How long, in seconds, the results of the preflight request can be cached. Type: String
`Access-Control-Allow-Methods`	The HTTP method that was sent in the original request. If the method in the request is not allowed, Amazon S3 will not include this header in the response. Type: String
`Access-Control-Allow-Headers`	A comma-delimited list of HTTP headers that the browser can send in the actual request. If any of the requested headers is not allowed, Amazon S3 will not include that header in the response, nor will the response contain any of the headers with the `Access-Control` prefix. Type: String
`Access-Control-Expose-Headers`	A comma-delimited list of HTTP headers. This header provides the JavaScript client with access to these headers in the response to the actual request. Type: String

Response Elements

This implementation of the operation does not return response elements.

Examples

Example : Send a preflight OPTIONS request to a `cors` enabled bucket

A browser can send this preflight request to Amazon S3 to determine if it can send the actual PUT request from http://www.example.com origin to the Amazon S3 bucket named `examplebucket`.

Sample Request

```
OPTIONS /exampleobject HTTP/1.1
Host: examplebucket.s3.amazonaws.com
Origin: http://www.example.com
Access-Control-Request-Method: PUT
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: 6SvaESv3VULYPLik5LLl7lSPPtSnBvDdGmnklX1HfUl7uS2m1DF6td6KWKNjYMXZ
x-amz-request-id: BDC4B83DF5096BBE
Date: Wed, 21 Aug 2012 23:09:55 GMT
Etag: "1f1a1af1f1111111111111c11aed1da1"
Access-Control-Allow-Origin: http://www.example.com
Access-Control-Allow-Methods: PUT
Access-Control-Expose-Headers: x-amz-request-id
Content-Length: 0
Server: AmazonS3
```

Appendix: SOAP API

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

This section describes the SOAP API with respect to service, bucket, and object operations. Note that SOAP requests, both authenticated and anonymous, must be sent to Amazon S3 using SSL. Amazon S3 returns an error when you send a SOAP request over HTTP.

The latest Amazon S3 WSDL is available at docs.amazonaws.cn/2006-03-01/AmazonS3.wsdl.

Topics

- Operations on the Service (SOAP API)
- Operations on Buckets (SOAP API)
- Operations on Objects (SOAP API)
- Authenticating SOAP requests
- Setting access policy with SOAP
- Common elements
- SOAP Error Responses

Operations on the Service (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

This section describes operations you can perform on the Amazon S3 service.

Topics

- ListAllMyBuckets (SOAP API)

ListAllMyBuckets (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

The `ListAllMyBuckets` operation returns a list of all buckets owned by the sender of the request.

Example

`Sample Request`

```
<ListAllMyBuckets xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</ListAllMyBuckets>
```

`Sample Response`

```
<ListAllMyBucketsResult xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <Owner>
    <ID>bcaf1ffd86f41161ca5fb16fd081034f</ID>
    <DisplayName>webfile</DisplayName>
  </Owner>
  <Buckets>
    <Bucket>
      <Name>quotes;/Name>
      <CreationDate>2006-02-03T16:45:09.000Z</CreationDate>
    </Bucket>
    <Bucket>
      <Name>samples</Name>
      <CreationDate>2006-02-03T16:41:58.000Z</CreationDate>
    </Bucket>
```

```
 </Buckets>
</ListAllMyBucketsResult>
```

Response Body

- `Owner:`

  This provides information that Amazon S3 uses to represent your identity for purposes of authentication and access control. ID is a unique and permanent identifier for the developer who made the request. DisplayName is a human-readable name representing the developer who made the request. It is not unique, and might change over time.We recommend that you match your DisplayName to your Forum name.

- `Name:`

  The name of a bucket. Note that if one of your buckets was recently deleted, the name of the deleted bucket might still be present in this list for a period of time.

- `CreationDate:`

  The time that the bucket was created.

Access Control

You must authenticate with a valid Amazon Access Key ID. Anonymous requests are never allowed to list buckets, and you can only list buckets for which you are the owner.

Operations on Buckets (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

This section describes operations you can perform on Amazon S3 buckets.

Topics

- CreateBucket (SOAP API)

- DeleteBucket (SOAP API)
- ListBucket (SOAP API)
- GetBucketAccessControlPolicy (SOAP API)
- SetBucketAccessControlPolicy (SOAP API)
- GetBucketLoggingStatus (SOAP API)
- SetBucketLoggingStatus (SOAP API)

CreateBucket (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

The `CreateBucket` operation creates a bucket. Not every string is an acceptable bucket name. For information on bucket naming restrictions, see Working with Amazon S3 Buckets .

> **Note**
>
> To determine whether a bucket name exists, use `ListBucket` and set `MaxKeys` to 0. A NoSuchBucket response indicates that the bucket is available, an AccessDenied response indicates that someone else owns the bucket, and a Success response indicates that you own the bucket or have permission to access it.

Example Create a bucket named "quotes"

`Sample Request`

```
<CreateBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
```

```
</CreateBucket>
```

Sample Response

```
<CreateBucketResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <CreateBucketResponse>
    <Bucket>quotes</Bucket>
  </CreateBucketResponse>
</CreateBucketResponse>
```

Elements

- `Bucket:` The name of the bucket you are trying to create.
- `AccessControlList:` The access control list for the new bucket. This element is optional. If not provided, the bucket is created with an access policy that give the requester FULL_CONTROL access.

Access Control

You must authenticate with a valid Amazon Access Key ID. Anonymous requests are never allowed to create buckets.

Related Resources

- ListBucket (SOAP API)

DeleteBucket (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

The `DeleteBucket` operation deletes a bucket. All objects in the bucket must be deleted before the bucket itself can be deleted.

Example

This example deletes the "quotes" bucket.

`Sample Request`

```
<DeleteBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <AWSAccessKeyId> AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</DeleteBucket>
```

`Sample Response`

```
<DeleteBucketResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <DeleteBucketResponse>
    <Code>204</Code>
    <Description>No Content</Description>
  </DeleteBucketResponse>
</DeleteBucketResponse>
```

Elements

- `Bucket:` The name of the bucket you want to delete.

Access Control

Only the owner of a bucket is allowed to delete it, regardless the access control policy on the bucket.

ListBucket (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

The `ListBucket` operation returns information about some of the items in the bucket.

For a general introduction to the list operation, see the Listing Object Keys.

Requests

This example lists up to 1000 keys in the "quotes" bucket that have the prefix "notes."

Syntax

```
<ListBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Prefix>notes/</Prefix>
  <Delimiter>/</Delimiter>
  <MaxKeys>1000</MaxKeys>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</ListBucket>
```

Parameters

Name	Description	Required
prefix	Limits the response to keys which begin with the indicated prefix. You can use prefixes to separate a bucket into different sets of keys in a way similar to how a file system uses folders. **Important** Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints. Type: String Default: None	No
marker	Indicates where in the bucket to begin listing. The list will only include keys that occur lexicographically after marker. This is	No

Name	Description	Required
	convenient for pagination: To get the next page of results use the last key of the current page as the marker. Type: String Default: None	
`max-keys`	The maximum number of keys you'd like to see in the response body. The server might return fewer than this many keys, but will not return more. Type: String Default: None	No
`delimiter`	Causes keys that contain the same string between the prefix and the first occurrence of the delimiter to be rolled up into a single result element in the CommonPrefixes collection. These rolled-up keys are not returned elsewhere in the response. Type: String Default: None	No

Success Response

This response assumes the bucket contains the following keys:

```
notes/todos.txt
notes/2005-05-23/customer_mtg_notes.txt
notes/2005-05-23/phone_notes.txt
notes/2005-05-28/sales_notes.txt
```

Syntax

```
<?xml version="1.0" encoding="UTF-8"?>
<ListBucketResult xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
  <Name>backups</Name>
  <Prefix>notes/</Prefix>
```

```
  <MaxKeys>1000</MaxKeys>
  <Delimiter>/</Delimiter>
  <IsTruncated>false</IsTruncated>
  <Contents>
    <Key>notes/todos.txt</Key>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    <ETag>&amp;quot;828ef3fdfa96f00ad9f27c383fc9ac7f&amp;quot;</ETag>
    <Size>5126</Size>
    <StorageClass>STANDARD</StorageClass>
    <Owner>
      <ID>75aa57f09aa0c8caeab4f8c24e99d10f8e7faeebf76c078efc7c6caea54ba06a</ID>
      <DisplayName>webfile</DisplayName>
    </Owner>
    <StorageClass>STANDARD</StorageClass>
  </Contents>
  <CommonPrefixes>
    <Prefix>notes/2005-05-23/</Prefix>
  </CommonPrefixes>
  <CommonPrefixes>
    <Prefix>notes/2005-05-28/</Prefix>
  </CommonPrefixes>
  </ListBucketResult>
```

As you can see, many of the fields in the response echo the request parameters. `IsTruncated`, `Contents`, and `CommonPrefixes` are the only response elements that can contain new information.

Response Elements

Name	Description
`Contents`	Metadata about each object returned. Type: XML metadata Ancestor: ListBucketResult
`CommonPrefixes`	A response can contain `CommonPrefixes` only if you specify a `delimiter`. When you do, `CommonPrefixes` contains all (if there are any) keys between `Prefix` and the next occurrence of the string specified by `delimiter`. In effect, `CommonPrefixes` lists keys that act like subdirectories in the directory specified by `Prefix`. For example, if `prefix` is

Name	Description
	notes/ and delimiter is a slash (/), in notes/summer/july , the common prefix is notes/summer/ . Type: String Ancestor: ListBucketResult
Delimiter	Causes keys that contain the same string between the prefix and the first occurrence of the delimiter to be rolled up into a single result element in the CommonPrefixes collection. These rolled-up keys are not returned elsewhere in the response. Type: String Ancestor: ListBucketResult
IsTruncated	Specifies whether (true) or not (false) all of the results were returned. All of the results may not be returned if the number of results exceeds that specified by MaxKeys. Type: String Ancestor: boolean
Marker	Indicates where in the bucket to begin listing. Type: String Ancestor: ListBucketResult
MaxKeys	The maximum number of keys returned in the response body. Type: String Ancestor: ListBucketResult

Name	Description
Name	Name of the bucket. Type: String Ancestor: ListBucketResult
Prefix	Keys that begin with the indicated prefix. Type: String Ancestor: ListBucketResult

Response Body

For information about the list response, see Listing Keys Response.

Access Control

To list the keys of a bucket you need to have been granted READ access on the bucket.

GetBucketAccessControlPolicy (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

The GetBucketAccessControlPolicy operation fetches the access control policy for a bucket.

Example

This example retrieves the access control policy for the "quotes" bucket.

Sample Request

```
<GetBucketAccessControlPolicy xmlns="http://doc.s3.amazonaws.com/2006-03-01">
```

```
  <Bucket>quotes</Bucket>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetBucketAccessControlPolicy>
```

Sample Response

```
<AccessControlPolicy>
  <Owner>
    <ID>a9a7b886d6fd2441bf9b1c61be666e9</ID>
    <DisplayName>chriscustomer</DisplayName>
  </Owner>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b886d6f41bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
    <Grant>
      <Grantee xsi:type="Group">
        <URI>http://acs.amazonaws.com/groups/global/AllUsers<URI>
      </Grantee>
      <Permission>READ</Permission>
    </Grant>
  </AccessControlList>
<AccessControlPolicy>
```

Response Body

The response contains the access control policy for the bucket. For an explanation of this response, see SOAP Access Policy .

Access Control

You must have READ_ACP rights to the bucket in order to retrieve the access control policy for a bucket.

SetBucketAccessControlPolicy (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

The `SetBucketAccessControlPolicy` operation sets the Access Control Policy for an existing bucket. If successful, the previous Access Control Policy for the bucket is entirely replaced with the specified Access Control Policy.

Example

Give the specified user (usually the owner) `FULL_CONTROL` access to the "quotes" bucket.

`Sample Request`

```
<SetBucketAccessControlPolicy xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b8863000e241bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
  </AccessControlList>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</SetBucketAccessControlPolicy >
```

`Sample Response`

```
<GetBucketAccessControlPolicyResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <GetBucketAccessControlPolicyResponse>
    <Code>200</Code>
```

```
    <Description>OK</Description>
  </GetBucketAccessControlPolicyResponse>
</GetBucketAccessControlPolicyResponse>
```

Access Control

You must have WRITE_ACP rights to the bucket in order to set the access control policy for a bucket.

GetBucketLoggingStatus (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

The GetBucketLoggingStatus retrieves the logging status for an existing bucket.

For a general introduction to this feature, see Server Logs.

Example

Sample Request

```
<?xml version="1.0" encoding="utf-8"?>
    <soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="http://
www.w3.org/2001/XMLSchema">
      <soap:Body>
        <GetBucketLoggingStatus xmlns="http://doc.s3.amazonaws.com/2006-03-01">
          <Bucket>mybucket</Bucket>
          <AWSAccessKeyId>YOUR_AWS_ACCESS_KEY_ID</AWSAccessKeyId>
          <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
          <Signature>YOUR_SIGNATURE_HERE</Signature>
        </GetBucketLoggingStatus>
      </soap:Body>
    </soap:Envelope>
```

Sample Response

```
<?xml version="1.0" encoding="utf-8"?>
    <soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
 xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xsi="http://www.w3.org/2001/
XMLSchema-instance" >
      <soapenv:Header>
      </soapenv:Header>
      <soapenv:Body>
        <GetBucketLoggingStatusResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
          <GetBucketLoggingStatusResponse>
            <LoggingEnabled>
              <TargetBucket>mylogs</TargetBucket>
              <TargetPrefix>mybucket-access_log-</TargetPrefix>
            </LoggingEnabled>
          </GetBucketLoggingStatusResponse>
        </GetBucketLoggingStatusResponse>
      </soapenv:Body>
    </soapenv:Envelope>
```

Access Control

Only the owner of a bucket is permitted to invoke this operation.

SetBucketLoggingStatus (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

The `SetBucketLoggingStatus` operation updates the logging status for an existing bucket.

For a general introduction to this feature, see Server Logs.

Example

This sample request enables server access logging for the 'mybucket' bucket, and configures the logs to be delivered to 'mylogs' under prefix 'access_log-'

Sample Request

```
<?xml version="1.0" encoding="utf-8"?>
    <soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="http://
www.w3.org/2001/XMLSchema">
    <soap:Body>
    <SetBucketLoggingStatus xmlns="http://doc.s3.amazonaws.com/2006-03-01">
      <Bucket>myBucket</Bucket>
      <AWSAccessKeyId>YOUR_AWS_ACCESS_KEY_ID</AWSAccessKeyId>
      <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
      <Signature>YOUR_SIGNATURE_HERE</Signature>
      <BucketLoggingStatus>
        <LoggingEnabled>
          <TargetBucket>mylogs</TargetBucket>
          <TargetPrefix>mybucket-access_log-</TargetPrefix>
        </LoggingEnabled>
      </BucketLoggingStatus>
    </SetBucketLoggingStatus>
    </soap:Body>
    :</soap:Envelope>
```

Sample Response

```
<?xml version="1.0" encoding="utf-8"?>
    <soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
 xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xsi="http://www.w3.org/2001/
XMLSchema-instance" >
      <soapenv:Header>
      </soapenv:Header>
      <soapenv:Body>
        <SetBucketLoggingStatusResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01"/
>
      </soapenv:Body>
    </soapenv:Envelope>
```

Access Control

Only the owner of a bucket is permitted to invoke this operation.

Operations on Objects (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

This section describes operations you can perform on Amazon S3 objects.

Topics

- PutObjectInline (SOAP API)
- PutObject (SOAP API)
- CopyObject (SOAP API)
- GetObject (SOAP API)
- GetObjectExtended (SOAP API)
- DeleteObject (SOAP API)
- GetObjectAccessControlPolicy (SOAP API)
- SetObjectAccessControlPolicy (SOAP API)

PutObjectInline (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

The `PutObjectInline` operation adds an object to a bucket. The data for the object is provided in the body of the SOAP message.

If an object already exists in a bucket, the new object will overwrite it because Amazon S3 stores the last write request. However, Amazon S3 is a distributed system. If Amazon S3 receives multiple

write requests for the same object nearly simultaneously, all of the objects might be stored, even though only one wins in the end. Amazon S3 does not provide object locking; if you need this, make sure to build it into your application layer.

To ensure an object is not corrupted over the network, you can calculate the MD5 of an object, PUT it to Amazon S3, and compare the returned Etag to the calculated MD5 value.

PutObjectInline is not suitable for use with large objects. The system limits this operation to working with objects 1MB or smaller. PutObjectInline will fail with the `InlineDataTooLargeError` status code if the Data parameter encodes an object larger than 1MB. To upload large objects, consider using the non-inline PutObject API, or the REST API instead.

Example

This example writes some text and metadata into the "Nelson" object in the "quotes" bucket, give a user (usually the owner) `FULL_CONTROL` access to the object, and make the object readable by anonymous parties.

`Sample Request`

```
<PutObjectInline xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <Metadata>
    <Name>Content-Type</Name>
    <Value>text/plain</Value>
  </Metadata>
  <Metadata>
    <Name>family</Name>
    <Value>Muntz</Value>
  </Metadata>
  <Data>aGEtaGE=</Data>
  <ContentLength>5</ContentLength>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b886d6fde241bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
    <Grant>
```

```
      <Grantee xsi:type="Group">
        <URI>http://acs.amazonaws.com/groups/global/AllUsers</URI>
      </Grantee>
      <Permission>READ</Permission>
    </Grant>
  </AccessControlList>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</PutObjectInline>
```

Sample Response

```
<PutObjectInlineResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <PutObjectInlineResponse>
    <ETag>&quot828ef3fdfa96f00ad9f27c383fc9ac7f&quot</ETag>
    <LastModified>2006-01-01T12:00:00.000Z</lastModified>
  </PutObjectInlineResponse>
</PutObjectInlineResponse>
```

Elements

- `Bucket:` The bucket in which to add the object.
- `Key:` The key to assign to the object.

> **Important**
>
> Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints.

- `Metadata:` You can provide name-value metadata pairs in the metadata element. These will be stored with the object.
- `Data:` The base 64 encoded form of the data.
- `ContentLength:` The length of the data in bytes.

- `AccessControlList:` An Access Control List for the resource. This element is optional. If omitted, the requester is given `FULL_CONTROL` access to the object. If the object already exists, the preexisting access control policy is replaced.

Responses

- `ETag:` The entity tag is an MD5 hash of the object that you can use to do conditional fetches of the object using `GetObjectExtended`. The ETag only reflects changes to the contents of an object, not its metadata.
- `LastModified:` The Amazon S3 timestamp for the saved object.

Access Control

You must have `WRITE` access to the bucket in order to put objects into the bucket.

PutObject (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

The `PutObject` operation adds an object to a bucket. The data for the object is attached as a DIME attachment.

To ensure an object is not corrupted over the network, you can calculate the MD5 of an object, PUT it to Amazon S3, and compare the returned Etag to the calculated MD5 value.

If an object already exists in a bucket, the new object will overwrite it because Amazon S3 stores the last write request. However, Amazon S3 is a distributed system. If Amazon S3 receives multiple

write requests for the same object nearly simultaneously, all of the objects might be stored, even though only one wins in the end. Amazon S3 does not provide object locking; if you need this, make sure to build it into your application layer.

Example

This example puts some data and metadata in the "Nelson" object of the "quotes" bucket, give a user (usually the owner) FULL_CONTROL access to the object, and make the object readable by anonymous parties. In this sample, the actual attachment is not shown.

Sample Request

```
<PutObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <Metadata>
    <Name>Content-Type</Name>
    <Value>text/plain</Value>
  </Metadata>
  <Metadata>
    <Name>family</Name>
    <Value>Muntz</Value>
  </Metadata>
  <ContentLength>5</ContentLength>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b886d6241bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
    <Grant>
      <Grantee xsi:type="Group">
        <URI>http://acs.amazonaws.com/groups/global/AllUsers<URI>
      </Grantee>
      <Permission>READ</Permission>
    </Grant>
  </AccessControlList>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2007-05-11T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</PutObject>
```

Sample Response

```
<PutObjectResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <PutObjectResponse>
    <ETag>&amp;quot;828ef3fdfa96f00ad9f27c383fc9ac7f&amp;quot;</ETag>
    <LastModified>2006-03-01T12:00:00.183Z</LastModified>
  </PutObjectResponse>
</PutObjectResponse>
```

Elements

- `Bucket:` The bucket in which to add the object.
- `Key:` The key to assign to the object.

> **Important**
>
> Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints.

- `Metadata:` You can provide name-value metadata pairs in the metadata element. These will be stored with the object.
- `ContentLength:` The length of the data in bytes.
- `AccessControlList:` An Access Control List for the resource. This element is optional. If omitted, the requester is given `FULL_CONTROL` access to the object. If the object already exists, the preexisting Access Control Policy is replaced.

- CopyObject (SOAP API)

CopyObject (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

Description

The `CopyObject` operation creates a copy of an object when you specify the key and bucket of a source object and the key and bucket of a target destination.

When copying an object, you can preserve all metadata (default) or specify new metadata. However, the ACL is not preserved and is set to `private` for the user making the request. To override the default ACL setting, specify a new ACL when generating a copy request. For more information, see Using ACLs.

All copy requests must be authenticated. Additionally, you must have *read* access to the source object and *write* access to the destination bucket. For more information, see Using Auth Access.

To only copy an object under certain conditions, such as whether the Etag matches or whether the object was modified before or after a specified date, use the request parameters `CopySourceIfUnmodifiedSince`, `CopyIfUnmodifiedSince`, `CopySourceIfMatch`, or `CopySourceIfNoneMatch`.

> **Note**
>
> You might need to configure the SOAP stack socket timeout for copying large objects.

Request Syntax

```
<CopyObject xmlns="http://bucket_name.s3.amazonaws.com/2006-03-01">
```

```
  <SourceBucket>source_bucket</SourceBucket>
  <SourceObject>source_object</SourceObject>
  <DestinationBucket>destination_bucket</DestinationBucket>
  <DestinationObject>destination_object</DestinationObject>
  <MetadataDirective>{REPLACE | COPY}</MetadataDirective>
  <Metadata>
    <Name>metadata_name</Name>
    <Value>metadata_value</Value>
  </Metadata>
  ...
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="user_type">
        <ID>user_id</ID>
        <DisplayName>display_name</DisplayName>
      </Grantee>
      <Permission>permission</Permission>
    </Grant>
    ...
  </AccessControlList>
  <CopySourceIfMatch>etag</CopySourceIfMatch>
  <CopySourceIfNoneMatch>etag</CopySourceIfNoneMatch>
  <CopySourceIfModifiedSince>date_time</CopySourceIfModifiedSince>
  <CopySourceIfUnmodifiedSince>date_time</CopySourceIfUnmodifiedSince>
  <AWSAccessKeyId>AWSAccessKeyId</AWSAccessKeyId>
  <Timestamp>TimeStamp</Timestamp>
  <Signature>Signature</Signature>
</CopyObject>
```

Request Parameters

Name	Description	Required
SourceBucket	The name of the source bucket. Type: String Default: None Constraints: A valid source bucket.	Yes
SourceKey	The key name of the source object.	Yes

Name	Description	Required
	Type: String Default: None Constraints: The key for a valid source object to which you have READ access. **Important** Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more informati on, see XML related object key constraints.	
`DestinationBucket`	The name of the destination bucket. Type: String Default: None Constraints: You must have WRITE access to the destination bucket.	Yes
`DestinationKey`	The key of the destination object. Type: String Default: None Constraints: You must have WRITE access to the destination bucket.	Yes

Name	Description	Required
MetadataDirective	Specifies whether the metadata is copied from the source object or replaced with metadata provided in the request. Type: String Default: COPY Valid values: COPY | REPLACE Constraints: Values other than COPY or REPLACE will result in an immediate error. You cannot copy an object to itself unless the MetadataDirective header is specified and its value set to REPLACE.	No
Metadata	Specifies metadata name-value pairs to set for the object.If MetadataDirective is set to COPY, all metadata is ignored. Type: String Default: None Constraints: None.	No
AccessControlList	Grants access to users by e-mail addresses or canonical user ID. Type: String Default: None Constraints: None	No

Name	Description	Required
CopySourceIfMatch	Copies the object if its entity tag (ETag) matches the specified tag; otherwise return a PreconditionFailed. Type: String Default: None Constraints: None. If the Etag does not match, the object is not copied.	No
CopySourceIfNoneMatch	Copies the object if its entity tag (ETag) is different than the specified Etag; otherwise returns an error. Type: String Default: None Constraints: None.	No
CopySourceIfUnmodifiedSince	Copies the object if it hasn't been modified since the specified time; otherwise returns a PreconditionFailed. Type: dateTime Default: None	No
CopySourceIfModifiedSince	Copies the object if it has been modified since the specified time; otherwise returns an error. Type: dateTime Default: None	No

Response Syntax

```
<CopyObjectResponse xmlns="http://bucket_name.s3.amazonaws.com/2006-03-01">
  <CopyObjectResponse>
    <ETag>"etag"</ETag>
    <LastModified>timestamp</LastModified>
  </CopyObjectResponse>
</CopyObjectResponse>
```

Response Elements

Following is a list of response elements.

> **Note**
>
> The SOAP API does not return extra whitespace. Extra whitespace is only returned by the REST API.

Name	Description
`Etag`	Returns the etag of the new object. The ETag only reflects changes to the contents of an object, not its metadata. Type: String Ancestor: CopyObjectResult
`LastModified`	Returns the date the object was last modified. Type: String Ancestor: CopyObjectResult

For information about general response elements, see Using REST Error Response Headers.

Special Errors

There are no special errors for this operation. For information about general Amazon S3 errors, see List of error codes.

Examples

This example copies the `flotsam` object from the `pacific` bucket to the `jetsam` object of the `atlantic` bucket, preserving its metadata.

Sample Request

```
<CopyObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <SourceBucket>pacific</SourceBucket>
  <SourceObject>flotsam</SourceObject>
  <DestinationBucket>atlantic</DestinationBucket>
  <DestinationObject>jetsam</DestinationObject>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2008-02-18T13:54:10.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbq7RrtSFmw=</Signature>
</CopyObject>
```

Sample Response

```
<CopyObjectResponse xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <CopyObjectResponse>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
    <LastModified>2008-02-18T13:54:10.183Z</LastModified>
  </CopyObjectResponse>
</CopyObjectResponse>
```

This example copies the "tweedledee" object from the wonderland bucket to the "tweedledum" object of the wonderland bucket, replacing its metadata.

Sample Request

```
<CopyObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <SourceBucket>wonderland</SourceBucket>
  <SourceObject>tweedledee</SourceObject>
  <DestinationBucket>wonderland</DestinationBucket>
  <DestinationObject>tweedledum</DestinationObject>
  <MetadataDirective >REPLACE</MetadataDirective >
```

```
  <Metadata>
    <Name>Content-Type</Name>
    <Value>text/plain</Value>
  </Metadata>
  <Metadata>
    <Name>relationship</Name>
    <Value>twins</Value>
  </Metadata>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2008-02-18T13:54:10.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbq7RrtSFmw=</Signature>
</CopyObject>
```

Sample Response

```
<CopyObjectResponse xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <CopyObjectResponse>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
    <LastModified>2008-02-18T13:54:10.183Z</LastModified>
  </CopyObjectResponse>
</CopyObjectResponse>
```

Related Resources

- PutObject (SOAP API)
- PutObjectInline (SOAP API)

GetObject (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

The `GetObject` operation returns the current version of an object. If you try to `GetObject` an object that has a delete marker as its current version, S3 returns a 404 error. You cannot use the SOAP API to retrieve a specified version of an object. To do that, use the REST API. For more information, see Versioning. For more options, use the GetObjectExtended (SOAP API) operation.

> **Note**
>
> Object key names with the value "soap" aren't supported for virtual-hosted-style requests. For object key name values where "soap" is used, a path-style URL must be used instead.

Example

This example gets the "Nelson" object from the "quotes" bucket.

Sample Request

```
<GetObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <GetMetadata>true</GetMetadata>
  <GetData>true</GetData>
  <InlineData>true</InlineData>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>

```

```
  </GetObjectResponse>
</GetObjectResponse>
```

Elements

- `Bucket:` The bucket from which to retrieve the object.
- `Key:` The key that identifies the object.

> **Important**
>
> Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints.

- `GetMetadata:` The metadata is returned with the object if this is true.
- `GetData:` The object data is returned if this is true.
- `InlineData:` If this is true, then the data is returned, base 64-encoded, as part of the SOAP body of the response. If false, then the data is returned as a SOAP attachment. The InlineData option is not suitable for use with large objects. The system limits this operation to working with 1MB of data or less. A GetObject request with the InlineData flag set will fail with the `InlineDataTooLargeError` status code if the resulting Data parameter would have encoded more than 1MB. To download large objects, consider calling GetObject without setting the InlineData flag, or use the REST API instead.

Returned Elements

- `Metadata:` The name-value paired metadata stored with the object.
- `Data:` If InlineData was true in the request, this contains the base 64 encoded object data.
- `LastModified:` The time that the object was stored in Amazon S3.
- `ETag:` The object's entity tag. This is a hash of the object that can be used to do conditional gets. The ETag only reflects changes to the contents of an object, not its metadata.

Access Control

You can read an object only if you have been granted `READ` access to the object.

SOAP Chunked and Resumable Downloads

To provide GET flexibility, Amazon S3 supports chunked and resumable downloads.

Select from the following:

- For large object downloads, you might want to break them into smaller chunks. For more information, see Range GETs
- For GET operations that fail, you can design your application to download the remainder instead of the entire file. For more information, see REST GET Error Recovery

Range GETs

For some clients, you might want to break large downloads into smaller downloads. To break a GET into smaller units, use Range.

Before you can break a GET into smaller units, you must determine its size. For example, the following request gets the size of the bigfile object.

```
<ListBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>bigbucket</Bucket>
  <Prefix>bigfile</Prefix>
  <MaxKeys>1</MaxKeys>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</ListBucket>
```

Amazon S3 returns the following response.

```
<ListBucketResult xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <Name>quotes</Name>
  <Prefix>N</Prefix>
  <MaxKeys>1</MaxKeys>
  <IsTruncated>false</IsTruncated>
  <Contents>
    <Key>bigfile</Key>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    <ETag>&amp;quot;828ef3fdfa96f00ad9f27c383fc9ac7f&amp;quot;</ETag>
    <Size>2023276</Size>
```

```
    <StorageClass>STANDARD</StorageClass>
    <Owner>
      <ID>bcaf1ffd86f41161ca5fb16fd081034f</ID>
      <DisplayName>bigfile</DisplayName>
     </Owner>
  </Contents>
</ListBucketResult>
```

Following is a request that downloads the first megabyte from the bigfile object.

```
<GetObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>bigbucket</Bucket>
  <Key>bigfile</Key>
  <GetMetadata>true</GetMetadata>
  <GetData>true</GetData>
  <InlineData>true</InlineData>
  <ByteRangeStart>0</ByteRangeStart>
  <ByteRangeEnd>1048576</ByteRangeEnd>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObject>
```

Amazon S3 returns the first megabyte of the file and the Etag of the file.

```
<GetObjectResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <GetObjectResponse>
    <Status>
      <Code>200</Code>
      <Description>OK</Description>
    </Status>
    <Metadata>
      <Name>Content-Type</Name>
      <Value>text/plain</Value>
    </Metadata>
    <Metadata>
      <Name>family</Name>
      <Value>Muntz</Value>
    </Metadata>
    <Data>--first megabyte of bigfile--</Data>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
  </GetObjectResponse>
```

```
</GetObjectResponse>
```

To ensure the file did not change since the previous portion was downloaded, specify the IfMatch element. Although the IfMatch element is not required, it is recommended for content that is likely to change.

The following is a request that gets the remainder of the file, using the IfMatch request header.

```
<GetObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>bigbucket</Bucket>
  <Key>bigfile</Key>
  <GetMetadata>true</GetMetadata>
  <GetData>true</GetData>
  <InlineData>true</InlineData>
  <ByteRangeStart>10485761</ByteRangeStart>
  <ByteRangeEnd>2023276</ByteRangeEnd>
  <IfMatch>"828ef3fdfa96f00ad9f27c383fc9ac7f"</IfMatch>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObject>
```

Amazon S3 returns the following response and the remainder of the file.

```
<GetObjectResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <GetObjectResponse>
    <Status>
      <Code>200</Code>
      <Description>OK</Description>
    </Status>
    <Metadata>
      <Name>Content-Type</Name>
      <Value>text/plain</Value>
    </Metadata>
    <Metadata>
      <Name>family</Name>
      <Value>>Muntz</Value>
    </Metadata>
    <Data>--remainder of bigfile--</Data>
    <LastModified>2006-01-01T12:00:00.000Z</LastModified>
    <ETag>"828ef3fdfa96f00ad9f27c383fc9ac7f"</ETag>
  </GetObjectResponse>
```

```
</GetObjectResponse>
```

Versioned GetObject

The following request returns the specified version of the object in the bucket.

```
<GetObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
<Bucket>quotes</Bucket>
<Key>Nelson</Key>
<GetMetadata>true</GetMetadata>
<GetData>true</GetData>
<InlineData>true</InlineData>
<AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
<Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
<Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObject>
```

Sample Response

```
<GetObjectResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
<GetObjectResponse>
<Status>
<Code>200</Code>
<Description>OK</Description>
</Status>
<Metadata>
<Name>Content-Type</Name>
<Value>text/plain</Value>
</Metadata>
<Metadata>
<Name>family</Name>
<Value>Muntz</Value>
</Metadata>
<Data>aGEtaGE=</Data>
<LastModified>2006-01-01T12:00:00.000Z</LastModified>
<ETag>&amp;quot;828ef3fdfa96f00ad9f27c383fc9ac7f&amp;quot;</ETag>
</GetObjectResponse>
</GetObjectResponse>
```

REST GET Error Recovery

If an object GET fails, you can get the rest of the file by specifying the range to download. To do so, you must get the size of the object using `ListBucket` and perform a range `GET` on the remainder of the file. For more information, see GetObjectExtended (SOAP API).

Related Resources

Operations on Objects (SOAP API)

GetObjectExtended (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

`GetObjectExtended` is exactly like GetObject (SOAP API), except that it supports the following additional elements that can be used to accomplish much of the same functionality provided by HTTP GET headers (go to http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html).

GetObjectExtended supports the following elements in addition to those supported by GetObject:

- `ByteRangeStart, ByteRangeEnd:` These elements specify that only a portion of the object data should be retrieved. They follow the behavior of the HTTP byte ranges (go to http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.35).
- `IfModifiedSince:` Return the object only if the object's timestamp is later than the specified timestamp. (http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.25)
- `IfUnmodifiedSince:` Return the object only if the object's timestamp is earlier than or equal to the specified timestamp. (go to http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.28)
- `IfMatch:` Return the object only if its ETag matches the supplied tag(s). (go to http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.24)
- `IfNoneMatch:` Return the object only if its ETag does not match the supplied tag(s). (go to http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.26)

- `ReturnCompleteObjectOnConditionFailure`:ReturnCompleteObjectOnConditionFailure: If true, then if the request includes a range element and one or both of IfUnmodifiedSince/IfMatch elements, and the condition fails, return the entire object rather than a fault. This enables the If-Range functionality (go to http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.27).

DeleteObject (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

The `DeleteObject` operation removes the specified object from Amazon S3. Once deleted, there is no method to restore or undelete an object.

> **Note**
>
> If you delete an object that does not exist, Amazon S3 will return a success (not an error message).

Example

This example deletes the "Nelson" object from the "quotes" bucket.

`Sample Request`

```
<DeleteObject xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <AWSAccessKeyId> AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</DeleteObject>
```

`Sample Response`

```
<DeleteObjectResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <DeleteObjectResponse>
    <Code>200</Code>
    <Description>OK</Description>
  </DeleteObjectResponse>
</DeleteObjectResponse>
```

Elements

- `Bucket`: The bucket that holds the object.
- `Key`: The key that identifies the object.

> **Important**
>
> Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints.

Access Control

You can delete an object only if you have `WRITE` access to the bucket, regardless of who owns the object or what rights are granted to it.

GetObjectAccessControlPolicy (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

The `GetObjectAccessControlPolicy` operation fetches the access control policy for an object.

Important

Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints.

Example

This example retrieves the access control policy for the "Nelson" object from the "quotes" bucket.

Sample Request

```
<GetObjectAccessControlPolicy xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</GetObjectAccessControlPolicy>
```

Sample Response

```
<AccessControlPolicy>
  <Owner>
    <ID>a9a7b886d6fd24a541bf9b1c61be666e9</ID>
    <DisplayName>chriscustomer</DisplayName>
  </Owner>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b841bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
    <Grant>
      <Grantee xsi:type="Group">
        <URI>http://acs.amazonaws.com/groups/global/AllUsers<URI>
      </Grantee>
      <Permission>READ</Permission>
    </Grant>
```

```
  </AccessControlList>
</AccessControlPolicy>
```

Response Body

The response contains the access control policy for the bucket. For an explanation of this response, SOAP Access Policy .

Access Control

You must have READ_ACP rights to the object in order to retrieve the access control policy for an object.

SetObjectAccessControlPolicy (SOAP API)

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

The SetObjectAccessControlPolicy operation sets the access control policy for an existing object. If successful, the previous access control policy for the object is entirely replaced with the specified access control policy.

Example

This example gives the specified user (usually the owner) FULL_CONTROL access to the "Nelson" object from the "quotes" bucket.

Sample Request

```
<SetObjectAccessControlPolicy xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>a9a7b886d6fd24a52fe8ca5bef65f89a64e0193f23000e241bf9b1c61be666e9</ID>
        <DisplayName>chriscustomer</DisplayName>
```

```
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
  </AccessControlList>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2006-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</SetObjectAccessControlPolicy>
```

Sample Response

```
<SetObjectAccessControlPolicyResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <SetObjectAccessControlPolicyResponse>
    <Code>200</Code>
    <Description>OK</Description>
  </SetObjectAccessControlPolicyResponse>
</SetObjectAccessControlPolicyResponse>
```

Key

Important

Replacement must be made for object keys containing special characters (such as carriage returns) when using XML requests. For more information, see XML related object key constraints.

Access Control

You must have WRITE_ACP rights to the object in order to set the access control policy for a bucket.

Authenticating SOAP requests

Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

Every non-anonymous request must contain authentication information to establish the identity of the principal making the request. In SOAP, the authentication information is put into the following elements of the SOAP request:

- Your Amazon Access Key ID

  > **Note**
  >
  > When making authenticated SOAP requests, temporary security credentials are not supported. For more information about types of credentials, see Making requests.

- `Timestamp`: This must be a dateTime (go to http://www.w3.org/TR/xmlschema-2/#dateTime) in the Coordinated Universal Time (Greenwich Mean Time) time zone, such as `2009-01-01T12:00:00.000Z`. Authorization will fail if this timestamp is more than 15 minutes away from the clock on Amazon S3 servers.
- `Signature`: The RFC 2104 HMAC-SHA1 digest (go to http://www.ietf.org/rfc/rfc2104.txt) of the concatenation of "AmazonS3" + OPERATION + Timestamp, using your Amazon Secret Access Key as the key. For example, in the following CreateBucket sample request, the signature element would contain the HMAC-SHA1 digest of the value "AmazonS3CreateBucket2009-01-01T12:00:00.000Z":

For example, in the following CreateBucket sample request, the signature element would contain the HMAC-SHA1 digest of the value "AmazonS3CreateBucket2009-01-01T12:00:00.000Z":

Example

```
<CreateBucket xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Acl>private</Acl>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2009-01-01T12:00:00.000Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</CreateBucket>
```

> **Note**
>
> SOAP requests, both authenticated and anonymous, must be sent to Amazon S3 using SSL. Amazon S3 returns an error when you send a SOAP request over HTTP.

Important

Due to different interpretations regarding how extra time precision should be dropped, .NET users should take care not to send Amazon S3 overly specific time stamps. This can be accomplished by manually constructing `DateTime` objects with only millisecond precision.

Setting access policy with SOAP

Note

SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

Access control can be set at the time a bucket or object is written by including the "AccessControlList" element with the request to `CreateBucket`, `PutObjectInline`, or `PutObject`. The AccessControlList element is described in Identity and Access Management for Amazon S3 . If no access control list is specified with these operations, the resource is created with a default access policy that gives the requester FULL_CONTROL access (this is the case even if the request is a PutObjectInline or PutObject request for an object that already exists).

Following is a request that writes data to an object, makes the object readable by anonymous principals, and gives the specified user FULL_CONTROL rights to the bucket (Most developers will want to give themselves FULL_CONTROL access to their own bucket).

Example

Following is a request that writes data to an object and makes the object readable by anonymous principals.

`Sample Request`

```
<PutObjectInline xmlns="http://doc.s3.amazonaws.com/2006-03-01">
  <Bucket>quotes</Bucket>
  <Key>Nelson</Key>
  <Metadata>
```

```
    <Name>Content-Type</Name>
    <Value>text/plain</Value>
  </Metadata>
  <Data>aGEtaGE=</Data>
  <ContentLength>5</ContentLength>
  <AccessControlList>
    <Grant>
      <Grantee xsi:type="CanonicalUser">
        <ID>75cc57f09aa0c8caeab4f8c24e99d10f8e7faeebf76c078efc7c6caea54ba06a</ID>
        <DisplayName>chriscustomer</DisplayName>
      </Grantee>
      <Permission>FULL_CONTROL</Permission>
    </Grant>
    <Grant>
      <Grantee xsi:type="Group">
        <URI>http://acs.amazonaws.com/groups/global/AllUsers<URI>
      </Grantee>
      <Permission>READ</Permission>
    </Grant>
  </AccessControlList>
  <AWSAccessKeyId>AKIAIOSFODNN7EXAMPLE</AWSAccessKeyId>
  <Timestamp>2009-03-01T12:00:00.183Z</Timestamp>
  <Signature>Iuyz3d3P0aTou39dzbqaEXAMPLE=</Signature>
</PutObjectInline>
```

Sample Response

```
<PutObjectInlineResponse xmlns="http://s3.amazonaws.com/doc/2006-03-01">
  <PutObjectInlineResponse>
    <ETag>&quot828ef3fdfa96f00ad9f27c383fc9ac7f&quot</ETag>
    <LastModified>2009-01-01T12:00:00.000Z</LastModified>
  </PutObjectInlineResponse>
</PutObjectInlineResponse>
```

The access control policy can be read or set for an existing bucket or object using the `GetBucketAccessControlPolicy`, `GetObjectAccessControlPolicy`, `SetBucketAccessControlPolicy`, and `SetObjectAccessControlPolicy` methods. For more information, see the detailed explanation of these methods.

Common elements

You can include the following authorization-related elements with any SOAP request:

- `AWSAccessKeyId:` The Amazon Access Key ID of the requester
- `Timestamp:` The current time on your system
- `Signature:` The signature for the request

SOAP Error Responses

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

In SOAP, an error result is returned to the client as a SOAP fault, with the HTTP response code 500. If you do not receive a SOAP fault, then your request was successful. The Amazon S3 SOAP fault code is comprised of a standard SOAP 1.1 fault code (either "Server" or "Client") concatenated with the Amazon S3-specific error code. For example: "Server.InternalError" or "Client.NoSuchBucket". The SOAP fault string element contains a generic, human readable error message in English. Finally, the SOAP fault detail element contains miscellaneous information relevant to the error.

For example, if you attempt to delete the object "Fred", which does not exist, the body of the SOAP response contains a "NoSuchKey" SOAP fault.

The following example shows a sample SOAP error response.

```
<soapenv:Body>
  <soapenv:Fault>
    <Faultcode>soapenv:Client.NoSuchKey</Faultcode>
    <Faultstring>The specified key does not exist.</Faultstring>
    <Detail>
      <Key>Fred</Key>
    </Detail>
  </soapenv:Fault>
  </soapenv:Body>
```

The following table explains the SOAP error response elements

Name	Description
`Detail`	Container for the key involved in the error Type: Container Ancestor: Body.Fault
`Fault`	Container for error information. Type: Container Ancestor: Body
`Faultcode`	The fault code is a string that uniquely identifies an error condition. It is meant to be read and understood by programs that detect and handle errors by type. For more information, see List of Error Codes. Type: String Ancestor: Body.Fault
`Faultstring`	The fault string contains a generic description of the error condition in English. It is intended for a human audience. Simple programs display the message directly to the end user if they encounter an error condition they don't know how or don't care to handle. Sophisticated programs with more exhaustive error handling and proper internationalization are more likely to ignore the fault string. Type: String Ancestor: Body.Fault
`Key`	Identifies the key involved in the error Type: String Ancestor: Body.Fault

Appendix: Authenticating requests (Amazon signature version 2)

Important

This section describes how to authenticate requests using Amazon Signature Version 2. Signature Version 2 is being turned off (deprecated), Amazon S3 will only accept API requests that are signed using Signature Version 4. For more information, see Amazon Signature Version 2 turned off (deprecated) for Amazon S3
Signature Version 4 is supported in all Amazon Web Services Regions, and it is the only version that is supported for new Regions. For more information, see Authenticating Requests (Amazon Signature Version 4) in the *Amazon Simple Storage Service API Reference*. Amazon S3 offers you the ability to identify what API signature version was used to sign a request. It is important to identify if any of your workflows are utilizing Signature Version 2 signing and upgrading them to use Signature Version 4 to prevent impact to your business.

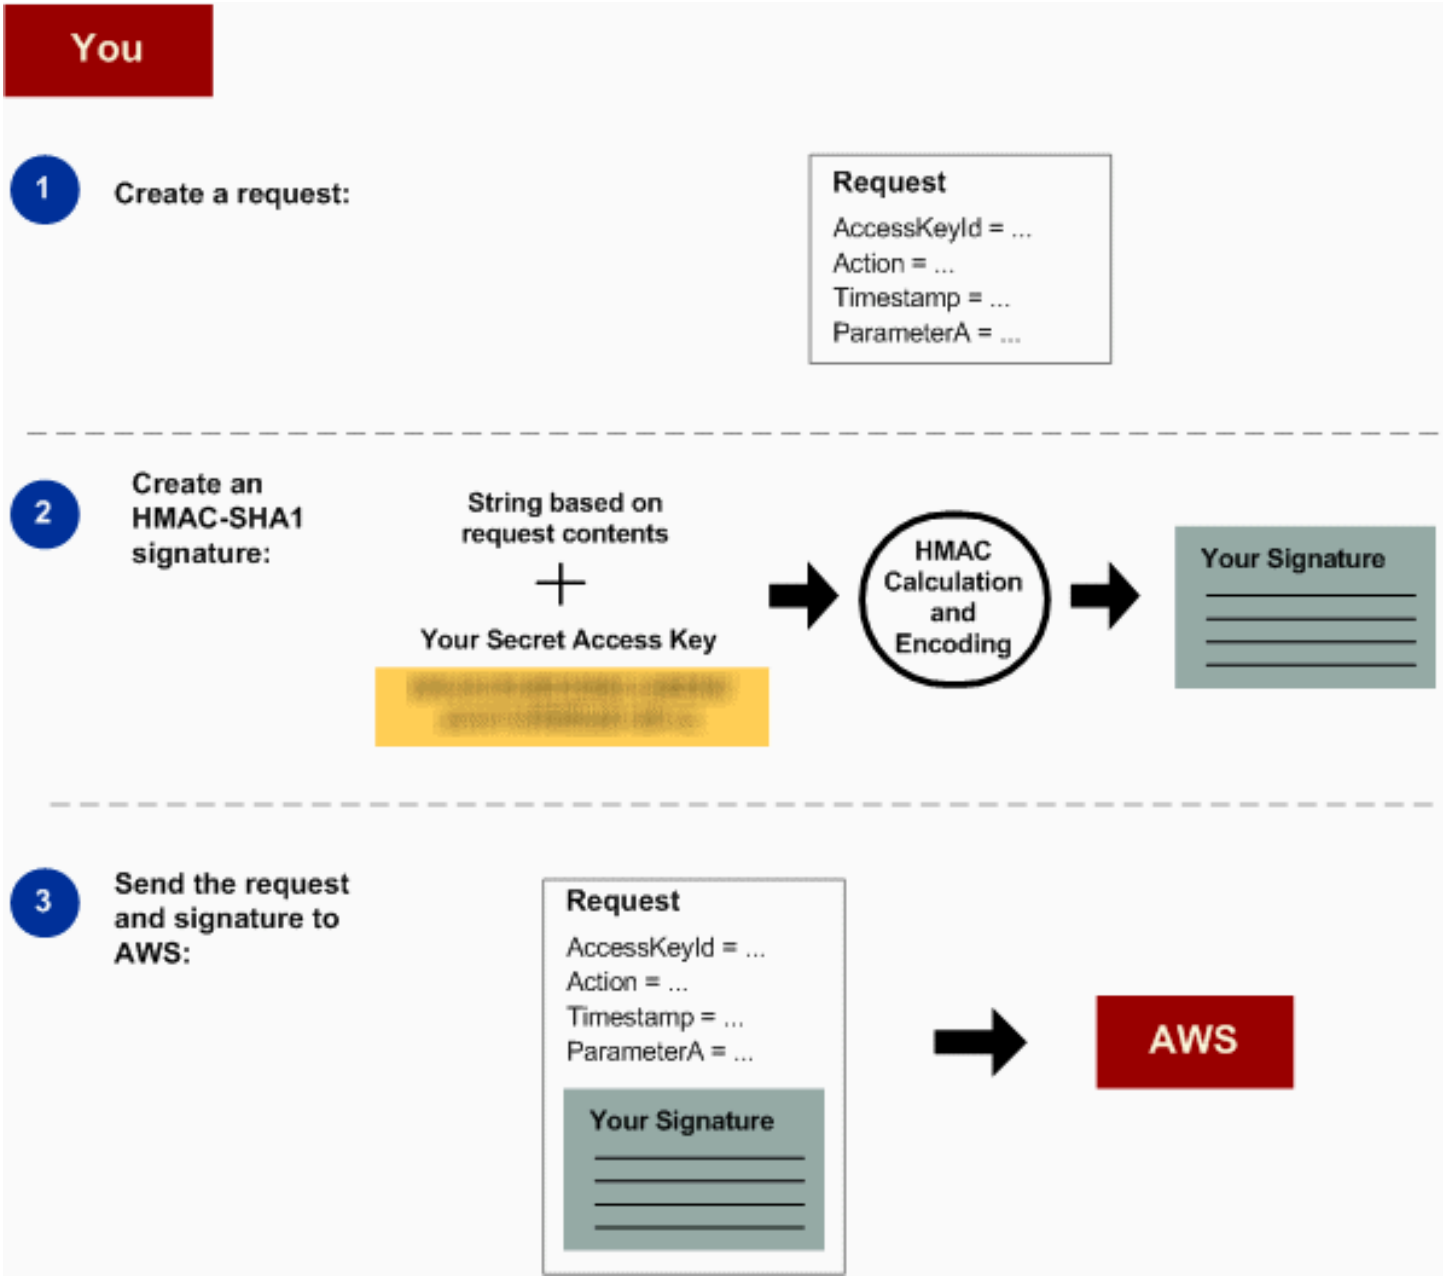
- If you are using CloudTrail event logs(recommended option), please see Identifying Amazon S3 Signature Version 2 requests by using CloudTrail on how to query and identify such requests.
- If you are using the Amazon S3 Server Access logs, see Using Amazon S3 server access logs to identify requests

Topics

- Authenticating requests using the REST API (Amazon signature version 2)
- Signing and authenticating REST requests (Amazon signature version 2)
- Browser-based uploads using POST (Amazon signature version 2)

Authenticating requests using the REST API (Amazon signature version 2)

When accessing Amazon S3 using REST, you must provide the following items in your request so the request can be authenticated:



Request elements

- **Amazon access key Id** – Each request must contain the access key ID of the identity you are using to send your request.
- **Signature** – Each request must contain a valid request signature, or the request is rejected.

  A request signature is calculated using your secret access key, which is a shared secret known only to you and Amazon.
- **Time stamp** – Each request must contain the date and time the request was created, represented as a string in UTC.
- **Date** – Each request must contain the time stamp of the request.

  Depending on the API action you're using, you can provide an expiration date and time for the request instead of or in addition to the time stamp. See the authentication topic for the particular action to determine what it requires.

Following are the general steps for authenticating requests to Amazon S3. It is assumed you have the necessary security credentials, access key ID and secret access key.

1	Construct a request to Amazon.
2	Calculate the signature using your secret access key.
3	Send the request to Amazon S3. Include your access key ID and the signature in your request. Amazon S3 performs the next three steps.

4	Amazon S3 uses the access key ID to look up your secret access key.
5	Amazon S3 calculates a signature from the request data and the secret access key using the same algorithm that you used to calculate the signature you sent in the request.
6	If the signature generated by Amazon S3 matches the one you sent in the request, the request is considered authentic. If the comparison fails, the request is discarded, and Amazon S3 returns an error response.

Detailed authentication information

For detailed information about REST authentication, see Signing and authenticating REST requests (Amazon signature version 2).

> **Note**
>
> This topic explains authenticating requests using Signature Version 2. Amazon S3 now supports the latest Signature Version 4. This latest signature version is supported in all regions and any new regions after January 30, 2014 will support only Signature Version 4. For more information, go to Authenticating Requests (Amazon Signature Version 4) in the *Amazon Simple Storage Service API Reference*.

Authentication is the process of proving your identity to the system. Identity is an important factor in Amazon S3 access control decisions. Requests are allowed or denied in part based on the identity of the requester. For example, the right to create buckets is reserved for registered developers and (by default) the right to create objects in a bucket is reserved for the owner of the bucket in question. As a developer, you'll be making requests that invoke these privileges, so you'll need to prove your identity to the system by authenticating your requests. This section shows you how.

> **Note**
>
> The content in this section does not apply to HTTP POST. For more information, see Browser-based uploads using POST (Amazon signature version 2).

The Amazon S3 REST API uses a custom HTTP scheme based on a keyed-HMAC (Hash Message Authentication Code) for authentication. To authenticate a request, you first concatenate selected elements of the request to form a string. You then use your Amazon secret access key to calculate the HMAC of that string. Informally, we call this process "signing the request," and we call the output of the HMAC algorithm the signature, because it simulates the security properties of a real signature. Finally, you add this signature as a parameter of the request by using the syntax described in this section.

When the system receives an authenticated request, it fetches the Amazon secret access key that you claim to have and uses it in the same way to compute a signature for the message it received. It then compares the signature it calculated against the signature presented by the requester. If the two signatures match, the system concludes that the requester must have access to the Amazon secret access key and therefore acts with the authority of the principal to whom the key was issued. If the two signatures do not match, the request is dropped and the system responds with an error message.

Example Authenticated Amazon S3 REST request

```
GET /photos/puppy.jpg HTTP/1.1
Host: awsexamplebucket1.us-west-1.s3.amazonaws.com
Date: Tue, 27 Mar 2007 19:36:42 +0000

Authorization: AWS AKIAIOSFODNN7EXAMPLE:
qgk2+6Sv9/oM7G3qLEjTH1a1l1g=
```

Using temporary security credentials

If you are signing your request using temporary security credentials (see Making requests), you must include the corresponding security token in your request by adding the `x-amz-security-token` header.

When you obtain temporary security credentials using the Amazon Security Token Service API, the response includes temporary security credentials and a session token. You provide the session

token value in the `x-amz-security-token` header when you send requests to Amazon S3. For information about the Amazon Security Token Service API provided by IAM, go to Action in the *Amazon Security Token Service API Reference Guide* .

The authentication header

The Amazon S3 REST API uses the standard HTTP `Authorization` header to pass authentication information. (The name of the standard header is unfortunate because it carries authentication information, not authorization.) Under the Amazon S3 authentication scheme, the Authorization header has the following form:

```
Authorization: AWS AWSAccessKeyId:Signature
```

Developers are issued an Amazon access key ID and Amazon secret access key when they register. For request authentication, the `AWSAccessKeyId` element identifies the access key ID that was used to compute the signature and, indirectly, the developer making the request.

The `Signature` element is the RFC 2104 HMAC-SHA1 of selected elements from the request, and so the `Signature` part of the Authorization header will vary from request to request. If the request signature calculated by the system matches the `Signature` included with the request, the requester will have demonstrated possession of the Amazon secret access key. The request will then be processed under the identity, and with the authority, of the developer to whom the key was issued.

Following is pseudogrammar that illustrates the construction of the `Authorization` request header. (In the example, \n means the Unicode code point `U+000A`, commonly called newline).

```
Authorization = "AWS" + " " + AWSAccessKeyId + ":" + Signature;

Signature = Base64( HMAC-SHA1( UTF-8-Encoding-Of(YourSecretAccessKey), UTF-8-Encoding-
Of( StringToSign ) ) );

StringToSign = HTTP-Verb + "\n" +
 Content-MD5 + "\n" +
 Content-Type + "\n" +
 Date + "\n" +
 CanonicalizedAmzHeaders +
 CanonicalizedResource;
```

```
CanonicalizedResource = [ "/" + Bucket ] +
 <HTTP-Request-URI, from the protocol name up to the query string> +
 [ subresource, if present. For example "?acl", "?location", or "?logging"];

CanonicalizedAmzHeaders = <described below>
```

HMAC-SHA1 is an algorithm defined by RFC 2104 - Keyed-Hashing for Message Authentication . The algorithm takes as input two byte-strings, a key and a message. For Amazon S3 request authentication, use your Amazon secret access key (`YourSecretAccessKey`) as the key, and the UTF-8 encoding of the `StringToSign` as the message. The output of HMAC-SHA1 is also a byte string, called the digest. The `Signature` request parameter is constructed by Base64 encoding this digest.

Request canonicalization for signing

Recall that when the system receives an authenticated request, it compares the computed request signature with the signature provided in the request in `StringToSign`. For that reason, you must compute the signature by using the same method used by Amazon S3. We call the process of putting a request in an agreed-upon form for signing *canonicalization*.

Constructing the CanonicalizedResource element

`CanonicalizedResource` represents the Amazon S3 resource targeted by the request. Construct it for a REST request as follows:

1. Start with an empty string ("").
2. If the request specifies a bucket using the HTTP Host header (virtual hosted-style), append the bucket name preceded by a "/" (e.g., "/bucketname"). For path-style requests and requests that don't address a bucket, do nothing. For more information about virtual hosted-style requests, see Virtual hosting of buckets .

   For a virtual hosted-style request "https://awsexamplebucket1.s3.us-west-1.amazonaws.com/photos/puppy.jpg", the `CanonicalizedResource` is "/awsexamplebucket1".

   For the path-style request, "https://s3.us-west-1.amazonaws.com/awsexamplebucket1/photos/puppy.jpg", the `CanonicalizedResource` is "".
3. Append the path part of the un-decoded HTTP Request-URI, up-to but not including the query string.

For a virtual hosted-style request "https://awsexamplebucket1.s3.us-west-1.amazonaws.com/photos/puppy.jpg", the `CanonicalizedResource` is "/awsexamplebucket1/photos/puppy.jpg".

For a path-style request, "https://s3.us-west-1.amazonaws.com/awsexamplebucket1/photos/puppy.jpg", the `CanonicalizedResource` is "/awsexamplebucket1/photos/puppy.jpg". At this point, the `CanonicalizedResource` is the same for both the virtual hosted-style and path-style request.

For a request that does not address a bucket, such as GET Service, append "/".

4. If the request addresses a subresource, such as `?versioning`, `?location`, `?acl`, `?lifecycle`, or `?versionid`, append the subresource, its value if it has one, and the question mark. Note that in case of multiple subresources, subresources must be lexicographically sorted by subresource name and separated by '&', e.g., ?acl&versionId=*value*.

   The subresources that must be included when constructing the CanonicalizedResource Element are acl, lifecycle, location, logging, notification, partNumber, policy, requestPayment, uploadId, uploads, versionId, versioning, versions, and website.

   If the request specifies query string parameters overriding the response header values (see Get Object), append the query string parameters and their values. When signing, you do not encode these values; however, when making the request, you must encode these parameter values. The query string parameters in a GET request include `response-content-type`, `response-content-language`, `response-expires`, `response-cache-control`, `response-content-disposition`, and `response-content-encoding`.

   The `delete` query string parameter must be included when you create the CanonicalizedResource for a multi-object Delete request.

Elements of the CanonicalizedResource that come from the HTTP Request-URI should be signed literally as they appear in the HTTP request, including URL-Encoding meta characters.

The `CanonicalizedResource` might be different than the HTTP Request-URI. In particular, if your request uses the HTTP `Host` header to specify a bucket, the bucket does not appear in the HTTP Request-URI. However, the `CanonicalizedResource` continues to include the bucket. Query string parameters might also appear in the Request-URI but are not included in `CanonicalizedResource`. For more information, see Virtual hosting of buckets .

Constructing the CanonicalizedAmzHeaders element

To construct the CanonicalizedAmzHeaders part of `StringToSign`, select all HTTP request headers that start with 'x-amz-' (using a case-insensitive comparison), and use the following process.

1. Convert each HTTP header name to lowercase. For example, '`X-Amz-Date`' becomes '`x-amz-date`'.
2. Sort the collection of headers lexicographically by header name.
3. Combine header fields with the same name into one "header-name:comma-separated-value-list" pair as prescribed by RFC 2616, section 4.2, without any spaces between values. For example, the two metadata headers '`x-amz-meta-username: fred`' and '`x-amz-meta-username: barney`' would be combined into the single header '`x-amz-meta-username: fred,barney`'.
4. "Unfold" long headers that span multiple lines (as allowed by RFC 2616, section 4.2) by replacing the folding spaces (including new-line) by a single space.
5. Trim any spaces around the colon in the header. For example, the header '`x-amz-meta-username: fred,barney`' would become '`x-amz-meta-username:fred,barney`'.
6. Finally, append a newline character (`U+000A`) to each canonicalized header in the resulting list. Construct the CanonicalizedResource element by concatenating all headers in this list into a single string.

Positional versus named HTTP header StringToSign elements

The first few header elements of `StringToSign` (Content-Type, Date, and Content-MD5) are positional in nature. `StringToSign` does not include the names of these headers, only their values from the request. In contrast, the '`x-amz-`' elements are named. Both the header names and the header values appear in `StringToSign`.

If a positional header called for in the definition of `StringToSign` is not present in your request (for example, `Content-Type` or `Content-MD5` are optional for PUT requests and meaningless for GET requests), substitute the empty string ("") for that position.

Time stamp requirement

A valid time stamp (using either the HTTP `Date` header or an `x-amz-date` alternative) is mandatory for authenticated requests. Furthermore, the client timestamp included with an authenticated request must be within 15 minutes of the Amazon S3 system time when the

request is received. If not, the request will fail with the `RequestTimeTooSkewed` error code. The intention of these restrictions is to limit the possibility that intercepted requests could be replayed by an adversary. For stronger protection against eavesdropping, use the HTTPS transport for authenticated requests.

> **Note**
>
> The validation constraint on request date applies only to authenticated requests that do not use query string authentication. For more information, see Query string request authentication alternative.

Some HTTP client libraries do not expose the ability to set the `Date` header for a request. If you have trouble including the value of the 'Date' header in the canonicalized headers, you can set the timestamp for the request by using an '`x-amz-date`' header instead. The value of the `x-amz-date` header must be in one of the RFC 2616 formats (http://www.ietf.org/rfc/rfc2616.txt). When an `x-amz-date` header is present in a request, the system will ignore any `Date` header when computing the request signature. Therefore, if you include the `x-amz-date` header, use the empty string for the `Date` when constructing the `StringToSign`. See the next section for an example.

Authentication examples

The examples in this section use the (non-working) credentials in the following table.

Parameter	Value
AWSAccessKeyId	`AKIAIOSFODNN7EXAMPLE`
AWSSecretAccessKey	`wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY`

In the example `StringToSigns`, formatting is not significant, and `\n` means the Unicode code point `U+000A`, commonly called newline. Also, the examples use "+0000" to designate the time zone. You can use "GMT" to designate timezone instead, but the signatures shown in the examples will be different.

Object GET

This example gets an object from the awsexamplebucket1 bucket.

Request	StringToSign

`GET /photos/puppy.jpg HTTP/1.1`
`Host: awsexamplebucket1.us-west-1.s3.amazonaws.com`
`Date: Tue, 27 Mar 2007 19:36:42 +0000`
 	
`Authorization: AWS AKIAIOSFODNN7EXAMPLE:qgk2+6Sv9/oM7G3qLEjTH1a1l1g=`
	`GET\n`
	`\n`
	`\n`
	`Tue, 27 Mar 2007 19:36:42 +0000\n`
	`/awsexamplebucket1/photos/puppy.jpg`

Note that the CanonicalizedResource includes the bucket name, but the HTTP Request-URI does not. (The bucket is specified by the Host header.)

Note

The following Python script calculates the preceding signature, using the provided parameters. You can use this script to construct your own signatures, replacing the keys and StringToSign as appropriate.

```
import base64
import hmac
from hashlib import sha1

access_key = 'AKIAIOSFODNN7EXAMPLE'.encode("UTF-8")
secret_key = 'wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY'.encode("UTF-8")

string_to_sign = 'GET\n\n\nTue, 27 Mar 2007 19:36:42 +0000\n/awsexamplebucket1/photos/puppy.jpg'.encode("UTF-8")
signature = base64.b64encode(
                                hmac.new(
                                        secret_key, string_to_sign, sha1
                                        ).digest()
                                ).strip()

print(f"AWS {access_key.decode()}:{signature.decode()}")
```

Object PUT

This example puts an object into the awsexamplebucket1 bucket.

Request	StringToSign

`PUT /photos/puppy.jpg HTTP/1.1`
`Content-Type: image/jpeg`
`Content-Length: 94328`
`Host: awsexamplebucket1.s3.us-wes`
`t-1.amazonaws.com`
`Date: Tue, 27 Mar 2007 21:15:45 +0000`
 	
`Authorization: AWS AKIAIOSFODNN7EXAMP`
`LE:`
`iqRzw+ileNPu1fhspnRs8nOjjIA=`
	`PUT\n`
	`\n`
	`image/jpeg\n`
	`Tue, 27 Mar 2007 21:15:45 +0000\n`
	`/awsexamplebucket1/photos/puppy.jpg`

Note the Content-Type header in the request and in the StringToSign. Also note that the Content-MD5 is left blank in the StringToSign, because it is not present in the request.

List

This example lists the content of the awsexamplebucket1 bucket.

Request	StringToSign

`GET /?prefix=photos&max-keys=50&marker=puppy`
` HTTP/1.1`
`User-Agent: Mozilla/5.0`
`Host: awsexamplebucket1.s3.us-west-1.amazo`
`naws.com`
`Date: Tue, 27 Mar 2007 19:42:41 +0000`
 	
`Authorization: AWS AKIAIOSFODNN7EXAMPLE:`
`m0WP8eCtspQl5Ahe6L1SozdX9YA=`
	`GET\n`
	`\n`
	`\n`
	`Tue, 27 Mar 2007 19:42:41`
	` +0000\n`
	`/awsexamplebucket1/`

Note the trailing slash on the CanonicalizedResource and the absence of query string parameters.

Fetch

This example fetches the access control policy subresource for the 'awsexamplebucket1' bucket.

Request	StringToSign

`GET /?acl HTTP/1.1`
`Host: awsexamplebucket1.s3.us-west-1.amazonaws.com`
`Date: Tue, 27 Mar 2007 19:44:46 +0000`
 	
`Authorization: AWS AKIAIOSFODNN7EXAMPLE:82ZHiFIjc+WbcwFKGUVEQspPn+0=`
	`GET\n`
	`\n`
	`\n`
	`Tue, 27 Mar 2007 19:44:46 +0000\n`
	`/awsexamplebucket1/?acl`

Notice how the subresource query string parameter is included in the CanonicalizedResource.

Delete

This example deletes an object from the 'awsexamplebucket1' bucket using the path-style and Date alternative.

Request	StringToSign

`DELETE /awsexamplebucket1/photos/puppy.jpg HTTP/1.1`
`User-Agent: dotnet`
`Host: s3.us-west-1.amazonaws.com`
`Date: Tue, 27 Mar 2007 21:20:27 +0000`
 	
`x-amz-date: Tue, 27 Mar 2007 21:20:26 +0000`
`Authorization: AWS AKIAIOSFODNN7EXAMPLE:XbyTlbQdu9Xw5o8P4iMwPktxQd8=`
	`DELETE\n`
	`\n`
	`\n`
	`Tue, 27 Mar 2007 21:20:26 +0000\n`
	`/awsexamplebucket1/photos/puppy.jpg`

Note how we used the alternate 'x-amz-date' method of specifying the date (because our client library prevented us from setting the date, say). In this case, the `x-amz-date` takes precedence over the `Date` header. Therefore, date entry in the signature must contain the value of the `x-amz-date` header.

Upload

This example uploads an object to a CNAME style virtual hosted bucket with metadata.

Request	StringToSign

```
PUT /db-backup.dat.gz HTTP/1.1
User-Agent: curl/7.15.5
Host: static.example.com:8080
Date: Tue, 27 Mar 2007 21:06:08 +0000

x-amz-acl: public-read
content-type: application/x-download
Content-MD5: 4gJE4saaMU4BqNR0kLY+lw==
X-Amz-Meta-ReviewedBy: joe@example.com
X-Amz-Meta-ReviewedBy: jane@exam
ple.com
X-Amz-Meta-FileChecksum: 0x02661779
X-Amz-Meta-ChecksumAlgorithm: crc32
Content-Disposition: attachment;
 filename=database.dat
Content-Encoding: gzip
Content-Length: 5913339

 Authorization: AWS AKIAIOSFODNN7EXAMP
LE:
jtBQa0Aq+DkULFI8qrpwIjGEx0E=
```

```
PUT\n
4gJE4saaMU4BqNR0kLY+lw==\n
application/x-download\n
Tue, 27 Mar 2007 21:06:08 +0000\n

x-amz-acl:public-read\n
x-amz-meta-checksumalgorithm:c

x-amz-meta-filechecksum:0x026
61779\n
x-amz-meta-reviewedby:
joe@example.com,jane@example.com
\n
/static.example.com/db-backup.dat
.gz
```

Notice how the 'x-amz-' headers are sorted, trimmed of extra spaces, and converted to lowercase. Note also that multiple headers with the same name have been joined using commas to separate values.

Note how only the `Content-Type` and `Content-MD5` HTTP entity headers appear in the `StringToSign`. The other `Content-*` entity headers do not.

Again, note that the `CanonicalizedResource` includes the bucket name, but the HTTP Request-URI does not. (The bucket is specified by the Host header.)

List all my buckets

Request	StringToSign

`GET / HTTP/1.1`
`Host: s3.us-west-1.amazonaws.com`
`Date: Wed, 28 Mar 2007 01:29:59 +0000`

	`/dictionary/fran%C3%A7ais/pr%c3%a9f%c3%a8re`

> **Note**
>
> The elements in `StringToSign` that were derived from the Request-URI are taken literally, including URL-Encoding and capitalization.

REST request signing problems

When REST request authentication fails, the system responds to the request with an XML error document. The information contained in this error document is meant to help developers diagnose the problem. In particular, the `StringToSign` element of the `SignatureDoesNotMatch` error document tells you exactly what request canonicalization the system is using.

Some toolkits silently insert headers that you do not know about beforehand, such as adding the header `Content-Type` during a PUT. In most of these cases, the value of the inserted header remains constant, allowing you to discover the missing headers by using tools such as Ethereal or tcpmon.

Query string request authentication alternative

You can authenticate certain types of requests by passing the required information as query-string parameters instead of using the `Authorization` HTTP header. This is useful for enabling direct third-party browser access to your private Amazon S3 data without proxying the request. The idea is to construct a "presigned" request and encode it as a URL that an end-user's browser can retrieve. Additionally, you can limit a presigned request by specifying an expiration time.

For more information on using query parameters to authenticate requests , see Authenticating Requests: Using Query Parameters (Amazon Signature Version 4) in the *Amazon Simple Storage Service API Reference*. For examples of using the Amazon SDKs to generating presigned URLs, see Sharing objects with presigned URLs .

Creating a signature

Following is an example query string authenticated Amazon S3 REST request.

```
GET /photos/puppy.jpg
?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=1141889120&Signature=vjbyPxybdZaNmGa
%2ByT272YEAiv4%3D HTTP/1.1
Host: awsexamplebucket1.s3.us-west-1.amazonaws.com
Date: Mon, 26 Mar 2007 19:37:58 +0000
```

The query string request authentication method doesn't require any special HTTP headers. Instead, the required authentication elements are specified as query string parameters:

Query string parameter name	Example value	Description
`AWSAccessKeyId`	`AKIAIOSFODNN7EXAMPLE`	Your Amazon access key ID. Specifies the Amazon secret access key used to sign the request and, indirectly,

Query string parameter name	Example value	Description
		the identity of the developer making the request.
Expires	1141889120	The time when the signature expires, specified as the number of seconds since the epoch (00:00:00 UTC on January 1, 1970). A request received after this time (according to the server) will be rejected.
Signature	vjbyPxybdZaNmGa%2B yT272YEAiv4%3D	The URL encoding of the Base64 encoding of the HMAC-SHA1 of StringToSign.

The query string request authentication method differs slightly from the ordinary method but only in the format of the Signature request parameter and the StringToSign element. Following is pseudo-grammar that illustrates the query string request authentication method.

```
Signature = URL-Encode( Base64( HMAC-SHA1( YourSecretAccessKey, UTF-8-Encoding-
Of( StringToSign ) ) ) );

StringToSign = HTTP-VERB + "\n" +
    Content-MD5 + "\n" +
    Content-Type + "\n" +
    Expires + "\n" +
    CanonicalizedAmzHeaders +
    CanonicalizedResource;
```

YourSecretAccessKey is the Amazon secret access key ID that Amazon assigns to you when you sign up to be an Amazon Web Service developer. Notice how the Signature is URL-Encoded to make it suitable for placement in the query string. Note also that in StringToSign, the HTTP Date positional element has been replaced with Expires. The CanonicalizedAmzHeaders and CanonicalizedResource are the same.

> **Note**
>
> In the query string authentication method, you do not use the `Date` or the `x-amz-date request` header when calculating the string to sign.

Query string request authentication

Request	StringToSign

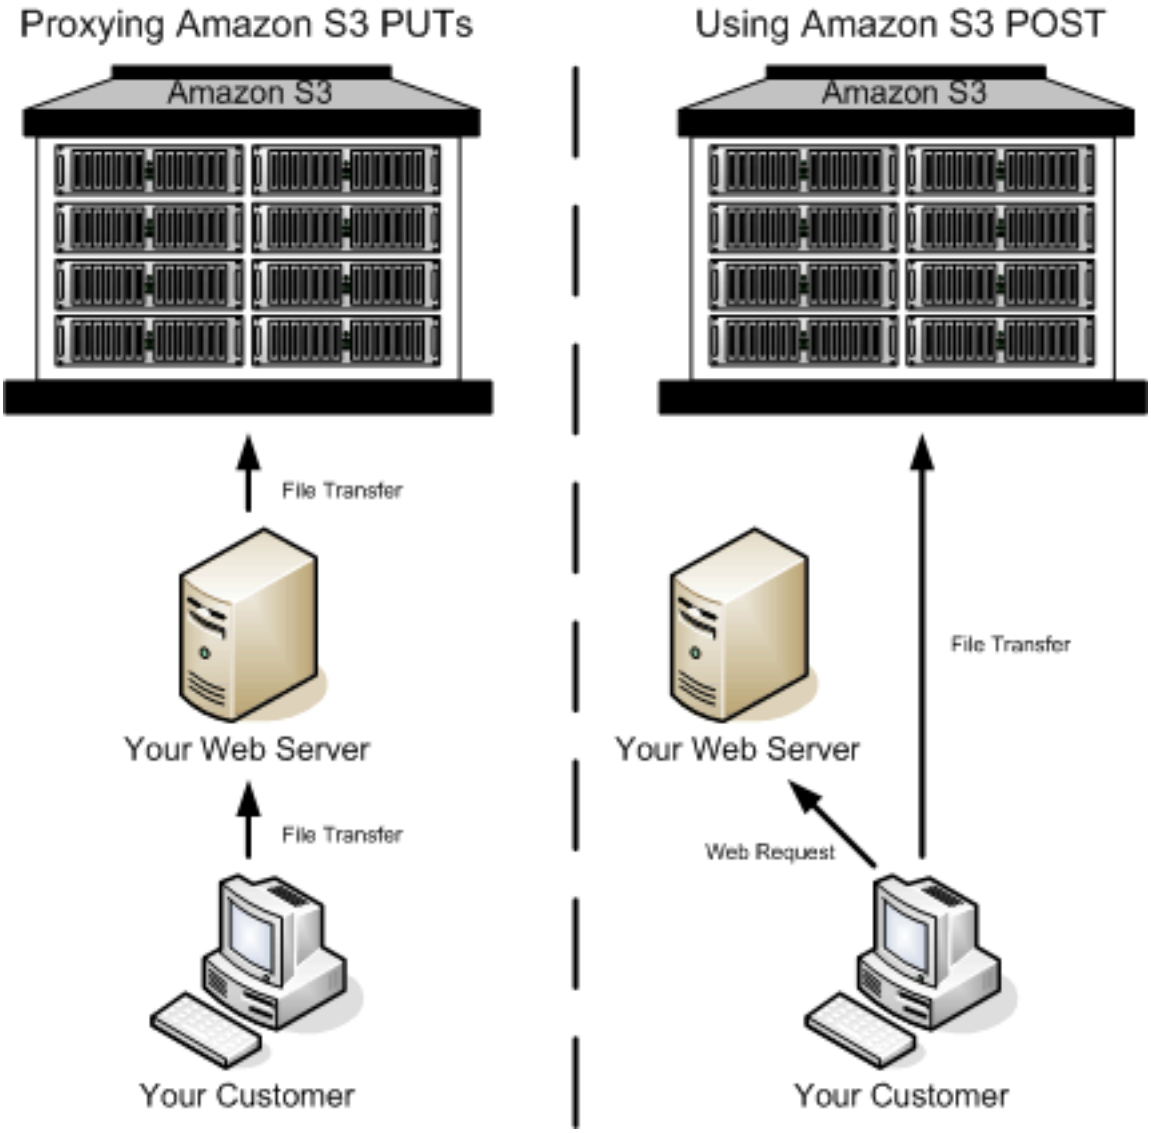
`GET /photos/puppy.jpg?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&`
`    Signature=NpgCjnDzrM%2BWFzoENXmpNDUsSn8%3D&`
`    Expires=1175139620 HTTP/1.1`
 	
`Host: awsexamplebucket1.s3.us-west-1.amazonaws.com`
	`GET\n`
	`\n`
	`\n`
	`1175139620\n`
	
	`/awsexamplebucket1/photos/puppy.jpg`

We assume that when a browser makes the GET request, it won't provide a Content-MD5 or a Content-Type header, nor will it set any x-amz- headers, so those parts of the `StringToSign` are left blank.

Using Base64 encoding

HMAC request signatures must be Base64 encoded. Base64 encoding converts the signature into a simple ASCII string that can be attached to the request. Characters that could appear in the signature string like plus (+), forward slash (/), and equals (=) must be encoded if used in a URI. For example, if the authentication code includes a plus (+) sign, encode it as %2B in the request. Encode a forward slash as %2F and equals as %3D.

For examples of Base64 encoding, refer to the Amazon S3 Authentication examples.



Browser-based uploads using POST (Amazon signature version 2)

Amazon S3 supports POST, which allows your users to upload content directly to Amazon S3. POST is designed to simplify uploads, reduce upload latency, and save you money on applications where users upload data to store in Amazon S3.

Note

The request authentication discussed in this section is based on Amazon Signature Version 2, a protocol for authenticating inbound API requests to Amazon services.
Amazon S3 now supports Signature Version 4, a protocol for authenticating inbound API requests to Amazon services, in all Amazon Web Services Regions. At this time, Amazon Web Services Regions created before January 30, 2014 will continue to support the previous protocol, Signature Version 2. Any new regions after January 30, 2014 will support only Signature Version 4 and therefore all requests to those regions must be made with Signature Version 4. For more information, see Authenticating Requests in Browser-Based Uploads Using POST (Amazon Signature Version 4) in the *Amazon Simple Storage Service API Reference*.

The following figure shows an upload using Amazon S3 POST.

Uploading using POST

1	The user opens a web browser and accesses your web page.
2	Your web page contains an HTTP form that contains all the information necessary for the user to upload content to Amazon S3.
3	The user uploads content directly to Amazon S3.

> **Note**
>
> Query string authentication is not supported for POST.

HTML forms (Amazon signature version 2)

Topics

- HTML form encoding
- HTML form declaration
- HTML form fields
- Policy construction
- Constructing a signature
- Redirection

When you communicate with Amazon S3, you normally use the REST or SOAP API to perform put, get, delete, and other operations. With POST, users upload data directly to Amazon S3 through their browsers, which cannot process the SOAP API or create a REST PUT request.

> **Note**
>
> SOAP APIs for Amazon S3 are not available for new customers, and are approaching End of Life (EOL) on October 31, 2025. We recommend that you use either the REST API or the Amazon SDKs.

To allow users to upload content to Amazon S3 by using their browsers, you use HTML forms. HTML forms consist of a form declaration and form fields. The form declaration contains high-level information about the request. The form fields contain detailed information about the request, as well as the policy that is used to authenticate it and ensure that it meets the conditions that you specify.

> **Note**
>
> The form data and boundaries (excluding the contents of the file) cannot exceed 20 KB.

This section explains how to use HTML forms.

HTML form encoding

The form and policy must be UTF-8 encoded. You can apply UTF-8 encoding to the form by specifying it in the HTML heading or as a request header.

> **Note**
>
> The HTML form declaration does not accept query string authentication parameters.

The following is an example of UTF-8 encoding in the HTML heading:

```
<html>
  <head>
    ...
    <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />
    ...
  </head>
  <body>
```

The following is an example of UTF-8 encoding in a request header:

```
Content-Type: text/html; charset=UTF-8
```

HTML form declaration

The form declaration has three components: the action, the method, and the enclosure type. If any of these values is improperly set, the request fails.

The action specifies the URL that processes the request, which must be set to the URL of the bucket. For example, if the name of your bucket is `awsexamplebucket1` and the Region is US West (N. California), the URL is `https://awsexamplebucket1.s3.us-west-1.amazonaws.com/`.

> **Note**
>
> The key name is specified in a form field.

The method must be POST.

The enclosure type (enctype) must be specified and must be set to multipart/form-data for both file uploads and text area uploads. For more information, go to RFC 1867.

Example

The following example is a form declaration for the bucket "awsexamplebucket1".

```
<form action="https://awsexamplebucket1.s3.us-west-1.amazonaws.com/" method="post"

enctype="multipart/form-data">
```

HTML form fields

The following table describes fields that can be used within an HTML form.

> **Note**
>
> The variable `${filename}` is automatically replaced with the name of the file provided by the user and is recognized by all form fields. If the browser or client provides a full or partial path to the file, only the text following the last slash (/) or backslash (\) will be used. For example, "C:\Program Files\directory1\file.txt" will be interpreted as "file.txt". If no file or file name is provided, the variable is replaced with an empty string.

Field name	Description	Required
`AWSAccessKeyId`	The Amazon Access Key ID of the owner of the bucket who grants an anonymous user access for a request that satisfies the set of constraints in the policy. This field is required if the request includes a policy document.	Conditional
`acl`	An Amazon S3 access control list (ACL). If an invalid access control list is specified, an error is generated.	No

Field name	Description	Required
	Type: String Default: private Valid Values: `private | public-read | public-read-write | aws-exec-read | authenticated-read | bucket-owner-read | bucket-owner-full-control`	
`Cache-Control, Content-Type, Content-Disposition, Content-Encoding, Expires`	REST-specific headers. For more information, see PUT Object.	No
`key`	The name of the uploaded key. To use the filename provided by the user, use the ${filename} variable. For example, if user Betty uploads the file lolcatz.jpg and you specify /user/betty/${filename}, the file is stored as /user/betty/lolcatz.jpg. For more information, see Working with object metadata .	Yes
`policy`	Security policy describing what is permitted in the request. Requests without a security policy are considered anonymous and will succeed only on publicly writable buckets.	No

Field name	Description	Required
`success_action_redirect, redirect`	The URL to which the client is redirected upon successful upload. Amazon S3 appends the bucket, key, and etag values as query string parameters to the URL. If success_action_redirect is not specified, Amazon S3 returns the empty document type specified in the success_action_status field. If Amazon S3 cannot interpret the URL, it ignores the field. If the upload fails, Amazon S3 displays an error and does not redirect the user to a URL. For more information, see Redirection. **Note** The redirect field name is deprecated and support for the redirect field name will be removed in the future.	No

Field name	Description	Required
`success_action_status`	The status code returned to the client upon successful upload if success_action_redirect is not specified. Valid values are 200, 201, or 204 (default). If the value is set to 200 or 204, Amazon S3 returns an empty document with a 200 or 204 status code. If the value is set to 201, Amazon S3 returns an XML document with a 201 status code. For information about the content of the XML document, see POST Object. If the value is not set or if it is set to an invalid value, Amazon S3 returns an empty document with a 204 status code. **Note** Some versions of the Adobe Flash player do not properly handle HTTP responses with an empty body. To support uploads through Adobe Flash, we recommend setting `success_action_status` to 201.	No

Field name	Description	Required
signature	The HMAC signature constructed by using the secret access key that corresponds to the provided AWSAccessKeyId. This field is required if a policy document is included with the request. For more information, see Identity and Access Management for Amazon S3.	Conditional
Other field names prefixed with x-amz-meta-	User-specified metadata. Amazon S3 does not validate or use this data. For more information, see PUT Object.	No
file	File or text content. The file or content must be the last field in the form. Any fields below it are ignored. You cannot upload more than one file at a time.	Yes

Policy construction

Topics

- Expiration
- Conditions
- Condition matching
- Character escaping

The policy is a UTF-8 and Base64-encoded JSON document that specifies conditions that the request must meet and is used to authenticate the content. Depending on how you design your

policy documents, you can use them per upload, per user, for all uploads, or according to other designs that meet your needs.

> **Note**
>
> Although the policy document is optional, we highly recommend it over making a bucket publicly writable.

The following is an example of a policy document:

```
{ "expiration": "2007-12-01T12:00:00.000Z",

  "conditions": [

    {"acl": "public-read" },

    {"bucket": "awsexamplebucket1" },

    ["starts-with", "$key", "user/eric/"],

  ]

}
```

The policy document contains the expiration and conditions.

Expiration

The expiration element specifies the expiration date of the policy in ISO 8601 UTC date format. For example, "2007-12-01T12:00:00.000Z" specifies that the policy is not valid after midnight UTC on 2007-12-01. Expiration is required in a policy.

Conditions

The conditions in the policy document validate the contents of the uploaded object. Each form field that you specify in the form (except AWSAccessKeyId, signature, file, policy, and field names that have an x-ignore- prefix) must be included in the list of conditions.

Note

If you have multiple fields with the same name, the values must be separated by commas. For example, if you have two fields named "x-amz-meta-tag" and the first one has a value of "Ninja" and second has a value of "Stallman", you would set the policy document to `Ninja,Stallman`.
All variables within the form are expanded before the policy is validated. Therefore, all condition matching should be performed against the expanded fields. For example, if you set the key field to `user/betty/${filename}`, your policy might be `[ "starts-with", "$key", "user/betty/" ]`. Do not enter `[ "starts-with", "$key", "user/betty/${filename}" ]`. For more information, see Condition matching.

The following table describes policy document conditions.

Element name	Description
acl	Specifies conditions that the ACL must meet. Supports exact matching and `starts-with` .
content-length-range	Specifies the minimum and maximum allowable size for the uploaded content. Supports range matching.
Cache-Control, Content-Type, Content-Disposition, Content-Encoding, Expires	REST-specific headers. Supports exact matching and `starts-with` .
key	The name of the uploaded key. Supports exact matching and `starts-with` .
success_action_redirect, redirect	The URL to which the client is redirected upon successful upload.

Element name	Description
	Supports exact matching and `starts-with` .
success_action_status	The status code returned to the client upon successful upload if success_action_redirect is not specified. Supports exact matching.
Other field names prefixed with x-amz-meta-	User-specified metadata. Supports exact matching and `starts-with` .

Note

If your toolkit adds additional fields (e.g., Flash adds filename), you must add them to the policy document. If you can control this functionality, prefix `x-ignore-` to the field so Amazon S3 ignores the feature and it won't affect future versions of this feature.

Condition matching

The following table describes condition matching types. Although you must specify one condition for each form field that you specify in the form, you can create more complex matching criteria by specifying multiple conditions for a form field.

Condition	Description
Exact Matches	Exact matches verify that fields match specific values. This example indicates that the ACL must be set to public-read: `{"acl": "public-read" }` This example is an alternate way to indicate that the ACL must be set to public-read:

Condition	Description
	`[ "eq", "$acl", "public-read" ]`
Starts With	If the value must start with a certain value, use starts-with. This example indicates that the key must start with user/betty: `["starts-with", "$key", "user/betty/"]`
Matching Any Content	To configure the policy to allow any content within a field, use starts-with with an empty value. This example allows any success_action_redirect: `["starts-with", "$success_action_redirect", ""]`
Specifying Ranges	For fields that accept ranges, separate the upper and lower ranges with a comma. This example allows a file size from 1 to 10 megabytes: `["content-length-range", 1048579, 10485760]`

Character escaping

The following table describes characters that must be escaped within a policy document.

Escape sequence	Description
\\	Backslash
\$	Dollar sign

Escape sequence	Description
\b	Backspace
\f	Form feed
\n	New line
\r	Carriage return
\t	Horizontal tab
\v	Vertical tab
\u*xxxx*	All Unicode characters

Constructing a signature

Step	Description
1	Encode the policy by using UTF-8.
2	Encode those UTF-8 bytes by using Base64.
3	Sign the policy with your secret access key by using HMAC SHA-1.
4	Encode the SHA-1 signature by using Base64.

For general information about authentication, see Identity and Access Management for Amazon S3.

Redirection

This section describes how to handle redirects.

General redirection

On completion of the POST request, the user is redirected to the location that you specified in the `success_action_redirect` field. If Amazon S3 cannot interpret the URL, it ignores the `success_action_redirect` field.

If `success_action_redirect` is not specified, Amazon S3 returns the empty document type specified in the `success_action_status` field.

If the POST request fails, Amazon S3 displays an error and does not provide a redirect.

Pre-upload redirection

If your bucket was created using <CreateBucketConfiguration>, your end users might require a redirect. If this occurs, some browsers might handle the redirect incorrectly. This is relatively rare but is most likely to occur right after a bucket is created.

Upload examples (Amazon signature version 2)

Topics

- File upload
- Text area upload

> **Note**
>
> The request authentication discussed in this section is based on Amazon Signature Version 2, a protocol for authenticating inbound API requests to Amazon services.
> Amazon S3 now supports Signature Version 4, a protocol for authenticating inbound API requests to Amazon services, in all Amazon Web Services Regions. At this time, Amazon Web Services Regions created before January 30, 2014 will continue to support the previous protocol, Signature Version 2. Any new regions after January 30, 2014 will support only Signature Version 4 and therefore all requests to those regions must be made with Signature Version 4. For more information, see Examples: Browser-Based Upload using HTTP POST (Using Amazon Signature Version 4) in the *Amazon Simple Storage Service API Reference*.

File upload

This example shows the complete process for constructing a policy and form that can be used to upload a file attachment.

Policy and form construction

The following policy supports uploads to Amazon S3 for the awsexamplebucket1 bucket.

```
{ "expiration": "2007-12-01T12:00:00.000Z",
  "conditions": [
    {"bucket": "awsexamplebucket1"},
    ["starts-with", "$key", "user/eric/"],
    {"acl": "public-read"},
    {"success_action_redirect": "https://awsexamplebucket1.s3.us-west-1.amazonaws.com/
successful_upload.html"},
    ["starts-with", "$Content-Type", "image/"],
    {"x-amz-meta-uuid": "14365123651274"},
    ["starts-with", "$x-amz-meta-tag", ""]
  ]
}
```

This policy requires the following:

- The upload must occur before 12:00 UTC on December 1, 2007.
- The content must be uploaded to the awsexamplebucket1 bucket.
- The key must start with "user/eric/".
- The ACL is set to public-read.
- The success_action_redirect is set to https://awsexamplebucket1.s3.us-west-1.amazonaws.com/successful_upload.html.
- The object is an image file.
- The x-amz-meta-uuid tag must be set to 14365123651274.
- The x-amz-meta-tag can contain any value.

The following is a Base64-encoded version of this policy.

```
eyAiZXhwaXJhdGlvbiI6ICIyMDA3LTEyLTAxVDEyOjAwOjAwLjAwMFoiLAogICJjb25kaXRpb25zIjogWwogICAgeyJidW
```

Using your credentials create a signature, for example `0RavWzkygo6QX9caELEqKi9kDbU=` is the signature for the preceding policy document.

The following form supports a POST request to the amzn-s3-demo-bucket bucket that uses this policy.

```
<html>
  <head>
    ...
    <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />
    ...
  </head>
  <body>
  ...
  <form action="https://amzn-s3-demo-bucket.s3.us-west-1.amazonaws.com/" method="post"
 enctype="multipart/form-data">
    Key to upload: <input type="input" name="key" value="user/eric/" /><br />
    <input type="hidden" name="acl" value="public-read" />
    <input type="hidden" name="success_action_redirect" value="https://
awsexamplebucket1.s3.us-west-1.amazonaws.com/successful_upload.html" />
    Content-Type: <input type="input" name="Content-Type" value="image/jpeg" /><br />
    <input type="hidden" name="x-amz-meta-uuid" value="14365123651274" />
    Tags for File: <input type="input" name="x-amz-meta-tag" value="" /><br />
    <input type="hidden" name="AWSAccessKeyId" value="AKIAIOSFODNN7EXAMPLE" />
    <input type="hidden" name="Policy" value="POLICY" />
    <input type="hidden" name="Signature" value="SIGNATURE" />
    File: <input type="file" name="file" /> <br />
    <!-- The elements after this will be ignored -->
    <input type="submit" name="submit" value="Upload to Amazon S3" />
  </form>
  ...
</html>
```

Sample request

This request assumes that the image uploaded is 117,108 bytes; the image data is not included.

```

Text area upload

Topics

- Policy and form construction
- Sample request
- Sample response

The following example shows the complete process for constructing a policy and form to upload a text area. Uploading a text area is useful for submitting user-created content, such as blog postings.

Policy and form construction

The following policy supports text area uploads to Amazon S3 for the awsexamplebucket1 bucket.

```
{ "expiration": "2007-12-01T12:00:00.000Z",
  "conditions": [
```

```
    {"bucket": "awsexamplebucket1"},
    ["starts-with", "$key", "user/eric/"],
    {"acl": "public-read"},
    {"success_action_redirect": "https://awsexamplebucket1.s3.us-west-1.amazonaws.com/
new_post.html"},
    ["eq", "$Content-Type", "text/html"],
    {"x-amz-meta-uuid": "14365123651274"},
    ["starts-with", "$x-amz-meta-tag", ""]
  ]
}
```

This policy requires the following:

- The upload must occur before 12:00 GMT on 2007-12-01.
- The content must be uploaded to the awsexamplebucket1 bucket.
- The key must start with "user/eric/".
- The ACL is set to public-read.
- The success_action_redirect is set to https://awsexamplebucket1.s3.us-west-1.amazonaws.com/new_post.html.
- The object is HTML text.
- The x-amz-meta-uuid tag must be set to 14365123651274.
- The x-amz-meta-tag can contain any value.

Following is a Base64-encoded version of this policy.

```
eyAiZXhwaXJhdGlvbiI6ICIyMDA3LTEyLTAxVDEyOjAwOjAwLjAwMFoiLAogICJjb25kaXR
pb25zIjogWwogICAgeyJidWNrZXQiOiAiam9obnNtaXRoIn0sCiAgICBbInN0YXJ0cy13aXRoIiwgIiRrZXkiLCAidXNlci

C5zMy5hbWF6b25hd3MuY29tL25ld19wb3N0Lmh0bWwifSwKICAgIFsiZXEiLCAiJENvbnRlbnQtVHlwZSIsICJ0ZXh0L2h0
CAgIHsieC1hbXotbWV0YS11dWlkIjogIjE0MzY1MTIzNjUxMjc0In0sCiAgICBbInN0YXJ0cy13aXRoIiwgIiR4LWFtei1t
IsICIiXQogIF0KfQo=
```

Using your credentials, create a signature. For example, qA7FWXKq6VvU68lI9KdveT1cWgF= is the signature for the preceding policy document.

The following form supports a POST request to the amzn-s3-demo-bucket bucket that uses this policy.

```
<html>
```

```
  <head>
    ...
    <meta http-equiv="Content-Type" content="text/html; charset=UTF-8" />
    ...
  </head>
  <body>
  ...
  <form action="https://amzn-s3-demo-bucket.s3.us-west-1.amazonaws.com/" method="post"
 enctype="multipart/form-data">
    Key to upload: <input type="input" name="key" value="user/eric/" /><br />
    <input type="hidden" name="acl" value="public-read" />
    <input type="hidden" name="success_action_redirect" value="https://
awsexamplebucket1.s3.us-west-1.amazonaws.com/new_post.html" />
    <input type="hidden" name="Content-Type" value="text/html" />
    <input type="hidden" name="x-amz-meta-uuid" value="14365123651274" />
    Tags for File: <input type="input" name="x-amz-meta-tag" value="" /><br />
    <input type="hidden" name="AWSAccessKeyId" value="AKIAIOSFODNN7EXAMPLE" />
    <input type="hidden" name="Policy" value="POLICY" />
    <input type="hidden" name="Signature" value="SIGNATURE" />
    Entry: <textarea name="file" cols="60" rows="10">

Your blog post goes here.

    </textarea><br />
    <!-- The elements after this will be ignored -->
    <input type="submit" name="submit" value="Upload to Amazon S3" />
  </form>
  ...
</html>
```

Sample request

This request assumes that the image uploaded is 117,108 bytes; the image data is not included.

```
POST / HTTP/1.1

POST with adobe flash (Amazon signature version 2)

This section describes how to use POST with Adobe Flash.

Adobe flash player security

By default, the Adobe Flash Player security model prohibits Adobe Flash Players from making network connections to servers outside the domain that serves the SWF file.

To override the default, you must upload a publicly readable crossdomain.xml file to the bucket that will accept POST uploads. The following is a sample crossdomain.xml file.

```
<?xml version="1.0"?>
<!DOCTYPE cross-domain-policy SYSTEM
"http://www.macromedia.com/xml/dtds/cross-domain-policy.dtd">
<cross-domain-policy>
<allow-access-from domain="*" secure="false" />
</cross-domain-policy>
```

> **Note**
>
> For more information about the Adobe Flash security model, go to the Adobe website.

Adding the crossdomain.xml file to your bucket allows any Adobe Flash Player to connect to the crossdomain.xml file within your bucket; however, it does not grant access to the actual Amazon S3 bucket.

Adobe flash considerations

The FileReference API in Adobe Flash adds the `Filename` form field to the POST request. When you build Adobe Flash applications that upload to Amazon S3 by using the FileReference API action, include the following condition in your policy:

```
['starts-with', '$Filename', '']
```

Some versions of the Adobe Flash Player do not properly handle HTTP responses that have an empty body. To configure POST to return a response that does not have an empty body, set `success_action_status` to 201. Amazon S3 will then return an XML document with a 201 status code. For information about the content of the XML document, see POST Object. For information about form fields, see HTML form fields.

Appendix: Lifecycle Configuration APIs (Deprecated)

Bucket lifecycle configuration is updated to support filters based on object tags. That is, you can now specify a rule that specifies key name prefix, one or more object tags, or both to select a subset of objects to which the rule applies. The APIs have been updated accordingly. The following topics describes the prior version of the PUT and GET bucket lifecycle operations for backward compatibility.

Topics

- PUT Bucket lifecycle (Deprecated)
- GET Bucket lifecycle (Deprecated)

PUT Bucket lifecycle (Deprecated)

Description

> **Important**
>
> For an updated version of this API, see PutBucketLifecycleConfiguration. This version has been deprecated. Existing lifecycle configurations will work. For new lifecycle configurations, use the updated API.

Creates a new lifecycle configuration for the bucket or replaces an existing lifecycle configuration. For information about lifecycle configuration, see Object Lifecycle Management in the *Amazon Simple Storage Service User Guide*.

Permissions

By default, all Amazon S3 resources, including buckets, objects, and related subresources (for example, lifecycle configuration and website configuration) are private. Only the resource owner, the Amazon Web Services account that created the resource, can access it. The resource owner can optionally grant access permissions to others by writing an access policy. For this operation, users must get the `s3:PutLifecycleConfiguration` permission.

You can also explicitly deny permissions. Explicit denial also supersedes any other permissions. If you want to prevent users or accounts from removing or deleting objects from your bucket, you must deny them permissions for the following actions:

- `s3:DeleteObject`
- `s3:DeleteObjectVersion`
- `s3:PutLifecycleConfiguration`

For more information about permissions, see Managing Access Permissions to Your Amazon S3 Resources in the *Amazon Simple Storage Service User Guide*.

Requests

Syntax

```
PUT /?lifecycle HTTP/1.1
Host: bucketname.s3.amazonaws.com
Content-Length: length
Date: date
Authorization: authorization string
Content-MD5: MD5

Lifecycle configuration in the request body
```

For details about authorization strings, see Authenticating Requests (Amazon Signature Version 4).

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

Name	Description	Required
Content-MD5	The base64-encoded 128-bit MD5 digest of the data. You must use this header as a message integrity check to verify that the request body was not corrupted in transit. For more information, see RFC 1864. Type: String Default: None	Yes

Request Body

In the request, you specify the lifecycle configuration in the request body. The lifecycle configuration is specified as XML. The following is an example of a basic lifecycle configuration. It specifies one rule. The `Prefix` in the rule identifies objects to which the rule applies. The rule also specifies two actions (`Transition`and `Expiration`). Each action specifies a timeline when

Amazon S3 should perform the action. The `Status` indicates whether the rule is enabled or disabled.

```
<LifecycleConfiguration>
    <Rule>
        <ID>sample-rule</ID>
        <Prefix>key-prefix</Prefix>
        <Status>rule-status</Status>
        <Transition>
           <Date>value</Date>
           <StorageClass>storage class</StorageClass>
        </Transition>
        <Expiration>
           <Days>value</Days>
        </Expiration>
    </Rule>
</LifecycleConfiguration>
```

If the state of your bucket is versioning-enabled or versioning-suspended, you can have many versions of the same object: one current version and zero or more noncurrent versions. The following lifecycle configuration specifies the actions (`NoncurrentVersionTransition`, `NoncurrentVersionExpiration`) that are specific to noncurrent object versions.

```
<LifecycleConfiguration>
    <Rule>
        <ID>sample-rule</ID>
        <Prefix>key-prefix</Prefix>
        <Status>rule-status</Status>
        <NoncurrentVersionTransition>
           <NoncurrentDays>value</NoncurrentDays>
           <StorageClass>storage class</StorageClass>
        </NoncurrentVersionTransition>
        <NoncurrentVersionExpiration>
           <NoncurrentDays>value</NoncurrentDays>
        </NoncurrentVersionExpiration>
    </Rule>
</LifecycleConfiguration>
```

You can use the multipart upload API to upload large objects in parts. For more information about multipart uploads, see Multipart Upload Overview in the *Amazon Simple Storage Service User Guide*. With lifecycle configuration, you can tell Amazon S3 to cancel incomplete multipart

uploads, which are identified by the key name prefix specified in the rule, if they don't complete within a specified number of days. When Amazon S3 cancels a multipart upload, it deletes all parts associated with the upload. This ensures that you don't have incomplete multipart uploads that have left parts stored in Amazon S3, so you don't have to pay storage costs for them. The following is an example lifecycle configuration that specifies a rule with the `AbortIncompleteMultipartUpload` action. This action tells Amazon S3 to cancel incomplete multipart uploads seven days after initiation.

```
<LifecycleConfiguration>
    <Rule>
        <ID>sample-rule</ID>
        <Prefix>SomeKeyPrefix/</Prefix>
        <Status>rule-status</Status>
        <AbortIncompleteMultipartUpload>
          <DaysAfterInitiation>7</DaysAfterInitiation>
        </AbortIncompleteMultipartUpload>
    </Rule>
</LifecycleConfiguration>
```

The following table describes the XML elements in the lifecycle configuration.

Name	Description	Required
`AbortIncompleteMultipartUpload`	Container for specifying when an incomplete multipart upload becomes eligible for an abort operation. Child: `DaysAfterInitiation` Type: Container Ancestor: `Rule`	Yes, if no other action is specified for the rule
`Date`	Date when you want Amazon S3 to take the action. For more information, see Lifecycle Rules: Based on a Specific Date in the *Amazon Simple Storage Service User Guide*.	Yes, if `Days` and `ExpiredObjectDelet`

Name	Description	Required
	The date value must conform to ISO 8601 format. The time is always midnight UTC. Type: String Ancestor: `Expiration` or `Transition`	`eMarker` are absent
`Days`	Specifies the number of days after object creation when the specific rule action takes effect. Type: Nonnegative Integer when used with `Transition` , Positive Integer when used with `Expiration` Ancestor: `Expiration` , `Transition`	Yes, if `Date` and `ExpiredObjectDeleteMarker` are absent
`DaysAfterInitiation`	Specifies the number of days after initiating a multipart upload when the multipart upload must be completed. If it does not complete by the specified number of days, it becomes eligible for an abort operation and Amazon S3 cancels the incomplete multipart upload. Type: Positive Integer Ancestor: `AbortIncompleteMultipartUpload`	Yes, if a parent tag is specified

Name	Description	Required
`Expiration`	This action specifies a period in an object's lifetime when Amazon S3 should take the appropriate expiration action. The action Amazon S3 takes depends on whether the bucket is versioning-enabled. • If versioning has never been enabled on the bucket, Amazon S3 deletes the only copy of the object permanently. • If the bucket is versioning-enabled (or versioning is suspended), the action applies only to the current version of the object. A versioning-enabled bucket can have many versions of the same object: one current version and zero or more noncurrent versions. Instead of deleting the current version, Amazon S3 makes it a noncurrent version by adding a delete marker as the new current version. **Important** If a bucket's state is versioning-suspended, Amazon S3 creates a delete marker with version ID `null`. If you have a version with version ID `null`, Amazon S3 overwrites that version.	Yes, if no other action is present in the `Rule`.

Name	Description	Required
	Note To set the expiration for noncurrent objects, use the `NoncurrentVersionExpiration` action. Type: Container Children: Days or Date Ancestor: Rule	
`ID`	Unique identifier for the rule. The value cannot be longer than 255 characters. Type: String Ancestor: Rule	No
`LifecycleConfiguration`	Container for lifecycle rules. You can add as many as 1000 rules. Type: Container Children: Rule Ancestor: None	Yes

Name	Description	Required
`ExpiredObjectDeleteMarker`	On a versioned bucket (a versioning-enabled or versioning-suspended bucket), you can add this element in the lifecycle configuration to tell Amazon S3 to delete expired object delete markers. For an example, see Example 8: Removing Expired Object Delete Markers in the *Amazon Simple Storage Service User Guide*. Don't add it to a non-versioned bucket, because that type of bucket cannot include delete markers. Type: String Valid values: true | false (the value `false` is allowed, but it is no-op, which means that Amazon S3 will not take action) Ancestor: `Expiration`	Yes, if `Date` and `Days` are absent
`NoncurrentDays`	Specifies the number of days an object is noncurrent before Amazon S3 can perform the associated action. For information about the noncurrent days calculations, see How Amazon S3 Calculates When an Object Became Noncurrent in the *Amazon Simple Storage Service User Guide*. Type: Nonnegative Integer when used with `NoncurrentVersionTransition`, Positive Integer when used with `NoncurrentVersionExpiration` Ancestor: `NoncurrentVersionExpiration` or `NoncurrentVersionTransition`	Yes

Name	Description	Required
NoncurrentVersionExpiration	Specifies when noncurrent object versions expire. Upon expiration, Amazon S3 permanently deletes the noncurrent object versions. Set this lifecycle configuration action on a bucket that has versioning enabled (or suspended) to tell Amazon S3 to delete noncurrent object versions at a specific period in the object's lifetime. Type: Container Children: NoncurrentDays Ancestor: Rule	Yes, if no other action is present in the Rule
NoncurrentVersionTransition	Container for the transition rule that describes when noncurrent objects transition to the STANDARD_IA , ONEZONE_IA , or GLACIER storage class. If your bucket is versioning-enabled (or if versioning is suspended), you can set this action to tell Amazon S3 to transition noncurrent object versions at a specific period in the object's lifetime. Type: Container Children: NoncurrentDays and StorageClass Ancestor: Rule	Yes, if no other action is present in the Rule

Name	Description	Required
`Prefix`	Object key prefix that identifies one or more objects to which the rule applies. Type: String Ancestor: Rule	Yes
`Rule`	Container for a lifecycle rule. A lifecycle configuration can contain as many as 1000 rules. Type: Container Ancestor:LifecycleConfiguration	Yes
`Status`	If enabled, Amazon S3 executes the rule as scheduled. If it is disabled, Amazon S3 ignores the rule. Type: String Ancestor: Rule Valid values: Enabled, Disabled	Yes
`StorageClass`	Specifies the Amazon S3 storage class to which you want the object to transition. Type: String Ancestor: Transition and NoncurrentVersionTransition Valid values: STANDARD_IA | ONEZONE_IA | GLACIER	Yes This element is required only if you specify one or both its ancestors.

Name	Description	Required
Transition	This action specifies a period in the objects' lifetime when Amazon S3 should transition them to the STANDARD_IA , ONEZONE_IA , or GLACIER storage class. When this action is in effect, what Amazon S3 does depends on whether the bucket is versioning-enabled. • If versioning has never been enabled on the bucket, Amazon S3 transitions the only copy of the object to the specified storage class. • If your bucket is versioning-enabled (or versioning is suspended), Amazon S3 transitions only the current versions of objects identified in the rule. **Note** A versioning-enabled bucket can have many versions of an object. This action has no effect on noncurrent object versions. To transition noncurrent objects, you must use the NoncurrentVersionTransition action. Type: Container Children: Days or Date, and StorageClass	Yes, if no other action is present in the Rule

Name	Description	Required
	Ancestor: Rule	

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers.

Response Elements

This implementation of the operation does not return response elements.

Special Errors

This implementation of the operation does not return special errors. For general information about Amazon S3 errors and a list of error codes, see Error Responses.

Examples

Example 1: Add Lifecycle Configuration to a Bucket That Is Not Versioning-enabled

The following lifecycle configuration specifies two rules, each with one action.

- The Transition action tells Amazon S3 to transition objects with the "documents/" prefix to the GLACIER storage class 30 days after creation.
- The Expiration action tells Amazon S3 to delete objects with the "logs/" prefix 365 days after creation.

```
<LifecycleConfiguration>
  <Rule>
    <ID>id1</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <Transition>
      <Days>30</Days>
      <StorageClass>GLACIER</StorageClass>
    </Transition>
```

```
  </Rule>
  <Rule>
    <ID>id2</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <Expiration>
      <Days>365</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>
```

The following is a sample PUT `/?lifecycle` request that adds the preceding lifecycle configuration to the `examplebucket` bucket.

```
PUT /?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Wed, 14 May 2014 02:11:21 GMT
Content-MD5: q6yJDlIkcBaGGfb3QLY69A==
Authorization: authorization string
Content-Length: 415

<LifecycleConfiguration>
  <Rule>
    <ID>id1</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <Transition>
      <Days>30</Days>
      <StorageClass>GLACIER</StorageClass>
    </Transition>
  </Rule>
  <Rule>
    <ID>id2</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <Expiration>
      <Days>365</Days>
    </Expiration>
  </Rule>
</LifecycleConfiguration>
```

The following is a sample response.

```
HTTP/1.1 200 OK
x-amz-id-2: r+qR7+nhXtJDDIJ0JJYcd+1j5nM/rUFiiiZ/fNbDOsd3JUE8NWMLNHXmvPfwMpdc
x-amz-request-id: 9E26D08072A8EF9E
Date: Wed, 14 May 2014 02:11:22 GMT
Content-Length: 0
Server: AmazonS3
```

Example 2: Add Lifecycle Configuration to a Versioning-enabled Bucket

The following lifecycle configuration specifies two rules, each with one action for Amazon S3 to perform. You specify these actions when your bucket is versioning-enabled or versioning is suspended:

- The `NoncurrentVersionExpiration` action tells Amazon S3 to expire noncurrent versions of objects with the "logs/" prefix 100 days after the objects become noncurrent.
- The `NoncurrentVersionTransition` action tells Amazon S3 to transition noncurrent versions of objects with the "documents/" prefix to the GLACIER storage class 30 days after they become noncurrent.

```
<LifeCycleConfiguration>
  <Rule>
    <ID>DeleteAfterBecomingNonCurrent</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>100</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </Rule>
  <Rule>
    <ID>TransitionAfterBecomingNonCurrent</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <NoncurrentVersionTransition>
      <NoncurrentDays>30</NoncurrentDays>
      <StorageClass>GLACIER</StorageClass>
    </NoncurrentVersionTransition>
  </Rule>
</LifeCycleConfiguration>
```

The following is a sample PUT /?lifecycle request that adds the preceding lifecycle configuration to the examplebucket bucket.

```
PUT /?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Wed, 14 May 2014 02:21:48 GMT
Content-MD5: 96rxH9mDqVNKkaZDddgnw==
Authorization: authorization string
Content-Length: 598

<LifeCycleConfiguration>
  <Rule>
    <ID>DeleteAfterBecomingNonCurrent</ID>
    <Prefix>logs/</Prefix>
    <Status>Enabled</Status>
    <NoncurrentVersionExpiration>
      <NoncurrentDays>1</NoncurrentDays>
    </NoncurrentVersionExpiration>
  </Rule>
  <Rule>
    <ID>TransitionSoonAfterBecomingNonCurrent</ID>
    <Prefix>documents/</Prefix>
    <Status>Enabled</Status>
    <NoncurrentVersionTransition>
      <NoncurrentDays>0</NoncurrentDays>
      <StorageClass>GLACIER</StorageClass>
    </NoncurrentVersionTransition>
  </Rule>
</LifeCycleConfiguration>
```

The following is a sample response.

```
HTTP/1.1 200 OK
x-amz-id-2: aXQ+KbIrmMmoO//3bMdDTw/CnjArwje+J49Hf+j44yRb/VmbIkgIO5A+PT98Cp/6k07hf
+LD2mY=
x-amz-request-id: 02D7EC4C10381EB1
Date: Wed, 14 May 2014 02:21:50 GMT
Content-Length: 0
Server: AmazonS3
```

Additional Examples

For more examples of transitioning objects to storage classes such as STANDARD_IA or ONEZONE_IA, see Examples of Lifecycle Configuration.

Related Resources

- GetBucketLifecycleConfiguration
- POST Object restore
- By default, a resource owner—in this case, a bucket owner, which is the Amazon Web Services account that created the bucket—can perform any of the operations. A resource owner can also grant others permission to perform the operation. For more information, see the following topics in the *Amazon Simple Storage Service User Guide*:
  - Specifying Permissions in a Policy
  - Managing Access Permissions to Your Amazon S3 Resources

GET Bucket lifecycle (Deprecated)

Description

> **Important**
>
> For an updated version of this API, see GetBucketLifecycleConfiguration. If you configured a bucket lifecycle using the <filter> element, you should see an updated version of this topic. This topic is provided for backward compatibility.

Returns the `lifecycle` configuration information set on the bucket. For information about lifecycle configuration, go to Object Lifecycle Management in the *Amazon Simple Storage Service User Guide*.

To use this operation, you must have permission to perform the `s3:GetLifecycleConfiguration` action. The bucket owner has this permission by default. The bucket owner can grant this permission to others. For more information about permissions, see Managing Access Permissions to Your Amazon S3 Resources in the *Amazon Simple Storage Service User Guide*.

Requests

Syntax

```
GET /?lifecycle HTTP/1.1
Host: bucketname.s3.amazonaws.com
Date: date
Authorization: authorization string (see Authenticating Requests (Amazon Signature
 Version
  4))
```

Request Parameters

This implementation of the operation does not use request parameters.

Request Headers

This implementation of the operation uses only request headers that are common to all operations. For more information, see Common Request Headers.

Request Elements

This implementation of the operation does not use request elements.

Responses

Response Headers

This implementation of the operation uses only response headers that are common to most responses. For more information, see Common Response Headers.

Response Elements

This implementation of GET returns the following response elements.

Name	Description	Required
AbortIncompleteMultipartUpload	Container for specifying when an incomplete multipart upload becomes eligible for an abort operation. Child: DaysAfterInitiation Type: Container Ancestor: Rule	Yes, if no other action is specified for the rule
Date	Date when you want Amazon S3 to take the action. For more information, see Lifecycle Rules: Based on a Specific Date in the *Amazon Simple Storage Service User Guide*. The date value must conform to the ISO 8601 format. The time is always midnight UTC. Type: String Ancestor: Expiration or Transition	Yes, if Days and ExpiredObjectDeleteMarker are absent

Name	Description	Required
Days	Specifies the number of days after object creation when the specific rule action takes effect. The object's eligibility time is calculated as creation time + the number of days with the resulting time rounded to midnight UTC of the next day. Type: Non-negative Integer when used with Transition , Positive Integer when used with Expiration . Ancestor: Transition or Expiration	Yes, if Date and ExpiredObjectDeleteMarker are absent
DaysAfterInitiation	Specifies the number of days after initiating a multipart upload when the multipart upload must be completed. If it does not complete by the specified number of days, it becomes eligible for an abort operation and Amazon S3 cancels the incomplete multipart upload. Type: Positive Integer Ancestor: AbortIncompleteMultipartUpload	Yes, if Date is absent

Name	Description	Required
`Expiration`	This action specifies a period in the object's lifetime when Amazon S3 should take the appropriate expiration action. The expiration action occurs only on objects that are eligible according to the period specified in the child `Date` or `Days` element. The action Amazon S3 takes depends on whether the bucket is versioning enabled. • If versioning has never been enabled on the bucket, Amazon S3 deletes the only copy of the object permanently. • Otherwise, if your bucket is versioning-enabled (or versioning is suspended), the action applies only to the current version of the object. Buckets that are versioning-enabled or versioning-suspended can have many versions of the same object: one current version, and zero or more noncurrent versions. Instead of deleting the current version, Amazon S3 makes it a noncurrent version by adding a delete marker as the new current version. **Important** If the state of a bucket is versioning-suspended, Amazon S3 creates a delete marker with version ID `null`. If you have a version with	Yes, if the parent tag is specified

Name	Description	Required
	version ID `null`, then Amazon S3 overwrites that version. **Note** To set the expiration for noncurrent objects, you must use the `NoncurrentVersionExpiration` action. Type: Container Children: Days or Date Ancestor: Rule	
`ID`	Unique identifier for the rule. The value cannot be longer than 255 characters. Type: String Ancestor: Rule	No
`LifecycleConfiguration`	Container for lifecycle rules. You can add as many as 1000 rules. Type: Container Children: Rule Ancestor: None	Yes

Name	Description	Required
`ExpiredObjectDeleteMarker`	On a versioned bucket (versioning-enabled or versioning-suspended bucket), this element indicates whether Amazon S3 will delete any expired object delete markers in the bucket. For an example, go to Example 8: Specify Expiration Action to Remove Expired Object Delete Markers in the *Amazon Simple Storage Service User Guide*. Type: String Valid values: true | false (the value false is allowed but it is no-op, Amazon S3 doesn't take action if the value is false) Ancestor: `Expiration`	Yes, if `Date` and `Days` are absent
`NoncurrentDays`	Specifies the number of days that an object is noncurrent before Amazon S3 can perform the associated action. For information about calculating noncurrent days, see Lifecycle Rules Based on the Number of Days in the *Amazon Simple Storage Service User Guide*. Type: Nonnegative Integer when used with `NoncurrentVersionTransition`, Positive Integer when used with `NoncurrentVersionExpiration` Ancestor: `NoncurrentVersionExpiration` or `NoncurrentVersionTransition`	Yes, only if the ancestor is present

Name	Description	Required
NoncurrentVersionExpiration	Specifies when noncurrent object versions expire. Upon expiration, Amazon S3 permanently deletes the noncurrent object versions. Set this lifecycle configuration action on a bucket that has versioning enabled (or suspended) to request that Amazon S3 delete noncurrent object versions at a specific period in the object's lifetime. Type: Container Children: NoncurrentDays Ancestor: Rule	Yes, if no other action is present in the Rule
NoncurrentVersionTransition	Container for the transition rule that describes when noncurrent objects transition to the STANDARD_IA, ONEZONE_IA, or the GLACIER storage class. If your bucket is versioning-enabled (or versioning is suspended), you can set this action to request Amazon S3 to transition noncurrent object versions to the GLACIER storage class at a specific period in the object's lifetime. Type: Container Children: NoncurrentDays and StorageClass Ancestor: Rule	Yes, if no other action is present in the Rule

Name	Description	Required
`Prefix`	Object key prefix identifying one or more objects to which the rule applies. Type: String Ancestor: Rule	Yes
`Rule`	Container for a lifecycle rule. Type: Container Ancestor: LifecycleConfiguration	Yes
`Status`	If Enabled, Amazon S3 executes the rule as scheduled. If Disabled, Amazon S3 ignores the rule. Type: String Ancestor: Rule Valid values: Enabled or Disabled	Yes
`StorageClass`	Specifies the Amazon S3 storage class to which you want to transition the object. Type: String Ancestor: Transition and NoncurrentVersionTransition Valid values: `STANDARD_IA` | `ONEZONE_IA` | GLACIER	Yes

Name	Description	Required
`Transition`	This action specifies a period in the objects' lifetime when Amazon S3 should transition them to the `STANDARD_IA` , `ONEZONE_IA` , or GLACIER storage class. When this action is in effect, what Amazon S3 does depends on whether the bucket is versioning-enabled. • If versioning has never been enabled on the bucket, Amazon S3 transitions the only copy of the object to the specified storage class. • When your bucket is versioning-enabled (or versioning is suspended), Amazon S3 transitions only the current versions of the objects identified in the rule. **Note** A versioning-enabled or versioning-suspended bucket can contain many versions of an object. This action has no effect on the noncurrent object versions. To transition noncurrent objects, you must use the `NoncurrentVersionTransition` action. Type: Container	Yes, if no other action is present in the `Rule`

Name	Description	Required
	Children: Days or Date, and StorageClass Ancestor: Rule	

Special Errors

Error Code	Description	HTTP Status Code	SOAP Fault Code Prefix
`NoSuchLifecycleConfiguration`	The lifecycle configuration does not exist.	404 Not Found	Client

For general information about Amazon S3 errors and a list of error codes, see Error responses.

Examples

Example 1: Retrieve a Lifecycle Subresource

This example is a GET request to retrieve the `lifecycle` subresource from the specified bucket, and an example response with the returned lifecycle configuration.

Sample Request

```
GET /?lifecycle HTTP/1.1
Host: examplebucket.s3.amazonaws.com
x-amz-date: Thu, 15 Nov 2012 00:17:21 GMT
Authorization: signatureValue
```

Sample Response

```
HTTP/1.1 200 OK
x-amz-id-2: ITnGT1y4RyTmXa3rPi4hklTXouTf0hccUjo0iCPjz6FnfIutBj3M7fPGlWO2SEWp
x-amz-request-id: 51991C342C575321
Date: Thu, 15 Nov 2012 00:17:23 GMT
Server: AmazonS3
Content-Length: 358
```

```
<?xml version="1.0" encoding="UTF-8"?>
<LifecycleConfiguration xmlns="http://s3.amazonaws.com/doc/2006-03-01/">
    <Rule>
        <ID>Archive and then delete rule</ID>
        <Prefix>projectdocs/</Prefix>
        <Status>Enabled</Status>
       <Transition>
           <Days>30</Days>
           <StorageClass>STANDARD_IA</StorageClass>
        </Transition>
        <Transition>
           <Days>365</Days>
           <StorageClass>GLACIER</StorageClass>
        </Transition>
        <Expiration>
           <Days>3650</Days>
        </Expiration>
    </Rule>
</LifecycleConfiguration>
```
