To verify a domain with Amazon SES

The following example uses the `verify-domain-identity` command to verify a domain:

```
aws ses verify-domain-identity --domain example.com
```

Output:

```
{
    "VerificationToken": "eoEmxw+YaYhb3h3iVJHuXMJXqeu1q1/wwmvjuEXAMPLE"
}
```

To complete domain verification, you must add a TXT record with the returned verification token to your domain's DNS settings. For more information, see Verifying Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see VerifyDomainIdentity in *Amazon CLI Command Reference*.

`verify-email-identity`

The following code example shows how to use `verify-email-identity`.

Amazon CLI

To verify an email address with Amazon SES

The following example uses the `verify-email-identity` command to verify an email address:

```
aws ses verify-email-identity --email-address user@example.com
```

Before you can send an email using Amazon SES, you must verify the address or domain that you are sending the email from to prove that you own it. If you do not have production access yet, you also need to verify any email addresses that you send emails to except for email addresses provided by the Amazon SES mailbox simulator.

After verify-email-identity is called, the email address will receive a verification email. The user must click on the link in the email to complete the verification process.

For more information, see Verifying Email Addresses in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see VerifyEmailIdentity in *Amazon CLI Command Reference*.

Shield examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Shield.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-drt-log-bucket`

The following code example shows how to use `associate-drt-log-bucket`.

Amazon CLI

To authorize the DRT to access an Amazon S3 bucket

The following `associate-drt-log-bucket` example creates an association between the DRT and the specified S3 bucket. This permits the DRT to access the bucket on behalf of the account.:

```
aws shield associate-drt-log-bucket \
    --log-bucket flow-logs-for-website-lb
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *Amazon Shield Advanced Developer Guide*.

- For API details, see AssociateDrtLogBucket in *Amazon CLI Command Reference*.

`associate-drt-role`

The following code example shows how to use `associate-drt-role`.

Amazon CLI

To authorize the DRT to mitigate potential attacks on your behalf

The following `associate-drt-role` example creates an association between the DRT and the specified role. The DRT can use the role to access and manage the account.

```
aws shield associate-drt-role \
    --role-arn arn:aws:iam::123456789012:role/service-role/DrtRole
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *Amazon Shield Advanced Developer Guide*.

- For API details, see AssociateDrtRole in *Amazon CLI Command Reference*.

`create-protection`

The following code example shows how to use `create-protection`.

Amazon CLI

To enable Amazon Shield Advanced protection for a single Amazon resource

The following `create-protection` example enables Shield Advanced protection for the specified Amazon CloudFront distribution.

```
aws shield create-protection \
    --name "Protection for CloudFront distribution" \
    --resource-arn arn:aws:cloudfront::123456789012:distribution/E198WC25FXOWY8
```

Output:

```
{
    "ProtectionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Specify Your Resources to Protect in the *Amazon Shield Advanced Developer Guide*.

- For API details, see CreateProtection in *Amazon CLI Command Reference*.

`create-subscription`

The following code example shows how to use `create-subscription`.

Amazon CLI

To enable Amazon Shield Advanced protection for an account

The following `create-subscription` example enables Shield Advanced protection for the account.

```
aws shield create-subscription
```

This command produces no output.

For more information, see Getting Started with Amazon Shield Advanced in the *Amazon Shield Advanced Developer Guide*.

- For API details, see CreateSubscription in *Amazon CLI Command Reference*.

`delete-protection`

The following code example shows how to use `delete-protection`.

Amazon CLI

To remove Amazon Shield Advanced protection from an Amazon resource

The following `delete-protection` example removes the specified Amazon Shield Advanced protection.

```
aws shield delete-protection \
    --protection-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Removing Amazon Shield Advanced from an Amazon Resource in the *Amazon Shield Advanced Developer Guide*.

- For API details, see DeleteProtection in *Amazon CLI Command Reference*.

`describe-attack`

The following code example shows how to use `describe-attack`.

Amazon CLI

To retrieve a detailed description of an attack

The following `describe-attack` example displays details about the DDoS attack with the specified attack ID. You can obtain attack IDs by running the `list-attacks` command.

```
aws shield describe-attack --attack-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "Attack": {
        "AttackId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "ResourceArn": "arn:aws:elasticloadbalancing:us-

```

For more information, see Reviewing DDoS Incidents in the *Amazon Shield Advanced Developer Guide*.

- For API details, see DescribeAttack in *Amazon CLI Command Reference*.

`describe-drt-access`

The following code example shows how to use `describe-drt-access`.

Amazon CLI

To retrieve a description of the authorizations the DRT has to mitigate attacks on your behalf

The following `describe-drt-access` example retrieves the role and S3 bucket authorizations that the DRT has, which allow it to respond to potential attacks on your behalf.

```
aws shield describe-drt-access
```

Output:

```
{
    "RoleArn": "arn:aws:iam::123456789012:role/service-role/DrtRole",
    "LogBucketList": [
        "flow-logs-for-website-lb"
    ]
}
```

For more information, see Authorize the DDoS Response Team in the *Amazon Shield Advanced Developer Guide*.

- For API details, see DescribeDrtAccess in *Amazon CLI Command Reference*.

`describe-emergency-contact-settings`

The following code example shows how to use `describe-emergency-contact-settings`.

Amazon CLI

To retrieve emergency e-mail addresses that you have on file with the DRT

The following `describe-emergency-contact-settings` example retrieves the e-mail addresses that are on file with the DRT for the account. These are the addresses the DRT should contact when it's responding to a suspected attack.

```
aws shield describe-emergency-contact-settings
```

Output:

```
{
    "EmergencyContactList": [
```

```
        {
            "EmailAddress": "ops@example.com"
        },
        {
            "EmailAddress": "ddos-notifications@example.com"
       }
    ]
}
```

For more information, see How Amazon Shield Works<https://docs.aws.amazon.com/waf/latest/developerguide/ddos-overview.html> in the *Amazon Shield Advanced Developer Guide*.

- For API details, see DescribeEmergencyContactSettings in *Amazon CLI Command Reference*.

`describe-protection`

The following code example shows how to use `describe-protection`.

Amazon CLI

To retrieve the details for an Amazon Shield Advanced protection

The following `describe-protection` example displays details about the Shield Advanced protection with the specified ID. You can obtain protection IDs by running the `list-protections` command.

```
aws shield describe-protection \
    --protection-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Protection": {
        "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Name": "1.2.3.4",
        "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:eip-allocation/
eipalloc-0ac1537af40742a6d"
    }
}
```

For more information, see Specify Your Resources to Protect in the *Amazon Shield Advanced Developer Guide*.

- For API details, see DescribeProtection in *Amazon CLI Command Reference*.

`describe-subscription`

The following code example shows how to use `describe-subscription`.

Amazon CLI

To retrieve the details of the Amazon Shield Advanced protection for the account

The following `describe-subscription` example displays details about the Shield Advanced protection provided for the account.:

```
aws shield describe-subscription
```

Output:

```
{
    "Subscription": {
        "StartTime": 1534368978.0,

                "Max": 1000
```

```
            }
        ]
    }
}
```

For more information, see How Amazon Shield Works in the *Amazon Shield Advanced Developer Guide*.

- For API details, see DescribeSubscription in *Amazon CLI Command Reference*.

`disassociate-drt-log-bucket`

The following code example shows how to use `disassociate-drt-log-bucket`.

Amazon CLI

To remove the authorization for DRT to access an Amazon S3 bucket on your behalf

The following `disassociate-drt-log-bucket` example removes the association between the DRT and the specified S3 bucket. After this command completes, the DRT can no longer access the bucket on behalf of the account.

```
aws shield disassociate-drt-log-bucket \
    --log-bucket flow-logs-for-website-lb
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *Amazon Shield Advanced Developer Guide*.

- For API details, see DisassociateDrtLogBucket in *Amazon CLI Command Reference*.

`disassociate-drt-role`

The following code example shows how to use `disassociate-drt-role`.

Amazon CLI

To remove the authorization for DRT to mitigate potential attacks on your behalf

The following `disassociate-drt-role` example removes the association between the DRT and the account. After this call, the DRT can no longer access or manage your account.

```
aws shield disassociate-drt-role
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *Amazon Shield Advanced Developer Guide*.

- For API details, see DisassociateDrtRole in *Amazon CLI Command Reference*.

`get-subscription-state`

The following code example shows how to use `get-subscription-state`.

Amazon CLI

To retrieve the current state of the account's Amazon Shield Advanced subscription

The following `get-subscription-state` example retrieves the state of the Shield Advanced protection for the account.

```
aws shield get-subscription-state
```

Output:

```
{
    "SubscriptionState": "ACTIVE"
}
```

For more information, see How Amazon Shield Works in the *Amazon Shield Advanced Developer Guide*.

- For API details, see GetSubscriptionState in *Amazon CLI Command Reference*.

`list-attacks`

The following code example shows how to use `list-attacks`.

Amazon CLI

To retrieve attack summaries from Amazon Shield Advanced

The following `list-attacks` example retrieves summaries of attacks for the specified Amazon CloudFront distribution during the specified time period. The response includes attack IDs that you can provide to the `describe-attack` command for detailed information on an attack.

```
aws shield list-attacks \
    --resource-arns arn:aws:cloudfront::12345678910:distribution/E1PXMP22ZVFAOR \
    --start-time FromInclusive=1529280000,ToExclusive=1529300000
```

Output:

```
{
    "AttackSummaries": [
        {
            "AttackId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ResourceArn": "arn:aws:cloudfront::123456789012:distribution/
E1PXMP22ZVFAOR",
            "StartTime": 1529280000.0,
            "EndTime": 1529449200.0,
            "AttackVectors": [
                {
                    "VectorType": "SYN_FLOOD"
                }
            ]
        }
    ]
}
```

For more information, see Reviewing DDoS Incidents in the *Amazon Shield Advanced Developer Guide*.

- For API details, see ListAttacks in *Amazon CLI Command Reference*.

`list-protections`

The following code example shows how to use `list-protections`.

Amazon CLI

To retrieve protection summaries from Amazon Shield Advanced

The following `list-protections` example retrieves summaries of the protections that are enabled for the account.

```
aws shield list-protections
```

Output:

```
{
    "Protections": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Name": "Protection for CloudFront distribution",
            "ResourceArn": "arn:aws:cloudfront::123456789012:distribution/
E198WC25FXOWY8"
        }
    ]
}
```

For more information, see Specify Your Resources to Protect in the *Amazon Shield Advanced Developer Guide*.

- For API details, see ListProtections in *Amazon CLI Command Reference*.

`update-emergency-contact-settings`

The following code example shows how to use `update-emergency-contact-settings`.

Amazon CLI

To define the emergency e-mail addresses that are on file with the DRT

The following `update-emergency-contact-settings` example defines two e-mail addresses that the DRT should contact when it's responding to a suspected attack.

```
aws shield update-emergency-contact-settings \
        --emergency-contact-list EmailAddress=ops@example.com EmailAddress=ddos-
notifications@example.com
```

This command produces no output.

For more information, see How Amazon Shield Works in the *Amazon Shield Advanced Developer Guide*.

- For API details, see UpdateEmergencyContactSettings in *Amazon CLI Command Reference*.

`update-subscription`

The following code example shows how to use `update-subscription`.

Amazon CLI

To modify the account's Amazon Shield Advanced subscription

The following `update-subscription` example enables auto-renewal of the Amazon Shield Advanced subscription for the account.

```
aws shield update-subscription \
    --auto-renew ENABLED
```

This command produces no output.

For more information, see How Amazon Shield Works in the *Amazon Shield Advanced Developer Guide*.

- For API details, see UpdateSubscription in *Amazon CLI Command Reference*.

Signer examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Signer.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`cancel-signing-profile`

The following code example shows how to use `cancel-signing-profile`.

Amazon CLI

To delete a signing profile

The following `cancel-signing-profile` example removes an existing signing profile from Amazon Signer.

```
aws signer cancel-signing-profile \
    --profile-name MyProfile1
```

This command produces no output.

- For API details, see CancelSigningProfile in *Amazon CLI Command Reference*.

`describe-signing-job`

The following code example shows how to use `describe-signing-job`.

Amazon CLI

To display details about a signing job

The following `describe-signing-job` example displays details about the specified signing job.

```
aws signer describe-signing-job \
    --job-id 2065c468-73e2-4385-a6c9-0123456789abc
```

Output:

```
{
    "status": "Succeeded",
    "completedAt": 1568412037,
    "platformId": "AmazonFreeRTOS-Default",
    "signingMaterial": {
        "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
    },

    "signedObject": {
        "s3": {
            "bucketName": "signer-destination",
            "key": "signed-2065c468-73e2-4385-a6c9-0123456789abc"
        }
    },
    "requestedBy": "arn:aws:iam::123456789012:user/maria",
    "createdAt": 1568412036
}
```

- For API details, see DescribeSigningJob in *Amazon CLI Command Reference*.

`get-signing-platform`

The following code example shows how to use `get-signing-platform`.

Amazon CLI

To display details about a signing platform

The following `get-signing-platform` example displays details about the specified signing platform.

```
aws signer get-signing-platform \
    --platform-id AmazonFreeRTOS-TI-CC3220SF
```

Output:

```
{
    "category": "AWS",
    "displayName": "Amazon FreeRTOS SHA1-RSA CC3220SF-Format",
    "target": "SHA1-RSA-TISHA1",
    "platformId": "AmazonFreeRTOS-TI-CC3220SF",
    "signingConfiguration": {
```

```
        "encryptionAlgorithmOptions": {
            "defaultValue": "RSA",
            "allowedValues": [
                "RSA"
            ]
        },
        "hashAlgorithmOptions": {
            "defaultValue": "SHA1",
            "allowedValues": [
                "SHA1"
            ]
        }
    },
    "maxSizeInMB": 16,
    "partner": "AmazonFreeRTOS",
    "signingImageFormat": {
        "defaultFormat": "JSONEmbedded",
        "supportedFormats": [
            "JSONEmbedded"
        ]
    }
}
```

- For API details, see GetSigningPlatform in *Amazon CLI Command Reference*.

`get-signing-profile`

The following code example shows how to use `get-signing-profile`.

Amazon CLI

To display details about a signing profile

The following `get-signing-profile` example displays details about the specified signing profile.

```
aws signer get-signing-profile \
    --profile-name MyProfile3
```

Output:

```
{
```

```
    "platformId": "AmazonFreeRTOS-TI-CC3220SF",
    "profileName": "MyProfile3",
    "status": "Active",
    "signingMaterial": {
        "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
    }
}
```

- For API details, see GetSigningProfile in *Amazon CLI Command Reference*.

`list-signing-jobs`

The following code example shows how to use `list-signing-jobs`.

Amazon CLI

To list all signing jobs

The following `list-signing-jobs` example displays details about all signing jobs for the account.

```
aws signer list-signing-jobs
```

In this example, two jobs are returned, one successful, and one failed.

```
{
    "jobs": [
        {
            "status": "Succeeded",
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            },
            "jobId": "2065c468-73e2-4385-a6c9-0123456789abc",
            "source": {
                "s3": {
                    "version": "PNyFaUTgsQh5ZdMCcoCe6pT1gOpgB_M4",
                    "bucketName": "signer-source",
                    "key": "MyCode.rb"
                }
```

```
            },
            "signedObject": {
                "s3": {
                    "bucketName": "signer-destination",
                    "key": "signed-2065c468-73e2-4385-a6c9-0123456789abc"
                }
            },
            "createdAt": 1568412036
        },
        {
            "status": "Failed",
            "source": {
                "s3": {
                    "version": "PNyFaUTgsQh5ZdMCcoCe6pT1gOpgB_M4",
                    "bucketName": "signer-source",
                    "key": "MyOtherCode.rb"
                }
            },
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            },
            "createdAt": 1568402690,
            "jobId": "74d9825e-22fc-4a0d-b962-0123456789abc"
        }
    ]
}
```

- For API details, see ListSigningJobs in *Amazon CLI Command Reference*.

`list-signing-platforms`

The following code example shows how to use `list-signing-platforms`.

Amazon CLI

To list all signing platforms

The following `list-signing-platforms` example displays details about all available signing platforms.

```
aws signer list-signing-platforms
```

Output:

```
{
    "platforms": [
        {
            "category": "AWS",
            "displayName": "AWS IoT Device Management SHA256-ECDSA ",
            "target": "SHA256-ECDSA",
            "platformId": "AWSIoTDeviceManagement-SHA256-ECDSA",
            "signingConfiguration": {
                "encryptionAlgorithmOptions": {
                    "defaultValue": "ECDSA",
                    "allowedValues": [
                        "ECDSA"
                    ]
                },
                "hashAlgorithmOptions": {
                    "defaultValue": "SHA256",
                    "allowedValues": [
                        "SHA256"
                    ]
                }
            },
            "maxSizeInMB": 2048,
            "partner": "AWSIoTDeviceManagement",
            "signingImageFormat": {
                "defaultFormat": "JSONDetached",
                "supportedFormats": [
                    "JSONDetached"
                ]
            }
        },
        {
            "category": "AWS",
            "displayName": "Amazon FreeRTOS SHA1-RSA CC3220SF-Format",
            "target": "SHA1-RSA-TISHA1",
            "platformId": "AmazonFreeRTOS-TI-CC3220SF",
            "signingConfiguration": {
                "encryptionAlgorithmOptions": {
                    "defaultValue": "RSA",

                        "RSA"
                    ]
                },
```

```
                "hashAlgorithmOptions": {
                    "defaultValue": "SHA1",
                    "allowedValues": [
                        "SHA1"
                    ]
                }
            },
            "maxSizeInMB": 16,
            "partner": "AmazonFreeRTOS",
            "signingImageFormat": {
                "defaultFormat": "JSONEmbedded",
                "supportedFormats": [
                    "JSONEmbedded"
                ]
            }
        },
        {
            "category": "AWS",
            "displayName": "Amazon FreeRTOS SHA256-ECDSA",
            "target": "SHA256-ECDSA",
            "platformId": "AmazonFreeRTOS-Default",
            "signingConfiguration": {
                "encryptionAlgorithmOptions": {
                    "defaultValue": "ECDSA",
                    "allowedValues": [
                        "ECDSA"
                    ]
                },
                "hashAlgorithmOptions": {
                    "defaultValue": "SHA256",
                    "allowedValues": [
                        "SHA256"
                    ]
                }
            },
            "maxSizeInMB": 16,
            "partner": "AmazonFreeRTOS",
            "signingImageFormat": {
                "defaultFormat": "JSONEmbedded",
                "supportedFormats": [
                    "JSONEmbedded"
                ]
            }
        }
```

```
    ]
}
```

- For API details, see ListSigningPlatforms in *Amazon CLI Command Reference*.

`list-signing-profiles`

The following code example shows how to use `list-signing-profiles`.

Amazon CLI

To list all signing profiles

The following `list-signing-profiles` example displays details about all signing profiles for the account.

```
aws signer list-signing-profiles
```

Output:

```
{
    "profiles": [
        {
            "platformId": "AmazonFreeRTOS-TI-CC3220SF",
            "profileName": "MyProfile4",
            "status": "Active",
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            }
        },
        {
            "platformId": "AWSIoTDeviceManagement-SHA256-ECDSA",
            "profileName": "MyProfile5",
            "status": "Active",
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            }
        }
    ]
}
```

- For API details, see ListSigningProfiles in *Amazon CLI Command Reference*.

`put-signing-profile`

The following code example shows how to use `put-signing-profile`.

Amazon CLI

To create a signing profile

The following `put-signing-profile` example creates a signing profile using the specified certificate and platform.

```
aws signer put-signing-profile \
    --profile-name MyProfile6 \
    --signing-material certificateArn=arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc \
    --platform AmazonFreeRTOS-TI-CC3220SF
```

Output:

```
{
    "arn": "arn:aws:signer:us-west-2:123456789012:/signing-profiles/MyProfile6"
}
```

- For API details, see PutSigningProfile in *Amazon CLI Command Reference*.

`start-signing-job`

The following code example shows how to use `start-signing-job`.

Amazon CLI

To start a signing job

The following `start-signing-job` example starts a signing job on the code found at the specified source. It uses the specified profile to do the signing and places the signed code in the specified destination.

```
aws signer start-signing-job \
```

```
    --source 's3={bucketName=signer-
source,key=MyCode.rb,version=PNyFaUTgsQh5ZdMCcoCe6pT1gOpgB_M4}' \
    --destination 's3={bucketName=signer-destination,prefix=signed-}' \
    --profile-name MyProfile7
```

The output is the ID of the signing job.

```
{
    "jobId": "2065c468-73e2-4385-a6c9-0123456789abc"
}
```

- For API details, see StartSigningJob in *Amazon CLI Command Reference*.

Snowball Edge examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Snowball Edge.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`get-snowball-usage`

The following code example shows how to use `get-snowball-usage`.

Amazon CLI

To get information about the Snowball service limit for your account

The following `get-snowball-usage` example displays information about the Snowball service limit for your account, and also the number of Snowballs your account has in use.

```
aws snowball get-snowball-usage
```

Output:

```
{
    "SnowballLimit": 1,
    "SnowballsInUse": 0
}
```

FOR more information, see Amazon Snowball Edge Limits in the *Amazon Snowball Developer Guide*.

- For API details, see GetSnowballUsage in *Amazon CLI Command Reference*.

`list-jobs`

The following code example shows how to use `list-jobs`.

Amazon CLI

To list the current Snowball jobs in your account

The following `list-jobs` example displays an array of `JobListEntry` objects. In this example, a single job is listed.

```
aws snowball list-jobs
```

Output:

```
{
    "JobListEntries": [
        {
            "CreationDate": 2016-09-27T14:50Z,
             "Description": "Important Photos 2016-08-11",
             "IsMaster": TRUE,
             "JobId": "ABCd1e324fe-022f-488e-a98b-3b0566063db1",
             "JobState": "Complete",
             "JobType": "IMPORT",
             "SnowballType": "EDGE"
        }
```

```
    ]
}
```

For more information, see Jobs for Amazon Snowball Edge devices in the *Amazon Snowball Developer Guide*.

- For API details, see ListJobs in *Amazon CLI Command Reference*.

Amazon SNS examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Amazon SNS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other Amazon Web Services services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

- Scenarios

Actions

`add-permission`

The following code example shows how to use `add-permission`.

Amazon CLI

To add a permission to a topic

The following `add-permission` example adds the permission for Amazon account `987654321098` to use the `Publish` action with the specified topic under Amazon account `123456789012`.

```
aws sns add-permission \
    --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --label Publish-Permission \
    --aws-account-id 987654321098 \
    --action-name Publish
```

This command produces no output.

- For API details, see AddPermission in *Amazon CLI Command Reference*.

`check-if-phone-number-is-opted-out`

The following code example shows how to use `check-if-phone-number-is-opted-out`.

Amazon CLI

To check SMS message opt-out for a phone number

The following `check-if-phone-number-is-opted-out` example checks whether the specified phone number is opted out of receiving SMS messages from the current Amazon account.

```
aws sns check-if-phone-number-is-opted-out \
    --phone-number +1555550100
```

Output:

```
{
    "isOptedOut": false
}
```

- For API details, see CheckIfPhoneNumberIsOptedOut in *Amazon CLI Command Reference*.

`confirm-subscription`

The following code example shows how to use `confirm-subscription`.

Amazon CLI

To confirm a subscription

The following `confirm-subscription` command completes the confirmation process started when you subscribed to an SNS topic named `my-topic`. The --token parameter comes from the confirmation message sent to the notification endpoint specified in the subscribe call.

```
aws sns confirm-subscription \
    --topic-arn arn:aws:sns:us-west-2:123456789012:my-topic \
    --
token 2336412f37fb687f5d51e6e241d7700ae02f7124d8268910b858cb4db727ceeb2474bb937929d3bdd7ce5d
```

Output:

```
{
    "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
}
```

- For API details, see ConfirmSubscription in *Amazon CLI Command Reference*.

`create-platform-application`

The following code example shows how to use `create-platform-application`.

Amazon CLI

To create a platform application

The following `create-platform-application` example creates a Google Firebase platform application using the specified platform credential.

```
aws sns create-platform-application \
    --name MyApplication \
    --platform GCM \
    --attributes PlatformCredential=EXAMPLEabcd12345jklm67890stuv12345bcdef
```

Output:

```
{
    "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication"
}
```

- For API details, see CreatePlatformApplication in *Amazon CLI Command Reference*.

`create-topic`

The following code example shows how to use `create-topic`.

Amazon CLI

To create an SNS topic

The following `create-topic` example creates an SNS topic named `my-topic`.

```
aws sns create-topic \
    --name my-topic
```

Output:

```
{
    "ResponseMetadata": {
        "RequestId": "1469e8d7-1642-564e-b85d-a19b4b341f83"
    },
    "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
}
```

For more information, see Using the Amazon Command Line Interface with Amazon SQS and Amazon SNS in the *Amazon Command Line Interface User Guide*.

- For API details, see CreateTopic in *Amazon CLI Command Reference*.

`delete-endpoint`

The following code example shows how to use `delete-endpoint`.

Amazon CLI

To delete a platform application endpoint

The following `delete-endpoint` example deletes the specified platform application endpoint.

```
aws sns delete-endpoint \
    --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234
```

This command produces no output.

- For API details, see DeleteEndpoint in *Amazon CLI Command Reference*.

`delete-platform-application`

The following code example shows how to use `delete-platform-application`.

Amazon CLI

To delete a platform application

The following `delete-platform-application` example deletes the specified platform application.

```
aws sns delete-platform-application \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/ADM/
MyApplication
```

This command produces no output.

- For API details, see DeletePlatformApplication in *Amazon CLI Command Reference*.

`delete-topic`

The following code example shows how to use `delete-topic`.

Amazon CLI

To delete an SNS topic

The following `delete-topic` example deletes the specified SNS topic.

```
aws sns delete-topic \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"
```

This command produces no output.

- For API details, see DeleteTopic in *Amazon CLI Command Reference*.

`get-endpoint-attributes`

The following code example shows how to use `get-endpoint-attributes`.

Amazon CLI

To list platform application endpoint attributes

The following `get-endpoint-attributes` example lists the attributes for the specified platform application endpoint.

```
aws sns get-endpoint-attributes \
    --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234
```

Output:

```
{
    "Attributes": {
        "Enabled": "true",
        "Token": "EXAMPLE12345..."
    }
}
```

- For API details, see GetEndpointAttributes in *Amazon CLI Command Reference*.

`get-platform-application-attributes`

The following code example shows how to use `get-platform-application-attributes`.

Amazon CLI

To list the platform application attributes

The following `get-platform-application-attributes` example lists the attributes for the specified platform application.

```
aws sns get-platform-application-attributes \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/MPNS/
MyApplication
```

Output:

```
{
    "Attributes": {
```

```
        "Enabled": "true",
        "SuccessFeedbackSampleRate": "100"
    }
}
```

- For API details, see GetPlatformApplicationAttributes in *Amazon CLI Command Reference*.

`get-sms-attributes`

The following code example shows how to use `get-sms-attributes`.

Amazon CLI

To list the default SMS message attributes

The following `get-sms-attributes` example lists the default attributes for sending SMS messages.

```
aws sns get-sms-attributes
```

Output:

```
{
    "attributes": {
        "DefaultSenderID": "MyName"
    }
}
```

- For API details, see GetSMSAttributes in *Amazon CLI Command Reference*.

`get-subscription-attributes`

The following code example shows how to use `get-subscription-attributes`.

Amazon CLI

To retrieve subscription attributes for a topic

The following `get-subscription-attributes` displays the attributes of the specified subscription. You can get the `subscription-arn` from the output of the `list-subscriptions` command.

```
aws sns get-subscription-attributes \
    --subscription-arn "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
```

Output:

```
{
    "Attributes": {
        "Endpoint": "my-email@example.com",
        "Protocol": "email",
        "RawMessageDelivery": "false",
        "ConfirmationWasAuthenticated": "false",
        "Owner": "123456789012",
        "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f",
        "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
    }
}
```

- For API details, see GetSubscriptionAttributes in *Amazon CLI Command Reference*.

`get-topic-attributes`

The following code example shows how to use `get-topic-attributes`.

Amazon CLI

To retrieve the attributes of a topic

The following `get-topic-attributes` example displays the attributes for the specified topic.

```
aws sns get-topic-attributes \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"
```

Output:

```
{
    "Attributes": {
        "SubscriptionsConfirmed": "1",
        "DisplayName": "my-topic",
        "SubscriptionsDeleted": "0",
```

```
        "EffectiveDeliveryPolicy": "{\"http\":{\"defaultHealthyRetryPolicy\":
{\"minDelayTarget\":20,\"maxDelayTarget\":20,\"numRetries\":3,\"numMaxDelayRetries
\":0,\"numNoDelayRetries\":0,\"numMinDelayRetries\":0,\"backoffFunction\":\"linear
\"},\"disableSubscriptionOverrides\":false}}",
        "Owner": "123456789012",
        "Policy": "{\"Version\":\"2008-10-17\",\"Id\":\"__default_policy_ID\",
\"Statement\":[{\"Sid\":\"__default_statement_ID\",\"Effect\":\"Allow\",\"Principal
\":{\"AWS\":\"*\"},\"Action\":[\"SNS:Subscribe\",\"SNS:ListSubscriptionsByTopic
\",\"SNS:DeleteTopic\",\"SNS:GetTopicAttributes\",\"SNS:Publish\",
\"SNS:RemovePermission\",\"SNS:AddPermission\",\"SNS:SetTopicAttributes\"],
\"Resource\":\"arn:aws:sns:us-west-2:123456789012:my-topic\",\"Condition\":
{\"StringEquals\":{\"AWS:SourceOwner\":\"0123456789012\"}}}]}",
        "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
        "SubscriptionsPending": "0"
    }
}
```

- For API details, see GetTopicAttributes in *Amazon CLI Command Reference*.

`list-endpoints-by-platform-application`

The following code example shows how to use `list-endpoints-by-platform-application`.

Amazon CLI

To list the endpoints for a platform application

The following `list-endpoints-by-platform-application` example lists the endpoints and endpoint attributes for the specified platform application.

```
aws sns list-endpoints-by-platform-application \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication
```

Output:

```
{
    "Endpoints": [
        {
            "Attributes": {
                "Token": "EXAMPLE12345...,
                "Enabled": "true"
```

```
            },
            "EndpointArn": "arn:aws:sns:us-west-2:123456789012:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234"
        }
    ]
}
```

- For API details, see ListEndpointsByPlatformApplication in *Amazon CLI Command Reference*.

`list-phone-numbers-opted-out`

The following code example shows how to use `list-phone-numbers-opted-out`.

Amazon CLI

To list SMS message opt-outs

The following `list-phone-numbers-opted-out` example lists the phone numbers opted out of receiving SMS messages.

```
aws sns list-phone-numbers-opted-out
```

Output:

```
{
    "phoneNumbers": [
        "+15555550100"
    ]
}
```

- For API details, see ListPhoneNumbersOptedOut in *Amazon CLI Command Reference*.

`list-platform-applications`

The following code example shows how to use `list-platform-applications`.

Amazon CLI

To list platform applications

The following `list-platform-applications` example lists the platform applications for ADM and MPNS.

```
aws sns list-platform-applications
```

Output:

```
{
    "PlatformApplications": [
        {
            "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/ADM/
MyApplication",
            "Attributes": {
                "SuccessFeedbackSampleRate": "100",
                "Enabled": "true"
            }
        },
        {
            "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/MPNS/
MyOtherApplication",
            "Attributes": {
                "SuccessFeedbackSampleRate": "100",
                "Enabled": "true"
            }
        }
    ]
}
```

- For API details, see ListPlatformApplications in *Amazon CLI Command Reference*.

`list-subscriptions-by-topic`

The following code example shows how to use `list-subscriptions-by-topic`.

Amazon CLI

To list the subscriptions associated with a topic

The following `list-subscriptions-by-topic` retrieves a list of SNS subscriptions associated with the specified topic.

```
aws sns list-subscriptions-by-topic \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"
```

Output:

```
{
    "Subscriptions": [
        {
            "Owner": "123456789012",
            "Endpoint": "my-email@example.com",
            "Protocol": "email",
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
            "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
        }
    ]
}
```

- For API details, see ListSubscriptionsByTopic in *Amazon CLI Command Reference*.

`list-subscriptions`

The following code example shows how to use `list-subscriptions`.

Amazon CLI

To list your SNS subscriptions

The following `list-subscriptions` example displays a list of the SNS subscriptions in your Amazon account.

```
aws sns list-subscriptions
```

Output:

```
{
    "Subscriptions": [
        {
            "Owner": "123456789012",
            "Endpoint": "my-email@example.com",
            "Protocol": "email",
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
            "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
        }
```

```
    ]
}
```

- For API details, see ListSubscriptions in *Amazon CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

Amazon CLI

To list tags for a topic

The following `list-tags-for-resource` example lists the tags for the specified Amazon SNS topic.

```
aws sns list-tags-for-resource \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic
```

Output:

```
{
    "Tags": [
        {
            "Key": "Team",
            "Value": "Alpha"
        }
    ]
}
```

- For API details, see ListTagsForResource in *Amazon CLI Command Reference*.

`list-topics`

The following code example shows how to use `list-topics`.

Amazon CLI

To list your SNS topics

The following `list-topics` example lists all of SNS topics in your Amazon account.

```
aws sns list-topics
```

Output:

```
{
    "Topics": [
        {
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
        }
    ]
}
```

- For API details, see ListTopics in *Amazon CLI Command Reference*.

`opt-in-phone-number`

The following code example shows how to use `opt-in-phone-number`.

Amazon CLI

To opt-in for SMS messages

The following `opt-in-phone-number` example opts the specified phone number into receiving SMS messages.

```
aws sns opt-in-phone-number \
    --phone-number +15555550100
```

This command produces no output.

- For API details, see OptInPhoneNumber in *Amazon CLI Command Reference*.

`publish`

The following code example shows how to use `publish`.

Amazon CLI

Example 1: To publish a message to a topic

The following `publish` example publishes the specified message to the specified SNS topic. The message comes from a text file, which enables you to include line breaks.

```
aws sns publish \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic" \
    --message file://message.txt
```

Contents of `message.txt`:

```
Hello World
Second Line
```

Output:

```
{
    "MessageId": "123a45b6-7890-12c3-45d6-111122223333"
}
```

Example 2: To publish an SMS message to a phone number

The following `publish` example publishes the message `Hello world!` to the phone number `+1-555-555-0100`.

```
aws sns publish \
    --message "Hello world!" \
    --phone-number +1-555-555-0100
```

Output:

```
{
    "MessageId": "123a45b6-7890-12c3-45d6-333322221111"
}
```

- For API details, see Publish in *Amazon CLI Command Reference*.

`put-data-protection-policy`

The following code example shows how to use `put-data-protection-policy`.

Amazon CLI

To set data protection policy

Example 1: To deny publishers from publishing messages with CreditCardNumber

The following `put-data-protection-policy` example denies publishers from publishing messages with CreditCardNumber.

```
aws sns put-data-protection-policy \
    --resource-arn arn:aws:sns:us-east-1:123456789012:mytopic \
    --data-protection-policy "{\"Name\":\"data_protection_policy\",\"Description
\":\"Example data protection policy\",\"Version\":\"2021-06-01\",\"Statement
\":[{\"DataDirection\":\"Inbound\",\"Principal\":[\"*\"],\"DataIdentifier\":
[\"arn:aws:dataprotection::aws:data-identifier/CreditCardNumber\"],\"Operation\":
{\"Deny\":{}}}]}"
```

This command produces no output.

Example 2: To load parameters from a file

The following `put-data-protection-policy` loads parameters from a file.

```
aws sns put-data-protection-policy \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --data-protection-policy file://policy.json
```

This command produces no output.

- For API details, see PutDataProtectionPolicy in *Amazon CLI Command Reference*.

`remove-permission`

The following code example shows how to use `remove-permission`.

Amazon CLI

To remove a permission from a topic

The following `remove-permission` example removes the permission `Publish-Permission` from the specified topic.

```
aws sns remove-permission \
    --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --label Publish-Permission
```

This command produces no output.

- For API details, see RemovePermission in *Amazon CLI Command Reference*.

`set-endpoint-attributes`

The following code example shows how to use `set-endpoint-attributes`.

Amazon CLI

To set endpoint attributes

The following `set-endpoint-attributes` example disables the specified platform application endpoint.

```
aws sns set-endpoint-attributes \
    --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234 \
    --attributes Enabled=false
```

Output:

```
{
    "Attributes": {
        "Enabled": "false",
        "Token": "EXAMPLE12345..."
    }
}
```

- For API details, see SetEndpointAttributes in *Amazon CLI Command Reference*.

`set-platform-application-attributes`

The following code example shows how to use `set-platform-application-attributes`.

Amazon CLI

To set platform application attributes

The following `set-platform-application-attributes` example sets the `EventDeliveryFailure` attribute for the specified platform application to the ARN of the specified Amazon SNS topic.

```
aws sns set-platform-application-attributes \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication \
```

```
    --attributes EventDeliveryFailure=arn:aws:sns:us-
west-2:123456789012:AnotherTopic
```

This command produces no output.

- For API details, see SetPlatformApplicationAttributes in *Amazon CLI Command Reference*.

`set-sms-attributes`

The following code example shows how to use `set-sms-attributes`.

Amazon CLI

To set SMS message attributes

The following `set-sms-attributes` example sets the default sender ID for SMS messages to `MyName`.

```
aws sns set-sms-attributes \
    --attributes DefaultSenderID=MyName
```

This command produces no output.

- For API details, see SetSMSAttributes in *Amazon CLI Command Reference*.

`set-subscription-attributes`

The following code example shows how to use `set-subscription-attributes`.

Amazon CLI

To set subscription attributes

The following `set-subscription-attributes` example sets the `RawMessageDelivery` attribute to an SQS subscription.

```
aws sns set-subscription-attributes \
    --subscription-arn arn:aws:sns:us-
east-1:123456789012:mytopic:f248de18-2cf6-578c-8592-b6f1eaa877dc \
    --attribute-name RawMessageDelivery \
    --attribute-value true
```

This command produces no output.

The following `set-subscription-attributes` example sets a `FilterPolicy` attribute to an SQS subscription.

```
aws sns set-subscription-attributes \
    --subscription-arn arn:aws:sns:us-
east-1:123456789012:mytopic:f248de18-2cf6-578c-8592-b6f1eaa877dc \
    --attribute-name FilterPolicy \
    --attribute-value "{ \"anyMandatoryKey\": [\"any\", \"of\", \"these\"] }"
```

This command produces no output.

The following `set-subscription-attributes` example removes the `FilterPolicy` attribute from an SQS subscription.

```
aws sns set-subscription-attributes \
    --subscription-arn arn:aws:sns:us-
east-1:123456789012:mytopic:f248de18-2cf6-578c-8592-b6f1eaa877dc \
    --attribute-name FilterPolicy \
    --attribute-value "{}"
```

This command produces no output.

- For API details, see SetSubscriptionAttributes in *Amazon CLI Command Reference*.

`set-topic-attributes`

The following code example shows how to use `set-topic-attributes`.

Amazon CLI

To set an attribute for a topic

The following `set-topic-attributes` example sets the `DisplayName` attribute for the specified topic.

```
aws sns set-topic-attributes \
    --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --attribute-name DisplayName \
    --attribute-value MyTopicDisplayName
```

This command produces no output.

- For API details, see SetTopicAttributes in *Amazon CLI Command Reference*.

`subscribe`

The following code example shows how to use `subscribe`.

Amazon CLI

To subscribe to a topic

The following `subscribe` command subscribes an email address to the specified topic.

```
aws sns subscribe \
    --topic-arn arn:aws:sns:us-west-2:123456789012:my-topic \
    --protocol email \
    --notification-endpoint my-email@example.com
```

Output:

```
{
    "SubscriptionArn": "pending confirmation"
}
```

- For API details, see Subscribe in *Amazon CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

Amazon CLI

To add a tag to a topic

The following `tag-resource` example adds a metadata tag to the specified Amazon SNS topic.

```
aws sns tag-resource \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --tags Key=Team,Value=Alpha
```

This command produces no output.

- For API details, see TagResource in *Amazon CLI Command Reference*.

`unsubscribe`

The following code example shows how to use `unsubscribe`.

Amazon CLI

To unsubscribe from a topic

The following `unsubscribe` example deletes the specified subscription from a topic.

```
aws sns unsubscribe \
    --subscription-arn arn:aws:sns:us-west-2:0123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f
```

This command produces no output.

- For API details, see Unsubscribe in *Amazon CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

Amazon CLI

To remove a tag from a topic

The following `untag-resource` example removes any tags with the specified keys from the specified Amazon SNS topic.

```
aws sns untag-resource \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --tag-keys Team
```

This command produces no output.

- For API details, see UntagResource in *Amazon CLI Command Reference*.

Scenarios

Create a platform endpoint for push notifications

The following code example shows how to create a platform endpoint for Amazon SNS push notifications.

Amazon CLI

To create a platform application endpoint

The following `create-platform-endpoint` example creates an endpoint for the specified platform application using the specified token.

```
aws sns create-platform-endpoint \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication \
    --token EXAMPLE12345...
```

Output:

```
{
      "EndpointArn": "arn:aws:sns:us-west-2:1234567890:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234"
}
```

Amazon SQS examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Amazon SQS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-permission`

The following code example shows how to use `add-permission`.

Amazon CLI

To add a permission to a queue

This example enables the specified Amazon account to send messages to the specified queue.

Command:

```
aws sqs add-permission --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/
MyQueue --label SendMessagesFromMyQueue --aws-account-ids 12345EXAMPLE --
actions SendMessage
```

Output:

```
None.
```

- For API details, see AddPermission in *Amazon CLI Command Reference*.

`cancel-message-move-task`

The following code example shows how to use `cancel-message-move-task`.

Amazon CLI

To cancel a message move task

The following `cancel-message-move-task` example cancels the specified message move task.

```
aws sqs cancel-message-move-task \
    --task-handle AQEB6nR4...HzlvZQ==
```

Output:

```
{
    "ApproximateNumberOfMessagesMoved": 102
}
```

For more information, see Amazon SQS API permissions: Actions and resource reference in the *Developer Guide*.

- For API details, see CancelMessageMoveTask in *Amazon CLI Command Reference*.

`change-message-visibility-batch`

The following code example shows how to use `change-message-visibility-batch`.

Amazon CLI

To change multiple messages' timeout visibilities as a batch

This example changes the 2 specified messages' timeout visibilities to 10 hours (10 hours * 60 minutes * 60 seconds).

Command:

```
aws sqs change-message-visibility-batch --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --entries file://change-message-visibility-batch.json
```

Input file (change-message-visibility-batch.json):

```
[
  {
    "Id": "FirstMessage",
        "ReceiptHandle": "AQEBhz2q...Jf3kaw==",
        "VisibilityTimeout": 36000
  },
  {
    "Id": "SecondMessage",
        "ReceiptHandle": "AQEBkTUH...HifSnw==",
        "VisibilityTimeout": 36000
  }
]
```

Output:

```
{
  "Successful": [
    {
      "Id": "SecondMessage"
    },
    {
```

```
      "Id": "FirstMessage"
    }
  ]
}
```

- For API details, see ChangeMessageVisibilityBatch in *Amazon CLI Command Reference*.

`change-message-visibility`

The following code example shows how to use `change-message-visibility`.

Amazon CLI

To change a message's timeout visibility

This example changes the specified message's timeout visibility to 10 hours (10 hours * 60 minutes * 60 seconds).

Command:

```
aws sqs change-message-visibility --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --receipt-handle AQEBTpyI...t6HyQg== --visibility-timeout 36000
```

Output:

```
None.
```

- For API details, see ChangeMessageVisibility in *Amazon CLI Command Reference*.

`create-queue`

The following code example shows how to use `create-queue`.

Amazon CLI

To create a queue

This example creates a queue with the specified name, sets the message retention period to 3 days (3 days * 24 hours * 60 minutes * 60 seconds), and sets the queue's dead letter queue to the specified queue with a maximum receive count of 1,000 messages.

Command:

```
aws sqs create-queue --queue-name MyQueue --attributes file://create-queue.json
```

Input file (create-queue.json):

```
{
  "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-
east-1:80398EXAMPLE:MyDeadLetterQueue\",\"maxReceiveCount\":\"1000\"}",
  "MessageRetentionPeriod": "259200"
}
```

Output:

```
{
  "QueueUrl": "https://queue.amazonaws.com/80398EXAMPLE/MyQueue"
}
```

- For API details, see CreateQueue in *Amazon CLI Command Reference*.

`delete-message-batch`

The following code example shows how to use `delete-message-batch`.

Amazon CLI

To delete multiple messages as a batch

This example deletes the specified messages.

Command:

```
aws sqs delete-message-batch --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --entries file://delete-message-batch.json
```

Input file (delete-message-batch.json):

```
[
  {
        "Id": "FirstMessage",
        "ReceiptHandle": "AQEB1mgl...Z4GuLw=="
```

```
  },
  {
    "Id": "SecondMessage",
        "ReceiptHandle": "AQEBLsYM...VQubAA=="
  }
]
```

Output:

```
{
  "Successful": [
    {
      "Id": "FirstMessage"
    },
    {
      "Id": "SecondMessage"
    }
  ]
}
```

- For API details, see DeleteMessageBatch in *Amazon CLI Command Reference*.

`delete-message`

The following code example shows how to use `delete-message`.

Amazon CLI

To delete a message

This example deletes the specified message.

Command:

```
aws sqs delete-message --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --receipt-handle AQEBRXTo...q2doVA==
```

Output:

```
None.
```

- For API details, see DeleteMessage in *Amazon CLI Command Reference*.

`delete-queue`

The following code example shows how to use `delete-queue`.

Amazon CLI

To delete a queue

This example deletes the specified queue.

Command:

```
aws sqs delete-queue --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyNewerQueue
```

Output:

```
None.
```

- For API details, see DeleteQueue in *Amazon CLI Command Reference*.

`get-queue-attributes`

The following code example shows how to use `get-queue-attributes`.

Amazon CLI

To get a queue's attributes

This example gets all of the specified queue's attributes.

Command:

```
aws sqs get-queue-attributes --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names All
```

Output:

```
{
  "Attributes": {
    "ApproximateNumberOfMessagesNotVisible": "0",
```

```
    "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-
east-1:80398EXAMPLE:MyDeadLetterQueue\",\"maxReceiveCount\":1000}",
    "MessageRetentionPeriod": "345600",
    "ApproximateNumberOfMessagesDelayed": "0",
    "MaximumMessageSize": "262144",
    "CreatedTimestamp": "1442426968",
    "ApproximateNumberOfMessages": "0",
    "ReceiveMessageWaitTimeSeconds": "0",
    "DelaySeconds": "0",
    "VisibilityTimeout": "30",
    "LastModifiedTimestamp": "1442426968",
    "QueueArn": "arn:aws:sqs:us-east-1:80398EXAMPLE:MyNewQueue"
  }
}
```

This example gets only the specified queue's maximum message size and visibility timeout attributes.

Command:

```
aws sqs get-queue-attributes --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyNewQueue --attribute-
names MaximumMessageSize VisibilityTimeout
```

Output:

```
{
  "Attributes": {
    "VisibilityTimeout": "30",
    "MaximumMessageSize": "262144"
  }
}
```

- For API details, see GetQueueAttributes in *Amazon CLI Command Reference*.

`get-queue-url`

The following code example shows how to use `get-queue-url`.

Amazon CLI

To get a queue URL

This example gets the specified queue's URL.

Command:

```
aws sqs get-queue-url --queue-name MyQueue
```

Output:

```
{
  "QueueUrl": "https://queue.amazonaws.com/80398EXAMPLE/MyQueue"
}
```

- For API details, see GetQueueUrl in *Amazon CLI Command Reference*.

`list-dead-letter-source-queues`

The following code example shows how to use `list-dead-letter-source-queues`.

Amazon CLI

To list dead letter source queues

This example lists the queues that are associated with the specified dead letter source queue.

Command:

```
aws sqs list-dead-letter-source-queues --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue
```

Output:

```
{
  "queueUrls": [
    "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue"
  ]
}
```

- For API details, see ListDeadLetterSourceQueues in *Amazon CLI Command Reference*.

`list-message-move-tasks`

The following code example shows how to use `list-message-move-tasks`.

Amazon CLI

To list the message move tasks

The following `list-message-move-tasks` example lists the 2 most recent message move tasks in the specified queue.

```
aws sqs list-message-move-tasks \
    --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue \
    --max-results 2
```

Output:

```
{
    "Results": [
        {
            "TaskHandle": "AQEB6nR4...HzlvZQ==",
            "Status": "RUNNING",
            "SourceArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1",
            "DestinationArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2",
            "MaxNumberOfMessagesPerSecond": 50,
            "ApproximateNumberOfMessagesMoved": 203,
            "ApproximateNumberOfMessagesToMove": 30,
            "StartedTimestamp": 1442428276921
        },

        {
            "Status": "COMPLETED",
            "SourceArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1",
            "DestinationArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2",
            "ApproximateNumberOfMessagesMoved": 29,
            "ApproximateNumberOfMessagesToMove": 0,
            "StartedTimestamp": 1342428272093
        }
    ]
}
```

For more information, see Amazon SQS API permissions: Actions and resource reference in the *Developer Guide*.

- For API details, see ListMessageMoveTasks in *Amazon CLI Command Reference*.

`list-queue-tags`

The following code example shows how to use `list-queue-tags`.

Amazon CLI

To list all cost allocation tags for a queue

The following `list-queue-tags` example displays all of the cost allocation tags associated with the specified queue.

```
aws sqs list-queue-tags \
    --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue
```

Output:

```
{
    "Tags": {
        "Team": "Alpha"
    }
}
```

For more information, see Listing Cost Allocation Tags in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see ListQueueTags in *Amazon CLI Command Reference*.

`list-queues`

The following code example shows how to use `list-queues`.

Amazon CLI

To list queues

This example lists all queues.

Command:

```
aws sqs list-queues
```

Output:

```
{
  "QueueUrls": [
    "https://queue.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/TestQueue1",
        "https://queue.amazonaws.com/80398EXAMPLE/TestQueue2"
  ]
}
```

This example lists only queues that start with "My".

Command:

```
aws sqs list-queues --queue-name-prefix My
```

Output:

```
{
  "QueueUrls": [
    "https://queue.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue"
  ]
}
```

- For API details, see ListQueues in *Amazon CLI Command Reference*.

`purge-queue`

The following code example shows how to use `purge-queue`.

Amazon CLI

To purge a queue

This example deletes all messages in the specified queue.

Command:

```
aws sqs purge-queue --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyNewQueue
```

Output:

```
None.
```

- For API details, see PurgeQueue in *Amazon CLI Command Reference*.

`receive-message`

The following code example shows how to use `receive-message`.

Amazon CLI

To receive a message

This example receives up to 10 available messages, returning all available attributes.

Command:

```
aws sqs receive-message --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names All --message-attribute-names All --max-number-of-messages 10
```

Output:

```
{
  "Messages": [
    {
      "Body": "My first message.",
      "ReceiptHandle": "AQEBzbVv...fqNzFw==",
      "MD5OfBody": "1000f835...a35411fa",
      "MD5OfMessageAttributes": "9424c491...26bc3ae7",
      "MessageId": "d6790f8d-d575-4f01-bc51-40122EXAMPLE",
      "Attributes": {
        "ApproximateFirstReceiveTimestamp": "1442428276921",
        "SenderId": "AIDAIAZKMSNQ7TEXAMPLE",
        "ApproximateReceiveCount": "5",
        "SentTimestamp": "1442428276921"
      },
      "MessageAttributes": {
```

```
        "PostalCode": {
          "DataType": "String",
          "StringValue": "ABC123"
        },
        "City": {
          "DataType": "String",
          "StringValue": "Any City"
        }
      }
    }
  ]
}
```

This example receives the next available message, returning only the SenderId and SentTimestamp attributes as well as the PostalCode message attribute.

Command:

```
aws sqs receive-message --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names SenderId SentTimestamp
 --message-attribute-names PostalCode
```

Output:

```
{
  "Messages": [
    {
      "Body": "My first message.",
      "ReceiptHandle": "AQEB6nR4...HzlvZQ==",
      "MD5OfBody": "1000f835...a35411fa",
      "MD5OfMessageAttributes": "b8e89563...e088e74f",
      "MessageId": "d6790f8d-d575-4f01-bc51-40122EXAMPLE",
      "Attributes": {
        "SenderId": "AIDAIAZKMSNQ7TEXAMPLE",
        "SentTimestamp": "1442428276921"
      },
      "MessageAttributes": {
        "PostalCode": {
          "DataType": "String",
          "StringValue": "ABC123"
        }
      }
    }
```

```
  ]
}
```

- For API details, see ReceiveMessage in *Amazon CLI Command Reference*.

`remove-permission`

The following code example shows how to use `remove-permission`.

Amazon CLI

To remove a permission

This example removes the permission with the specified label from the specified queue.

Command:

```
aws sqs remove-permission --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --label SendMessagesFromMyQueue
```

Output:

```
None.
```

- For API details, see RemovePermission in *Amazon CLI Command Reference*.

`send-message-batch`

The following code example shows how to use `send-message-batch`.

Amazon CLI

To send multiple messages as a batch

This example sends 2 messages with the specified message bodies, delay periods, and message attributes, to the specified queue.

Command:

```
aws sqs send-message-batch --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --entries file://send-message-batch.json
```

Input file (send-message-batch.json):

```
[
  {
    "Id": "FuelReport-0001-2015-09-16T140731Z",
        "MessageBody": "Fuel report for account 0001 on 2015-09-16 at 02:07:31 PM.",
        "DelaySeconds": 10,
        "MessageAttributes": {
          "SellerName": {
            "DataType": "String",
                "StringValue": "Example Store"
      },
          "City": {
        "DataType": "String",
        "StringValue": "Any City"
      },
          "Region": {
            "DataType": "String",
                "StringValue": "WA"
      },
          "PostalCode": {
            "DataType": "String",
                "StringValue": "99065"
          },
          "PricePerGallon": {
            "DataType": "Number",
                "StringValue": "1.99"
      }
        }
  },
  {
    "Id": "FuelReport-0002-2015-09-16T140930Z",
        "MessageBody": "Fuel report for account 0002 on 2015-09-16 at 02:09:30 PM.",
        "DelaySeconds": 10,
        "MessageAttributes": {
          "SellerName": {
            "DataType": "String",
                "StringValue": "Example Fuels"
      },
          "City": {
        "DataType": "String",
        "StringValue": "North Town"
      },
          "Region": {
```

```
            "DataType": "String",
                "StringValue": "WA"
      },
          "PostalCode": {
            "DataType": "String",
                "StringValue": "99123"
          },
          "PricePerGallon": {
            "DataType": "Number",
                "StringValue": "1.87"
      }
        }
  }
]
```

Output:

```
{
  "Successful": [
    {
      "MD5OfMessageBody": "203c4a38...7943237e",
      "MD5OfMessageAttributes": "10809b55...baf283ef",
      "Id": "FuelReport-0001-2015-09-16T140731Z",
      "MessageId": "d175070c-d6b8-4101-861d-adeb3EXAMPLE"
    },
    {
      "MD5OfMessageBody": "2cf0159a...c1980595",
      "MD5OfMessageAttributes": "55623928...ae354a25",
      "Id": "FuelReport-0002-2015-09-16T140930Z",
      "MessageId": "f9b7d55d-0570-413e-b9c5-a9264EXAMPLE"
    }
  ]
}
```

- For API details, see SendMessageBatch in *Amazon CLI Command Reference*.

`send-message`

The following code example shows how to use `send-message`.

Amazon CLI

To send a message

This example sends a message with the specified message body, delay period, and message attributes, to the specified queue.

Command:

```
aws sqs send-message --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --message-body "Information about the largest city in Any Region." --delay-seconds 10 --message-attributes file://send-message.json
```

Input file (send-message.json):

```
{
  "City": {
    "DataType": "String",
    "StringValue": "Any City"
  },
  "Greeting": {
    "DataType": "Binary",
    "BinaryValue": "Hello, World!"
  },
  "Population": {
    "DataType": "Number",
    "StringValue": "1250800"
  }
}
```

Output:

```
{
  "MD5OfMessageBody": "51b0a325...39163aa0",
  "MD5OfMessageAttributes": "00484c68...59e48f06",
  "MessageId": "da68f62c-0c07-4bee-bf5f-7e856EXAMPLE"
}
```

- For API details, see SendMessage in *Amazon CLI Command Reference*.

`set-queue-attributes`

The following code example shows how to use `set-queue-attributes`.

Amazon CLI

To set queue attributes

This example sets the specified queue to a delivery delay of 10 seconds, a maximum message size of 128 KB (128 KB * 1,024 bytes), a message retention period of 3 days (3 days * 24 hours * 60 minutes * 60 seconds), a receive message wait time of 20 seconds, and a default visibility timeout of 60 seconds. This example also associates the specified dead letter queue with a maximum receive count of 1,000 messages.

Command:

```
aws sqs set-queue-attributes --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyNewQueue --attributes file://set-queue-attributes.json
```

Input file (set-queue-attributes.json):

```
{
  "DelaySeconds": "10",
  "MaximumMessageSize": "131072",
  "MessageRetentionPeriod": "259200",
  "ReceiveMessageWaitTimeSeconds": "20",
  "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-east-1:80398EXAMPLE:MyDeadLetterQueue\",\"maxReceiveCount\":\"1000\"}",
  "VisibilityTimeout": "60"
}
```

Output:

```
None.
```

- For API details, see SetQueueAttributes in *Amazon CLI Command Reference*.

`start-message-move-task`

The following code example shows how to use `start-message-move-task`.

Amazon CLI

*Example 1: *To start a message move task**

The following `start-message-move-task` example starts a message move task to redrive messages from the specified dead-letter queue to the source queue.

```
aws sqs start-message-move-task \
    --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue
```

Output:

```
{
    "TaskHandle": "AQEB6nR4...HzlvZQ=="
}
```

For more information, see This is the topic title in the *Name of your guide*.

*Example 2: *To start a message move task with a maximum rate**

The following `start-message-move-task` example starts a message move task to redrive messages from the specified dead-letter queue to the specified destination queue at a maximum rate of 50 messages per second.

```
aws sqs start-message-move-task \
    --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1 \
    --destination-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2 \
    --max-number-of-messages-per-second 50
```

Output:

```
{
    "TaskHandle": "AQEB6nR4...HzlvZQ=="
}
```

For more information, see Amazon SQS API permissions: Actions and resource reference in the *Developer Guide*.

- For API details, see StartMessageMoveTask in *Amazon CLI Command Reference*.

`tag-queue`

The following code example shows how to use `tag-queue`.

Amazon CLI

To add cost allocation tags to a queue

The following `tag-queue` example adds a cost allocation tag to the specified Amazon SQS queue.

```
aws sqs tag-queue \
    --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue \
    --tags Priority=Highest
```

This command produces no output.

For more information, see Adding Cost Allocation Tags in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see TagQueue in *Amazon CLI Command Reference*.

`untag-queue`

The following code example shows how to use `untag-queue`.

Amazon CLI

To remove cost allocation tags from a queue

The following `untag-queue` example removes a cost allocation tag from the specified Amazon SQS queue.

```
aws sqs untag-queue \
    --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue \
    --tag-keys "Priority"
```

This command produces no output.

For more information, see Adding Cost Allocation Tags in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see UntagQueue in *Amazon CLI Command Reference*.

Storage Gateway examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Storage Gateway.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`describe-gateway-information`

The following code example shows how to use `describe-gateway-information`.

Amazon CLI

To describe a gateway

The following `describe-gateway-information` command returns metadata about the specified gateway. To specify which gateway to describe, use the Amazon Resource Name (ARN) of the gateway in the command.

This examples specifies a gateway with the id `sgw-12A3456B` in account `123456789012`:

```
aws storagegateway describe-gateway-information --gateway-
arn "arn:aws:storagegateway:us-west-2:123456789012:gateway/sgw-12A3456B"
```

This command outputs a JSON block that contains metadata about about the gateway such as its name, network interfaces, configured time zone, and the state (whether the gateway is running or not).

- For API details, see DescribeGatewayInformation in *Amazon CLI Command Reference*.

`list-file-shares`

The following code example shows how to use `list-file-shares`.

Amazon CLI

To list file shares

The following `command-name` example lists the available widgets in your Amazon account.

```
aws storagegateway list-file-shares \
    --gateway-arn arn:aws:storagegateway:us-east-1:209870788375:gateway/sgw-FB02E292
```

Output:

```
{
    "FileShareInfoList": [
        {
            "FileShareType": "NFS",
            "FileShareARN": "arn:aws:storagegateway:us-east-1:111122223333:share/
share-2FA12345",
            "FileShareId": "share-2FA12345",
            "FileShareStatus": "AVAILABLE",
            "GatewayARN": "arn:aws:storagegateway:us-east-1:111122223333:gateway/
sgw-FB0AAAAA"
        }
    ],
    "Marker": null
}
```

For more information, see ListFileShares in the *Amazon Storage Gateway Service API Reference*.

- For API details, see ListFileShares in *Amazon CLI Command Reference*.

`list-gateways`

The following code example shows how to use `list-gateways`.

Amazon CLI

To list gateways for an account

The following `list-gateways` command lists all the gateways defined for an account:

```
aws storagegateway list-gateways
```

This command outputs a JSON block that contains a list of gateway Amazon Resource Names (ARNs).

- For API details, see ListGateways in *Amazon CLI Command Reference*.

`list-volumes`

The following code example shows how to use `list-volumes`.

Amazon CLI

To list the volumes configured for a gateway

The following `list-volumes` command returns a list of volumes configured for the specified gateway. To specify which gateway to describe, use the Amazon Resource Name (ARN) of the gateway in the command.

This examples specifies a gateway with the id `sgw-12A3456B` in account `123456789012`:

```
aws storagegateway list-volumes --gateway-arn "arn:aws:storagegateway:us-
west-2:123456789012:gateway/sgw-12A3456B"
```

This command outputs a JSON block that a list of volumes that includes the type and ARN for each volume.

- For API details, see ListVolumes in *Amazon CLI Command Reference*.

`refresh-cache`

The following code example shows how to use `refresh-cache`.

Amazon CLI

To refresh the file share cache

The following `refresh-cache` example refreshes the cache for the specified file share.

```
aws storagegateway refresh-cache \
    --file-share-arn arn:aws:storagegateway:us-east-1:111122223333:share/
share-2FA12345
```

Output:

```
{
    "FileShareARN": "arn:aws:storagegateway:us-east-1:111122223333:share/
share-2FA12345",
    "NotificationId": "4954d4b1-abcd-ef01-1234-97950a7d3483"
}
```

For more information, see ListFileShares in the *Amazon Storage Gateway Service API Reference*.

- For API details, see RefreshCache in *Amazon CLI Command Reference*.

Amazon STS examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Amazon STS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`assume-role-with-saml`

The following code example shows how to use `assume-role-with-saml`.

Amazon CLI

To get short-term credentials for a role authenticated with SAML

The following `assume-role-with-saml` command retrieves a set of short-term credentials for the IAM role `TestSaml`. The request in this example is authenticated by using the SAML assertion supplied by your identity provider when you authenticate to it.

```
aws sts assume-role-with-saml \
    --role-arn arn:aws:iam::123456789012:role/TestSaml \
    --principal-arn arn:aws:iam::123456789012:saml-provider/SAML-test \
    --saml-
assertion "VERYLONGENCODEDASSERTIONEXAMPLExzYW1sOkF1ZGllbmNlPmJsYW5rPC9zYW1sOkF1ZGllbmNlPjwv

For more information, see Requesting Temporary Security Credentials in the *Amazon IAM User Guide*.

- For API details, see AssumeRoleWithSaml in *Amazon CLI Command Reference*.

`assume-role-with-web-identity`

The following code example shows how to use `assume-role-with-web-identity`.

Amazon CLI

To get short-term credentials for a role authenticated with Web Identity (OAuth 2."0)

The following `assume-role-with-web-identity` command retrieves a set of short-term credentials for the IAM role app1. The request is authenticated by using the web identity token supplied by the specified web identity provider. Two additional policies are applied to the session to further restrict what the user can do. The returned credentials expire one hour after they are generated.

```
aws sts assume-role-with-web-identity \
    --duration-seconds 3600 \
    --role-session-name "app1" \
    --provider-id "www.amazon.com" \
    --policy-arns "arn:aws:iam::123456789012:policy/
q=webidentitydemopolicy1","arn:aws:iam::123456789012:policy/webidentitydemopolicy2"
 \
    --role-arn arn:aws:iam::123456789012:role/FederatedWebIdentityRole \
    --web-identity-token "Atza

```

For more information, see Requesting Temporary Security Credentials in the *Amazon IAM User Guide*.

- For API details, see AssumeRoleWithWebIdentity in *Amazon CLI Command Reference*.

`assume-role`

The following code example shows how to use `assume-role`.

Amazon CLI

To assume a role

The following `assume-role` command retrieves a set of short-term credentials for the IAM role `s3-access-example`.

```
aws sts assume-role \
    --role-arn arn:aws:iam::123456789012:role/xaccounts3access \
    --role-session-name s3-access-example
```

Output:

```
{
    "AssumedRoleUser": {
        "AssumedRoleId": "AROA3XFRBF535PLBIFPI4:s3-access-example",
        "Arn": "arn:aws:sts::123456789012:assumed-role/xaccounts3access/s3-access-
example"
    },
    "Credentials": {
        "SecretAccessKey": "9drTJvcXLB89EXAMPLELB8923FB892xMFI",
        "SessionToken": "AQoXdzELDDY//////////

        "Expiration": "2016-03-15T00:05:07Z",
        "AccessKeyId": "ASIAJEXAMPLEXEG2JICEA"
```

```
    }
}
```

The output of the command contains an access key, secret key, and session token that you can use to authenticate to Amazon.

For Amazon CLI use, you can set up a named profile associated with a role. When you use the profile, the Amazon CLI will call assume-role and manage credentials for you. For more information, see Use an IAM role in the Amazon CLI in the *Amazon CLI User Guide*.

- For API details, see AssumeRole in *Amazon CLI Command Reference*.

`assume-root`

The following code example shows how to use `assume-root`.

Amazon CLI

To launch a privileged session

The following `assume-root` command retrieves a set of short-term credentials you can use to remove a misconfigured Amazon S3 bucket policy for a member account in your organization.

```
aws sts assume-root \
    --duration-seconds 900 \
    --target-principal 111122223333 \
    --task-policy-arn arn=arn:aws:iam::aws:policy/root-task/S3UnlockBucketPolicy
```

Output:

```
{
    "Credentials": {
        "SecretAccessKey": "9drTJvcXLB89EXAMPLELB8923FB892xMFI",
        "SessionToken": "AQoXdzELDDY//////////

        "Expiration": "2024-11-15T00:05:07Z",
        "AccessKeyId": "ASIAJEXAMPLEXEG2JICEA"
```

```
    },
    "SourceIdentity": "Alice",
}
```

The output of the command contains an access key, secret key, and session token that you can use to to perform privileged actions in the member account. For more information, see Perform a privileged task on an Amazon Organizations member account in the *Amazon IAM User Guide*.

- For API details, see AssumeRoot in *Amazon CLI Command Reference*.

`decode-authorization-message`

The following code example shows how to use `decode-authorization-message`.

Amazon CLI

To decode an encoded authorization message returned in response to a request

The following `decode-authorization-message` example decodes additional information about the authorization status of a request from an encoded message returned in response to an Amazon Web Services request.

```
aws sts decode-authorization-message \
    --encoded-message EXAMPLEWodyRNrtlQARDip-

}
```

For more information, see Policy evaluation logic in the *Amazon IAM User Guide*.

- For API details, see DecodeAuthorizationMessage in *Amazon CLI Command Reference*.

`get-caller-identity`

The following code example shows how to use `get-caller-identity`.

Amazon CLI

To get details about the current IAM identity

The following `get-caller-identity` command displays information about the IAM identity used to authenticate the request. The caller is an IAM user.

```
aws sts get-caller-identity
```

Output:

```
{
    "UserId": "AIDASAMPLEUSERID",
```

```
    "Account": "123456789012",
    "Arn": "arn:aws:iam::123456789012:user/DevAdmin"
}
```

- For API details, see GetCallerIdentity in *Amazon CLI Command Reference*.

`get-federation-token`

The following code example shows how to use `get-federation-token`.

Amazon CLI

To return a set of temporary security credentials using IAM user access key credentials

The following `get-federation-token` example returns a set of temporary security credentials (consisting of an access key ID, a secret access key, and a security token) for a user. You must call the `GetFederationToken` operation using the long-term security credentials of an IAM user.

```
aws sts get-federation-token \
    --name Bob \
    --policy file://myfile.json \
    --policy-arns arn=arn:aws:iam::aws:policy/AmazonS3ReadOnlyAccess \
    --duration-seconds 900
```

Contents of `myfile.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",

For more information, see Requesting Temporary Security Credentials in the *Amazon IAM User Guide*.

- For API details, see GetFederationToken in *Amazon CLI Command Reference*.

`get-session-token`

The following code example shows how to use `get-session-token`.

Amazon CLI

To get a set of short term credentials for an IAM identity

The following `get-session-token` command retrieves a set of short-term credentials for the IAM identity making the call. The resulting credentials can be used for requests where multi-factor authentication (MFA) is required by policy. The credentials expire 15 minutes after they are generated.

```
aws sts get-session-token \
    --duration-seconds 900 \
    --serial-number "YourMFADeviceSerialNumber" \
    --token-code 123456
```

Output:

```
{
    "Credentials": {
        "AccessKeyId": "ASIAIOSFODNN7EXAMPLE",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYzEXAMPLEKEY",
        "SessionToken": "AQoEXAMPLEH4aoAH0gNCAPyJxz4BlCFFxWNE1OPTgk5TthT

        "Expiration": "2020-05-19T18:06:10+00:00"
    }
}
```

For more information, see Requesting Temporary Security Credentials in the *Amazon IAM User Guide*.

- For API details, see GetSessionToken in *Amazon CLI Command Reference*.

Amazon Web Services Support examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Amazon Web Services Support.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-attachments-to-set`

The following code example shows how to use `add-attachments-to-set`.

Amazon CLI

To add an attachment to a set

The following `add-attachments-to-set` example adds an image to a set that you can then specify for a support case in your Amazon account.

```
aws support add-attachments-to-set \
    --attachment-set-id "as-2f5a6faa2a4a1e600-mu-nk5xQlBr70-
G1cUos5LZkd38KOAHZa9BMDVzNEXAMPLE" \
    --attachments fileName=troubleshoot-screenshot.png,data=base64-encoded-string
```

Output:

```
{
    "attachmentSetId": "as-2f5a6faa2a4a1e600-mu-nk5xQlBr70-
G1cUos5LZkd38KOAHZa9BMDVzNEXAMPLE",
    "expiryTime": "2020-05-14T17:04:40.790+0000"
}
```

For more information, see Case management in the *Amazon Support User Guide*.

- For API details, see AddAttachmentsToSet in *Amazon CLI Command Reference*.

`add-communication-to-case`

The following code example shows how to use `add-communication-to-case`.

Amazon CLI

To add communication to a case

The following `add-communication-to-case` example adds communications to a support case in your Amazon account.

```
aws support add-communication-to-case \
    --case-id "case-12345678910-2013-c4c1d2bf33c5cf47" \
    --communication-body "I'm attaching a set of images to this case." \
    --cc-email-addresses "myemail@example.com" \
    --attachment-set-id "as-2f5a6faa2a4a1e600-mu-nk5xQlBr70-
G1cUos5LZkd38KOAHZa9BMDVzNEXAMPLE"
```

Output:

```
{
    "result": true
}
```

For more information, see Case management in the *Amazon Support User Guide*.

- For API details, see AddCommunicationToCase in *Amazon CLI Command Reference*.

`create-case`

The following code example shows how to use `create-case`.

Amazon CLI

To create a case

The following `create-case` example creates a support case for your Amazon account.

```
aws support create-case \
    --category-code "using-aws" \
    --cc-email-addresses "myemail@example.com" \
    --communication-body "I want to learn more about an AWS service." \
    --issue-type "technical" \
    --language "en" \
    --service-code "general-info" \
```

```
    --severity-code "low" \
    --subject "Question about my account"
```

Output:

```
{
    "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47"
}
```

For more information, see Case management in the *Amazon Support User Guide*.

- For API details, see CreateCase in *Amazon CLI Command Reference*.

`describe-attachment`

The following code example shows how to use `describe-attachment`.

Amazon CLI

To describe an attachment

The following `describe-attachment` example returns information about the attachment with the specified ID.

```
aws support describe-attachment \
    --attachment-id "attachment-KBnjRNrePd9D6Jx0-Mm00xZuDEaL2JAj_0-
gJv9qqDooTipsz3V1Nb19rCfkZneeQeDPgp8X1iVJyHH7UuhZDdNeqGoduZsPrAhyMakqlc60-
iJjL5HqyYGiT1FG8EXAMPLE"
```

Output:

```
{
    "attachment": {
        "fileName": "troubleshoot-screenshot.png",
        "data": "base64-blob"
    }
}
```

For more information, see Case management in the *Amazon Support User Guide*.

- For API details, see DescribeAttachment in *Amazon CLI Command Reference*.

`describe-cases`

The following code example shows how to use `describe-cases`.

Amazon CLI

To describe a case

The following `describe-cases` example returns information about the specified support case in your Amazon account.

```
aws support describe-cases \
    --display-id "1234567890" \
    --after-time "2020-03-23T21:31:47.774Z" \
    --include-resolved-cases \
    --language "en" \
    --no-include-communications \
    --max-item 1
```

Output:

```
{
    "cases": [
        {
            "status": "resolved",
            "ccEmailAddresses": [],
            "timeCreated": "2020-03-23T21:31:47.774Z",
            "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47",
            "severityCode": "low",
            "language": "en",
            "categoryCode": "using-aws",
            "serviceCode": "general-info",
            "submittedBy": "myemail@example.com",
            "displayId": "1234567890",
            "subject": "Question about my account"
        }
    ]
}
```

For more information, see Case management in the *Amazon Support User Guide*.

- For API details, see DescribeCases in *Amazon CLI Command Reference*.

`describe-communications`

The following code example shows how to use `describe-communications`.

Amazon CLI

To describe the latest communication for a case

The following `describe-communications` example returns the latest communication for the specified support case in your Amazon account.

```
aws support describe-communications \
    --case-id "case-12345678910-2013-c4c1d2bf33c5cf47" \
    --after-time "2020-03-23T21:31:47.774Z" \
    --max-item 1
```

Output:

```
{
    "communications": [
        {
            "body": "I want to learn more about an AWS service.",
            "attachmentSet": [],
            "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47",
            "timeCreated": "2020-05-12T23:12:35.000Z",
            "submittedBy": "Amazon Web Services"
        }
    ],
    "NextToken": "eyJuZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiEXAMPLE=="
}
```

For more information, see Case management in the *Amazon Support User Guide*.

- For API details, see DescribeCommunications in *Amazon CLI Command Reference*.

`describe-services`

The following code example shows how to use `describe-services`.

Amazon CLI

To list Amazon services and service categories

The following `describe-services` example lists the available service categories for requesting general information.

```
aws support describe-services \
    --service-code-list "general-info"
```

Output:

```
{
    "services": [
        {
            "code": "general-info",
            "name": "General Info and Getting Started",
            "categories": [
                {
                    "code": "charges",
                    "name": "How Will I Be Charged?"
                },
                {
                    "code": "gdpr-queries",
                    "name": "Data Privacy Query"
                },
                {
                    "code": "reserved-instances",
                    "name": "Reserved Instances"
                },
                {
                    "code": "resource",
                    "name": "Where is my Resource?"
                },
                {
                    "code": "using-aws",
                    "name": "Using AWS & Services"
                },
                {
                    "code": "free-tier",
                    "name": "Free Tier"
                },
                {
                    "code": "security-and-compliance",
                    "name": "Security & Compliance"
                },
                {
```

```
                    "code": "account-structure",
                    "name": "Account Structure"
                }
            ]
        }
    ]
}
```

For more information, see Case management in the *Amazon Support User Guide*.

- For API details, see DescribeServices in *Amazon CLI Command Reference*.

`describe-severity-levels`

The following code example shows how to use `describe-severity-levels`.

Amazon CLI

To list the available severity levels

The following `describe-severity-levels` example lists the available severity levels for a support case.

```
aws support describe-severity-levels
```

Output:

```
{
    "severityLevels": [
        {
            "code": "low",
            "name": "Low"
        },
        {
            "code": "normal",
            "name": "Normal"
        },
        {
            "code": "high",
            "name": "High"
        },
        {
```

```
            "code": "urgent",
            "name": "Urgent"
        },
        {
            "code": "critical",
            "name": "Critical"
        }
    ]
}
```

For more information, see Choosing a severity in the *Amazon Support User Guide*.

- For API details, see DescribeSeverityLevels in *Amazon CLI Command Reference*.

`describe-trusted-advisor-check-refresh-statuses`

The following code example shows how to use `describe-trusted-advisor-check-refresh-statuses`.

Amazon CLI

To list the refresh statuses of Amazon Trusted Advisor checks

The following `describe-trusted-advisor-check-refresh-statuses` example lists the refresh statuses for two Trusted Advisor checks: Amazon S3 Bucket Permissions and IAM Use.

```
aws support describe-trusted-advisor-check-refresh-statuses \
    --check-id "Pfx0RwqBli" "zXCkfM1nI3"
```

Output:

```
{
    "statuses": [
        {
            "checkId": "Pfx0RwqBli",
            "status": "none",
            "millisUntilNextRefreshable": 0
        },
        {
            "checkId": "zXCkfM1nI3",
            "status": "none",
```

```
            "millisUntilNextRefreshable": 0
        }
    ]
}
```

For more information, see Amazon Trusted Advisor in the *Amazon Support User Guide*.

- For API details, see DescribeTrustedAdvisorCheckRefreshStatuses in *Amazon CLI Command Reference*.

`describe-trusted-advisor-check-result`

The following code example shows how to use `describe-trusted-advisor-check-result`.

Amazon CLI

To list the results of an Amazon Trusted Advisor check

The following `describe-trusted-advisor-check-result` example lists the results of the IAM Use check.

```
aws support describe-trusted-advisor-check-result \
    --check-id "zXCkfM1nI3"
```

Output:

```
{
    "result": {
        "checkId": "zXCkfM1nI3",
        "timestamp": "2020-05-13T21:38:05Z",
        "status": "ok",
        "resourcesSummary": {
            "resourcesProcessed": 1,
            "resourcesFlagged": 0,
            "resourcesIgnored": 0,
            "resourcesSuppressed": 0
        },
        "categorySpecificSummary": {
            "costOptimizing": {
                "estimatedMonthlySavings": 0.0,
                "estimatedPercentMonthlySavings": 0.0
            }
```

```
        },
        "flaggedResources": [
            {
                "status": "ok",
                "resourceId": "47DEQpj8HBSa-_TImW-5JCeuQeRkm5NMpJWZEXAMPLE",
                "isSuppressed": false
            }
        ]
    }
}
```

For more information, see Amazon Trusted Advisor in the *Amazon Support User Guide*.

- For API details, see DescribeTrustedAdvisorCheckResult in *Amazon CLI Command Reference*.

`describe-trusted-advisor-check-summaries`

The following code example shows how to use `describe-trusted-advisor-check-summaries`.

Amazon CLI

To list the summaries of Amazon Trusted Advisor checks

The following `describe-trusted-advisor-check-summaries` example lists the results for two Trusted Advisor checks: Amazon S3 Bucket Permissions and IAM Use.

```
aws support describe-trusted-advisor-check-summaries \
    --check-ids "Pfx0RwqBli" "zXCkfM1nI3"
```

Output:

```
{
    "summaries": [
        {
            "checkId": "Pfx0RwqBli",
            "timestamp": "2020-05-13T21:38:12Z",
            "status": "ok",
            "hasFlaggedResources": true,
            "resourcesSummary": {
                "resourcesProcessed": 44,
                "resourcesFlagged": 0,
```

```
                "resourcesIgnored": 0,
                "resourcesSuppressed": 0
            },
            "categorySpecificSummary": {
                "costOptimizing": {
                    "estimatedMonthlySavings": 0.0,
                    "estimatedPercentMonthlySavings": 0.0
                }
            }
        },
        {
            "checkId": "zXCkfM1nI3",
            "timestamp": "2020-05-13T21:38:05Z",
            "status": "ok",
            "hasFlaggedResources": true,
            "resourcesSummary": {
                "resourcesProcessed": 1,
                "resourcesFlagged": 0,
                "resourcesIgnored": 0,
                "resourcesSuppressed": 0
            },
            "categorySpecificSummary": {
                "costOptimizing": {
                    "estimatedMonthlySavings": 0.0,
                    "estimatedPercentMonthlySavings": 0.0
                }
            }
        }
    ]
}
```

For more information, see Amazon Trusted Advisor in the *Amazon Support User Guide*.

- For API details, see DescribeTrustedAdvisorCheckSummaries in *Amazon CLI Command Reference*.

`describe-trusted-advisor-checks`

The following code example shows how to use `describe-trusted-advisor-checks`.

Amazon CLI

To list the available Amazon Trusted Advisor checks

The following `describe-trusted-advisor-checks` example lists the available Trusted Advisor checks in your Amazon account. This information includes the check name, ID, description, category, and metadata. Note that the output is shortened for readability.

```
aws support describe-trusted-advisor-checks \
    --language "en"
```

Output:

```
{
    "checks": [
        {
            "id": "zXCkfM1nI3",
            "name": "IAM Use",
            "description": "Checks for your use of AWS Identity and Access
 Management (IAM). You can use IAM to create users, groups, and roles in AWS, and
 you can use permissions to control access to AWS resources. \n<br>\n<br>\n<b>Alert
 Criteria</b><br>\nYellow: No IAM users have been created for this account.\n<br>
\n<br>\n<b>Recommended Action</b><br>\nCreate one or more IAM users and groups in
 your account. You can then create additional users whose permissions are limited
 to perform specific tasks in your AWS environment. For more information, see <a
 href=\"https://docs.aws.amazon.com/IAM/latest/UserGuide/IAMGettingStarted.html\"
 target=\"_blank\">Getting Started</a>. \n<br><br>\n<b>Additional Resources</b><br>
\n<a href=\"https://docs.aws.amazon.com/IAM/latest/UserGuide/IAM_Introduction.html\"
 target=\"_blank\">What Is IAM?</a>",
            "category": "security",
            "metadata": []
        }
    ]
}
```

For more information, see Amazon Trusted Advisor in the *Amazon Support User Guide*.

- For API details, see DescribeTrustedAdvisorChecks in *Amazon CLI Command Reference*.

`refresh-trusted-advisor-check`

The following code example shows how to use `refresh-trusted-advisor-check`.

Amazon CLI

To refresh an Amazon Trusted Advisor check

The following `refresh-trusted-advisor-check` example refreshes the Amazon S3 Bucket Permissions Trusted Advisor check in your Amazon account.

```
aws support refresh-trusted-advisor-check \
    --check-id "Pfx0RwqBli"
```

Output:

```
{
    "status": {
        "checkId": "Pfx0RwqBli",
        "status": "enqueued",
        "millisUntilNextRefreshable": 3599992
    }
}
```

For more information, see Amazon Trusted Advisor in the *Amazon Support User Guide*.

- For API details, see RefreshTrustedAdvisorCheck in *Amazon CLI Command Reference*.

`resolve-case`

The following code example shows how to use `resolve-case`.

Amazon CLI

To resolve a support case

The following `resolve-case` example resolves a support case in your Amazon account.

```
aws support resolve-case \
    --case-id "case-12345678910-2013-c4c1d2bf33c5cf47"
```

Output:

```
{
    "finalCaseStatus": "resolved",
    "initialCaseStatus": "work-in-progress"
}
```

For more information, see Case management in the *Amazon Support User Guide*.

- For API details, see ResolveCase in *Amazon CLI Command Reference*.

Amazon SWF examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Amazon SWF.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`count-closed-workflow-executions`

The following code example shows how to use `count-closed-workflow-executions`.

Amazon CLI

Counting Closed Workflow Executions

You can use `swf count-closed-workflow-executions` to retrieve the number of closed workflow executions for a given domain. You can specify filters to count specific classes of executions.

The `--domain` and *either* `--close-time-filter` or `--start-time-filter` arguments are required. All other arguments are optional.

```
aws swf count-closed-workflow-executions \
    --domain DataFrobtzz \
    --close-time-filter "{ \"latestDate\" : 1377129600, \"oldestDate\" :
 1370044800 }"
```

Output:

```
{
    "count": 2,
    "truncated": false
}
```

If "truncated" is `true`, then "count" represents the maximum number that can be returned by Amazon SWF. Any further results are truncated.

To reduce the number of results returned, you can:

modify the `--close-time-filter` or `--start-time-filter` values to narrow the time range that is searched. Eachof these is mutually exclusive: You can specify *only one of these* in a request.use the `--close-status-filter`, `--execution-filter`, `--tag-filter` or `--type-filter` arguments to furtherfilter the results. However, these arguments are also mutually exclusive.

See AlsoCountClosedWorkflowExecutions in the *Amazon Simple Workflow Service API Reference*

- For API details, see CountClosedWorkflowExecutions in *Amazon CLI Command Reference*.

`count-open-workflow-executions`

The following code example shows how to use `count-open-workflow-executions`.

Amazon CLI

Counting Open Workflow Executions

You can use `swf count-open-workflow-executions` to retrieve the number of open workflow executions for a given domain. You can specify filters to count specific classes of executions.

The `--domain` and `--start-time-filter` arguments are required. All other arguments are optional.

```
aws swf count-open-workflow-executions \
    --domain DataFrobtzz \
    --start-time-filter "{ \"latestDate\" : 1377129600, \"oldestDate\" :
 1370044800 }"
```

Output:

```
{
    "count": 4,
    "truncated": false
}
```

If "truncated" is `true`, then "count" represents the maximum number that can be returned by Amazon SWF. Any further results are truncated.

To reduce the number of results returned, you can:

modify the `--start-time-filter` values to narrow the time range that is searched.use the `--close-status-filter`, `--execution-filter`, `--tag-filter` or `--type-filter` arguments to furtherfilter the results. Each of these is mutually exclusive: You can specify *only one of these* in a request.

For more information, see CountOpenWorkflowExecutions in the *Amazon Simple Workflow Service API Reference*

- For API details, see CountOpenWorkflowExecutions in *Amazon CLI Command Reference*.

`deprecate-domain`

The following code example shows how to use `deprecate-domain`.

Amazon CLI

Deprecating a Domain

To deprecate a domain (you can still see it, but cannot create new workflow executions or register types on it), use `swf deprecate-domain`. It has a sole required parameter, `--name`, which takes the name of the domain to deprecate.

```
aws swf deprecate-domain \
    --name MyNeatNewDomain ""
```

As with `register-domain`, no output is returned. If you use `list-domains` to view the registered domains, however, you will see that the domain has been deprecated and no longer appears in the returned data.

```
aws swf list-domains \
    --registration-status REGISTERED
```

```
        {
            "domainInfos": [
                {
                    "status": "REGISTERED",
                    "name": "DataFrobotz"
                },
                {
                    "status": "REGISTERED",
                    "name": "erontest"
                }
            ]
        }
```

If you use `--registration-status DEPRECATED` with `list-domains`, you will see your deprecated domain.

```
aws swf list-domains \
    --registration-status DEPRECATED
        {
            "domainInfos": [
                {
                    "status": "DEPRECATED",
                    "name": "MyNeatNewDomain"
                }
            ]
        }
```

You can still use `describe-domain` to get information about a deprecated domain.

```
aws swf describe-domain \
    --name MyNeatNewDomain
        {
            "domainInfo": {
                "status": "DEPRECATED",
                "name": "MyNeatNewDomain"
            },
            "configuration": {
                "workflowExecutionRetentionPeriodInDays": "0"
            }
        }
```

See AlsoDeprecateDomain in the *Amazon Simple Workflow Service API Reference*

- For API details, see DeprecateDomain in *Amazon CLI Command Reference*.

`describe-domain`

The following code example shows how to use `describe-domain`.

Amazon CLI

Getting Information About a Domain

To get detailed information about a particular domain, use the `swf describe-domain` command. There is one required parameter: `--name`, which takes the name of the domain you want information about.

```
aws swf describe-domain \
    --name DataFrobotz
        {
            "domainInfo": {
                "status": "REGISTERED",
                "name": "DataFrobotz"
            },
            "configuration": {
                "workflowExecutionRetentionPeriodInDays": "1"
            }
        }
```

You can also use `describe-domain` to get information about deprecated domains.

```
aws swf describe-domain \
    --name MyNeatNewDomain
        {
            "domainInfo": {
                "status": "DEPRECATED",
                "name": "MyNeatNewDomain"
            },
            "configuration": {
                "workflowExecutionRetentionPeriodInDays": "0"
            }
        }
```

See AlsoDescribeDomain in the *Amazon Simple Workflow Service API Reference*

- For API details, see DescribeDomain in *Amazon CLI Command Reference*.

`list-activity-types`

The following code example shows how to use `list-activity-types`.

Amazon CLI

Listing Activity Types

To get a list of the activity types for a domain, use `swf list-activity-types`. The `--domain` and `--registration-status` arguments are required.

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED
```

Output:

```
{
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.451,
            "activityType": {
                "version": "1",
                "name": "confirm-user-email"
            },
            "description": "subscribe confirm-user-email activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.709,
            "activityType": {
                "version": "1",
                "name": "confirm-user-phone"
            },
            "description": "subscribe confirm-user-phone activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454149.871,
            "activityType": {
```

```
                "version": "1",
                "name": "get-subscription-info"
            },
            "description": "subscribe get-subscription-info activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.909,
            "activityType": {
                "version": "1",
                "name": "send-subscription-success"
            },
            "description": "subscribe send-subscription-success activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.085,
            "activityType": {
                "version": "1",
                "name": "subscribe-user-sns"
            },
            "description": "subscribe subscribe-user-sns activity"
        }
    ]
}
```

You can use the `--name` argument to select only activity types with a particular name:

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED \
    --name "send-subscription-success"
```

Output:

```
{
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.909,
            "activityType": {
                "version": "1",
                "name": "send-subscription-success"
```

```
            },
            "description": "subscribe send-subscription-success activity"
        }
    ]
}
```

To retrieve results in pages, you can set the `--maximum-page-size` argument. If more results are returned than will fit in a page of results, a "nextPageToken" will be returned in the result set:

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED \
    --maximum-page-size 2
```

Output:

```
{
    "nextPageToken": "AAAAKgAAAAEAAAAAAAAAA1Gp1BelJq
+PmHvAnDxJYbup8+0R4LVtbXLDl7QNY7C3OpHo9Sz06D/GuFz1OyC73umBQ1tOPJ/gC/
aYpzDMqUIWIA1T9W0s2DryyZX4OC/6Lhk9/
o5kdsuWMSBkHhgaZjgwp3WJINIFJFdaSMxY2vYAX7AtRtpcqJuBDDRE9RaRqDGYqIYUMltarkiqpSY1ZVveBasBvlvyU
WGAaqehiDz7/JzLT/wWNNUMOd+Nhe",
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.451,
            "activityType": {
                "version": "1",
                "name": "confirm-user-email"
            },
            "description": "subscribe confirm-user-email activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.709,
            "activityType": {
                "version": "1",
                "name": "confirm-user-phone"
            },
            "description": "subscribe confirm-user-phone activity"
        }
```

```
    ]
}
```

You can pass the nextPageToken value to the next call to `list-activity-types` in the `--next-page-token` argument, retrieving the next page of results:

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED \
    --maximum-page-size 2 \
    --next-page-token "AAAAKgAAAAEAAAAAAAAAA1Gp1BelJq
+PmHvAnDxJYbup8+0R4LVtbXLDl7QNY7C3OpHo9Sz06D/GuFz1OyC73umBQ1tOPJ/gC/
aYpzDMqUIWIA1T9W0s2DryyZX4OC/6Lhk9/
o5kdsuWMSBkHhgaZjgwp3WJINIFJFdaSMxY2vYAX7AtRtpcqJuBDDRE9RaRqDGYqIYUMltarkiqpSY1ZVveBasBvlvyU
WGAaqehiDz7/JzLT/wWNNUMOd+Nhe"
```

Output:

```
{
    "nextPageToken": "AAAAKgAAAAEAAAAAAAAAAw+7LZ4GRZPzTqBHsp2wBxWB8m1sgLCclgCuq3J+h/
m3+vOfFqtkcjLwV5cc4OjNAzTCuq/
XcylPumGwkjbajtqpZpbqOcVNfjFxGoi0LB2Olbvv0krbUISBvlpFPmSWpDSZJsxg5UxCcweteSlFn1PNSZ/
MoinBZo8OTkjMuzcsTuKOzH9wCaR8ITcALJ3SaqHU3pyIRS5hPmFA3OLIc8zaAepjlaujo6hntNSCruB4"
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454149.871,
            "activityType": {
                "version": "1",
                "name": "get-subscription-info"
            },
            "description": "subscribe get-subscription-info activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.909,
            "activityType": {
                "version": "1",
                "name": "send-subscription-success"
            },
            "description": "subscribe send-subscription-success activity"
        }
    ]
```

```
}
```

If there are still more results to return, "nextPageToken" will be returned with the results. When there are no more pages of results to return, "nextPageToken" will *not* be returned in the result set.

You can use the `--reverse-order` argument to reverse the order of the returned results. This also affects paged results.

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED \
    --maximum-page-size 2 \
    --reverse-order
```

Output:

```
{
    "nextPageToken": "AAAAKgAAAAEAAAAAAAAAAwXcpu5ePSyQkrC
+8WMbmSrenuZC2ZkIXQYBPB/b9xIOVkj+bMEFhGj0KmmJ4rF7iddhjf7UMYCsfGkEn7mk
+yMCgVc1JxDWmB0EH46bhcmcLmYNQihMDmUWocpr7To6/R7CLu0St1gkFayxOidJXErQW0zdNfQaIWAnF/
cwioBbXlkz1fQzmDeU3M5oYGMPQIrUqkPq7pMEW0q0lK5eDN97NzFYdZZ/rlcLDWPZhUjY",
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.085,
            "activityType": {
                "version": "1",
                "name": "subscribe-user-sns"
            },
            "description": "subscribe subscribe-user-sns activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.909,
            "activityType": {
                "version": "1",
                "name": "send-subscription-success"
            },
            "description": "subscribe send-subscription-success activity"
        }
    ]
```

```
}
```

See AlsoListActivityTypes in the *Amazon Simple Workflow Service API Reference*

- For API details, see ListActivityTypes in *Amazon CLI Command Reference*.

`list-domains`

The following code example shows how to use `list-domains`.

Amazon CLI

Example 1: To list your registered domains

The following `list-domains` command example lists the `REGISTERED` SWF domains that you have registered for your account.

```
aws swf list-domains \
    --registration-status REGISTERED
```

Output:

```
{
  "domainInfos": [
    {
      "status": "REGISTERED",
      "name": "DataFrobotz"
    },
    {
      "status": "REGISTERED",
      "name": "erontest"
    }
  ]
}
```

For more information, see ListDomains in the *Amazon Simple Workflow Service API Reference*

Example 2: To list your deprecated domains

The following `list-domains` command example lists the `DEPRECATED` SWF domains that you have registered for your account. Deprecated domains are domains that can not register new workflows or activities, but that can still be queried.

```
aws swf list-domains \
    --registration-status DEPRECATED
```

Output:

```
{
  "domainInfos": [
    {
      "status": "DEPRECATED",
      "name": "MyNeatNewDomain"
    }
  ]
}
```

For more information, see ListDomains in the *Amazon Simple Workflow Service API Reference*

Example 3: To list the first page of registered domains

The following `list-domains` command example lists the first page `REGISTERED` SWF domains that you have registered for your account using the `--maximum-page-size` option.

```
aws swf list-domains \
    --registration-status REGISTERED \
    --maximum-page-size 1
```

Output:

```
{
    "domainInfos": [
        {
            "status": "REGISTERED",
            "name": "DataFrobotz"
        }
    ],
"nextPageToken": "AAAAKgAAAAEAAAAAAAAAA2QJKNtidVgd49TTeNwYcpD
+QKT2ynuEbibcQWe2QKrslMGe63gpS0MgZGpcpoKttL4OCXRFn98Xif557it
+wSZUsvUDtImjDLvguyuyyFdIZtvIxIKEOPm3k2r4OjAGaFsGOuVbrKljvla7wdU7FYH3OlkNCP8b7PBj9SBkUyGoiAg
}
```

For more information, see ListDomains in the *Amazon Simple Workflow Service API Reference*

Example 4: To list the specified single page of registered domains

The following `list-domains` command example lists the first page REGISTERED SWF domains that you have registered for your account using the `--maximum-page-size` option.

When you make the call again, this time supplying the value of `nextPageToken` in the `--next-page-token` argument, you'll get another page of results.

```
aws swf list-domains \
    --registration-status REGISTERED \
    --maximum-page-size 1 \
    --next-page-token "AAAAKgAAAAEAAAAAAAAAA2QJKNtidVgd49TTeNwYcpD
+QKT2ynuEbibcQWe2QKrslMGe63gpS0MgZGpcpoKttL4OCXRFn98Xif557it
+wSZUsvUDtImjDLvguyuyyFdIZtvIxIKEOPm3k2r4OjAGaFsGOuVbrKljvla7wdU7FYH3OlkNCP8b7PBj9SBkUyGoiAg
```

Output:

```
{
    "domainInfos": [
        {
            "status": "REGISTERED",
            "name": "erontest"
        }
    ]
}
```

When there are no further pages of results to retrieve, `nextPageToken` will not be returned in the results.

For more information, see ListDomains in the *Amazon Simple Workflow Service API Reference*

- For API details, see ListDomains in *Amazon CLI Command Reference*.

`list-workflow-types`

The following code example shows how to use `list-workflow-types`.

Amazon CLI

Listing Workflow Types

To get a list of the workflow types for a domain, use `swf list-workflow-types`. The `--domain` and `--registration-status` arguments are required. Here's a simple example.

```
aws swf list-workflow-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED
```

Output:

```
{
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454149.598,
            "description": "DataFrobtzz subscribe workflow",
            "workflowType": {
                "version": "v3",
                "name": "subscribe"
            }
        }
    ]
}
```

As with `list-activity-types`, you can use the `--name` argument to select only workflow types with a particular name, and use the `--maximum-page-size` argument in coordination with `--next-page-token` to page results. To reverse the order in which results are returned, use `--reverse-order`.

See AlsoListWorkflowTypes in the *Amazon Simple Workflow Service API Reference*

- For API details, see ListWorkflowTypes in *Amazon CLI Command Reference*.

`register-domain`

The following code example shows how to use `register-domain`.

Amazon CLI

Registering a Domain

You can use the Amazon CLI to register new domains. Use the `swf register-domain` command. There are two required parameters, `--name`, which takes the domain name, and `--workflow-execution-retention-period-in-days`, which takes an integer to specify the number of days to retain workflow execution data on this domain, up to a maxium period

of 90 days (for more information, see the SWF FAQ <https://aws.amazon.com/swf/faqs/#retain_limit>). Workflow execution data will not be retained after the specified number of days have passed.

```
aws swf register-domain \
    --name MyNeatNewDomain \
    --workflow-execution-retention-period-in-days 0
    ""
```

When you register a domain, nothing is returned (""), but you can use `swf list-domains` or `swf describe-domain` to see the new domain.

```
aws swf list-domains \
    --registration-status REGISTERED
        {
            "domainInfos": [
                {
                    "status": "REGISTERED",
                    "name": "DataFrobotz"
                },
                {
                    "status": "REGISTERED",
                    "name": "MyNeatNewDomain"
                },
                {
                    "status": "REGISTERED",
                    "name": "erontest"
                }
            ]
        }
```

Using `swf describe-domain`:

```
aws swf describe-domain --
name MyNeatNewDomain
{
    "domainInfo": {
        "status": "REGISTERED",
        "name": "MyNeatNewDomain"
    },
    "configuration": {
        "workflowExecutionRetentionPeriodInDays": "0"
```

```
  }
}
```

See AlsoRegisterDomain in the *Amazon Simple Workflow Service API Reference*

- For API details, see RegisterDomain in *Amazon CLI Command Reference*.

`register-workflow-type`

The following code example shows how to use `register-workflow-type`.

Amazon CLI

Registering a Workflow Type

To register a Workflow type with the Amazon CLI, use the `swf register-workflow-type` command.

```
aws swf register-workflow-type \
    --domain DataFrobtzz \
    --name "MySimpleWorkflow" \
    --workflow-version "v1"
```

If successful, the command produces no output.

On an error (for example, if you try to register the same workflow typetwice, or specify a domain that doesn't exist) you will get a response in JSON.

```
{
    "message": "WorkflowType=[name=MySimpleWorkflow, version=v1]",
    "__type": "com.amazonaws.swf.base.model#TypeAlreadyExistsFault"
}
```

The `--domain`, `--name` and `--workflow-version` are required. You can also set the workflow description, timeouts, and child workflow policy.

For more information, see RegisterWorkflowType in the *Amazon Simple Workflow Service API Reference*

- For API details, see RegisterWorkflowType in *Amazon CLI Command Reference*.

Systems Manager examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Systems Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`add-tags-to-resource`

The following code example shows how to use `add-tags-to-resource`.

Amazon CLI

Example 1: To add tags to a maintenance window

The following `add-tags-to-resource` example adds a tag to the specified maintenance window.

```
aws ssm add-tags-to-resource \
    --resource-type "MaintenanceWindow" \
    --resource-id "mw-03eb9db428EXAMPLE" \
    --tags "Key=Stack,Value=Production"
```

This command produces no output.

Example 2: To add tags to a parameter

The following `add-tags-to-resource` example adds two tags to to the specified parameter.

```
aws ssm add-tags-to-resource \
    --resource-type "Parameter" \
    --resource-id "My-Parameter" \
```

```
    --tags '[{"Key":"Region","Value":"East"},{"Key":"Environment",
 "Value":"Production"}]'
```

This command produces no output.

Example 3: To add tags to an SSM document

The following `add-tags-to-resource` example adds a tag to to the specified document.

```
aws ssm add-tags-to-resource \
    --resource-type "Document" \
    --resource-id "My-Document" \
    --tags "Key=Quarter,Value=Q322"
```

This command produces no output.

For more information, see Tagging Systems Manager resources in the *Amazon Systems Manager User Guide*.

- For API details, see AddTagsToResource in *Amazon CLI Command Reference*.

`associate-ops-item-related-item`

The following code example shows how to use `associate-ops-item-related-item`.

Amazon CLI

To associate a related item

The following `associate-ops-item-related-item` example associates a related item to the OpsItem.

```
aws ssm associate-ops-item-related-item \
    --ops-item-id "oi-649fExample" \
    --association-type "RelatesTo" \
    --resource-type "AWS::SSMIncidents::IncidentRecord" \
    --resource-uri "arn:aws:ssm-incidents::111122223333:incident-record/Example-
Response-Plan/c2bde883-f7d5-343a-b13a-bf5fe9ea689f"
```

Output:

```
{
    "AssociationId": "61d7178d-a30d-4bc5-9b4e-a9e74EXAMPLE"
```

```
}
```

For more information, see Working with Incident Manager incidents in OpsCenter in the *Amazon Systems Manager User Guide*.

- For API details, see AssociateOpsItemRelatedItem in *Amazon CLI Command Reference*.

`cancel-command`

The following code example shows how to use `cancel-command`.

Amazon CLI

Example 1: To cancel a command for all instances

The following `cancel-command` example attempts to cancel the specified command that is already running for all instances.

```
aws ssm cancel-command \
    --command-id "662add3d-5831-4a10-b64a-f2ff3EXAMPLE"
```

This command produces no output.

Example 2: To cancel a command for specific instances

The following `cancel-command` example attempts to cancel a command for the specified instance only.

```
aws ssm cancel-command \
    --command-id "662add3d-5831-4a10-b64a-f2ff3EXAMPLE"
    --instance-ids "i-02573cafcfEXAMPLE"
```

This command produces no output.

For more information, see Tagging Systems Manager Parameters in the *Amazon Systems Manager User Guide*.

- For API details, see CancelCommand in *Amazon CLI Command Reference*.

`cancel-maintenance-window-execution`

The following code example shows how to use `cancel-maintenance-window-execution`.

Amazon CLI

To cancel a maintenance window execution

This `cancel-maintenance-window-execution` example stops the specified maintenance window execution that is already in progress.

```
aws ssm cancel-maintenance-window-execution \
    --window-execution-id j2l8d5b5c-mw66-tk4d-r3g9-1d4d1EXAMPLE
```

Output:

```
{
    "WindowExecutionId": "j2l8d5b5c-mw66-tk4d-r3g9-1d4d1EXAMPLE"
}
```

For more information, see Systems Manager Maintenance Windows Tutorials (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see CancelMaintenanceWindowExecution in *Amazon CLI Command Reference*.

`create-activation`

The following code example shows how to use `create-activation`.

Amazon CLI

To create a managed instance activation

The following `create-activation` example creates a managed instance activation.

```
aws ssm create-activation \
    --default-instance-name "HybridWebServers" \
    --iam-role "HybridWebServersRole" \
    --registration-limit 5
```

Output:

```
{
    "ActivationId": "5743558d-563b-4457-8682-d16c3EXAMPLE",
```

```
    "ActivationCode": "dRmgnYaFv567vEXAMPLE"
}
```

For more information, see Step 4: Create a Managed-Instance Activation for a Hybrid Environment in the *Amazon Systems Manager User Guide*.

- For API details, see CreateActivation in *Amazon CLI Command Reference*.

`create-association-batch`

The following code example shows how to use `create-association-batch`.

Amazon CLI

To create multiple associations

This example associates a configuration document with multiple instances. The output returns a list of successful and failed operations, if applicable.

Command:

```
aws ssm create-association-batch --entries "Name=AWS-
UpdateSSMAgent,InstanceId=i-1234567890abcdef0" "Name=AWS-
UpdateSSMAgent,InstanceId=i-9876543210abcdef0"
```

Output:

```
{
  "Successful": [
      {
          "Name": "AWS-UpdateSSMAgent",
          "InstanceId": "i-1234567890abcdef0",
          "AssociationVersion": "1",
          "Date": 1550504725.007,
          "LastUpdateAssociationDate": 1550504725.007,
          "Status": {
              "Date": 1550504725.007,
              "Name": "Associated",
              "Message": "Associated with AWS-UpdateSSMAgent"
          },
          "Overview": {
              "Status": "Pending",
```

```
            "DetailedStatus": "Creating"
        },
        "DocumentVersion": "$DEFAULT",
        "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
        "Targets": [
            {
                "Key": "InstanceIds",
                "Values": [
                    "i-1234567890abcdef0"
                ]
            }
        ]
    },
    {
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-9876543210abcdef0",
        "AssociationVersion": "1",
        "Date": 1550504725.057,
        "LastUpdateAssociationDate": 1550504725.057,
        "Status": {
            "Date": 1550504725.057,
            "Name": "Associated",
            "Message": "Associated with AWS-UpdateSSMAgent"
        },
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "DocumentVersion": "$DEFAULT",
        "AssociationId": "9c9f7f20-5154-4fed-a83e-0123456789ab",
        "Targets": [
            {
                "Key": "InstanceIds",
                "Values": [
                    "i-9876543210abcdef0"
                ]
            }
        ]
    }
  ],
  "Failed": []
}
```

- For API details, see CreateAssociationBatch in *Amazon CLI Command Reference*.

`create-association`

The following code example shows how to use `create-association`.

Amazon CLI

Example 1: To associate a document using instance IDs

This example associates a configuration document with an instance, using instance IDs.

```
aws ssm create-association \
    --instance-id "i-0cb2b964d3e14fd9f" \
    --name "AWS-UpdateSSMAgent"
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487875500.33,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see CreateAssociation in the *Amazon Systems Manager API Reference*.

Example 2: To associate a document using targets

This example associates a configuration document with an instance, using targets.

```
aws ssm create-association \
    --name "AWS-UpdateSSMAgent" \
    --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f"
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487875500.33,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see CreateAssociation in the *Amazon Systems Manager API Reference*.

Example 3: To create an association that runs only once

This example creates a new association that only runs once on the specified date and time. Associations created with a date in the past or present (by the time it is processed the date is in the past) run immediately.

```
aws ssm create-association \
    --name "AWS-UpdateSSMAgent" \
    --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f" \
    --schedule-expression "at(2020-05-14T15:55:00)"  \
    --apply-only-at-cron-interval
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487875500.33,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see CreateAssociation in the *Amazon Systems Manager API Reference* or Reference: Cron and rate expressions for Systems Manager in the *Amazon Systems Manager User Guide*.

- For API details, see CreateAssociation in *Amazon CLI Command Reference*.

`create-document`

The following code example shows how to use `create-document`.

Amazon CLI

To create a document

The following `create-document` example creates a Systems Manager document.

```
aws ssm create-document \
    --content file://exampleDocument.yml \
    --name "Example" \
    --document-type "Automation" \
    --document-format YAML
```

Output:

```
{
    "DocumentDescription": {
        "Hash": "fc2410281f40779e694a8b95975d0f9f316da8a153daa94e3d9921102EXAMPLE",
        "HashType": "Sha256",
        "Name": "Example",
        "Owner": "29884EXAMPLE",
        "CreatedDate": 1583256349.452,
        "Status": "Creating",
        "DocumentVersion": "1",
        "Description": "Document Example",
        "Parameters": [
            {
                "Name": "AutomationAssumeRole",
                "Type": "String",
                "Description": "(Required) The ARN of the role that allows
 Automation to perform the actions on your behalf. If no role is specified, Systems
 Manager Automation uses your IAM permissions to execute this document.",
                "DefaultValue": ""
```

```
            },
            {
                "Name": "InstanceId",
                "Type": "String",
                "Description": "(Required) The ID of the Amazon EC2 instance.",
                "DefaultValue": ""
            }
        ],
        "PlatformTypes": [
            "Windows",
            "Linux"
        ],
        "DocumentType": "Automation",
        "SchemaVersion": "0.3",
        "LatestVersion": "1",
        "DefaultVersion": "1",
        "DocumentFormat": "YAML",
        "Tags": []
    }
}
```

For more information, see Creating Systems Manager Documents in the *Amazon Systems Manager User Guide*.

- For API details, see CreateDocument in *Amazon CLI Command Reference*.

`create-maintenance-window`

The following code example shows how to use `create-maintenance-window`.

Amazon CLI

Example 1: To create a maintenance window

The following `create-maintenance-window` example creates a new maintenance window that every five minutes for up to two hours (as needed), prevents new tasks from starting within one hour of the end of the maintenance window execution, allows unassociated targets (instances that you haven't registered with the maintenance window), and indicates through the use of custom tags that its creator intends to use it in a tutorial.

```
aws ssm create-maintenance-window \
    --name "My-Tutorial-Maintenance-Window" \
```

```
    --schedule "rate(5 minutes)" \
    --duration 2 --cutoff 1 \
    --allow-unassociated-targets \
    --tags "Key=Purpose,Value=Tutorial"
```

Output:

```
{
    "WindowId": "mw-0c50858d01EXAMPLE"
}
```

Example 2: To create a maintenance window that runs only once

The following `create-maintenance-window` example creates a new maintenance window that only runs one time on the specified date and time.

```
aws ssm create-maintenance-window \
    --name My-One-Time-Maintenance-Window \
    --schedule "at(2020-05-14T15:55:00)" \
    --duration 5 \
    --cutoff 2 \
    --allow-unassociated-targets \
    --tags "Key=Environment,Value=Production"
```

Output:

```
{
    "WindowId": "mw-01234567890abcdef"
}
```

For more information, see Maintenance Windows in the *Amazon Systems Manager User Guide*.

- For API details, see CreateMaintenanceWindow in *Amazon CLI Command Reference*.

`create-ops-item`

The following code example shows how to use `create-ops-item`.

Amazon CLI

To create an OpsItems

The following `create-ops-item` example uses the /aws/resources key in OperationalData to create an OpsItem with an Amazon DynamoDB related resource.

```
aws ssm create-ops-item \
    --title "EC2 instance disk full" \
    --description "Log clean up may have failed which caused the disk to be full" \
    --priority 2 \
    --source ec2 \
    --operational-data '{"/aws/resources":{"Value":"[{\"arn
\": \"arn:aws:dynamodb:us-west-2:12345678:table/OpsItems
\"}]","Type":"SearchableString"}}' \
    --notifications Arn="arn:aws:sns:us-west-2:12345678:TestUser"
```

Output:

```
{
    "OpsItemId": "oi-1a2b3c4d5e6f"
}
```

For more information, see Creating OpsItems in the *Amazon Systems Manager User Guide*.

- For API details, see CreateOpsItem in *Amazon CLI Command Reference*.

`create-patch-baseline`

The following code example shows how to use `create-patch-baseline`.

Amazon CLI

Example 1: To create a patch baseline with auto-approval

The following `create-patch-baseline` example creates a patch baseline for Windows Server that approves patches for a production environment seven days after they are released by Microsoft.

```
aws ssm create-patch-baseline \
    --name "Windows-Production-Baseline-AutoApproval" \
    --operating-system "WINDOWS" \
    --approval-
rules "PatchRules=[{PatchFilterGroup={PatchFilters=[{Key=MSRC_SEVERITY,Values=[Critical,Impo
{Key=CLASSIFICATION,Values=[SecurityUpdates,Updates,UpdateRollups,CriticalUpdates]}]},Approv
 \
```

```
    --description "Baseline containing all updates approved for Windows Server
 production systems"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

Example 2: To create a patch baseline with an approval cutoff date

The following `create-patch-baseline` example creates a patch baseline for Windows Server that approves all patches for a production environment that are released on or before July 7, 2020.

```
aws ssm create-patch-baseline \
    --name "Windows-Production-Baseline-AutoApproval" \
    --operating-system "WINDOWS" \
    --approval-
rules "PatchRules=[{PatchFilterGroup={PatchFilters=[{Key=MSRC_SEVERITY,Values=[Critical,Impo
{Key=CLASSIFICATION,Values=[SecurityUpdates,Updates,UpdateRollups,CriticalUpdates]}]},Approv
 \
    --description "Baseline containing all updates approved for Windows Server
 production systems"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

Example 3: To create a patch baseline with approval rules stored in a JSON file

The following `create-patch-baseline` example creates a patch baseline for Amazon Linux 2017.09 that approves patches for a production environment seven days after they are released, specifies approval rules for the patch baseline, and specifies a custom repository for patches.

```
aws ssm create-patch-baseline \
    --cli-input-json file://my-amazon-linux-approval-rules-and-repo.json
```

Contents of `my-amazon-linux-approval-rules-and-repo.json`:

```
{
    "Name": "Amazon-Linux-2017.09-Production-Baseline",
    "Description": "My approval rules patch baseline for Amazon Linux 2017.09
 instances",
    "OperatingSystem": "AMAZON_LINUX",
    "Tags": [
        {
            "Key": "Environment",
            "Value": "Production"
        }
    ],
    "ApprovalRules": {
        "PatchRules": [
            {
                "ApproveAfterDays": 7,
                "EnableNonSecurity": true,
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "SEVERITY",
                            "Values": [
                                "Important",
                                "Critical"
                            ]
                        },
                        {
                            "Key": "CLASSIFICATION",
                            "Values": [
                                "Security",
                                "Bugfix"
                            ]
                        },
                        {
                            "Key": "PRODUCT",
                            "Values": [
                                "AmazonLinux2017.09"
                            ]
                        }
                    ]
                }
            }
        ]
```

```
    },
    "Sources": [
        {
            "Name": "My-AL2017.09",
            "Products": [
                "AmazonLinux2017.09"
            ],
            "Configuration": "[amzn-main] \nname=amzn-main-Base
\nmirrorlist=http://repo./$awsregion./$awsdomain//$releasever/main/mirror.list //

KEY-amazon-ga \nenabled=1 \nretries=3 \ntimeout=5\nreport_instanceid=yes"
        }
    ]
}
```

Example 4: To create a patch baseline that specifies approved and rejected patches

The following `create-patch-baseline` example explicitly specifies patches to approve and reject as exception to the default approval rules.

```
aws ssm create-patch-baseline \
    --name "Amazon-Linux-2017.09-Alpha-Baseline" \
    --description "My custom approve/reject patch baseline for Amazon Linux 2017.09
 instances" \
    --operating-system "AMAZON_LINUX" \
    --approved-patches "CVE-2018-1234567,example-pkg-EE-2018*.amzn1.noarch" \
    --approved-patches-compliance-level "HIGH" \
    --approved-patches-enable-non-security \
    --tags "Key=Environment,Value=Alpha"
```

For more information, see Create a Custom Patch Baseline in the *Amazon Systems Manager User Guide*.

- For API details, see CreatePatchBaseline in *Amazon CLI Command Reference*.

`create-resource-data-sync`

The following code example shows how to use `create-resource-data-sync`.

Amazon CLI

To create a resource data sync

This example creates a resource data sync. There is no output if the command succeeds.

Command:

```
aws ssm create-resource-data-sync --sync-name "ssm-resource-data-sync" --s3-
destination "BucketName=ssm-bucket,Prefix=inventory,SyncFormat=JsonSerDe,Region=us-
east-1"
```

- For API details, see CreateResourceDataSync in *Amazon CLI Command Reference*.

`delete-activation`

The following code example shows how to use `delete-activation`.

Amazon CLI

To delete a managed instance activation

The following `delete-activation` example deletes a managed instance activation.

```
aws ssm delete-activation \
    --activation-id "aa673477-d926-42c1-8757-1358cEXAMPLE"
```

This command produces no output.

For more information, see Setting Up Amazon Systems Manager for Hybrid Environments in the *Amazon Systems Manager User Guide*.

- For API details, see DeleteActivation in *Amazon CLI Command Reference*.

`delete-association`

The following code example shows how to use `delete-association`.

Amazon CLI

Example 1: To delete an association using the association ID

The following `delete-association` example deletes the association for the specified association ID. There is no output if the command succeeds.

```
aws ssm delete-association \
```

```
    --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

This command produces no output.

For more information, see Editing and creating a new version of an association in the *Amazon Systems Manager User Guide*.

Example 2: To delete an association

The following `delete-association` example deletes the association between an instance and a document. There is no output if the command succeeds.

```
aws ssm delete-association \
    --instance-id "i-1234567890abcdef0" \
    --name "AWS-UpdateSSMAgent"
```

This command produces no output.

For more information, see Working with associations in Systems Manager in the *Amazon Systems Manager User Guide*.

- For API details, see DeleteAssociation in *Amazon CLI Command Reference*.

`delete-document`

The following code example shows how to use `delete-document`.

Amazon CLI

To delete a document

The following `delete-document` example deletes a Systems Manager document.

```
aws ssm delete-document \
    --name "Example"
```

This command produces no output.

For more information, see Creating Systems Manager Documents in the *Amazon Systems Manager User Guide*.

- For API details, see DeleteDocument in *Amazon CLI Command Reference*.

delete-inventory

The following code example shows how to use `delete-inventory`.

Amazon CLI

To delete a custom inventory type

This example deletes a custom inventory schema.

Command:

```
aws ssm delete-inventory --type-name "Custom:RackInfo" --schema-delete-
option "DeleteSchema"
```

Output:

```
{
  "DeletionId": "d72ac9e8-1f60-4d40-b1c6-bf8c78c68c4d",
  "TypeName": "Custom:RackInfo",
  "DeletionSummary": {
      "TotalCount": 1,
      "RemainingCount": 1,
      "SummaryItems": [
          {
              "Version": "1.0",
              "Count": 1,
              "RemainingCount": 1
          }
      ]
  }
}
```

To disable a custom inventory type

This example disables a custom inventory schema.

Command:

```
aws ssm delete-inventory --type-name "Custom:RackInfo" --schema-delete-
option "DisableSchema"
```

Output:

```
{
  "DeletionId": "6961492a-8163-44ec-aa1e-923364dd0850",
  "TypeName": "Custom:RackInformation",
  "DeletionSummary": {
      "TotalCount": 0,
      "RemainingCount": 0,
      "SummaryItems": []
  }
}
```

- For API details, see DeleteInventory in *Amazon CLI Command Reference*.

`delete-maintenance-window`

The following code example shows how to use `delete-maintenance-window`.

Amazon CLI

To delete a maintenance window

This `delete-maintenance-window` example removes the specified maintenance window.

```
aws ssm delete-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9"
```

Output:

```
{
    "WindowId":"mw-1a2b3c4d5e6f7g8h9"
}
```

For more information, see Delete a Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DeleteMaintenanceWindow in *Amazon CLI Command Reference*.

`delete-parameter`

The following code example shows how to use `delete-parameter`.

Amazon CLI

To delete a parameter

The following `delete-parameter` example deletes the specified single parameter.

```
aws ssm delete-parameter \
    --name "MyParameter"
```

This command produces no output.

For more information, see Working with Parameter Store in the *Amazon Systems Manager User Guide*.

- For API details, see DeleteParameter in *Amazon CLI Command Reference*.

`delete-parameters`

The following code example shows how to use `delete-parameters`.

Amazon CLI

To delete a list of parameters

The following `delete-parameters` example deletes the specified parameters.

```
aws ssm delete-parameters \
    --names "MyFirstParameter" "MySecondParameter" "MyInvalidParameterName"
```

Output:

```
{
    "DeletedParameters": [
        "MyFirstParameter",
        "MySecondParameter"
    ],
    "InvalidParameters": [
        "MyInvalidParameterName"
    ]
}
```

For more information, see Working with Parameter Store in the *Amazon Systems Manager User Guide*.

- For API details, see DeleteParameters in *Amazon CLI Command Reference*.

`delete-patch-baseline`

The following code example shows how to use `delete-patch-baseline`.

Amazon CLI

To delete a patch baseline

The following `delete-patch-baseline` example deletes the specified patch baseline.

```
aws ssm delete-patch-baseline \
    --baseline-id "pb-045f10b4f382baeda"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f382baeda"
}
```

For more information, see Update or Delete a Patch Baseline (Console) in the *Amazon Systems Manager User Guide*.

- For API details, see DeletePatchBaseline in *Amazon CLI Command Reference*.

`delete-resource-data-sync`

The following code example shows how to use `delete-resource-data-sync`.

Amazon CLI

To delete a resource data sync

This example deletes a resource data sync. There is no output if the command succeeds.

Command:

```
aws ssm delete-resource-data-sync --sync-name "ssm-resource-data-sync"
```

- For API details, see DeleteResourceDataSync in *Amazon CLI Command Reference*.

`deregister-managed-instance`

The following code example shows how to use `deregister-managed-instance`.

Amazon CLI

To deregister a managed instance

The following `deregister-managed-instance` example deregisters the specified managed instance.

```
aws ssm deregister-managed-instance \
    --instance-id 'mi-08ab247cdfEXAMPLE'
```

This command produces no output.

For more information, see Deregistering managed nodes in a hybrid and multicloud environment in the *Amazon Systems Manager User Guide*.

- For API details, see DeregisterManagedInstance in *Amazon CLI Command Reference*.

`deregister-patch-baseline-for-patch-group`

The following code example shows how to use `deregister-patch-baseline-for-patch-group`.

Amazon CLI

To deregister a patch group from a patch baseline

The following `deregister-patch-baseline-for-patch-group` example deregisters the specified patch group from the specified patch baseline.

```
aws ssm deregister-patch-baseline-for-patch-group \
    --patch-group "Production" \
    --baseline-id "pb-0ca44a362fEXAMPLE"
```

Output:

```
{
  "PatchGroup":"Production",
  "BaselineId":"pb-0ca44a362fEXAMPLE"
}
```

For more information, see Add a Patch Group to a Patch Baseline in the *Amazon Systems Manager User Guide*.

- For API details, see DeregisterPatchBaselineForPatchGroup in *Amazon CLI Command Reference*.

`deregister-target-from-maintenance-window`

The following code example shows how to use `deregister-target-from-maintenance-window`.

Amazon CLI

To remove a target from a maintenance window

The following `deregister-target-from-maintenance-window` example removes the specified target from the specified maintenance window.

```
aws ssm deregister-target-from-maintenance-window \
    --window-id "mw-ab12cd34ef56gh78" \
    --window-target-id "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
```

Output:

```
{
    "WindowId":"mw-ab12cd34ef56gh78",
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

For more information, see Update a Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DeregisterTargetFromMaintenanceWindow in *Amazon CLI Command Reference*.

`deregister-task-from-maintenance-window`

The following code example shows how to use `deregister-task-from-maintenance-window`.

Amazon CLI

To remove a task from a maintenance window

The following `deregister-task-from-maintenance-window` example removes the specified task from the specified maintenance window.

```
aws ssm deregister-task-from-maintenance-window \
    --window-id "mw-ab12cd34ef56gh78" \
    --window-task-id "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d5e6c"
```

Output:

```
{
    "WindowTaskId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d5e6c",
    "WindowId":"mw-ab12cd34ef56gh78"
}
```

For more information, see Systems Manager Maintenance Windows Tutorials (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DeregisterTaskFromMaintenanceWindow in *Amazon CLI Command Reference*.

`describe-activations`

The following code example shows how to use `describe-activations`.

Amazon CLI

To describe activations

The following `describe-activations` example lists details about the activations in your Amazon account.

```
aws ssm describe-activations
```

Output:

```
{
    "ActivationList": [
        {
            "ActivationId": "5743558d-563b-4457-8682-d16c3EXAMPLE",
            "Description": "Example1",
            "IamRole": "HybridWebServersRole,
            "RegistrationLimit": 5,
            "RegistrationsCount": 5,
            "ExpirationDate": 1584316800.0,
            "Expired": false,
            "CreatedDate": 1581954699.792
        },
        {
            "ActivationId": "3ee0322b-f62d-40eb-b672-13ebfEXAMPLE",
            "Description": "Example2",
            "IamRole": "HybridDatabaseServersRole",
            "RegistrationLimit": 5,
            "RegistrationsCount": 5,
            "ExpirationDate": 1580515200.0,
            "Expired": true,
            "CreatedDate": 1578064132.002
        },
    ]
}
```

For more information, see Step 4: Create a Managed-Instance Activation for a Hybrid Environment in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeActivations in *Amazon CLI Command Reference*.

`describe-association-execution-targets`

The following code example shows how to use `describe-association-execution-targets`.

Amazon CLI

To get details of an association execution

The following `describe-association-execution-targets` example describes the specified association execution.

```
aws ssm describe-association-execution-targets \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
    --execution-id "7abb6378-a4a5-4f10-8312-0123456789ab"
```

Output:

```
{
    "AssociationExecutionTargets": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
            "ResourceId": "i-1234567890abcdef0",
            "ResourceType": "ManagedInstance",
            "Status": "Success",
            "DetailedStatus": "Success",
            "LastExecutionDate": 1550505538.497,
            "OutputSource": {
                "OutputSourceId": "97fff367-fc5a-4299-aed8-0123456789ab",
                "OutputSourceType": "RunCommand"
            }
        }
    ]
}
```

For more information, see Viewing association histories in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeAssociationExecutionTargets in *Amazon CLI Command Reference*.

`describe-association-executions`

The following code example shows how to use `describe-association-executions`.

Amazon CLI

Example 1: To get details of all executions for an association

The following `describe-association-executions` example describes all executions of the specified association.

```
aws ssm describe-association-executions \
```

```
    --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

Output:

```
{
    "AssociationExecutions": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "474925ef-1249-45a2-b93d-0123456789ab",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505827.119,
            "ResourceCountByStatus": "{Success=1}"
        },
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505536.843,
            "ResourceCountByStatus": "{Success=1}"
        },
        ...
    ]
}
```

For more information, see Viewing association histories in the *Amazon Systems Manager User Guide*.

Example 2: To get details of all executions for an association after a specific date and time

The following `describe-association-executions` example describes all executions of an association after the specified date and time.

```
aws ssm describe-association-executions \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
    --filters "Key=CreatedTime,Value=2019-02-18T16:00:00Z,Type=GREATER_THAN"
```

Output:

```
{
    "AssociationExecutions": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "474925ef-1249-45a2-b93d-0123456789ab",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505827.119,
            "ResourceCountByStatus": "{Success=1}"
        },
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505536.843,
            "ResourceCountByStatus": "{Success=1}"
        },
        ...
    ]
}
```

For more information, see Viewing association histories in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeAssociationExecutions in *Amazon CLI Command Reference*.

`describe-association`

The following code example shows how to use `describe-association`.

Amazon CLI

Example 1: To get details of an association

The following `describe-association` example describes the association for the specified association ID.

```
aws ssm describe-association \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-GatherSoftwareInventory",
        "AssociationVersion": "1",
        "Date": 1534864780.995,
        "LastUpdateAssociationDate": 1543235759.81,
        "Overview": {
            "Status": "Success",
            "AssociationStatusAggregatedCount": {
                "Success": 2
            }
        },
        "DocumentVersion": "$DEFAULT",
        "Parameters": {
            "applications": [
                "Enabled"
            ],
            "awsComponents": [
                "Enabled"
            ],
            "customInventory": [
                "Enabled"
            ],
            "files": [
                ""
            ],
            "instanceDetailedInformation": [
                "Enabled"
            ],
            "networkConfig": [
                "Enabled"
            ],
            "services": [
                "Enabled"
            ],
            "windowsRegistry": [
                ""
            ],
            "windowsRoles": [
                "Enabled"
            ],
            "windowsUpdates": [
```

```
                "Enabled"
            ]
        },
        "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
        "Targets": [
            {
                "Key": "InstanceIds",
                "Values": [
                    "*"
                ]
            }
        ],
        "ScheduleExpression": "rate(24 hours)",
        "LastExecutionDate": 1550501886.0,
        "LastSuccessfulExecutionDate": 1550501886.0,
        "AssociationName": "Inventory-Association"
    }
}
```

For more information, see Editing and creating a new version of an association in the *Amazon Systems Manager User Guide*.

Example 2: To get details of an association for a specific instance and document

The following `describe-association` example describes the association between an instance and a document.

```
aws ssm describe-association \
    --instance-id "i-1234567890abcdef0" \
    --name "AWS-UpdateSSMAgent"
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487876122.564,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-1234567890abcdef0",
```

```
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Associated",
            "AssociationStatusAggregatedCount": {
                "Pending": 1
            }
        },
        "AssociationId": "d8617c07-2079-4c18-9847-1234567890ab",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487876122.564,
        "Date": 1487876122.564,
        "Targets": [
            {
                "Values": [
                    "i-1234567890abcdef0"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see Editing and creating a new version of an association in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeAssociation in *Amazon CLI Command Reference*.

`describe-automation-executions`

The following code example shows how to use `describe-automation-executions`.

Amazon CLI

To describe an automation execution

The following `describe-automation-executions` example displays details about an Automation execution.

```
aws ssm describe-automation-executions \
    --filters Key=ExecutionId,Values=73c8eef8-f4ee-4a05-820c-e354fEXAMPLE
```

Output:

```
{
    "AutomationExecutionMetadataList": [
        {
            "AutomationExecutionId": "73c8eef8-f4ee-4a05-820c-e354fEXAMPLE",
            "DocumentName": "AWS-StartEC2Instance",
            "DocumentVersion": "1",
            "AutomationExecutionStatus": "Success",
            "ExecutionStartTime": 1583737233.748,
            "ExecutionEndTime": 1583737234.719,
            "ExecutedBy": "arn:aws:sts::29884EXAMPLE:assumed-role/mw_service_role/
OrchestrationService",
            "LogFile": "",
            "Outputs": {},
            "Mode": "Auto",
            "Targets": [],
            "ResolvedTargets": {
                "ParameterValues": [],
                "Truncated": false
            },
            "AutomationType": "Local"
        }
    ]
}
```

For more information, see Running a Simple Automation Workflow in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeAutomationExecutions in *Amazon CLI Command Reference*.

`describe-automation-step-executions`

The following code example shows how to use `describe-automation-step-executions`.

Amazon CLI

Example 1: To describe all steps for an automation execution

The following `describe-automation-step-executions` example displays details about the steps of an Automation execution.

```
aws ssm describe-automation-step-executions \
    --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE
```

Output:

```
{
    "StepExecutions": [
        {
            "StepName": "startInstances",
            "Action": "aws:changeInstanceState",
            "ExecutionStartTime": 1583737234.134,
            "ExecutionEndTime": 1583737234.672,
            "StepStatus": "Success",
            "Inputs": {
                "DesiredState": "\"running\"",
                "InstanceIds": "[\"i-0cb99161f6EXAMPLE\"]"
            },
            "Outputs": {
                "InstanceStates": [
                    "running"
                ]
            },
            "StepExecutionId": "95e70479-cf20-4d80-8018-7e4e2EXAMPLE",
            "OverriddenParameters": {}
        }
    ]
}
```

Example 2: To describe a specific step for an automation execution

The following `describe-automation-step-executions` example displays details about a specific step of an Automation execution.

```
aws ssm describe-automation-step-executions \
    --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE \
    --filters Key=StepExecutionId,Values=95e70479-cf20-4d80-8018-7e4e2EXAMPLE
```

For more information, see Running an Automation Workflow Step by Step (Command Line) in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeAutomationStepExecutions in *Amazon CLI Command Reference*.

`describe-available-patches`

The following code example shows how to use `describe-available-patches`.

Amazon CLI

To get available patches

The following `describe-available-patches` example retrieves details about all available patches for Windows Server 2019 that have a MSRC severity of Critical.

```
aws ssm describe-available-patches \
    --
filters "Key=PRODUCT,Values=WindowsServer2019" "Key=MSRC_SEVERITY,Values=Critical"
```

Output:

```
{
    "Patches": [
        {
            "Id": "fe6bd8c2-3752-4c8b-ab3e-1a7ed08767ba",
            "ReleaseDate": 1544047205.0,
            "Title": "2018-11 Update for Windows Server 2019 for x64-based Systems
 (KB4470788)",
            "Description": "Install this update to resolve issues in Windows. For a
 complete listing of the issues that are included in this update, see the associated
 Microsoft Knowledge Base article for more information. After you install this item,
 you may have to restart your computer.",

            "Language": "All"
        },
        ...
    ]
}
```

To get details of a specific patch

The following `describe-available-patches` example retrieves details about the specified patch.

```
aws ssm describe-available-patches \
    --filters "Key=PATCH_ID,Values=KB4480979"
```

Output:

```
{
    "Patches": [
        {
            "Id": "680861e3-fb75-432e-818e-d72e5f2be719",
            "ReleaseDate": 1546970408.0,
            "Title": "2019-01 Security Update for Adobe Flash Player for Windows
 Server 2016 for x64-based Systems (KB4480979)",
            "Description": "A security issue has been identified in a Microsoft
 software product that could affect your system. You can help protect your system
 by installing this update from Microsoft. For a complete listing of the issues that
 are included in this update, see the associated Microsoft Knowledge Base article.
 After you install this update, you may have to restart your system.",
            "ContentUrl": "https://support.microsoft.com/en-us/kb/4480979",
            "Vendor": "Microsoft",
            "ProductFamily": "Windows",
            "Product": "WindowsServer2016",
            "Classification": "SecurityUpdates",
```

```
            "MsrcSeverity": "Critical",
            "KbNumber": "KB4480979",
            "MsrcNumber": "",
            "Language": "All"
        }
    ]
}
```

For more information, see How Patch Manager Operations Work in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeAvailablePatches in *Amazon CLI Command Reference*.

`describe-document-permission`

The following code example shows how to use `describe-document-permission`.

Amazon CLI

To describe document permissions

The following `describe-document-permission` example displays permission details about a Systems Manager document that is shared publicly.

```
aws ssm describe-document-permission \
    --name "Example" \
    --permission-type "Share"
```

Output:

```
{
    "AccountIds": [
        "all"
    ],
    "AccountSharingInfoList": [
        {
            "AccountId": "all",
            "SharedDocumentVersion": "$DEFAULT"
        }
    ]
}
```

For more information, see Share a Systems Manager Document in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeDocumentPermission in *Amazon CLI Command Reference*.

`describe-document`

The following code example shows how to use `describe-document`.

Amazon CLI

To display details of a document

The following `describe-document` example displays details about a Systems Manager document in your Amazon account.

```
aws ssm describe-document \
    --name "Example"
```

Output:

```
{
    "Document": {
        "Hash": "fc2410281f40779e694a8b95975d0f9f316da8a153daa94e3d9921102EXAMPLE",
        "HashType": "Sha256",
        "Name": "Example",
        "Owner": "29884EXAMPLE",
        "CreatedDate": 1583257938.266,

        "Description": "Document Example",
        "Parameters": [
            {
                "Name": "AutomationAssumeRole",
                "Type": "String",
                "Description": "(Required) The ARN of the role that allows
 Automation to perform the actions on your behalf. If no role is specified, Systems
 Manager Automation uses your IAM permissions to execute this document.",
                "DefaultValue": ""
            },
            {
                "Name": "InstanceId",
                "Type": "String",
```

```
                "Description": "(Required) The ID of the Amazon EC2 instance.",
                "DefaultValue": ""
            }
        ],
        "PlatformTypes": [
            "Windows",
            "Linux"
        ],
        "DocumentType": "Automation",
        "SchemaVersion": "0.3",
        "LatestVersion": "1",
        "DefaultVersion": "1",
        "DocumentFormat": "YAML",
        "Tags": []
    }
}
```

For more information, see Creating Systems Manager Documents in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeDocument in *Amazon CLI Command Reference*.

`describe-effective-instance-associations`

The following code example shows how to use `describe-effective-instance-associations`.

Amazon CLI

To get details of the effective associations for an instance

The following `describe-effective-instance-associations` example retrieves details about the effective associations for an instance.

Command:

```
aws ssm describe-effective-instance-associations --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "Associations": [
        {
```

```
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "InstanceId": "i-1234567890abcdef0",
            "Content": "{\n    \"schemaVersion\": \"1.2\",\n    \"description\":
 \"Update the Amazon SSM Agent to the latest version or specified version.\",\n
   \"parameters\": {\n        \"version\": {\n            \"default\": \"\",\n
         \"description\": \"(Optional) A specific version of the Amazon SSM Agent
 to install. If not specified, the agent will be updated to the latest version.\",
\n            \"type\": \"String\"\n        },\n        \"allowDowngrade\": {\n
            \"default\": \"false\",\n            \"description\": \"(Optional)
 Allow the Amazon SSM Agent service to be downgraded to an earlier version. If
 set to false, the service can be upgraded to newer versions only (default). If
 set to true, specify the earlier version.\",\n            \"type\": \"String\",
\n            \"allowedValues\": [\n                \"true\",\n

 \"aws:updateSsmAgent\": {\n            \"properties\": [\n                {\n
               \"agentName\": \"amazon-ssm-agent\",\n                \"source\":
 \"https://s3.{Region}.amazonaws.com/amazon-ssm-{Region}/ssm-agent-manifest.json\",
\n                \"allowDowngrade\": \"{{ allowDowngrade }}\",\n
 \"targetVersion\": \"{{ version }}\"\n                }\n            ]\n        }\n
    }\n}\n",
            "AssociationVersion": "1"
        }
    ]
}
```

- For API details, see DescribeEffectiveInstanceAssociations in *Amazon CLI Command Reference*.

`describe-effective-patches-for-patch-baseline`

The following code example shows how to use `describe-effective-patches-for-patch-baseline`.

Amazon CLI

Example 1: To get all patches defined by a custom patch baseline

The following `describe-effective-patches-for-patch-baseline` example returns the patches defined by a custom patch baseline in the current Amazon account. Note that for a custom baseline, only the ID is required for `--baseline-id`.

```
aws ssm describe-effective-patches-for-patch-baseline \
    --baseline-id "pb-08b654cf9b9681f04"
```

Output:

```
{
    "EffectivePatches": [
        {
            "Patch": {
                "Id": "fe6bd8c2-3752-4c8b-ab3e-1a7ed08767ba",
                "ReleaseDate": 1544047205.0,
                "Title": "2018-11 Update for Windows Server 2019 for x64-based
 Systems (KB4470788)",
                "Description": "Install this update to resolve issues in Windows.
 For a complete listing of the issues that are included in this update, see the
 associated Microsoft Knowledge Base article for more information. After you install
 this item, you may have to restart your computer.",
                "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",
                "Vendor": "Microsoft",
                "ProductFamily": "Windows",
                "Product": "WindowsServer2019",
                "Classification": "SecurityUpdates",
                "MsrcSeverity": "Critical",
                "KbNumber": "KB4470788",
                "MsrcNumber": "",
                "Language": "All"
            },
            "PatchStatus": {
                "DeploymentStatus": "APPROVED",
                "ComplianceLevel": "CRITICAL",
                "ApprovalDate": 1544047205.0
            }
        },
        {
            "Patch": {
                "Id": "915a6b1a-f556-4d83-8f50-b2e75a9a7e58",
                "ReleaseDate": 1549994400.0,
                "Title": "2019-02 Cumulative Update for .NET Framework 3.5 and 4.7.2
 for Windows Server 2019 for x64 (KB4483452)",
                "Description": "A security issue has been identified in a Microsoft
 software product that could affect your system. You can help protect your system by
 installing this update from Microsoft. For a complete listing of the issues that
 are included in this update, see the associated Microsoft Knowledge Base article.
 After you install this update, you may have to restart your system.",
                "ContentUrl": "https://support.microsoft.com/en-us/kb/4483452",
                "Vendor": "Microsoft",
                "ProductFamily": "Windows",
```

```
                "Product": "WindowsServer2019",
                "Classification": "SecurityUpdates",
                "MsrcSeverity": "Important",
                "KbNumber": "KB4483452",
                "MsrcNumber": "",
                "Language": "All"
            },
            "PatchStatus": {
                "DeploymentStatus": "APPROVED",
                "ComplianceLevel": "CRITICAL",
                "ApprovalDate": 1549994400.0
            }
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```

Example 2: To get all patches defined by an Amazon managed patch baseline

The following `describe-effective-patches-for-patch-baseline` example returns the patches defined by an Amazon managed patch baseline. Note that for an Amazon managed baseline, the complete baseline ARN is required for `--baseline-id`

```
aws ssm describe-effective-patches-for-patch-baseline \
    --baseline-id "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-020d361a05defe4ed"
```

See example 1 for sample output.

For more information, see How Security Patches Are Selected in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeEffectivePatchesForPatchBaseline in *Amazon CLI Command Reference*.

`describe-instance-associations-status`

The following code example shows how to use `describe-instance-associations-status`.

Amazon CLI

To describe the status of an instance's associations

This example shows details of the associations for an instance.

Command:

```
aws ssm describe-instance-associations-status --instance-id "i-1234567890abcdef0"
```

Output:

```
{
  "InstanceAssociationStatusInfos": [
      {
          "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
          "Name": "AWS-GatherSoftwareInventory",
          "DocumentVersion": "1",
          "AssociationVersion": "1",
          "InstanceId": "i-1234567890abcdef0",
          "ExecutionDate": 1550501886.0,
          "Status": "Success",
          "ExecutionSummary": "1 out of 1 plugin processed, 1 success, 0 failed, 0
 timedout, 0 skipped. ",
          "AssociationName": "Inventory-Association"
      },
      {
          "AssociationId": "5c5a31f6-6dae-46f9-944c-0123456789ab",
          "Name": "AWS-UpdateSSMAgent",
          "DocumentVersion": "1",
          "AssociationVersion": "1",
          "InstanceId": "i-1234567890abcdef0",
          "ExecutionDate": 1550505828.548,
          "Status": "Success",
          "DetailedStatus": "Success",
          "AssociationName": "UpdateSSMAgent"
      }
  ]
}
```

- For API details, see DescribeInstanceAssociationsStatus in *Amazon CLI Command Reference*.

`describe-instance-information`

The following code example shows how to use `describe-instance-information`.

Amazon CLI

Example 1: To describe managed instance information

The following `describe-instance-information` example retrieves details of each of your managed instances.

```
aws ssm describe-instance-information
```

Example 2: To describe information about a specific managed instance

The following `describe-instance-information` example shows details of the managed instance `i-028ea792daEXAMPLE`.

```
aws ssm describe-instance-information \
    --filters "Key=InstanceIds,Values=i-028ea792daEXAMPLE"
```

Example 3: To describe information about managed instances with a specific tag key

The following `describe-instance-information` example shows details for managed instances that have the tag key DEV.

```
aws ssm describe-instance-information \
    --filters "Key=tag-key,Values=DEV"
```

Output:

```
{
    "InstanceInformationList": [
        {
            "InstanceId": "i-028ea792daEXAMPLE",
            "PingStatus": "Online",
            "LastPingDateTime": 1582221233.421,
            "AgentVersion": "2.3.842.0",
            "IsLatestVersion": true,
            "PlatformType": "Linux",
            "PlatformName": "SLES",
            "PlatformVersion": "15.1",
            "ResourceType": "EC2Instance",
            "IPAddress": "192.0.2.0",
```

```

`describe-instance-patch-states-for-patch-group`

The following code example shows how to use `describe-instance-patch-states-for-patch-group`.

Amazon CLI

Example 1: To get the instance states for a patch group

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states per-instance for the specified patch group.

```
aws ssm describe-instance-patch-states-for-patch-group \
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "PatchGroup": "Production",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a3f5ff34-9bc4-4d2c-a665-4d1c1EXAMPLE",
```

```
            "OwnerInformation": "",
            "InstalledCount": 32,
            "InstalledOtherCount": 1,
            "InstalledPendingRebootCount": 0,
            "InstalledRejectedCount": 0,
            "MissingCount": 2,
            "FailedCount": 0,

            "OtherNonCompliantCount": 0
        }
    ]
}
```

Example 2: To get the instance states for a patch group with more than five missing patches

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states for the specified patch group for instances with more than five missing patches.

```
aws ssm describe-instance-patch-states-for-patch-group \
    --filters Key=MissingCount,Type=GreaterThan,Values=5 \
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "PatchGroup": "Production",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a3f5ff34-9bc4-4d2c-a665-4d1c1EXAMPLE",
            "OwnerInformation": "",
            "InstalledCount": 46,
            "InstalledOtherCount": 4,
            "InstalledPendingRebootCount": 1,
            "InstalledRejectedCount": 1,
            "MissingCount": 7,
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 232,
            "NotApplicableCount": 654,
            "OperationStartTime": "2021-08-04T11:03:50.590000-07:00",
            "OperationEndTime": "2021-08-04T11:04:21.555000-07:00",
            "Operation": "Scan",
            "RebootOption": "NoReboot",
            "CriticalNonCompliantCount": 0,
            "SecurityNonCompliantCount": 1,
            "OtherNonCompliantCount": 1
        }
    ]
}
```

Example 3: To get the instance states for a patch group with fewer than ten instances that require a reboot

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states for the specified patch group for instances with fewer than ten instances requiring a reboot.

```
aws ssm describe-instance-patch-states-for-patch-group \
    --filters Key=InstalledPendingRebootCount,Type=LessThan,Values=10 \
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a3f5ff34-9bc4-4d2c-a665-4d1c1EXAMPLE",
            "PatchGroup": "Production",
            "OwnerInformation": "",
            "InstalledCount": 32,
            "InstalledOtherCount": 1,
            "InstalledPendingRebootCount": 4,
            "InstalledRejectedCount": 0,
            "MissingCount": 2,
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 846,
            "NotApplicableCount": 212,
            "OperationStartTime": "2021-08-046T11:03:50.590000-07:00",
            "OperationEndTime": "2021-08-06T11:04:21.555000-07:00",
            "Operation": "Scan",
            "RebootOption": "NoReboot",
            "CriticalNonCompliantCount": 0,
            "SecurityNonCompliantCount": 1,
            "OtherNonCompliantCount": 0
        }
    ]
}
```

For more information, see Understanding patch compliance state values in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeInstancePatchStatesForPatchGroup in *Amazon CLI Command Reference*.

describe-instance-patch-states

The following code example shows how to use `describe-instance-patch-states`.

Amazon CLI

To get the patch summary states for instances

This `describe-instance-patch-states` example gets the patch summary states for an instance.

```
aws ssm describe-instance-patch-states \
    --instance-ids "i-1234567890abcdef0"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "PatchGroup": "my-patch-group",
            "BaselineId": "pb-0713accee01234567",
            "SnapshotId": "521c3536-930c-4aa9-950e-01234567abcd",
            "CriticalNonCompliantCount": 2,
            "SecurityNonCompliantCount": 2,
            "OtherNonCompliantCount": 1,
            "InstalledCount": 123,
            "InstalledOtherCount": 334,
            "InstalledPendingRebootCount": 0,
            "InstalledRejectedCount": 0,
            "MissingCount": 1,
            "FailedCount": 2,
            "UnreportedNotApplicableCount": 11,
            "NotApplicableCount": 2063,
            "OperationStartTime": "2021-05-03T11:00:56-07:00",
            "OperationEndTime": "2021-05-03T11:01:09-07:00",
            "Operation": "Scan",
            "LastNoRebootInstallOperationTime": "2020-06-14T12:17:41-07:00",
            "RebootOption": "RebootIfNeeded"
        }
    ]
}
```

For more information, see About Patch Compliance in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeInstancePatchStates in *Amazon CLI Command Reference*.

`describe-instance-patches`

The following code example shows how to use `describe-instance-patches`.

Amazon CLI

Example 1: To get the patch state details for an instance

The following `describe-instance-patches` example retrieves details about the patches for the specified instance.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "Patches": [
        {
            "Title": "2019-01 Security Update for Adobe Flash Player for Windows
 Server 2016 for x64-based Systems (KB4480979)",
            "KBId": "KB4480979",
            "Classification": "SecurityUpdates",
            "Severity": "Critical",
            "State": "Installed",
            "InstalledTime": "2019-01-09T00:00:00+00:00"
        },
        {
            "Title": "",
            "KBId": "KB4481031",
            "Classification": "",
            "Severity": "",
            "State": "InstalledOther",
            "InstalledTime": "2019-02-08T00:00:00+00:00"
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```

Example 2: To get a list of patches in the Missing state for an instance

The following `describe-instance-patches` example retrieves information about patches that are in the Missing state for the specified instance.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0" \
    --filters Key=State,Values=Missing
```

Output:

```
{
    "Patches": [
        {
            "Title": "Windows Malicious Software Removal Tool x64 - February 2019
 (KB890830)",
            "KBId": "KB890830",
            "Classification": "UpdateRollups",
            "Severity": "Unspecified",
            "State": "Missing",
            "InstalledTime": "1970-01-01T00:00:00+00:00"
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```

For more information, see About Patch Compliance States in the *Amazon Systems Manager User Guide*.

Example 3: To get a list of patches installed since a specified InstalledTime for an instance

The following `describe-instance-patches` example retrieves information about patches installed since a specified time for the specified instance by combining the use of `--filters` and `--query`.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0" \
    --filters Key=State,Values=Installed \
    --query "Patches[?InstalledTime >= `2023-01-01T16:00:00`]"
```

Output:

```
{
    "Patches": [
        {
            "Title": "2023-03 Cumulative Update for Windows Server 2019 (1809) for
 x64-based Systems (KB5023702)",
            "KBId": "KB5023702",
            "Classification": "SecurityUpdates",
            "Severity": "Critical",
            "State": "Installed",
            "InstalledTime": "2023-03-16T11:00:00+00:00"
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```

- For API details, see DescribeInstancePatches in *Amazon CLI Command Reference*.

`describe-inventory-deletions`

The following code example shows how to use `describe-inventory-deletions`.

Amazon CLI

To get inventory deletions

This example retrieves details for inventory deletion operations.

Command:

```
aws ssm describe-inventory-deletions
```

Output:

```
{
  "InventoryDeletions": [
      {
          "DeletionId": "6961492a-8163-44ec-aa1e-01234567850",
          "TypeName": "Custom:RackInformation",
          "DeletionStartTime": 1550254911.0,
          "LastStatus": "InProgress",
```

```
            "LastStatusMessage": "The Delete is in progress",
            "DeletionSummary": {
                "TotalCount": 0,
                "RemainingCount": 0,
                "SummaryItems": []
            },
            "LastStatusUpdateTime": 1550254911.0
        },
        {
            "DeletionId": "d72ac9e8-1f60-4d40-b1c6-987654321c4d",
            "TypeName": "Custom:RackInfo",
            "DeletionStartTime": 1550254859.0,
            "LastStatus": "InProgress",
            "LastStatusMessage": "The Delete is in progress",
            "DeletionSummary": {
                "TotalCount": 1,
                "RemainingCount": 1,
                "SummaryItems": [
                    {
                        "Version": "1.0",
                        "Count": 1,
                        "RemainingCount": 1
                    }
                ]
            },
            "LastStatusUpdateTime": 1550254859.0
        }
    ]
}
```

To get details of a specific inventory deletion

This example retrieves details for a specific inventory deletion operation.

Command:

```
aws ssm describe-inventory-deletions --deletion-id "d72ac9e8-1f60-4d40-
b1c6-987654321c4d"
```

Output:

```
{
  "InventoryDeletions": [
```

```
        {
            "DeletionId": "d72ac9e8-1f60-4d40-b1c6-987654321c4d",
            "TypeName": "Custom:RackInfo",
            "DeletionStartTime": 1550254859.0,
            "LastStatus": "InProgress",
            "LastStatusMessage": "The Delete is in progress",
            "DeletionSummary": {
                "TotalCount": 1,
                "RemainingCount": 1,
                "SummaryItems": [
                    {
                        "Version": "1.0",
                        "Count": 1,
                        "RemainingCount": 1
                    }
                ]
            },
            "LastStatusUpdateTime": 1550254859.0
        }
    ]
}
```

- For API details, see DescribeInventoryDeletions in *Amazon CLI Command Reference*.

`describe-maintenance-window-execution-task-invocations`

The following code example shows how to use `describe-maintenance-window-execution-task-invocations`.

Amazon CLI

To get the specific task invocations performed for a maintenance window task execution

The following `describe-maintenance-window-execution-task-invocations` example lists the invocations for the specified task executed as part of the specified maintenance window execution.

```
aws ssm describe-maintenance-window-execution-task-invocations \
    --window-execution-id "518d5565-5969-4cca-8f0e-da3b2a638355" \
    --task-id "ac0c6ae1-daa3-4a89-832e-d384503b6586"
```

Output:

```
{
    "WindowExecutionTaskInvocationIdentities": [
        {
            "Status": "SUCCESS",
            "Parameters": "{\"documentName\":\"AWS-RunShellScript\",\"instanceIds\":
[\"i-0000293ffd8c57862\"],\"parameters\":{\"commands\":[\"df\"]},\"maxConcurrency\":
\"1\",\"maxErrors\":\"1\"}",
            "InvocationId": "e274b6e1-fe56-4e32-bd2a-8073c6381d8b",
            "StartTime": 1487692834.723,
            "EndTime": 1487692834.871,
            "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2a638355",
            "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d384503b6586"
        }
    ]
}
```

For more information, see View Information About Tasks and Task Executions (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutionTaskInvocations in *Amazon CLI Command Reference*.

`describe-maintenance-window-execution-tasks`

The following code example shows how to use `describe-maintenance-window-execution-tasks`.

Amazon CLI

To list all tasks associated with a maintenance window execution

The following `ssm describe-maintenance-window-execution-tasks` example lists the tasks associated with the specified maintenance window execution.

```
aws ssm describe-maintenance-window-execution-tasks \
    --window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE"
```

Output:

```
{
    "WindowExecutionTaskIdentities": [
```

```
        {
            "Status": "SUCCESS",
            "TaskArn": "AWS-RunShellScript",
            "StartTime": 1487692834.684,
            "TaskType": "RUN_COMMAND",
            "EndTime": 1487692835.005,
            "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2EXAMPLE",
            "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"
        }
    ]
}
```

For more information, see View Information About Tasks and Task Executions (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutionTasks in *Amazon CLI Command Reference*.

`describe-maintenance-window-executions`

The following code example shows how to use `describe-maintenance-window-executions`.

Amazon CLI

Example 1: To list all executions for a maintenance window

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34eEXAMPLE"
```

Output:

```
{
    "WindowExecutions": [
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowExecutionId": "6027b513-64fe-4cf0-be7d-1191aEXAMPLE",
            "Status": "IN_PROGRESS",
            "StartTime": "2021-08-04T11:00:00.000000-07:00"
```

```
        },
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowExecutionId": "ff75b750-4834-4377-8f61-b3cadEXAMPLE",
            "Status": "SUCCESS",
            "StartTime": "2021-08-03T11:00:00.000000-07:00",
            "EndTime": "2021-08-03T11:37:21.450000-07:00"
        },
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowExecutionId": "9fac7dd9-ff21-42a5-96ad-bbc4bEXAMPLE",
            "Status": "FAILED",
            "StatusDetails": "One or more tasks in the orchestration failed.",
            "StartTime": "2021-08-02T11:00:00.000000-07:00",

        }
    ]
}
```

Example 2: To list all executions for a maintenance window before a specified date

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window before the specified date.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --filters "Key=ExecutedBefore,Values=2021-08-03T00:00:00Z"
```

Output:

```
{
    "WindowExecutions": [
        {
        "WindowId": "mw-ab12cd34eEXAMPLE",
        "WindowExecutionId": "9fac7dd9-ff21-42a5-96ad-bbc4bEXAMPLE",
        "Status": "FAILED",
        "StatusDetails": "One or more tasks in the orchestration failed.",
        "StartTime": "2021-08-02T11:00:00.000000-07:00",
        "EndTime": "2021-08-02T11:22:36.190000-07:00"
    }
    ]
}
```

Example 3: To list all executions for a maintenance window after a specified date

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window after the specified date.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --filters "Key=ExecutedAfter,Values=2021-08-04T00:00:00Z"
```

Output:

```
{
    "WindowExecutions": [
        {
        "WindowId": "mw-ab12cd34eEXAMPLE",
        "WindowExecutionId": "6027b513-64fe-4cf0-be7d-1191aEXAMPLE",
        "Status": "IN_PROGRESS",
        "StartTime": "2021-08-04T11:00:00.000000-07:00"
        }
    ]
}
```

For more information, see View information about tasks and task executions (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutions in *Amazon CLI Command Reference*.

`describe-maintenance-window-schedule`

The following code example shows how to use `describe-maintenance-window-schedule`.

Amazon CLI

Example 1: To list upcoming executions for a maintenance window

The following `describe-maintenance-window-schedule` example lists all upcoming executions for the specified maintenance window.

```
aws ssm describe-maintenance-window-schedule \
    --window-id mw-ab12cd34eEXAMPLE
```

Output:

```
{
    "ScheduledWindowExecutions": [
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "Name": "My-First-Maintenance-Window",
            "ExecutionTime": "2020-02-19T16:00Z"
        },
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "Name": "My-First-Maintenance-Window",
            "ExecutionTime": "2020-02-26T16:00Z"
        },
        ...
    ]
}
```

Example 2: To list all upcoming executions for a maintenance window before a specified date

The following `describe-maintenance-window-schedule` example lists all upcoming executions for the specified maintenance window that occur before the specified date.

```
aws ssm describe-maintenance-window-schedule \
    --window-id mw-0ecb1226dd7b2e9a6 \
    --filters "Key=ScheduledBefore,Values=2020-02-15T06:00:00Z"
```

Example 3: To list all upcoming executions for a maintenance window after a specified date

The following `describe-maintenance-window-schedule` example lists all upcoming executions for the specified maintenance window that occur after the specified date.

```
aws ssm describe-maintenance-window-schedule \
    --window-id mw-0ecb1226dd7b2e9a6 \
    --filters "Key=ScheduledAfter,Values=2020-02-15T06:00:00Z"
```

For more information, see View Information About Maintenance Windows (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowSchedule in *Amazon CLI Command Reference*.

describe-maintenance-window-targets

The following code example shows how to use `describe-maintenance-window-targets`.

Amazon CLI

Example 1: To list all targets for a Maintenance Window

The following `describe-maintenance-window-targets` example lists all of the targets for a maintenance window.

```
aws ssm describe-maintenance-window-targets \
    --window-id "mw-06cf17cbefEXAMPLE"
```

Output:

```
{
    "Targets": [
        {
            "ResourceType": "INSTANCE",
            "OwnerInformation": "Single instance",
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "Targets": [
                {
                    "Values": [
                        "i-0000293ffdEXAMPLE"
                    ],
                    "Key": "InstanceIds"
                }
            ],
            "WindowTargetId": "350d44e6-28cc-44e2-951f-4b2c9EXAMPLE"
        },
        {
            "ResourceType": "INSTANCE",
            "OwnerInformation": "Two instances in a list",
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "Targets": [
                {
                    "Values": [
                        "i-0000293ffdEXAMPLE",
                        "i-0cb2b964d3EXAMPLE"
                    ],
                    "Key": "InstanceIds"
```

```
                }
            ],
            "WindowTargetId": "e078a987-2866-47be-bedd-d9cf4EXAMPLE"
        }
    ]
}
```

Example 2: To list all targets for a maintenance window matching a specific owner information value

This `describe-maintenance-window-targets` example lists all of the targets for a maintenance window with a specific value.

```
aws ssm describe-maintenance-window-targets \
    --window-id "mw-0ecb1226ddEXAMPLE" \
    --filters "Key=OwnerInformation,Values=CostCenter1"
```

Output:

```
{
    "Targets": [
        {
            "WindowId": "mw-0ecb1226ddEXAMPLE",
            "WindowTargetId": "da89dcc3-7f9c-481d-ba2b-edcb7d0057f9",
            "ResourceType": "INSTANCE",
            "Targets": [
                {
                    "Key": "tag:Environment",
                    "Values": [
                        "Prod"
                    ]
                }
            ],
            "OwnerInformation": "CostCenter1",
            "Name": "ProdTarget1"
        }
    ]
}
```

For more information, see View Information About Maintenance Windows (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowTargets in *Amazon CLI Command Reference*.

describe-maintenance-window-tasks

The following code example shows how to use `describe-maintenance-window-tasks`.

Amazon CLI

Example 1: To list all tasks for a maintenance window

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-06cf17cbefEXAMPLE"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "WindowTaskId": "018b31c3-2d77-4b9e-bd48-c91edEXAMPLE",
            "TaskArn": "AWS-RestartEC2Instance",
            "TaskParameters": {},
            "Type": "AUTOMATION",
            "Description": "Restarting EC2 Instance for maintenance",
            "MaxConcurrency": "1",
            "MaxErrors": "1",

                }
            ]
        }
    ]
}
```

Example 2: To list all tasks for a maintenance window that invokes the Amazon-RunPowerShellScript command document

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that invokes the `AWS-RunPowerShellScript` command document.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --filters "Key=TaskArn,Values=AWS-RunPowerShellScript"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowTaskId": "0d36e6b4-3a4f-411e-adcb-3558eEXAMPLE",
            "TaskArn": "AWS-RunPowerShellScript",
```

```
            "Type": "RUN_COMMAND",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "da89dcc3-7f9c-481d-ba2b-edcb7EXAMPLE"
                    ]
                }
            ],
            "TaskParameters": {},
            "Priority": 1,
            "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "MyTask"
        }
    ]
}
```

Example 3: To list all tasks for a maintenance window that have a Priority of 3

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that have a `Priority` of 3.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --filters "Key=Priority,Values=3"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowTaskId": "0d36e6b4-3a4f-411e-adcb-3558eEXAMPLE",
            "TaskArn": "AWS-RunPowerShellScript",

                        "da89dcc3-7f9c-481d-ba2b-edcb7EXAMPLE"
```

```
                    ]
                }
            ],
            "TaskParameters": {},
            "Priority": 3,
            "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "MyRunCommandTask"
        },
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowTaskId": "ee45feff-ad65-4a6c-b478-5cab8EXAMPLE",
            "TaskArn": "AWS-RestartEC2Instance",
            "Type": "AUTOMATION",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "da89dcc3-7f9c-481d-ba2b-edcb7EXAMPLE"
                    ]
                }
            ],
            "TaskParameters": {},
            "Priority": 3,
            "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "10",
            "MaxErrors": "5",
            "Name": "My-Automation-Task",
            "Description": "A description for my Automation task"
        }
    ]
}
```

Example 4: To list all tasks for a maintenance window that have a Priority of 1 and use Run Command

This `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that have a `Priority` of 1 and use `Run Command`.

```
aws ssm describe-maintenance-window-tasks \
```

```
    --window-id "mw-ab12cd34eEXAMPLE" \
    --filters "Key=Priority,Values=1" "Key=TaskType,Values=RUN_COMMAND"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowTaskId": "0d36e6b4-3a4f-411e-adcb-3558eEXAMPLE",
            "TaskArn": "AWS-RunPowerShellScript",
            "Type": "RUN_COMMAND",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "da89dcc3-7f9c-481d-ba2b-edcb7EXAMPLE"
                    ]
                }
            ],
            "TaskParameters": {},
            "Priority": 1,
            "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "MyRunCommandTask"
        }
    ]
}
```

For more information, see View information about maintenance windows (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowTasks in *Amazon CLI Command Reference*.

`describe-maintenance-windows-for-target`

The following code example shows how to use `describe-maintenance-windows-for-target`.

Amazon CLI

To list all maintenance windows associated with a specific instance

The following `describe-maintenance-windows-for-target` example lists the maintenance windows that have targets or tasks associated with the specified instance.

```
aws ssm describe-maintenance-windows-for-target \
    --targets Key=InstanceIds,Values=i-1234567890EXAMPLE \
    --resource-type INSTANCE
```

Output:

```
{
    "WindowIdentities": [
        {
            "WindowId": "mw-0c5ed765acEXAMPLE",
            "Name": "My-First-Maintenance-Window"
        }
    ]
}
```

For more information, see View Information About Maintenance Windows (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowsForTarget in *Amazon CLI Command Reference*.

`describe-maintenance-windows`

The following code example shows how to use `describe-maintenance-windows`.

Amazon CLI

Example 1: To list all maintenance windows

The following `describe-maintenance-windows` example lists all maintenance windows in your Amazon account in the current Region.

```
aws ssm describe-maintenance-windows
```

Output:

```
{
```

```
    "WindowIdentities": [
        {
            "WindowId": "mw-0ecb1226ddEXAMPLE",
            "Name": "MyMaintenanceWindow-1",
            "Enabled": true,
            "Duration": 2,
            "Cutoff": 1,
            "Schedule": "rate(180 minutes)",
            "NextExecutionTime": "2020-02-12T23:19:20.596Z"
        },
        {
            "WindowId": "mw-03eb9db428EXAMPLE",
            "Name": "MyMaintenanceWindow-2",
            "Enabled": true,
            "Duration": 3,
            "Cutoff": 1,
            "Schedule": "rate(7 days)",
            "NextExecutionTime": "2020-02-17T23:22:00.956Z"
        },
    ]
}
```

Example 2: To list all enabled maintenance windows

The following `describe-maintenance-windows` example lists all enabled maintenance windows.

```
aws ssm describe-maintenance-windows \
    --filters "Key=Enabled,Values=true"
```

Example 3: To list maintenance windows matching a specific name

This `describe-maintenance-windows` example lists all maintenance windows with the specified name.

```
aws ssm describe-maintenance-windows \
    --filters "Key=Name,Values=MyMaintenanceWindow"
```

For more information, see View Information About Maintenance Windows (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindows in *Amazon CLI Command Reference*.

describe-ops-items

The following code example shows how to use `describe-ops-items`.

Amazon CLI

To list a set of OpsItems

The following `describe-ops-items` example displays a list of all open OpsItems in your Amazon account.

```
aws ssm describe-ops-items \
    --ops-item-filters "Key=Status,Values=Open,Operator=Equal"
```

Output:

```
{
    "OpsItemSummaries": [
        {
            "CreatedBy": "arn:aws:sts::111222333444:assumed-role/OpsItem-CWE-Role/

`describe-parameters`

The following code example shows how to use `describe-parameters`.

Amazon CLI

Example 1: To list all parameters

The following `describe-parameters` example lists all parameters in the current Amazon account and Region.

```
aws ssm describe-parameters
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MySecureStringParameter",
            "Type": "SecureString",
            "KeyId": "alias/aws/ssm",
            "LastModifiedDate": 1582155479.205,
            "LastModifiedUser": "arn:aws:sts::111222333444:assumed-role/Admin/
Richard-Roe-Managed",
            "Description": "This is a SecureString parameter",
            "Version": 2,
            "Tier": "Advanced",
            "Policies": [
                {
                    "PolicyText": "{\"Type\":\"Expiration\",\"Version\":\"1.0\",
\"Attributes\":{\"Timestamp\":\"2020-07-07T22:30:00Z\"}}",
                    "PolicyType": "Expiration",
                    "PolicyStatus": "Pending"
                },
                {
                    "PolicyText": "{\"Type\":\"ExpirationNotification\",\"Version\":
\"1.0\",\"Attributes\":{\"Before\":\"12\",\"Unit\":\"Hours\"}}",
                    "PolicyType": "ExpirationNotification",
                    "PolicyStatus": "Pending"
                }
            ]
        },
        {
            "Name": "MyStringListParameter",
            "Type": "StringList",
            "LastModifiedDate": 1582154764.222,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",

            "Tier": "Standard",
            "Policies": []
        }
    ]
}
```

Example 2: To list all parameters matching specific metadata

This `describe-parameters` example lists all parameters matching a filter.

aws ssm describe-parameters --filters "Key=Type,Values=StringList"

Output:

```
{
    "Parameters": [
        {
            "Name": "MyStringListParameter",
            "Type": "StringList",
            "LastModifiedDate": 1582154764.222,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
```

```
            "Description": "This is a StringList parameter",
            "Version": 1,
            "Tier": "Standard",
            "Policies": []
        }
    ]
}
```

For more information, see Searching for Systems Manager Parameters in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeParameters in *Amazon CLI Command Reference*.

`describe-patch-baselines`

The following code example shows how to use `describe-patch-baselines`.

Amazon CLI

Example 1: To list all patch baselines

The following `describe-patch-baselines` example retreives details for all patch baselines in your account in the current Region.

```
aws ssm describe-patch-baselines
```

Output:

```
{
    "BaselineIdentities": [
        {
            "BaselineName": "AWS-SuseDefaultPatchBaseline",
            "DefaultBaseline": true,
            "BaselineDescription": "Default Patch Baseline for Suse Provided by
 AWS.",
            "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-0123fdb36e334a3b2",
            "OperatingSystem": "SUSE"
        },
        {
            "BaselineName": "AWS-DefaultPatchBaseline",
            "DefaultBaseline": false,
```

```
            "BaselineDescription": "Default Patch Baseline Provided by AWS.",
            "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-020d361a05defe4ed",
            "OperatingSystem": "WINDOWS"
        },
        ...
        {
            "BaselineName": "MyWindowsPatchBaseline",
            "DefaultBaseline": true,
            "BaselineDescription": "My patch baseline for EC2 instances for Windows
 Server",
            "BaselineId": "pb-0ad00e0dd7EXAMPLE",
            "OperatingSystem": "WINDOWS"
        }
    ]
}
```

Example 2: To list all patch baselines provided by Amazon

The following `describe-patch-baselines` example lists all patch baselines provided by Amazon.

```
aws ssm describe-patch-baselines \
    --filters "Key=OWNER,Values=[AWS]"
```

Example 3: To list all patch baselines that you own

The following `describe-patch-baselines` example lists all custom patch baselines created in your account in the current Region.

```
aws ssm describe-patch-baselines \
    --filters "Key=OWNER,Values=[Self]"
```

For more information, see About Predefined and Custom Patch Baselines in the *Amazon Systems Manager User Guide*.

- For API details, see DescribePatchBaselines in *Amazon CLI Command Reference*.

`describe-patch-group-state`

The following code example shows how to use `describe-patch-group-state`.

Amazon CLI

To get the state of a patch group

The following `describe-patch-group-state` example retrieves the high-level patch compliance summary for a patch group.

```
aws ssm describe-patch-group-state \
    --patch-group "Production"
```

Output:

```
{
    "Instances": 21,
    "InstancesWithCriticalNonCompliantPatches": 1,
    "InstancesWithFailedPatches": 2,
    "InstancesWithInstalledOtherPatches": 3,
    "InstancesWithInstalledPatches": 21,
    "InstancesWithInstalledPendingRebootPatches": 2,
    "InstancesWithInstalledRejectedPatches": 1,
    "InstancesWithMissingPatches": 3,
    "InstancesWithNotApplicablePatches": 4,
    "InstancesWithOtherNonCompliantPatches": 1,
    "InstancesWithSecurityNonCompliantPatches": 1,
    "InstancesWithUnreportedNotApplicablePatches": 2
}
```

For more information, see About patch groups <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-patchgroups.html>__ and Understanding patch compliance state values in the *Amazon Systems Manager User Guide*.

- For API details, see DescribePatchGroupState in *Amazon CLI Command Reference*.

`describe-patch-groups`

The following code example shows how to use `describe-patch-groups`.

Amazon CLI

To display patch group registrations

The following `describe-patch-groups` example lists the patch group registrations.

```
aws ssm describe-patch-groups
```

Output:

```
{
    "Mappings": [
        {
            "PatchGroup": "Production",
            "BaselineIdentity": {
                "BaselineId": "pb-0123456789abcdef0",
                "BaselineName": "ProdPatching",
                "OperatingSystem": "WINDOWS",
                "BaselineDescription": "Patches for Production",
                "DefaultBaseline": false
            }
        },
        {
            "PatchGroup": "Development",
            "BaselineIdentity": {
                "BaselineId": "pb-0713accee01234567",
                "BaselineName": "DevPatching",
                "OperatingSystem": "WINDOWS",
                "BaselineDescription": "Patches for Development",
                "DefaultBaseline": true
            }
        },
        ...
    ]
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *Amazon Systems Manager User Guide*.

- For API details, see DescribePatchGroups in *Amazon CLI Command Reference*.

`describe-patch-properties`

The following code example shows how to use `describe-patch-properties`.

Amazon CLI

To list the Amazon Linux patch availability

The following `describe-patch-properties` example displays a list of the Amazon Linux products for which patches are available in your Amazon account.

```
aws ssm describe-patch-properties \
    --operating-system AMAZON_LINUX \
    --property PRODUCT
```

Output:

```
{
    "Properties": [
        {
            "Name": "AmazonLinux2012.03"
        },
        {
            "Name": "AmazonLinux2012.09"
        },
        {
            "Name": "AmazonLinux2013.03"
        },
        {
            "Name": "AmazonLinux2013.09"
        },
        {
            "Name": "AmazonLinux2014.03"
        },
        {
            "Name": "AmazonLinux2014.09"
        },
        {
            "Name": "AmazonLinux2015.03"
        },
        {
            "Name": "AmazonLinux2015.09"
        },
        {
            "Name": "AmazonLinux2016.03"
        },
        {
```

```
            "Name": "AmazonLinux2016.09"
        },
        {
            "Name": "AmazonLinux2017.03"
        },
        {
            "Name": "AmazonLinux2017.09"
        },
        {
            "Name": "AmazonLinux2018.03"
        }
    ]
}
```

For more information, see About Patch Baselines in the *Amazon Systems Manager User Guide*.

- For API details, see DescribePatchProperties in *Amazon CLI Command Reference*.

`describe-sessions`

The following code example shows how to use `describe-sessions`.

Amazon CLI

Example 1: To list all active Session Manager sessions

This `describe-sessions` example retrieves a list of the active sessions created most recently (both connected and disconnected sessions) over the past 30 days that were started by the specified user. This command returns only results for connections to targets initiated using Session Manager. It does not list connections made through other means, such as Remote Desktop Connections or SSH.

```
aws ssm describe-sessions \
    --state "Active" \
    --filters "key=Owner,value=arn:aws:sts::123456789012:assumed-role/Administrator/
Shirley-Rodriguez"
```

Output:

```
{
    "Sessions": [
```

```
        {
            "SessionId": "John-07a16060613c408b5",
            "Target": "i-1234567890abcdef0",
            "Status": "Connected",
            "StartDate": 1550676938.352,
            "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Shirley-
Rodriguez",
            "OutputUrl": {}
        },
        {
            "SessionId": "John-01edf534b8b56e8eb",
            "Target": "i-9876543210abcdef0",
            "Status": "Connected",
            "StartDate": 1550676842.194,
            "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Shirley-
Rodriguez",
            "OutputUrl": {}
        }
    ]
}
```

Example 2: To list all terminated Session Manager sessions

This `describe-sessions` example retrieves a list of the most recently terminated sessions from the past 30 days for all users.

```
aws ssm describe-sessions \
    --state "History"
```

Output:

```
{
    "Sessions": [
        {
            "SessionId": "Mary-Major-0022b1eb2b0d9e3bd",
            "Target": "i-1234567890abcdef0",
            "Status": "Terminated",
            "StartDate": 1550520701.256,
            "EndDate": 1550521931.563,
            "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Mary-
Major"
        },
        {
```

```
            "SessionId": "Jane-Roe-0db53f487931ed9d4",
            "Target": "i-9876543210abcdef0",
            "Status": "Terminated",
            "StartDate": 1550161369.149,
            "EndDate": 1550162580.329,
            "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Jane-Roe"
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```

For more information, see View Session History in the *Amazon Systems Manager User Guide*.

- For API details, see DescribeSessions in *Amazon CLI Command Reference*.

`disassociate-ops-item-related-item`

The following code example shows how to use `disassociate-ops-item-related-item`.

Amazon CLI

To delete a related item association

The following `disassociate-ops-item-related-item` example deletes the association between the OpsItem and a related item.

```
aws ssm disassociate-ops-item-related-item \
    --ops-item-id "oi-f99f2EXAMPLE" \
    --association-id "e2036148-cccb-490e-ac2a-390e5EXAMPLE"
```

This command produces no output.

For more information, see Working with Incident Manager incidents in OpsCenter in the *Amazon Systems Manager User Guide*.

- For API details, see DisassociateOpsItemRelatedItem in *Amazon CLI Command Reference*.

`get-automation-execution`

The following code example shows how to use `get-automation-execution`.

Amazon CLI

To display details about an automation execution

The following `get-automation-execution` example displays detailed information about an Automation execution.

```
aws ssm get-automation-execution \
    --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE
```

Output:

```
{
    "AutomationExecution": {
        "AutomationExecutionId": "73c8eef8-f4ee-4a05-820c-e354fEXAMPLE",
        "DocumentName": "AWS-StartEC2Instance",

```

For more information, see Walkthrough: Patch a Linux AMI (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see GetAutomationExecution in *Amazon CLI Command Reference*.

`get-calendar-state`

The following code example shows how to use `get-calendar-state`.

Amazon CLI

Example 1: To get the current state of a change calendar

This `get-calendar-state` example returns the state of a calendar at the current time. Because the example doesn't specify a time, the current state of the calendar is reported.

```
aws ssm get-calendar-state \
    --calendar-names "MyCalendar"
```

Output:

```
{
    "State": "OPEN",
    "AtTime": "2020-02-19T22:28:51Z",
    "NextTransitionTime": "2020-02-24T21:15:19Z"
```

```
}
```

Example 2: To get the state of a change calendar at a specified time

This `get-calendar-state` example returns the state of a calendar at the specified time.

```
aws ssm get-calendar-state \
    --calendar-names "MyCalendar" \
    --at-time "2020-07-19T21:15:19Z"
```

Output:

```
{
    "State": "CLOSED",
    "AtTime": "2020-07-19T21:15:19Z"
}
```

For more information, see Get the State of the Change Calendar in the *Amazon Systems Manager User Guide*.

- For API details, see GetCalendarState in *Amazon CLI Command Reference*.

`get-command-invocation`

The following code example shows how to use `get-command-invocation`.

Amazon CLI

To display the details of a command invocation

The following `get-command-invocation` example lists all the invocations of the specified command on the specified instance.

```
aws ssm get-command-invocation \
    --command-id "ef7fdfd8-9b57-4151-a15c-db9a12345678" \
    --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "CommandId": "ef7fdfd8-9b57-4151-a15c-db9a12345678",
    "InstanceId": "i-1234567890abcdef0",
```

```
    "Comment": "b48291dd-ba76-43e0-b9df-13e11ddaac26:6960febb-2907-4b59-8e1a-
d6ce8EXAMPLE",
    "DocumentName": "AWS-UpdateSSMAgent",
    "DocumentVersion": "",
    "PluginName": "aws:updateSsmAgent",
    "ResponseCode": 0,
    "ExecutionStartDateTime": "2020-02-19T18:18:03.419Z",
    "ExecutionElapsedTime": "PT0.091S",
    "ExecutionEndDateTime": "2020-02-19T18:18:03.419Z",
    "Status": "Success",
    "StatusDetails": "Success",
    "StandardOutputContent": "Updating amazon-ssm-agent from 2.3.842.0 to latest
\nSuccessfully downloaded https://s3.us-east-2.amazonaws.com/amazon-ssm-us-east-2/
ssm-agent-manifest.json\namazon-ssm-agent 2.3.842.0 has already been installed,
 update skipped\n",
    "StandardOutputUrl": "",
    "StandardErrorContent": "",
    "StandardErrorUrl": "",
    "CloudWatchOutputConfig": {

    }
}
```

For more information, see Understanding Command Statuses in the *Amazon Systems Manager User Guide*.

- For API details, see GetCommandInvocation in *Amazon CLI Command Reference*.

`get-connection-status`

The following code example shows how to use `get-connection-status`.

Amazon CLI

To display the connection status of a managed instance

This `get-connection-status` example returns the connection status of the specified managed instance.

```
aws ssm get-connection-status \
    --target i-1234567890abcdef0
```

Output:

```
{
    "Target": "i-1234567890abcdef0",
    "Status": "connected"
}
```

- For API details, see GetConnectionStatus in *Amazon CLI Command Reference*.

`get-default-patch-baseline`

The following code example shows how to use `get-default-patch-baseline`.

Amazon CLI

Example 1: To display the default Windows patch baseline

The following `get-default-patch-baseline` example retrieves details for the default patch baseline for Windows Server.

```
aws ssm get-default-patch-baseline
```

Output:

```
{
  "BaselineId": "pb-0713accee01612345",
  "OperatingSystem": "WINDOWS"
}
```

Example 2: To display the default patch baseline for Amazon Linux

The following `get-default-patch-baseline` example retrieves details for the default patch baseline for Amazon Linux.

```
aws ssm get-default-patch-baseline \
    --operating-system AMAZON_LINUX
```

Output:

```
{
    "BaselineId": "pb-047c6eb9c8fc12345",
```

```
    "OperatingSystem": "AMAZON_LINUX"
}
```

For more information, see About Predefined and Custom Patch Baselines <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-baselines.html>__ and Set an Existing Patch Baseline as the Default in the *Amazon Systems Manager User Guide*.

- For API details, see GetDefaultPatchBaseline in *Amazon CLI Command Reference*.

`get-deployable-patch-snapshot-for-instance`

The following code example shows how to use `get-deployable-patch-snapshot-for-instance`.

Amazon CLI

To retrieve the current snapshot for the patch baseline an instance uses

The following `get-deployable-patch-snapshot-for-instance` example retrieves details for the current snapshot for the specified patch baseline used by an instance. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, run `aws configure` and specify only the Region of your instance. Leave the `Access Key` and `Secret Key` fields empty.

Tip: Use `uuidgen` to generate a `snapshot-id`.

```
aws ssm get-deployable-patch-snapshot-for-instance \
    --instance-id "i-1234567890abcdef0" \
    --snapshot-id "521c3536-930c-4aa9-950e-01234567abcd"
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "SnapshotId": "521c3536-930c-4aa9-950e-01234567abcd",
    "Product": "AmazonLinux2018.03",
    "SnapshotDownloadUrl": "https://patch-baseline-snapshot-us-
east-1.s3.amazonaws.com/
ed85194ef27214f5984f28b4d664d14f7313568fea7d4b6ac6c10ad1f729d7e7-773304212436/

}
```

For more information, see Parameter name: Snapshot ID in the *Amazon Systems Manager User Guide*.

- For API details, see GetDeployablePatchSnapshotForInstance in *Amazon CLI Command Reference*.

`get-document`

The following code example shows how to use `get-document`.

Amazon CLI

To get document content

The following `get-document` example displays the content of a Systems Manager document.

```
aws ssm get-document \
    --name "AWS-RunShellScript"
```

Output:

```
{
    "Name": "AWS-RunShellScript",
    "DocumentVersion": "1",
    "Status": "Active",
    "Content": "{\n    \"schemaVersion\":\"1.2\",\n    \"description\":\"Run a
 shell script or specify the commands to run.\",\n    \"parameters\":{\n
 \"commands\":{\n            \"type\":\"StringList\",\n            \"description
\":\"(Required) Specify a shell script or a command to run.\",\n
 \"minItems\":1,\n            \"displayType\":\"textarea\"\n        },\n
 \"workingDirectory\":{\n            \"type\":\"String\",\n            \"default
\":\"\",\n            \"description\":\"(Optional) The path to the working
 directory on your instance.\",\n            \"maxChars\":4096\n        },\n
   \"executionTimeout\":{\n            \"type\":\"String\",\n            \"default
\":\"3600\",\n            \"description\":\"(Optional) The time in seconds for a
 command to complete before it is considered to have failed. Default is 3600 (1
 hour). Maximum is 172800 (48 hours).\",\n            \"allowedPattern\":\"([1-9]
[0-9]{0,4})|(1[0-6][0-9]{4})|(17[0-1][0-9]{3})|(172[0-7][0-9]{2})|(172800)\"\n
        }\n    },\n    \"runtimeConfig\":{\n        \"aws:runShellScript\":{\n
```

```
            \"properties\":[\n                {\n                    \"id\":
\"0.aws:runShellScript\",\n                    \"runCommand\":\"{{ commands }}\",\n
                    \"workingDirectory\":\"{{ workingDirectory }}\",\n
       \"timeoutSeconds\":\"{{ executionTimeout }}\"\n                }\n
  ]\n        }\n    }\n}\n",
    "DocumentType": "Command",
    "DocumentFormat": "JSON"
}
```

For more information, see Amazon Systems Manager Documents in the *Amazon Systems Manager User Guide*.

- For API details, see GetDocument in *Amazon CLI Command Reference*.

`get-inventory-schema`

The following code example shows how to use `get-inventory-schema`.

Amazon CLI

To view your inventory schema

This example returns a list of inventory type names for the account.

Command:

```
aws ssm get-inventory-schema
```

Output:

```
{
  "Schemas": [
      {
          "TypeName": "AWS:AWSComponent",
          "Version": "1.0",
          "Attributes": [
              {
                  "Name": "Name",
                  "DataType": "STRING"
              },
              {
                  "Name": "ApplicationType",
                  "DataType": "STRING"
```

```
                },
                {
                    "Name": "Publisher",
                    "DataType": "STRING"
                },
                {
                    "Name": "Version",
                    "DataType": "STRING"
                },
                {
                    "Name": "InstalledTime",
                    "DataType": "STRING"
                },
                {
                    "Name": "Architecture",
                    "DataType": "STRING"
                },
                {
                    "Name": "URL",
                    "DataType": "STRING"
                }
            ]
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```

To view the inventory schema for a specific inventory type

This example return the inventory schema for a the Amazon:AmazonComponent inventory type.

Command:

```
aws ssm get-inventory-schema --type-name "AWS:AWSComponent"
```

- For API details, see GetInventorySchema in *Amazon CLI Command Reference*.

`get-inventory`

The following code example shows how to use `get-inventory`.

Amazon CLI

To view your inventory

This example gets the custom metadata for your inventory.

Command:

```
aws ssm get-inventory
```

Output:

```
{
  "Entities": [
      {
          "Data": {
              "AWS:InstanceInformation": {
                  "Content": [
                      {
                          "ComputerName": "ip-172-31-44-222.us-
west-2.compute.internal",
                          "InstanceId": "i-0cb2b964d3e14fd9f",
                          "IpAddress": "172.31.44.222",
                          "AgentType": "amazon-ssm-agent",
                          "ResourceType": "EC2Instance",
                          "AgentVersion": "2.0.672.0",
                          "PlatformVersion": "2016.09",
                          "PlatformName": "Amazon Linux AMI",
                          "PlatformType": "Linux"
                      }
                  ],
                  "TypeName": "AWS:InstanceInformation",
                  "SchemaVersion": "1.0",
                  "CaptureTime": "2017-02-20T18:03:58Z"
              }
          },
          "Id": "i-0cb2b964d3e14fd9f"
      }
  ]
}
```

- For API details, see GetInventory in *Amazon CLI Command Reference*.

get-maintenance-window-execution-task-invocation

The following code example shows how to use `get-maintenance-window-execution-task-invocation`.

Amazon CLI

To get information about a maintenance window task invocation

The following `get-maintenance-window-execution-task-invocation` example lists information about the specified task invocation that is part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution-task-invocation \
    --window-execution-id "bc494bfa-e63b-49f6-8ad1-aa9f2EXAMPLE" \
    --task-id "96f2ad59-97e3-461d-a63d-40c8aEXAMPLE" \
    --invocation-id "a5273e2c-d2c6-4880-b3e1-5e550EXAMPLE"
```

Output:

```
{
    "Status": "SUCCESS",
    "Parameters": "{\"comment\":\"\",\"documentName\":\"AWS-RunPowerShellScript\",
\"instanceIds\":[\"i-1234567890EXAMPLE\"],\"maxConcurrency\":\"1\",\"maxErrors\":
\"1\",\"parameters\":{\"executionTimeout\":[\"3600\"],\"workingDirectory\":[\"\"],
\"commands\":[\"echo Hello\"]},\"timeoutSeconds\":600}",
    "ExecutionId": "03b6baa0-5460-4e15-83f2-ea685EXAMPLE",
    "InvocationId": "a5273e2c-d2c6-4880-b3e1-5e550EXAMPLE",
    "StartTime": 1549998326.421,
    "TaskType": "RUN_COMMAND",
    "EndTime": 1550001931.784,
    "WindowExecutionId": "bc494bfa-e63b-49f6-8ad1-aa9f2EXAMPLE",
    "StatusDetails": "Failed",
    "TaskExecutionId": "96f2ad59-97e3-461d-a63d-40c8aEXAMPLE"
}
```

For more information, see View Information About Tasks and Task Executions (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see GetMaintenanceWindowExecutionTaskInvocation in *Amazon CLI Command Reference*.

get-maintenance-window-execution-task

The following code example shows how to use `get-maintenance-window-execution-task`.

Amazon CLI

To get information about a maintenance window task execution

The following `get-maintenance-window-execution-task` example lists information about a task that is part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution-task \
    --window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE" \
    --task-id "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"
```

Output:

```
{
    "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2EXAMPLE",
    "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE",
    "TaskArn": "AWS-RunPatchBaseline",

}
```

For more information, see View information about tasks and task executions (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see GetMaintenanceWindowExecutionTask in *Amazon CLI Command Reference*.

`get-maintenance-window-execution`

The following code example shows how to use `get-maintenance-window-execution`.

Amazon CLI

To get information about a maintenance window task execution

The following `get-maintenance-window-execution` example lists information about a task executed as part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution \
```

```
    --window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE"
```

Output:

```
{
    "Status": "SUCCESS",
    "TaskIds": [
        "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"
    ],
    "StartTime": 1487692834.595,
    "EndTime": 1487692835.051,

}
```

For more information, see View Information About Tasks and Task Executions (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see GetMaintenanceWindowExecution in *Amazon CLI Command Reference*.

`get-maintenance-window-task`

The following code example shows how to use `get-maintenance-window-task`.

Amazon CLI

To get information about a maintenance window task

The following `get-maintenance-window-task` example retreives details about the specified maintenance window task.

```
aws ssm get-maintenance-window-task \
    --window-id mw-0c5ed765acEXAMPLE \
    --window-task-id 0e842a8d-2d44-4886-bb62-af8dcEXAMPLE
```

Output:

```
{
    "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/

}
```

For more information, see View Information About Maintenance Windows (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see GetMaintenanceWindowTask in *Amazon CLI Command Reference*.

`get-maintenance-window`

The following code example shows how to use `get-maintenance-window`.

Amazon CLI

To get information about a maintenance window

The following `get-maintenance-window` example retrieves details about the specified maintenance window.

```
aws ssm get-maintenance-window \
    --window-id "mw-03eb9db428EXAMPLE"
```

Output:

```
{
    "AllowUnassociatedTargets": true,
    "CreatedDate": 1515006912.957,
    "Cutoff": 1,
    "Duration": 6,
    "Enabled": true,
    "ModifiedDate": 2020-01-01T10:04:04.099Z,
    "Name": "My-Maintenance-Window",
    "Schedule": "rate(3 days)",
    "WindowId": "mw-03eb9db428EXAMPLE",
    "NextExecutionTime": "2020-02-25T00:08:15.099Z"
}
```

For more information, see View information about maintenance windows (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see GetMaintenanceWindow in *Amazon CLI Command Reference*.

`get-ops-item`

The following code example shows how to use `get-ops-item`.

Amazon CLI

To view information about an OpsItem

The following `get-ops-item` example displays details about the specified OpsItem.

```
aws ssm get-ops-item \
    --ops-item-id oi-0b725EXAMPLE
```

Output:

```
{
    "OpsItem": {
        "CreatedBy": "arn:aws:sts::111222333444:assumed-role/OpsItem-CWE-Role/

For more information, see Working with OpsItems in the *Amazon Systems Manager User Guide*.

- For API details, see GetOpsItem in *Amazon CLI Command Reference*.

`get-ops-summary`

The following code example shows how to use `get-ops-summary`.

Amazon CLI

To view a summary of all OpsItems

The following `get-ops-summary` example displays a summary of all OpsItems in your Amazon account.

```
aws ssm get-ops-summary
```

Output:

```
{
    "Entities": [
        {
            "Id": "oi-4309fEXAMPLE",
            "Data": {

For more information, see Working with OpsItems in the *Amazon Systems Manager User Guide*.

- For API details, see GetOpsSummary in *Amazon CLI Command Reference*.

`get-parameter-history`

The following code example shows how to use `get-parameter-history`.

Amazon CLI

To get a value history for a parameter

The following `get-parameter-history` example lists the history of changes for the specified parameter, including its value.

```
aws ssm get-parameter-history \
    --name "MyStringParameter"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582154711.976,
```

```
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
            "Description": "This is the first version of my String parameter",
            "Value": "Veni",
            "Version": 1,
            "Labels": [],
            "Tier": "Standard",
            "Policies": []
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582156093.471,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
            "Description": "This is the second version of my String parameter",
            "Value": "Vidi",
            "Version": 2,
            "Labels": [],
            "Tier": "Standard",
            "Policies": []
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582156117.545,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
            "Description": "This is the third version of my String parameter",
            "Value": "Vici",
            "Version": 3,
            "Labels": [],
            "Tier": "Standard",
            "Policies": []
        }
    ]
}
```

For more information, see Working with parameter versions in the *Amazon Systems Manager User Guide*.

- For API details, see GetParameterHistory in *Amazon CLI Command Reference*.

`get-parameter`

The following code example shows how to use `get-parameter`.

Amazon CLI

Example 1: To display the value of a parameter

The following `get-parameter` example lists the value for the specified single parameter.

```
aws ssm get-parameter \
    --name "MyStringParameter"
```

Output:

```
{
    "Parameter": {
        "Name": "MyStringParameter",
        "Type": "String",
        "Value": "Veni",
        "Version": 1,
        "LastModifiedDate": 1530018761.888,
        "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/MyStringParameter"
        "DataType": "text"
    }
}
```

For more information, see Working with Parameter Store in the *Amazon Systems Manager User Guide*.

Example 2: To decrypt the value of a SecureString parameter

The following `get-parameter` example decrypts the value of the specified `SecureString` parameter.

```
aws ssm get-parameter \
    --name "MySecureStringParameter" \
    --with-decryption
```

Output:

```
{
    "Parameter": {
        "Name": "MySecureStringParameter",
        "Type": "SecureString",
```

```
        "Value": "16679b88-310b-4895-a943-e0764EXAMPLE",
        "Version": 2,
        "LastModifiedDate": 1582155479.205,
        "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/
MySecureStringParameter"
        "DataType": "text"
    }
}
```

For more information, see Working with Parameter Store in the *Amazon Systems Manager User Guide*.

Example 3: To display the value of a parameter using labels

The following `get-parameter` example lists the value for the specified single parameter with a specified label.

```
aws ssm get-parameter \
    --name "MyParameter:label"
```

Output:

```
{
    "Parameter": {
        "Name": "MyParameter",
        "Type": "String",
        "Value": "parameter version 2",
        "Version": 2,
        "Selector": ":label",
        "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
        "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/MyParameter",
        "DataType": "text"
    }
}
```

For more information, see Working with parameter labels in the *Amazon Systems Manager User Guide*.

Example 4: To display the value of a parameter using versions

The following `get-parameter` example lists the value for the specified single parameter version.

```
aws ssm get-parameter \
    --name "MyParameter:2"
```

Output:

```
{
    "Parameter": {
        "Name": "MyParameter",
        "Type": "String",
        "Value": "parameter version 2",
        "Version": 2,
        "Selector": ":2",
        "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
        "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/MyParameter",
        "DataType": "text"
    }
}
```

For more information, see Working with parameter labels in the *Amazon Systems Manager User Guide*.

- For API details, see GetParameter in *Amazon CLI Command Reference*.

`get-parameters-by-path`

The following code example shows how to use `get-parameters-by-path`.

Amazon CLI

To list parameters in a specific path

The following `get-parameters-by-path` example lists the parameters within the specified hierarchy.

```
aws ssm get-parameters-by-path \
    --path "/site/newyork/department/"
```

Output:

```
{
    "Parameters": [
```

```
        {
            "Name": "/site/newyork/department/marketing",
            "Type": "String",
            "Value": "Floor 2",
            "Version": 1,
            "LastModifiedDate": 1530018761.888,
            "ARN": "arn:aws:ssm:us-east-1:111222333444:parameter/site/newyork/
department/marketing"
        },
        {
            "Name": "/site/newyork/department/infotech",
            "Type": "String",
            "Value": "Floor 3",
            "Version": 1,
            "LastModifiedDate": 1530018823.429,
            "ARN": "arn:aws:ssm:us-east-1:111222333444:parameter/site/newyork/
department/infotech"
        },
        ...
    ]
}
```

For more information, see Working with parameter hierarchies in the *Amazon Systems Manager User Guide*.

- For API details, see GetParametersByPath in *Amazon CLI Command Reference*.

`get-parameters`

The following code example shows how to use `get-parameters`.

Amazon CLI

Example 1: To list the values for a parameter

The following `get-parameters` example lists the values for the three specified parameters.

```
aws ssm get-parameters \
    --names "MyStringParameter" "MyStringListParameter" "MyInvalidParameterName"
```

Output:

```
{
```

```
    "Parameters": [
        {
            "Name": "MyStringListParameter",
            "Type": "StringList",
            "Value": "alpha,beta,gamma",
            "Version": 1,
            "LastModifiedDate": 1582154764.222,
            "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/
MyStringListParameter"
            "DataType": "text"
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "Value": "Vici",
            "Version": 3,
            "LastModifiedDate": 1582156117.545,
            "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/MyStringParameter"
            "DataType": "text"
        }
    ],
    "InvalidParameters": [
        "MyInvalidParameterName"
    ]
}
```

For more information, see Working with Parameter Store in the *Amazon Systems Manager User Guide*.

Example 2: To list names and values of multiple parameters using the ``--query`` option

The following `get-parameters` example lists the names and values for the specified parameters.

```
aws ssm get-parameters \
    --names MyStringParameter MyStringListParameter \
    --query "Parameters[*].{Name:Name,Value:Value}"
```

Output:

```
[
    {
        "Name": "MyStringListParameter",
```

```
        "Value": "alpha,beta,gamma"
    },
    {
        "Name": "MyStringParameter",
        "Value": "Vidi"
    }
]
```

For more information, see Working with Parameter Store in the *Amazon Systems Manager User Guide*.

Example 3: To display the value of a parameter using labels

The following `get-parameter` example lists the value for the specified single parameter with a specified label.

```
aws ssm get-parameter \
    --name "MyParameter:label"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyLabelParameter",
            "Type": "String",
            "Value": "parameter by label",
            "Version": 1,
            "Selector": ":label",
            "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
            "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/MyParameter",
            "DataType": "text"
        },
        {
            "Name": "MyVersionParameter",
            "Type": "String",
            "Value": "parameter by version",
            "Version": 2,
            "Selector": ":2",
            "LastModifiedDate": "2021-03-24T16:20:28.236000-07:00",
            "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/unlabel-param",
            "DataType": "text"
```

```
        }
    ],
    "InvalidParameters": []
}
```

For more information, see Working with parameter labels in the *Amazon Systems Manager User Guide*.

- For API details, see GetParameters in *Amazon CLI Command Reference*.

`get-patch-baseline-for-patch-group`

The following code example shows how to use `get-patch-baseline-for-patch-group`.

Amazon CLI

To display the patch baseline for a patch group

The following `get-patch-baseline-for-patch-group` example retrieves details about the patch baseline for the specified patch group.

```
aws ssm get-patch-baseline-for-patch-group \
    --patch-group "DEV"
```

Output:

```
{
    "PatchGroup": "DEV",
    "BaselineId": "pb-0123456789abcdef0",
    "OperatingSystem": "WINDOWS"
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *Amazon Systems Manager User Guide*.

- For API details, see GetPatchBaselineForPatchGroup in *Amazon CLI Command Reference*.

`get-patch-baseline`

The following code example shows how to use `get-patch-baseline`.

Amazon CLI

To display a patch baseline

The following `get-patch-baseline` example retrieves the details for the specified patch baseline.

```
aws ssm get-patch-baseline \
    --baseline-id "pb-0123456789abcdef0"
```

Output:

```
{
    "BaselineId": "pb-0123456789abcdef0",
    "Name": "WindowsPatching",
    "OperatingSystem": "WINDOWS",
    "GlobalFilters": {
        "PatchFilters": []
    },
    "ApprovalRules": {
        "PatchRules": [
            {
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "PRODUCT",
                            "Values": [
                                "WindowsServer2016"
                            ]
                        }
                    ]
                },

    "ModifiedDate": 1550244180.465,
    "Description": "Patches for Windows Servers",
    "Sources": []
}
```

For more information, see About Patch Baselines in the *Amazon Systems Manager User Guide*.

- For API details, see GetPatchBaseline in *Amazon CLI Command Reference*.

`get-service-setting`

The following code example shows how to use `get-service-setting`.

Amazon CLI

To retrieve the service setting for Parameter Store throughput

The following `get-service-setting` This example retrieves the current service setting for Parameter Store throughput in the specified region.

```
aws ssm get-service-setting \
    --setting-id arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-store/high-throughput-enabled
```

Output:

```
{
    "ServiceSetting": {
        "SettingId": "/ssm/parameter-store/high-throughput-enabled",
        "SettingValue": "false",
        "LastModifiedDate": 1555532818.578,
        "LastModifiedUser": "System",
        "ARN": "arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-store/high-throughput-enabled",
        "Status": "Default"
    }
}
```

For more information, see Increasing Parameter Store Throughput in the *Amazon Systems Manager Users Guide*.

- For API details, see GetServiceSetting in *Amazon CLI Command Reference*.

`label-parameter-version`

The following code example shows how to use `label-parameter-version`.

Amazon CLI

Example 1: To add a label to latest version of a parameter

The following `label-parameter-version` example adds a label to the latest version of the specified parameter.

```
aws ssm label-parameter-version \
    --name "MyStringParameter" \
    --labels "ProductionReady"
```

Output:

```
{
    "InvalidLabels": [],
    "ParameterVersion": 3
}
```

For more information, see Working with parameter labels in the *Amazon Systems Manager User Guide*.

Example 2: To add a label to a specific version of a parameter

The following `label-parameter-version` example adds a label to the specified version of a parameter.

```
aws ssm label-parameter-version \
    --name "MyStringParameter" \
    --labels "ProductionReady" \
    --parameter-version "2" --labels "DevelopmentReady"
```

For more information, see Working with parameter labels in the *Amazon Systems Manager User Guide*.

- For API details, see LabelParameterVersion in *Amazon CLI Command Reference*.

`list-association-versions`

The following code example shows how to use `list-association-versions`.

Amazon CLI

To list all versions of an association for a specific association ID

The following `list-association-versions` example lists all versions of the specified associations.

```
aws ssm list-association-versions \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

Output:

```
{
"AssociationVersions": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "CreatedDate": 1550505536.726,
            "Name": "AWS-UpdateSSMAgent",
            "Parameters": {
                "allowDowngrade": [
                    "false"
                ],
                "version": [
                    ""
                ]
            },
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-1234567890abcdef0"
                    ]
                }
            ],
            "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
            "AssociationName": "UpdateSSMAgent"
```

```
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *Amazon Systems Manager User Guide*.

- For API details, see ListAssociationVersions in *Amazon CLI Command Reference*.

`list-associations`

The following code example shows how to use `list-associations`.

Amazon CLI

Example 1: To list your associations for a specific instance

The following list-associations example lists all associations with the AssociationName, UpdateSSMAgent.

```
aws ssm list-associations /
    --association-filter-list "key=AssociationName,value=UpdateSSMAgent"
```

Output:

```
{
    "Associations": [
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-1234567890abcdef0",
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-016648b75dd622dab"
                    ]
                }
            ],
            "Overview": {
                "Status": "Pending",
                "DetailedStatus": "Associated",
```

```
                "AssociationStatusAggregatedCount": {
                    "Pending": 1
                }
            },
            "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
            "AssociationName": "UpdateSSMAgent"
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *Systems Manager User Guide*.

Example 2: To list your associations for a specific document

The following list-associations example lists all associations for the specified document.

```
aws ssm list-associations /
    --association-filter-list "key=Name,value=AWS-UpdateSSMAgent"
```

Output:

```
{
    "Associations": [
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-1234567890abcdef0",
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-1234567890abcdef0"
                    ]
                }
            ],
            "LastExecutionDate": 1550505828.548,
            "Overview": {
                "Status": "Success",
                "DetailedStatus": "Success",
                "AssociationStatusAggregatedCount": {
                    "Success": 1
```

```
                }
            },
            "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
            "AssociationName": "UpdateSSMAgent"
        },
    {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-9876543210abcdef0",
            "AssociationId": "fbc07ef7-b985-4684-b82b-0123456789ab",
            "AssociationVersion": "1",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-9876543210abcdef0"
                    ]
                }
            ],
            "LastExecutionDate": 1550507531.0,
            "Overview": {
                "Status": "Success",
                "AssociationStatusAggregatedCount": {
                    "Success": 1
                }
            }
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *Systems Manager User Guide*.

- For API details, see ListAssociations in *Amazon CLI Command Reference*.

`list-command-invocations`

The following code example shows how to use `list-command-invocations`.

Amazon CLI

To list the invocations of a specific command

The following `list-command-invocations` example lists all the invocations of a command.

```
aws ssm list-command-invocations \
    --command-id "ef7fdfd8-9b57-4151-a15c-db9a12345678" \
    --details
```

Output:

```
{
    "CommandInvocations": [
        {
            "CommandId": "ef7fdfd8-9b57-4151-a15c-db9a12345678",

}
```

For more information, see Understanding Command Statuses in the *Amazon Systems Manager User Guide*.

- For API details, see ListCommandInvocations in *Amazon CLI Command Reference*.

`list-commands`

The following code example shows how to use `list-commands`.

Amazon CLI

Example 1: To get the status of a specific command

The following `list-commands` example retrieves and displays the status of the specified command.

```
aws ssm list-commands \
    --command-id "0831e1a8-a1ac-4257-a1fd-c831bEXAMPLE"
```

Example 2: To get the status of commands requested after a specific date

The following `list-commands` example retrieves the details of commands requested after the specified date.

```
aws ssm list-commands \
    --filter "key=InvokedAfter,value=2020-02-01T00:00:00Z"
```

Example 3: To list all commands requested in an Amazon account

The following `list-commands` example lists all commands requested by users in the current Amazon account and Region.

```
aws ssm list-commands
```

Output:

```
{
    "Commands": [
        {
            "CommandId": "8bee3135-398c-4d31-99b6-e42d2EXAMPLE",

`list-compliance-items`

The following code example shows how to use `list-compliance-items`.

Amazon CLI

To list compliance items for a specific instance

This example lists all compliance items for the specified instance.

Command:

```
aws ssm list-compliance-items --resource-ids "i-1234567890abcdef0" --resource-
types "ManagedInstance"
```

Output:

```
{
  "ComplianceItems": [
      {
          "ComplianceType": "Association",
          "ResourceType": "ManagedInstance",
          "ResourceId": "i-1234567890abcdef0",
          "Id": "8dfe3659-4309-493a-8755-0123456789ab",
          "Title": "",
          "Status": "COMPLIANT",
          "Severity": "UNSPECIFIED",
          "ExecutionSummary": {
              "ExecutionTime": 1550408470.0
          },
          "Details": {
              "DocumentName": "AWS-GatherSoftwareInventory",
              "DocumentVersion": "1"
          }
      },
      {
          "ComplianceType": "Association",
          "ResourceType": "ManagedInstance",
          "ResourceId": "i-1234567890abcdef0",
          "Id": "e4c2ed6d-516f-41aa-aa2a-0123456789ab",
          "Title": "",
          "Status": "COMPLIANT",
          "Severity": "UNSPECIFIED",
          "ExecutionSummary": {
              "ExecutionTime": 1550508475.0
          },
          "Details": {
              "DocumentName": "AWS-UpdateSSMAgent",
              "DocumentVersion": "1"
          }
      },
              ...
  ],
  "NextToken": "--token string truncated--"
```

```
}
```

To list compliance items for a specific instance and association ID

This example lists all compliance items for the specified instance and association ID.

Command:

```
aws ssm list-compliance-items --resource-ids "i-1234567890abcdef0" --resource-
types "ManagedInstance" --
filters "Key=ComplianceType,Values=Association,Type=EQUAL" "Key=Id,Values=e4c2ed6d-516f-41aa
aa2a-0123456789ab,Type=EQUAL"
```

To list compliance items for a instance after a specific date and time

This example lists all compliance items for an instance after the specified date and time.

Command:

```
aws ssm list-compliance-items --resource-ids "i-1234567890abcdef0" --resource-
types "ManagedInstance" --
filters "Key=ExecutionTime,Values=2019-02-18T16:00:00Z,Type=GREATER_THAN"
```

- For API details, see ListComplianceItems in *Amazon CLI Command Reference*.

`list-compliance-summaries`

The following code example shows how to use `list-compliance-summaries`.

Amazon CLI

To list compliance summaries for all compliance types

This example lists compliance summaries for all compliance types in your account.

Command:

```
aws ssm list-compliance-summaries
```

Output:

```
{
  "ComplianceSummaryItems": [
```

```
        {
            "ComplianceType": "Association",
            "CompliantSummary": {
                "CompliantCount": 2,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 2
                }
            },
            "NonCompliantSummary": {
                "NonCompliantCount": 0,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 0
                }
            }
        },
        {
            "ComplianceType": "Patch",
            "CompliantSummary": {
                "CompliantCount": 1,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 1
                }
            },
            "NonCompliantSummary": {
                "NonCompliantCount": 1,
                "SeveritySummary": {
                    "CriticalCount": 1,
                    "HighCount": 0,
                    "MediumCount": 0,
```

```
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 0
                }
            }
        },
                ...
    ],
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ=="
}
```

To list compliance summaries for a specific compliance type

This example lists the compliance summary for the Patch compliance type.

Command:

```
aws ssm list-compliance-summaries --
filters "Key=ComplianceType,Values=Patch,Type=EQUAL"
```

- For API details, see ListComplianceSummaries in *Amazon CLI Command Reference*.

`list-document-metadata-history`

The following code example shows how to use `list-document-metadata-history`.

Amazon CLI

Example: To view approval history and status for a change template

The following `list-document-metadata-history` example returns the approval history for the specified Change Manager change template.

```
aws ssm list-document-metadata-history \
    --name MyChangeManageTemplate \
    --metadata DocumentReviews
```

Output:

```
{
```

```
    "Name": "MyChangeManagerTemplate",
    "DocumentVersion": "1",
    "Author": "arn:aws:iam::111222333444;:user/JohnDoe",
    "Metadata": {
        "ReviewerResponse": [
            {
                "CreateTime": "2021-07-30T11:58:28.025000-07:00",
                "UpdatedTime": "2021-07-30T12:01:19.274000-07:00",
                "ReviewStatus": "APPROVED",
                "Comment": [
                    {
                        "Type": "COMMENT",
                        "Content": "I approve this template version"
                    }
                ],
                "Reviewer": "arn:aws:iam::111222333444;:user/ShirleyRodriguez"
            },
            {
                "CreateTime": "2021-07-30T11:58:28.025000-07:00",
                "UpdatedTime": "2021-07-30T11:58:28.025000-07:00",
                "ReviewStatus": "PENDING"
            }
        ]
    }
}
```

For more information, see Reviewing and approving or rejecting change templates in the *Amazon Systems Manager User Guide*.

- For API details, see ListDocumentMetadataHistory in *Amazon CLI Command Reference*.

`list-document-versions`

The following code example shows how to use `list-document-versions`.

Amazon CLI

To list document versions

The following `list-document-versions` example lists all versions for a Systems Manager document.

```
aws ssm list-document-versions \
```

```
    --name "Example"
```

Output:

```
{
    "DocumentVersions": [
        {
            "Name": "Example",
            "DocumentVersion": "1",
            "CreatedDate": 1583257938.266,
            "IsDefaultVersion": true,
            "DocumentFormat": "YAML",
            "Status": "Active"
        }
    ]
}
```

For more information, see Sending Commands that Use the Document Version Parameter in the *Amazon Systems Manager User Guide*.

- For API details, see ListDocumentVersions in *Amazon CLI Command Reference*.

`list-documents`

The following code example shows how to use `list-documents`.

Amazon CLI

Example 1: To list documents

The following `list-documents` example lists documents owned by the requesting account tagged with the custom tag.

```
aws ssm list-documents \
    --filters Key=Owner,Values=Self Key=tag:DocUse,Values=Testing
```

Output:

```
{
    "DocumentIdentifiers": [
```

```
        {
            "Name": "Example",
            "Owner": "29884EXAMPLE",
            "PlatformTypes": [
                "Windows",
                "Linux"
            ],
            "DocumentVersion": "1",
            "DocumentType": "Automation",
            "SchemaVersion": "0.3",
            "DocumentFormat": "YAML",
            "Tags": [
                {
                    "Key": "DocUse",
                    "Value": "Testing"
                }
            ]
        }
    ]
}
```

For more information, see Amazon Systems Manager Documents in the *Amazon Systems Manager User Guide*.

Example 2: To list shared documents

The following `list-documents` example lists shared documents, including private shared documents not owned by Amazon.

```
aws ssm list-documents \
    --filters Key=Name,Values=sharedDocNamePrefix  Key=Owner,Values=Private
```

Output:

```
{
    "DocumentIdentifiers": [
        {
            "Name": "Example",
            "Owner": "12345EXAMPLE",
            "PlatformTypes": [
                "Windows",
                "Linux"
```

```
            ],
            "DocumentVersion": "1",
            "DocumentType": "Command",
            "SchemaVersion": "0.3",
            "DocumentFormat": "YAML",
            "Tags": []
        }
    ]
}
```

For more information, see Amazon Systems Manager Documents in the *Amazon Systems Manager User Guide*.

- For API details, see ListDocuments in *Amazon CLI Command Reference*.

`list-inventory-entries`

The following code example shows how to use `list-inventory-entries`.

Amazon CLI

Example 1: To view specific inventory type entries for an instance

This following `list-inventory-entries` example lists the inventory entries for the Amazon:Application inventory type on a specific instance.

```
aws ssm list-inventory-entries \
    --instance-id "i-1234567890abcdef0" \
    --type-name "AWS:Application"
```

Output:

```
{
  "TypeName": "AWS:Application",
  "InstanceId": "i-1234567890abcdef0",
  "SchemaVersion": "1.1",
  "CaptureTime": "2019-02-15T12:17:55Z",
  "Entries": [
    {
      "Architecture": "i386",
      "Name": "Amazon SSM Agent",
      "PackageId": "{88a60be2-89a1-4df8-812a-80863c2a2b68}",
```

```
      "Publisher": "Amazon Web Services",
      "Version": "2.3.274.0"
    },
    {
      "Architecture": "x86_64",
      "InstalledTime": "2018-05-03T13:42:34Z",
      "Name": "AmazonCloudWatchAgent",
      "Publisher": "",
      "Version": "1.200442.0"
    }
  ]
}
```

Example 2: To view custom inventory entries assigned to an instance

The following `list-inventory-entries` example lists a custom inventory entry assigned to an instance.

```
aws ssm list-inventory-entries \
    --instance-id "i-1234567890abcdef0" \
    --type-name "Custom:RackInfo"
```

Output:

```
{
  "TypeName": "Custom:RackInfo",
  "InstanceId": "i-1234567890abcdef0",
  "SchemaVersion": "1.0",
  "CaptureTime": "2021-05-22T10:01:01Z",
  "Entries": [
    {
      "RackLocation": "Bay B/Row C/Rack D/Shelf E"
    }
  ]
}
```

- For API details, see ListInventoryEntries in *Amazon CLI Command Reference*.

`list-ops-item-related-items`

The following code example shows how to use `list-ops-item-related-items`.

Amazon CLI

To list the related-item resources of an OpsItem

The following `list-ops-item-related-items` example lists the related-item resources of an OpsItem.

```
aws ssm list-ops-item-related-items \
    --ops-item-id "oi-f99f2EXAMPLE"
```

Output:

```
{
    "Summaries": [
        {
            "OpsItemId": "oi-f99f2EXAMPLE",
            "AssociationId": "e2036148-cccb-490e-ac2a-390e5EXAMPLE",
            "ResourceType": "AWS::SSMIncidents::IncidentRecord",
            "AssociationType": "IsParentOf",

For more information, see Working with Incident Manager incidents in OpsCenter in the *Amazon Systems Manager User Guide*.

- For API details, see ListOpsItemRelatedItems in *Amazon CLI Command Reference*.

`list-resource-compliance-summaries`

The following code example shows how to use `list-resource-compliance-summaries`.

Amazon CLI

To list resource-level compliance summary counts

This example lists resource-level compliance summary counts.

Command:

```
aws ssm list-resource-compliance-summaries
```

Output:

```
{
  "ResourceComplianceSummaryItems": [
      {
          "ComplianceType": "Association",
          "ResourceType": "ManagedInstance",
          "ResourceId": "i-1234567890abcdef0",
          "Status": "COMPLIANT",
          "OverallSeverity": "UNSPECIFIED",
          "ExecutionSummary": {
              "ExecutionTime": 1550509273.0
          },
          "CompliantSummary": {
              "CompliantCount": 2,
              "SeveritySummary": {
                  "CriticalCount": 0,
                  "HighCount": 0,
                  "MediumCount": 0,
                  "LowCount": 0,
                  "InformationalCount": 0,
                  "UnspecifiedCount": 2
              }
          },
          "NonCompliantSummary": {
              "NonCompliantCount": 0,
              "SeveritySummary": {
                  "CriticalCount": 0,
                  "HighCount": 0,
                  "MediumCount": 0,
                  "LowCount": 0,
                  "InformationalCount": 0,
                  "UnspecifiedCount": 0
```

```
                }
            }
        },
        {
            "ComplianceType": "Patch",
            "ResourceType": "ManagedInstance",
            "ResourceId": "i-9876543210abcdef0",
            "Status": "COMPLIANT",
            "OverallSeverity": "UNSPECIFIED",
            "ExecutionSummary": {
                "ExecutionTime": 1550248550.0,
                "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
                "ExecutionType": "Command"
            },
            "CompliantSummary": {
                "CompliantCount": 397,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 397
                }
            },
            "NonCompliantSummary": {
                "NonCompliantCount": 0,
                "SeveritySummary": {
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 0
                }
            }
        }
    ],
    "NextToken": "--token string truncated--"
}
```

To list resource-level compliance summaries for a specific compliance type

This example lists resource-level compliance summaries for the Patch compliance type.

Command:

```
aws ssm list-resource-compliance-summaries --
filters "Key=ComplianceType,Values=Patch,Type=EQUAL"
```

- For API details, see ListResourceComplianceSummaries in *Amazon CLI Command Reference*.

`list-resource-data-sync`

The following code example shows how to use `list-resource-data-sync`.

Amazon CLI

To list your resource data sync configurations

This example retrieves information about your resource data sync configurations.

```
aws ssm list-resource-data-sync
```

Output:

```
{
    "ResourceDataSyncItems": [
        {
            "SyncName": "MyResourceDataSync",
            "S3Destination": {
                "BucketName": "ssm-resource-data-sync",
                "SyncFormat": "JsonSerDe",
                "Region": "us-east-1"
            },
            "LastSyncTime": 1550261472.003,
            "LastSuccessfulSyncTime": 1550261472.003,
            "LastStatus": "Successful",
            "SyncCreatedTime": 1543235736.72,
            "LastSyncStatusMessage": "The sync was successfully completed"
        }
    ]
}
```

- For API details, see ListResourceDataSync in *Amazon CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

Amazon CLI

To list the tags applied to a patch baseline

The following `list-tags-for-resource` example lists the tags for a patch baseline.

```
aws ssm list-tags-for-resource \
    --resource-type "PatchBaseline" \
    --resource-id "pb-0123456789abcdef0"
```

Output:

```
{
    "TagList": [
        {
            "Key": "Environment",
            "Value": "Production"
        },
        {
            "Key": "Region",
            "Value": "EMEA"
        }
    ]
}
```

For more information, see Tagging Amazon Resources in the *Amazon General Reference*.

- For API details, see ListTagsForResource in *Amazon CLI Command Reference*.

`modify-document-permission`

The following code example shows how to use `modify-document-permission`.

Amazon CLI

To modify document permissions

The following `modify-document-permission` example shares a Systems Manager document publicly.

```
aws ssm modify-document-permission \
    --name "Example" \
    --permission-type "Share" \
    --account-ids-to-add "All"
```

This command produces no output.

For more information, see Share a Systems Manager Document in the *Amazon Systems Manager User Guide*.

- For API details, see ModifyDocumentPermission in *Amazon CLI Command Reference*.

`put-compliance-items`

The following code example shows how to use `put-compliance-items`.

Amazon CLI

To register a compliance type and compliance details to a designated instance

This example registers the compliance type `Custom:AVCheck` to the specified managed instance. There is no output if the command succeeds.

Command:

```
aws ssm put-compliance-items --resource-id "i-1234567890abcdef0" --
resource-type "ManagedInstance" --compliance-type "Custom:AVCheck"
 --execution-summary "ExecutionTime=2019-02-18T16:00:00Z" --
items "Id=Version2.0,Title=ScanHost,Severity=CRITICAL,Status=COMPLIANT"
```

- For API details, see PutComplianceItems in *Amazon CLI Command Reference*.

`put-inventory`

The following code example shows how to use `put-inventory`.

Amazon CLI

To assign customer metadata to an instance

This example assigns rack location information to an instance. There is no output if the command succeeds.

Command (Linux):

```
aws ssm put-inventory --instance-id "i-016648b75dd622dab" --items
 '[{"TypeName": "Custom:RackInfo","SchemaVersion": "1.0","CaptureTime":
 "2019-01-22T10:01:01Z","Content":[{"RackLocation": "Bay B/Row C/Rack D/Shelf
 E"}]}]'
```

Command (Windows):

```
aws ssm put-inventory --instance-id "i-016648b75dd622dab" --
items "TypeName=Custom:RackInfo,SchemaVersion=1.0,CaptureTime=2019-01-22T10:01:01Z,Content=[
 B/Row C/Rack D/Shelf F'}]"
```

- For API details, see PutInventory in *Amazon CLI Command Reference*.

`put-parameter`

The following code example shows how to use `put-parameter`.

Amazon CLI

Example 1: To change a parameter value

The following `put-parameter` example changes the value of the specified parameter.

```
aws ssm put-parameter \
    --name "MyStringParameter" \
    --type "String" \
    --value "Vici" \
    --overwrite
```

Output:

```
{
    "Version": 2,
    "Tier": "Standard"
}
```

For more information, see Create a Systems Manager parameter (Amazon CLI), Managing parameter tiers, and Working with parameter policies in the *Amazon Systems Manager User Guide*.

Example 2: To create an advanced parameter

The following `put-parameter` example creates an advanced parameter.

```
aws ssm put-parameter \
    --name "MyAdvancedParameter" \
    --description "This is an advanced parameter" \
    --value "Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod
 tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam,
 quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat
 [truncated]" \
    --type "String" \
    --tier Advanced
```

Output:

```
{
    "Version": 1,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (Amazon CLI), Managing parameter tiers, and Working with parameter policies in the *Amazon Systems Manager User Guide*.

Example 3: To convert a standard parameter to an advanced parameter

The following `put-parameter` example converts an existing standard parameter into an advanced parameter.

```
aws ssm put-parameter \
    --name "MyConvertedParameter" \
    --value "abc123" \
    --type "String" \
    --tier Advanced \
    --overwrite
```

Output:

```
{
    "Version": 2,
```

```
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (Amazon CLI), Managing parameter tiers, and Working with parameter policies in the *Amazon Systems Manager User Guide*.

Example 4: To create a parameter with a policy attached

The following `put-parameter` example creates an advanced parameter with a parameter policy attached.

```
aws ssm put-parameter \
    --name "/Finance/Payroll/q2accesskey" \
    --value "P@sSwW)rd" \
    --type "SecureString" \
    --tier Advanced \
    --policies "[{\"Type\":\"Expiration\",\"Version\":\"1.0\",\"Attributes\":
{\"Timestamp\":\"2020-06-30T00:00:00.000Z\"}},{\"Type\":\"ExpirationNotification\",
\"Version\":\"1.0\",\"Attributes\":{\"Before\":\"5\",\"Unit\":\"Days\"}},{\"Type\":
\"NoChangeNotification\",\"Version\":\"1.0\",\"Attributes\":{\"After\":\"60\",\"Unit
\":\"Days\"}}]"
```

Output:

```
{
    "Version": 1,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (Amazon CLI), Managing parameter tiers, and Working with parameter policies in the *Amazon Systems Manager User Guide*.

Example 5: To add a policy to an existing parameter

The following `put-parameter` example attaches a policy to an existing advanced parameter.

```
aws ssm put-parameter \
    --name "/Finance/Payroll/q2accesskey" \
    --value "N3wP@sSwW)rd" \
```

```
    --type "SecureString" \
    --tier Advanced \
    --policies "[{\"Type\":\"Expiration\",\"Version\":\"1.0\",\"Attributes\":
{\"Timestamp\":\"2020-06-30T00:00:00.000Z\"}},{\"Type\":\"ExpirationNotification\",
\"Version\":\"1.0\",\"Attributes\":{\"Before\":\"5\",\"Unit\":\"Days\"}},{\"Type\":
\"NoChangeNotification\",\"Version\":\"1.0\",\"Attributes\":{\"After\":\"60\",\"Unit
\":\"Days\"}}]"
    --overwrite
```

Output:

```
{
    "Version": 2,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (Amazon CLI), Managing parameter tiers, and Working with parameter policies in the *Amazon Systems Manager User Guide*.

- For API details, see PutParameter in *Amazon CLI Command Reference*.

`register-default-patch-baseline`

The following code example shows how to use `register-default-patch-baseline`.

Amazon CLI

To set the default patch baseline

The following `register-default-patch-baseline` example registers the specified custom patch baseline as the default patch baseline for the operating system type that it supports.

```
aws ssm register-default-patch-baseline \
    --baseline-id "pb-abc123cf9bEXAMPLE"
```

Output:

```
{
    "BaselineId":"pb-abc123cf9bEXAMPLE"
}
```

The following `register-default-patch-baseline` example registers the default patch baseline provided by Amazon for CentOS as the default patch baseline.

```
aws ssm register-default-patch-baseline \
    --baseline-id "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-0574b43a65ea646ed"
```

Output:

```
{
    "BaselineId":"pb-abc123cf9bEXAMPLE"
}
```

For more information, see About Predefined and Custom Patch Baselines in the *Amazon Systems Manager User Guide*.

- For API details, see RegisterDefaultPatchBaseline in *Amazon CLI Command Reference*.

`register-patch-baseline-for-patch-group`

The following code example shows how to use `register-patch-baseline-for-patch-group`.

Amazon CLI

To register a patch baseline for a patch group

The following `register-patch-baseline-for-patch-group` example registers a patch baseline for a patch group.

```
aws ssm register-patch-baseline-for-patch-group \
    --baseline-id "pb-045f10b4f382baeda" \
    --patch-group "Production"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f382baeda",
    "PatchGroup": "Production"
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *Amazon Systems Manager User Guide*.

- For API details, see RegisterPatchBaselineForPatchGroup in *Amazon CLI Command Reference*.

`register-target-with-maintenance-window`

The following code example shows how to use `register-target-with-maintenance-window`.

Amazon CLI

Example 1: To register a single target with a maintenance window

The following `register-target-with-maintenance-window` example registers an instance with a maintenance window.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-ab12cd34ef56gh78" \
    --target "Key=InstanceIds,Values=i-0000293ffd8c57862" \
    --owner-information "Single instance" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 2: To register multiple targets with a maintenance window using instance IDs

The following `register-target-with-maintenance-window` example registers two instances with a maintenance window by specifying their instance IDs.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-ab12cd34ef56gh78" \
    --target "Key=InstanceIds,Values=i-0000293ffd8c57862,i-0cb2b964d3e14fd9f" \
    --owner-information "Two instances in a list" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 3: To register targets with a maintenance window using resource tags

The following `register-target-with-maintenance-window` example registers instances with a maintenance window by specifying resource tags that have been applied to the instances.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-06cf17cbefcb4bf4f" \
    --targets "Key=tag:Environment,Values=Prod" "Key=Role,Values=Web" \
    --owner-information "Production Web Servers" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 4: To register targets using a group of tag keys

The following `register-target-with-maintenance-window` example register instances that all have one or more tag keys assigned to them, regardless of their key values.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-0c50858d01EXAMPLE" \
    --resource-type "INSTANCE" \
    --target "Key=tag-key,Values=Name,Instance-Type,CostCenter"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

Example 5: To register targets using a resource group name

The following `register-target-with-maintenance-window` example register a specified resource group, regardless of the type of resources it contains.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-0c50858d01EXAMPLE" \
    --resource-type "RESOURCE_GROUP" \
    --target "Key=resource-groups:Name,Values=MyResourceGroup"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

For more information, see Register a Target Instance with the Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see RegisterTargetWithMaintenanceWindow in *Amazon CLI Command Reference*.

`register-task-with-maintenance-window`

The following code example shows how to use `register-task-with-maintenance-window`.

Amazon CLI

Example 1: To register an Automation task with a maintenance window

The following `register-task-with-maintenance-window` example registers an Automation task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --window-id "mw-082dcd7649EXAMPLE" \
    --targets Key=InstanceIds,Values=i-1234520122EXAMPLE \
    --task-arn AWS-RestartEC2Instance \
    --service-role-arn arn:aws:iam::111222333444:role/SSM --task-type AUTOMATION \
    --task-invocation-parameters "{\"Automation\":{\"DocumentVersion\":\"\$LATEST\",
\"Parameters\":{\"InstanceId\":[\"{{RESOURCE_ID}}\"]}}}" \
    --priority 0 \
    --max-concurrency 1 \
    --max-errors 1 \
```

```
    --name "AutomationExample" \
    --description "Restarting EC2 Instance for maintenance"
```

Output:

```
{
    "WindowTaskId":"11144444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

Example 2: To register a Lambda task with a Maintenance Window

The following `register-task-with-maintenance-window` example registers a Lambda task with a Maintenance Window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --window-id "mw-082dcd7649dee04e4" \
    --targets Key=InstanceIds,Values=i-12344d305eEXAMPLE \
    --task-arn arn:aws:lambda:us-east-1:111222333444:function:SSMTestLAMBDA \
    --service-role-arn arn:aws:iam::111222333444:role/SSM \
    --task-type LAMBDA \
    --task-invocation-parameters '{"Lambda":{"Payload":"{\"InstanceId\":
\"{{RESOURCE_ID}}\",\"targetType\":\"{{TARGET_TYPE}}\"}","Qualifier":"$LATEST"}}' \
    --priority 0 \
    --max-concurrency 10 \
    --max-errors 5 \
    --name "Lambda_Example" \
    --description "My Lambda Example"
```

Output:

```
{
    "WindowTaskId":"22244444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

Example 3: To register a Run Command task with a maintenance window

The following `register-task-with-maintenance-window` example registers a Run Command task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --window-id "mw-082dcd7649dee04e4" \
    --targets "Key=InstanceIds,Values=i-12344d305eEXAMPLE" \
    --service-role-arn "arn:aws:iam::111222333444:role/SSM" \
    --task-type "RUN_COMMAND" \
    --name "SSMInstallPowerShellModule" \
    --task-arn "AWS-InstallPowerShellModule" \
    --task-invocation-parameters "{\"RunCommand\":{\"Comment\":\"\",
\"OutputS3BucketName\":\"runcommandlogs\",\"Parameters\":{\"commands\":[\"Get-
Module -ListAvailable\"],\"executionTimeout\":[\"3600\"],\"source\":[\"https:\/
\/gallery.technet.microsoft.com\/EZOut-33ae0fb7\/file\/110351\/1\/EZOut.zip\"],
\"workingDirectory\":[\"\\\\\"]},\"TimeoutSeconds\":600}}" \
    --max-concurrency 1 \
    --max-errors 1 \
    --priority 10
```

Output:

```
{
    "WindowTaskId":"33344444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

Example 4: To register a Step Functions task with a maintenance window

The following `register-task-with-maintenance-window` example registers a Step Functions task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --window-id "mw-1234d787d6EXAMPLE" \
    --targets Key=WindowTargetIds,Values=12347414-69c3-49f8-95b8-ed2dcEXAMPLE \
    --task-arn arn:aws:states:us-
east-1:111222333444:stateMachine:SSMTestStateMachine \
    --service-role-arn arn:aws:iam::111222333444:role/MaintenanceWindows \
    --task-type STEP_FUNCTIONS \
    --task-invocation-parameters '{"StepFunctions":{"Input":"{\"InstanceId\":
\"{{RESOURCE_ID}}\"}"}}' \
```

```
    --priority 0 \
    --max-concurrency 10 \
    --max-errors 5 \
    --name "Step_Functions_Example" \
    --description "My Step Functions Example"
```

Output:

```
{
    "WindowTaskId":"44444444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

Example 5: To register a task using a maintenance windows target ID

The following `register-task-with-maintenance-window` example registers a task using a maintenance window target ID. The maintenance window target ID was in the output of the `aws ssm register-target-with-maintenance-window` command. You can also retrieve it from the output of the `aws ssm describe-maintenance-window-targets` command.

```
aws ssm register-task-with-maintenance-window \
    --targets "Key=WindowTargetIds,Values=350d44e6-28cc-44e2-951f-4b2c9EXAMPLE" \
    --task-arn "AWS-RunShellScript" \
    --service-role-arn "arn:aws:iam::111222333444:role/MaintenanceWindowsRole" \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --task-type "RUN_COMMAND" \
    --task-parameters  "{\"commands\":{\"Values\":[\"df\"]}}" \
    --max-concurrency 1 \
    --max-errors 1 \
    --priority 10
```

Output:

```
{
    "WindowTaskId":"33344444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see RegisterTaskWithMaintenanceWindow in *Amazon CLI Command Reference*.

`remove-tags-from-resource`

The following code example shows how to use `remove-tags-from-resource`.

Amazon CLI

To remove a tag from a patch baseline

The following `remove-tags-from-resource` example removes tags from a patch baseline.

```
aws ssm remove-tags-from-resource \
    --resource-type "PatchBaseline" \
    --resource-id "pb-0123456789abcdef0" \
    --tag-keys "Region"
```

This command produces no output.

For more information, see Tagging Amazon Resources in the *Amazon General Reference*.

- For API details, see RemoveTagsFromResource in *Amazon CLI Command Reference*.

`reset-service-setting`

The following code example shows how to use `reset-service-setting`.

Amazon CLI

To reset the service setting for Parameter Store throughput

The following `reset-service-setting` example resets the service setting for Parameter Store throughput in the specified region to no longer use increased throughput.

```
aws ssm reset-service-setting \
    --setting-id arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-store/high-throughput-enabled
```

Output:

```
{
    "ServiceSetting": {
```

```
        "SettingId": "/ssm/parameter-store/high-throughput-enabled",
        "SettingValue": "false",
        "LastModifiedDate": 1555532818.578,
        "LastModifiedUser": "System",
        "ARN": "arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-
store/high-throughput-enabled",
        "Status": "Default"
    }
}
```

For more information, see Increasing Parameter Store Throughput in the *Amazon Systems Manager User Guide*.

- For API details, see ResetServiceSetting in *Amazon CLI Command Reference*.

`resume-session`

The following code example shows how to use `resume-session`.

Amazon CLI

To resume a Session Manager session

This `resume-session` example resumes a Session Manager session with an instance after it has been disconnected. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call.

```
aws ssm resume-session \
    --session-id Mary-Major-07a16060613c408b5
```

Output:

```
{
    "SessionId": "Mary-Major-07a16060613c408b5",
    "TokenValue":
 "AAEAAVbTGsaOnyvcUoNGqifbv5r/8lgxuQljCuY8qVcvOnoBAAAAAFxtd3jIXAFUUXGTJ7zF/
AWJPwDviOlF5p3dlAgrqVIVO6IEXhkHLz0/1gXKRKEME71E6TLOplLDJAMZ

wekrj6WsDUpnEegFBfGftpAIz2GXQVfTJXKfkc5qepQ11C11DOIT2dozOqXgHwfQHfAKLErM5dWDZqKwyT1Z3iw7unQd
+ihfGa6MEJJ97Jmat/a2TspEnOjNn9Mvu5iwXIW2yCvWZrGUj+/
QI5Xr7s1XJBEnSKR54o4fN0GV9RWl0RZsZm1m1ki0JJtiwwgZ",
    "StreamUrl": "wss://ssmmessages.us-east-2.amazonaws.com/v1/data-channel/Mary-
Major-07a16060613c408b5?role=publish_subscribe"
```

```
}
```

For more information, see Install the Session Manager Plugin for the Amazon CLI in the *Amazon Systems Manager User Guide*.

- For API details, see ResumeSession in *Amazon CLI Command Reference*.

`send-automation-signal`

The following code example shows how to use `send-automation-signal`.

Amazon CLI

To send a signal to an automation execution

The following `send-automation-signal` example sends an Approve signal to an Automation execution.

```
aws ssm send-automation-signal \
    --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE \
    --signal-type "Approve"
```

This command produces no output.

For more information, see Running an Automation Workflow with Approvers in the *Amazon Systems Manager User Guide*.

- For API details, see SendAutomationSignal in *Amazon CLI Command Reference*.

`send-command`

The following code example shows how to use `send-command`.

Amazon CLI

Example 1: To run a command on one or more remote instances

The following `send-command` example runs an `echo` command on a target instance.

```
aws ssm send-command \
    --document-name "AWS-RunShellScript" \
    --parameters 'commands=["echo HelloWorld"]' \
    --targets "Key=instanceids,Values=i-1234567890abcdef0" \
```

```
    --comment "echo HelloWorld"
```

Output:

```
{
    "Command": {
        "CommandId": "92853adf-ba41-4cd6-9a88-142d1EXAMPLE",
        "DocumentName": "AWS-RunShellScript",
        "DocumentVersion": "",
        "Comment": "echo HelloWorld",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "echo HelloWorld"
            ]
        },
        "InstanceIds": [
            "i-0f00f008a2dcbefe2"
        ],
        "Targets": [],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 1,
        "CompletedCount": 0,
        "ErrorCount": 0,
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
            "CloudWatchOutputEnabled": false
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *Amazon Systems Manager User Guide*.

Examle 2: To get IP information about an instance

The following `send-command` example retrieves the IP information about an instance.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *Amazon Systems Manager User Guide*.

Example 3: To run a command on instances with specific tags

The following `send-command` example runs a command on instances that have the tag key "ENV" and the value "Dev".

```
aws ssm send-command \
    --targets "Key=tag:ENV,Values=Dev" \
    --document-name "AWS-RunShellScript" \
    --parameters "commands=ifconfig"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *Amazon Systems Manager User Guide*.

Example 4: To run a command that sends SNS notifications

The following `send-command` example runs a command that sends SNS notifications for all notification events and the `Command` notification type.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
```

```
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig" \
    --service-role-arn "arn:aws:iam::123456789012:role/SNS_Role" \
    --notification-config "NotificationArn=arn:aws:sns:us-
east-1:123456789012:SNSTopicName,NotificationEvents=All,NotificationType=Command"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *Amazon Systems Manager User Guide*.

Example 5: To run a command that outputs to S3 and CloudWatch

The following `send-command` example runs a command that outputs command details to an S3 bucket and to a CloudWatch Logs log group.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig" \
    --output-s3-bucket-name "s3-bucket-name" \
    --output-s3-key-prefix "runcommand" \
    --cloud-watch-output-
config "CloudWatchOutputEnabled=true,CloudWatchLogGroupName=CWLGroupName"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *Amazon Systems Manager User Guide*.

Example 6: To run commands on multiple instances with different tags

The following `send-command` example runs a command on instances with two different tag keys and values.

```
aws ssm send-command \
    --document-name "AWS-RunPowerShellScript" \
    --parameters commands=["echo helloWorld"] \
    --targets Key=tag:Env,Values=Dev Key=tag:Role,Values=WebServers
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *Amazon Systems Manager User Guide*.

Example 7: To target multiple instances with the same tag key

The following `send-command` example runs a command on instances that have the same tag key but with different values.

```
aws ssm send-command \
    --document-name "AWS-RunPowerShellScript" \
    --parameters commands=["echo helloWorld"] \
    --targets Key=tag:Env,Values=Dev,Test
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *Amazon Systems Manager User Guide*.

Example 8: To run a command that uses a shared document

The following `send-command` example runs a shared document on a target instance.

```
aws ssm send-command \
    --document-name "arn:aws:ssm:us-east-1:123456789012:document/ExampleDocument" \
    --targets "Key=instanceids,Values=i-1234567890abcdef0"
```

See example 1 for sample output.

For more information, see Using shared SSM documents in the *Amazon Systems Manager User Guide*.

- For API details, see SendCommand in *Amazon CLI Command Reference*.

`start-associations-once`

The following code example shows how to use `start-associations-once`.

Amazon CLI

To run an association immediately and only one time

The following `start-associations-once` example run the specified association immediately and only once. There is no output if the command succeeds.

```
aws ssm start-associations-once \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

This command produces no output.

For more information, see Viewing association histories in the *Amazon Systems Manager User Guide*.

- For API details, see StartAssociationsOnce in *Amazon CLI Command Reference*.

`start-automation-execution`

The following code example shows how to use `start-automation-execution`.

Amazon CLI

Example 1: To execute an automation document

The following `start-automation-execution` example runs an Automation document.

```
aws ssm start-automation-execution \
    --document-name "AWS-UpdateLinuxAmi" \
    --parameters "AutomationAssumeRole=arn:aws:iam::123456789012:role/
SSMAutomationRole,SourceAmiId=ami-EXAMPLE,IamInstanceProfileName=EC2InstanceRole"
```

Output:

```
{
  "AutomationExecutionId": "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"
}
```

For more information, see Running an Automation Workflow Manually in the *Amazon Systems Manager User Guide*.

Example 2: To run a shared automation document

The following `start-automation-execution` example runs a shared Automation document.

```
aws ssm start-automation-execution \
```

```
    --document-name "arn:aws:ssm:us-east-1:123456789012:document/ExampleDocument"
```

Output:

```
{
  "AutomationExecutionId": "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"
}
```

For more information, see Using shared SSM documents in the *Amazon Systems Manager User Guide*.

- For API details, see StartAutomationExecution in *Amazon CLI Command Reference*.

`start-change-request-execution`

The following code example shows how to use `start-change-request-execution`.

Amazon CLI

Example 1: To start a change request

The following `start-change-request-execution` example starts a change request with minimal options specified.

```
aws ssm start-change-request-execution \
    --change-request-name MyChangeRequest \
    --document-name AWS-HelloWorldChangeTemplate \
    --runbooks '[{"DocumentName": "AWS-HelloWorld","Parameters":
 {"AutomationAssumeRole": ["arn:aws:iam:us-east-2:1112223233444:role/
MyChangeManagerAssumeRole"]}}]' \
    --parameters
 Approver="JohnDoe",ApproverType="IamUser",ApproverSnsTopicArn="arn:aws:sns:us-
east-2:1112223233444:MyNotificationTopic"
```

Output:

```
{
  "AutomationExecutionId": "9d32a4fc-f944-11e6-4105-0a1b2EXAMPLE"
}
```

Example 2: To start a change request using an external JSON file

The following `start-automation-execution` example starts a change request with multiple options specified in a JSON file.

```
aws ssm start-change-request-execution \
    --cli-input-json file://MyChangeRequest.json
```

Contents of `MyChangeRequest.json`:

```
{
    "ChangeRequestName": "MyChangeRequest",
    "DocumentName": "AWS-HelloWorldChangeTemplate",
    "DocumentVersion": "$DEFAULT",
    "ScheduledTime": "2021-12-30T03:00:00",
    "ScheduledEndTime": "2021-12-30T03:05:00",
    "Tags": [
        {
            "Key": "Purpose",
            "Value": "Testing"
        }
    ],
    "Parameters": {
        "Approver": [
            "JohnDoe"
        ],
        "ApproverType": [
            "IamUser"
        ],
        "ApproverSnsTopicArn": [
            "arn:aws:sns:us-east-2:111222333444;:MyNotificationTopic
        ]
    },
    "Runbooks": [
        {
            "DocumentName": "AWS-HelloWorld",
            "DocumentVersion": "1",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Parameters": {
                "AutomationAssumeRole": [
                    "arn:aws:iam::111222333444:role/MyChangeManagerAssumeRole"
                ]
            }
        }
```

```
    ],
    "ChangeDetails": "### Document Name: HelloWorldChangeTemplate\n\n## What does
 this document do?\nThis change template demonstrates the feature set available
 for creating change templates for Change Manager. This template starts a Runbook
 workflow for the Automation document called AWS-HelloWorld.\n\n## Input Parameters
\n* ApproverSnsTopicArn: (Required) Amazon Simple Notification Service ARN for
 approvers.\n* Approver: (Required) The name of the approver to send this request
 to.\n* ApproverType: (Required) The type of reviewer.\n  * Allowed Values: IamUser,
 IamGroup, IamRole, SSOGroup, SSOUser\n\n## Output Parameters\nThis document has no
 outputs \n"
}
```

Output:

```
{
  "AutomationExecutionId": "9d32a4fc-f944-11e6-4105-0a1b2EXAMPLE"
}
```

For more information, see Creating change requests in the *Amazon Systems Manager User Guide*.

- For API details, see StartChangeRequestExecution in *Amazon CLI Command Reference*.

`start-session`

The following code example shows how to use `start-session`.

Amazon CLI

Example 1: To start a Session Manager session

This `start-session` example establishes a connection with an instance for a Session Manager session. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call.

```
aws ssm start-session \
    --target "i-1234567890abcdef0"
```

Output:

```
Starting session with SessionId: Jane-Roe-07a16060613c408b5
```

Example 2: To start a Session Manager session using SSH

This `start-session` example establishes a connection with an instance for a Session Manager session using SSH. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call, and that the command uses the default user on the instance, such as `ec2-user` for EC2 instances for Linux.

```
ssh -i /path/my-key-pair.pem ec2-user@i-02573cafcfEXAMPLE
```

Output:

```
Starting session with SessionId: ec2-user-07a16060613c408b5
```

For more information, see Start a Session and Install the Session Manager Plugin for the Amazon CLI in the *Amazon Systems Manager User Guide*.

- For API details, see StartSession in *Amazon CLI Command Reference*.

`stop-automation-execution`

The following code example shows how to use `stop-automation-execution`.

Amazon CLI

To stop an automation execution

The following `stop-automation-execution` example stops an Automation document.

```
aws ssm stop-automation-execution
    --automation-execution-id "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"
```

This command produces no output.

For more information, see Running an Automation Workflow Manually in the *Amazon Systems Manager User Guide*.

- For API details, see StopAutomationExecution in *Amazon CLI Command Reference*.

`terminate-session`

The following code example shows how to use `terminate-session`.

Amazon CLI

To end a Session Manager session

This `terminate-session` example permanently ends a session that was created by the user "Shirley-Rodriguez" and closes the data connection between the Session Manager client and SSM Agent on the instance.

```
aws ssm terminate-session \
    --session-id "Shirley-Rodriguez-07a16060613c408b5"
```

Output:

```
{
    "SessionId": "Shirley-Rodriguez-07a16060613c408b5"
}
```

For more information, see Terminate a Session in the *Amazon Systems Manager User Guide*.

- For API details, see TerminateSession in *Amazon CLI Command Reference*.

`unlabel-parameter-version`

The following code example shows how to use `unlabel-parameter-version`.

Amazon CLI

To delete parameter labels

The following `unlabel-parameter-version` example deletes the specified labels from the given parameter version.

```
aws ssm unlabel-parameter-version \
    --name "parameterName" \
    --parameter-version "version" \
    --labels "label_1" "label_2" "label_3"
```

Output:

```
{
    "RemovedLabels": [
        "label_1"
```

```
        "label_2"
        "label_3"
    ],
    "InvalidLabels": []
}
```

For more information, see Delete parameter labels (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see UnlabelParameterVersion in *Amazon CLI Command Reference*.

`update-association-status`

The following code example shows how to use `update-association-status`.

Amazon CLI

To update the association status

The following `update-association-status` example updates the association status of the association between an instance and a document.

```
aws ssm update-association-status \
    --name "AWS-UpdateSSMAgent" \
    --instance-id "i-1234567890abcdef0" \
    --association-
status "Date=1424421071.939,Name=Pending,Message=temp_status_change,AdditionalInfo=Additiona
Config-Needed"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-1234567890abcdef0",
        "AssociationVersion": "1",
        "Date": 1550507529.604,
        "LastUpdateAssociationDate": 1550507806.974,
        "Status": {
            "Date": 1424421071.0,
            "Name": "Pending",
            "Message": "temp_status_change",
            "AdditionalInfo": "Additional-Config-Needed"
```

```
        },
        "Overview": {
            "Status": "Success",
            "AssociationStatusAggregatedCount": {
                "Success": 1
            }
        },
        "DocumentVersion": "$DEFAULT",
        "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
        "Targets": [
            {
                "Key": "InstanceIds",
                "Values": [
                    "i-1234567890abcdef0"
                ]
            }
        ],
        "LastExecutionDate": 1550507808.0,
        "LastSuccessfulExecutionDate": 1550507808.0
    }
}
```

For more information, see Working with associations in Systems Manager in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateAssociationStatus in *Amazon CLI Command Reference*.

`update-association`

The following code example shows how to use `update-association`.

Amazon CLI

Example 1: To update a document association

The following `update-association` example updates an association with a new document version.

```
aws ssm update-association \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
    --document-version "\$LATEST"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-UpdateSSMAgent",
        "AssociationVersion": "2",
        "Date": 1550508093.293,
        "LastUpdateAssociationDate": 1550508106.596,
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "DocumentVersion": "$LATEST",
        "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
        "Targets": [
            {
                "Key": "tag:Name",
                "Values": [
                    "Linux"
                ]
            }
        ],
        "LastExecutionDate": 1550508094.879,
        "LastSuccessfulExecutionDate": 1550508094.879
    }
}
```

For more information, see Editing and creating a new version of an association in the *Amazon Systems Manager User Guide*.

Example 2: To update the schedule expression of an association

The following `update-association` example updates the schedule expression for the specified association.

```
aws ssm update-association \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
    --schedule-expression "cron(0 0 0/4 1/1 * ? *)"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-HelloWorld",
```

```
        "AssociationVersion": "2",
        "Date": "2021-02-08T13:54:19.203000-08:00",
        "LastUpdateAssociationDate": "2021-06-29T11:51:07.933000-07:00",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "DocumentVersion": "$DEFAULT",
        "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
        "Targets": [
            {
                "Key": "aws:NoOpAutomationTag",
                "Values": [
                    "AWS-NoOpAutomationTarget-Value"
                ]
            }
        ],
        "ScheduleExpression": "cron(0 0 0/4 1/1 * ? *)",
        "LastExecutionDate": "2021-06-26T19:00:48.110000-07:00",
        "ApplyOnlyAtCronInterval": false
    }
}
```

For more information, see Editing and creating a new version of an association in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateAssociation in *Amazon CLI Command Reference*.

`update-document-default-version`

The following code example shows how to use `update-document-default-version`.

Amazon CLI

To update the default version of a document

The following `update-document-default-version` example updates the default version of a Systems Manager document.

```
aws ssm update-document-default-version \
    --name "Example" \
    --document-version "2"
```

Output:

```
{
    "Description": {
        "Name": "Example",
        "DefaultVersion": "2"
    }
}
```

For more information, see Writing SSM Document Content in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateDocumentDefaultVersion in *Amazon CLI Command Reference*.

`update-document-metadata`

The following code example shows how to use `update-document-metadata`.

Amazon CLI

Example: To approve the latest version of a change template

The following `update-document-metadata` provides an approval for the latest version of a change template that has been submitted for review.

```
aws ssm update-document-metadata \
    --name MyChangeManagerTemplate \
    --document-reviews 'Action=Approve,Comment=[{Type=Comment,Content=Approved!}]'
```

This command produces no output.

For more information, see Reviewing and approving or rejecting change templates in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateDocumentMetadata in *Amazon CLI Command Reference*.

`update-document`

The following code example shows how to use `update-document`.

Amazon CLI

To create a new version of a document

The following `update-document` example creates a new version of a document when run on a Windows computer. The document specified by `--document` must be in JSON format. Note that `file://` must be referenced followed by the path of the content file. Because of the $ at the beginning of the `--document-version` parameter, On Windows you must surround the value with double quotes. On Linux, MacOS, or at a PowerShell prompt, you must surround the value with single quotes.

Windows version:

```
aws ssm update-document \
    --name "RunShellScript" \
    --content "file://RunShellScript.json" \
    --document-version "$LATEST"
```

Linux/Mac version:

```
aws ssm update-document \
    --name "RunShellScript" \
    --content "file://RunShellScript.json" \
    --document-version '$LATEST'
```

Output:

```
{
  "DocumentDescription": {
      "Status": "Updating",
      "Hash": "f775e5df4904c6fa46686c4722fae9de1950dace25cd9608ff8d622046b68d9b",
      "Name": "RunShellScript",
      "Parameters": [
          {
              "Type": "StringList",
              "Name": "commands",
              "Description": "(Required) Specify a shell script or a command to
 run."
          }
      ],
      "DocumentType": "Command",
      "PlatformTypes": [
          "Linux"
      ],
      "DocumentVersion": "2",
      "HashType": "Sha256",
```

```
      "CreatedDate": 1487899655.152,
      "Owner": "809632081692",
      "SchemaVersion": "2.0",
      "DefaultVersion": "1",
      "LatestVersion": "2",
      "Description": "Run an updated script"
  }
}
```

- For API details, see UpdateDocument in *Amazon CLI Command Reference*.

`update-maintenance-window-target`

The following code example shows how to use `update-maintenance-window-target`.

Amazon CLI

To update a maintenance window target

The following `update-maintenance-window-target` example updates only the name of a maintenance window target.

```
aws ssm update-maintenance-window-target \
    --window-id "mw-0c5ed765acEXAMPLE" \
    --window-target-id "57e8344e-fe64-4023-8191-6bf05EXAMPLE" \
    --name "NewName" \
    --no-replace
```

Output:

```
{
    "Description": "",
    "OwnerInformation": "",
    "WindowTargetId": "57e8344e-fe64-4023-8191-6bf05EXAMPLE",
    "WindowId": "mw-0c5ed765acEXAMPLE",
    "Targets": [
        {
            "Values": [
                "i-1234567890EXAMPLE"
            ],
            "Key": "InstanceIds"
        }
```

```
    ],
    "Name": "NewName"
}
```

For more information, see Update a Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateMaintenanceWindowTarget in *Amazon CLI Command Reference*.

`update-maintenance-window-task`

The following code example shows how to use `update-maintenance-window-task`.

Amazon CLI

To update a maintenance window task

The following `update-maintenance-window-task` example updates the service role for a maintenance window task.

```
aws ssm update-maintenance-window-task \
    --window-id "mw-0c5ed765acEXAMPLE" \
    --window-task-id "23d3809e-9fbe-4ddf-b41a-b49d7EXAMPLE" \
    --service-role-arn "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM"
```

Output:

```
{
    "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
    "MaxErrors": "1",
    "TaskArn": "AWS-UpdateEC2Config",
    "MaxConcurrency": "1",
    "WindowTaskId": "23d3809e-9fbe-4ddf-b41a-b49d7EXAMPLE",
    "TaskParameters": {},
    "Priority": 1,
    "TaskInvocationParameters": {
        "RunCommand": {
            "TimeoutSeconds": 600,
            "Parameters": {
                "allowDowngrade": [
```

```
                    "false"
                ]
            }
        }
    },
    "WindowId": "mw-0c5ed765acEXAMPLE",
    "Description": "UpdateEC2Config",
    "Targets": [
        {
            "Values": [
                "57e8344e-fe64-4023-8191-6bf05EXAMPLE"
            ],
            "Key": "WindowTargetIds"
        }
    ],
    "Name": "UpdateEC2Config"
}
```

For more information, see Update a Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateMaintenanceWindowTask in *Amazon CLI Command Reference*.

`update-maintenance-window`

The following code example shows how to use `update-maintenance-window`.

Amazon CLI

Example 1: To update a maintenance window

The following `update-maintenance-window` example updates the name of a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
    --name "My-Renamed-MW"
```

Output:

```
{
    "Cutoff": 1,
    "Name": "My-Renamed-MW",
```

```
    "Schedule": "cron(0 16 ? * TUE *)",
    "Enabled": true,
    "AllowUnassociatedTargets": true,
    "WindowId": "mw-1a2b3c4d5e6f7g8h9",
    "Duration": 4
}
```

Example 2: To disable a maintenance window

The following `update-maintenance-window` example disables a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
    --no-enabled
```

Example 3: To enable a maintenance window

The following `update-maintenance-window` example enables a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
    --enabled
```

For more information, see Update a Maintenance Window (Amazon CLI) in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateMaintenanceWindow in *Amazon CLI Command Reference*.

`update-managed-instance-role`

The following code example shows how to use `update-managed-instance-role`.

Amazon CLI

To update the IAM role of a managed instance

The following `update-managed-instance-role` example updates the IAM instance profile of a managed instance.

```
aws ssm update-managed-instance-role \
    --instance-id "mi-08ab247cdfEXAMPLE" \
    --iam-role "ExampleRole"
```

This command produces no output.

For more information, see Step 4: Create an IAM Instance Profile for Systems Manager in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateManagedInstanceRole in *Amazon CLI Command Reference*.

`update-ops-item`

The following code example shows how to use `update-ops-item`.

Amazon CLI

To update an OpsItem

The following `update-ops-item` example updates the description, priority, and category for an OpsItem. In addition, the command specifies an SNS topic where the notifications are sent when this OpsItem is edited or changed.

```
aws ssm update-ops-item \
    --ops-item-id "oi-287b5EXAMPLE" \
    --description "Primary OpsItem for failover event 2020-01-01-fh398yf" \
    --priority 2 \
    --category "Security" \
    --notifications "Arn=arn:aws:sns:us-east-2:111222333444:my-us-east-2-topic"
```

Output:

```
This command produces no output.
```

For more information, see Working with OpsItems in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateOpsItem in *Amazon CLI Command Reference*.

`update-patch-baseline`

The following code example shows how to use `update-patch-baseline`.

Amazon CLI

Example 1: To update a patch baseline

The following `update-patch-baseline` example adds the specified two patches as rejected and one patch as approved to the specified patch baseline.

```
aws ssm update-patch-baseline \
        --baseline-id "pb-0123456789abcdef0" \
        --rejected-patches "KB2032276" "MS10-048" \
        --approved-patches "KB2124261"
```

Output:

```
{
    "BaselineId": "pb-0123456789abcdef0",
    "Name": "WindowsPatching",
    "OperatingSystem": "WINDOWS",
    "GlobalFilters": {
        "PatchFilters": []
    },
    "ApprovalRules": {
        "PatchRules": [
            {
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "PRODUCT",
                            "Values": [
                                "WindowsServer2016"
                            ]
                        }
                    ]
                },
                "ComplianceLevel": "CRITICAL",
                "ApproveAfterDays": 0,
                "EnableNonSecurity": false
            }
        ]
    },
    "ApprovedPatches": [
        "KB2124261"
    ],
    "ApprovedPatchesComplianceLevel": "UNSPECIFIED",
    "ApprovedPatchesEnableNonSecurity": false,
    "RejectedPatches": [
        "KB2032276",
```

```
        "MS10-048"
    ],
    "RejectedPatchesAction": "ALLOW_AS_DEPENDENCY",
    "CreatedDate": 1550244180.465,
    "ModifiedDate": 1550244180.465,
    "Description": "Patches for Windows Servers",
    "Sources": []
}
```

Example 2: To rename a patch baseline

The following `update-patch-baseline` example renames the specified patch baseline.

```
aws ssm update-patch-baseline \
    --baseline-id "pb-0713accee01234567" \
    --name "Windows-Server-2012-R2-Important-and-Critical-Security-Updates"
```

For more information, see Update or Delete a Patch Baseline <https://docs.aws.amazon.com/systems-manager/latest/userguide/patch-baseline-update-or-delete.html>`__ in the *Amazon Systems Manager User Guide*.

- For API details, see UpdatePatchBaseline in *Amazon CLI Command Reference*.

update-resource-data-sync

The following code example shows how to use `update-resource-data-sync`.

Amazon CLI

To update a resource data sync

The following `update-resource-data-sync` example updates a SyncFromSource resource data sync.

```
aws ssm update-resource-data-sync \
    --sync-name exampleSync \
    --sync-type SyncFromSource \
    --sync-source '{"SourceType":"SingleAccountMultiRegions", "SourceRegions":["us-east-1", "us-west-2"]}'
```

This command produces no output.

For more information, see Setting Up Systems Manager Explorer to Display Data from Multiple Accounts and Regions in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateResourceDataSync in *Amazon CLI Command Reference*.

`update-service-setting`

The following code example shows how to use `update-service-setting`.

Amazon CLI

To update the service setting for Parameter Store throughput

The following `update-service-setting` example updates the current service setting for Parameter Store throughput in the specified region to use increased throughput.

```
aws ssm update-service-setting \
    --setting-id arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-store/high-throughput-enabled \
    --setting-value true
```

This command produces no output.

For more information, see Increasing Parameter Store Throughput in the *Amazon Systems Manager User Guide*.

- For API details, see UpdateServiceSetting in *Amazon CLI Command Reference*.

Amazon Textract examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Amazon Textract.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`analyze-document`

The following code example shows how to use `analyze-document`.

Amazon CLI

To analyze text in a document

The following `analyze-document` example shows how to analyze text in a document.

Linux/macOS:

```
aws textract analyze-document \
    --document '{"S3Object":{"Bucket":"bucket","Name":"document"}}' \
    --feature-types '["TABLES","FORMS"]'
```

Windows:

```
aws textract analyze-document \
    --document "{\"S3Object\":{\"Bucket\":\"bucket\",\"Name\":\"document\"}}" \
    --feature-types "[\"TABLES\",\"FORMS\"]" \
    --region region-name
```

Output:

```
{
    "Blocks": [
        {
            "Geometry": {
                "BoundingBox": {
                    "Width": 1.0,
                    "Top": 0.0,
                    "Left": 0.0,
                    "Height": 1.0
                },
                "Polygon": [
                    {
                        "Y": 0.0,
```

```
                        "X": 0.0
                    },
                    {
                        "Y": 0.0,
                        "X": 1.0
                    },
                    {
                        "Y": 1.0,
                        "X": 1.0
                    },
                    {
                        "Y": 1.0,
                        "X": 0.0
                    }
                ]
            },
            "Relationships": [
                {
                    "Type": "CHILD",
                    "Ids": [
                        "87586964-d50d-43e2-ace5-8a890657b9a0",
                        "a1e72126-21d9-44f4-a8d6-5c385f9002ba",
                        "e889d012-8a6b-4d2e-b7cd-7a8b327d876a"
                    ]
                }
            ],
            "BlockType": "PAGE",
            "Id": "c2227f12-b25d-4e1f-baea-1ee180d926b2"
        }
    ],
    "DocumentMetadata": {
        "Pages": 1
    }
}
```

For more information, see Analyzing Document Text with Amazon Textract in the *Amazon Textract Developers Guide*

- For API details, see AnalyzeDocument in *Amazon CLI Command Reference*.

`detect-document-text`

The following code example shows how to use `detect-document-text`.

Amazon CLI

To detect text in a document

The following `detect-document-text` The following example shows how to detect text in a document.

Linux/macOS:

```
aws textract detect-document-text \
    --document '{"S3Object":{"Bucket":"bucket","Name":"document"}}'
```

Windows:

```
aws textract detect-document-text \
    --document "{\"S3Object\":{\"Bucket\":\"bucket\",\"Name\":\"document\"}}" \
    --region region-name
```

Output:

```
{
    "Blocks": [
        {
            "Geometry": {
                "BoundingBox": {
                    "Width": 1.0,
                    "Top": 0.0,
                    "Left": 0.0,
                    "Height": 1.0
                },
                "Polygon": [
                    {
                        "Y": 0.0,
                        "X": 0.0
                    },
                    {
                        "Y": 0.0,
                        "X": 1.0
                    },
                    {
                        "Y": 1.0,
                        "X": 1.0
                    },
```

```
                    {
                        "Y": 1.0,
                        "X": 0.0
                    }
                ]
            },
            "Relationships": [
                {
                    "Type": "CHILD",
                    "Ids": [
                        "896a9f10-9e70-4412-81ce-49ead73ed881",

- For API details, see GetDocumentTextDetection in *Amazon CLI Command Reference*.

`start-document-analysis`

The following code example shows how to use `start-document-analysis`.

Amazon CLI

To start analyzing text in a multi-page document

The following `start-document-analysis` example shows how to start asynchronous analysis of text in a multi-page document.

Linux/macOS:

```
aws textract start-document-analysis \
    --document-location '{"S3Object":{"Bucket":"bucket","Name":"document"}}' \
    --feature-types '["TABLES","FORMS"]' \
    --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleArn"
```

Windows:

```
aws textract start-document-analysis \
    --document-location "{\"S3Object\":{\"Bucket\":\"bucket\",\"Name\":\"document
\"}}" \
    --feature-types "[\"TABLES\", \"FORMS\"]" \
    --region region-name \
    --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleArn"
```

Output:

```
{
    "JobId": "df7cf32ebbd2a5de113535fcf4d921926a701b09b4e7d089f3aebadb41e0712b"
}
```

For more information, see Detecting and Analyzing Text in Multi-Page Documents in the *Amazon Textract Developers Guide*

- For API details, see StartDocumentAnalysis in *Amazon CLI Command Reference*.

`start-document-text-detection`

The following code example shows how to use `start-document-text-detection`.

Amazon CLI

To start detecting text in a multi-page document

The following `start-document-text-detection` example shows how to start asynchronous detection of text in a multi-page document.

Linux/macOS:

```
aws textract start-document-text-detection \
        --document-location '{"S3Object":{"Bucket":"bucket","Name":"document"}}' \
        --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleARN"
```

Windows:

```
aws textract start-document-text-detection \
    --document-location "{\"S3Object\":{\"Bucket\":\"bucket\",\"Name\":\"document
\"}}" \
    --region region-name \
    --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleArn"
```

Output:

```
{
    "JobId": "57849a3dc627d4df74123dca269d69f7b89329c870c65bb16c9fd63409d200b9"
}
```

For more information, see Detecting and Analyzing Text in Multi-Page Documents in the *Amazon Textract Developers Guide*

- For API details, see StartDocumentTextDetection in *Amazon CLI Command Reference*.

Amazon Transcribe examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Amazon Transcribe.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-language-model`

The following code example shows how to use `create-language-model`.

Amazon CLI

Example 1: To create a custom language model using both training and tuning data.

The following `create-language-model` example creates a custom language model. You can use a custom language model to improve transcription performance for domains such as legal, hospitality, finance, and insurance. For language-code, enter a valid language code. For base-model-name, specify a base model that is best suited for the sample rate of the audio that you want to transcribe with your custom language model. For model-name, specify the name that you want to call the custom language model.

```
aws transcribe create-language-model \
    --language-code language-code \
    --base-model-name base-model-name \
    --model-name cli-clm-example \
    --input-data-config S3Uri="s3://amzn-s3-demo-bucket/Amazon-S3-Prefix-for-
training-data",TuningDataS3Uri="s3://amzn-s3-demo-bucket/Amazon-S3-Prefix-for-
tuning-data",DataAccessRoleArn="arn:aws:iam::AWS-account-number:role/IAM-role-with-
permissions-to-create-a-custom-language-model"
```

Output:

```
{
    "LanguageCode": "language-code",
    "BaseModelName": "base-model-name",
    "ModelName": "cli-clm-example",
    "InputDataConfig": {
        "S3Uri": "s3://amzn-s3-demo-bucket/Amazon-S3-Prefix/",
        "TuningDataS3Uri": "s3://amzn-s3-demo-bucket/Amazon-S3-Prefix/",
        "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-with-
permissions-create-a-custom-language-model"
```

```
    },
    "ModelStatus": "IN_PROGRESS"
}
```

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

Example 2: To create a custom language model using only training data.

The following `create-language-model` example transcribes your audio file. You can use a custom language model to improve transcription performance for domains such as legal, hospitality, finance, and insurance. For language-code, enter a valid language code. For base-model-name, specify a base model that is best suited for the sample rate of the audio that you want to transcribe with your custom language model. For model-name, specify the name that you want to call the custom language model.

```
aws transcribe create-language-model \
    --language-code en-US \
    --base-model-name base-model-name \
    --model-name cli-clm-example \
    --input-data-config S3Uri="s3://amzn-s3-demo-bucket/Amazon-S3-Prefix-For-
Training-Data",DataAccessRoleArn="arn:aws:iam::AWS-account-number:role/IAM-role-
with-permissions-to-create-a-custom-language-model"
```

Output:

```
{
    "LanguageCode": "en-US",
    "BaseModelName": "base-model-name",
    "ModelName": "cli-clm-example",
    "InputDataConfig": {
        "S3Uri": "s3://amzn-s3-demo-bucket/Amazon-S3-Prefix-For-Training-Data/",
        "DataAccessRoleArn": "arn:aws:iam::your-AWS-account-number:role/IAM-role-
with-permissions-to-create-a-custom-language-model"
    },
    "ModelStatus": "IN_PROGRESS"
}
```

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

- For API details, see CreateLanguageModel in *Amazon CLI Command Reference*.

`create-medical-vocabulary`

The following code example shows how to use `create-medical-vocabulary`.

Amazon CLI

To create a medical custom vocabulary

The following `create-medical-vocabulary` example creates a custom vocabulary. To create a custom vocabulary, you must have created a text file with all the terms that you want to transcribe more accurately. For vocabulary-file-uri, specify the Amazon Simple Storage Service (Amazon S3) URI of that text file. For language-code, specify a language code corresponding to the language of your custom vocabulary. For vocabulary-name, specify what you want to call your custom vocabulary.

```
aws transcribe create-medical-vocabulary \
    --vocabulary-name cli-medical-vocab-example \
    --language-code language-code \
    --vocabulary-file-uri https://amzn-s3-demo-bucket.AWS-Region.amazonaws.com/the-text-file-for-the-medical-custom-vocabulary.txt
```

Output:

```
{
    "VocabularyName": "cli-medical-vocab-example",
    "LanguageCode": "language-code",
    "VocabularyState": "PENDING"
}
```

For more information, see Medical Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see CreateMedicalVocabulary in *Amazon CLI Command Reference*.

`create-vocabulary-filter`

The following code example shows how to use `create-vocabulary-filter`.

Amazon CLI

To create a vocabulary filter

The following `create-vocabulary-filter` example creates a vocabulary filter that uses a text file that contains a list of words that you wouldn't want to appear in a transcription. For language-code, specify the language code corresponding to the language of your vocabulary filter. For vocabulary-filter-file-uri, specify the Amazon Simple Storage Service (Amazon S3) URI of the text file. For vocabulary-filter-name, specify the name of your vocabulary filter.

```
aws transcribe create-vocabulary-filter \
    --language-code language-code \
    --vocabulary-filter-file-uri s3://amzn-s3-demo-bucket/vocabulary-filter.txt \
    --vocabulary-filter-name cli-vocabulary-filter-example
```

Output:

```
{
    "VocabularyFilterName": "cli-vocabulary-filter-example",
    "LanguageCode": "language-code"
}
```

For more information, see Filtering Unwanted Words in the *Amazon Transcribe Developer Guide*.

- For API details, see CreateVocabularyFilter in *Amazon CLI Command Reference*.

`create-vocabulary`

The following code example shows how to use `create-vocabulary`.

Amazon CLI

To create a custom vocabulary

The following `create-vocabulary` example creates a custom vocabulary. To create a custom vocabulary, you must have created a text file with all the terms that you want to transcribe more accurately. For vocabulary-file-uri, specify the Amazon Simple Storage Service (Amazon S3) URI of that text file. For language-code, specify a language code corresponding to the language of your custom vocabulary. For vocabulary-name, specify what you want to call your custom vocabulary.

```
aws transcribe create-vocabulary \
    --language-code language-code \
    --vocabulary-name cli-vocab-example \
    --vocabulary-file-uri s3://amzn-s3-demo-bucket/Amazon-S3-prefix/the-text-file-for-the-custom-vocabulary.txt
```

Output:

```
{
    "VocabularyName": "cli-vocab-example",
    "LanguageCode": "language-code",
    "VocabularyState": "PENDING"
}
```

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see CreateVocabulary in *Amazon CLI Command Reference*.

`delete-language-model`

The following code example shows how to use `delete-language-model`.

Amazon CLI

To delete a custom language model

The following `delete-language-model` example deletes a custom language model.

```
aws transcribe delete-language-model \
    --model-name model-name
```

This command produces no output.

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteLanguageModel in *Amazon CLI Command Reference*.

`delete-medical-transcription-job`

The following code example shows how to use `delete-medical-transcription-job`.

Amazon CLI

To delete a medical transcription job

The following `delete-medical-transcription-job` example deletes a medical transcription job.

```
aws transcribe delete-medical-transcription-job \
    --medical-transcription-job-name medical-transcription-job-name
```

This command produces no output.

For more information, see DeleteMedicalTranscriptionJob in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteMedicalTranscriptionJob in *Amazon CLI Command Reference*.

`delete-medical-vocabulary`

The following code example shows how to use `delete-medical-vocabulary`.

Amazon CLI

To delete a medical custom vocabulary

The following `delete-medical-vocabulary` example deletes a medical custom vocabulary. For vocabulary-name, specify the name of the medical custom vocabulary.

```
aws transcribe delete-vocabulary \
    --vocabulary-name medical-custom-vocabulary-name
```

This command produces no output.

For more information, see Medical Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteMedicalVocabulary in *Amazon CLI Command Reference*.

`delete-transcription-job`

The following code example shows how to use `delete-transcription-job`.

Amazon CLI

To delete one of your transcription jobs

The following `delete-transcription-job` example deletes one of your transcription jobs.

```
aws transcribe delete-transcription-job \
    --transcription-job-name your-transcription-job
```

This command produces no output.

For more information, see DeleteTranscriptionJob in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteTranscriptionJob in *Amazon CLI Command Reference*.

`delete-vocabulary-filter`

The following code example shows how to use `delete-vocabulary-filter`.

Amazon CLI

To delete a vocabulary filter

The following `delete-vocabulary-filter` example deletes a vocabulary filter.

```
aws transcribe delete-vocabulary-filter \
    --vocabulary-filter-name vocabulary-filter-name
```

This command produces no output.

For more information, see Filtering Unwanted Words in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteVocabularyFilter in *Amazon CLI Command Reference*.

`delete-vocabulary`

The following code example shows how to use `delete-vocabulary`.

Amazon CLI

To delete a custom vocabulary

The following `delete-vocabulary` example deletes a custom vocabulary.

```
aws transcribe delete-vocabulary \
    --vocabulary-name vocabulary-name
```

This command produces no output.

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteVocabulary in *Amazon CLI Command Reference*.

`describe-language-model`

The following code example shows how to use `describe-language-model`.

Amazon CLI

To get information about a specific custom language model

The following `describe-language-model` example gets information about a specific custom language model. For example, under BaseModelName you can see whether your model is trained using a NarrowBand or WideBand model. Custom language models with a NarrowBand base model can transcribe audio with a sample rate less than 16 kHz. Language models using a WideBand base model can transcribe audio with a sample rate greater than 16 kHz. The S3Uri parameter indicates the Amazon S3 prefix you've used to access the training data to create the custom language model.

```
aws transcribe describe-language-model \
    --model-name cli-clm-example
```

Output:

```
{
    "LanguageModel": {
        "ModelName": "cli-clm-example",
        "CreateTime": "2020-09-25T17:57:38.504000+00:00",
        "LastModifiedTime": "2020-09-25T17:57:48.585000+00:00",
        "LanguageCode": "language-code",
        "BaseModelName": "base-model-name",
        "ModelStatus": "IN_PROGRESS",
        "UpgradeAvailability": false,
        "InputDataConfig": {
```

```
            "S3Uri": "s3://amzn-s3-demo-bucket/Amazon-S3-Prefix/",
            "TuningDataS3Uri": "s3://amzn-s3-demo-bucket/Amazon-S3-Prefix/",
            "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-
with-permissions-to-create-a-custom-language-model"
        }
    }
}
```

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

- For API details, see DescribeLanguageModel in *Amazon CLI Command Reference*.

`get-medical-transcription-job`

The following code example shows how to use `get-medical-transcription-job`.

Amazon CLI

To get information about a specific medical transcription job

The following `get-medical-transcription-job` example gets information about a specific medical transcription job. To access the transcription results, use the TranscriptFileUri parameter. If you've enabled additional features for the transcription job, you can see them in the Settings object. The Specialty parameter shows the medical specialty of the provider. The Type parameter indicates whether the speech in the transcription job is of a medical conversation, or a medical dictation.

```
aws transcribe get-medical-transcription-job \
    --medical-transcription-job-name vocabulary-dictation-medical-transcription-job
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "vocabulary-dictation-medical-transcription-
job",
        "TranscriptionJobStatus": "COMPLETED",
        "LanguageCode": "en-US",
        "MediaSampleRateHertz": 48000,
        "MediaFormat": "mp4",
```

```
        "Media": {
            "MediaFileUri": "s3://Amazon-S3-Prefix/your-audio-file.file-extension"
        },
        "Transcript": {
            "TranscriptFileUri": "https://s3.Region.amazonaws.com/Amazon-S3-Prefix/
vocabulary-dictation-medical-transcription-job.json"
        },
        "StartTime": "2020-09-21T21:17:27.045000+00:00",
        "CreationTime": "2020-09-21T21:17:27.016000+00:00",
        "CompletionTime": "2020-09-21T21:17:59.561000+00:00",
        "Settings": {
            "ChannelIdentification": false,
            "ShowAlternatives": false,
            "VocabularyName": "cli-medical-vocab-example"
        },
        "Specialty": "PRIMARYCARE",
        "Type": "DICTATION"
    }
}
```

For more information, see Batch Transcription in the *Amazon Transcribe Developer Guide*.

- For API details, see GetMedicalTranscriptionJob in *Amazon CLI Command Reference*.

`get-medical-vocabulary`

The following code example shows how to use `get-medical-vocabulary`.

Amazon CLI

To get information about a medical custom vocabulary

The following `get-medical-vocabulary` example gets information on a medical custom vocabulary. You can use the VocabularyState parameter to see the processing state of the vocabulary. If it's READY, you can use it in the StartMedicalTranscriptionJob operation.:

```
aws transcribe get-medical-vocabulary \
    --vocabulary-name medical-vocab-example
```

Output:

```
{
```

```
    "VocabularyName": "medical-vocab-example",
    "LanguageCode": "en-US",
    "VocabularyState": "READY",
    "LastModifiedTime": "2020-09-19T23:59:04.349000+00:00",
    "DownloadUri": "https://link-to-download-the-text-file-used-to-create-your-
medical-custom-vocabulary"
}
```

For more information, see Medical Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see GetMedicalVocabulary in *Amazon CLI Command Reference*.

`get-transcription-job`

The following code example shows how to use `get-transcription-job`.

Amazon CLI

To get information about a specific transcription job

The following `get-transcription-job` example gets information about a specific transcription job. To access the transcription results, use the TranscriptFileUri parameter. Use the MediaFileUri parameter to see which audio file you transcribed with this job. You can use the Settings object to see the optional features you've enabled in the transcription job.

```
aws transcribe get-transcription-job \
    --transcription-job-name your-transcription-job
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "your-transcription-job",
        "TranscriptionJobStatus": "COMPLETED",
        "LanguageCode": "language-code",
        "MediaSampleRateHertz": 48000,
        "MediaFormat": "mp4",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.file-
extension"
```

```
        },
        "Transcript": {
            "TranscriptFileUri": "https://Amazon-S3-file-location-of-transcription-
output"
        },
        "StartTime": "2020-09-18T22:27:23.970000+00:00",
        "CreationTime": "2020-09-18T22:27:23.948000+00:00",
        "CompletionTime": "2020-09-18T22:28:21.197000+00:00",
        "Settings": {
            "ChannelIdentification": false,
            "ShowAlternatives": false
        },
        "IdentifyLanguage": true,
        "IdentifiedLanguageScore": 0.8672199249267578
    }
}
```

For more information, see Getting Started (Amazon Command Line Interface) in the *Amazon Transcribe Developer Guide*.

- For API details, see GetTranscriptionJob in *Amazon CLI Command Reference*.

`get-vocabulary-filter`

The following code example shows how to use `get-vocabulary-filter`.

Amazon CLI

To get information about a vocabulary filter

The following `get-vocabulary-filter` example gets information about a vocabulary filter. You can use the DownloadUri parameter to get the list of words you used to create the vocabulary filter.

```
aws transcribe get-vocabulary-filter \
    --vocabulary-filter-name testFilter
```

Output:

```
{
    "VocabularyFilterName": "testFilter",
```

```
    "LanguageCode": "language-code",
    "LastModifiedTime": "2020-05-07T22:39:32.147000+00:00",
    "DownloadUri": "https://Amazon-S3-location-to-download-your-vocabulary-filter"
}
```

For more information, see Filter Unwanted Words in the *Amazon Transcribe Developer Guide*.

- For API details, see GetVocabularyFilter in *Amazon CLI Command Reference*.

`get-vocabulary`

The following code example shows how to use `get-vocabulary`.

Amazon CLI

To get information about a custom vocabulary

The following `get-vocabulary` example gets information on a previously created custom vocabulary.

```
aws transcribe get-vocabulary \
    --vocabulary-name cli-vocab-1
```

Output:

```
{
    "VocabularyName": "cli-vocab-1",
    "LanguageCode": "language-code",
    "VocabularyState": "READY",
    "LastModifiedTime": "2020-09-19T23:22:32.836000+00:00",
    "DownloadUri": "https://link-to-download-the-text-file-used-to-create-your-
custom-vocabulary"
}
```

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see GetVocabulary in *Amazon CLI Command Reference*.

`list-language-models`

The following code example shows how to use `list-language-models`.

Amazon CLI

To list your custom language models

The following `list-language-models` example lists the custom language models associated with your Amazon account and Region. You can use the `S3Uri` and `TuningDataS3Uri` parameters to find the Amazon S3 prefixes you've used as your training data, or your tuning data. The BaseModelName tells you whether you've used a NarrowBand, or WideBand model to create a custom language model. You can transcribe audio with a sample rate of less than 16 kHz with a custom language model using a NarrowBand base model. You can transcribe audio 16 kHz or greater with a custom language model using a WideBand base model. The `ModelStatus` parameter shows whether you can use the custom language model in a transcription job. If the value is COMPLETED, you can use it in a transcription job.

```
aws transcribe list-language-models
```

Output:

```
{
    "Models": [
        {
            "ModelName": "cli-clm-2",
            "CreateTime": "2020-09-25T17:57:38.504000+00:00",
            "LastModifiedTime": "2020-09-25T17:57:48.585000+00:00",
            "LanguageCode": "language-code",
            "BaseModelName": "WideBand",
            "ModelStatus": "IN_PROGRESS",
            "UpgradeAvailability": false,
            "InputDataConfig": {
                "S3Uri": "s3://amzn-s3-demo-bucket/clm-training-data/",
                "TuningDataS3Uri": "s3://amzn-s3-demo-bucket/clm-tuning-data/",
                "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-
used-to-create-the-custom-language-model"
            }
        },
        {
            "ModelName": "cli-clm-1",
            "CreateTime": "2020-09-25T17:16:01.835000+00:00",
            "LastModifiedTime": "2020-09-25T17:16:15.555000+00:00",
            "LanguageCode": "language-code",
            "BaseModelName": "WideBand",
            "ModelStatus": "IN_PROGRESS",
```

```
            "UpgradeAvailability": false,
            "InputDataConfig": {
                "S3Uri": "s3://amzn-s3-demo-bucket/clm-training-data/",
                "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-
used-to-create-the-custom-language-model"
            }
        },
        {
            "ModelName": "clm-console-1",
            "CreateTime": "2020-09-24T19:26:28.076000+00:00",
            "LastModifiedTime": "2020-09-25T04:25:22.271000+00:00",
            "LanguageCode": "language-code",
            "BaseModelName": "NarrowBand",
            "ModelStatus": "COMPLETED",
            "UpgradeAvailability": false,
            "InputDataConfig": {
                "S3Uri": "s3://amzn-s3-demo-bucket/clm-training-data/",
                "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-
used-to-create-the-custom-language-model"
            }
        }
    ]
}
```

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

- For API details, see ListLanguageModels in *Amazon CLI Command Reference*.

`list-medical-transcription-jobs`

The following code example shows how to use `list-medical-transcription-jobs`.

Amazon CLI

To list your medical transcription jobs

The following `list-medical-transcription-jobs` example lists the medical transcription jobs associated with your Amazon account and Region. To get more information about a particular transcription job, copy the value of a MedicalTranscriptionJobName parameter in the transcription output, and specify that value for the `MedicalTranscriptionJobName` option of the `get-medical-transcription-job` command. To see more of your transcription jobs,

copy the value of the NextToken parameter, run the `list-medical-transcription-jobs` command again, and specify that value in the `--next-token` option.

```
aws transcribe list-medical-transcription-jobs
```

Output:

```
{
    "NextToken": "3/PblzkiGhzjER3KHuQt2fmbPLF7cDYafjFMEoGn44ON/

- For API details, see ListMedicalTranscriptionJobs in *Amazon CLI Command Reference*.

`list-medical-vocabularies`

The following code example shows how to use `list-medical-vocabularies`.

Amazon CLI

To list your medical custom vocabularies

The following `list-medical-vocabularies` example lists the medical custom vocabularies associated with your Amazon account and Region. To get more information about a particular transcription job, copy the value of a `MedicalTranscriptionJobName` parameter in the transcription output, and specify that value for the `MedicalTranscriptionJobName` option of the `get-medical-transcription-job` command. To see more of your transcription jobs, copy the value of the `NextToken` parameter, run the `list-medical-transcription-jobs` command again, and specify that value in the `--next-token` option.

```
aws transcribe list-medical-vocabularies
```

Output:

```
{
    "Vocabularies": [
        {
            "VocabularyName": "cli-medical-vocab-2",
            "LanguageCode": "en-US",

- For API details, see ListMedicalVocabularies in *Amazon CLI Command Reference*.

`list-transcription-jobs`

The following code example shows how to use `list-transcription-jobs`.

Amazon CLI

To list your transcription jobs

The following `list-transcription-jobs` example lists the transcription jobs associated with your Amazon account and Region.

```
aws transcribe list-transcription-jobs
```

Output:

```
{
    "NextToken": "NextToken",
    "TranscriptionJobSummaries": [
        {
            "TranscriptionJobName": "speak-id-job-1",
            "CreationTime": "2020-08-17T21:06:15.391000+00:00",
            "StartTime": "2020-08-17T21:06:15.416000+00:00",
            "CompletionTime": "2020-08-17T21:07:05.098000+00:00",
            "LanguageCode": "language-code",
            "TranscriptionJobStatus": "COMPLETED",
            "OutputLocationType": "SERVICE_BUCKET"
        },
        {
            "TranscriptionJobName": "job-1",
            "CreationTime": "2020-08-17T20:50:24.207000+00:00",
            "StartTime": "2020-08-17T20:50:24.230000+00:00",
            "CompletionTime": "2020-08-17T20:52:18.737000+00:00",

            "TranscriptionJobStatus": "COMPLETED",
            "OutputLocationType": "SERVICE_BUCKET"
        }
    ]
}
```

For more information, see Getting Started (Amazon Command Line Interface) in the *Amazon Transcribe Developer Guide*.

- For API details, see ListTranscriptionJobs in *Amazon CLI Command Reference*.

`list-vocabularies`

The following code example shows how to use `list-vocabularies`.

Amazon CLI

To list your custom vocabularies

The following `list-vocabularies` example lists the custom vocabularies associated with your Amazon account and Region.

```
aws transcribe list-vocabularies
```

Output:

```
{
    "NextToken": "NextToken",
    "Vocabularies": [
        {
            "VocabularyName": "ards-test-1",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-04-27T22:00:27.330000+00:00",
            "VocabularyState": "READY"
        },
        {
            "VocabularyName": "sample-test",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-04-24T23:04:11.044000+00:00",
            "VocabularyState": "READY"
        },
        {
            "VocabularyName": "CRLF-to-LF-test-3-1",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-04-24T22:12:22.277000+00:00",
            "VocabularyState": "READY"
        },
        {
            "VocabularyName": "CRLF-to-LF-test-2",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-04-24T21:53:50.455000+00:00",
            "VocabularyState": "READY"
        },
        {
            "VocabularyName": "CRLF-to-LF-1-1",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-04-24T21:39:33.356000+00:00",
            "VocabularyState": "READY"
        }
    ]
}
```

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see ListVocabularies in *Amazon CLI Command Reference*.

`list-vocabulary-filters`

The following code example shows how to use `list-vocabulary-filters`.

Amazon CLI

To list your vocabulary filters

The following `list-vocabulary-filters` example lists the vocabulary filters associated with your Amazon account and Region.

```
aws transcribe list-vocabulary-filters
```

Output:

```
{
    "NextToken": "NextToken": [
        {
            "VocabularyFilterName": "testFilter",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-05-07T22:39:32.147000+00:00"
        },
        {
            "VocabularyFilterName": "testFilter2",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-05-21T23:29:35.174000+00:00"
        },
        {
            "VocabularyFilterName": "filter2",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-05-08T20:18:26.426000+00:00"
        },
        {
            "VocabularyFilterName": "filter-review",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-06-03T18:52:30.448000+00:00"
        },
        {
            "VocabularyFilterName": "crlf-filt",
```

```
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-05-22T19:42:42.737000+00:00"
        }
    ]
}
```

For more information, see Filtering Unwanted Words in the *Amazon Transcribe Developer Guide*.

- For API details, see ListVocabularyFilters in *Amazon CLI Command Reference*.

`start-medical-transcription-job`

The following code example shows how to use `start-medical-transcription-job`.

Amazon CLI

Example 1: To transcribe a medical dictation stored as an audio file

The following `start-medical-transcription-job` example transcribes an audio file. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```
{
    "MedicalTranscriptionJobName": "simple-dictation-medical-transcription-job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "DICTATION",
    "OutputBucketName":"amzn-s3-demo-bucket",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "simple-dictation-medical-transcription-job",
```

```
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "StartTime": "2020-09-20T00:35:22.256000+00:00",
        "CreationTime": "2020-09-20T00:35:22.218000+00:00",
        "Specialty": "PRIMARYCARE",
        "Type": "DICTATION"
    }
}
```

For more information, see Batch Transcription Overview in the *Amazon Transcribe Developer Guide*.

Example 2: To transcribe a clinician-patient dialogue stored as an audio file

The following `start-medical-transcription-job` example transcribes an audio file containing a clinician-patient dialogue. You specify the location of the transcription output in the OutputBucketName parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://mysecondfile.json
```

Contents of `mysecondfile.json`:

```
{
    "MedicalTranscriptionJobName": "simple-dictation-medical-transcription-job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION",
    "OutputBucketName":"amzn-s3-demo-bucket",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
```

```
        "MedicalTranscriptionJobName": "simple-conversation-medical-transcription-
job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "StartTime": "2020-09-20T23:19:49.965000+00:00",
        "CreationTime": "2020-09-20T23:19:49.941000+00:00",
        "Specialty": "PRIMARYCARE",
        "Type": "CONVERSATION"
    }
}
```

For more information, see Batch Transcription Overview in the *Amazon Transcribe Developer Guide*.

Example 3: To transcribe a multichannel audio file of a clinician-patient dialogue

The following `start-medical-transcription-job` example transcribes the audio from each channel in the audio file and merges the separate transcriptions from each channel into a single transcription output. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://mythirdfile.json
```

Contents of `mythirdfile.json`:

```
{
    "MedicalTranscriptionJobName": "multichannel-conversation-medical-transcription-
job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION",
    "OutputBucketName":"amzn-s3-demo-bucket",
        "Media": {
          "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "Settings":{
          "ChannelIdentification": true
        }
```

```
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "multichannel-conversation-medical-
transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "StartTime": "2020-09-20T23:46:44.081000+00:00",
        "CreationTime": "2020-09-20T23:46:44.053000+00:00",
        "Settings": {
            "ChannelIdentification": true
        },
        "Specialty": "PRIMARYCARE",
        "Type": "CONVERSATION"
    }
}
```

For more information, see Channel Identification in the *Amazon Transcribe Developer Guide*.

Example 4: To transcribe an audio file of a clinician-patient dialogue and identify the speakers in the transcription output

The following `start-medical-transcription-job` example transcribes an audio file and labels the speech of each speaker in the transcription output. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://myfourthfile.json
```

Contents of `myfourthfile.json`:

```
{
    "MedicalTranscriptionJobName": "speaker-id-conversation-medical-transcription-
job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
```

```
    "Type": "CONVERSATION",
    "OutputBucketName":"amzn-s3-demo-bucket",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
    "Settings":{
        "ShowSpeakerLabels": true,
        "MaxSpeakerLabels": 2
        }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "speaker-id-conversation-medical-
transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "StartTime": "2020-09-21T18:43:37.265000+00:00",
        "CreationTime": "2020-09-21T18:43:37.157000+00:00",
        "Settings": {
            "ShowSpeakerLabels": true,
            "MaxSpeakerLabels": 2
        },
        "Specialty": "PRIMARYCARE",
        "Type": "CONVERSATION"
    }
}
```

For more information, see Identifying Speakers in the *Amazon Transcribe Developer Guide*.

Example 5: To transcribe a medical conversation stored as an audio file with up to two transcription alternatives

The following `start-medical-transcription-job` example creates up to two alternative transcriptions from a single audio file. Every transcriptions has a level of confidence associated with it. By default, Amazon Transcribe returns the transcription with the highest confidence level. You can specify that Amazon Transcribe return additional transcriptions

with lower confidence levels. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://myfifthfile.json
```

Contents of `myfifthfile.json`:

```
{
    "MedicalTranscriptionJobName": "alternatives-conversation-medical-transcription-
job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION",
    "OutputBucketName":"amzn-s3-demo-bucket",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
    },
    "Settings":{
        "ShowAlternatives": true,
        "MaxAlternatives": 2
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "alternatives-conversation-medical-
transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "StartTime": "2020-09-21T19:09:18.199000+00:00",
        "CreationTime": "2020-09-21T19:09:18.171000+00:00",
        "Settings": {
            "ShowAlternatives": true,
            "MaxAlternatives": 2
        },
        "Specialty": "PRIMARYCARE",
```

```
        "Type": "CONVERSATION"
    }
}
```

For more information, see Alternative Transcriptions in the *Amazon Transcribe Developer Guide*.

Example 6: To transcribe an audio file of a medical dictation with up to two alternative transcriptions

The following `start-medical-transcription-job` example transcribes an audio file and uses a vocabulary filter to mask any unwanted words. You specify the location of the transcription output in the OutputBucketName parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://mysixthfile.json
```

Contents of `mysixthfile.json`:

```
{
    "MedicalTranscriptionJobName": "alternatives-conversation-medical-transcription-
job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "DICTATION",
    "OutputBucketName":"amzn-s3-demo-bucket",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
    },
    "Settings":{
          "ShowAlternatives": true,
          "MaxAlternatives": 2
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "alternatives-dictation-medical-
transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
```

```
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "StartTime": "2020-09-21T21:01:14.592000+00:00",
        "CreationTime": "2020-09-21T21:01:14.569000+00:00",
        "Settings": {
            "ShowAlternatives": true,
            "MaxAlternatives": 2
        },
        "Specialty": "PRIMARYCARE",
        "Type": "DICTATION"
    }
}
```

For more information, see Alternative Transcriptions in the *Amazon Transcribe Developer Guide*.

Example 7: To transcribe an audio file of a medical dictation with increased accuracy by using a custom vocabulary

The following `start-medical-transcription-job` example transcribes an audio file and uses a medical custom vocabulary you've previously created to increase the transcription accuracy. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myseventhfile.json
```

Contents of `mysixthfile.json`:

```
{
    "MedicalTranscriptionJobName": "vocabulary-dictation-medical-transcription-job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "DICTATION",
    "OutputBucketName":"amzn-s3-demo-bucket",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
    },
    "Settings":{
        "VocabularyName": "cli-medical-vocab-1"
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "vocabulary-dictation-medical-transcription-
job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.extension"
        },
        "StartTime": "2020-09-21T21:17:27.045000+00:00",
        "CreationTime": "2020-09-21T21:17:27.016000+00:00",
        "Settings": {
            "VocabularyName": "cli-medical-vocab-1"
        },
        "Specialty": "PRIMARYCARE",
        "Type": "DICTATION"
    }
}
```

For more information, see Medical Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see StartMedicalTranscriptionJob in *Amazon CLI Command Reference*.

`start-transcription-job`

The following code example shows how to use `start-transcription-job`.

Amazon CLI

Example 1: To transcribe an audio file

The following `start-transcription-job` example transcribes your audio file.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```
{
    "TranscriptionJobName": "cli-simple-transcription-job",
```

```
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-file-
name.file-extension"
    }
}
```

For more information, see Getting Started (Amazon Command Line Interface) in the *Amazon Transcribe Developer Guide*.

Example 2: To transcribe a multi-channel audio file

The following `start-transcription-job` example transcribes your multi-channel audio file.

```
aws transcribe start-transcription-job \
    --cli-input-json file://mysecondfile.json
```

Contents of `mysecondfile.json`:

```
{
    "TranscriptionJobName": "cli-channelid-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
        "ChannelIdentification":true
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-channelid-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
```

```
        "StartTime": "2020-09-17T16:07:56.817000+00:00",
        "CreationTime": "2020-09-17T16:07:56.784000+00:00",
        "Settings": {
            "ChannelIdentification": true
        }
    }
}
```

For more information, see Transcribing Multi-Channel Audio in the *Amazon Transcribe Developer Guide*.

Example 3: To transcribe an audio file and identify the different speakers

The following `start-transcription-job` example transcribes your audio file and identifies the speakers in the transcription output.

```
aws transcribe start-transcription-job \
    --cli-input-json file://mythirdfile.json
```

Contents of `mythirdfile.json`:

```
{
    "TranscriptionJobName": "cli-speakerid-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
    "ShowSpeakerLabels": true,
    "MaxSpeakerLabels": 2
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-speakerid-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
```

```
            "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-17T16:22:59.696000+00:00",
        "CreationTime": "2020-09-17T16:22:59.676000+00:00",
        "Settings": {
            "ShowSpeakerLabels": true,
            "MaxSpeakerLabels": 2
        }
    }
}
```

For more information, see Identifying Speakers in the *Amazon Transcribe Developer Guide*.

Example 4: To transcribe an audio file and mask any unwanted words in the transcription output

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myfourthfile.json
```

Contents of `myfourthfile.json`:

```
{
    "TranscriptionJobName": "cli-filter-mask-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
          "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-
file-name.file-extension"
    },
    "Settings":{
        "VocabularyFilterName": "your-vocabulary-filter",
        "VocabularyFilterMethod": "mask"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
```

```
        "TranscriptionJobName": "cli-filter-mask-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
        },
        "StartTime": "2020-09-18T16:36:18.568000+00:00",
        "CreationTime": "2020-09-18T16:36:18.547000+00:00",
        "Settings": {
            "VocabularyFilterName": "your-vocabulary-filter",
            "VocabularyFilterMethod": "mask"
        }
    }
}
```

For more information, see Filtering Transcriptions in the *Amazon Transcribe Developer Guide*.

Example 5: To transcribe an audio file and remove any unwanted words in the transcription output

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myfifthfile.json
```

Contents of `myfifthfile.json`:

```
{
    "TranscriptionJobName": "cli-filter-remove-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
        "VocabularyFilterName": "your-vocabulary-filter",
        "VocabularyFilterMethod": "remove"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-filter-remove-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-18T16:36:18.568000+00:00",
        "CreationTime": "2020-09-18T16:36:18.547000+00:00",
        "Settings": {
            "VocabularyFilterName": "your-vocabulary-filter",
            "VocabularyFilterMethod": "remove"
        }
    }
}
```

For more information, see Filtering Transcriptions in the *Amazon Transcribe Developer Guide*.

Example 6: To transcribe an audio file with increased accuracy using a custom vocabulary

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
    --cli-input-json file://mysixthfile.json
```

Contents of `mysixthfile.json`:

```
{
    "TranscriptionJobName": "cli-vocab-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
        "VocabularyName": "your-vocabulary"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-vocab-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-18T16:36:18.568000+00:00",
        "CreationTime": "2020-09-18T16:36:18.547000+00:00",
        "Settings": {
            "VocabularyName": "your-vocabulary"
        }
    }
}
```

For more information, see Filtering Transcriptions in the *Amazon Transcribe Developer Guide*.

Example 7: To identify the language of an audio file and transcribe it

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myseventhfile.json
```

Contents of `myseventhfile.json`:

```
{
    "TranscriptionJobName": "cli-identify-language-transcription-job",
    "IdentifyLanguage": true,
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-file-
name.file-extension"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-identify-language-transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-18T22:27:23.970000+00:00",
        "CreationTime": "2020-09-18T22:27:23.948000+00:00",
        "IdentifyLanguage": true
    }
}
```

For more information, see Identifying the Language in the *Amazon Transcribe Developer Guide*.

Example 8: To transcribe an audio file with personally identifiable information redacted

The following `start-transcription-job` example transcribes your audio file and redacts any personally identifiable information in the transcription output.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myeighthfile.json
```

Contents of `myeigthfile.json`:

```
{
    "TranscriptionJobName": "cli-redaction-job",
    "LanguageCode": "language-code",
    "Media": {
        "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
    },
    "ContentRedaction": {
        "RedactionOutput":"redacted",
        "RedactionType":"PII"
    }
}
```

Output:

```
{
```

```
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-redaction-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
        },
        "StartTime": "2020-09-25T23:49:13.195000+00:00",
        "CreationTime": "2020-09-25T23:49:13.176000+00:00",
        "ContentRedaction": {
            "RedactionType": "PII",
            "RedactionOutput": "redacted"
        }
    }
}
```

For more information, see Automatic Content Redaction in the *Amazon Transcribe Developer Guide*.

Example 9: To generate a transcript with personally identifiable information (PII) redacted and an unredacted transcript

The following `start-transcription-job` example generates two transcrptions of your audio file, one with the personally identifiable information redacted, and the other without any redactions.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myninthfile.json
```

Contents of `myninthfile.json`:

```
{
    "TranscriptionJobName": "cli-redaction-job-with-unredacted-transcript",
    "LanguageCode": "language-code",
    "Media": {
          "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
        },
    "ContentRedaction": {
        "RedactionOutput":"redacted_and_unredacted",
        "RedactionType":"PII"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-redaction-job-with-unredacted-transcript",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
        },
        "StartTime": "2020-09-25T23:59:47.677000+00:00",
        "CreationTime": "2020-09-25T23:59:47.653000+00:00",
        "ContentRedaction": {
            "RedactionType": "PII",
            "RedactionOutput": "redacted_and_unredacted"
        }
    }
}
```

For more information, see Automatic Content Redaction in the *Amazon Transcribe Developer Guide*.

Example 10: To use a custom language model you've previously created to transcribe an audio file.

The following `start-transcription-job` example transcribes your audio file with a custom language model you've previously created.

```
aws transcribe start-transcription-job \
    --cli-input-json file://mytenthfile.json
```

Contents of `mytenthfile.json`:

```
{
    "TranscriptionJobName": "cli-clm-2-job-1",
    "LanguageCode": "language-code",
    "Media": {
        "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.file-extension"
    },
    "ModelSettings": {
        "LanguageModelName":"cli-clm-2"
```

```
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-clm-2-job-1",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://amzn-s3-demo-bucket/your-audio-file.file-
extension"
        },
        "StartTime": "2020-09-28T17:56:01.835000+00:00",
        "CreationTime": "2020-09-28T17:56:01.801000+00:00",
        "ModelSettings": {
            "LanguageModelName": "cli-clm-2"
        }
    }
}
```

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

- For API details, see StartTranscriptionJob in *Amazon CLI Command Reference*.

`update-medical-vocabulary`

The following code example shows how to use `update-medical-vocabulary`.

Amazon CLI

To update a medical custom vocabulary with new terms.

The following `update-medical-vocabulary` example replaces the terms used in a medical custom vocabulary with the new ones. Prerequisite: to replace the terms in a medical custom vocabulary, you need a file with new terms.

```
aws transcribe update-medical-vocabulary \
    --vocabulary-file-uri s3://amzn-s3-demo-bucket/Amazon-S3-Prefix/medical-custom-
vocabulary.txt \
```

```
    --vocabulary-name medical-custom-vocabulary \
    --language-code language
```

Output:

```
{
    "VocabularyName": "medical-custom-vocabulary",
    "LanguageCode": "en-US",
    "VocabularyState": "PENDING"
}
```

For more information, see Medical Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see UpdateMedicalVocabulary in *Amazon CLI Command Reference*.

`update-vocabulary-filter`

The following code example shows how to use `update-vocabulary-filter`.

Amazon CLI

To replace the words in a vocabulary filter

The following `update-vocabulary-filter` example replaces the words in a vocabulary filter with new ones. Prerequisite: To update a vocabulary filter with the new words, you must have those words saved as a text file.

```
aws transcribe update-vocabulary-filter \
    --vocabulary-filter-file-uri s3://amzn-s3-demo-bucket/Amazon-S3-Prefix/your-text-file-to-update-your-vocabulary-filter.txt \
    --vocabulary-filter-name vocabulary-filter-name
```

Output:

```
{
    "VocabularyFilterName": "vocabulary-filter-name",
    "LanguageCode": "language-code",
    "LastModifiedTime": "2020-09-23T18:40:35.139000+00:00"
}
```

For more information, see Filtering Unwanted Words in the *Amazon Transcribe Developer Guide*.

- For API details, see UpdateVocabularyFilter in *Amazon CLI Command Reference*.

`update-vocabulary`

The following code example shows how to use `update-vocabulary`.

Amazon CLI

To update a custom vocabulary with new terms.

The following `update-vocabulary` example overwrites the terms used to create a custom vocabulary with the new ones that you provide. Prerequisite: to replace the terms in a custom vocabulary, you need a file with new terms.

```
aws transcribe update-vocabulary \
    --vocabulary-file-uri s3://amzn-s3-demo-bucket/Amazon-S3-Prefix/custom-vocabulary.txt \
    --vocabulary-name custom-vocabulary \
    --language-code language-code
```

Output:

```
{
    "VocabularyName": "custom-vocabulary",
    "LanguageCode": "language",
    "VocabularyState": "PENDING"
}
```

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see UpdateVocabulary in *Amazon CLI Command Reference*.

Amazon Translate examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Amazon Translate.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`import-terminology`

The following code example shows how to use `import-terminology`.

Amazon CLI

To import a custom terminology from a file

The following `import-terminology` example creates a terminology called `MyTestTerminology` from the `test-terminology.csv` file:

```
aws translate import-terminology \
    --name MyTestTerminology \
    --description "Creating a test terminology in AWS Translate" \
    --merge-strategy OVERWRITE \
    --data-file fileb://test-terminology.csv \
    --terminology-data Format=CSV
```

Contents of `test-terminology.csv`:

en,fr,es,zh Hello world!,Bonjour tout le monde!,Hola Mundo!,????
Amazon,Amazon,Amazon,Amazon

Output:

```
{
    "TerminologyProperties": {
        "SourceLanguageCode": "en",
        "Name": "MyTestTerminology",
        "TargetLanguageCodes": [
            "fr",
            "es",
            "zh"
```

```
        ],
        "SizeBytes": 97,
        "LastUpdatedAt": 1571089500.851,
        "CreatedAt": 1571089500.851,
        "TermCount": 6,
        "Arn": "arn:aws:translate:us-west-2:123456789012:terminology/
MyTestTerminology/LATEST",
        "Description": "Creating a test terminology in AWS Translate"
    }
}
```

- For API details, see ImportTerminology in *Amazon CLI Command Reference*.

Trusted Advisor examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Trusted Advisor.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

`get-organization-recommendation`

The following code example shows how to use `get-organization-recommendation`.

Amazon CLI

To get an organization recommendation

The following `get-organization-recommendation` example gets an organization recommendation by its identifier.

```
aws trustedadvisor get-organization-recommendation \
```

```
    --organization-recommendation-identifier arn:aws:trustedadvisor:::organization-
recommendation/9534ec9b-bf3a-44e8-8213-2ed68b39d9d5
```

Output:

```
{
    "organizationRecommendation": {
        "arn": "arn:aws:trustedadvisor:::organization-recommendation/9534ec9b-
bf3a-44e8-8213-2ed68b39d9d5",
        "name": "Lambda Runtime Deprecation Warning",
        "description": "One or more lambdas are using a deprecated runtime",
        "awsServices": [
            "lambda"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
        "id": "9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
        "lifecycleStage": "resolved",
        "pillars": [
            "security"
        ],
        "resourcesAggregates": {
            "errorCount": 0,
            "okCount": 0,
            "warningCount": 0
        },
        "source": "ta_check",
        "status": "warning",
        "type": "priority"
    }
}
```

For more information, see Get started with the Trusted Advisor API in the *Amazon Trusted Advisor User Guide*.

- For API details, see GetOrganizationRecommendation in *Amazon CLI Command Reference*.

`get-recommendation`

The following code example shows how to use `get-recommendation`.

Amazon CLI

To get a recommendation

The following `get-recommendation` example gets a recommendation by its identifier.

```
aws trustedadvisor get-recommendation \
    --recommendation-
identifier arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-
bbb7-491a-833b-5773e9589578
```

Output:

```
{
    "recommendation": {
        "arn": "arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-
bbb7-491a-833b-5773e9589578",
        "name": "MFA Recommendation",
        "description": "Enable multi-factor authentication",
        "awsServices": [
            "iam"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/7DAFEmoDos",
        "id": "55fa4d2e-bbb7-491a-833b-5773e9589578",
        "lastUpdatedAt": "2023-11-01T15:57:58.673Z",
        "pillarSpecificAggregates": {
            "costOptimizing": {
                "estimatedMonthlySavings": 0.0,
                "estimatedPercentMonthlySavings": 0.0
            }
        },
        "pillars": [
            "security"

`list-checks`

The following code example shows how to use `list-checks`.

Amazon CLI

To list Trusted Advisor checks

The following `list-checks` example lists all Trusted Advisor checks.

```
aws trustedadvisor list-checks
```

Output:

```
{
    "checkSummaries": [
        {
            "arn": "arn:aws:trustedadvisor:::check/1iG5NDGVre",
            "awsServices": [
                "EC2"
            ],
            "description": "Checks security groups for rules that allow unrestricted
 access to a resource. Unrestricted access increases opportunities for malicious
 activity (hacking, denial-of-service attacks, loss of data)",

`list-organization-recommendation-accounts`

The following code example shows how to use `list-organization-recommendation-accounts`.

Amazon CLI

To list organization recommendation accounts

The following `list-organization-recommendation-accounts` example lists all account recommendation summaries for an organization recommendation by its identifier.

```
aws trustedadvisor list-organization-recommendation-accounts \
    --organization-recommendation-identifier arn:aws:trustedadvisor:::organization-recommendation/9534ec9b-bf3a-44e8-8213-2ed68b39d9d5
```

Output:

```
{
    "accountRecommendationLifecycleSummaries": [{
        "accountId": "000000000000",
        "accountRecommendationArn":
 "arn:aws:trustedadvisor::000000000000:recommendation/9534ec9b-
bf3a-44e8-8213-2ed68b39d9d5",
        "lifecycleStage": "resolved",
        "updateReason": "Resolved issue",
        "updateReasonCode": "valid_business_case",
        "lastUpdatedAt": "2023-01-17T18:25:44.552Z"
    }],
    "nextToken": "REDACTED"
}
```

For more information, see Get started with the Trusted Advisor API in the *Amazon Trusted Advisor User Guide*.

- For API details, see ListOrganizationRecommendationAccounts in *Amazon CLI Command Reference*.

`list-organization-recommendation-resources`

The following code example shows how to use `list-organization-recommendation-resources`.

Amazon CLI

To list organization recommendation resources

The following `list-organization-recommendation-resources` example lists all resources for an organization recommendation by its identifier.

```
aws trustedadvisor list-organization-recommendation-resources \
    --organization-recommendation-identifier arn:aws:trustedadvisor:::organization-recommendation/5a694939-2e54-45a2-ae72-730598fa89d0
```

Output:

```
{
    "organizationRecommendationResourceSummaries": [
        {
            "arn": "arn:aws:trustedadvisor::000000000000:recommendation-resource/5a694939-2e54-45a2-ae72-730598fa89d0/bb38affc0ce0681d9a6cd13f30238ba03a8f63dfe7a379dc403c619119d86af",

`list-organization-recommendations`

The following code example shows how to use `list-organization-recommendations`.

Amazon CLI

Example 1: To list organization recommendations

The following `list-organization-recommendations` example lists all organization recommendations and does not include a filter.

```
aws trustedadvisor list-organization-recommendations
```

Output:

```
{
    "organizationRecommendationSummaries": [
        {
            "arn": "arn:aws:trustedadvisor:::organization-recommendation/9534ec9b-
bf3a-44e8-8213-2ed68b39d9d5",
            "name": "Lambda Runtime Deprecation Warning",
            "awsServices": [
                "lambda"
            ],
            "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
            "id": "9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
            "lifecycleStage": "resolved",
            "pillars": [
                "security"
            ],
            "resourcesAggregates": {
                "errorCount": 0,
                "okCount": 0,
```

```
                "warningCount": 0
            },
            "source": "ta_check",
            "status": "warning",
            "type": "priority"
        },
        {
            "arn": "arn:aws:trustedadvisor:::organization-
recommendation/4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
            "name": "Lambda Runtime Deprecation Warning",
            "awsServices": [
                "lambda"
            ],
            "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
            "id": "4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
            "lifecycleStage": "resolved",
            "pillars": [
                "security"
            ],
            "resourcesAggregates": {
                "errorCount": 0,
                "okCount": 0,
                "warningCount": 0
            },
            "source": "ta_check",
            "status": "warning",
            "type": "priority"
        },
    ],
    "nextToken": "REDACTED"
}
```

For more information, see Get started with the Trusted Advisor API in the *Amazon Trusted Advisor User Guide*.

Example 2: To list organization recommendations with a filter

The following `list-organization-recommendations` example filters and returns a max of one organization recommendation that is a part of the "security" pillar.

```
aws trustedadvisor list-organization-recommendations \
    --pillar security \
    --max-items 100
```

Output:

```
{
    "organizationRecommendationSummaries": [{
        "arn": "arn:aws:trustedadvisor:::organization-recommendation/9534ec9b-
bf3a-44e8-8213-2ed68b39d9d5",
        "name": "Lambda Runtime Deprecation Warning",
        "awsServices": [
            "lambda"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
        "id": "9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
        "lifecycleStage": "resolved",
        "pillars": [
            "security"
        ],
        "resourcesAggregates": {
            "errorCount": 0,
            "okCount": 0,
            "warningCount": 0
        },
        "source": "ta_check",
        "status": "warning",
        "type": "priority"
    }],
    "nextToken": "REDACTED"
}
```

For more information, see Get started with the Trusted Advisor API in the *Amazon Trusted Advisor User Guide*.

Example 3: To list organization recommendations with a pagination token

The following `list-organization-recommendations` example uses the "nextToken" returned from a previous request to fetch the next page of organization recommendations.

```
aws trustedadvisor list-organization-recommendations \
    --pillar security \
    --max-items 100 \
    --starting-token <next-token>
```

Output:

```
{
    "organizationRecommendationSummaries": [{
        "arn": "arn:aws:trustedadvisor:::organization-
recommendation/4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
        "name": "Lambda Runtime Deprecation Warning",
        "awsServices": [
            "lambda"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
        "id": "4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
        "lifecycleStage": "resolved",
        "pillars": [
            "security"
        ],
        "resourcesAggregates": {
            "errorCount": 0,
            "okCount": 0,
            "warningCount": 0
        },
        "source": "ta_check",
        "status": "warning",
        "type": "priority"
    }]
}
```

For more information, see Get started with the Trusted Advisor API in the *Amazon Trusted Advisor User Guide*.

- For API details, see ListOrganizationRecommendations in *Amazon CLI Command Reference*.

`list-recommendation-resources`

The following code example shows how to use `list-recommendation-resources`.

Amazon CLI

To list recommendation resources

The following `list-recommendation-resources` example lists all resources for a recommendation by its identifier.

```
aws trustedadvisor list-recommendation-resources \
```

```
    --recommendation-
identifier arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-
bbb7-491a-833b-5773e9589578
```

Output:

```
{
    "recommendationResourceSummaries": [
        {
            "arn": "arn:aws:trustedadvisor::000000000000:recommendation-

`list-recommendations`

The following code example shows how to use `list-recommendations`.

Amazon CLI

Example 1: To list recommendations

The following `list-recommendations` example lists all recommendations and does not include a filter.

```
aws trustedadvisor list-recommendations
```

Output:

```
{
    "recommendationSummaries": [
        {
            "arn": "arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-

        }
    ],
    "nextToken": "REDACTED"
}
```

For more information, see Get started with the Trusted Advisor API in the *Amazon Trusted Advisor User Guide*.

Example 2: To list recommendations with a filter

The following `list-recommendations` example lists recommendations and includes a filter.

```
aws trustedadvisor list-recommendations \
    --aws-service iam \
    --max-items 100
```

Output:

```
{
    "recommendationSummaries": [{
        "arn": "arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-
bbb7-491a-833b-5773e9589578",
        "name": "MFA Recommendation",
        "awsServices": [
            "iam"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/7DAFEmoDos",
        "id": "55fa4d2e-bbb7-491a-833b-5773e9589578",
        "lastUpdatedAt": "2023-11-01T15:57:58.673Z",
        "pillarSpecificAggregates": {
            "costOptimizing": {
                "estimatedMonthlySavings": 0.0,
                "estimatedPercentMonthlySavings": 0.0
            }
        },
        "pillars": [
            "security"
        ],
        "resourcesAggregates": {
            "errorCount": 1,
            "okCount": 0,
            "warningCount": 0
        },
        "source": "ta_check",
        "status": "error",
        "type": "standard"
    }],
    "nextToken": "REDACTED"
}
```

For more information, see Get started with the Trusted Advisor API in the *Amazon Trusted Advisor User Guide*.

Example 3: To list recommendations with a pagination token

The following `list-recommendations` example uses the "nextToken" returned from a previous request to fetch the next page of filtered Recommendations.

```
aws trustedadvisor list-recommendations \
    --aws-service rds \
    --max-items 100 \
    --starting-token <next-token>
```

Output:

```
{
    "recommendationSummaries": [{
        "arn":
 "arn:aws:trustedadvisor::000000000000:recommendation/8b602b6f-452d-4cb2-8a9e-
c7650955d9cd",
        "name": "RDS clusters quota warning",
        "awsServices": [
            "rds"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/gjqMBn6pjz",
        "id": "8b602b6f-452d-4cb2-8a9e-c7650955d9cd",

        "pillarSpecificAggregates": {
            "costOptimizing": {
                "estimatedMonthlySavings": 0.0,
                "estimatedPercentMonthlySavings": 0.0
            }
        },
        "pillars": [
            "service_limits"
        ],
        "resourcesAggregates": {
            "errorCount": 0,
            "okCount": 3,
            "warningCount": 6
        },
        "source": "ta_check",
        "status": "warning",
```

```
        "type": "standard"
    }]
}
```

For more information, see Get started with the Trusted Advisor API in the *Amazon Trusted Advisor User Guide*.

- For API details, see ListRecommendations in *Amazon CLI Command Reference*.

`update-organization-recommendation-lifecycle`

The following code example shows how to use `update-organization-recommendation-lifecycle`.

Amazon CLI

To update an organization recommendation lifecycle

The following `update-organization-recommendation-lifecycle` example updates the lifecycle of an organization recommendation by its identifier.

```
aws trustedadvisor update-organization-recommendation-lifecycle \
    --organization-recommendation-identifier arn:aws:trustedadvisor:::organization-recommendation/96b5e5ca-7930-444c-90c6-06d386128100 \
    --lifecycle-stage dismissed \
    --update-reason-code not_applicable
```

This command produces no output.

For more information, see Get started with the Trusted Advisor API in the *Amazon Trusted Advisor User Guide*.

- For API details, see UpdateOrganizationRecommendationLifecycle in *Amazon CLI Command Reference*.

`update-recommendation-lifecycle`

The following code example shows how to use `update-recommendation-lifecycle`.

Amazon CLI

To update a recommendation lifecycle

The following `update-recommendation-lifecycle` example updates the lifecycle of a recommendation by its identifier.

```
aws trustedadvisor update-recommendation-lifecycle \
    --recommendation-
identifier arn:aws:trustedadvisor::000000000000:recommendation/861c9c6e-
f169-405a-8b59-537a8caccd7a \
    --lifecycle-stage resolved \
    --update-reason-code valid_business_case
```

This command produces no output.

For more information, see Get started with the Trusted Advisor API in the *Amazon Trusted Advisor User Guide*.

- For API details, see UpdateRecommendationLifecycle in *Amazon CLI Command Reference*.

Verified Permissions examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Verified Permissions.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-identity-source`

The following code example shows how to use `create-identity-source`.

Amazon CLI

To create an identity source

The following `create-identity-source` example creates an identity source that lets you reference identities stored in the specified Amazon Cognito user pool. Those identities are available in Verified Permissions as entities of type `User`.

```
aws verifiedpermissions create-identity-source \
    --configuration file://config.txt \
    --principal-entity-type "User" \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `config.txt`:

```
{
    "cognitoUserPoolConfiguration": {
        "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-
west-2_1a2b3c4d5",
        "clientIds":["a1b2c3d4e5f6g7h8i9j0kalbmc"]
    }
}
```

Output:

```
{
    "createdDate": "2023-05-19T20:30:28.214829+00:00",
    "identitySourceId": "ISEXAMPLEabcdefg111111",
    "lastUpdatedDate": "2023-05-19T20:30:28.214829+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111"
}
```

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see CreateIdentitySource in *Amazon CLI Command Reference*.

`create-policy-store`

The following code example shows how to use `create-policy-store`.

Amazon CLI

To create a policy store

The following `create-policy-store` example creates a policy store in the current Amazon Region.

```
aws verifiedpermissions create-policy-store \
    --validation-settings "mode=STRICT"
```

Output:

```
{
    "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg111111",
    "createdDate": "2023-05-16T17:41:29.103459+00:00",
    "lastUpdatedDate": "2023-05-16T17:41:29.103459+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111"
}
```

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see CreatePolicyStore in *Amazon CLI Command Reference*.

`create-policy-template`

The following code example shows how to use `create-policy-template`.

Amazon CLI

To create a policy template

The following `create-policy-template` example creates a policy template with a statement that contains a placeholder for the principal.

```
aws verifiedpermissions create-policy-template \
    --statement file://template1.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `template1.txt`:

```
permit(
    principal in ?principal,
    action == Action::"view",
```

```
    resource == Photo::"VacationPhoto94.jpg"
);
```

Output:

```
{
    "createdDate": "2023-06-12T20:47:42.804511+00:00",
    "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyTemplateId": "PTEXAMPLEabcdefg111111"
}
```

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see CreatePolicyTemplate in *Amazon CLI Command Reference*.

`create-policy`

The following code example shows how to use `create-policy`.

Amazon CLI

Example 1: To create a static policy

The following `create-policy` example creates a static policy with a policy scope that specifies both a principal and a resource.

```
aws verifiedpermissions create-policy \
    --definition file://definition1.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of file `definition1.txt`:

```
{
    "static": {
        "description":  "Grant everyone of janeFriends UserGroup access to the
 vacationFolder Album",
        "statement": "permit(principal in UserGroup::\"janeFriends\", action,
 resource in Album::\"vacationFolder\" );"
    }
```

```
}
```

Output:

```
{
    "createdDate": "2023-06-12T20:33:37.382907+00:00",
    "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
    "policyId": "SPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "STATIC",
    "principal": {
        "entityId": "janeFriends",
        "entityType": "UserGroup"
    },
    "resource": {
        "entityId": "vacationFolder",
        "entityType": "Album"
    }
}
```

Example 2: To create a static policy that grants access to a resource to everyone

The following `create-policy` example creates a static policy with a policy scope that specifies only a resource.

```
aws verifiedpermissions create-policy \
    --definition file://definition2.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of file `definition2.txt`:

```
{
    "static": {
        "description":  "Grant everyone access to the publicFolder Album",
        "statement": "permit(principal, action, resource in Album::\"publicFolder
\");"
    }
}
```

Output:

```
{
```

```
    "createdDate": "2023-06-12T20:39:44.975897+00:00",
    "lastUpdatedDate": "2023-06-12T20:39:44.975897+00:00",
    "policyId": "PbfR73F8oh5MMfr9uRtFDB",
    "policyStoreId": "PSEXAMPLEabcdefg222222",
    "policyType": "STATIC",
    "resource": {
        "entityId": "publicFolder",
        "entityType": "Album"
    }
}
```

Example 3: To create a template-linked policy that is associated with the specified template

The following `create-policy` example creates a template-linked policy using the specified policy template and associates the specified principal to use with the new template-linked policy.

```
aws verifiedpermissions create-policy \
    --definition file://definition.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `definition.txt`:

```
{
    "templateLinked": {
        "policyTemplateId": "PTEXAMPLEabcdefg111111",
        "principal": {
            "entityType": "User",
            "entityId": "alice"
        }
    }
}
```

Output:

```
{
    "createdDate": "2023-06-12T20:49:51.490211+00:00",
    "lastUpdatedDate": "2023-06-12T20:49:51.490211+00:00",
    "policyId": "TPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "TEMPLATE_LINKED",
    "principal": {
```

```
        "entityId": "alice",
        "entityType": "User"
    },
    "resource": {
        "entityId": "VacationPhoto94.jpg",
        "entityType": "Photo"
    }
}
```

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see CreatePolicy in *Amazon CLI Command Reference*.

`delete-identity-source`

The following code example shows how to use `delete-identity-source`.

Amazon CLI

To delete an identity source

The following `delete-identity-source` example deletes the identity source that has the specified Id.

```
aws verifiedpermissions delete-identity-source \
    --identity-source-id ISEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see DeleteIdentitySource in *Amazon CLI Command Reference*.

`delete-policy-store`

The following code example shows how to use `delete-policy-store`.

Amazon CLI

To delete a policy store

The following `delete-policy-store` example deletes the policy store that has the specified Id.

```
aws verifiedpermissions delete-policy-store \
    --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see DeletePolicyStore in *Amazon CLI Command Reference*.

`delete-policy-template`

The following code example shows how to use `delete-policy-template`.

Amazon CLI

To delete a policy template

The following `delete-policy-template` example deletes the policy template that has the specified Id.

```
aws verifiedpermissions delete-policy \
    --policy-template-id PTEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see DeletePolicyTemplate in *Amazon CLI Command Reference*.

`delete-policy`

The following code example shows how to use `delete-policy`.

Amazon CLI

To delete a static or template-linked policy

The following `delete-policy` example deletes the policy that has the specified Id.

```
aws verifiedpermissions delete-policy \
    --policy-id SPEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see DeletePolicy in *Amazon CLI Command Reference*.

`get-identity-source`

The following code example shows how to use `get-identity-source`.

Amazon CLI

To retrieve details about an identity source

The following `get-identity-source` example displays the details for the identity source with the specified Id.

```
aws verifiedpermissions get-identity-source \
    --identity-source  ISEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "createdDate": "2023-06-12T22:27:49.150035+00:00",
    "details": {
        "clientIds": [ "a1b2c3d4e5f6g7h8i9j0kalbmc" ],
        "discoveryUrl": "https://cognito-idp.us-west-2.amazonaws.com/us-
west-2_1a2b3c4d5",
        "openIdIssuer": "COGNITO",
        "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-
west-2_1a2b3c4d5"
    },
    "identitySourceId": "ISEXAMPLEabcdefg111111",

```

```
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "principalEntityType": "User"
}
```

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see GetIdentitySource in *Amazon CLI Command Reference*.

`get-policy-store`

The following code example shows how to use `get-policy-store`.

Amazon CLI

To retrieve details about a policy store

The following `get-policy-store` example displays the details for the policy store with the specified Id.

```
aws verifiedpermissions get-policy-store \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg111111",
    "createdDate": "2023-06-05T20:16:46.225598+00:00",
    "lastUpdatedDate": "2023-06-08T20:40:23.173691+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "validationSettings": { "mode": "OFF" }
}
```

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see GetPolicyStore in *Amazon CLI Command Reference*.

`get-policy-template`

The following code example shows how to use `get-policy-template`.

Amazon CLI

To retrieve details about a policy template

The following `get-policy-template` example displays the details for the policy template with the specified ID.

```
aws verifiedpermissions get-policy-template \
    --policy-template-id  PTEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "createdDate": "2023-06-12T20:47:42.804511+00:00",
    "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyTemplateId": "PTEXAMPLEabcdefg111111",
    "statement": "permit(\n    principal in ?principal,\n    action == Action::
\"view\",\n    resource == Photo::\"VacationPhoto94.jpg\"\n);"
}
```

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see GetPolicyTemplate in *Amazon CLI Command Reference*.

`get-policy`

The following code example shows how to use `get-policy`.

Amazon CLI

To retrieve details about a policy

The following `get-policy` example displays the details for the policy with the specified ID.

```
aws verifiedpermissions get-policy \
    --policy-id PSEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "createdDate": "2023-06-12T20:33:37.382907+00:00",
    "definition": {
        "static": {
            "description": "Grant everyone of janeFriends UserGroup access to the
 vacationFolder Album",
            "statement": "permit(principal in UserGroup::\"janeFriends\", action,
 resource in Album::\"vacationFolder\" );"
        }
    },
    "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
    "policyId": "SPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "STATIC",
    "principal": {
        "entityId": "janeFriends",
        "entityType": "UserGroup"
    },
    "resource": {
        "entityId": "vacationFolder",
        "entityType": "Album"
    }
}
```

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see GetPolicy in *Amazon CLI Command Reference*.

`get-schema`

The following code example shows how to use `get-schema`.

Amazon CLI

To retrieve the schema in a policy store

The following `get-schema` example displays the details of the schema in the specified policy store.

```
aws verifiedpermissions get-schema \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "schema": "{\"MySampleNamespace\":{\"entityTypes\":{\"Employee\":{\"shape
\":{\"attributes\":{\"jobLevel\":{\"type\":\"Long\"},\"name\":{\"type\":\"String
\"}},\"type\":\"Record\"}}},\"actions\":{\"remoteAccess\":{\"appliesTo\":
{\"principalTypes\":[\"Employee\"]}}}}",
    "createdDate": "2023-06-14T17:47:13.999885+00:00",
    "lastUpdatedDate": "2023-06-14T17:47:13.999885+00:00"
}
```

For more information about schema, see Policy store schema in the *Amazon Verified Permissions User Guide*.

- For API details, see GetSchema in *Amazon CLI Command Reference*.

`is-authorized-with-token`

The following code example shows how to use `is-authorized-with-token`.

Amazon CLI

Example 1: To request an authorization decision for a user request (allow)

The following `is-authorized-with-token` example requests an authorization decision for a user who was authenticated by Amazon Cognito. The request uses the identity token provided by Cognito rather than the access token. In this example, the specified information store is configured to return principals as entities of type `CognitoUser`.

```
aws verifiedpermissions is-authorized-with-token \
    --action actionId="View",actionType="Action" \
    --resource entityId="vacationPhoto94.jpg",entityType="Photo" \
    --policy-store-id PSEXAMPLEabcdefg111111 \
    --identity-token "AbCdE12345...long.string...54321EdCbA"
```

The policy store contains a policy with the following statement that accepts identities from the specified Cognito user pool and application Id.

```
permit(
    principal == CognitoUser::"us-east-1_1a2b3c4d5|a1b2c3d4e5f6g7h8i9j0kalbmc",
```

```
    action,
    resource == Photo::"VacationPhoto94.jpg"
);
```

Output:

```
{
    "decision":"Allow",
    "determiningPolicies":[
        {
        "determiningPolicyId":"SPEXAMPLEabcdefg111111"
        }
    ],
    "errors":[]
}
```

For more information about using identities from a Cognito user pool, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see IsAuthorizedWithToken in *Amazon CLI Command Reference*.

`is-authorized`

The following code example shows how to use `is-authorized`.

Amazon CLI

Example 1: To request an authorization decision for a user request (allow)

The following `is-authorized` example requests an authorization decision for a principal of type `User` named `Alice`, who wants to perform the `updatePhoto` operation, on a resource of type `Photo` named `VacationPhoto94.jpg`.

The response shows that the request is allowed by one policy.

```
aws verifiedpermissions is-authorized \
    --principal entityType=User,entityId=alice \
    --action actionType=Action,actionId=view \
    --resource entityType=Photo,entityId=VactionPhoto94.jpg \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "decision": "ALLOW",
    "determiningPolicies": [
        {
            "policyId": "SPEXAMPLEabcdefg111111"
        }
    ],
    "errors": []
}
```

Example 2: To request an authorization decision for a user request (deny)

The following example is the same as the previous example, except that the principal is `User::"Bob"`. The policy store doesn't contain any policy that allows that user access to `Album::"alice_folder"`.

The output indicates that the `Deny` was implicit because the list of `DeterminingPolicies` is empty.

```
aws verifiedpermissions create-policy \
    --definition file://definition2.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "decision": "DENY",
    "determiningPolicies": [],
    "errors": []
}
```

For more information, see the Amazon Verified Permissions User Guide.

- For API details, see IsAuthorized in *Amazon CLI Command Reference*.

`list-identity-sources`

The following code example shows how to use `list-identity-sources`.

Amazon CLI

To list the available identity sources

The following `list-identity-sources` example lists all identity sources in the specified policy store.

```
aws verifiedpermissions list-identity-sources \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "identitySources": [
        {
            "createdDate": "2023-06-12T22:27:49.150035+00:00",
            "details": {
                "clientIds": [ "a1b2c3d4e5f6g7h8i9j0kalbmc" ],
                "discoveryUrl": "https://cognito-idp.us-west-2.amazonaws.com/us-
west-2_1a2b3c4d5",
                "openIdIssuer": "COGNITO",
                "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/
us-west-2_1a2b3c4d5"
            },
            "identitySourceId": "ISEXAMPLEabcdefg111111",
            "lastUpdatedDate": "2023-06-12T22:27:49.150035+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "principalEntityType": "User"
        }
    ]
}
```

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see ListIdentitySources in *Amazon CLI Command Reference*.

`list-policies`

The following code example shows how to use `list-policies`.

Amazon CLI

To list the available policies

The following `list-policies` example lists all policies in the specified policy store.

```
aws verifiedpermissions list-policies \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "policies": [
        {
            "createdDate": "2023-06-12T20:33:37.382907+00:00",
            "definition": {
                "static": {
                    "description": "Grant everyone of janeFriends UserGroup access
 to the vacationFolder Album"
                }
            },
            "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
            "policyId": "SPEXAMPLEabcdefg111111",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "policyType": "STATIC",
            "principal": {
                "entityId": "janeFriends",
                "entityType": "UserGroup"
            },
            "resource": {
                "entityId": "vacationFolder",
                "entityType": "Album"
            }
        },
        {
            "createdDate": "2023-06-12T20:39:44.975897+00:00",
            "definition": {
                "static": {
                    "description": "Grant everyone access to the publicFolder Album"
                }
            },
            "lastUpdatedDate": "2023-06-12T20:39:44.975897+00:00",
            "policyId": "SPEXAMPLEabcdefg222222",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "policyType": "STATIC",
            "resource": {
                "entityId": "publicFolder",
                "entityType": "Album"
            }
```

```
        },
        {
            "createdDate": "2023-06-12T20:49:51.490211+00:00",
            "definition": {
                "templateLinked": {
                    "policyTemplateId": "PTEXAMPLEabcdefg111111"
                }
            },
            "lastUpdatedDate": "2023-06-12T20:49:51.490211+00:00",
            "policyId": "SPEXAMPLEabcdefg333333",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "policyType": "TEMPLATE_LINKED",
            "principal": {
                "entityId": "alice",
                "entityType": "User"
            },
            "resource": {
                "entityId": "VacationPhoto94.jpg",
                "entityType": "Photo"
            }
        }
    ]
}
```

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see ListPolicies in *Amazon CLI Command Reference*.

`list-policy-stores`

The following code example shows how to use `list-policy-stores`.

Amazon CLI

To list the available policy stores

The following `list-policy-stores` example lists all policy stores in the Amazon Region. All commands for Verified Permissions except `create-policy-store` and `list-policy-stores` require that you specify the Id of the policy store you want to work with.

```
aws verifiedpermissions list-policy-stores
```

Output:

```
{
    "policyStores": [
        {
            "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg111111",
            "createdDate": "2023-06-05T20:16:46.225598+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg111111"
        },
        {
            "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg222222",
            "createdDate": "2023-06-08T18:09:37.364356+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg222222"
        },
        {
            "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg333333",
            "createdDate": "2023-06-08T18:09:46.920600+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg333333"
        }
    ]
}
```

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see ListPolicyStores in *Amazon CLI Command Reference*.

`list-policy-templates`

The following code example shows how to use `list-policy-templates`.

Amazon CLI

To list the available policy templates

The following `list-policy-templates` example lists all policy templates in the specified policy store.

```
aws verifiedpermissions list-policy-templates \
```

```
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "policyTemplates": [
        {
            "createdDate": "2023-06-12T20:47:42.804511+00:00",
            "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "policyTemplateId": "PTEXAMPLEabcdefg111111"
        }
    ]
}
```

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see ListPolicyTemplates in *Amazon CLI Command Reference*.

`put-schema`

The following code example shows how to use `put-schema`.

Amazon CLI

To save a schema to a policy store

The following `put-schema` example creates or replaces the schema in the specified policy store.

The `cedarJson` parameter in the input file takes a string representation of a JSON object. It contains embedded quotation marks (") within the outermost quotation mark pair. This requires you to convert the JSON to a string by preceding all embedded quotation marks with a backslash character (\") and combining all lines into a single text line with no line breaks.

Example strings can be displayed wrapped across multiple lines here for readability, but the operation requires the parameters be submitted as single line strings.

aws verifiedpermissions put-schema --definition file://schema.txt --policy-store-id PSEXAMPLEabcdefg111111

Contents of `schema.txt`:

```
{
    "cedarJson": "{\"MySampleNamespace\": {\"actions\": {\"remoteAccess\": {
            \"appliesTo\": {\"principalTypes\": [\"Employee\"]}}},\"entityTypes\": {
            \"Employee\": {\"shape\": {\"attributes\": {\"jobLevel\": {\"type\":
            \"Long\"},\"name\": {\"type\": \"String\"}},\"type\": \"Record\"}}}}}"
}
```

Output:

```
{
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "namespaces": [
        "MySampleNamespace"
    ],
    "createdDate": "2023-06-14T17:47:13.999885+00:00",
    "lastUpdatedDate": "2023-06-14T17:47:13.999885+00:00"
}
```

For more information about schema, see Policy store schema in the *Amazon Verified Permissions User Guide*.

- For API details, see PutSchema in *Amazon CLI Command Reference*.

`update-identity-source`

The following code example shows how to use `update-identity-source`.

Amazon CLI

To update an identity source

The following `update-identity-source` example modifies the specified identity source by providing a new Cognito user pool configuration and changing the entity type returned by the identity source.

```
aws verifiedpermissions update-identity-source
    --identity-source-id ISEXAMPLEabcdefg111111 \
    --update-configuration file://config.txt \
    --principal-entity-type "Employee" \
```

```
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `config.txt`:

```
{
        "cognitoUserPoolConfiguration": {
                "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/
us-west-2_1a2b3c4d5",
                "clientIds":["a1b2c3d4e5f6g7h8i9j0kalbmc"]
        }
}
```

Output:

```
{
    "createdDate": "2023-05-19T20:30:28.214829+00:00",
    "identitySourceId": "ISEXAMPLEabcdefg111111",
    "lastUpdatedDate": "2023-05-19T20:30:28.214829+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111"
}
```

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see UpdateIdentitySource in *Amazon CLI Command Reference*.

update-policy-store

The following code example shows how to use `update-policy-store`.

Amazon CLI

To update a policy store

The following `update-policy-store` example modifies a policy store by changing its validation setting.

```
aws verifiedpermissions update-policy-store \
    --validation-settings "mode=STRICT" \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg111111",
    "createdDate": "2023-05-16T17:41:29.103459+00:00",
    "lastUpdatedDate": "2023-05-16T17:41:29.103459+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111"
}
```

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see UpdatePolicyStore in *Amazon CLI Command Reference*.

`update-policy-template`

The following code example shows how to use `update-policy-template`.

Amazon CLI

Example 1: To update a policy template

The following `update-policy-template` example modifies the specified template-linked policy to replace its policy statement.

```
aws verifiedpermissions update-policy-template \
    --policy-template-id PTEXAMPLEabcdefg111111 \
    --statement file://template1.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of file `template1.txt`:

```
permit(
    principal in ?principal,
    action == Action::"view",
    resource == Photo::"VacationPhoto94.jpg"
);
```

Output:

```
{
```

```
    "createdDate": "2023-06-12T20:47:42.804511+00:00",
    "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyTemplateId": "PTEXAMPLEabcdefg111111"
}
```

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see UpdatePolicyTemplate in *Amazon CLI Command Reference*.

`update-policy`

The following code example shows how to use `update-policy`.

Amazon CLI

To update a static policy

The following `update-policy` example modifies an existing static policy by updating its description and statement.

```
aws verifiedpermissions update-policy \
    --policy-id SPEXAMPLEabcdefg111111 \
    --definition file://updated-definition.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

The `statement` parameter takes a string representation of a JSON object. It contains embedded quotation marks (") within the outermost quotation mark pair. This requires you to convert the JSON to a string by preceding all embedded quotation marks with a backslash character (\") and combining all lines into a single text line with no line breaks.

You can display example strings wrapped across multiple lines for readability, but the operation requires the parameters to be submitted as single-line strings.

Contents of file `updated-definition.txt`:

```
{
    "static": {
        "description": "Updated policy to grant janeFriends UserGroup access to the
 vacationFolder Album with view action only",
```

```
        "statement": "permit(principal in UserGroup::\"janeFriends\", action ==
 Action::\"view\", resource in Album::\"vacationFolder\" );"

```

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see UpdatePolicy in *Amazon CLI Command Reference*.

VPC Lattice examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with VPC Lattice.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-listener`

The following code example shows how to use `create-listener`.

Amazon CLI

To create a listener

The following `create-listener` example creates an HTTPS listener with a default rule that forwards traffic to the specified VPC Lattice target group.

```
aws vpc-lattice create-listener \
    --name my-service-listener \
    --protocol HTTPS \
    --port 443 \
    --service-identifier svc-0285b53b2eEXAMPLE \
    --default-action file://listener-config.json
```

Contents of `listener-config.json`:

```
{
    "forward": {
        "targetGroups": [
            {
                "targetGroupIdentifier": "tg-0eaa4b9ab4EXAMPLE"
            }
        ]
    }
}
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE/listener/listener-07cc7fb0abEXAMPLE",
    "defaultAction": {
        "forward": {
            "targetGroups": [
                {
                    "targetGroupIdentifier": "tg-0eaa4b9ab4EXAMPLE",
```

```
                    "weight": 100
                }
            ]
        }
    },
    "id": "listener-07cc7fb0abEXAMPLE",
    "name": "my-service-listener",
    "port": 443,
    "protocol": "HTTPS",
    "serviceArn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "serviceId": "svc-0285b53b2eEXAMPLE"
}
```

For more information, see Listeners in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateListener in *Amazon CLI Command Reference*.

`create-resource-configuration`

The following code example shows how to use `create-resource-configuration`.

Amazon CLI

To create a resource configuration

The following `create-resource-configuration` example creates a resource configuration that specifies a single IPv4 address.

```
aws vpc-lattice create-resource-configuration \
    --name my-resource-config \
    --type SINGLE \
    --resource-gateway-identifier rgw-0bba03f3d56060135 \
    --resource-configuration-definition 'ipResource={ipAddress=10.0.14.85}'
```

Output:

```
{
    "allowAssociationToShareableServiceNetwork": true,
    "arn": "arn:aws:vpc-lattice:us-east-1:123456789012:resourceconfiguration/
rcfg-07129f3acded87625",
    "id": "rcfg-07129f3acded87625",
```

```
    "name": "my-resource-config",
    "portRanges": [
        "1-65535"
    ],
    "protocol": "TCP",
    "resourceConfigurationDefinition": {
        "ipResource": {
            "ipAddress": "10.0.14.85"
        }
    },
    "resourceGatewayId": "rgw-0bba03f3d56060135",
    "status": "ACTIVE",
    "type": "SINGLE"
}
```

For more information, see Resource configurations for VPC resources in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateResourceConfiguration in *Amazon CLI Command Reference*.

`create-resource-gateway`

The following code example shows how to use `create-resource-gateway`.

Amazon CLI

To create a resource gateway

The following `create-resource-gateway` example creates a resource gateway for the specified subnet.

```
aws vpc-lattice create-resource-gateway \
    --name my-resource-gateway \
    --vpc-identifier vpc-0bf4c2739bc05a69 \
    --subnet-ids subnet-08e8943905b63a683
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-1:123456789012:resourcegateway/
rgw-0bba03f3d56060135",
    "id": "rgw-0bba03f3d56060135",
```

```
    "ipAddressType": "IPV4",
    "name": "my-resource-gateway",
    "securityGroupIds": [
        "sg-087ffd596c5fe962c"
    ],
    "status": "ACTIVE",
    "subnetIds": [
        "subnet-08e8943905b63a683"
    ],
    "vpcIdentifier": "vpc-0bf4c2739bc05a694"
}
```

For more information, see Resource gateways in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateResourceGateway in *Amazon CLI Command Reference*.

`create-service-network-service-association`

The following code example shows how to use `create-service-network-service-association`.

Amazon CLI

To create a service association

The following `create-service-network-service-association` example associates the specified service with the specified service network.

```
aws vpc-lattice create-service-network-service-association \
    --service-identifier svc-0285b53b2eEXAMPLE \
    --service-network-identifier sn-080ec7dc93EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-
east-2:123456789012:servicenetworkserviceassociation/snsa-0e16955a8cEXAMPLE",
    "createdBy": "123456789012",
    "dnsEntry": {
        "domainName": "my-lattice-service-0285b53b2eEXAMPLE.7d67968.vpc-lattice-
svcs.us-east-2.on.aws",
```

```
        "hostedZoneId": "Z09127221KTH2CEXAMPLE"
    },
    "id": "snsa-0e16955a8cEXAMPLE",
    "status": "CREATE_IN_PROGRESS"
}
```

For more information, see Manage service associations in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateServiceNetworkServiceAssociation in *Amazon CLI Command Reference*.

`create-service-network-vpc-association`

The following code example shows how to use `create-service-network-vpc-association`.

Amazon CLI

To create a VPC association

The following `create-service-network-vpc-association` example associates the specified vpc with the specified service network. The specified security group controls which resources in the VPC can access the service network and its services.

```
aws vpc-lattice create-service-network-vpc-association \
    --vpc-identifier vpc-0a1b2c3d4eEXAMPLE \
    --service-network-identifier sn-080ec7dc93EXAMPLE \
    --security-group-ids sg-0aee16bc6cEXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetworkvpcassociation/
snva-0821fc8631EXAMPLE",
    "createdBy": "123456789012",
    "id": "snva-0821fc8631EXAMPLE",
    "securityGroupIds": [
        "sg-0aee16bc6cEXAMPLE"
    ],
    "status": "CREATE_IN_PROGRESS"
}
```

For more information, see Manage VPC associations in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateServiceNetworkVpcAssociation in *Amazon CLI Command Reference*.

`create-service-network`

The following code example shows how to use `create-service-network`.

Amazon CLI

To create a service network

The following `create-service-network` example creates a service network with the specified name.

```
aws vpc-lattice create-service-network \
    --name my-service-network
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
    "authType": "NONE",
    "id": "sn-080ec7dc93EXAMPLE",
    "name": "my-service-network"
}
```

For more information, see Service networks in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateServiceNetwork in *Amazon CLI Command Reference*.

`create-service`

The following code example shows how to use `create-service`.

Amazon CLI

To create a service

The following `create-service` example creates a service with the specified name.

```
aws vpc-lattice create-service \
```

```
    --name my-lattice-service
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "authType": "NONE",
    "dnsEntry": {
        "domainName": "my-lattice-service-0285b53b2eEXAMPLE.1a2b3c4.vpc-lattice-
svcs.us-east-2.on.aws",
        "hostedZoneId": "Z09127221KTH2CEXAMPLE"
    },
    "id": "svc-0285b53b2eEXAMPLE",
    "name": "my-lattice-service",
    "status": "CREATE_IN_PROGRESS"
}
```

For more information, see Services in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateService in *Amazon CLI Command Reference*.

`create-target-group`

The following code example shows how to use `create-target-group`.

Amazon CLI

Example 1: To create a target group of type INSTANCE

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```
aws vpc-lattice create-target-group \
    --name my-lattice-target-group-instance \
    --type INSTANCE \
    --config file://tg-config.json
```

Contents of `tg-config.json`:

```
{
    "port": 443,
```

```
    "protocol": "HTTPS",
    "protocolVersion": "HTTP1",
    "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
}
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "config": {
        "healthCheck": {
            "enabled": true,
            "healthCheckIntervalSeconds": 30,
            "healthCheckTimeoutSeconds": 5,
            "healthyThresholdCount": 5,
            "matcher": {
                "httpCode": "200"
            },
            "path": "/",
            "protocol": "HTTPS",
            "protocolVersion": "HTTP1",
            "unhealthyThresholdCount": 2
        },
        "port": 443,
        "protocol": "HTTPS",
        "protocolVersion": "HTTP1",
        "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
    },
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-instance",
    "status": "CREATE_IN_PROGRESS",
    "type": "INSTANCE"
}
```

Example 2: To create a target group of type IP

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```
aws vpc-lattice create-target-group \
    --name my-lattice-target-group-ip \
    --type IP \
```

```
    --config file://tg-config.json
```

Contents of `tg-config.json`:

```
{
    "ipAddressType": "IPV4",
    "port": 443,
    "protocol": "HTTPS",
    "protocolVersion": "HTTP1",
    "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
}
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "config": {
        "healthCheck": {
            "enabled": true,
            "healthCheckIntervalSeconds": 30,
            "healthCheckTimeoutSeconds": 5,
            "healthyThresholdCount": 5,
            "matcher": {
                "httpCode": "200"
            },
            "path": "/",
            "protocol": "HTTPS",
            "protocolVersion": "HTTP1",
            "unhealthyThresholdCount": 2
        },
        "ipAddressType": "IPV4",
        "port": 443,
        "protocol": "HTTPS",
        "protocolVersion": "HTTP1",
        "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
    },
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-ip",
    "status": "CREATE_IN_PROGRESS",
    "type": "IP"
}
```

Example 3: To create a target group of type LAMBDA

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```
aws vpc-lattice create-target-group \
    --name my-lattice-target-group-lambda \
    --type LAMBDA
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-lambda",
    "status": "CREATE_IN_PROGRESS",
    "type": "LAMBDA"
}
```

Example 4: To create a target group of type ALB

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```
aws vpc-lattice create-target-group \
    --name my-lattice-target-group-alb \
    --type ALB \
    --config file://tg-config.json
```

Contents of `tg-config.json`:

```
{
    "port": 443,
    "protocol": "HTTPS",
    "protocolVersion": "HTTP1",
    "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
}
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "config": {
        "port": 443,
        "protocol": "HTTPS",
        "protocolVersion": "HTTP1",
        "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
    },
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-alb",
    "status": "CREATE_IN_PROGRESS",
    "type": "ALB"
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateTargetGroup in *Amazon CLI Command Reference*.

`delete-auth-policy`

The following code example shows how to use `delete-auth-policy`.

Amazon CLI

To delete an auth policy

The following `delete-auth-policy` example deletes the auth policy for the specified service.

```
aws vpc-lattice delete-auth-policy \
    --resource-identifier svc-0285b53b2eEXAMPLE
```

This command produces no output.

For more information, see Auth policies in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteAuthPolicy in *Amazon CLI Command Reference*.

`delete-listener`

The following code example shows how to use `delete-listener`.

Amazon CLI

To delete a listener

The following `delete-listener` example deletes the specified listener.

```
aws vpc-lattice delete-listener \
    --listener-identifier listener-07cc7fb0abEXAMPLE \
    --service-identifier svc-0285b53b2eEXAMPLE
```

This command produces no output.

For more information, see Listeners in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteListener in *Amazon CLI Command Reference*.

`delete-resource-configuration`

The following code example shows how to use `delete-resource-configuration`.

Amazon CLI

To delete a resource configuration

The following `delete-resource-configuration` example deletes the specified resource configuration.

```
aws vpc-lattice delete-resource-configuration \
    --resource-configuration-identifier rcfg-07129f3acded87625
```

This command produces no output.

For more information, see Resource gateways in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteResourceConfiguration in *Amazon CLI Command Reference*.

`delete-resource-gateway`

The following code example shows how to use `delete-resource-gateway`.

Amazon CLI

To delete a resource gateway

The following `delete-resource-gateway` example deletes the specified resource gateway.

```
aws vpc-lattice delete-resource-gateway \
    --resource-gateway-identifier rgw-0bba03f3d56060135
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-1:123456789012:resourcegateway/
rgw-0bba03f3d56060135",
    "id": "rgw-0bba03f3d56060135",
    "name": "my-resource-gateway",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Resource gateways in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteResourceGateway in *Amazon CLI Command Reference*.

`delete-service-network-service-association`

The following code example shows how to use `delete-service-network-service-association`.

Amazon CLI

To delete a service association

The following `delete-service-network-service-association` example disassociates the specified service association.

```
aws vpc-lattice delete-service-network-service-association \
    --service-network-service-association-identifier snsa-031fabb4d8EXAMPLE
```

Output:

```
{
```

```
    "arn": "arn:aws:vpc-lattice:us-
east-2:123456789012:servicenetworkserviceassociation/snsa-031fabb4d8EXAMPLE",
    "id": "snsa-031fabb4d8EXAMPLE",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Manage service associations in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteServiceNetworkServiceAssociation in *Amazon CLI Command Reference*.

`delete-service-network-vpc-association`

The following code example shows how to use `delete-service-network-vpc-association`.

Amazon CLI

To delete a VPC association

The following `delete-service-network-vpc-association` example disassociates the specified VPC association.

```
aws vpc-lattice delete-service-network-vpc-association \
    --service-network-vpc-association-identifier snva-0821fc8631EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetworkvpcassociation/
snva-0821fc8631EXAMPLE",
    "id": "snva-0821fc8631EXAMPLE",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Manage VPC associations in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteServiceNetworkVpcAssociation in *Amazon CLI Command Reference*.

`delete-service-network`

The following code example shows how to use `delete-service-network`.

Amazon CLI

To delete a service network

The following `delete-service-network` example deletes the specified service network.

```
aws vpc-lattice delete-service-network \
    --service-network-identifier sn-080ec7dc93EXAMPLE
```

This command produces no output.

For more information, see Service networks in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteServiceNetwork in *Amazon CLI Command Reference*.

`delete-service`

The following code example shows how to use `delete-service`.

Amazon CLI

To delete a service

The following `delete-service` example deletes the specified service.

```
aws vpc-lattice delete-service \
    --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "id": "svc-0285b53b2eEXAMPLE",
    "name": "my-lattice-service",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Services in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteService in *Amazon CLI Command Reference*.

`delete-target-group`

The following code example shows how to use `delete-target-group`.

Amazon CLI

To delete a target group

The following `delete-target-group` example deletes the specified target group.

```
aws vpc-lattice delete-target-group \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteTargetGroup in *Amazon CLI Command Reference*.

`deregister-targets`

The following code example shows how to use `deregister-targets`.

Amazon CLI

To deregister a target

The following `deregister-targets` example deregisters the specified target from the specified target group.

```
aws vpc-lattice deregister-targets \
    --targets i-07dd579bc5EXAMPLE \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "successful": [
        {
            "id": "i-07dd579bc5EXAMPLE",
            "port": 443
        }
    ],
    "unsuccessful": []
}
```

For more information, see Register targets in the *Amazon VPC Lattice User Guide*.

- For API details, see DeregisterTargets in *Amazon CLI Command Reference*.

`get-auth-policy`

The following code example shows how to use `get-auth-policy`.

Amazon CLI

To get information about an auth policy

The following `get-auth-policy` example gets information about the auth policy for the specified service.

```
aws vpc-lattice get-auth-policy \
    --resource-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "createdAt": "2023-06-07T03:51:20.266Z",
    "lastUpdatedAt": "2023-06-07T04:39:27.082Z",
    "policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow
\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:role/my-clients\"},
\"Action\":\"vpc-lattice-svcs:Invoke\",\"Resource\":\"arn:aws:vpc-lattice:us-
east-2:123456789012:service/svc-0285b53b2eEXAMPLE\"}]}",
    "state": "Active"
}
```

For more information, see Auth policies in the *Amazon VPC Lattice User Guide*.

- For API details, see GetAuthPolicy in *Amazon CLI Command Reference*.

`get-listener`

The following code example shows how to use `get-listener`.

Amazon CLI

To get information about a service listener

The following `get-listener` example gets information about the specified listener for the specified service.

```
aws vpc-lattice get-listener \
    --listener-identifier listener-0ccf55918cEXAMPLE \
    --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE/listener/listener-0ccf55918cEXAMPLE",

For more information, see Define routing in the *Amazon VPC Lattice User Guide*.

- For API details, see GetListener in *Amazon CLI Command Reference*.

`get-resource-configuration`

The following code example shows how to use `get-resource-configuration`.

Amazon CLI

To get information about a resource configuration

The following `get-resource-configuration` example gets information about the specified resource configuration.

```
aws vpc-lattice get-resource-configuration \
    --resource-configuration-identifier rcfg-07129f3acded87625
```

Output:

```
{
    "allowAssociationToShareableServiceNetwork": true,
    "amazonManaged": false,
    "arn": "arn:aws:vpc-lattice:us-east-1:123456789012:resourceconfiguration/
rcfg-07129f3acded87625",
    "createdAt": "2025-02-01T00:57:35.871000+00:00",
    "id": "rcfg-07129f3acded87625",
    "lastUpdatedAt": "2025-02-01T00:57:46.874000+00:00",
    "name": "my-resource-config",
    "portRanges": [
        "1-65535"
    ],
    "protocol": "TCP",
    "resourceConfigurationDefinition": {
        "ipResource": {
            "ipAddress": "10.0.14.85"
        }
    },
    "resourceGatewayId": "rgw-0bba03f3d56060135",
    "status": "ACTIVE",
    "type": "SINGLE"
}
```

For more information, see Resource gateways in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see GetResourceConfiguration in *Amazon CLI Command Reference*.

`get-resource-gateway`

The following code example shows how to use `get-resource-gateway`.

Amazon CLI

To get information about a resource gateway

The following `get-resource-gateway` example gets information about the specified resource gateway.

```
aws vpc-lattice get-resource-gateway \
    --resource-gateway-identifier rgw-0bba03f3d56060135
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-1:123456789012:resourcegateway/
rgw-0bba03f3d56060135",
    "createdAt": "2025-02-01T00:57:33.241000+00:00",
    "id": "rgw-0bba03f3d56060135",
    "ipAddressType": "IPV4",
    "lastUpdatedAt": "2025-02-01T00:57:44.351000+00:00",
    "name": "my-resource-gateway",
    "securityGroupIds": [
        "sg-087ffd596c5fe962c"
    ],
    "status": "ACTIVE",
    "subnetIds": [
        "subnet-08e8943905b63a683"
    ],
    "vpcId": "vpc-0bf4c2739bc05a694"
}
```

For more information, see Resource gateways in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see GetResourceGateway in *Amazon CLI Command Reference*.

`get-service-network-service-association`

The following code example shows how to use `get-service-network-service-association`.

Amazon CLI

To get information about a service association

The following `get-service-network-service-association` example gets information about the specified service association.

```
aws vpc-lattice get-service-network-service-association \
    --service-network-service-association-identifier snsa-031fabb4d8EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-
east-2:123456789012:servicenetworkserviceassociation/snsa-031fabb4d8EXAMPLE",

    "createdBy": "123456789012",
    "dnsEntry": {
        "domainName": "my-lattice-service-0285b53b2eEXAMPLE.7d67968.vpc-lattice-
svcs.us-east-2.on.aws",
        "hostedZoneId": "Z09127221KTH2CEXAMPLE"
    },
    "id": "snsa-031fabb4d8EXAMPLE",
    "serviceArn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "serviceId": "svc-0285b53b2eEXAMPLE",
    "serviceName": "my-lattice-service",
    "serviceNetworkArn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
    "serviceNetworkId": "sn-080ec7dc93EXAMPLE",
    "serviceNetworkName": "my-service-network",
    "status": "ACTIVE"
}
```

For more information, see Manage service associations in the *Amazon VPC Lattice User Guide*.

- For API details, see GetServiceNetworkServiceAssociation in *Amazon CLI Command Reference*.

`get-service-network-vpc-association`

The following code example shows how to use `get-service-network-vpc-association`.

Amazon CLI

To get information about a VPC association

The following `get-service-network-vpc-association` example gets information about the specified VPC association.

```
aws vpc-lattice get-service-network-vpc-association \
    --service-network-vpc-association-identifier snva-0821fc8631EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetworkvpcassociation/
snva-0821fc8631EXAMPLE",
    "createdAt": "2023-06-06T23:41:08.421Z",
    "createdBy": "123456789012",

    "lastUpdatedAt": "2023-06-06T23:41:08.421Z",
    "securityGroupIds": [
        "sg-0aee16bc6cEXAMPLE"
    ],
    "serviceNetworkArn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
    "serviceNetworkId": "sn-080ec7dc93EXAMPLE",
    "serviceNetworkName": "my-service-network",
    "status": "ACTIVE",
    "vpcId": "vpc-0a1b2c3d4eEXAMPLE"
}
```

For more information, see Manage VPC associations in the *Amazon VPC Lattice User Guide*.

- For API details, see GetServiceNetworkVpcAssociation in *Amazon CLI Command Reference*.

`get-service-network`

The following code example shows how to use `get-service-network`.

Amazon CLI

To get information about a service network

The following `get-service-network` example gets information about the specified service network.

```
aws vpc-lattice get-service-network \
    --service-network-identifier sn-080ec7dc93EXAMPLE
```

Output:

```
{
   "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
   "authType": "AWS_IAM",
   "createdAt": "2023-05-05T15:26:08.417Z",

   "name": "my-service-network",
   "numberOfAssociatedServices": 2,
   "numberOfAssociatedVPCs": 3
}
```

For more information, see Service networks in the *Amazon VPC Lattice User Guide*.

- For API details, see GetServiceNetwork in *Amazon CLI Command Reference*.

`get-service`

The following code example shows how to use `get-service`.

Amazon CLI

To get information about a service

The following `get-service` example gets information about the specified service.

```
aws vpc-lattice get-service \
    --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "authType": "AWS_IAM",
    "createdAt": "2023-05-05T21:35:29.339Z",
    "dnsEntry": {
        "domainName": "my-lattice-service-0285b53b2eEXAMPLE.7d67968.vpc-lattice-
svcs.us-east-2.on.aws",
        "hostedZoneId": "Z09127221KTH2CFUOHIZH"
    },
    "id": "svc-0285b53b2eEXAMPLE",
    "lastUpdatedAt": "2023-05-05T21:35:29.339Z",
    "name": "my-lattice-service",
    "status": "ACTIVE"
}
```

For more information, see Services in the *Amazon VPC Lattice User Guide*.

- For API details, see GetService in *Amazon CLI Command Reference*.

`get-target-group`

The following code example shows how to use `get-target-group`.

Amazon CLI

To get information about a target group

The following `get-target-group` example gets information about the specified target group, which has a target type of `INSTANCE`.

```
aws vpc-lattice get-target-group \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "config": {
        "healthCheck": {
            "enabled": true,
```

```
            "healthCheckIntervalSeconds": 30,
            "healthCheckTimeoutSeconds": 5,
            "healthyThresholdCount": 5,
            "matcher": {
                "httpCode": "200"
            },
            "path": "/",
            "protocol": "HTTPS",
            "protocolVersion": "HTTP1",
            "unhealthyThresholdCount": 2
        },
        "port": 443,
        "protocol": "HTTPS",
        "protocolVersion": "HTTP1",
        "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
    },
    "createdAt": "2023-05-06T04:41:04.122Z",
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "lastUpdatedAt": "2023-05-06T04:41:04.122Z",
    "name": "my-target-group",
    "serviceArns": [
        "arn:aws:vpc-lattice:us-east-2:123456789012:service/svc-0285b53b2eEXAMPLE"
    ],
    "status": "ACTIVE",
    "type": "INSTANCE"
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see GetTargetGroup in *Amazon CLI Command Reference*.

`list-listeners`

The following code example shows how to use `list-listeners`.

Amazon CLI

To list service listeners

The following `list-listeners` example lists the listeners for the specified service.

```
aws vpc-lattice list-listeners \
    --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE/listener/listener-0ccf55918cEXAMPLE",
            "createdAt": "2023-05-07T05:08:45.192Z",
            "id": "listener-0ccf55918cEXAMPLE",
            "lastUpdatedAt": "2023-05-07T05:08:45.192Z",
            "name": "http-80",
            "port": 80,
            "protocol": "HTTP"
        }
    ]
}
```

For more information, see Define routing in the *Amazon VPC Lattice User Guide*.

- For API details, see ListListeners in *Amazon CLI Command Reference*.

`list-resource-configurations`

The following code example shows how to use `list-resource-configurations`.

Amazon CLI

To list your resource configurations

The following `list-resource-configurations` example lists your resource configurations.

```
aws vpc-lattice list-resource-configurations
```

Output:

```
{
    "items": [
        {
            "amazonManaged": false,
            "arn": "arn:aws:vpc-lattice:us-
east-1:123456789012:resourceconfiguration/rcfg-07129f3acded87625",
            "createdAt": "2025-02-01T00:57:35.871000+00:00",
            "id": "rcfg-07129f3acded87625",
```

```
            "lastUpdatedAt": "2025-02-01T00:57:46.874000+00:00",
            "name": "my-resource-config",
            "resourceGatewayId": "rgw-0bba03f3d56060135",
            "status": "ACTIVE",
            "type": "SINGLE"
        }
    ]
}
```

For more information, see Resource configurations in the *Amazon VPC Lattice User Guide*.

- For API details, see ListResourceConfigurations in *Amazon CLI Command Reference*.

`list-resource-endpoint-associations`

The following code example shows how to use `list-resource-endpoint-associations`.

Amazon CLI

To list the VPC endpoint associations

The following `list-resource-endpoint-associations` example lists the VPC endpoints associated with the specified resource configuration.

```
aws vpc-lattice list-resource-endpoint-associations \
    --resource-configuration-identifier rcfg-07129f3acded87625
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:vpc-lattice:us-
east-1:123456789012:resourceendpointassociation/rea-0956a7435baf89326",
            "createdAt": "2025-02-01T00:57:38.998000+00:00",
            "id": "rea-0956a7435baf89326",
            "resourceConfigurationArn": "arn:aws:vpc-lattice:us-
east-1:123456789012:resourceconfiguration/rcfg-07129f3acded87625",
            "resourceConfigurationId": "rcfg-07129f3acded87625",
            "vpcEndpointId": "vpce-019b90d6f16d4f958",
            "vpcEndpointOwner": "123456789012"
        }
    ]
```

```
}
```

For more information, see Manage associations for a VPC Lattice resource configuration in the *Amazon VPC Lattice User Guide*.

- For API details, see ListResourceEndpointAssociations in *Amazon CLI Command Reference*.

`list-resource-gateways`

The following code example shows how to use `list-resource-gateways`.

Amazon CLI

To list your resource gateways

The following `list-resource-gateways` example lists your resource gateways.

```
aws vpc-lattice list-resource-gateways
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:vpc-lattice:us-east-1:123456789012:resourcegateway/
rgw-0bba03f3d56060135",
            "createdAt": "2025-02-01T00:57:33.241000+00:00",
            "id": "rgw-0bba03f3d56060135",
            "ipAddressType": "IPV4",
            "lastUpdatedAt": "2025-02-01T00:57:44.351000+00:00",
            "name": "my-resource-gateway",
            "seurityGroupIds": [
                "sg-087ffd596c5fe962c"
            ],
            "status": "ACTIVE",
            "subnetIds": [
                "subnet-08e8943905b63a683"
            ],
            "vpcIdentifier": "vpc-0bf4c2739bc05a694"
        }
    ]
}
```

For more information, see Resource gateways in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see ListResourceGateways in *Amazon CLI Command Reference*.

`list-service-network-service-associations`

The following code example shows how to use `list-service-network-service-associations`.

Amazon CLI

To list service associations

The following `list-service-network-service-associations` example lists the service associations for the specified service network. The `--query` option scopes the output to the IDs of the service associations.

```
aws vpc-lattice list-service-network-service-associations \
    --service-network-identifier sn-080ec7dc93EXAMPLE \
    --query items[*].id
```

Output:

```
[
    "snsa-031fabb4d8EXAMPLE",
    "snsa-0e16955a8cEXAMPLE"
]
```

For more information, see Manage service associations in the *Amazon VPC Lattice User Guide*.

- For API details, see ListServiceNetworkServiceAssociations in *Amazon CLI Command Reference*.

`list-service-network-vpc-associations`

The following code example shows how to use `list-service-network-vpc-associations`.

Amazon CLI

To list VPC associations

The following `list-service-network-vpc-associations` example lists the VPC associations for the specified service network. The `--query` option scopes the output to the IDs of the VPC associations.

```
aws vpc-lattice list-service-network-vpc-associations \
    --service-network-identifier sn-080ec7dc93EXAMPLE \
    --query items[*].id
```

Output:

```
[
    "snva-0821fc8631EXAMPLE",
    "snva-0c5dcb60d6EXAMPLE"
]
```

For more information, see Manage VPC associations in the *Amazon VPC Lattice User Guide*.

- For API details, see ListServiceNetworkVpcAssociations in *Amazon CLI Command Reference*.

`list-service-network-vpc-endpoint-associations`

The following code example shows how to use `list-service-network-vpc-endpoint-associations`.

Amazon CLI

To list the VPC endpoint associations

The following `list-service-network-vpc-endpoint-associations` example lists the VPC endpoints associated with the specific service network.

```
aws vpc-lattice list-service-network-vpc-endpoint-associations \
    --service-network-identifier sn-0808d1748faee0c1e
```

Output:

```
{
    "items": [
        {
            "createdAt": "2025-02-01T01:21:36.667000+00:00",
```

```
            "serviceNetworkArn": "arn:aws:vpc-lattice:us-
east-1:123456789012:servicenetwork/sn-0808d1748faee0c1e",
            "state": "ACTIVE",
            "vpcEndpointId": "vpce-0cc199f605eaeace7",
            "vpcEndpointOwnerId": "123456789012"
        }
    ]
}
```

For more information, see Manage the associations for a VPC Lattice service network in the *Amazon VPC Lattice User Guide*.

- For API details, see ListServiceNetworkVpcEndpointAssociations in *Amazon CLI Command Reference*.

`list-service-networks`

The following code example shows how to use `list-service-networks`.

Amazon CLI

To list your service networks

The following `list-service-networks` example lists the service networks owned or shared with the calling account. The `--query` option scopes the results to the Amazon Resource Names (ARN) of the service networks.

```
aws vpc-lattice list-service-networks \
    --query items[*].arn
```

Output:

```
[
    "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
    "arn:aws:vpc-lattice:us-east-2:111122223333:servicenetwork/sn-0ec4d436cfEXAMPLE"
]
```

For more information, see Service networks in the *Amazon VPC Lattice User Guide*.

- For API details, see ListServiceNetworks in *Amazon CLI Command Reference*.

`list-services`

The following code example shows how to use `list-services`.

Amazon CLI

To list your services

The following `list-services` example lists the servies owned or shared with the calling account. The `--query` option scopes the results to the Amazon Resource Names (ARN) of the services.

```
aws vpc-lattice list-services \
    --query items[*].arn
```

Output:

```
[
    "arn:aws:vpc-lattice:us-east-2:123456789012:service/svc-0285b53b2eEXAMPLE",
    "arn:aws:vpc-lattice:us-east-2:111122223333:service/svc-0b8ac96550EXAMPLE"
]
```

For more information, see Services in the *Amazon VPC Lattice User Guide*.

- For API details, see ListServices in *Amazon CLI Command Reference*.

`list-target-groups`

The following code example shows how to use `list-target-groups`.

Amazon CLI

To list your target groups

The following `list-target-groups` example lists the target groups with a target type of LAMBDA.

```
aws vpc-lattice list-target-groups \
    --target-group-type LAMBDA
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-045c1b7d9dEXAMPLE",
            "createdAt": "2023-05-06T05:22:16.637Z",
            "id": "tg-045c1b7d9dEXAMPLE",
            "lastUpdatedAt": "2023-05-06T05:22:16.637Z",
            "name": "my-target-group-lam",
            "serviceArns": [
                "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE"
            ],
            "status": "ACTIVE",
            "type": "LAMBDA"
        }
    ]
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see ListTargetGroups in *Amazon CLI Command Reference*.

`list-targets`

The following code example shows how to use `list-targets`.

Amazon CLI

To list the targets for a target group

The following `list-targets` example lists the targets for the specified target group.

```
aws vpc-lattice list-targets \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "items": [
        {
            "id": "i-07dd579bc5EXAMPLE",
```

```
            "port": 443,
            "status": "HEALTHY"
        },
        {
            "id": "i-047b3c9078EXAMPLE",
            "port": 443,
            "reasonCode": "HealthCheckFailed",
            "status": "UNHEALTHY"
        }
    ]
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see ListTargets in *Amazon CLI Command Reference*.

`put-auth-policy`

The following code example shows how to use `put-auth-policy`.

Amazon CLI

To create an auth policy for a service

The following `put-auth-policy` example grants access to requests from any authenticated principal that uses the specified IAM role. The resource is the ARN of the service to which the policy is attached.

```
aws vpc-lattice put-auth-policy \
    --resource-identifier svc-0285b53b2eEXAMPLE \
    --policy file://auth-policy.json
```

Contents of `auth-policy.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:role/my-clients"
            },
            "Action": "vpc-lattice-svcs:Invoke",
```

```
            "Resource": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE"
        }
    ]
}
```

Output:

```
{
    "policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow
\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:role/my-clients\"},
\"Action\":\"vpc-lattice-svcs:Invoke\",\"Resource\":\"arn:aws:vpc-lattice:us-
east-2:123456789012:service/svc-0285b53b2eEXAMPLE\"}]}",
    "state": "Active"
}
```

For more information, see Auth policies in the *Amazon VPC Lattice User Guide*.

- For API details, see PutAuthPolicy in *Amazon CLI Command Reference*.

`register-targets`

The following code example shows how to use `register-targets`.

Amazon CLI

To register a target

The following `register-targets` example registers the specified targets with the specified target group.

```
aws vpc-lattice register-targets \
    --targets id=i-047b3c9078EXAMPLE id=i-07dd579bc5EXAMPLE \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "successful": [
        {
            "id": "i-07dd579bc5EXAMPLE",
            "port": 443
```

```
        }
    ],
    "unsuccessful": [
        {
            "failureCode": "UnsupportedTarget",
            "failureMessage": "Instance targets must be in the same VPC as their
 target group",
            "id": "i-047b3c9078EXAMPLE",
            "port": 443
        }
    ]
}
```

For more information, see Register targets in the *Amazon VPC Lattice User Guide*.

- For API details, see RegisterTargets in *Amazon CLI Command Reference*.

Amazon WAF Classic examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Amazon WAF Classic.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`put-logging-configuration`

The following code example shows how to use `put-logging-configuration`.

Amazon CLI

To create a logging configuration for the web ACL ARN with the specified Kinesis Firehose stream ARN

The following `put-logging-configuration` example displays logging configuration for WAF with CloudFront.

```
aws waf put-logging-configuration \
    --logging-configuration ResourceArn=arn:aws:waf::123456789012:webacl/3bffd3ed-fa2e-445e-869f-a6a7cf153fd3,LogDestinationConfigs=arn:aws:firehose:us-east-1:123456789012:deliverystream/aws-waf-logs-firehose-stream,RedactedFields=[]
```

Output:

```
{
    "LoggingConfiguration": {
        "ResourceArn": "arn:aws:waf::123456789012:webacl/3bffd3ed-fa2e-445e-869f-a6a7cf153fd3",
        "LogDestinationConfigs": [
            "arn:aws:firehose:us-east-1:123456789012:deliverystream/aws-waf-logs-firehose-stream"
        ]
    }
}
```

- For API details, see PutLoggingConfiguration in *Amazon CLI Command Reference*.

`update-byte-match-set`

The following code example shows how to use `update-byte-match-set`.

Amazon CLI

To update a byte match set

The following `update-byte-match-set` command deletes a ByteMatchTuple object (filter) in a ByteMatchSet:

```
aws waf update-byte-match-set --byte-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates
 Action="DELETE",ByteMatchTuple={FieldToMatch={Type="HEADER",Data="referer"},TargetString="b
```

For more information, see Working with String Match Conditions in the *Amazon WAF* developer guide.

- For API details, see UpdateByteMatchSet in *Amazon CLI Command Reference*.

`update-ip-set`

The following code example shows how to use `update-ip-set`.

Amazon CLI

To update an IP set

The following `update-ip-set` command updates an IPSet with an IPv4 address and deletes an IPv6 address:

```
aws waf update-ip-set --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90
 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates
 Action="INSERT",IPSetDescriptor={Type="IPV4",Value="12.34.56.78/16"},Action="DELETE",IPSetD
```

Alternatively you can use a JSON file to specify the input. For example:

```
aws waf update-ip-set --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-
token 12cs345-67cd-890b-1cd2-c3a4567d89f1  --updates file://change.json
```

Where content of the JSON file is:

```
[
{
"Action": "INSERT",
"IPSetDescriptor":
{
"Type": "IPV4",
"Value": "12.34.56.78/16"
}
},
{
"Action": "DELETE",
"IPSetDescriptor":
{
"Type": "IPV6",
"Value": "1111:0000:0000:0000:0000:0000:0000:0111/128"
}
}
```

```
]
```

For more information, see Working with IP Match Conditions in the *Amazon WAF* developer guide.

- For API details, see UpdateIpSet in *Amazon CLI Command Reference*.

`update-rule`

The following code example shows how to use `update-rule`.

Amazon CLI

To update a rule

The following `update-rule` command deletes a Predicate object in a rule:

```
aws waf update-rule --rule-id a123fae4-b567-8e90-1234-5ab67ac8ca90
 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates
 Action="DELETE",Predicate={Negated=false,Type="ByteMatch",DataId="MyByteMatchSetID"}
```

For more information, see Working with Rules in the *Amazon WAF* developer guide.

- For API details, see UpdateRule in *Amazon CLI Command Reference*.

`update-size-constraint-set`

The following code example shows how to use `update-size-constraint-set`.

Amazon CLI

To update a size constraint set

The following `update-size-constraint-set` command deletes a SizeConstraint object (filters) in a size constraint set:

```
aws waf update-size-constraint-set --size-constraint-set-id a123fae4-
b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --
updates
 Action="DELETE",SizeConstraint={FieldToMatch={Type="QUERY_STRING"},TextTransformation="NONE
```

For more information, see Working with Size Constraint Conditions in the *Amazon WAF* developer guide.

- For API details, see UpdateSizeConstraintSet in *Amazon CLI Command Reference*.

`update-sql-injection-match-set`

The following code example shows how to use `update-sql-injection-match-set`.

Amazon CLI

To update a SQL Injection Match Set

The following `update-sql-injection-match-set` command deletes a SqlInjectionMatchTuple object (filters) in a SQL injection match set:

```
aws waf update-sql-injection-match-set --sql-injection-
match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --
change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates
 Action="DELETE",SqlInjectionMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformati
```

For more information, see Working with SQL Injection Match Conditions in the *Amazon WAF* developer guide.

- For API details, see UpdateSqlInjectionMatchSet in *Amazon CLI Command Reference*.

`update-web-acl`

The following code example shows how to use `update-web-acl`.

Amazon CLI

To update a web ACL

The following `update-web-acl` command deletes an `ActivatedRule` object in a WebACL.

aws waf update-web-acl --web-acl-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates Action="DELETE",ActivatedRule='{Priority=1,RuleId="WAFRule-1-Example",Action={Type="ALLOW"},Type="REGULAR"}'

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with Web ACLs in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see UpdateWebAcl in *Amazon CLI Command Reference*.

`update-xss-match-set`

The following code example shows how to use `update-xss-match-set`.

Amazon CLI

To update an XSSMatchSet

The following `update-xss-match-set` command deletes an XssMatchTuple object (filters) in an XssMatchSet:

```
aws waf update-xss-match-set --xss-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90
 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates
 Action="DELETE",XssMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformation="URL_D
```

For more information, see Working with Cross-site Scripting Match Conditions in the *Amazon WAF* developer guide.

- For API details, see UpdateXssMatchSet in *Amazon CLI Command Reference*.

Amazon WAF Classic Regional examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Amazon WAF Classic Regional.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-web-acl`

The following code example shows how to use `associate-web-acl`.

Amazon CLI

To associate a web ACL with a resource

The following `associate-web-acl` command associates a web ACL, specified by the web-acl-id, with a resource, specified by the resource-arn. The resource ARN can refer to either a application load balancer or an API Gateway:

```
aws waf-regional associate-web-acl \
    --web-acl-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --resource-arn 12cs345-67cd-890b-1cd2-c3a4567d89f1
```

For more information, see Working with Web ACLs in the *Amazon WAF Developer Guide*.

- For API details, see AssociateWebAcl in *Amazon CLI Command Reference*.

`put-logging-configuration`

The following code example shows how to use `put-logging-configuration`.

Amazon CLI

To create a logging configuration for the web ACL ARN with the specified Kinesis Firehose stream ARN

The following `put-logging-configuration` example displays logging configuration for WAF with ALB/APIGateway in Region `us-east-1`.

```
aws waf-regional put-logging-configuration \
    --logging-configuration ResourceArn=arn:aws:waf-
regional:us-east-1:123456789012:webacl/3bffd3ed-fa2e-445e-869f-
a6a7cf153fd3,LogDestinationConfigs=arn:aws:firehose:us-
east-1:123456789012:deliverystream/aws-waf-logs-firehose-stream,RedactedFields=[] \
    --region us-east-1
```

Output:

```
{
    "LoggingConfiguration": {
        "ResourceArn": "arn:aws:waf-regional:us-east-1:123456789012:webacl/3bffd3ed-
fa2e-445e-869f-a6a7cf153fd3",
        "LogDestinationConfigs": [
            "arn:aws:firehose:us-east-1:123456789012:deliverystream/aws-waf-logs-
firehose-stream"
        ]
    }
}
```

- For API details, see PutLoggingConfiguration in *Amazon CLI Command Reference*.

`update-byte-match-set`

The following code example shows how to use `update-byte-match-set`.

Amazon CLI

To update a byte match set

The following `update-byte-match-set` command deletes a `ByteMatchTuple` object (filter) in a `ByteMatchSet`. Because the `updates` value has embedded double quotes, you must surround the value with single quotes.

```
aws waf-regional update-byte-match-set \
    --byte-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 'Action="DELETE",ByteMatchTuple={FieldToMatch={Type="HEADER",Data="referer"},TargetString="
```

For more information, see Working with String Match Conditions in the *Amazon WAF Developer Guide*.

- For API details, see UpdateByteMatchSet in *Amazon CLI Command Reference*.

`update-ip-set`

The following code example shows how to use `update-ip-set`.

Amazon CLI

To update an IP set

The following `update-ip-set` command updates an IPSet with an IPv4 address and deletes an IPv6 address. Get the value for `change-token` by running the `get-change-token` command. Because the value for updates includes embedded double-quotes, you must surround the value with single quotes.

```
aws waf update-ip-set \
    --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 'Action="INSERT",IPSetDescriptor={Type="IPV4",Value="12.34.56.78/16"},Action="DELETE",IPSet
```

Alternatively you can use a JSON file to specify the input. For example:

```
aws waf-regional update-ip-set \
    --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1  \
    --updates file://change.json
```

Content of the `change.json`

```
[
    {
        "Action": "INSERT",
        "IPSetDescriptor":
        {
            "Type": "IPV4",
            "Value": "12.34.56.78/16"
        }
    },
    {
        "Action": "DELETE",
        "IPSetDescriptor":
        {
            "Type": "IPV6",
            "Value": "1111:0000:0000:0000:0000:0000:0000:0111/128"
        }
    }
]
```

For more information, see Working with IP Match Conditions in the *Amazon WAF Developer Guide*.

- For API details, see UpdateIpSet in *Amazon CLI Command Reference*.

`update-rule`

The following code example shows how to use `update-rule`.

Amazon CLI

To update a rule

The following `update-rule` command deletes a `Predicate` object in a rule. Because the `updates` value has embedded double quotes, you must surround the entire value with single quotes.

```
aws waf-regional update-rule \
    --rule-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 'Action="DELETE",Predicate={Negated=false,Type="ByteMatch",DataId="MyByteMatchSetID"}'
```

For more information, see Working with Rules in the *Amazon WAF Developer Guide* .

- For API details, see UpdateRule in *Amazon CLI Command Reference*.

`update-size-constraint-set`

The following code example shows how to use `update-size-constraint-set`.

Amazon CLI

To update a size constraint set

The following `update-size-constraint-set` command deletes a SizeConstraint` object (filters) in a size constraint set. Because the `updates` value contains embedded double quotes, you must surround the entire value with single quotes.

```
aws waf-regional update-size-constraint-set \
    --size-constraint-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
```

```
    --updates
'Action="DELETE",SizeConstraint={FieldToMatch={Type="QUERY_STRING"},TextTransformation="NON
```

For more information, see Working with Size Constraint Conditions in the *Amazon WAF Developer Guide*.

- For API details, see UpdateSizeConstraintSet in *Amazon CLI Command Reference*.

`update-sql-injection-match-set`

The following code example shows how to use `update-sql-injection-match-set`.

Amazon CLI

To update a SQL Injection Match Set

The following `update-sql-injection-match-set` command deletes a `SqlInjectionMatchTuple` object (filters) in a SQL injection match set. Because the `updates` value contains embedded double quotes, you must surround the entire value in single quotes. :

aws waf-regional update-sql-injection-match-set --sql-injection-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates 'Action="DELETE",SqlInjectionMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformatio

For more information, see Working with SQL Injection Match Conditions in the *Amazon WAF Developer Guide*.

- For API details, see UpdateSqlInjectionMatchSet in *Amazon CLI Command Reference*.

`update-web-acl`

The following code example shows how to use `update-web-acl`.

Amazon CLI

To update a web ACL

The following `update-web-acl` command deletes an `ActivatedRule` object in a WebACL. Because the `updates` value contains embedded double quotes, you must surround the entire value in single quotes.

```
aws waf-regional update-web-acl \
    --web-acl-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates Action="DELETE",ActivatedRule='{Priority=1,RuleId="WAFRule-1-
Example",Action={Type="ALLOW"},Type="ALLOW"}'
```

For more information, see Working with Web ACLs in the *Amazon WAF Developer Guide*.

- For API details, see UpdateWebAcl in *Amazon CLI Command Reference*.

`update-xss-match-set`

The following code example shows how to use `update-xss-match-set`.

Amazon CLI

To update an XSSMatchSet

The following `update-xss-match-set` command deletes an `XssMatchTuple` object (filters) in an `XssMatchSet`. Because the `updates` value contains embedded double quotes, you must surround the entire value with single quotes.

```
aws waf-regional update-xss-match-set \
    --xss-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 'Action="DELETE",XssMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformation="URL_
```

For more information, see Working with Cross-site Scripting Match Conditions in the *Amazon WAF Developer Guide* .

- For API details, see UpdateXssMatchSet in *Amazon CLI Command Reference*.

Amazon WAFV2 examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Amazon WAFV2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-web-acl`

The following code example shows how to use `associate-web-acl`.

Amazon CLI

To associate a web ACL with a regional Amazon resource

The following `associate-web-acl` example associates the specified web ACL with an Application Load Balancer.

```
aws wafv2 associate-web-acl \
    --web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-cli/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/
app/waf-cli-alb/1ea17125f8b25a2a \
    --region us-west-2
```

This command produces no output.

For more information, see Associating or Disassociating a Web ACL with an Amazon Resource in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see AssociateWebAcl in *Amazon CLI Command Reference*.

`check-capacity`

The following code example shows how to use `check-capacity`.

Amazon CLI

To obtain the capacity used by a set of rules

The following `check-capacity` retrieves the capacity requirements for a rule set that contains a rate-based rule statement, and an AND rule statement that contains nested rules.

```
aws wafv2 check-capacity \
    --scope REGIONAL \
    --rules file://waf-rule-list.json \
    --region us-west-2
```

Contents of file://waf-rule-list.json:

```
[
    {
        "Name":"basic-rule",
        "Priority":0,
        "Statement":{
            "AndStatement":{
                "Statements":[
                    {
                        "ByteMatchStatement":{
                            "SearchString":"example.com",
                            "FieldToMatch":{
                                "SingleHeader":{
                                    "Name":"host"
                                }
                            },
                            "TextTransformations":[
                                {
                                    "Priority":0,
                                    "Type":"LOWERCASE"
                                }
                            ],
                            "PositionalConstraint":"EXACTLY"
                        }
                    },
                    {
                        "GeoMatchStatement":{
                            "CountryCodes":[
                                "US",
                                "IN"
                            ]
                        }
                    }
                ]
```

```
            }
        },
        "Action":{
            "Allow":{

            }
        },
        "VisibilityConfig":{
            "SampledRequestsEnabled":true,
            "CloudWatchMetricsEnabled":true,
            "MetricName":"basic-rule"
        }
    },
    {
        "Name":"rate-rule",
        "Priority":1,
        "Statement":{
            "RateBasedStatement":{
                "Limit":1000,
                "AggregateKeyType":"IP"
            }
        },
        "Action":{
            "Block":{

            }
        },
        "VisibilityConfig":{
            "SampledRequestsEnabled":true,
            "CloudWatchMetricsEnabled":true,
            "MetricName":"rate-rule"
        }
    }
]
```

Output:

```
{
    "Capacity":15
}
```

For more information, see Amazon WAF Web ACL Capacity Units (WCU) in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see CheckCapacity in *Amazon CLI Command Reference*.

`create-ip-set`

The following code example shows how to use `create-ip-set`.

Amazon CLI

To create an IP set for use in your web ACLs and rule groups

The following `create-ip-set` command creates an IP set with a single address range specification.

```
aws wafv2 create-ip-set \
    --name testip \
    --scope REGIONAL \
    --ip-address-version IPV4 \
    --addresses 198.51.100.0/16
```

Output:

```
{
    "Summary":{
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Description":"",
        "Name":"testip",
        "LockToken":"447e55ac-0000-0000-0000-86b67c17f8b5",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see IP Sets and Regex Pattern Sets in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see CreateIpSet in *Amazon CLI Command Reference*.

`create-regex-pattern-set`

The following code example shows how to use `create-regex-pattern-set`.

Amazon CLI

To create a regex pattern set for use in your web ACLs and rule groups

The following `create-regex-pattern-set` command creates a regex pattern set with two regex patterns specified.

```
aws wafv2 create-regex-pattern-set \
    --name regexPatterSet01 \
    --scope REGIONAL \
    --description 'Test web-acl' \
    --regular-expression-list '[{"RegexString": "/[0-9]*/"},{"RegexString": "/[a-z]*/"}]'
```

Output:

```
{
    "Summary":{
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/regexpatternset/regexPatterSet01/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Description":"Test web-acl",
        "Name":"regexPatterSet01",
        "LockToken":"0bc01e21-03c9-4b98-9433-6229cbf1ef1c",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see IP Sets and Regex Pattern Sets in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see CreateRegexPatternSet in *Amazon CLI Command Reference*.

`create-rule-group`

The following code example shows how to use `create-rule-group`.

Amazon CLI

To create a custom rule group for use in your web ACLs

The following `create-rule-group` command creates a custom rule group for regional use. The rule statements for the group are provided in a JSON-formatted file.

```
aws wafv2 create-rule-group \
    --name "TestRuleGroup" \
    --scope REGIONAL \
    --capacity 250 \
    --rules file://waf-rule.json \
    --visibility-
config SampledRequestsEnabled=true,CloudWatchMetricsEnabled=true,MetricName=TestRuleGroupMet
 \
    --region us-west-2
```

Contents of file://waf-rule.json:

```
[
    {
        "Name":"basic-rule",
        "Priority":0,
        "Statement":{
            "AndStatement":{
                "Statements":[
                    {
                        "ByteMatchStatement":{
                            "SearchString":"example.com",
                            "FieldToMatch":{
                                "SingleHeader":{
                                    "Name":"host"
                                }
                            },
                            "TextTransformations":[
                                {
                                    "Priority":0,
                                    "Type":"LOWERCASE"
                                }
                            ],
                            "PositionalConstraint":"EXACTLY"
                        }
                    },
                    {
                        "GeoMatchStatement":{
                            "CountryCodes":[
                                "US",
                                "IN"
                            ]
                        }
```

```
                    }
                ]
            }
        },
        "Action":{
            "Allow":{

            }
        },
        "VisibilityConfig":{
            "SampledRequestsEnabled":true,
            "CloudWatchMetricsEnabled":true,
            "MetricName":"basic-rule"
        }
    }
]
```

Output:

```
{
    "Summary":{
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/
TestRuleGroup/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Description":"",
        "Name":"TestRuleGroup",
        "LockToken":"7b3bcec2-374e-4c5a-b2b9-563bf47249f0",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Managing Your Own Rule Groups in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see CreateRuleGroup in *Amazon CLI Command Reference*.

`create-web-acl`

The following code example shows how to use `create-web-acl`.

Amazon CLI

To create a web ACL

The following `create-web-acl` command creates a web ACL for regional use. The rule statements for the web ACL are provided in a JSON-formatted file.

```
aws wafv2 create-web-acl \
    --name TestWebAcl \
    --scope REGIONAL \
    --default-action Allow={} \
    --visibility-
config SampledRequestsEnabled=true,CloudWatchMetricsEnabled=true,MetricName=TestWebAclMetric
 \
    --rules file://waf-rule.json \
    --region us-west-2
```

Contents of file://waf-rule.json:

```
[
    {
        "Name":"basic-rule",
        "Priority":0,
        "Statement":{
            "AndStatement":{
                "Statements":[
                    {
                        "ByteMatchStatement":{
                            "SearchString":"example.com",
                            "FieldToMatch":{
                                "SingleHeader":{
                                    "Name":"host"
                                }
                            },
                            "TextTransformations":[
                                {
                                    "Priority":0,
                                    "Type":"LOWERCASE"
                                }
                            ],
                            "PositionalConstraint":"EXACTLY"
                        }
                    },
                    {
                        "GeoMatchStatement":{
                            "CountryCodes":[
                                "US",
```

```
                                "IN"
                            ]
                        }
                    }
                ]
            }
        },
        "Action":{
            "Allow":{

            }
        },
        "VisibilityConfig":{
            "SampledRequestsEnabled":true,
            "CloudWatchMetricsEnabled":true,
            "MetricName":"basic-rule"
        }
    }
]
```

Output:

```
{
    "Summary":{
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/TestWebAcl/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Description":"",
        "Name":"TestWebAcl",
        "LockToken":"2294b3a1-eb60-4aa0-a86f-a3ae04329de9",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Managing and Using a Web Access Control List (Web ACL) in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see CreateWebAcl in *Amazon CLI Command Reference*.

`delete-ip-set`

The following code example shows how to use `delete-ip-set`.

Amazon CLI

To delete an IP set

The following `delete-ip-set` deletes the specified IP set. This call requires an ID, which you can obtain from the call, `list-ip-sets`, and a lock token, which you can obtain from the calls, `list-ip-sets` and `get-ip-set`.

```
aws wafv2 delete-ip-set \
    --name test1 \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token 46851772-db6f-459d-9385-49428812e357
```

This command produces no output.

For more information, see IP Sets and Regex Pattern Sets in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see DeleteIpSet in *Amazon CLI Command Reference*.

`delete-logging-configuration`

The following code example shows how to use `delete-logging-configuration`.

Amazon CLI

To disable logging for a web ACL

The following `delete-logging-configuration` removes any logging configuration from the specified web ACL.

```
aws wafv2 delete-logging-configuration \
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

This command produces no output.

For more information, see Logging Web ACL Traffic Information in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see DeleteLoggingConfiguration in *Amazon CLI Command Reference*.

delete-regex-pattern-set

The following code example shows how to use `delete-regex-pattern-set`.

Amazon CLI

To delete a regex pattern set

The following `delete-regex-pattern-set` updates the settings for the specified regex pattern set. This call requires an ID, which you can obtain from the call, `list-regex-pattern-sets`, and a lock token, which you can obtain from the call `list-regex-pattern-sets` or the call `get-regex-pattern-set`.

```
aws wafv2 delete-regex-pattern-set \
    --name regexPatterSet01 \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token 0bc01e21-03c9-4b98-9433-6229cbf1ef1c
```

This command produces no output.

For more information, see IP Sets and Regex Pattern Sets in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see DeleteRegexPatternSet in *Amazon CLI Command Reference*.

delete-rule-group

The following code example shows how to use `delete-rule-group`.

Amazon CLI

To delete a custom rule group

The following `delete-rule-group` deletes the specified custom rule group. This call requires an ID, which you can obtain from the call, `list-rule-groups`, and a lock token, which you can obtain from the call `list-rule-groups` or the call `get-rule-group`.

```
aws wafv2 delete-rule-group \
    --name TestRuleGroup \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
```

```
    --lock-token 7b3bcec2-0000-0000-0000-563bf47249f0
```

This command produces no output.

For more information, see Managing Your Own Rule Groups in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see DeleteRuleGroup in *Amazon CLI Command Reference*.

`delete-web-acl`

The following code example shows how to use `delete-web-acl`.

Amazon CLI

To delete a web ACL

The following `delete-web-acl` deletes the specified web ACL from your account. A web ACL can only be deleted when it's not associated with any resources. This call requires an ID, which you can obtain from the call, `list-web-acls`, and a lock token, which you can obtain from the call `list-web-acls` or the call `get-web-acl`.

```
aws wafv2 delete-web-acl \
    --name test \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token ebab4ed2-155e-4c9a-9efb-e4c45665b1f5
```

This command produces no output.

For more information, see Managing and Using a Web Access Control List (Web ACL) in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see DeleteWebAcl in *Amazon CLI Command Reference*.

`describe-managed-rule-group`

The following code example shows how to use `describe-managed-rule-group`.

Amazon CLI

To retrieve the description for a managed rule group

The following `describe-managed-rule-group` retrieves the description for an Amazon managed rule group.

```
aws wafv2 describe-managed-rule-group \
    --vendor-name AWS \
    --name AWSManagedRulesCommonRuleSet \
    --scope REGIONAL
```

Output:

```
{
    "Capacity": 700,
    "Rules": [
        {
            "Name": "NoUserAgent_HEADER",
            "Action": {

                "Block": {}
            }
        },
        {
            "Name": "GenericRFI_URIPATH",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "CrossSiteScripting_COOKIE",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "CrossSiteScripting_QUERYARGUMENTS",
            "Action": {
```

```
                "Block": {}
            }
        },
        {
            "Name": "CrossSiteScripting_BODY",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "CrossSiteScripting_URIPATH",
            "Action": {
                "Block": {}
            }
        }
    ]
}
```

For more information, see Managed Rule Groups in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see DescribeManagedRuleGroup in *Amazon CLI Command Reference*.

`disassociate-web-acl`

The following code example shows how to use `disassociate-web-acl`.

Amazon CLI

To disassociate a web ACL from a regional Amazon resource

The following `disassociate-web-acl` example removes any existing web ACL association from the specified Application Load Balancer.

```
aws wafv2 disassociate-web-acl \
    --resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/waf-cli-alb/1ea17125f8b25a2a \
    --region us-west-2
```

This command produces no output.

For more information, see Associating or Disassociating a Web ACL with an Amazon Resource in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see DisassociateWebAcl in *Amazon CLI Command Reference*.

`get-ip-set`

The following code example shows how to use `get-ip-set`.

Amazon CLI

To retrieve a specific IP set

The following `get-ip-set` retrieves the IP set with the specified name, scope, and ID. You can get the ID for an IP set from the commands `create-ip-set` and `list-ip-sets`.

```
aws wafv2 get-ip-set \
    --name testip \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "IPSet":{
        "Description":"",
        "Name":"testip",
        "IPAddressVersion":"IPV4",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/
a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
        "Addresses":[
            "192.0.2.0/16"
        ]
    },
    "LockToken":"447e55ac-2396-4c6d-b9f9-86b67c17f8b5"
}
```

For more information, see IP Sets and Regex Pattern Sets in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see GetIpSet in *Amazon CLI Command Reference*.

`get-logging-configuration`

The following code example shows how to use `get-logging-configuration`.

Amazon CLI

To retrieve the logging configurations for a web ACL

The following `get-logging-configuration` retrieves the logging configuration for the specified web ACL.

```
aws wafv2 get-logging-configuration \
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --region us-west-2
```

Output:

```
{
    "LoggingConfiguration":{
        "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "RedactedFields":[
            {
                "Method":{

                }
            }
        ],
        "LogDestinationConfigs":[
            "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-logs-
custom-transformation"
        ]
    }
}
```

For more information, see Logging Web ACL Traffic Information in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see GetLoggingConfiguration in *Amazon CLI Command Reference*.

`get-rate-based-statement-managed-keys`

The following code example shows how to use `get-rate-based-statement-managed-keys`.

Amazon CLI

To retrieve a list of IP addresses that are blocked by a rate-based rule

The following `get-rate-based-statement-managed-keys` retrieves the IP addresses currently blocked by a rate-based rule that's being used for a regional application.

```
aws wafv2 get-rate-based-statement-managed-keys \
    --scope REGIONAL \
    --web-acl-name testwebacl2 \
    --web-acl-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --rule-name ratebasedtest
```

Output:

```
{
    "ManagedKeysIPV4":{
        "IPAddressVersion":"IPV4",
        "Addresses":[
            "198.51.100.0/32"
        ]
    },
    "ManagedKeysIPV6":{
        "IPAddressVersion":"IPV6",
        "Addresses":[

        ]
    }
}
```

For more information, see Rate-Based Rule Statement in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see GetRateBasedStatementManagedKeys in *Amazon CLI Command Reference*.

`get-regex-pattern-set`

The following code example shows how to use `get-regex-pattern-set`.

Amazon CLI

To retrieve a specific regex pattern set

The following `get-regex-pattern-set` retrieves the regex pattern set with the specified name, scope, region, and ID. You can get the ID for a regex pattern set from the commands `create-regex-pattern-set` and `list-regex-pattern-sets`.

```
aws wafv2 get-regex-pattern-set \
    --name regexPatterSet01 \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --region us-west-2
```

Output:

```
{
    "RegexPatternSet":{
        "Description":"Test web-acl",
        "RegularExpressionList":[
            {
                "RegexString":"/[0-9]*/"
            },
            {
                "RegexString":"/[a-z]*/"
            }
        ],
        "Name":"regexPatterSet01",
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/regexpatternset/
regexPatterSet01/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    },
    "LockToken":"c8abf33f-b6fc-46ae-846e-42f994d57b29"
}
```

For more information, see IP Sets and Regex Pattern Sets in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see GetRegexPatternSet in *Amazon CLI Command Reference*.

`get-rule-group`

The following code example shows how to use `get-rule-group`.

Amazon CLI

To retrieve a specific custom rule group

The following `get-rule-group` retrieves the custom rule group with the specified name, scope, and ID. You can get the ID for a rule group from the commands `create-rule-group` and `list-rule-groups`.

```
aws wafv2 get-rule-group \
    --name ff \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RuleGroup":{
        "Capacity":1,
        "Description":"",
        "Rules":[
            {
                "Priority":0,
                "Action":{
                    "Block":{

                    }
                },
                "VisibilityConfig":{
                    "SampledRequestsEnabled":true,
                    "CloudWatchMetricsEnabled":true,
                    "MetricName":"jj"
                },
                "Name":"jj",
                "Statement":{
                    "SizeConstraintStatement":{
                        "ComparisonOperator":"LE",
                        "TextTransformations":[
                            {
                                "Priority":0,
```

```
                                "Type":"NONE"
                            }
                        ],
                        "FieldToMatch":{
                            "UriPath":{

                            }
                        },
                        "Size":7
                    }
                }
            }
        ],
        "VisibilityConfig":{
            "SampledRequestsEnabled":true,
            "CloudWatchMetricsEnabled":true,
            "MetricName":"ff"
        },
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/ff/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Name":"ff"
    },
    "LockToken":"485458c9-1830-4234-af31-ec4d52ced1b3"
}
```

For more information, see Managing Your Own Rule Groups in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see GetRuleGroup in *Amazon CLI Command Reference*.

`get-sampled-requests`

The following code example shows how to use `get-sampled-requests`.

Amazon CLI

To retrieve a sample of web requests for a web ACL

The following `get-sampled-requests` retrieves the sampled web requests for the specified web ACL, rule metric, and time frame.

```
aws wafv2 get-sampled-requests \
```

```
    --web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-cli/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --rule-metric-name AWS-AWSManagedRulesSQLiRuleSet \
    --scope=REGIONAL \
    --time-window StartTime=2020-02-12T20:00Z,EndTime=2020-02-12T21:10Z \
    --max-items 100
```

Output:

```
{
    "TimeWindow": {
    "EndTime": 1581541800.0,
    "StartTime": 1581537600.0
    },
    "SampledRequests": [
        {

- For API details, see GetSampledRequests in *Amazon CLI Command Reference*.

`get-web-acl-for-resource`

The following code example shows how to use `get-web-acl-for-resource`.

Amazon CLI

To retrieve the web ACL that's associated with an Amazon resource

The following `get-web-acl-for-resource` retrieves the JSON for the web ACL that's associated with the specified resource.

```
aws wafv2 get-web-acl-for-resource \
    --resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/waf-cli-alb/1ea17125f8b25a2a
```

Output:

```
{
    "WebACL":{
        "Capacity":3,
        "Description":"",
        "Rules":[
            {
                "Priority":1,
                "Action":{
                    "Block":{

                    }
                },
                "VisibilityConfig":{
                    "SampledRequestsEnabled":true,
                    "CloudWatchMetricsEnabled":true,
                    "MetricName":"testrule01"
                },
                "Name":"testrule01",
                "Statement":{
                    "AndStatement":{
                        "Statements":[
                            {
                                "ByteMatchStatement":{

```

For more information, see Associating or Disassociating a Web ACL with an Amazon Resource in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see GetWebAclForResource in *Amazon CLI Command Reference*.

get-web-acl

The following code example shows how to use `get-web-acl`.

Amazon CLI

To retrieve a web ACL

The following `get-web-acl` retrieves the web ACL with the specified name, scope, and ID. You can get the ID for a web ACL from the commands `create-web-acl` and `list-web-acls`.

```
aws wafv2 get-web-acl \
    --name test01 \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "WebACL":{
        "Capacity":3,
        "Description":"",
        "Rules":[
            {
                "Priority":1,
                "Action":{
                    "Block":{

                    }
                },
                "VisibilityConfig":{
                   "SampledRequestsEnabled":true,
                    "CloudWatchMetricsEnabled":true,
                    "MetricName":"testrule01"
                },
                "Name":"testrule01",
                "Statement":{
                    "AndStatement":{
                        "Statements":[
                            {
                                "ByteMatchStatement":{
                                    "PositionalConstraint":"EXACTLY",
                                    "TextTransformations":[
```

```
                                    {
                                        "Priority":0,
                                        "Type":"NONE"
                                    }
                                ],
                                "SearchString":"dGVzdHN0cmluZw==",
                                "FieldToMatch":{
                                    "UriPath":{

                                    }
                                }
                            }
                        },
                        {
                            "SizeConstraintStatement":{
                                "ComparisonOperator":"EQ",

`list-available-managed-rule-groups`

The following code example shows how to use `list-available-managed-rule-groups`.

Amazon CLI

To retrieve the managed rule groups

The following `list-available-managed-rule-groups` returns the list of all managed rule groups that are currently available for use in your web ACLs.

```
aws wafv2 list-available-managed-rule-groups \
    --scope REGIONAL
```

Output:

```
{
   "ManagedRuleGroups": [
       {
           "VendorName": "AWS",
           "Name": "AWSManagedRulesCommonRuleSet",
           "Description": "Contains rules that are generally applicable to web
applications. This provides protection against exploitation of a wide range of
vulnerabilities, including those described in OWASP publications and common Common
Vulnerabilities and Exposures (CVE)."
       },
       {
           "VendorName": "AWS",
           "Name": "AWSManagedRulesAdminProtectionRuleSet",
```

```
            "Description": "Contains rules that allow you to block external access
to exposed admin pages. This may be useful if you are running third-party software
or would like to reduce the risk of a malicious actor gaining administrative access
to your application."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesKnownBadInputsRuleSet",
            "Description": "Contains rules that allow you to block request patterns
that are known to be invalid and are associated with exploitation or discovery of
vulnerabilities. This can help reduce the risk of a malicious actor discovering a
vulnerable application."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesSQLiRuleSet",
            "Description": "Contains rules that allow you to block request patterns
associated with exploitation of SQL databases, like SQL injection attacks. This can
help prevent remote injection of unauthorized queries."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesLinuxRuleSet",
            "Description": "Contains rules that block request patterns associated
with exploitation of vulnerabilities specific to Linux, including LFI attacks. This
can help prevent attacks that expose file contents or execute code for which the
attacker should not have had access."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesUnixRuleSet",
            "Description": "Contains rules that block request patterns associated
with exploiting vulnerabilities specific to POSIX/POSIX-like OS, including LFI
attacks. This can help prevent attacks that expose file contents or execute code
for which access should not been allowed."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesWindowsRuleSet",
            "Description": "Contains rules that block request patterns associated
with exploiting vulnerabilities specific to Windows, (e.g., PowerShell commands).
This can help prevent exploits that allow attacker to run unauthorized commands or
execute malicious code."
        },
```

```
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesPHPRuleSet",
            "Description": "Contains rules that block request patterns associated
 with exploiting vulnerabilities specific to the use of the PHP, including injection
 of unsafe PHP functions. This can help prevent exploits that allow an attacker to
 remotely execute code or commands."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesWordPressRuleSet",
            "Description": "The WordPress Applications group contains rules that
 block request patterns associated with the exploitation of vulnerabilities specific
 to WordPress sites."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesAmazonIpReputationList",
            "Description": "This group contains rules that are based on Amazon
 threat intelligence. This is useful if you would like to block sources associated
 with bots or other threats."
        }
    ]
}
```

For more information, see Managed Rule Groups in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see ListAvailableManagedRuleGroups in *Amazon CLI Command Reference*.

`list-ip-sets`

The following code example shows how to use `list-ip-sets`.

Amazon CLI

To retrieve a list of IP sets

The following `list-ip-sets` retrieves all IP sets for the account that have regional scope.

```
aws wafv2 list-ip-sets \
    --scope REGIONAL
```

Output:

```
{
    "IPSets":[
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Description":"",
            "Name":"testip",
            "LockToken":"0674c84b-0304-47fe-8728-c6bff46af8fc",
            "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111  "
        }
    ],
    "NextMarker":"testip"
}
```

For more information, see IP Sets and Regex Pattern Sets in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see ListIpSets in *Amazon CLI Command Reference*.

`list-logging-configurations`

The following code example shows how to use `list-logging-configurations`.

Amazon CLI

To retrieve a list of all logging configurations for a region

The following `list-logging-configurations` retrieves the all logging configurations for web ACLs that are scoped for regional use in the `us-west-2` region.

```
aws wafv2 list-logging-configurations \
    --scope REGIONAL \
    --region us-west-2
```

Output:

```
{
    "LoggingConfigurations":[
        {
```

```
            "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
test-2/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "RedactedFields":[
                {
                    "QueryString":{

                    }
                }
            ],
            "LogDestinationConfigs":[
                "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-
logs-test"
            ]
        },
        {
            "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
test/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "RedactedFields":[
                {
                    "Method":{

                    }
                }
            ],
            "LogDestinationConfigs":[
                "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-
logs-custom-transformation"
            ]
        }
    ]
}
```

For more information, see Logging Web ACL Traffic Information in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see ListLoggingConfigurations in *Amazon CLI Command Reference*.

`list-regex-pattern-sets`

The following code example shows how to use `list-regex-pattern-sets`.

Amazon CLI

To retrieve a list of regex pattern sets

The following `list-regex-pattern-sets` retrieves all regex pattern sets for the account that are defined in the region `us-west-2`.

```
aws wafv2 list-regex-pattern-sets \
--scope REGIONAL \
--region us-west-2
```

Output:

```
{
    "NextMarker":"regexPatterSet01",
    "RegexPatternSets":[
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/regexpatternset/
regexPatterSet01/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Description":"Test web-acl",
            "Name":"regexPatterSet01",
            "LockToken":"f17743f7-0000-0000-0000-19a8b93bfb01",
            "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

For more information, see IP Sets and Regex Pattern Sets in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see ListRegexPatternSets in *Amazon CLI Command Reference*.

`list-resources-for-web-acl`

The following code example shows how to use `list-resources-for-web-acl`.

Amazon CLI

To retrieve the resources associated with a web ACL

The following `list-resources-for-web-acl` retrieves the API Gateway REST API resources that are currently associated with the specified web ACL in the region `us-west-2`.

```
aws wafv2 list-resources-for-web-acl \
    --web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/TestWebAcl/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --resource-type API_GATEWAY \
    --region us-west-2
```

Output:

```
{
    "ResourceArns": [
        "arn:aws:apigateway:us-west-2::/restapis/EXAMPLE111/stages/testing"
    ]
}
```

For more information, see Associating or Disassociating a Web ACL with an Amazon Resource in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see ListResourcesForWebAcl in *Amazon CLI Command Reference*.

`list-rule-groups`

The following code example shows how to use `list-rule-groups`.

Amazon CLI

To retrieve a list of custom rule groups

The following `list-rule-groups` retrieves all custom rule groups that are defined for the account for the specified scope and region location.

```
aws wafv2 list-rule-groups \
    --scope REGIONAL \
    --region us-west-2
```

Output:

```
{
    "RuleGroups":[
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/
TestRuleGroup/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
            "Description":"",
            "Name":"TestRuleGroup",
            "LockToken":"1eb5ec48-0000-0000-0000-ee9b906c541e",

        }
    ],
    "NextMarker":"test"
}
```

For more information, see Managing Your Own Rule Groups in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see ListRuleGroups in *Amazon CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

Amazon CLI

To retrieve all tags for an Amazon WAF resource

The following `list-tags-for-resource` retrieves the list of all tag key, value pairs for the specified web ACL.

```
aws wafv2 list-tags-for-resource \
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/testwebacl2/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "NextMarker":"",
    "TagInfoForResource":{
```

```
        "ResourceARN":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
testwebacl2/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "TagList":[

        ]
    }
}
```

For more information, see Getting Started with Amazon WAF in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see ListTagsForResource in *Amazon CLI Command Reference*.

`list-web-acls`

The following code example shows how to use `list-web-acls`.

Amazon CLI

To retrieve the web ACLs for a scope

The following `list-web-acls` retrieves all web ACLs that are defined for the account for the specified scope.

```
aws wafv2 list-web-acls \
    --scope REGIONAL
```

Output:

```
{
    "NextMarker":"Testt",
    "WebACLs":[
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/Testt/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Description":"sssss",
            "Name":"Testt",
            "LockToken":"7f36cb30-74ef-4cff-8cd4-a77e1aba1746",
            "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

For more information, see Managing and Using a Web Access Control List (Web ACL) in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see ListWebAcls in *Amazon CLI Command Reference*.

`put-logging-configuration`

The following code example shows how to use `put-logging-configuration`.

Amazon CLI

To add a logging configuration to a web ACL

The following `put-logging-configuration` adds the Amazon Kinesis Data Firehose logging configuration `aws-waf-logs-custom-transformation` to the specified web ACL, with no fields redacted from the logs.

```
aws wafv2 put-logging-configuration \
    --logging-configuration ResourceArn=arn:aws:wafv2:us-
west-2:123456789012:regional/webacl/test-cli/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111,LogDestinationConfigs=arn:aws:firehose:us-
west-2:123456789012:deliverystream/aws-waf-logs-custom-transformation \
            --region us-west-2
```

Output:

```
{
    "LoggingConfiguration":{
        "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-
cli/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "LogDestinationConfigs":[
            "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-logs-
custom-transformation"
        ]
    }
}
```

For more information, see Logging Web ACL Traffic Information in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see PutLoggingConfiguration in *Amazon CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

Amazon CLI

To add tags to an Amazon WAF resource

The following `tag-resource` example adds a tag with a key of `Name` and value set to `AWSWAF` to the specified web ACL.

```
aws wafv2 tag-resource \
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
apiGatewayWebAcl/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tags Key=Name,Value=AWSWAF
```

This command produces no output.

For more information, see Getting Started with Amazon WAF in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see TagResource in *Amazon CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

Amazon CLI

To remove tags from an Amazon WAF resource

The following `untag-resource` example removes the tag with the key `KeyName` from the specified web ACL.

```
aws wafv2 untag-resource \
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
apiGatewayWebAcl/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tag-keys "KeyName"
```

This command produces no output.

For more information, see Getting Started with Amazon WAF in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see UntagResource in *Amazon CLI Command Reference*.

`update-ip-set`

The following code example shows how to use `update-ip-set`.

Amazon CLI

To modify the settings for an existing IP set

The following `update-ip-set` updates the settings for the specified IP set. This call requires an ID, which you can obtain from the call, `list-ip-sets`, and a lock token which you can obtain from the calls, `list-ip-sets` and `get-ip-set`. This call also returns a lock token that you can use for a subsequent update.

```
aws wafv2 update-ip-set \
    --name testip \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --addresses 198.51.100.0/16 \
    --lock-token 447e55ac-2396-4c6d-b9f9-86b67c17f8b5
```

Output:

```
{
    "NextLockToken": "0674c84b-0304-47fe-8728-c6bff46af8fc"
}
```

For more information, see IP Sets and Regex Pattern Sets in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see UpdateIpSet in *Amazon CLI Command Reference*.

`update-regex-pattern-set`

The following code example shows how to use `update-regex-pattern-set`.

Amazon CLI

To modify the settings for an existing regex pattern set

The following `update-regex-pattern-set` updates the settings for the specified regex pattern set. This call requires an ID, which you can obtain from the call, `list-regex-pattern-sets`, and a lock token which you can obtain from the calls, `list-regex-pattern-sets` and `get-regex-pattern-set`. This call also returns a lock token that you can use for a subsequent update.

```
aws wafv2 update-regex-pattern-set \
    --name ExampleRegex \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --regular-expression-list RegexString="^.+$"  \
    --lock-token ed207e9c-82e9-4a77-aadd-81e6173ab7eb
```

Output:

```
{
    "NextLockToken": "12ebc73e-fa68-417d-a9b8-2bdd761a4fa5"
}
```

For more information, see IP Sets and Regex Pattern Sets in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see UpdateRegexPatternSet in *Amazon CLI Command Reference*.

`update-rule-group`

The following code example shows how to use `update-rule-group`.

Amazon CLI

To update a custom rule group

The following `update-rule-group` changes the visibility configuration for an existing custom rule group. This call requires an ID, which you can obtain from the call, `list-rule-groups`, and a lock token which you can obtain from the calls, `list-rule-groups` and `get-rule-group`. This call also returns a lock token that you can use for a subsequent update.

```
aws wafv2 update-rule-group \
    --name TestRuleGroup \
    --scope REGIONAL \
```

```
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token 7b3bcec2-0000-0000-0000-563bf47249f0 \
    --visibility-
config SampledRequestsEnabled=false,CloudWatchMetricsEnabled=false,MetricName=TestMetricsFor
 \
    --region us-west-2
```

Output:

```
{
    "NextLockToken": "1eb5ec48-0000-0000-0000-ee9b906c541e"
}
```

For more information, see Managing Your Own Rule Groups in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see UpdateRuleGroup in *Amazon CLI Command Reference*.

`update-web-acl`

The following code example shows how to use `update-web-acl`.

Amazon CLI

To update a web ACL

The following `update-web-acl` changes settings for an existing web ACL. This call requires an ID, which you can obtain from the call, `list-web-acls`, and a lock token and other settings, which you can obtain from the call `get-web-acl`. This call also returns a lock token that you can use for a subsequent update.

```
aws wafv2 update-web-acl \
    --name TestWebAcl \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token 2294b3a1-0000-0000-0000-a3ae04329de9 \
    --default-action Block={} \
    --visibility-
config SampledRequestsEnabled=false,CloudWatchMetricsEnabled=false,MetricName=NewMetricTestW
 \
    --rules file://waf-rule.json \
```

```
    --region us-west-2
```

Output:

```
{
    "NextLockToken": "714a0cfb-0000-0000-0000-2959c8b9a684"
}
```

For more information, see Managing and Using a Web Access Control List (Web ACL) in the *Amazon WAF, Amazon Firewall Manager, and Amazon Shield Advanced Developer Guide*.

- For API details, see UpdateWebAcl in *Amazon CLI Command Reference*.

WorkDocs examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with WorkDocs.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`abort-document-version-upload`

The following code example shows how to use `abort-document-version-upload`.

Amazon CLI

To stop a document version upload

This example stops a previously initiated document version upload.

Command:

```
aws workdocs abort-document-version-upload --document-
id feaba64d4efdf271c2521b60a2a44a8f057e84beaabbe22f012673132098 35f2 --version-
id 1536773972914-ddb67663e782e7ce8455ebc962217cf9f9e47b5a9a702e5c84dcccd417da9313
```

Output:

```
None
```

- For API details, see AbortDocumentVersionUpload in *Amazon CLI Command Reference*.

`activate-user`

The following code example shows how to use `activate-user`.

Amazon CLI

To activate a user

This example activates an inactive user.

Command:

```
aws workdocs activate-user --user-
id "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

Output:

```
{
  "User": {
      "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
      "Username": "exampleUser",
      "EmailAddress": "exampleUser@site.awsapps.com",
      "GivenName": "Example",
      "Surname": "User",
      "OrganizationId": "d-926726012c",
      "RootFolderId":
 "75f67c183aa1217409ac87576a45c03a5df5e6d8c51c35c01669970538e86cd0",
      "RecycleBinFolderId":
 "642b7dd3e60b14204534f3df7b1959e01b5d170f8c2707f410e40a8149120a57",
      "Status": "ACTIVE",
      "Type": "MINIMALUSER",
```

```
      "CreatedTimestamp": 1521226107.747,
      "ModifiedTimestamp": 1525297406.462,
      "Storage": {
          "StorageUtilizedInBytes": 0,
          "StorageRule": {
              "StorageAllocatedInBytes": 0,
              "StorageType": "QUOTA"
          }
      }
  }
}
```

- For API details, see ActivateUser in *Amazon CLI Command Reference*.

`add-resource-permissions`

The following code example shows how to use `add-resource-permissions`.

Amazon CLI

To add permissions for a resource

This example adds permissions to the resource for the specified principals.

Command:

```
aws workdocs add-resource-permissions --resource-
id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --
principals Id=anonymous,Type=ANONYMOUS,Role=VIEWER
```

Output:

```
{
  "ShareResults": [
      {
          "PrincipalId": "anonymous",
          "Role": "VIEWER",
          "Status": "SUCCESS",
          "ShareId":
 "d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65",
          "StatusMessage": ""
      }
```

```
  ]
}
```

- For API details, see AddResourcePermissions in *Amazon CLI Command Reference*.

`create-comment`

The following code example shows how to use `create-comment`.

Amazon CLI

To add a new comment

This example adds a new comment to the specified document version.

Command:

```
aws workdocs create-comment --document-
id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-
id 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --
text "This is a comment."
```

Output:

```
{
  "Comment": {
      "CommentId": "1534799058197-
c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5",
      "ThreadId": "1534799058197-
c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5",
      "Text": "This is a comment.",
      "Contributor": {
          "Id": "arn:aws:iam::123456789123:user/exampleUser",
          "Username": "exampleUser",
          "GivenName": "Example",
          "Surname": "User",
          "Status": "ACTIVE"
      },
      "CreatedTimestamp": 1534799058.197,
      "Status": "PUBLISHED",
      "Visibility": "PUBLIC"
  }
```

```
}
```

- For API details, see CreateComment in *Amazon CLI Command Reference*.

`create-custom-metadata`

The following code example shows how to use `create-custom-metadata`.

Amazon CLI

To create custom metadata

This example creates custom metadata for the specified document.

Command:

```
aws workdocs create-custom-metadata --resource-
id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --custom-
metadata KeyName1=example,KeyName2=example2
```

Output:

```
None
```

- For API details, see CreateCustomMetadata in *Amazon CLI Command Reference*.

`create-folder`

The following code example shows how to use `create-folder`.

Amazon CLI

To create a folder

This example creates a folder.

Command:

```
aws workdocs create-folder --name documents --parent-folder-
id 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678
```

Output:

```
{
  "Metadata": {
      "Id": "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",
      "Name": "documents",
      "CreatorId": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
      "ParentFolderId":
 "1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678",
      "CreatedTimestamp": 1534450467.622,
      "ModifiedTimestamp": 1534450467.622,
      "ResourceState": "ACTIVE",
      "Signature": "",
      "Size": 0,
      "LatestVersionSize": 0
  }
}
```

- For API details, see CreateFolder in *Amazon CLI Command Reference*.

`create-labels`

The following code example shows how to use `create-labels`.

Amazon CLI

To create labels

This example creates a series of labels for a document.

Command:

```
aws workdocs create-labels --resource-
id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --
labels "documents" "examples" "my_documents"
```

Output:

```
None
```

- For API details, see CreateLabels in *Amazon CLI Command Reference*.

`create-notification-subscription`

The following code example shows how to use `create-notification-subscription`.

Amazon CLI

To create a notification subscription

The following `create-notification-subscription` example configures a notification subscription for the specified Amazon WorkDocs organization.

```
aws workdocs create-notification-subscription \
    --organization-id d-123456789c \
    --protocol HTTPS \
    --subscription-type ALL \
    --notification-endpoint "https://example.com/example"
```

Output:

```
{
    "Subscription": {
        "SubscriptionId": "123ab4c5-678d-901e-f23g-45h6789j0123",
        "EndPoint": "https://example.com/example",
        "Protocol": "HTTPS"
    }
}
```

For more information, see Subscribe to Notifications in the *Amazon WorkDocs Developer Guide*.

- For API details, see CreateNotificationSubscription in *Amazon CLI Command Reference*.

`create-user`

The following code example shows how to use `create-user`.

Amazon CLI

To create a new user

This example creates a new user in a Simple AD or Microsoft AD directory.

Command:

```
aws workdocs create-user --organization-id d-926726012c --username exampleUser2
 --email-address exampleUser2@site.awsapps.com --given-name example2Name --
surname example2Surname --password examplePa$$w0rd
```

Output:

```
{
  "User": {
      "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
      "Username": "exampleUser2",
      "EmailAddress": "exampleUser2@site.awsapps.com",
      "GivenName": "example2Name",
      "Surname": "example2Surname",
      "OrganizationId": "d-926726012c",
      "RootFolderId":
 "35b886cb17198cbd547655e58b025dff0cf34aaed638be52009567e23dc67390",
      "RecycleBinFolderId":
 "9858c3e9ed4c2460dde9aadb4c69fde998070dd46e5e985bd08ec6169ea249ff",
      "Status": "ACTIVE",
      "Type": "MINIMALUSER",
      "CreatedTimestamp": 1535478836.584,
      "ModifiedTimestamp": 1535478836.584,
      "Storage": {
          "StorageUtilizedInBytes": 0,
          "StorageRule": {
              "StorageAllocatedInBytes": 0,
              "StorageType": "QUOTA"
          }
      }
  }
}
```

- For API details, see CreateUser in *Amazon CLI Command Reference*.

`deactivate-user`

The following code example shows how to use `deactivate-user`.

Amazon CLI

To deactivate a user

This example deactivates an active user.

Command:

```
aws workdocs deactivate-user --user-
id "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

Output:

```
None
```

- For API details, see DeactivateUser in *Amazon CLI Command Reference*.

`delete-comment`

The following code example shows how to use `delete-comment`.

Amazon CLI

To delete a specified comment from a document version

This example deletes the specified comment from the specified document version.

Command:

```
aws workdocs delete-comment --document-
id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-
id 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --
comment-id 1534799058197-
c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5
```

Output:

```
None
```

- For API details, see DeleteComment in *Amazon CLI Command Reference*.

`delete-custom-metadata`

The following code example shows how to use `delete-custom-metadata`.

Amazon CLI

To delete custom metadata from a resource

This example deletes all custom metadata from the specified resource.

Command:

```
aws workdocs delete-custom-metadata --resource-
id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --delete-all
```

Output:

```
None
```

- For API details, see DeleteCustomMetadata in *Amazon CLI Command Reference*.

`delete-document`

The following code example shows how to use `delete-document`.

Amazon CLI

To delete a document

This example deletes the specified document.

Command:

```
aws workdocs delete-document --document-
id b83ed5e5b167b65ef69de9d597627ff1a0d4f07a45e67f1fab7d26b54427de0a
```

Output:

```
None
```

- For API details, see DeleteDocument in *Amazon CLI Command Reference*.

`delete-folder-contents`

The following code example shows how to use `delete-folder-contents`.

Amazon CLI

To delete the contents of a folder

This example deletes the contents of the specified folder.

Command:

```
aws workdocs delete-folder-contents --folder-
id 26fa8aa4ba2071447c194f7b150b07149dbdb9e1c8a301872dcd93a4735ce65d
```

Output:

```
None
```

- For API details, see DeleteFolderContents in *Amazon CLI Command Reference*.

`delete-folder`

The following code example shows how to use `delete-folder`.

Amazon CLI

To delete a folder

This example deletes the specified folder.

Command:

```
aws workdocs delete-folder --folder-
id 26fa8aa4ba2071447c194f7b150b07149dbdb9e1c8a301872dcd93a4735ce65d
```

Output:

```
None
```

- For API details, see DeleteFolder in *Amazon CLI Command Reference*.

`delete-labels`

The following code example shows how to use `delete-labels`.

Amazon CLI

To delete labels

This example deletes the specified labels from a document.

Command:

```
aws workdocs delete-labels --resource-
id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --
labels "documents" "examples"
```

Output:

```
None
```

- For API details, see DeleteLabels in *Amazon CLI Command Reference*.

`delete-notification-subscription`

The following code example shows how to use `delete-notification-subscription`.

Amazon CLI

To delete a notification subscription

The following `delete-notification-subscription` example deletes the specified notification subscription.

```
aws workdocs delete-notification-subscription \
    --subscription-id 123ab4c5-678d-901e-f23g-45h6789j0123 \
    --organization-id d-123456789c
```

This command produces no output.

For more information, see Subscribe to Notifications in the *Amazon WorkDocs Developer Guide*.

- For API details, see DeleteNotificationSubscription in *Amazon CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

Amazon CLI

To delete a user

This example deletes a user.

Command:

```
aws workdocs delete-user --user-
id "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

Output:

```
None
```

- For API details, see DeleteUser in *Amazon CLI Command Reference*.

`describe-activities`

The following code example shows how to use `describe-activities`.

Amazon CLI

To get a list of user activities

This example returns a list of the latest user activities for the specified organization, with a limit set for the latest two activities.

Command:

```
aws workdocs describe-activities --organization-id d-926726012c --limit 2
```

Output:

```
{
  "UserActivities": [
      {
          "Type": "DOCUMENT_VERSION_DOWNLOADED",
          "TimeStamp": 1534800122.17,

- For API details, see DescribeActivities in *Amazon CLI Command Reference*.

describe-comments

The following code example shows how to use `describe-comments`.

Amazon CLI

To list all comments for a specified document version

This example lists all the comments for the specified document version.

Command:

```
aws workdocs describe-comments --document-
id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-

          "Status": "PUBLISHED",
          "Visibility": "PUBLIC"
      }
  ]
}
```

- For API details, see DescribeComments in *Amazon CLI Command Reference*.

describe-document-versions

The following code example shows how to use `describe-document-versions`.

Amazon CLI

To retrieve a document's versions

This example retrieves the document versions for the specified document, including initialized versions and a URL for the source document.

Command:

```
aws workdocs describe-document-versions --document-
id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --fields SOURCE
```

Output:

```
{
  "DocumentVersions": [
      {

- For API details, see DescribeDocumentVersions in *Amazon CLI Command Reference*.

`describe-folder-contents`

The following code example shows how to use `describe-folder-contents`.

Amazon CLI

To describe the contents of a folder

This example describes all the active contents of the specified folder, including its documents and subfolders, sorted by date in ascending order.

Command:

```
aws workdocs describe-folder-contents --folder-
id 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678 --sort DATE --
order ASCENDING --type ALL
```

Output:

```
{
  "Folders": [
      {
          "Id": "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",

          },
          "ResourceState": "ACTIVE"
      }
```

```
  ]
}
```

- For API details, see DescribeFolderContents in *Amazon CLI Command Reference*.

`describe-groups`

The following code example shows how to use `describe-groups`.

Amazon CLI

To retrieve a list of groups

The following `describe-groups` example lists the groups associated with the specified Amazon WorkDocs organization.

```
aws workdocs describe-groups \
    --search-query "e" \
    --organization-id d-123456789c
```

Output:

```
{
    "Groups": [
        {
            "Id": "S-1-1-11-1122222222-2222233333-3333334444-4444&d-123456789c",
            "Name": "Example Group 1"
        },
        {
            "Id": "S-1-1-11-1122222222-2222233333-3333334444-5555&d-123456789c",
            "Name": "Example Group 2"
        }
    ]
}
```

For more information, see Getting Started with Amazon WorkDocs in the *Amazon WorkDocs Administration Guide*.

- For API details, see DescribeGroups in *Amazon CLI Command Reference*.

`describe-notification-subscriptions`

The following code example shows how to use `describe-notification-subscriptions`.

Amazon CLI

To retrieve a list of notification subscriptions

The following `describe-notification-subscriptions` example retrieves the notification subscriptions for the specified Amazon WorkDocs organization.

```
aws workdocs describe-notification-subscriptions \
    --organization-id d-123456789c
```

Output:

```
{
    "Subscriptions": [
        {
            "SubscriptionId": "123ab4c5-678d-901e-f23g-45h6789j0123",
            "EndPoint": "https://example.com/example",
            "Protocol": "HTTPS"
        }
    ]
}
```

For more information, see Subscribe to Notifications in the *Amazon WorkDocs Developer Guide*.

- For API details, see DescribeNotificationSubscriptions in *Amazon CLI Command Reference*.

`describe-resource-permissions`

The following code example shows how to use `describe-resource-permissions`.

Amazon CLI

To get a list of permissions for a resource

This example returns a list of the permissions for the specified resource (document or folder).

Command:

```
aws workdocs describe-resource-permissions --resource-
id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3
```

Output:

```
{
  "Principals": [
      {
          "Id": "anonymous",
          "Type": "ANONYMOUS",
          "Roles": [
              {
                  "Role": "VIEWER",
                  "Type": "DIRECT"
              }
          ]
      },
      {
          "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
          "Type": "USER",
          "Roles": [
              {
                  "Role": "OWNER",
                  "Type": "DIRECT"
              }
          ]
      },
      {
          "Id": "d-926726012c",
          "Type": "ORGANIZATION",
          "Roles": [
              {
                  "Role": "VIEWER",
                  "Type": "INHERITED"
              }
          ]
      }
  ]
}
```

- For API details, see DescribeResourcePermissions in *Amazon CLI Command Reference*.

`describe-users`

The following code example shows how to use `describe-users`.

Amazon CLI

To retrieve details for specified users

This example retrieves details for all the users in the specified organization.

Command:

```
aws workdocs describe-users --organization-id d-926726012c
```

Output:

```
{
  "Users": [
      {
          "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
          "Username": "example1User",
          "OrganizationId": "d-926726012c",
          "RootFolderId":
 "3c0e3f849dd20a9771d937b9bbcc97e18796150ae56c26d64a4fa0320a2dedc9",
          "RecycleBinFolderId":
 "c277f4c4d647be1f5147b3184ffa96e1e2bf708278b696cacba68ba13b91f4fe",
          "Status": "INACTIVE",
          "Type": "USER",
          "CreatedTimestamp": 1535478999.452,
          "ModifiedTimestamp": 1535478999.452
      },
      {
          "Id": "S-1-1-11-1111111111-2222222222-3333333333-4444&d-926726012c",
          "Username": "example2User",

```

- For API details, see DescribeUsers in *Amazon CLI Command Reference*.

`get-document-path`

The following code example shows how to use `get-document-path`.

Amazon CLI

To retrieve a document's path information

This example retrieves the path information (hierarchy from the root folder) for the specified document, and includes the names of the parent folders.

Command:

```
aws workdocs get-document-path --document-
id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --fields NAME
```

Output:

```
{
  "Path": {
      "Components": [
          {
              "Id":
 "a43d29cbb8e7c4d25cfee8b803a504b0dc63e760b55ad0c611c6b87691eb6ff3",
              "Name": "/"
          },
          {
              "Id":
 "1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678",
              "Name": "Top Level Folder"
          },
          {
              "Id":
 "d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65",
```

```
                "Name": "exampleDoc.docx"
            }
        ]
    }
}
```

- For API details, see GetDocumentPath in *Amazon CLI Command Reference*.

`get-document-version`

The following code example shows how to use `get-document-version`.

Amazon CLI

To retrieve version metadata for a specified document

This example retrieves version metadata for the specified document, including a source URL and custom metadata.

Command:

```
aws workdocs get-document-version --document-
id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-
id 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --
fields SOURCE --include-custom-metadata
```

Output:

```
{
  "Metadata": {
      "Id":
 "1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920",
      "Name": "exampleDoc",
      "ContentType": "application/vnd.openxmlformats-

        }
    }
}
```

- For API details, see GetDocumentVersion in *Amazon CLI Command Reference*.

`get-document`

The following code example shows how to use `get-document`.

Amazon CLI

To retrieve document details

This example retrieves the details of the specified document.

Command:

```
aws workdocs get-document --document-
id d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65
```

Output:

```

        },
        "ResourceState": "ACTIVE"
    }
}
```

- For API details, see GetDocument in *Amazon CLI Command Reference*.

`get-folder-path`

The following code example shows how to use `get-folder-path`.

Amazon CLI

To retrieve path information for a folder

This example retrieves the path information (hierarchy from the root folder) for the specified folder, and includes the names of the parent folders.

Command:

```
aws workdocs get-folder-path --folder-
id 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08 --fields NAME
```

Output:

```
{
    "Path": {
        "Components": [
            {
                "Id":
 "a43d29cbb8e7c4d25cfee8b803a504b0dc63e760b55ad0c611c6b87691eb6ff3",
                "Name": "/"
            },
            {
```

```
                "Id":
 "1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678",
                "Name": "Top Level Folder"
            },
            {
                "Id":
 "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",
                "Name": "Sublevel Folder"
            }
        ]
    }
}
```

- For API details, see GetFolderPath in *Amazon CLI Command Reference*.

`get-folder`

The following code example shows how to use `get-folder`.

Amazon CLI

To retrieve the metadata for a folder

This example retrieves the metadata for the specified folder.

Command:

```
aws workdocs get-folder --folder-
id 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08
```

Output:

```
{
    "Metadata": {
        "Id": "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",
        "Name": "exampleFolder",
        "CreatorId": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
        "ParentFolderId":
 "1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678",
        "CreatedTimestamp": 1534450467.622,
        "ModifiedTimestamp": 1534451113.504,
        "ResourceState": "ACTIVE",
```

```
      "Signature": "1a23456b78901c23d4ef56gh7EXAMPLE",
      "Size": 23019,
      "LatestVersionSize": 11537
  }
}
```

- For API details, see GetFolder in *Amazon CLI Command Reference*.

`get-resources`

The following code example shows how to use `get-resources`.

Amazon CLI

To retrieve shared resources

The following `get-resources` example retrieves the resources shared with the specified Amazon WorkDocs user.

```
aws workdocs get-resources \
    --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333" \
    --collection-type SHARED_WITH_ME
```

Output:

```
{
"Folders": [],
"Documents": []
}
```

For more information, see Sharing Files and Folders in the *Amazon WorkDocs User Guide*.

- For API details, see GetResources in *Amazon CLI Command Reference*.

`initiate-document-version-upload`

The following code example shows how to use `initiate-document-version-upload`.

Amazon CLI

To initiate a document version upload

The following `initiate-document-upload` example creates a new document object and version object.

```
aws workdocs initiate-document-version-upload \
    --name exampledocname \
    --parent-folder-
id eacd546d952531c633452ed67cac23161aa0d5df2e8061223a59e8f67e7b6189
```

Output:

```
{
    "Metadata": {
        "Id": "feaba64d4efdf271c2521b60a2a44a8f057e84beaabbe22f01267313209835f2",

```
        }
    }
}
```

- For API details, see InitiateDocumentVersionUpload in *Amazon CLI Command Reference*.

`remove-all-resource-permissions`

The following code example shows how to use `remove-all-resource-permissions`.

Amazon CLI

To remove all permissions from a specified resource

This example removes all permissions from the specified resource.

Command:

```
aws workdocs remove-all-resource-permissions --resource-
id 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678
```

Output:

```
None
```

- For API details, see RemoveAllResourcePermissions in *Amazon CLI Command Reference*.

`remove-resource-permission`

The following code example shows how to use `remove-resource-permission`.

Amazon CLI

To remove permissions from a resource

This example removes permissions from the resource for the specified principal.

Command:

```
aws workdocs remove-resource-permission --resource-
id 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678 --principal-
id anonymous
```

Output:

```
None
```

- For API details, see RemoveResourcePermission in *Amazon CLI Command Reference*.

`update-document-version`

The following code example shows how to use `update-document-version`.

Amazon CLI

To change a document version status to Active

This example changes the status of the document version to Active.

Command:

```
aws workdocs update-document-version --document-
id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-
id 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --
version-status ACTIVE
```

Output:

```
None
```

- For API details, see UpdateDocumentVersion in *Amazon CLI Command Reference*.

`update-document`

The following code example shows how to use `update-document`.

Amazon CLI

To update a document

This example updates a document's name and parent folder.

Command:

```
aws workdocs update-document --document-
id 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --
name updatedDoc --parent-folder-
id 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08
```

Output:

```
None
```

- For API details, see UpdateDocument in *Amazon CLI Command Reference*.

`update-folder`

The following code example shows how to use `update-folder`.

Amazon CLI

To update a folder

This example updates a folder's name and parent folder.

Command:

```
aws workdocs update-folder --folder-
id 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08 --
name exampleFolder1 --parent-folder-
id 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678
```

Output:

```
None
```

- For API details, see UpdateFolder in *Amazon CLI Command Reference*.

`update-user`

The following code example shows how to use `update-user`.

Amazon CLI

To update a user

This example updates the time zone for the specified user.

Command:

```
aws workdocs update-user --user-
id "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c" --time-zone-
id "America/Los_Angeles"
```

Output:

```
{
  "User": {
      "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
      "Username": "exampleUser",
      "EmailAddress": "exampleUser@site.awsapps.com",
      "GivenName": "Example",
      "Surname": "User",
      "OrganizationId": "d-926726012c",
      "RootFolderId":

      "Status": "ACTIVE",
      "Type": "USER",
      "TimeZoneId": "America/Los_Angeles",
      "Storage": {
          "StorageUtilizedInBytes": 0,
          "StorageRule": {
              "StorageAllocatedInBytes": 53687091200,
              "StorageType": "QUOTA"
          }
      }
  }
}
```

- For API details, see UpdateUser in *Amazon CLI Command Reference*.

Amazon WorkMail examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Amazon WorkMail.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`associate-delegate-to-resource`

The following code example shows how to use `associate-delegate-to-resource`.

Amazon CLI

To add a delegate to a resource

The following `associate-delegate-to-resource` command adds a delegate to a resource.

```
aws workmail associate-delegate-to-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-68bf2d3b1c0244aab7264c24b9217443 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see AssociateDelegateToResource in *Amazon CLI Command Reference*.

`associate-member-to-group`

The following code example shows how to use `associate-member-to-group`.

Amazon CLI

To add a member to a group

The following `associate-member-to-group` command adds the specified member to a group.

```
aws workmail associate-member-to-group \
```

```
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --member-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see AssociateMemberToGroup in *Amazon CLI Command Reference*.

`create-alias`

The following code example shows how to use `create-alias`.

Amazon CLI

To create an alias

The following `create-alias` command creates an alias for the specified entity (user or group).

```
aws workmail create-alias \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --alias exampleAlias@site.awsapps.com
```

This command produces no output.

- For API details, see CreateAlias in *Amazon CLI Command Reference*.

`create-group`

The following code example shows how to use `create-group`.

Amazon CLI

To create a new group

The following `create-group` command creates a new group for the specified organization.

```
aws workmail create-group \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --name exampleGroup1
```

Output:

```
{
    "GroupId": "S-1-1-11-1122222222-2222233333-3333334444-4444"
}
```

- For API details, see CreateGroup in *Amazon CLI Command Reference*.

`create-resource`

The following code example shows how to use `create-resource`.

Amazon CLI

To create a new resource

The following `create-resource` command creates a new resource (meeting room) for the specified organization.

```
aws workmail create-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --name exampleRoom1 \
    --type ROOM
```

Output:

```
{
    "ResourceId": "r-7afe0efbade843a58cdc10251fce992c"
}
```

- For API details, see CreateResource in *Amazon CLI Command Reference*.

`create-user`

The following code example shows how to use `create-user`.

Amazon CLI

To create a new user

The following `create-user` command creates a new user.

```
aws workmail create-user \
```

```
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --name exampleName \
    --display-name exampleDisplayName \
    --password examplePa$$w0rd
```

Output:

```
{
    "UserId": "S-1-1-11-1111111111-2222222222-3333333333-3333"
}
```

- For API details, see CreateUser in *Amazon CLI Command Reference*.

`delete-access-control-rule`

The following code example shows how to use `delete-access-control-rule`.

Amazon CLI

To delete an access control rule

The following `delete-access-control-rule` example deletes the specified access control rule from the specified Amazon WorkMail organization.

```
aws workmail delete-access-control-rule \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza \
    --name "myRule"
```

This command produces no output.

For more information, see Working with Access Control Rules in the *Amazon WorkMail Administrator Guide*.

- For API details, see DeleteAccessControlRule in *Amazon CLI Command Reference*.

`delete-alias`

The following code example shows how to use `delete-alias`.

Amazon CLI

To delete an alias

The following `delete-alias` command deletes the alias for the specified entity (user or group).

```
aws workmail delete-alias \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --alias exampleAlias@site.awsapps.com
```

This command produces no output.

- For API details, see DeleteAlias in *Amazon CLI Command Reference*.

`delete-group`

The following code example shows how to use `delete-group`.

Amazon CLI

To delete an existing group

The following `delete-group` command deletes an existing group from Amazon WorkMail.

```
aws workmail delete-group \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444
```

This command produces no output.

- For API details, see DeleteGroup in *Amazon CLI Command Reference*.

`delete-mailbox-permissions`

The following code example shows how to use `delete-mailbox-permissions`.

Amazon CLI

To delete mailbox permissions

The following `delete-mailbox-permissions` command deletes mailbox permissions that were previously granted to a user or group. The entity represents the user that owns the mailbox, and the grantee represents the user or group for whom to delete permissions.

```
aws workmail delete-mailbox-permissions \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --grantee-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see DeleteMailboxPermissions in *Amazon CLI Command Reference*.

`delete-resource`

The following code example shows how to use `delete-resource`.

Amazon CLI

To delete an existing resource

The following `delete-resource` command deletes an existing resource from Amazon WorkMail.

```
aws workmail delete-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-7afe0efbade843a58cdc10251fce992c
```

This command produces no output.

- For API details, see DeleteResource in *Amazon CLI Command Reference*.

`delete-user`

The following code example shows how to use `delete-user`.

Amazon CLI

To delete a user

The following `delete-user` command deletes the specified user from Amazon WorkMail and all subsequent systems.

```
aws workmail delete-user \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see DeleteUser in *Amazon CLI Command Reference*.

`deregister-from-work-mail`

The following code example shows how to use `deregister-from-work-mail`.

Amazon CLI

To disable an existing entity

The following `deregister-from-work-mail` command disables an existing entity (user, group, or resource) from using Amazon WorkMail.

```
aws workmail deregister-from-work-mail \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see DeregisterFromWorkMail in *Amazon CLI Command Reference*.

`describe-group`

The following code example shows how to use `describe-group`.

Amazon CLI

To retrieve information for a group

The following `describe-group` command retrieves information about the specified group.

```
aws workmail describe-group \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444
```

Output:

```
{
    "GroupId": "S-1-1-11-1122222222-2222233333-3333334444-4444",
    "Name": "exampleGroup1",
```

```
    "State": "ENABLED"
}
```

- For API details, see DescribeGroup in *Amazon CLI Command Reference*.

`describe-organization`

The following code example shows how to use `describe-organization`.

Amazon CLI

To retrieve information for an organization

The following `describe-organization` command retrieves information for the specified Amazon WorkMail organization.

```
aws workmail describe-organization \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
    "OrganizationId": "m-d281d0a2fd824be5b6cd3d3ce909fd27",
    "Alias": "alias",
    "State": "Active",
    "DirectoryId": "d-926726012c",
    "DirectoryType": "VpcDirectory",
    "DefaultMailDomain": "site.awsapps.com",
    "CompletedDate": 1522693605.468,
    "ARN": "arn:aws:workmail:us-west-2:111122223333:organization/m-
n1pq2345678r901st2u3vx45x6789yza"
}
```

For more information, see Working with Organizations in the *Amazon WorkMail Administrator Guide*.

- For API details, see DescribeOrganization in *Amazon CLI Command Reference*.

`describe-resource`

The following code example shows how to use `describe-resource`.

Amazon CLI

To retrieve information for a resource

The following `describe-resource` command retrieves information about the specified resource.

```
aws workmail describe-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-7afe0efbade843a58cdc10251fce992c
```

Output:

```
{
    "ResourceId": "r-7afe0efbade843a58cdc10251fce992c",
    "Name": "exampleRoom1",
    "Type": "ROOM",
    "BookingOptions": {
        "AutoAcceptRequests": true,
        "AutoDeclineRecurringRequests": false,
        "AutoDeclineConflictingRequests": true
    },
    "State": "ENABLED"
}
```

- For API details, see DescribeResource in *Amazon CLI Command Reference*.

`describe-user`

The following code example shows how to use `describe-user`.

Amazon CLI

To retrieve user information

The following `describe-user` command retrieves information about the specified user.

```
aws workmail describe-user \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{
    "UserId": "S-1-1-11-1111111111-2222222222-3333333333-3333",
    "Name": "exampleUser1",
    "Email": "exampleUser1@site.awsapps.com",
    "DisplayName": "",
    "State": "ENABLED",
    "UserRole": "USER",
    "EnabledDate": 1532459261.827
}
```

- For API details, see DescribeUser in *Amazon CLI Command Reference*.

`disassociate-delegate-from-resource`

The following code example shows how to use `disassociate-delegate-from-resource`.

Amazon CLI

To remove a member from a resource

The following `disassociate-delegate-from-resource` command removes the specified member from a resource.

```
ws workmail disassociate-delegate-from-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-68bf2d3b1c0244aab7264c24b9217443 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see DisassociateDelegateFromResource in *Amazon CLI Command Reference*.

`disassociate-member-from-group`

The following code example shows how to use `disassociate-member-from-group`.

Amazon CLI

To remove a member from a group

The following `disassociate-member-from-group` command removes the specified member from a group.

```
aws workmail disassociate-member-from-group \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --member-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see DisassociateMemberFromGroup in *Amazon CLI Command Reference*.

`get-access-control-effect`

The following code example shows how to use `get-access-control-effect`.

Amazon CLI

To get the effect of access control rules

The following `get-access-control-effect` example retrieves the effect of the specified Amazon WorkMail organization's access control rules for the specified IP address, access protocol action, and user ID.

```
aws workmail get-access-control-effect \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza \
    --ip-address "192.0.2.0" \
    --action "WindowsOutlook" \
    --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333"
```

Output:

```
{
    "Effect": "DENY",
    "MatchedRules": [
        "myRule"
    ]
}
```

For more information, see Working with Access Control Rules in the *Amazon WorkMail Administrator Guide*.

- For API details, see GetAccessControlEffect in *Amazon CLI Command Reference*.

`get-mailbox-details`

The following code example shows how to use `get-mailbox-details`.

Amazon CLI

To get a user's mailbox details

The following `get-mailbox-details` command retrieves details about the specified user's mailbox.

```
aws workmail get-mailbox-details \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{
    "MailboxQuota": 51200,
    "MailboxSize": 0.03890800476074219
}
```

For more information, see Managing User Accounts in the *Amazon WorkMail Administrator Guide*.

- For API details, see GetMailboxDetails in *Amazon CLI Command Reference*.

`list-access-control-rules`

The following code example shows how to use `list-access-control-rules`.

Amazon CLI

To list access control rules

The following `list-access-control-rules` example lists the access control rules for the specified Amazon WorkMail organization.

```
aws workmail list-access-control-rules \
```

```
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza
```

Output:

```
{
    "Rules": [
        {
            "Name": "default",
            "Effect": "ALLOW",
            "Description": "Default WorkMail Rule",
            "DateCreated": 0.0,
            "DateModified": 0.0
        },
        {
            "Name": "myRule",
            "Effect": "DENY",
            "Description": "my rule",
            "UserIds": [
            "S-1-1-11-1111111111-2222222222-3333333333-3333"
            ],
            "DateCreated": 1581635628.0,
            "DateModified": 1581635628.0
        }
    ]
}
```

For more information, see Working with Access Control Rules in the *Amazon WorkMail Administrator Guide*.

- For API details, see ListAccessControlRules in *Amazon CLI Command Reference*.

`list-aliases`

The following code example shows how to use `list-aliases`.

Amazon CLI

To list aliases for a member

The following `list-aliases` command lists aliases for the specified member (user or group).

```
aws workmail list-aliases \
```

```
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{
    "Aliases": [
        "exampleAlias@site.awsapps.com",
        "exampleAlias1@site.awsapps.com"
    ]
}
```

- For API details, see ListAliases in *Amazon CLI Command Reference*.

`list-group-members`

The following code example shows how to use `list-group-members`.

Amazon CLI

To list group members

The following `list-group-members` command lists the members of the specified group.

```
aws workmail list-group-members \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444
```

Output:

```
{
    "Members": [
        {
            "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",
            "Name": "exampleUser1",
            "Type": "USER",
            "State": "ENABLED",
            "EnabledDate": 1532459261.827
        }
    ]
}
```

- For API details, see ListGroupMembers in *Amazon CLI Command Reference*.

`list-groups`

The following code example shows how to use `list-groups`.

Amazon CLI

To retrieve a list of groups

The following `list-groups` command retrieves summaries of the groups in the specified organization.

```
aws workmail list-groups \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
    "Groups": [
        {
            "Id": "S-1-1-11-1122222222-2222233333-3333334444-4444",
            "Name": "exampleGroup1",
            "State": "DISABLED"
        },
        {
            "Id": "S-4-4-44-1122222222-2222233333-3333334444-4444",
            "Name": "exampleGroup2",
            "State": "ENABLED"
        }
    ]
}
```

- For API details, see ListGroups in *Amazon CLI Command Reference*.

`list-mailbox-permissions`

The following code example shows how to use `list-mailbox-permissions`.

Amazon CLI

To retrieve mailbox permissions

The following `list-mailbox-permissions` command retrieves the mailbox permissions associated with the specified entity's mailbox.

```
aws workmail list-mailbox-permissions \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{
    "Permissions": [
        {
            "GranteeId": "S-1-1-11-1122222222-2222233333-3333334444-4444",
            "GranteeType": "USER",
            "PermissionValues": [
                "FULL_ACCESS"
            ]
        }
    ]
}
```

- For API details, see ListMailboxPermissions in *Amazon CLI Command Reference*.

`list-organizations`

The following code example shows how to use `list-organizations`.

Amazon CLI

To retrieve a list of organizations

The following `list-organizations` command retrieves summaries of the customer's organizations.

```
aws workmail list-organizations
```

Output:

```
{
    "OrganizationSummaries": [
```

```
        {
            "OrganizationId": "m-d281d0a2fd824be5b6cd3d3ce909fd27",
            "Alias": "exampleAlias",
            "State": "Active"
        }
    ]
}
```

- For API details, see ListOrganizations in *Amazon CLI Command Reference*.

`list-resource-delegates`

The following code example shows how to use `list-resource-delegates`.

Amazon CLI

To list the delegates for a resource

The following `list-resource-delegates` command retrieves the delegates associated with the specified resource.

```
aws workmail list-resource-delegates \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-68bf2d3b1c0244aab7264c24b9217443
```

Output:

```
{
    "Delegates": [
        {
            "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",
            "Type": "USER"
        }
    ]
}
```

- For API details, see ListResourceDelegates in *Amazon CLI Command Reference*.

`list-resources`

The following code example shows how to use `list-resources`.

Amazon CLI

To retrieve a list of resources

The following `list-resources` command retrieves summaries of the resources for the specified organization.

```
aws workmail list-resources \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
    "Resources": [
        {
            "Id": "r-7afe0efbade843a58cdc10251fce992c",
            "Name": "exampleRoom1",
            "Type": "ROOM",
            "State": "ENABLED"
        }
    ]
}
```

- For API details, see ListResources in *Amazon CLI Command Reference*.

`list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

Amazon CLI

To list the tags for a resource

The following `list-tags-for-resource` example lists the tags for the specified Amazon WorkMail organization.

```
aws workmail list-tags-for-resource \
    --resource-arn arn:aws:workmail:us-west-2:111122223333:organization/m-n1pq2345678r901st2u3vx45x6789yza
```

Output:

```
{
    "Tags": [
        {
            "Key": "priority",
            "Value": "1"
        }
    ]
}
```

For more information, see Tagging an Organization in the *Amazon WorkMail Administrator Guide*.

- For API details, see ListTagsForResource in *Amazon CLI Command Reference*.

`list-users`

The following code example shows how to use `list-users`.

Amazon CLI

To retrieve a list of users

The following `list-users` command retrieves summaries of the users in the specified organization.

```
aws workmail list-users \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
    "Users": [
        {
            "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",
            "Email": "exampleUser1@site.awsapps.com",
            "Name": "exampleUser1",
            "State": "ENABLED",
            "UserRole": "USER",
            "EnabledDate": 1532459261.827
        },
        {
            "Id": "S-1-1-11-1122222222-2222233333-3333334444-4444",
```

```
            "Name": "exampleGuestUser",
            "State": "DISABLED",
            "UserRole": "SYSTEM_USER"
        }
    ]
}
```

- For API details, see ListUsers in *Amazon CLI Command Reference*.

`put-access-control-rule`

The following code example shows how to use `put-access-control-rule`.

Amazon CLI

To put a new access control rule

The following `put-access-control-rule` example denies the specified user access to the specified Amazon WorkMail organization.

```
aws workmail put-access-control-rule \
    --name "myRule" \
    --effect "DENY" \
    --description "my rule" \
    --user-ids "S-1-1-11-1111111111-2222222222-3333333333-3333" \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza
```

This command produces no output.

For more information, see Working with Access Control Rules in the *Amazon WorkMail Administrator Guide*.

- For API details, see PutAccessControlRule in *Amazon CLI Command Reference*.

`put-mailbox-permissions`

The following code example shows how to use `put-mailbox-permissions`.

Amazon CLI

To set mailbox permissions

The following `put-mailbox-permissions` command sets full access permissions for the specified grantee (user or group). The entity represents the owner of the mailbox.

```
aws workmail put-mailbox-permissions \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
    --grantee-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --permission-values FULL_ACCESS
```

This command produces no output.

- For API details, see PutMailboxPermissions in *Amazon CLI Command Reference*.

`register-to-work-mail`

The following code example shows how to use `register-to-work-mail`.

Amazon CLI

To register an existing or disabled entity

The following `register-to-work-mail` command enables the specified existing entity (user, group, or resource) to use Amazon WorkMail.

```
aws workmail register-to-work-mail \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --email exampleGroup1@site.awsapps.com
```

This command produces no output.

- For API details, see RegisterToWorkMail in *Amazon CLI Command Reference*.

`reset-password`

The following code example shows how to use `reset-password`.

Amazon CLI

To reset a user's password

The following `reset-password` command resets the password for the specified user.

```
aws workmail reset-password \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
    --password examplePa$$w0rd
```

This command produces no output.

- For API details, see ResetPassword in *Amazon CLI Command Reference*.

`tag-resource`

The following code example shows how to use `tag-resource`.

Amazon CLI

To apply a tag to a resource

The following `tag-resource` example applies a tag with key "priority" and value "1" to the specified Amazon WorkMail organization.

```
aws workmail tag-resource \
    --resource-arn arn:aws:workmail:us-west-2:111122223333:organization/m-
n1pq2345678r901st2u3vx45x6789yza \
    --tags "Key=priority,Value=1"
```

This command produces no output.

For more information, see Tagging an Organization in the *Amazon WorkMail Administrator Guide*.

- For API details, see TagResource in *Amazon CLI Command Reference*.

`untag-resource`

The following code example shows how to use `untag-resource`.

Amazon CLI

To untag a resource

The following `untag-resource` example removes the specified tag from the specified Amazon WorkMail organization.

```
aws workmail untag-resource \
    --resource-arn arn:aws:workmail:us-west-2:111122223333:organization/m-n1pq2345678r901st2u3vx45x6789yza \
    --tag-keys "priority"
```

This command produces no output.

For more information, see Tagging an Organization in the *Amazon WorkMail Administrator Guide*.

- For API details, see UntagResource in *Amazon CLI Command Reference*.

`update-mailbox-quota`

The following code example shows how to use `update-mailbox-quota`.

Amazon CLI

To update a user's mailbox quota

The following `update-mailbox-quota` command changes the specified user's mailbox quota.

```
aws workmail update-mailbox-quota \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
    --mailbox-quota 40000
```

This command produces no output.

For more information, see Managing User Accounts in the *Amazon WorkMail Administrator Guide*.

- For API details, see UpdateMailboxQuota in *Amazon CLI Command Reference*.

`update-primary-email-address`

The following code example shows how to use `update-primary-email-address`.

Amazon CLI

To update a primary email address

The following `update-primary-email-address` command updates the primary email address of the specified entity (user, group, or resource).

```
aws workmail update-primary-email-address \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
    --email exampleUser2@site.awsapps.com
```

This command produces no output.

- For API details, see UpdatePrimaryEmailAddress in *Amazon CLI Command Reference*.

`update-resource`

The following code example shows how to use `update-resource`.

Amazon CLI

To update a resource

The following `update-resource` command updates the name of the specified resource.

```
aws workmail update-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-7afe0efbade843a58cdc10251fce992c \
    --name exampleRoom2
```

This command produces no output.

- For API details, see UpdateResource in *Amazon CLI Command Reference*.

Amazon WorkMail Message Flow examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Amazon WorkMail Message Flow.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Actions

`get-raw-message-content`

The following code example shows how to use `get-raw-message-content`.

Amazon CLI

To get the raw content of an email message

The following `get-raw-message-content` example gets the raw content of an in-transit email message and sends it to a text file named `test`.

```
aws workmailmessageflow get-raw-message-content \
    --message-id a1b2cd34-ef5g-6h7j-kl8m-npq9012345rs \
    test
```

Contents of file `test` after command runs:

```
Subject: Hello World
From: =?UTF-8?Q?marymajor_marymajor?= <marymajor@example.com>
To: =?UTF-8?Q?mateojackson=40example=2Enet?= <mateojackson@example.net>

- For API details, see GetRawMessageContent in *Amazon CLI Command Reference*.

WorkSpaces examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with WorkSpaces.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`create-tags`

The following code example shows how to use `create-tags`.

Amazon CLI

To add tags to a WorkSpace

The following `create-tags` example adds the specified tags to the specified WorkSpace.

```
aws workspaces create-tags \
    --resource-id ws-dk1xzr417 \
    --tags Key=Department,Value=Finance
```

This command produces no output.

For more information, see Tag WorkSpaces resources in the *Amazon WorkSpaces Administration Guide*.

- For API details, see CreateTags in *Amazon CLI Command Reference*.

`create-workspaces`

The following code example shows how to use `create-workspaces`.

Amazon CLI

Example 1: To create an AlwaysOn WorkSpace

The following `create-workspaces` example creates an AlwaysOn WorkSpace for the specified user, using the specified directory and bundle.

```
aws workspaces create-workspaces \
    --workspaces DirectoryId=d-926722edaf,UserName=Mateo,BundleId=wsb-0zsvgp8fc
```

Output:

```
{
    "FailedRequests": [],
    "PendingRequests": [
        {
```

```
            "WorkspaceId": "ws-kcqms853t",
            "DirectoryId": "d-926722edaf",
            "UserName": "Mateo",
            "State": "PENDING",
            "BundleId": "wsb-0zsvgp8fc"
        }
    ]
}
```

Example 2: To create an AutoStop WorkSpace

The following `create-workspaces` example creates an AutoStop WorkSpace for the specified user, using the specified directory and bundle.

```
aws workspaces create-workspaces \
    --
workspaces DirectoryId=d-926722edaf,UserName=Mary,BundleId=wsb-0zsvgp8fc,WorkspaceProperties
```

Output:

```
{
    "FailedRequests": [],
    "PendingRequests": [
        {
            "WorkspaceId": "ws-dk1xzr417",
            "DirectoryId": "d-926722edaf",
            "UserName": "Mary",
            "State": "PENDING",
            "BundleId": "wsb-0zsvgp8fc"
        }
    ]
}
```

Example 3: To create a user-decoupled WorkSpace

The following `create-workspaces` example creates a user-decoupled WorkSpace by setting the username to `[UNDEFINED]`, and specifying a WorkSpace name, directory ID, and bundle ID.

```
aws workspaces create-workspaces \
    --workspaces
 DirectoryId=d-926722edaf,UserName='"[UNDEFINED]"',WorkspaceName=MaryWorkspace1,BundleId=wsb
```

Output:

```
{
    "FailedRequests": [],
    "PendingRequests": [
        {
            "WorkspaceId": "ws-abcd1234",
            "DirectoryId": "d-926722edaf",
            "UserName": "[UNDEFINED]",
            "State": "PENDING",
            "BundleId": "wsb-0zsvgp8fc",
            "WorkspaceName": "MaryWorkspace1"
        }
    ]
}
```

For more information, see Launch a virtual desktop in the *Amazon WorkSpaces Administration Guide*.

- For API details, see CreateWorkspaces in *Amazon CLI Command Reference*.

`delete-tags`

The following code example shows how to use `delete-tags`.

Amazon CLI

To delete a tag from a WorkSpace

The following `delete-tags` example deletes the specified tag from the specified WorkSpace.

```
aws workspaces delete-tags \
    --resource-id ws-dk1xzr417 \
    --tag-keys Department
```

This command produces no output.

For more information, see Tag WorkSpaces resources in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DeleteTags in *Amazon CLI Command Reference*.

`deregister-workspace-directory`

The following code example shows how to use `deregister-workspace-directory`.

Amazon CLI

To deregister a directory

The following `deregister-workspace-directory` example deregisters the specified directory.

```
aws workspaces deregister-workspace-directory \
    --directory-id d-926722edaf
```

This command produces no output.

For more information, see Register a directory with WorkSpaces in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DeregisterWorkspaceDirectory in *Amazon CLI Command Reference*.

`describe-tags`

The following code example shows how to use `describe-tags`.

Amazon CLI

To describe the tags for a WorkSpace

The following `describe-tags` example describes the tags for the specified WorkSpace.

```
aws workspaces describe-tags \
    --resource-id ws-dk1xzr417
```

Output:

```
{
    "TagList": [
        {
            "Key": "Department",
            "Value": "Finance"
        }
    ]
```

```
}
```

For more information, see Tag WorkSpaces resources in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeTags in *Amazon CLI Command Reference*.

`describe-workspace-bundles`

The following code example shows how to use `describe-workspace-bundles`.

Amazon CLI

To list the bundles provided by Amazon

The following `describe-workspace-bundles` example lists the names and IDs of the bundles provided by Amazon, in table format and sorted by name.

```
aws workspaces describe-workspace-bundles \
    --owner AMAZON \
    --query "Bundles[*].[Name, BundleId]"
```

Output:

```
[
    [
        "Standard with Amazon Linux 2",
        "wsb-clj85qzj1"
    ],
    [
        "Performance with Windows 10 (Server 2016 based)",
        "wsb-gm4d5tx2v"
    ],
    [
        "PowerPro with Windows 7",
        "wsb-1pzkp0bx4"
    ],
    [
        "Power with Amazon Linux 2",
        "wsb-2bs6k5lgn"
    ],
    [
        "Graphics with Windows 10 (Server 2019 based)",
```

```
        "wsb-03gyjnfyy"
    ],
    ...
]
```

For more information, see WorkSpaces bundles and images in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeWorkspaceBundles in *Amazon CLI Command Reference*.

`describe-workspace-directories`

The following code example shows how to use `describe-workspace-directories`.

Amazon CLI

To describe a registered directory

The following `describe-workspace-directories` example describes the specified registered directory.

```
aws workspaces describe-workspace-directories \
    --directory-ids d-926722edaf
```

Output:

```
{
    "Directories": [
        {
            "DirectoryId": "d-926722edaf",
            "Alias": "d-926722edaf",
            "DirectoryName": "example.com",
            "RegistrationCode": "WSpdx+9RJ8JT",
            "SubnetIds": [
                "subnet-9d19c4c6",
                "subnet-500d5819"
            ],
            "DnsIpAddresses": [
                "172.16.1.140",
                "172.16.0.30"
            ],
            "CustomerUserName": "Administrator",
```

```
            "IamRoleId": "arn:aws:iam::123456789012:role/workspaces_DefaultRole",
            "DirectoryType": "SIMPLE_AD",
            "WorkspaceSecurityGroupId": "sg-0d89e927e5645d7c5",
            "State": "REGISTERED",
            "WorkspaceCreationProperties": {
                "EnableInternetAccess": false,
                "UserEnabledAsLocalAdministrator": true,
                "EnableMaintenanceMode": true
            },
            "WorkspaceAccessProperties": {
                "DeviceTypeWindows": "ALLOW",
                "DeviceTypeOsx": "ALLOW",
                "DeviceTypeWeb": "DENY",
                "DeviceTypeIos": "ALLOW",
                "DeviceTypeAndroid": "ALLOW",
                "DeviceTypeChromeOs": "ALLOW",
                "DeviceTypeZeroClient": "ALLOW",
                "DeviceTypeLinux": "DENY"
            },
            "Tenancy": "SHARED",
            "SelfservicePermissions": {
                "RestartWorkspace": "ENABLED",
                "IncreaseVolumeSize": "DISABLED",
                "ChangeComputeType": "DISABLED",
                "SwitchRunningMode": "DISABLED",
                "RebuildWorkspace": "DISABLED"
            }
        }
    ]
}
```

For more information, see Manage directories for WorkSpaces Personal in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeWorkspaceDirectories in *Amazon CLI Command Reference*.

`describe-workspaces-connection-status`

The following code example shows how to use `describe-workspaces-connection-status`.

Amazon CLI

To describe the connection status of a WorkSpace

The following `describe-workspaces-connection-status` example describes the connection status of the specified WorkSpace.

```
aws workspaces describe-workspaces-connection-status \
    --workspace-ids ws-dk1xzr417
```

Output:

```
{
    "WorkspacesConnectionStatus": [
        {
            "WorkspaceId": "ws-dk1xzr417",
            "ConnectionState": "CONNECTED",
            "ConnectionStateCheckTimestamp": 1662526214.744
        }
    ]
}
```

For more information, see Administer your WorkSpaces in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeWorkspacesConnectionStatus in *Amazon CLI Command Reference*.

`describe-workspaces`

The following code example shows how to use `describe-workspaces`.

Amazon CLI

To describe a WorkSpace

The following `describe-workspaces` example describes the specified WorkSpace.

```
aws workspaces describe-workspaces \
    --workspace-ids ws-dk1xzr417
```

Output:

```
{
    "Workspaces": [
        {
            "WorkspaceId": "ws-dk1xzr417",
```

```
            "DirectoryId": "d-926722edaf",
            "UserName": "Mary",
            "IpAddress": "172.16.0.175",
            "State": "STOPPED",
            "BundleId": "wsb-0zsvgp8fc",
            "SubnetId": "subnet-500d5819",
            "ComputerName": "WSAMZN-RBSLTTD9",
            "WorkspaceProperties": {
                "RunningMode": "AUTO_STOP",
                "RunningModeAutoStopTimeoutInMinutes": 60,
                "RootVolumeSizeGib": 80,
                "UserVolumeSizeGib": 10,
                "ComputeTypeName": "VALUE"
            },
            "ModificationStates": []
        }
    ]
}
```

For more information, see Administer your WorkSpaces in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeWorkspaces in *Amazon CLI Command Reference*.

`migrate-workspace`

The following code example shows how to use `migrate-workspace`.

Amazon CLI

To migrate a WorkSpace

The following `migrate-workspace` example migrates the specified WorkSpace to the specified bundle.

```
aws workspaces migrate-workspace \
    --source-workspace-id ws-dk1xzr417 \
    --bundle-id wsb-j4dky1gs4
```

Output:

```
{
```

```
    "SourceWorkspaceId": "ws-dk1xzr417",
    "TargetWorkspaceId": "ws-x5h1lbkp5"
}
```

For more information, see Migrate a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see MigrateWorkspace in *Amazon CLI Command Reference*.

`modify-workspace-creation-properties`

The following code example shows how to use `modify-workspace-creation-properties`.

Amazon CLI

To modify a WorkSpace creation property of a directory

The following `modify-workspace-creation-properties` example enables the `EnableInternetAccess` property for the specified directory. This enables automatic assignment of public IP addresses for the WorkSpaces created for the directory.

```
aws workspaces modify-workspace-creation-properties \
    --resource-id d-926722edaf \
    --workspace-creation-properties EnableInternetAccess=true
```

This command produces no output.

For more information, see Update directory details for your WorkSpaces in the *Amazon WorkSpaces Administration Guide*.

- For API details, see ModifyWorkspaceCreationProperties in *Amazon CLI Command Reference*.

`modify-workspace-properties`

The following code example shows how to use `modify-workspace-properties`.

Amazon CLI

To modify the running mode of a WorkSpace

The following `modify-workspace-properties` example sets the running mode of the specified WorkSpace to `AUTO_STOP`.

```
aws workspaces modify-workspace-properties \
    --workspace-id ws-dk1xzr417 \
    --workspace-properties RunningMode=AUTO_STOP
```

This command produces no output.

For more information, see Modify a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see ModifyWorkspaceProperties in *Amazon CLI Command Reference*.

`modify-workspace-state`

The following code example shows how to use `modify-workspace-state`.

Amazon CLI

To modify the state of a WorkSpace

The following `modify-workspace-state` example sets the state of the specified WorkSpace to `ADMIN_MAINTENANCE`.

```
aws workspaces modify-workspace-state \
    --workspace-id ws-dk1xzr417 \
    --workspace-state ADMIN_MAINTENANCE
```

This command produces no output.

For more information, see WorkSpace maintenance in the *Amazon WorkSpaces Administration Guide*.

- For API details, see ModifyWorkspaceState in *Amazon CLI Command Reference*.

`reboot-workspaces`

The following code example shows how to use `reboot-workspaces`.

Amazon CLI

To reboot a WorkSpace

The following `reboot-workspaces` example reboots the specified WorkSpace.

```
aws workspaces reboot-workspaces \
    --reboot-workspace-requests ws-dk1xzr417
```

Output:

```
{
    "FailedRequests": []
}
```

For more information, see Reboot a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see RebootWorkspaces in *Amazon CLI Command Reference*.

`rebuild-workspaces`

The following code example shows how to use `rebuild-workspaces`.

Amazon CLI

To rebuild a WorkSpace

The following `rebuild-workspaces` example rebuilds the specified WorkSpace.

```
aws workspaces rebuild-workspaces \
    --rebuild-workspace-requests ws-dk1xzr417
```

Output:

```
{
    "FailedRequests": []
}
```

For more information, see Rebuild a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see RebuildWorkspaces in *Amazon CLI Command Reference*.

`register-workspace-directory`

The following code example shows how to use `register-workspace-directory`.

Amazon CLI

To register a directory

The following `register-workspace-directory` example registers the specified directory for use with Amazon WorkSpaces.

```
aws workspaces register-workspace-directory \
    --directory-id d-926722edaf
```

This command produces no output.

For more information, see Register an existing Amazon Directory Service directory with WorkSpaces Personal in the *Amazon WorkSpaces Administration Guide*.

- For API details, see RegisterWorkspaceDirectory in *Amazon CLI Command Reference*.

`restore-workspace`

The following code example shows how to use `restore-workspace`.

Amazon CLI

To restore a WorkSpace

The following `restore-workspace` example restores the specified WorkSpace.

```
aws workspaces restore-workspace \
    --workspace-id ws-dk1xzr417
```

This command produces no output.

For more information, see Restore a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see RestoreWorkspace in *Amazon CLI Command Reference*.

`start-workspaces`

The following code example shows how to use `start-workspaces`.

Amazon CLI

To start an AutoStop WorkSpace

The following `start-workspaces` example starts the specified WorkSpace. The WorkSpace must have a running mode of `AutoStop`.

```
aws workspaces start-workspaces \
    --start-workspace-requests WorkspaceId=ws-dk1xzr417
```

Output:

```
{
    "FailedRequests": []
}
```

For more information, see Stop and start an AutoStop WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see StartWorkspaces in *Amazon CLI Command Reference*.

`stop-workspaces`

The following code example shows how to use `stop-workspaces`.

Amazon CLI

To stop an AutoStop WorkSpace

The following `stop-workspaces` example stops the specified WorkSpace. The WorkSpace must have a running mode of `AutoStop`.

```
aws workspaces stop-workspaces \
    --stop-workspace-requests WorkspaceId=ws-dk1xzr417
```

Output:

```
{
    "FailedRequests": []
```

```
}
```

For more information, see Stop and start an AutoStop WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see StopWorkspaces in *Amazon CLI Command Reference*.

`terminate-workspaces`

The following code example shows how to use `terminate-workspaces`.

Amazon CLI

To terminate a WorkSpace

The following `terminate-workspaces` example terminates the specified workspace.

```
aws workspaces terminate-workspaces \
    --terminate-workspace-requests ws-dk1xzr417
```

Output:

```
{
    "FailedRequests": []
}
```

For more information, see Delete a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see TerminateWorkspaces in *Amazon CLI Command Reference*.

X-Ray examples using Amazon CLI

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with X-Ray.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`batch-traces-get`

The following code example shows how to use `batch-traces-get`.

Amazon CLI

To get a list of traces

The following `batch-get-traces` example retrieves a list of traces specified by an ID. The full trace includes a document for each segment, compiled from all of the segment documents received with the same trace ID.

```
aws xray batch-get-traces \
    --trace-ids 1-5d82881a-0a9126e92a73e971eed891b9
```

Output:

```
{
    "Traces": [
        {
            "Id": "1-5d82881a-0a9126e92a73e971eed891b9",
            "Duration": 0.232,
            "Segments": [
                {

        }
    ],
    "UnprocessedTraceIds": []
}
```

For more information, see Using the Amazon X-Ray API with the Amazon CLI in the *Amazon X-Ray Developer Guide*.

- For API details, see BatchTracesGet in *Amazon CLI Command Reference*.

`create-group`

The following code example shows how to use `create-group`.

Amazon CLI

To create a group

The following `create-group` example creates a group resource named `AdminGroup`. The group gets a filter expression that defines the criteria of the group as a segment related to a specific service causing a fault or an error.

```
aws xray create-group \
```

```
    --group-name "AdminGroup" \
    --filter-expression "service(\"mydomain.com\") {fault OR error}"
```

Output:

```
{
    "GroupName": "AdminGroup",
    "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/AdminGroup/123456789",
    "FilterExpression": "service(\"mydomain.com\") {fault OR error}"
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the Amazon X-Ray API in the *Amazon X-Ray Developer Guide*.

- For API details, see CreateGroup in *Amazon CLI Command Reference*.

`create-sampling-rule`

The following code example shows how to use `create-sampling-rule`.

Amazon CLI

To create a sampling rule

The following `create-sampling-rule` example creates a rule to control sampling behavior for instrumented applications. The rules are provided by a JSON file. The majority of the sampling rule fields are required to create the rule.

```
aws xray create-sampling-rule \
    --cli-input-json file://9000-base-scorekeep.json
```

Contents of `9000-base-scorekeep.json`:

```
{
    "SamplingRule": {
        "RuleName": "base-scorekeep",
        "ResourceARN": "*",
        "Priority": 9000,
        "FixedRate": 0.1,
        "ReservoirSize": 5,
```

```
        "ServiceName": "Scorekeep",
        "ServiceType": "*",
        "Host": "*",
        "HTTPMethod": "*",
        "URLPath": "*",
        "Version": 1
    }
}
```

Output:

```
{
    "SamplingRuleRecord": {
        "SamplingRule": {
            "RuleName": "base-scorekeep",
            "RuleARN": "arn:aws:xray:us-west-2:123456789012:sampling-rule/base-
scorekeep",
            "ResourceARN": "*",
            "Priority": 9000,
            "FixedRate": 0.1,
            "ReservoirSize": 5,
            "ServiceName": "Scorekeep",
            "ServiceType": "*",
            "Host": "*",
            "HTTPMethod": "*",
            "URLPath": "*",
            "Version": 1,
            "Attributes": {}
        },
        "CreatedAt": 1530574410.0,
        "ModifiedAt": 1530574410.0
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the Amazon X-Ray API in the *Amazon X-Ray Developer Guide*.

- For API details, see CreateSamplingRule in *Amazon CLI Command Reference*.

`delete-group`

The following code example shows how to use `delete-group`.

Amazon CLI

To delete a group

The following `delete-group` example deletes the specified group resource.

```
aws xray delete-group \
    --group-name "AdminGroup" \
    --group-arn "arn:aws:xray:us-east-2:123456789012:group/AdminGroup/123456789"
```

This command produces no output.

For more information, see Configuring Sampling, Groups, and Encryption Settings with the Amazon X-Ray API in the *Amazon X-Ray Developer Guide*.

- For API details, see DeleteGroup in *Amazon CLI Command Reference*.

`delete-sampling-rule`

The following code example shows how to use `delete-sampling-rule`.

Amazon CLI

To delete a sampling rule

The following `delete-sampling-rule` example deletes the specified sampling rule. You can specify the group by using either the group name or group ARN.

```
aws xray delete-sampling-rule \
    --rule-name polling-scorekeep
```

Output:

```
{
    "SamplingRuleRecord": {
        "SamplingRule": {
            "RuleName": "polling-scorekeep",
            "RuleARN": "arn:aws:xray:us-west-2:123456789012:sampling-rule/polling-
scorekeep",
            "ResourceARN": "*",
            "Priority": 5000,
```

```
            "FixedRate": 0.003,
            "ReservoirSize": 0,
            "ServiceName": "Scorekeep",
            "ServiceType": "*",
            "Host": "*",
            "HTTPMethod": "GET",
            "URLPath": "/api/state/*",
            "Version": 1,
            "Attributes": {}
        },
        "CreatedAt": 1530574399.0,
        "ModifiedAt": 1530574399.0
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the Amazon X-Ray API in the *Amazon X-Ray Developer Guide*.

- For API details, see DeleteSamplingRule in *Amazon CLI Command Reference*.

`get-encryption-config`

The following code example shows how to use `get-encryption-config`.

Amazon CLI

To retrieve the encryption configuration

The following `get-encryption-config` example retrieves the current encryption configuration for your Amazon X-Ray data.

```
aws xray get-encryption-config
```

Output:

```
{
    "EncryptionConfig": {
        "KeyId": "ae4aa6d49-a4d8-9df9-a475-4ff6d7898456",
        "Status": "ACTIVE",
        "Type": "NONE"
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the Amazon X-Ray API in the *Amazon X-Ray Developer Guide*.

- For API details, see GetEncryptionConfig in *Amazon CLI Command Reference*.

`get-group`

The following code example shows how to use `get-group`.

Amazon CLI

To retrieve a group

The following `get-group` example displays details for the specified group resource. The details include the group name, the group ARN, and the filter expression that defines the criteria for that group. Groups can also be retrieved by ARN.

```
aws xray get-group \
    --group-name "AdminGroup"
```

Output:

```
{
    "Group": [
        {
            "GroupName": "AdminGroup",
            "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/
AdminGroup/123456789",
            "FilterExpression": "service(\"mydomain.com\") {fault OR error}"
        }
    ]
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the Amazon X-Ray API in the *Amazon X-Ray Developer Guide*.

- For API details, see GetGroup in *Amazon CLI Command Reference*.

`get-groups`

The following code example shows how to use `get-groups`.

Amazon CLI

To retrieve all groups

The following example displays details for all active group.

```
aws xray get-groups
```

Output:

```
{
    "Groups": [
        {
            "GroupName": "AdminGroup",
            "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/
AdminGroup/123456789",
            "FilterExpression": "service(\"example.com\") {fault OR error}"
        },
        {
            "GroupName": "SDETGroup",
            "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/
SDETGroup/987654321",
            "FilterExpression": "responsetime > 2"
        }
    ]
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the Amazon X-Ray API in the *Amazon X-Ray Developer Guide*.

- For API details, see GetGroups in *Amazon CLI Command Reference*.

`get-sampling-rules`

The following code example shows how to use `get-sampling-rules`.

Amazon CLI

To retrieve all sampling rules

The following `get-sampling-rules` example displays details for all available sampling rules.:

```
aws xray get-sampling-rules
```

Output:

```
{
    "SamplingRuleRecords": [
        {
            "SamplingRule": {
                "RuleName": "Default",
                "RuleARN": "arn:aws:xray:us-east-1::sampling-rule/Default",
                "ResourceARN": "*",
                "Priority": 10000,
                "FixedRate": 0.01,
                "ReservoirSize": 0,
                "ServiceName": "*",
                "ServiceType": "*",
                "Host": "*",
                "HTTPMethod": "*",
                "URLPath": "*",
                "Version": 1,
                "Attributes": {}
            },
            "CreatedAt": 0.0,
            "ModifiedAt": 1530558121.0
        },
        {
            "SamplingRule": {
                "RuleName": "base-scorekeep",
                "RuleARN": "arn:aws:xray:us-east-1::sampling-rule/base-scorekeep",
                "ResourceARN": "*",
                "Priority": 9000,
                "FixedRate": 0.1,
                "ReservoirSize": 2,
                "ServiceName": "Scorekeep",
                "ServiceType": "*",
                "Host": "*",
                "HTTPMethod": "*",
                "URLPath": "*",
                "Version": 1,
                "Attributes": {}
            },
            "CreatedAt": 1530573954.0,
            "ModifiedAt": 1530920505.0
```

```
        },
        {
            "SamplingRule": {
                "RuleName": "polling-scorekeep",
                "RuleARN": "arn:aws:xray:us-east-1::sampling-rule/polling-
scorekeep",
                "ResourceARN": "*",
                "Priority": 5000,
                "FixedRate": 0.003,
                "ReservoirSize": 0,
                "ServiceName": "Scorekeep",
                "ServiceType": "*",
                "Host": "*",
                "HTTPMethod": "GET",
                "URLPath": "/api/state/*",
                "Version": 1,
                "Attributes": {}
            },
            "CreatedAt": 1530918163.0,
            "ModifiedAt": 1530918163.0
        }
    ]
}
```

For more information, see Using Sampling Rules with the X-Ray API in the *Amazon X-Ray Developer Guide*.

- For API details, see GetSamplingRules in *Amazon CLI Command Reference*.

`get-sampling-targets`

The following code example shows how to use `get-sampling-targets`.

Amazon CLI

To request a sampling quota

The following `get-sampling-targets` example requests a sampling quota for rules that the service is using to sample requests. The response from Amazon X-Ray includes a quota that can be used instead of borrowing from the reservoir.

```
aws xray get-sampling-targets \
```

```
    --sampling-statistics-documents '[ { "RuleName": "base-scorekeep", "ClientID":
"ABCDEF1234567890ABCDEF10", "Timestamp": "2018-07-07T00:20:06, "RequestCount": 110,
"SampledCount": 20, "BorrowCount": 10 }, { "RuleName": "polling-scorekeep", 31,
"BorrowCount": 0 } ]'
```

Output:

```
{
    "SamplingTargetDocuments": [
        {
            "RuleName": "base-scorekeep",
            "FixedRate": 0.1,
            "ReservoirQuota": 2,
            "ReservoirQuotaTTL": 1530923107.0,
            "Interval": 10
        },
        {
            "RuleName": "polling-scorekeep",
            "FixedRate": 0.003,
            "ReservoirQuota": 0,
            "ReservoirQuotaTTL": 1530923107.0,
            "Interval": 10
        }
    ],
    "LastRuleModification": 1530920505.0,
    "UnprocessedStatistics": []
}
```

For more information, see Using Sampling Rules with the X-Ray API in the *Amazon X-Ray Developer Guide*.

- For API details, see GetSamplingTargets in *Amazon CLI Command Reference*.

`get-service-graph`

The following code example shows how to use `get-service-graph`.

Amazon CLI

To get a service graph

The following example displays a document within a specified time period that describes services processing incoming requests, and the downstream services that they call as a result.:

```
aws xray get-service-graph \
    --start-time 1568835392.0
    --end-time 1568835446.0
```

Output:

```
{
    "Services": [
        {
            "ReferenceId": 0,
            "Name": "Scorekeep",
            "Names": [
                "Scorekeep"
            ],
            "Root": true,
            "Type": "AWS::ElasticBeanstalk::Environment",
            "State": "active",
            "StartTime": 1568835392.0,
            "EndTime": 1568835446.0,
            "Edges": [
                {
                    "ReferenceId": 1,
                    "StartTime": 1568835392.0,
                    "EndTime": 1568835446.0,
                    "SummaryStatistics": {
                        "OkCount": 14,
                        "ErrorStatistics": {
                            "ThrottleCount": 0,
                            "OtherCount": 0,
                            "TotalCount": 0
                        },
                        "FaultStatistics": {
                            "OtherCount": 0,
                            "TotalCount": 0
                        },
                        "TotalCount": 14,
                        "TotalResponseTime": 0.13
                    },
                    "ResponseTimeHistogram": [
                        {
                            "Value": 0.008,
                            "Count": 1
                        },
```

```
                        {
                            "Value": 0.005,

`get-trace-summaries`

The following code example shows how to use `get-trace-summaries`.

Amazon CLI

To get a trace summary

The following `get-trace-summaries` example retrieves IDs and metadata for traces available within a specified time frame.

```
aws xray get-trace-summaries \
    --start-time 1568835392.0 \
    --end-time 1568835446.0
```

Output:

```
[
    "http://scorekeep-env-1.123456789.us-east-2.elasticbeanstalk.com/api/move/
VSAE93HF/GSSD2NTB/DP0PCC09",
    "http://scorekeep-env-1.123456789.us-east-2.elasticbeanstalk.com/api/move/
GCQ2B35P/FREELDFT/4LRE643M",
    "http://scorekeep-env-1.123456789.us-east-2.elasticbeanstalk.com/api/game/
VSAE93HF/GSSD2NTB/starttime/1568835513",
    "http://scorekeep-env-1.123456789.us-east-2.elasticbeanstalk.com/api/
move/4MQNA5NN/L99KK2RF/null"
]
```

For more information, see Using the Amazon X-Ray API with the Amazon CLI in the *Amazon X-Ray Developer Guide*.

- For API details, see GetTraceSummaries in *Amazon CLI Command Reference*.

`put-encryption-config`

The following code example shows how to use `put-encryption-config`.

Amazon CLI

To update the encryption configuration

The following put-encryption-config``example updates the encryption configuration for AWS X-Ray data to use the default AWS managed KMS key ``aws/xray.

```
aws xray put-encryption-config \
    --type KMS \
    --key-id alias/aws/xray
```

Output:

```
{
    "EncryptionConfig": {
        "KeyId": "arn:aws:kms:us-west-2:123456789012:key/c234g4e8-39e9-4gb0-84e2-
b0ea215cbba5",
        "Status": "UPDATING",
        "Type": "KMS"
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the Amazon X-Ray API in the *Amazon X-Ray Developer Guide*.

- For API details, see PutEncryptionConfig in *Amazon CLI Command Reference*.

put-trace-segments

The following code example shows how to use put-trace-segments.

Amazon CLI

To upload a segment

The following put-trace-segments example uploads segment documents to Amazon X-Ray. The segment document is consumed as a list of JSON segment documents.

```
aws xray put-trace-segments \
    --trace-segment-documents "{\"id\":\"20312a0e2b8809f4\",\"name
\":\"DynamoDB\",\"trace_id\":\"1-5832862d-a43aafded3334a971fe312db\",
\"start_time\":1.479706157195E9,\"end_time\":1.479706157202E9,\"parent_id\":
\"79736b962fe3239e\",\"http\":{\"response\":{\"content_length\":60,\"status
\":200}},\"inferred\":true,\"aws\":{\"consistent_read\":false,\"table_name
\":\"scorekeep-session-xray\",\"operation\":\"GetItem\",\"request_id\":
```

```
\"SCAU23OM6M8FO38UASGC7785ARVV4KQNSO5AEMVJF66Q9ASUAAJG\",\"resource_names\":
[\"scorekeep-session-xray\"]},\"origin\":\"AWS::DynamoDB::Table\"}"
```

Output:

```
{
    "UnprocessedTraceSegments": []
}
```

For more information, see Sending Trace Data to Amazon X-Ray in the *Amazon X-Ray Developer Guide*.

- For API details, see PutTraceSegments in *Amazon CLI Command Reference*.

`update-group`

The following code example shows how to use `update-group`.

Amazon CLI

To update a group

The following `update-group` example updates the criteria by which to accept traces into the group named `AdminGroup`. You can specify the desired group by using either the group name or group ARN.

```
aws xray update-group \
    --group-name "AdminGroup" \
    --group-arn "arn:aws:xray:us-west-2:123456789012:group/AdminGroup/123456789" \
    --filter-expression "service(\"mydomain.com\") {fault}"
```

Output:

```
{
    "GroupName": "AdminGroup",
    "GroupARN": "arn:aws:xray:us-east-2:123456789012:group/AdminGroup/123456789",
    "FilterExpression": "service(\"mydomain.com\") {fault}"
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the Amazon X-Ray API in the *Amazon X-Ray Developer Guide*.

- For API details, see UpdateGroup in *Amazon CLI Command Reference*.

`update-sampling-rule`

The following code example shows how to use `update-sampling-rule`.

Amazon CLI

To update a sampling rule

The following `update-sampling-rule` example modifies a sampling rule's configuration. The rules are consumed from a JSON file. Only the fields being updated are required.

```
aws xray update-sampling-rule \
   --cli-input-json file://1000-default.json
```

Contents of `1000-default.json`:

```
{
    "SamplingRuleUpdate": {
        "RuleName": "Default",
        "FixedRate": 0.01,
        "ReservoirSize": 0
    }
}
```

Output:

```
{
    "SamplingRuleRecords": [
        {
            "SamplingRule": {
                "RuleName": "Default",
                "RuleARN": "arn:aws:xray:us-west-2:123456789012:sampling-rule/
Default",
                "ResourceARN": "*",
                "Priority": 10000,
                "FixedRate": 0.01,
                "ReservoirSize": 0,
                "ServiceName": "*",
                "ServiceType": "*",
```

```
                "Host": "*",
                "HTTPMethod": "*",
                "URLPath": "*",
                "Version": 1,
                "Attributes": {}
            },
            "CreatedAt": 0.0,
            "ModifiedAt": 1529959993.0
        }
    ]
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the Amazon X-Ray API in the *Amazon X-Ray Developer Guide*.

- For API details, see UpdateSamplingRule in *Amazon CLI Command Reference*.

Amazon CLI with Bash script code examples

The code examples in this topic show you how to use the Amazon Command Line Interface with Bash script with Amazon.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other Amazon Web Services services.

Some services contain additional example categories that show how to leverage libraries or functions specific to the service.

Services

- DynamoDB examples using Amazon CLI with Bash script
- Amazon EC2 examples using Amazon CLI with Bash script
- HealthImaging examples using Amazon CLI with Bash script
- IAM examples using Amazon CLI with Bash script
- Amazon KMS examples using Amazon CLI with Bash script

- Amazon S3 examples using Amazon CLI with Bash script
- Amazon STS examples using Amazon CLI with Bash script

DynamoDB examples using Amazon CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Bash script with DynamoDB.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other Amazon Web Services services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Basics
- Actions
- Scenarios

Basics

Learn the basics

The following code example shows how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table, then delete the table.

Amazon CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

The DynamoDB getting started scenario.

```
###############################################################################

}
```

The utility functions used in this example.

```
###############################################################################
```

```
# function iecho
#
# This function enables the script to display the specified text only if
# the global variable $VERBOSE is set to true.
#############################################################################
function iecho() {
  if [[ $VERBOSE == true ]]; then
    echo "$@"
  fi
}

#############################################################################
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
#############################################################################
function errecho() {
  printf "%s\n" "$*" 1>&2
}

#############################################################################
# function aws_cli_error_log()
#
# This function is used to log the error messages from the AWS CLI.
#
# See https://docs.aws.amazon.com/cli/latest/topic/return-codes.html#cli-aws-help-
return-codes.
#
# The function expects the following argument:
#         $1 - The error code returned by the AWS CLI.
#
#  Returns:
#          0: - Success.
#
#############################################################################
function aws_cli_error_log() {
  local err_code=$1
  errecho "Error code : $err_code"
  if [ "$err_code" == 1 ]; then
    errecho "  One or more S3 transfers failed."
  elif [ "$err_code" == 2 ]; then
    errecho "  Command line failed to parse."
  elif [ "$err_code" == 130 ]; then
    errecho "  Process received SIGINT."
```

Scenarios

Advanced Global Secondary Index scenarios

The following code example shows how to work with advanced Global Secondary Index configurations.

- Create a table with multiple GSIs.
- Create a table with on-demand capacity and GSI.
- Put items into a table with multiple GSIs.
- Query multiple GSIs with different conditions.

Amazon CLI with Bash script

Create a table with multiple GSIs.

```
# Create a table with multiple GSIs
aws dynamodb create-table \
    --table-name MusicLibrary \
    --attribute-definitions \
        AttributeName=Artist,AttributeType=S \
        AttributeName=SongTitle,AttributeType=S \
        AttributeName=AlbumTitle,AttributeType=S \
        AttributeName=Genre,AttributeType=S \
```

```
        AttributeName=Year,AttributeType=N \
    --key-schema \
        AttributeName=Artist,KeyType=HASH \
        AttributeName=SongTitle,KeyType=RANGE \
    --billing-mode PAY_PER_REQUEST \
    --global-secondary-indexes \
        "[
            {
                \"IndexName\": \"AlbumIndex\",
                \"KeySchema\": [{\"AttributeName\":\"AlbumTitle\",\"KeyType\":\"HASH
\"}],
                \"Projection\": {\"ProjectionType\":\"ALL\"}
            },
            {
                \"IndexName\": \"GenreYearIndex\",
                \"KeySchema\": [
                    {\"AttributeName\":\"Genre\",\"KeyType\":\"HASH\"},
                    {\"AttributeName\":\"Year\",\"KeyType\":\"RANGE\"}
                ],
                \"Projection\": {\"ProjectionType\":\"INCLUDE\",\"NonKeyAttributes
\":[\"Artist\",\"SongTitle\"]}
            }
        ]"
```

Create a table with on-demand capacity and GSI.

```
# Create a table with on-demand capacity and GSI
aws dynamodb create-table \
    --table-name MusicOnDemand \
    --attribute-definitions \
        AttributeName=Artist,AttributeType=S \
        AttributeName=SongTitle,AttributeType=S \
        AttributeName=Genre,AttributeType=S \
    --key-schema \
        AttributeName=Artist,KeyType=HASH \
        AttributeName=SongTitle,KeyType=RANGE \
    --billing-mode PAY_PER_REQUEST \
    --global-secondary-indexes \
        "[
            {
                \"IndexName\": \"GenreIndex\",
                \"KeySchema\": [{\"AttributeName\":\"Genre\",\"KeyType\":\"HASH\"}],
```

```
                \"Projection\": {\"ProjectionType\":\"ALL\"}
            }
        ]"
```

Put items into a table with multiple GSIs.

```
# Add items to MusicLibrary table
aws dynamodb put-item \
    --table-name MusicLibrary \
    --item '{
        "Artist": {"S": "The Beatles"},
        "SongTitle": {"S": "Hey Jude"},
        "AlbumTitle": {"S": "Past Masters"},
        "Genre": {"S": "Rock"},
        "Year": {"N": "1968"}
    }'

aws dynamodb put-item \
    --table-name MusicLibrary \
    --item '{
        "Artist": {"S": "Miles Davis"},
        "SongTitle": {"S": "So What"},
        "AlbumTitle": {"S": "Kind of Blue"},
        "Genre": {"S": "Jazz"},
        "Year": {"N": "1959"}
    }'
```

Query items from a table with multiple GSIs.

```
# Query the AlbumIndex GSI
echo "Querying AlbumIndex GSI:"
aws dynamodb query \
    --table-name MusicLibrary \
    --index-name AlbumIndex \
    --key-condition-expression "AlbumTitle = :album" \
    --expression-attribute-values '{":album":{"S":"Kind of Blue"}}'

# Query the GenreYearIndex GSI with a range condition
echo "Querying GenreYearIndex GSI with range condition:"
aws dynamodb query \
    --table-name MusicLibrary \
```

```
    --index-name GenreYearIndex \
    --key-condition-expression "Genre = :genre AND #yr > :year" \
    --expression-attribute-names '{"#yr": "Year"}' \
    --expression-attribute-values '{":genre":{"S":"Rock"},":year":{"N":"1965"}}'
```

Create and manage MRSC global tables

The following code example shows how to create and manage DynamoDB global tables with Multi-Region Strong Consistency (MRSC).

- Create a table with Multi-Region Strong Consistency.
- Verify MRSC configuration and replica status.
- Test strong consistency across Regions with immediate reads.
- Perform conditional writes with MRSC guarantees.
- Clean up MRSC global table resources.

Amazon CLI with Bash script

Create a table with Multi-Region Strong Consistency.

```
# Step 1: Create a new table in us-east-2 (primary region for MRSC)
# Note: Table must be empty when enabling MRSC
aws dynamodb create-table \
    --table-name MusicTable \
    --attribute-definitions \
        AttributeName=Artist,AttributeType=S \
        AttributeName=SongTitle,AttributeType=S \
    --key-schema \
        AttributeName=Artist,KeyType=HASH \
        AttributeName=SongTitle,KeyType=RANGE \
    --billing-mode PAY_PER_REQUEST \
    --region us-east-2
```

```
# Wait for table to become active
aws dynamodb wait table-exists --table-name MusicTable --region us-east-2

# Step 2: Add replica and witness with Multi-Region Strong Consistency
# MRSC requires exactly three replicas in supported regions
aws dynamodb update-table \
    --table-name MusicTable \
    --replica-updates '[{"Create": {"RegionName": "us-east-1"}}]' \
    --global-table-witness-updates '[{"Create": {"RegionName": "us-west-2"}}]' \
    --multi-region-consistency STRONG \
    --region us-east-2
```

Verify MRSC configuration and replica status.

```
# Verify the global table configuration and MRSC setting
aws dynamodb describe-table \
    --table-name MusicTable \
    --region us-east-2 \
    --query 'Table.
{TableName:TableName,TableStatus:TableStatus,MultiRegionConsistency:MultiRegionConsistency,R
{Region:RegionName,Status:ReplicaStatus}}'
```

Test strong consistency with immediate reads across Regions.

```
# Write an item to the primary region
aws dynamodb put-item \
    --table-name MusicTable \
    --item '{"Artist": {"S":"The Beatles"},"SongTitle": {"S":"Hey Jude"},"Album":
 {"S":"The Beatles 1967-1970"},"Year": {"N":"1968"}}' \
    --region us-east-2

# Read the item from replica region to verify strong consistency (cannot read or
 write to witness)
# No wait time needed - MRSC provides immediate consistency
echo "Reading from us-east-1 (immediate consistency):"
aws dynamodb get-item \
    --table-name MusicTable \
    --key '{"Artist": {"S":"The Beatles"},"SongTitle": {"S":"Hey Jude"}}' \
    --consistent-read \
    --region us-east-1
```

Perform conditional writes with MRSC guarantees.

```
# Perform a conditional update from a different region
# This demonstrates that conditions work consistently across all regions
aws dynamodb update-item \
    --table-name MusicTable \
    --key '{"Artist": {"S":"The Beatles"},"SongTitle": {"S":"Hey Jude"}}' \
    --update-expression "SET #rating = :rating" \
    --condition-expression "attribute_exists(Artist)" \
    --expression-attribute-names '{"#rating": "Rating"}' \
    --expression-attribute-values '{":rating": {"N":"5"}}' \
    --region us-east-1
```

Clean up MRSC global table resources.

```
# Remove replica tables (must be done before deleting the primary table)
aws dynamodb update-table \
    --table-name MusicTable \
    --replica-updates '[{"Delete": {"RegionName": "us-east-1"}}]' \
    --global-table-witness-updates '[{"Delete": {"RegionName": "us-west-2"}}]' \
    --region us-east-2

# Wait for replicas to be deleted
echo "Waiting for replicas to be deleted..."
sleep 30

# Delete the primary table
aws dynamodb delete-table \
    --table-name MusicTable \
    --region us-east-2
```

Manage Global Secondary Indexes

The following code example shows how to manage the complete lifecycle of Global Secondary Indexes.

- Create a table with a Global Secondary Index.
- Add a new GSI to an existing table.
- Update (increase) GSI warm throughput.
- Query data using GSIs.
- Delete a GSI.

Amazon CLI with Bash script

Create a table with a Global Secondary Index.

```
# Create a table with a GSI
aws dynamodb create-table \
    --table-name MusicCollection \
    --attribute-definitions \
        AttributeName=Artist,AttributeType=S \
        AttributeName=SongTitle,AttributeType=S \
        AttributeName=AlbumTitle,AttributeType=S \
    --key-schema \
        AttributeName=Artist,KeyType=HASH \
        AttributeName=SongTitle,KeyType=RANGE \
    --billing-mode PAY_PER_REQUEST \
    --global-secondary-indexes \
        "IndexName=AlbumIndex,\
        KeySchema=[{AttributeName=AlbumTitle,KeyType=HASH}],\
        Projection={ProjectionType=ALL}"
```

Add a new (on-demand) GSI to an existing table.

```
# Add a new GSI to an existing table
```

```
aws dynamodb update-table \
    --table-name MusicCollection \
    --attribute-definitions \
        AttributeName=Genre,AttributeType=S \
    --global-secondary-index-updates \
        "[{\"Create\":{\"IndexName\":\"GenreIndex\",\
        \"KeySchema\":[{\"AttributeName\":\"Genre\",\"KeyType\":\"HASH\"}],\
        \"Projection\":{\"ProjectionType\":\"ALL\"}}}]"
```

Update (increase) GSI warm throughput.

```
# Increase the warm throughput of a GSI (default values are 12k reads, 4k writes)
aws dynamodb update-table \
    --table-name MusicCollection \
    --global-secondary-index-updates \
        "[{\"Update\":{\"IndexName\":\"AlbumIndex\",\
        \"WarmThroughput\":{\"ReadUnitsPerSecond\":15000,\"WriteUnitsPerSecond
\":6000}}}]"
```

Query data using GSIs.

```
# Query the AlbumIndex GSI
aws dynamodb query \
    --table-name MusicCollection \
    --index-name AlbumIndex \
    --key-condition-expression "AlbumTitle = :album" \
    --expression-attribute-values '{":album":{"S":"Let It Be"}}'

# Query the GenreIndex GSI
aws dynamodb query \
    --table-name MusicCollection \
    --index-name GenreIndex \
    --key-condition-expression "Genre = :genre" \
    --expression-attribute-values '{":genre":{"S":"Jazz"}}'
```

Delete a GSI.

```
# Delete a GSI from a table
aws dynamodb update-table \
```

```
    --table-name MusicCollection \
    --global-secondary-index-updates \
        "[{\"Delete\":{\"IndexName\":\"GenreIndex\"}}]"
```

  - CreateTable
  - DeleteTable
  - Query
  - UpdateTable

Manage resource-based policies

The following code example shows how to manage the complete lifecycle of resource-based policies for DynamoDB tables.

- Create a table with a resource policy.
- Get a resource policy.
- Update a resource policy.
- Delete a resource policy.

Amazon CLI with Bash script

Create a table with a resource policy.

```
# Step 1: Create a DynamoDB table
aws dynamodb create-table \
    --table-name MusicCollection \
    --attribute-definitions \
        AttributeName=Artist,AttributeType=S \
        AttributeName=SongTitle,AttributeType=S \
    --key-schema \
        AttributeName=Artist,KeyType=HASH \
        AttributeName=SongTitle,KeyType=RANGE \
    --billing-mode PAY_PER_REQUEST

# Step 2: Create a resource-based policy document
cat > policy.json << 'EOF'
```

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::123456789012:role/DynamoDBReadOnly"
      },
      "Action": [
        "dynamodb:GetItem",
        "dynamodb:BatchGetItem",
        "dynamodb:Query",
        "dynamodb:Scan"
      ],
      "Resource": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection"
    }
  ]
}
EOF

# Step 3: Attach the resource-based policy to the table
aws dynamodb put-resource-policy \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
    --policy file://policy.json
```

Get a resource policy.

```
# Get the resource-based policy attached to a table
aws dynamodb get-resource-policy \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection
```

Update a resource policy.

```
# Step 1: Create an updated policy document
cat > updated-policy.json << 'EOF'
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
```

```
        "AWS": [
          "arn:aws:iam::123456789012:role/DynamoDBReadOnly",
          "arn:aws:iam::123456789012:role/DynamoDBAnalytics"
        ]
      },
      "Action": [
        "dynamodb:GetItem",
        "dynamodb:BatchGetItem",
        "dynamodb:Query",
        "dynamodb:Scan"
      ],
      "Resource": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection"
    }
  ]
}
EOF

# Step 2: Update the resource-based policy on the table
aws dynamodb put-resource-policy \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
    --policy file://updated-policy.json
```

Delete a resource policy.

```
# Delete the resource-based policy from a table
aws dynamodb delete-resource-policy \
    --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection
```

  - DeleteResourcePolicy
  - GetResourcePolicy
  - PutResourcePolicy

Set up Attribute-Based Access Control

The following code example shows how to implement Attribute-Based Access Control (ABAC) for DynamoDB.

- Create an IAM policy for ABAC.
- Create tables with tags for different departments.
- List and filter tables based on tags.

Amazon CLI with Bash script

Create an IAM policy for ABAC.

```
# Step 1: Create a policy document for ABAC
cat > abac-policy.json << 'EOF'
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "dynamodb:GetItem",
        "dynamodb:BatchGetItem",
        "dynamodb:Query",
        "dynamodb:Scan"
      ],
      "Resource": "arn:aws:dynamodb:*:*:table/*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceTag/Department": "${aws:PrincipalTag/Department}"
        }
      }
    },
    {
      "Effect": "Allow",
      "Action": [
        "dynamodb:PutItem",
        "dynamodb:UpdateItem",
        "dynamodb:DeleteItem",
        "dynamodb:BatchWriteItem"
      ],
      "Resource": "arn:aws:dynamodb:*:*:table/*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceTag/Department": "${aws:PrincipalTag/Department}",
          "aws:ResourceTag/Environment": "Development"
        }
```

```
      }
    }
  ]
}
EOF

# Step 2: Create the IAM policy
aws iam create-policy \
    --policy-name DynamoDBDepartmentBasedAccess \
    --policy-document file://abac-policy.json
```

Create tables with tags for different departments.

```
# Create a DynamoDB table with tags for ABAC
aws dynamodb create-table \
    --table-name FinanceData \
    --attribute-definitions \
        AttributeName=RecordID,AttributeType=S \
    --key-schema \
        AttributeName=RecordID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --tags \
        Key=Department,Value=Finance \
        Key=Environment,Value=Development

# Create another table with different tags
aws dynamodb create-table \
    --table-name MarketingData \
    --attribute-definitions \
        AttributeName=RecordID,AttributeType=S \
    --key-schema \
        AttributeName=RecordID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --tags \
        Key=Department,Value=Marketing \
        Key=Environment,Value=Production
```

List and filter tables based on tags.

```
# List all DynamoDB tables
echo "Listing all tables:"
```

```
aws dynamodb list-tables

# Get ARNs for all tables
echo -e "\nGetting ARNs for all tables:"
TABLE_ARNS=$(aws dynamodb list-tables --query "TableNames[*]" --output text | xargs
 -I {} aws dynamodb describe-table --table-name {} --query "Table.TableArn" --output
 text)

# For each table ARN, list its tags
echo -e "\nListing tags for each table:"
for ARN in $TABLE_ARNS; do
    TABLE_NAME=$(echo $ARN | awk -F/ '{print $2}')
    echo -e "\nTags for table: $TABLE_NAME"
    aws dynamodb list-tags-of-resource --resource-arn $ARN
done

# Example: Find tables with a specific tag
echo -e "\nFinding tables with Environment=Production tag:"
for ARN in $TABLE_ARNS; do
    TABLE_NAME=$(echo $ARN | awk -F/ '{print $2}')
    TAGS=$(aws dynamodb list-tags-of-resource --resource-arn $ARN --query "Tags[?
Key=='Environment' && Value=='Production']" --output text)
    if [ ! -z "$TAGS" ]; then
        echo "Table with Production tag: $TABLE_NAME"
    fi
done
```

- For API details, see the following topics in *Amazon CLI Command Reference*.
  - CreatePolicy
  - CreateTable
  - ListTables

Work with Local Secondary Indexes

The following code example shows how to create and query tables with Local Secondary Indexes.

- Create a table with a Local Secondary Index (LSI).
- Create a table with multiple LSIs with different projection types.
- Query data using LSIs.

Amazon CLI with Bash script

Create a table with a Local Secondary Index.

```
# Create a table with a Local Secondary Index
aws dynamodb create-table \
    --table-name CustomerOrders \
    --attribute-definitions \
        AttributeName=CustomerID,AttributeType=S \
        AttributeName=OrderID,AttributeType=S \
        AttributeName=OrderDate,AttributeType=S \
    --key-schema \
        AttributeName=CustomerID,KeyType=HASH \
        AttributeName=OrderID,KeyType=RANGE \
    --local-secondary-indexes \
        "IndexName=OrderDateIndex,\
        KeySchema=[{AttributeName=CustomerID,KeyType=HASH},
{AttributeName=OrderDate,KeyType=RANGE}],\
        Projection={ProjectionType=ALL}" \
    --billing-mode PAY_PER_REQUEST
```

Create a table with multiple LSIs.

```
# Create a table with multiple Local Secondary Indexes
aws dynamodb create-table \
    --table-name CustomerDetails \
    --attribute-definitions \
        AttributeName=CustomerID,AttributeType=S \
        AttributeName=Name,AttributeType=S \
        AttributeName=Email,AttributeType=S \
        AttributeName=RegistrationDate,AttributeType=S \
    --key-schema \
        AttributeName=CustomerID,KeyType=HASH \
        AttributeName=Name,KeyType=RANGE \
    --local-secondary-indexes \
        "[
            {
                \"IndexName\": \"EmailIndex\",
                \"KeySchema\": [
                    {\"AttributeName\":\"CustomerID\",\"KeyType\":\"HASH\"},
                    {\"AttributeName\":\"Email\",\"KeyType\":\"RANGE\"}
                ],
```

```
                \"Projection\": {\"ProjectionType\":\"INCLUDE\",\"NonKeyAttributes
\":[\"Address\",\"Phone\"]}
            },
            {
                \"IndexName\": \"RegistrationIndex\",
                \"KeySchema\": [
                    {\"AttributeName\":\"CustomerID\",\"KeyType\":\"HASH\"},
                    {\"AttributeName\":\"RegistrationDate\",\"KeyType\":\"RANGE\"}
                ],
                \"Projection\": {\"ProjectionType\":\"KEYS_ONLY\"}
            }
        ]" \
    --billing-mode PAY_PER_REQUEST
```

Query data using LSIs.

```
# Query the OrderDateIndex LSI
aws dynamodb query \
    --table-name CustomerOrders \
    --index-name OrderDateIndex \
    --key-condition-expression "CustomerID = :custId AND OrderDate BETWEEN :date1
 AND :date2" \
    --expression-attribute-values '{
        ":custId": {"S": "C1"},
        ":date1": {"S": "2023-01-01"},
        ":date2": {"S": "2023-02-01"}
    }'

# Query with a filter expression
aws dynamodb query \
    --table-name CustomerOrders \
    --index-name OrderDateIndex \
    --key-condition-expression "CustomerID = :custId" \
    --filter-expression "Amount > :amount" \
    --expression-attribute-values '{
        ":custId": {"S": "C1"},
        ":amount": {"N": "150"}
    }'
```

- For API details, see the following topics in *Amazon CLI Command Reference*.
  - CreateTable

- Query

Work with Streams and Time-to-Live

The following code example shows how to manage DynamoDB Streams and Time-to-Live features.

- Create a table with Streams enabled.
- Describe Streams.
- Create a Lambda function for processing Streams.
- Enable TTL on a table.
- Add items with TTL attributes.
- Describe TTL settings.

Amazon CLI with Bash script

Create a table with Streams enabled.

```
# Create a table with DynamoDB Streams enabled
aws dynamodb create-table \
    --table-name StreamsDemo \
    --attribute-definitions \
        AttributeName=ID,AttributeType=S \
    --key-schema \
        AttributeName=ID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --stream-specification StreamEnabled=true,StreamViewType=NEW_AND_OLD_IMAGES
```

Describe Streams.

```
# Get information about the stream
aws dynamodb describe-table \
    --table-name StreamsDemo \
    --query "Table.StreamSpecification"

# Get the stream ARN
STREAM_ARN=$(aws dynamodb describe-table \
    --table-name StreamsDemo \
    --query "Table.LatestStreamArn" \
```

```
    --output text)

echo "Stream ARN: $STREAM_ARN"

# Describe the stream
aws dynamodbstreams describe-stream \
    --stream-arn $STREAM_ARN
```

Create a Lambda function for Streams.

```
# Step 1: Create an IAM role for the Lambda function
cat > trust-policy.json << 'EOF'
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "lambda.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
EOF

aws iam create-role \
    --role-name DynamoDBStreamsLambdaRole \
    --assume-role-policy-document file://trust-policy.json

# Step 2: Attach permissions to the role
aws iam attach-role-policy \
    --role-name DynamoDBStreamsLambdaRole \
    --policy-arn arn:aws:iam::aws:policy/service-role/AWSLambdaDynamoDBExecutionRole

# Step 3: Create a Lambda function (code would be in a separate file)
echo "Lambda function creation would be done separately with appropriate code"

# Step 4: Create an event source mapping
echo "Example command to create event source mapping:"
echo "aws lambda create-event-source-mapping \\"
echo "    --function-name ProcessDynamoDBRecords \\"
```

```
echo "    --event-source $STREAM_ARN \\"
echo "    --batch-size 100 \\"
echo "    --starting-position LATEST"
```

Enable TTL on a table.

```
# Create a table for TTL demonstration
aws dynamodb create-table \
    --table-name TTLDemo \
    --attribute-definitions \
        AttributeName=ID,AttributeType=S \
    --key-schema \
        AttributeName=ID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST

# Wait for table to become active
aws dynamodb wait table-exists --table-name TTLDemo

# Enable TTL on the table
aws dynamodb update-time-to-live \
    --table-name TTLDemo \
    --time-to-live-specification "Enabled=true, AttributeName=ExpirationTime"
```

Add items with TTL attributes.

```
# Calculate expiration time (current time + 1 day in seconds)
EXPIRATION_TIME=$(date -d "+1 day" +%s)

# Add an item with TTL attribute
aws dynamodb put-item \
    --table-name TTLDemo \
    --item '{
        "ID": {"S": "item1"},
        "Data": {"S": "This item will expire in 1 day"},
        "ExpirationTime": {"N": "'$EXPIRATION_TIME'"}
    }'

# Add an item that expires in 1 hour
EXPIRATION_TIME_HOUR=$(date -d "+1 hour" +%s)
aws dynamodb put-item \
    --table-name TTLDemo \
```

```
    --item '{
        "ID": {"S": "item2"},
        "Data": {"S": "This item will expire in 1 hour"},
        "ExpirationTime": {"N": "'$EXPIRATION_TIME_HOUR'"}
    }'
```

Describe TTL settings.

```
# Describe TTL settings for a table
aws dynamodb describe-time-to-live \
    --table-name TTLDemo
```

- For API details, see the following topics in *Amazon CLI Command Reference*.
  - AttachRolePolicy
  - CreateRole
  - CreateTable
  - DescribeTable
  - DescribeTimeToLive
  - PutItem
  - UpdateTimeToLive

Work with global tables and multi-Region replication eventual consistency (MREC)

The following code example shows how to manage DynamoDB global tables with multi-Region replication with eventual consistency (MREC).

- Create a table with multi-Region replication (MREC).
- Put and get items from replica tables.
- Remove replicas one-by-one.
- Clean up by deleting the table.

Amazon CLI with Bash script

Create a table with multi-Region replication.

```
# Step 1: Create a new table (MusicTable) in US East (Ohio), with DynamoDB Streams
 enabled (NEW_AND_OLD_IMAGES)
aws dynamodb create-table \
    --table-name MusicTable \
    --attribute-definitions \
        AttributeName=Artist,AttributeType=S \
        AttributeName=SongTitle,AttributeType=S \
    --key-schema \
        AttributeName=Artist,KeyType=HASH \
        AttributeName=SongTitle,KeyType=RANGE \
    --billing-mode PAY_PER_REQUEST \
    --stream-specification StreamEnabled=true,StreamViewType=NEW_AND_OLD_IMAGES \
    --region us-east-2

# Step 2: Create an identical MusicTable table in US East (N. Virginia)
aws dynamodb update-table --table-name MusicTable --cli-input-json \
'{
  "ReplicaUpdates":
  [
    {
      "Create": {
        "RegionName": "us-east-1"
      }
    }
  ]
}' \
--region us-east-2

# Step 3: Create a table in Europe (Ireland)
aws dynamodb update-table --table-name MusicTable --cli-input-json \
'{
  "ReplicaUpdates":
  [
    {
      "Create": {
        "RegionName": "eu-west-1"
      }
    }
  ]
}' \
--region us-east-2
```

Describe the multi-Region table.

```
# Step 4: View the list of replicas created using describe-table
aws dynamodb describe-table \
    --table-name MusicTable \
    --region us-east-2 \
    --query 'Table.
{TableName:TableName,TableStatus:TableStatus,MultiRegionConsistency:MultiRegionConsistency,R
{Region:RegionName,Status:ReplicaStatus}}'
```

Put items in a replica table.

```
# Step 5: To verify that replication is working, add a new item to the Music table
 in US East (Ohio)
aws dynamodb put-item \
    --table-name MusicTable \
    --item '{"Artist": {"S":"item_1"},"SongTitle": {"S":"Song Value 1"}}' \
    --region us-east-2
```

Get items from replica tables.

```
# Step 6: Wait for a few seconds, and then check to see whether the item has been
# successfully replicated to US East (N. Virginia) and Europe (Ireland)
aws dynamodb get-item \
    --table-name MusicTable \
    --key '{"Artist": {"S":"item_1"},"SongTitle": {"S":"Song Value 1"}}' \
    --region us-east-1

aws dynamodb get-item \
    --table-name MusicTable \
    --key '{"Artist": {"S":"item_1"},"SongTitle": {"S":"Song Value 1"}}' \
    --region eu-west-1
```

Remove replicas.

```
# Step 7: Delete the replica table in Europe (Ireland) Region
aws dynamodb update-table --table-name MusicTable --cli-input-json \
'{
  "ReplicaUpdates":
```

```
  [
    {
      "Delete": {
        "RegionName": "eu-west-1"
      }
    }
  ]
}' \
--region us-east-2

# Delete the replica table in US East (N. Virginia) Region
aws dynamodb update-table --table-name MusicTable --cli-input-json \
'{
  "ReplicaUpdates":
  [
    {
      "Delete": {
        "RegionName": "us-east-1"
      }
    }
  ]
}' \
--region us-east-2
```

Clean up by deleting the table.

```
# Clean up: Delete the primary table
aws dynamodb delete-table --table-name MusicTable --region us-east-2

echo "Global table demonstration complete."
```

- For API details, see the following topics in *Amazon CLI Command Reference*.
  - CreateTable
  - DeleteTable
  - DescribeTable
  - GetItem
  - PutItem
  - UpdateTable

Work with resource tagging

The following code example shows how to manage tags for DynamoDB resources.

- Create a table with tags.
- List tags for a resource.
- Add tags to a resource.
- Remove tags from a resource.
- Filter tables by tags.

Amazon CLI with Bash script

Create a table with tags.

```
# Create a table with tags
aws dynamodb create-table \
    --table-name TaggedTable \
    --attribute-definitions \
        AttributeName=ID,AttributeType=S \
    --key-schema \
        AttributeName=ID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --tags \
        Key=Environment,Value=Production \
        Key=Project,Value=Analytics \
        Key=Owner,Value=DataTeam
```

List tags for a resource.

```
# Get the table ARN
TABLE_ARN=$(aws dynamodb describe-table \
    --table-name TaggedTable \
    --query "Table.TableArn" \
    --output text)

# List tags for the table
aws dynamodb list-tags-of-resource \
    --resource-arn $TABLE_ARN
```

Add tags to a resource.

```
# Add tags to an existing table
aws dynamodb tag-resource \
    --resource-arn $TABLE_ARN \
    --tags \
        Key=CostCenter,Value=12345 \
        Key=BackupSchedule,Value=Daily
```

Remove tags from a resource.

```
# Remove tags from a table
aws dynamodb untag-resource \
    --resource-arn $TABLE_ARN \
    --tag-keys Owner BackupSchedule
```

Filter tables by tags.

```
# Create another table with different tags
aws dynamodb create-table \
    --table-name AnotherTaggedTable \
    --attribute-definitions \
        AttributeName=ID,AttributeType=S \
    --key-schema \
        AttributeName=ID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --tags \
        Key=Environment,Value=Development \
        Key=Project,Value=Testing

# Wait for table to become active
aws dynamodb wait table-exists --table-name AnotherTaggedTable

# List all tables
echo "All tables:"
aws dynamodb list-tables

# Get ARNs for all tables
echo -e "\nFiltering tables by Environment=Production tag:"
```

```
TABLE_ARNS=$(aws dynamodb list-tables --query "TableNames[*]" --output text | xargs
 -I {} aws dynamodb describe-table --table-name {} --query "Table.TableArn" --output
 text)

# Find tables with specific tag
for ARN in $TABLE_ARNS; do
    TABLE_NAME=$(echo $ARN | awk -F/ '{print $2}')
    TAGS=$(aws dynamodb list-tags-of-resource --resource-arn $ARN --query "Tags[?
Key=='Environment' && Value=='Production']" --output text)
    if [ ! -z "$TAGS" ]; then
        echo "Table with Production tag: $TABLE_NAME"
    fi
done
```

- For API details, see the following topics in *Amazon CLI Command Reference*.
  - CreateTable
  - ListTagsOfResource
  - TagResource
  - UntagResource

Work with table encryption

The following code example shows how to manage encryption options for DynamoDB tables.

- Create a table with default encryption.
- Create a table with a customer managed CMK.
- Update table encryption settings.
- Describe table encryption.

Amazon CLI with Bash script

Create a table with default encryption.

```
# Create a table with default encryption (AWS owned key)
aws dynamodb create-table \
    --table-name CustomerData \
    --attribute-definitions \
        AttributeName=CustomerID,AttributeType=S \
```

```
    --key-schema \
        AttributeName=CustomerID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --sse-specification Enabled=true,SSEType=KMS
```

Create a table with a customer managed CMK.

```
# Step 1: Create a customer managed key in KMS
aws kms create-key \
    --description "Key for DynamoDB table encryption" \
    --key-usage ENCRYPT_DECRYPT \
    --customer-master-key-spec SYMMETRIC_DEFAULT

# Store the key ID for later use
KEY_ID=$(aws kms list-keys --query "Keys[?contains(KeyArn, 'Key for
 DynamoDB')].KeyId" --output text)

# Step 2: Create a table with the customer managed key
aws dynamodb create-table \
    --table-name SensitiveData \
    --attribute-definitions \
        AttributeName=RecordID,AttributeType=S \
    --key-schema \
        AttributeName=RecordID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --sse-specification Enabled=true,SSEType=KMS,KMSMasterKeyId=$KEY_ID
```

Update table encryption.

```
# Update a table to use a different KMS key
aws dynamodb update-table \
    --table-name CustomerData \
    --sse-specification Enabled=true,SSEType=KMS,KMSMasterKeyId=$KEY_ID
```

Describe table encryption.

```
# Describe the table to see encryption settings
aws dynamodb describe-table \
    --table-name CustomerData \
```

```
    --query "Table.SSEDescription"
```

- For API details, see the following topics in *Amazon CLI Command Reference*.
  - CreateKey
  - CreateTable
  - DescribeTable
  - UpdateTable

Amazon EC2 examples using Amazon CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Bash script with Amazon EC2.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Basics
- Actions

Basics

Learn the basics

The following code example shows how to:

- Create a key pair and security group.
- Select an Amazon Machine Image (AMI) and compatible instance type, then create an instance.
- Stop and restart the instance.
- Associate an Elastic IP address with your instance.
- Connect to your instance with SSH, then clean up resources.

Amazon CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Run an interactive scenario at a command prompt.

```
###############################################################################
# function get_started_with_ec2_instances
#
# Runs an interactive scenario that shows how to get started using EC2 instances.
#
#     "EC2 access" permissions are needed to run this code.
#
# Returns:
#       0 - If successful.
#       1 - If an error occurred.
###############################################################################
function get_started_with_ec2_instances() {
  # Requires version 4 for mapfile.

`CreateSecurityGroup`

The following code example shows how to use `CreateSecurityGroup`.

Amazon CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
#############################################################################
# function ec2_create_security_group
#
# This function creates an Amazon Elastic Compute Cloud (Amazon EC2) security group.
#
# Parameters:
#       -n security_group_name - The name of the security group.
#       -d security_group_description - The description of the security group.
```

```
#
# Returns:
#       The ID of the created security group, or an error message if the operation
 fails.
# And:
#       0 - If successful.
#       1 - If it fails.
#
###############################################################################

IAM examples using Amazon CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Bash script with IAM.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other Amazon Web Services services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Basics
- Actions
- Scenarios

Basics

Learn the basics

The following code example shows how to create a user and assume a role.

> **Warning**
>
> To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as Amazon IAM Identity Center.

- Create a user with no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list S3 buckets using temporary credentials, then clean up resources.

Amazon CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
##############################################################################
# function iam_create_user_assume_role
#
# Scenario to create an IAM user, create an IAM role, and apply the role to the
 user.
#
#     "IAM access" permissions are needed to run this code.
#     "STS assume role" permissions are needed to run this code. (Note: It might be
 necessary to
#           create a custom policy).
#
# Returns:
#       0 - If successful.
#       1 - If an error occurred.
##############################################################################

    iecho

    return 0
}
```

- For API details, see [UpdateAccessKey](#) in *Amazon CLI Command Reference*.

Scenarios

Set up Attribute-Based Access Control

The following code example shows how to implement Attribute-Based Access Control (ABAC) for DynamoDB.

- Create an IAM policy for ABAC.
- Create tables with tags for different departments.
- List and filter tables based on tags.

Amazon CLI with Bash script

Create an IAM policy for ABAC.

```
# Step 1: Create a policy document for ABAC
cat > abac-policy.json << 'EOF'
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "dynamodb:GetItem",
        "dynamodb:BatchGetItem",
        "dynamodb:Query",
        "dynamodb:Scan"
      ],
      "Resource": "arn:aws:dynamodb:*:*:table/*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceTag/Department": "${aws:PrincipalTag/Department}"
        }
      }
    },
    {
      "Effect": "Allow",
      "Action": [
        "dynamodb:PutItem",
        "dynamodb:UpdateItem",
        "dynamodb:DeleteItem",
        "dynamodb:BatchWriteItem"
```

```
      ],
      "Resource": "arn:aws:dynamodb:*:*:table/*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceTag/Department": "${aws:PrincipalTag/Department}",
          "aws:ResourceTag/Environment": "Development"
        }
      }
    }
  ]
}
EOF

# Step 2: Create the IAM policy
aws iam create-policy \
    --policy-name DynamoDBDepartmentBasedAccess \
    --policy-document file://abac-policy.json
```

Create tables with tags for different departments.

```
# Create a DynamoDB table with tags for ABAC
aws dynamodb create-table \
    --table-name FinanceData \
    --attribute-definitions \
        AttributeName=RecordID,AttributeType=S \
    --key-schema \
        AttributeName=RecordID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --tags \
        Key=Department,Value=Finance \
        Key=Environment,Value=Development

# Create another table with different tags
aws dynamodb create-table \
    --table-name MarketingData \
    --attribute-definitions \
        AttributeName=RecordID,AttributeType=S \
    --key-schema \
        AttributeName=RecordID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --tags \
        Key=Department,Value=Marketing \
```

```
        Key=Environment,Value=Production
```

List and filter tables based on tags.

```
# List all DynamoDB tables
echo "Listing all tables:"
aws dynamodb list-tables

# Get ARNs for all tables
echo -e "\nGetting ARNs for all tables:"
TABLE_ARNS=$(aws dynamodb list-tables --query "TableNames[*]" --output text | xargs
 -I {} aws dynamodb describe-table --table-name {} --query "Table.TableArn" --output
 text)

# For each table ARN, list its tags
echo -e "\nListing tags for each table:"
for ARN in $TABLE_ARNS; do
    TABLE_NAME=$(echo $ARN | awk -F/ '{print $2}')
    echo -e "\nTags for table: $TABLE_NAME"
    aws dynamodb list-tags-of-resource --resource-arn $ARN
done

# Example: Find tables with a specific tag
echo -e "\nFinding tables with Environment=Production tag:"
for ARN in $TABLE_ARNS; do
    TABLE_NAME=$(echo $ARN | awk -F/ '{print $2}')
    TAGS=$(aws dynamodb list-tags-of-resource --resource-arn $ARN --query "Tags[?
Key=='Environment' && Value=='Production']" --output text)
    if [ ! -z "$TAGS" ]; then
        echo "Table with Production tag: $TABLE_NAME"
    fi
done
```

- For API details, see the following topics in *Amazon CLI Command Reference*.
  - CreatePolicy
  - CreateTable
  - ListTables

Work with Streams and Time-to-Live

The following code example shows how to manage DynamoDB Streams and Time-to-Live features.

- Create a table with Streams enabled.
- Describe Streams.
- Create a Lambda function for processing Streams.
- Enable TTL on a table.
- Add items with TTL attributes.
- Describe TTL settings.

Amazon CLI with Bash script

Create a table with Streams enabled.

```
# Create a table with DynamoDB Streams enabled
aws dynamodb create-table \
    --table-name StreamsDemo \
    --attribute-definitions \
        AttributeName=ID,AttributeType=S \
    --key-schema \
        AttributeName=ID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --stream-specification StreamEnabled=true,StreamViewType=NEW_AND_OLD_IMAGES
```

Describe Streams.

```
# Get information about the stream
aws dynamodb describe-table \
    --table-name StreamsDemo \
    --query "Table.StreamSpecification"

# Get the stream ARN
STREAM_ARN=$(aws dynamodb describe-table \
    --table-name StreamsDemo \
    --query "Table.LatestStreamArn" \
    --output text)

echo "Stream ARN: $STREAM_ARN"
```

```
# Describe the stream
aws dynamodbstreams describe-stream \
    --stream-arn $STREAM_ARN
```

Create a Lambda function for Streams.

```
# Step 1: Create an IAM role for the Lambda function
cat > trust-policy.json << 'EOF'
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "lambda.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
EOF

aws iam create-role \
    --role-name DynamoDBStreamsLambdaRole \
    --assume-role-policy-document file://trust-policy.json

# Step 2: Attach permissions to the role
aws iam attach-role-policy \
    --role-name DynamoDBStreamsLambdaRole \
    --policy-arn arn:aws:iam::aws:policy/service-role/AWSLambdaDynamoDBExecutionRole

# Step 3: Create a Lambda function (code would be in a separate file)
echo "Lambda function creation would be done separately with appropriate code"

# Step 4: Create an event source mapping
echo "Example command to create event source mapping:"
echo "aws lambda create-event-source-mapping \\"
echo "    --function-name ProcessDynamoDBRecords \\"
echo "    --event-source $STREAM_ARN \\"
echo "    --batch-size 100 \\"
echo "    --starting-position LATEST"
```

Enable TTL on a table.

```
# Create a table for TTL demonstration
aws dynamodb create-table \
    --table-name TTLDemo \
    --attribute-definitions \
        AttributeName=ID,AttributeType=S \
    --key-schema \
        AttributeName=ID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST

# Wait for table to become active
aws dynamodb wait table-exists --table-name TTLDemo

# Enable TTL on the table
aws dynamodb update-time-to-live \
    --table-name TTLDemo \
    --time-to-live-specification "Enabled=true, AttributeName=ExpirationTime"
```

Add items with TTL attributes.

```
# Calculate expiration time (current time + 1 day in seconds)
EXPIRATION_TIME=$(date -d "+1 day" +%s)

# Add an item with TTL attribute
aws dynamodb put-item \
    --table-name TTLDemo \
    --item '{
        "ID": {"S": "item1"},
        "Data": {"S": "This item will expire in 1 day"},
        "ExpirationTime": {"N": "'$EXPIRATION_TIME'"}
    }'

# Add an item that expires in 1 hour
EXPIRATION_TIME_HOUR=$(date -d "+1 hour" +%s)
aws dynamodb put-item \
    --table-name TTLDemo \
    --item '{
        "ID": {"S": "item2"},
        "Data": {"S": "This item will expire in 1 hour"},
```

```
        "ExpirationTime": {"N": "'$EXPIRATION_TIME_HOUR'"}
    }'
```

Describe TTL settings.

```
# Describe TTL settings for a table
aws dynamodb describe-time-to-live \
    --table-name TTLDemo
```

Amazon KMS examples using Amazon CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Bash script with Amazon KMS.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other Amazon Web Services services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Scenarios

Scenarios

Work with table encryption

The following code example shows how to manage encryption options for DynamoDB tables.

- Create a table with default encryption.
- Create a table with a customer managed CMK.
- Update table encryption settings.
- Describe table encryption.

Amazon CLI with Bash script

Create a table with default encryption.

```
# Create a table with default encryption (AWS owned key)
aws dynamodb create-table \
    --table-name CustomerData \
    --attribute-definitions \
        AttributeName=CustomerID,AttributeType=S \
    --key-schema \
        AttributeName=CustomerID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --sse-specification Enabled=true,SSEType=KMS
```

Create a table with a customer managed CMK.

```
# Step 1: Create a customer managed key in KMS
aws kms create-key \
    --description "Key for DynamoDB table encryption" \
    --key-usage ENCRYPT_DECRYPT \
    --customer-master-key-spec SYMMETRIC_DEFAULT

# Store the key ID for later use
KEY_ID=$(aws kms list-keys --query "Keys[?contains(KeyArn, 'Key for
 DynamoDB')].KeyId" --output text)

# Step 2: Create a table with the customer managed key
aws dynamodb create-table \
    --table-name SensitiveData \
```

```
    --attribute-definitions \
        AttributeName=RecordID,AttributeType=S \
    --key-schema \
        AttributeName=RecordID,KeyType=HASH \
    --billing-mode PAY_PER_REQUEST \
    --sse-specification Enabled=true,SSEType=KMS,KMSMasterKeyId=$KEY_ID
```

Update table encryption.

```
# Update a table to use a different KMS key
aws dynamodb update-table \
    --table-name CustomerData \
    --sse-specification Enabled=true,SSEType=KMS,KMSMasterKeyId=$KEY_ID
```

Describe table encryption.

```
# Describe the table to see encryption settings
aws dynamodb describe-table \
    --table-name CustomerData \
    --query "Table.SSEDescription"
```

- For API details, see the following topics in *Amazon CLI Command Reference*.
  - CreateKey
  - CreateTable
  - DescribeTable
  - UpdateTable

Amazon S3 examples using Amazon CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Bash script with Amazon S3.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Basics
- Actions

Basics

Learn the basics

The following code example shows how to:

- Create a bucket and upload a file to it.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the bucket objects and the bucket.

Amazon CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
###############################################################################
# function s3_getting_started
#
# This function creates, copies, and deletes S3 buckets and objects.
#
# Returns:
#       0 - If successful.
#       1 - If an error occurred.
###############################################################################
function s3_getting_started() {

The Amazon S3 functions used in this scenario.

```
#############################################################################
# function create-bucket
#
# This function creates the specified bucket in the specified AWS Region, unless
# it already exists.
#
# Parameters:
#       -b bucket_name  -- The name of the bucket to create.
#       -r region_code  -- The code for an AWS Region in which to
#                          create the bucket.
#
# Returns:
#       The URL of the bucket that was created.
#     And:
#       0 - If successful.
#       1 - If it fails.
#############################################################################

Amazon STS examples using Amazon CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the Amazon Command Line Interface with Bash script with Amazon STS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions

Actions

`AssumeRole`

The following code example shows how to use `AssumeRole`.

Amazon CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
##############################################################################
# function iecho
```

```
#
# This function enables the script to display the specified text only if
# the global variable $VERBOSE is set to true.
##############################################################################
function iecho() {
  if [[ $VERBOSE == true ]]; then
    echo "$@"
  fi
}

function errecho() {
  printf "%s\n" "$*" 1>&2
}

##############################################################################
# function sts_assume_role
#
# This function assumes a role in the AWS account and returns the temporary
#  credentials.
#
# Parameters:
#       -n role_session_name -- The name of the session.
#       -r role_arn -- The ARN of the role to assume.
#
# Returns:
#       [access_key_id, secret_access_key, session_token]
#     And:
#       0 - If successful.
#       1 - If an error occurred.
##############################################################################
function sts_assume_role() {
  local role_session_name role_arn response
  local option OPTARG # Required to use getopts command in a function.

  # bashsupport disable=BP5008
  function usage() {
    echo "function sts_assume_role"
    echo "Assumes a role in the AWS account and returns the temporary credentials:"
    echo "  -n role_session_name -- The name of the session."
```

```
    echo "  -r role_arn -- The ARN of the role to assume."
    echo ""
  }

  while getopts n:r:h option; do
    case "${option}" in
      n) role_session_name=${OPTARG} ;;
      r) role_arn=${OPTARG} ;;
      h)
        usage
        return 0
        ;;
      \?)
        echo "Invalid parameter"
        usage
        return 1
        ;;
    esac
  done

  response=$(aws sts assume-role \
    --role-session-name "$role_session_name" \
    --role-arn "$role_arn" \
    --output text \
    --query "Credentials.[AccessKeyId, SecretAccessKey, SessionToken]")

  local error_code=${?}

  if [[ $error_code -ne 0 ]]; then
    aws_cli_error_log $error_code
    errecho "ERROR: AWS reports create-role operation failed.\n$response"
    return 1
  fi

  echo "$response"

  return 0
}
```

- For API details, see AssumeRole in *Amazon CLI Command Reference*.

Security in the Amazon CLI

Cloud security at Amazon is the highest priority. As an Amazon customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between Amazon and you. The shared responsibility model describes this as security *of* the cloud and security *in* the cloud:

- **Security of the cloud** – Amazon is responsible for protecting the infrastructure that runs Amazon services in the Amazon Cloud. Amazon also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the Amazon Compliance Programs. To learn about the compliance programs that apply to Amazon Command Line Interface, see Amazon Services in Scope by Compliance Program.
- **Security in the cloud** – Your responsibility is determined by the Amazon service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using the Amazon Command Line Interface (Amazon CLI). The following topics show you how to configure the Amazon CLI to meet your security and compliance objectives. You also learn how to use the Amazon CLI to help you to monitor and secure your Amazon resources.

Topics

- Data protection in the Amazon CLI
- Identity and Access Management
- Compliance Validation for this Amazon Product or Service
- Resilience for this Amazon Product or Service
- Infrastructure Security for this Amazon Product or Service
- Enforcing a minimum version of TLS for the Amazon CLI

Data protection in the Amazon CLI

The Amazon shared responsibility model applies to data protection in Amazon Command Line Interface. As described in this model, Amazon is responsible for protecting the global infrastructure

that runs all of the Amazon Web Services Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the Amazon Web Services services that you use. For more information about data privacy, see the Data Privacy FAQ.

For data protection purposes, we recommend that you protect Amazon Web Services account credentials and set up individual users with Amazon IAM Identity Center or Amazon Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with Amazon resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with Amazon CloudTrail. For information about using CloudTrail trails to capture Amazon activities, see Working with CloudTrail trails in the *Amazon CloudTrail User Guide*.
- Use Amazon encryption solutions, along with all default security controls within Amazon Web Services services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-3 validated cryptographic modules when accessing Amazon through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-3.

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field. This includes when you work with Amazon CLI or other Amazon Web Services services using the console, API, Amazon CLI, or Amazon SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Data encryption

A key feature of any secure service is that information is encrypted when it is not being actively used.

Encryption at rest

The Amazon CLI does not itself store any customer data other than the credentials it needs to interact with the Amazon services on the user's behalf.

If you use the Amazon CLI to invoke an Amazon service that transmits customer data to your local computer for storage, then refer to the Security & Compliance chapter in that service's User Guide for information on how that data is stored, protected, and encrypted.

Encryption in transit

By default, all data transmitted from the client computer running the Amazon CLI and Amazon service endpoints is encrypted by sending everything through a HTTPS/TLS connection.

You don't need to do anything to enable the use of HTTPS/TLS. It is always enabled unless you explicitly disable it for an individual command by using the `--no-verify-ssl` command line option.

Identity and Access Management

Amazon Identity and Access Management (IAM) is an Amazon Web Services service that helps an administrator securely control access to Amazon resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use Amazon resources. IAM is an Amazon Web Services service that you can use with no additional charge.

Topics

- Audience
- Authenticating with identities
- Managing access using policies
- How Amazon Web Services services work with IAM
- Troubleshooting Amazon identity and access

Audience

How you use Amazon Identity and Access Management (IAM) differs, depending on the work that you do in Amazon.

Service user – If you use Amazon Web Services services to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more Amazon features to do your work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in Amazon, see Troubleshooting Amazon identity and access or the user guide of the Amazon Web Services service you are using.

Service administrator – If you're in charge of Amazon resources at your company, you probably have full access to Amazon. It's your job to determine which Amazon features and resources your service users should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with Amazon, see the user guide of the Amazon Web Services service you are using.

IAM administrator – If you're an IAM administrator, you might want to learn details about how you can write policies to manage access to Amazon. To view example Amazon identity-based policies that you can use in IAM, see the user guide of the Amazon Web Services service you are using.

Authenticating with identities

Authentication is how you sign in to Amazon using your identity credentials. You must be *authenticated* (signed in to Amazon) as the Amazon Web Services account root user, as an IAM user, or by assuming an IAM role.

If you access Amazon programmatically, Amazon provides a software development kit (SDK) and a command line interface (CLI) to cryptographically sign your requests by using your credentials. If you don't use Amazon tools, you must sign requests yourself. For more information about using the recommended method to sign requests yourself, see Amazon Signature Version 4 for API requests in the *IAM User Guide*.

Regardless of the authentication method that you use, you might be required to provide additional security information. For example, Amazon recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see Amazon Multi-factor authentication in IAM in the *IAM User Guide*.

Amazon Web Services account root user

When you create an Amazon Web Services account, you begin with one sign-in identity that has complete access to all Amazon Web Services services and resources in the account. This identity

is called the Amazon Web Services account *root user* and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you don't use the root user for your everyday tasks. Safeguard your root user credentials and use them to perform the tasks that only the root user can perform. For the complete list of tasks that require you to sign in as the root user, see Tasks that require root user credentials in the *IAM User Guide*.

Federated identity

As a best practice, require human users, including users that require administrator access, to use federation with an identity provider to access Amazon Web Services services by using temporary credentials.

A *federated identity* is a user from your enterprise user directory, a web identity provider, the Amazon Directory Service, or any user that accesses Amazon Web Services services by using credentials provided through an identity source. When federated identities access Amazon Web Services accounts, they assume roles, and the roles provide temporary credentials.

IAM users and groups

An *IAM user* is an identity within your Amazon Web Services account that has specific permissions for a single person or application. Where possible, we recommend relying on temporary credentials instead of creating IAM users who have long-term credentials such as passwords and access keys. However, if you have specific use cases that require long-term credentials with IAM users, we recommend that you rotate access keys. For more information, see Rotate access keys regularly for use cases that require long-term credentials in the *IAM User Guide*.

An *IAM group* is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to manage for large sets of users. For example, you could have a group named *IAMAdmins* and give that group permissions to administer IAM resources.

Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see Use cases for IAM users in the *IAM User Guide*.

IAM roles

An *IAM role* is an identity within your Amazon Web Services account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. To temporarily assume an

IAM role in the Amazon Web Services Management Console, you can switch from a user to an IAM role (console). You can assume a role by calling an Amazon CLI or Amazon API operation or by using a custom URL. For more information about methods for using roles, see Methods to assume a role in the *IAM User Guide*.

IAM roles with temporary credentials are useful in the following situations:

- **Federated user access** – To assign permissions to a federated identity, you create a role and define permissions for the role. When a federated identity authenticates, the identity is associated with the role and is granted the permissions that are defined by the role. For information about roles for federation, see Create a role for a third-party identity provider (federation) in the *IAM User Guide*.
- **Temporary IAM user permissions** – An IAM user or role can assume an IAM role to temporarily take on different permissions for a specific task.
- **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some Amazon Web Services services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see Cross account resource access in IAM in the *IAM User Guide*.
- **Cross-service access** – Some Amazon Web Services services use features in other Amazon Web Services services. For example, when you make a call in a service, it's common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal's permissions, using a service role, or using a service-linked role.
  - **Forward access sessions (FAS)** – When you use an IAM user or role to perform actions in Amazon, you are considered a principal. When you use some services, you might perform an action that then initiates another action in a different service. FAS uses the permissions of the principal calling an Amazon Web Services service, combined with the requesting Amazon Web Services service to make requests to downstream services. FAS requests are only made when a service receives a request that requires interactions with other Amazon Web Services services or resources to complete. In this case, you must have permissions to perform both actions. For policy details when making FAS requests, see Forward access sessions.
  - **Service role** – A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Create a role to delegate permissions to an Amazon Web Services service in the *IAM User Guide*.

- **Service-linked role** – A service-linked role is a type of service role that is linked to an Amazon Web Services service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your Amazon Web Services account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.
- **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making Amazon CLI or Amazon API requests. This is preferable to storing access keys within the EC2 instance. To assign an Amazon role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see Use an IAM role to grant permissions to applications running on Amazon EC2 instances in the *IAM User Guide*.

Managing access using policies

You control access in Amazon by creating policies and attaching them to Amazon identities or resources. A policy is an object in Amazon that, when associated with an identity or resource, defines their permissions. Amazon evaluates these policies when a principal (user, root user, or role session) makes a request. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in Amazon as JSON documents. For more information about the structure and contents of JSON policy documents, see Overview of JSON policies in the *IAM User Guide*.

Administrators can use Amazon JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

By default, users and roles have no permissions. To grant users permission to perform actions on the resources that they need, an IAM administrator can create IAM policies. The administrator can then add the IAM policies to roles, and users can assume the roles.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the `iam:GetRole` action. A user with that policy can get role information from the Amazon Web Services Management Console, the Amazon CLI, or the Amazon API.

Identity-based policies

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Define custom IAM permissions with customer managed policies in the *IAM User Guide*.

Identity-based policies can be further categorized as *inline policies* or *managed policies*. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your Amazon Web Services account. Managed policies include Amazon managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see Choose between managed policies and inline policies in the *IAM User Guide*.

Resource-based policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM *role trust policies* and Amazon S3 *bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or Amazon Web Services services.

Resource-based policies are inline policies that are located in that service. You can't use Amazon managed policies from IAM in a resource-based policy.

Access control lists (ACLs)

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, Amazon WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see Access control list (ACL) overview in the *Amazon Simple Storage Service Developer Guide*.

Other policy types

Amazon supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of an entity's identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the `Principal` field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the *IAM User Guide*.
- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in Amazon Organizations. Amazon Organizations is a service for grouping and centrally managing multiple Amazon Web Services accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each Amazon Web Services account root user. For more information about Organizations and SCPs, see Service control policies in the *Amazon Organizations User Guide*.
- **Resource control policies (RCPs)** – RCPs are JSON policies that you can use to set the maximum available permissions for resources in your accounts without updating the IAM policies attached to each resource that you own. The RCP limits permissions for resources in member accounts and can impact the effective permissions for identities, including the Amazon Web Services account root user, regardless of whether they belong to your organization. For more information about Organizations and RCPs, including a list of Amazon Web Services services that support RCPs, see Resource control policies (RCPs) in the *Amazon Organizations User Guide*.
- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see Session policies in the *IAM User Guide*.

Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how Amazon determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the *IAM User Guide*.

How Amazon Web Services services work with IAM

To get a high-level view of how Amazon Web Services services work with most IAM features, see Amazon services that work with IAM in the *IAM User Guide*.

To learn how to use a specific Amazon Web Services service with IAM, see the security section of the relevant service's User Guide.

Troubleshooting Amazon identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with Amazon and IAM.

Topics

- I am not authorized to perform an action in Amazon
- I am not authorized to perform iam:PassRole
- I want to allow people outside of my Amazon Web Services account to access my Amazon resources

I am not authorized to perform an action in Amazon

If you receive an error that you're not authorized to perform an action, your policies must be updated to allow you to perform the action.

The following example error occurs when the `mateojackson` IAM user tries to use the console to view details about a fictional *`my-example-widget`* resource but doesn't have the fictional `awes:`*`GetWidget`* permissions.

```
User: arn:aws-cn:iam::123456789012:user/mateojackson is not authorized to perform:
 awes:GetWidget on resource: my-example-widget
```

In this case, the policy for the `mateojackson` user must be updated to allow access to the *`my-example-widget`* resource by using the `awes:`*`GetWidget`* action.

If you need help, contact your Amazon administrator. Your administrator is the person who provided you with your sign-in credentials.

I am not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the `iam:PassRole` action, your policies must be updated to allow you to pass a role to Amazon.

Some Amazon Web Services services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named `marymajor` tries to use the console to perform an action in Amazon. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws-cn:iam::123456789012:user/marymajor is not authorized to perform:
 iam:PassRole
```

In this case, Mary's policies must be updated to allow her to perform the `iam:PassRole` action.

If you need help, contact your Amazon administrator. Your administrator is the person who provided you with your sign-in credentials.

I want to allow people outside of my Amazon Web Services account to access my Amazon resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether Amazon supports these features, see How Amazon Web Services services work with IAM.
- To learn how to provide access to your resources across Amazon Web Services accounts that you own, see Providing access to an IAM user in another Amazon Web Services account that you own in the *IAM User Guide*.

- To learn how to provide access to your resources to third-party Amazon Web Services accounts, see Providing access to Amazon Web Services accounts owned by third parties in the *IAM User Guide*.
- To learn how to provide access through identity federation, see Providing access to externally authenticated users (identity federation) in the *IAM User Guide*.
- To learn the difference between using roles and resource-based policies for cross-account access, see Cross account resource access in IAM in the *IAM User Guide*.

Compliance Validation for this Amazon Product or Service

To learn whether an Amazon Web Services service is within the scope of specific compliance programs, see Amazon Web Services services in Scope by Compliance Program and choose the compliance program that you are interested in. For general information, see Amazon Web Services Compliance Programs.

You can download third-party audit reports using Amazon Artifact. For more information, see Downloading Reports in Amazon Artifact.

Your compliance responsibility when using Amazon Web Services services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. Amazon provides the following resources to help with compliance:

- Security & Compliance – These solution implementation guides discuss architectural considerations and provide steps for deploying security and compliance features.
- Amazon Compliance Resources – This collection of workbooks and guides might apply to your industry and location.
- Evaluating Resources with Rules in the *Amazon Config Developer Guide* – The Amazon Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- Amazon Security Hub – This Amazon Web Services service provides a comprehensive view of your security state within Amazon. Security Hub uses security controls to evaluate your Amazon resources and to check your compliance against security industry standards and best practices. For a list of supported services and controls, see Security Hub controls reference.
- Amazon GuardDuty – This Amazon Web Services service detects potential threats to your Amazon Web Services accounts, workloads, containers, and data by monitoring your environment for suspicious and malicious activities. GuardDuty can help you address various

compliance requirements, like PCI DSS, by meeting intrusion detection requirements mandated by certain compliance frameworks.

This Amazon product or service follows the shared responsibility model through the specific Amazon Web Services (Amazon) services it supports. For Amazon service security information, see the Amazon service security documentation page and Amazon services that are in scope of Amazon compliance efforts by compliance program.

Resilience for this Amazon Product or Service

The Amazon global infrastructure is built around Amazon Web Services Regions and Availability Zones.

Amazon Web Services Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking.

With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about Amazon Regions and Availability Zones, see Amazon Global Infrastructure.

This Amazon product or service follows the shared responsibility model through the specific Amazon Web Services (Amazon) services it supports. For Amazon service security information, see the Amazon service security documentation page and Amazon services that are in scope of Amazon compliance efforts by compliance program.

Infrastructure Security for this Amazon Product or Service

This Amazon product or service uses managed services, and therefore is protected by the Amazon global network security. For information about Amazon security services and how Amazon protects infrastructure, see Amazon Cloud Security. To design your Amazon environment using the best practices for infrastructure security, see Infrastructure Protection in *Security Pillar Amazon Well-Architected Framework*.

You use Amazon published API calls to access this Amazon Product or Service through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
- Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the Amazon Security Token Service (Amazon STS) to generate temporary security credentials to sign requests.

This Amazon product or service follows the shared responsibility model through the specific Amazon Web Services (Amazon) services it supports. For Amazon service security information, see the Amazon service security documentation page and Amazon services that are in scope of Amazon compliance efforts by compliance program.

Enforcing a minimum version of TLS for the Amazon CLI

When using the Amazon Command Line Interface (Amazon CLI), the Transport Layer Security (TLS) protocol plays a crucial role in securing communication between the Amazon CLI and Amazon Web Services services. To add increased security when communicating with Amazon services, you should use TLS 1.2 or later.

The Amazon CLI and Amazon Web Services service can exchange data securely, with the TLS protocol providing encryption, authentication, and data integrity. By leveraging the TLS protocol, the Amazon CLI ensures that your interactions with Amazon Web Services services are protected from unauthorized access and data breaches, enhancing the overall security of your Amazon ecosystem.

The Amazon shared responsibility model applies to data protection in Amazon Command Line Interface. As described in this model, Amazon is responsible for protecting the global infrastructure that runs all of the Amazon Web Services services. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the Amazon Web Services services that you use. For more information about data protection, see the section called “Data Protection”.

To ensure the Amazon CLI version 1 uses no TLS version earlier than TLS 1.2, you might need to recompile OpenSSL to enforce this minimum and then recompile Python to use the newly built OpenSSL.

Topics

- Determine your currently supported protocols
- Compile OpenSSL and Python

Determine your currently supported protocols

First, create a self-signed certificate to use for the test server and the Python SDK using OpenSSL.

```
$ openssl req -subj '/CN=localhost' -x509 -newkey rsa:4096 -nodes -keyout key.pem -out
 cert.pem -days 365
```

Then spin up a test server using OpenSSL.

```
$ openssl s_server -key key.pem -cert cert.pem -www
```

In a new terminal window, create a virtual environment and install the SDK for Python.

```
$ python3 -m venv test-env
source test-env/bin/activate
pip install botocore
```

Create a new Python script named `check.py` that uses the SDK's underlying HTTP library.

```
$ import urllib3
URL = 'https://localhost:4433/'

http = urllib3.PoolManager(
    ca_certs='cert.pem',
    cert_reqs='CERT_REQUIRED',
)
r = http.request('GET', URL)
print(r.data.decode('utf-8'))
```

Run your new script.

```
$ python check.py
```

This displays details about the connection made. Search for "Protocol : " in the output. If the output is "TLSv1.2" or later, the SDK defaults to TLS v1.2 or later. If it's an earlier version, you need to recompile OpenSSL and recompile Python.

However, even if your installation of Python defaults to TLS v1.2 or later, it's still possible for Python to renegotiate to a version earlier than TLS v1.2 if the server doesn't support TLS v1.2 or later. To check that Python doesn't automatically renegotiate to earlier versions, restart the test server with the following.

```
$ openssl s_server -key key.pem -cert cert.pem -no_tls1_3 -no_tls1_2 -www
```

If you're using an earlier version of OpenSSL, you might not have the `-no_tls_3` flag available. If this is the case, remove the flag because the version of OpenSSL you're using doesn't support TLS v1.3. Then rerun the Python script.

```
$ python check.py
```

If your installation of Python correctly doesn't renegotiate for versions earlier than TLS 1.2, you should receive an SSL error.

```
$ urllib3.exceptions.MaxRetryError: HTTPSConnectionPool(host='localhost',
 port=4433): Max retries exceeded with url: / (Caused by SSLError(SSLError(1, '[SSL:
 UNSUPPORTED_PROTOCOL] unsupported protocol (_ssl.c:1108)')))
```

If you're able to make a connection, you need to recompile OpenSSL and Python to disable negotiation of protocols earlier than TLS v1.2.

Compile OpenSSL and Python

To ensure the SDK or Amazon CLI doesn't negotiate for anything earlier than TLS 1.2, you need to recompile OpenSSL and Python. To do this, copy the following content to create a script and run it.

```
#!/usr/bin/env bash
set -e

OPENSSL_VERSION="1.1.1d"
OPENSSL_PREFIX="/opt/openssl-with-min-tls1_2"
PYTHON_VERSION="3.8.1"
PYTHON_PREFIX="/opt/python-with-min-tls1_2"
```

```
curl -O "https://www.openssl.org/source/openssl-$OPENSSL_VERSION.tar.gz"
tar -xzf "openssl-$OPENSSL_VERSION.tar.gz"
cd openssl-$OPENSSL_VERSION
./config --prefix=$OPENSSL_PREFIX no-ssl3 no-tls1 no-tls1_1 no-shared
make > /dev/null
sudo make install_sw > /dev/null

cd /tmp
curl -O "https://www.python.org/ftp/python/$PYTHON_VERSION/Python-$PYTHON_VERSION.tgz"
tar -xzf "Python-$PYTHON_VERSION.tgz"
cd Python-$PYTHON_VERSION
./configure --prefix=$PYTHON_PREFIX --with-openssl=$OPENSSL_PREFIX --disable-shared > /
dev/null
make > /dev/null
sudo make install > /dev/null
```

This compiles a version of Python that has a statically linked OpenSSL that doesn't automatically negotiate anything earlier than TLS 1.2. This also installs OpenSSL in the `/opt/openssl-with-min-tls1_2` directory and installs Python in the `/opt/python-with-min-tls1_2` directory. After you run this script, confirm installation of the new version of Python.

```
$ /opt/python-with-min-tls1_2/bin/python3 --version
```

This should print out the following.

```
$ Python 3.8.1
```

To confirm this new version of Python doesn't negotiate a version earlier than TLS 1.2, rerun the steps from Determine your currently supported protocols using the newly installed Python version (that is, `/opt/python-with-min-tls1_2/bin/python3`).

Troubleshooting errors for the Amazon CLI

This section covers common errors and troubleshooting steps to follow to resolve your issue. We suggest following the general troubleshooting first.

Contents

- General troubleshooting to try first
  - Check your Amazon CLI command formatting
  - Check the Amazon Web Services Region your Amazon CLI command is using
  - Confirm that you're running a recent version of the Amazon CLI
  - Use the --debug option
  - Enable and review the Amazon CLI command history logs
  - Confirm that your Amazon CLI is configured
- Command not found errors
- The "aws --version" command returns a different version than you installed
- The "aws --version" command returns a version after uninstalling the Amazon CLI
- The Amazon CLI processed a command with an incomplete parameter name
- Access denied errors
- Invalid credentials and key errors
- Signature does not match errors
- No Windows console found errors
- SSL certificate errors
- Invalid JSON errors
- Additional resources

General troubleshooting to try first

If you receive an error or encounter an issue with the Amazon CLI, we suggest the following general tips to help you troubleshoot.

Back to top

Check your Amazon CLI command formatting

If you receive an error that indicates that a command doesn't exist, or that it doesn't recognize a parameter (`Parameter validation failed`) that the documentation says is available , then your command might be formatted incorrectly. We suggest that you check the following:

- Check your command for spelling and formatting errors.
- Confirm all quotes and escaping appropriate for your terminal is correct in your command.
- Generate an Amazon CLI skeleton to confirm your command structure.
- For JSON, see the additional troubleshooting for JSON values. If you're having issues with your terminal processing JSON formatting, we suggest skipping past the terminal's quoting rules by using Blobs to pass JSON data directly to the Amazon CLI.

For more information on how a specific command should be structured, see the Amazon CLI reference guide.

Back to top

Check the Amazon Web Services Region your Amazon CLI command is using

> **Note**
>
> You must specify an Amazon Web Services Region when using the Amazon CLI, either explicitly or by setting a default Region. For a list of all of the Amazon Web Services Regions that you can specify, see Amazon Regions and Endpoints in the *Amazon Web Services General Reference*. The Amazon Web Services Region designators used by the Amazon CLI are the same names that you see in Amazon Web Services Management Console URLs and service endpoints.

Errors or unexpected results might occur if an Amazon Web Services service isn't available for your specified Amazon Web Services Region or your resources are located in a different Amazon Web Services Region. In order of precedence, the Amazon Web Services Region is set in the following ways:

- The `--region` command line option.

- The `AWS_DEFAULT_REGION` environment variable.
- The `region` profile setting.

Confirm you're using the correct Amazon Web Services Region for your resources.

Back to top

Confirm that you're running a recent version of the Amazon CLI

If you receive an error that indicates that a command doesn't exist, or that it doesn't recognize a parameter that the Amazon CLI reference guide says is available, first confirm that your command is correctly formatted. If the formatting is correct, then we recommend that you upgrade to the most recent version of the Amazon CLI. Updated versions of the Amazon CLI are released almost every business day. New Amazon services, features, and parameters are introduced in those new versions of the Amazon CLI. The only way to get access to those new services, features, or parameters is to upgrade to a version that was released after that element was first introduced.

How you update your version of the Amazon CLI depends on how you originally installed it as described in *Install the Amazon CLI*.

If you used one of the bundled installers, you might need to remove the existing installation before you download and install the latest version for your operating system.

Back to top

Use the `--debug` option

When the Amazon CLI reports an error that you don't immediately understand, or produces results that you don't expect, you can get more detail about the error by running the command again with the `--debug` option. With this option, the Amazon CLI outputs details about every step it takes to process your command. The details in the output can help you to determine when the error occurs and provides clues about where it started.

You can send the output to a text file for later review, or to send to Amazon Web Services Support when asked for it.

When you include the `--debug` option, some of the details include:

- Looking for credentials
- Parsing the provided parameters

- Constructing the request sent to Amazon servers
- The contents of the request sent to Amazon
- The contents of the raw response
- The formatted output

Here's an example of a command run with and without the `--debug` option.

```
$ aws iam list-groups --profile MyTestProfile
{
    "Groups": [
        {
            "Path": "/",
            "GroupName": "MyTestGroup",
            "GroupId": "AGPA0123456789EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/MyTestGroup",
            "CreateDate": "2019-08-12T19:34:04Z"
        }
    ]
}
```

```

Enable and review the Amazon CLI command history logs

You can enable the Amazon CLI command history logs using the `cli_history` file setting. After enabling this setting, the Amazon CLI records the history of `aws` commands.

You can this list your history using the `aws history list` command, and use the resulting command_ids in the `aws history show` command for details. For more information see `aws history` in the *Amazon CLI reference guide*.

When you include the `--debug` option, some of the details include:

- API calls made to botocore
- Status codes
- HTTP responses
- Headers
- Return codes

You can use this information to confirm paramater data and API calls are behaving in the way you expect, and can then deduce at what step in the process your command is failing.

Back to top

Confirm that your Amazon CLI is configured

Various errors can occur if your `config` and `credentials` files or your IAM user or role is not configured correctly. For more information on resolving errors with `config` and `credentials` files or your IAM user or roles, see the section called “Access denied errors” and the section called “Invalid credentials and key errors”.

Back to top

Command not found errors

This error means that the operating system can't find the Amazon CLI command. The installation might be incomplete or requires updating.

Possible cause: You're trying to use an Amazon CLI feature newer than your installed version, or have incorrect formatting

Example error text:

```
$ aws s3 copy
usage: aws [options] <command> <subcommand> [<subcommand> ...] [parameters]
To see help text, you can run:

  aws help
  aws <command> help
  aws <command> <subcommand> help
aws: error: argument subcommand: Invalid choice, valid choices are:

ls                                       | website
cp                                       | mv
....
```

Various errors can occur if your command is formatted incorrectly or you are using an earlier version from before the feature was released. For more information on resolving errors around these two issues, see the section called “Check your Amazon CLI command formatting” and the section called “Confirm that you're running a recent version of the Amazon CLI”.

Back to top

Possible cause: The terminal needs to be restarted after installation

Example error text:

```
$ aws --version
command not found: aws
```

If the `aws` command cannot be found after first installing or updating the Amazon CLI, you might need to restart your terminal for it to recognize any `PATH` updates.

Back to top

Possible cause: The Amazon CLI did not fully install

Example error text:

```
$ aws --version
command not found: aws
```

If the `aws` command cannot be found after first installing or updating the Amazon CLI, it might not have been fully installed. Try reinstalling by following the steps for your platform in *Install the Amazon CLI*.

Back to top

Possible cause: The Amazon CLI does not have permissions (Linux)

If the `aws` command cannot be found after first installing or updating the Amazon CLI on Linux, it might not have `execute` permissions for the folder it installed in. Run the following command with the `PATH` to your Amazon CLI installation,to provide `chmod` permissions to the Amazon CLI:

```
$ sudo chmod -R 755 /usr/local/aws-cli/
```

Back to top

Possible cause: The operating system PATH was not updated during installation

Example error text:

```
$ aws --version
command not found: aws
```

You might need to add the `aws` executable to your operating system's `PATH` environment variable. To add the Amazon CLI to your `PATH`, use the following instructions for your operating system.

Linux and macOS

1. Find your shell's profile script in your user directory. If you're not sure which shell you have, run `echo $SHELL`.

   ```
   $ ls -a ~
   ```

```
.  ..  .bash_logout  .bash_profile  .bashrc  Desktop  Documents  Downloads
```

- **Bash** – `.bash_profile`, `.profile`, or `.bash_login`
- **Zsh** – `.zshrc`
- **Tcsh** – `.tcshrc`, `.cshrc`, or `.login`

2. Add an export command to your profile script. The following command adds your local bin to the current PATH variable.

```
export PATH=/usr/local/bin:$PATH
```

3. Reload the updated profile into your current session.

```
$ source ~/.bash_profile
```

Windows

1. In a Windows Command Prompt, use the `where` command with the `/R` *path* parameter to find the `aws` file location. The results return all folders containing `aws`.

```
C:\> where /R c:\ aws
c:\Program Files\Amazon\AWSCLIV2\aws.exe
...
```

By default, the Amazon CLI version 2 is located in:

```
c:\Program Files\Amazon\AWSCLIV2\aws.exe
```

2. Press the Windows key and enter **`environment variables`**.
3. From the list of suggestions, choose **Edit environment variables for your account**.
4. Choose **PATH**, and then choose **Edit**.
5. Add the path you found in the first step into the **Variable value** field, for example, ***`C:\Program Files\Amazon\AWSCLIV2\aws.exe`***.
6. Choose **OK** twice to apply the new settings.
7. Close any running command prompts and reopen the command prompt window.

Back to top

The "aws --version" command returns a different version than you installed

Your terminal might be returning a different PATH for the Amazon CLI than you expect.

Possible cause: The terminal needs to be restarted after installing

If the aws command shows the wrong version, you might need to restart your terminal for it to recognize any PATH updates. All open terminals needs to be closed, not just your active terminal.

Back to top

Possible cause: The system needs to be restarted after installing

If the aws command shows the wrong version and restarting the terminal didn't work, you might need to restart your system for it to recognize your PATH updates.

Back to top

Possible cause: You have multiple versions of the Amazon CLI

If you updated the Amazon CLI and used a different install method than your pre-existing installation, it might cause multiple versions to be installed. For example, if on Linux or macOS you used pip for your current install, but tried to update using the .pkg install file, this could cause some conflicts especially with your PATH pointing to the old version.

To resolve this, uninstall all versions of the Amazon CLI and perform a clean install.

After uninstalling all versions, follow instructions appropriate for your operating system to install your desired version of the Amazon CLI version 1 or Amazon CLI version 2.

> **Note**
>
> If this is happening after you installed the Amazon CLI version 2 with a pre-existing install of Amazon CLI version 1, follow the migration instructions in Installation instructions when migrating from Amazon CLI version 1 .

Back to top

The "aws --version" command returns a version after uninstalling the Amazon CLI

This often occurs when there is still an Amazon CLI installed somewhere on your system.

Possible cause: The terminal needs to be restarted after uninstalling

If the `aws --version` command still works, you might need to restart your terminal for it to recognize any terminal updates.

Back to top

Possible cause: You have multiple versions of the Amazon CLI on your system, or didn't use the same uninstall method that you used to originally install the Amazon CLI

The Amazon CLI might not uninstall correctly if you uninstalled the Amazon CLI using a different method than you used to install it, or if you installed multiple versions. For example, if you used `pip` for your current install, you must use `pip` to uninstall it. To resolve this, uninstall Amazon CLI using the same method that you used to install it.

1. Follow the instructions appropriate for your operating system and your original installation method to uninstall the Amazon CLI version 1 and Amazon CLI version 2.
2. Close all terminals you have open.
3. Open your preferred terminal, enter in the following command and confirm that no version is returned.

```
$ aws --version
command not found: aws
```

If you still have a version listed in the output, the Amazon CLI was most likely installed using a different method or there are multiple versions. If you don't know which method you installed the Amazon CLI, follow the instructions for each uninstall method for the Amazon CLI version 1 and Amazon CLI version 2 appropriate to your operating system until no version output is received.

> **Note**
>
> If you used a package manager to install the Amazon CLI (`pip`, `apt`, `brew`, etc.), you must use the same package manager to uninstall it. Be sure to follow the

instructions provided by the package manager on how to uninstall all versions of a package.

Back to top

The Amazon CLI processed a command with an incomplete parameter name

Possible cause: You used a recognized abbreviation of the Amazon CLI parameter

Since the Amazon CLI is built using Python, the Amazon CLI uses the Python `argparse` library, including the `allow_abbrev` argument. Abbreviations of parameters are recognized by the Amazon CLI and processed.

The following `create-change-set` command example changes the CloudFormation stack name. The parameter `--change-set-n` is recognized as an abbreviation of `--change-set-name`, and the Amazon CLI processes the command.

```
$ aws cloudformation create-change-set --stack-name my-stack --change-set-n my-change-set
```

When your abbreviation could be multiple commands, the parameter will not be recognized as an abbreviation.

The following `create-change-set` command example changes the CloudFormation stack name. The parameter `--change-set-` is **not** recognized as an abbreviation, as there are there are multiple parameters it could be an abbreviation of, such as `--change-set-name` and `--change-set-type`. Therefore the Amazon CLI does **not** process the command.

```
$ aws cloudformation create-change-set --stack-name my-stack --change-set- my-change-set
```

Warning

Do not purposefully use parameter abbreviations. They are unreliable and are not backwards compatible. If any new parameters are added to a command that confuse your abbreviations, it will break your commands.

Additionally, if the parameter is a single-value argument, it can cause unexpected behavior with your commands. If multiple instances of a single-value argument is passed, only the last instance will run. In the following example, the parameter `--filters` is a single-valued argument. The parameters `--filters` and `--filter` are specified. The `--filter` parameter is an abbreviation of `--filters`. This cause two instances of `--filters` being applied and only the last `--filter` argument applies.

```
$ aws ec2 describe-vpc-peering-connections \
    --filters Name=tag:TagName,Values=VpcPeeringConnection \
    --filter Name=status-code,Values=active
```

Confirm you are using valid parameters before running a command to prevent unexpected behavior.

Back to top

Access denied errors

Possible cause: The Amazon CLI program file doesn't have "run" permission

On Linux or macOS, make sure that the `aws` program has run permissions for the calling user. Typically, the permissions are set to 755.

To add run permission for your user, run the following command, substituting *`~/.local/bin/aws`* with the path to the program on your computer.

```
$ chmod +x ~/.local/bin/aws
```

Back to top

Possible cause: Your IAM identity doesn't have permission to perform the operation

Example error text:

```
$ aws s3 ls
An error occurred (AcessDenied) when calling the ListBuckets operation: Access
 denied.
```

When you run a Amazon CLI command, Amazon operations are performed on your behalf, using credentials that associate you with an IAM account or role. The policies attached must grant you permission to call the API actions that correspond to the commands that you run with the Amazon CLI.

Most commands call a single action with a name that matches the command name. However, custom commands like `aws s3 sync` call multiple APIs. You can see which APIs a command calls by using the `--debug` option.

If you are sure that the user or role has the proper permissions assigned by policy, make sure that your Amazon CLI command is using the credentials you expect. See the next section about credentials to verify that the credentials the Amazon CLI is using are the ones that you expect.

For information about assigning IAM permissions, see Overview of Access Management: Permissions and Policies in the *IAM User Guide*.

Back to top

Invalid credentials and key errors

Example error text:

```
$ aws s3 ls
An error occurred (InvalidAccessKeyId) when calling the ListBuckets operation: The AWS
 Access Key Id
you provided does not exist in our records.
```

```
$ aws s3 ls
An error occurred (InvalidClientTokenId) when calling the ListBuckets operation: The
 security token
included in the request is invalid.
```

Possible cause: The Amazon CLI is reading incorrect credentials or from an unexpected location

The Amazon CLI might be reading credentials from a different location than you expect, or your key pair information is incorrect. You can run `aws configure list` to confirm which credentials are used.

The following example shows how to check the credentials used for the default profile.

```
$ aws configure list
      Name                    Value             Type    Location
      ----                    -----             ----    --------
   profile                <not set>             None    None
access_key     ****************XYVA shared-credentials-file
secret_key     ****************ZAGY shared-credentials-file
    region                us-west-2      config-file    ~/.aws/config
```

The following example shows how to check the credentials of a named profile.

```
$ aws configure list --profile saanvi
      Name                    Value             Type    Location
      ----                    -----             ----    --------
   profile                    saanvi           manual    --profile
access_key         **************** shared-credentials-file
secret_key         **************** shared-credentials-file
    region                us-west-2      config-file    ~/.aws/config
```

To confirm your key pair details, check your `config` and `credentials` files. For more information on `config` and `credentials` files, see the section called “Configuration settings”. For more information on credentials and authentication, including credentials precedence, see *Authentication and access credentials*.

Back to top

Possible cause: Your computer's clock is out of sync

If you are using valid credentials, your clock might be out of sync. On Linux or macOS, run `date` to check the time.

```
$ date
```

If your system clock is not correct within a few minutes, use `ntpd` to sync it.

```
$ sudo service ntpd stop
$ sudo ntpdate time.nist.gov
$ sudo service ntpd start
$ ntpstat
```

On Windows, use the date and time options in the Control Panel to configure your system clock.

Back to top

Signature does not match errors

Example error text:

```
$ aws s3 ls
An error occurred (SignatureDoesNotMatch) when calling the ListBuckets operation: The
 request signature we
calculated does not match the signature you provided. Check your key and signing
 method.
```

When the Amazon CLI runs a command, it sends an encrypted request to the Amazon servers to perform the appropriate Amazon service operations. Your credentials (the access key and secret key) are involved in the encryption and enable Amazon to authenticate the person making the request. There are several things that can interfere with the correct operation of this process, as follows.

Possible cause: Your clock is out of sync with the Amazon servers

To help protect against replay attacks, the current time can be used during the encryption/decryption process. If the time of the client and server disagree by more than the allowed amount, the process can fail and the request is rejected. This can also happen when you run a command in a virtual machine whose clock is out of sync with the host machine's clock. One possible cause is when the virtual machine hibernates and takes some time after waking up to sync the clock with the host machine.

On Linux or macOS, run `date` to check the time.

```
$ date
```

If your system clock is not correct within a few minutes, use `ntpd` to sync it.

```
$ sudo service ntpd stop
$ sudo ntpdate time.nist.gov
$ sudo service ntpd start
$ ntpstat
```

On Windows, use the date and time options in the Control Panel to configure your system clock.

Back to top

Possible cause: Your operating system is mishandling Amazon keys that contain certain special characters

If your Amazon keys include certain special characters, such as `-`, `+`, `/`, or `%`, some operating system variants process the string improperly and cause the key string to be interpreted incorrectly.

If you process your keys using other tools or scripts, such as tools that build the credentials file on a new instance as part of its creation, those tools and scripts might have their own handling of special characters that causes them to be transformed into something that Amazon no longer recognizes.

We suggest regenerating the secret key to get one that does not include the special character causing issues.

Back to top

No Windows console found errors

Example error text:

```
$ aws s3 ls
No Windows console found. Are you running cmd.exe?
```

When you use an Amazon CLI command, you receive a "No Windows console found. Are you running cmd.exe?" error message. This is usually an error seen for the Amazon CLI version 1 if the Python `prompt_toolkit` you have installed is outdated. To resolve this issue, install a recent version of the `prompt_toolkit` on the Python website.

Back to top

SSL certificate errors

Possible cause: The Amazon CLI doesn't trust your proxy's certificate

Example error text:

```
$ aws s3 ls
```

```
[SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed
```

When you use a Amazon CLI command, you receive an `[SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed` error message. This is caused by the Amazon CLI not trusting your proxy's certificate due to factors such as your proxy's certificate being self-signed, with your company set as the Certification Authority (CA). This prevents the Amazon CLI from finding your companies CA root certificate in the local CA registry.

To fix this, instruct the Amazon CLI where to find your companies `.pem` file using the `ca_bundle` configuration file setting, **`--ca-bundle`** command line option, or the `AWS_CA_BUNDLE` environment variable.

Back to top

Possible cause: Your configuration isn't pointing to the correct CA root certificate location

Example error text:

```
$ aws s3 ls
SSL validation failed for regionname [Errno 2] No such file or directory
```

This is caused by your Certification Authority (CA) bundle file location being configured incorrectly in the Amazon CLI. To fix this, confirm where your companies `.pem` file is located and update the Amazon CLI configuration by using the `ca_bundle` configuration file setting, **`--ca-bundle`** command line option, or the `AWS_CA_BUNDLE` environment variable.

Back to top

Possible cause: Your configuration isn't using the correct Amazon Web Services Region

Example error text:

```
$ aws s3 ls
[SSL: CERTIFICATE_ VERIFY_FAILED] certificate verify failed
```

Errors or unexpected results might occur if an Amazon Web Services service isn't available for your specified Amazon Web Services Region or your resources are located in a different Amazon Web Services Region. For troubleshooting steps, see the section called “Check the Amazon Web Services Region your Amazon CLI command is using”.

Back to top

Possible cause: Your TLS version needs to be updated

Example error text:

```
$ aws s3 ls
[SSL: UNSAFE_LEGACY_RENEGOTIATION_DISABLED] unsafe legacy renegotiation disabled
```

The Amazon Web Services service is using a version of TLS that is incompatible with your device's TLS version. To resolve this issue, update to a supported TLS version. For more information, see the section called “Enforcing a minimum TLS version”.

Back to top

Invalid JSON errors

Example error text:

```
$ aws dynamodb update-table \
    --provisioned-throughput '{"ReadCapacityUnits":15,WriteCapacityUnits":10}' \
    --table-name MyDDBTable
Error parsing parameter '--provisioned-throughput': Invalid JSON: Expecting property
 name enclosed in
double quotes: line 1 column 25 (char 24)
JSON received: {"ReadCapacityUnits":15,WriteCapacityUnits":10}
```

When you use an Amazon CLI command, you receive a "`Invalid JSON`" error message. This is usually an error seen when you enter a command with an expected JSON format and the Amazon CLI cannot read your JSON correctly.

Possible cause: You did not enter valid JSON for the Amazon CLI to use

Confirm you have valid JSON entered for your command. We suggest using a JSON validator for JSON you're having issues formatting.

For more advanced JSON usage in the command line, consider using a command line JSON processor, like `jq`, to create JSON strings. For more information on `jq`, see the jq repository on *GitHub*.

Back to top

Possible cause: Your terminal's quoting rules are preventing valid JSON being sent to the Amazon CLI

Before the Amazon CLI receives anything from a command, your terminal processes the command using it's own quoting and escaping rules. Due to a terminal's formatting rules, some of your JSON content may be stripped before the command is passed to the Amazon CLI. When formulating commands, be sure to use your terminal's quoting rules.

To troubleshoot, use the `echo` command to see how the shell is handling your parameters:

```
$ echo {"ReadCapacityUnits":15,"WriteCapacityUnits":10}
ReadCapacityUnits:15 WriteCapacityUnits:10
```

```
$ echo '{"ReadCapacityUnits":15,"WriteCapacityUnits":10}'
{"ReadCapacityUnits":15,"WriteCapacityUnits":10}
```

Modify your command until your until valid JSON is returned.

For more in-depth troubleshooting, use the `--debug` parameter to view the debug logs as they'll display exactly what got passed to the Amazon CLI:

```
$ aws dynamodb update-table \
    --provisioned-throughput '{"ReadCapacityUnits":15,WriteCapacityUnits":10}' \
    --table-name MyDDBTable \
    --debug
2022-07-19 22:25:07,741 - MainThread - awscli.clidriver - DEBUG - CLI version: aws-
cli/1.18.147
Python/2.7.18 Linux/5.4.196-119.356.amzn2int.x86_64 botocore/1.18.6
2022-07-19 22:25:07,741 - MainThread - awscli.clidriver - DEBUG - Arguments entered
 to CLI:
['dynamodb', 'update-table', '--provisioned-throughput',
 '{"ReadCapacityUnits":15,WriteCapacityUnits":10}',
 '--table-name', 'MyDDBTable', '--debug']
```

Use your terminal's quoting rules to fix any issues your JSON input has when being sent to the Amazon CLI. For more information on quoting rules, see the section called “Quotes with Strings”.

> **Note**
>
> If you're having issues with getting valid JSON to the Amazon CLI, we recommend to bypass a terminal's quoting rules for JSON data input by using Blobs to pass your JSON data directly to the Amazon CLI. For more information on Blobs, see Blob.

Back to top

Additional resources

For additional help with your Amazon CLI issues, visit the Amazon CLI community on *GitHub* or the Amazon Web Services re:Post community.

Back to top

Amazon CLI user guide document history

The following table describes important additions to the *Amazon Command Line Interface User Guide*, beginning in January 2019. For notification about updates to this documentation, you can subscribe to the RSS feed.

Change	Description	Date
Updated credential and authentication information.	Updated credential and authentication method instructions and examples. This includes updating relevant configuration pages. To accommodate this increase in documentation, relevant credential topics were moved to the new Authentication and access credentials section.	March 31, 2023
Content for the Amazon CLI V1 and V2 are now separated into their respective guides	For clarity and ease, the Amazon CLI version 1 and Amazon CLI version 2 content is now separated into their own guides. For Amazon CLI version 2, see the latest Amazon Command Line Interface User Guide	November 2, 2021
Added Amazon CLI alias information	Added Amazon CLI alias information. Aliases are shortcuts you can create in the Amazon Command Line Interface (Amazon CLI) to shorten commands or scripts that you frequently use.	March 11, 2021

Updated filter output information	Updated information for filters and moved to their own page.	February 1, 2021
Deprecation announcement for Python 2.7, 3.4, and 3.5	Python 2.7 was deprecated by the Python Software Foundation on January 1, 2020. Going forward, customers using the Amazon CLI version 1 should transition to using Python 3, with a minimum of Python 3.6. Python 2.7 support is deprecated for new versions of the Amazon CLI version 1 starting 7/19/2021. Python 3.4 and 3.5 is deprecated starting 2/1/2021.	January 29, 2021
Added Amazon S3 scripting example	Added an Amazon S3 lifecycle scripting example.	October 15, 2020
Added Amazon EC2 scripting example	Added an Amazon EC2 instance type scripting example.	October 15, 2020
Added retries information	Added a retries page for features and behavior of retries in the Amazon CLI.	September 17, 2020
Server-side and client-side pagination page	Updated pagination information and centralized on a single page.	August 17, 2020
Updated s3 commands page	Updated the high-level s3 commands page with new examples and resources.	July 30, 2020

Updated installation information	The install, update, and uninstall information for Linux, macOS, and Windows are updated.	May 19, 2020
Updated to remove support for Python 2.6 and 3.3 from Amazon CLI version 1	As of January 10th, 2020, Amazon CLI version 1 no longer supports using Python versions 2.6 or 3.3. You must update to a newer version of Python to use Amazon CLI version 1.17 or later.	January 10, 2020
New MFA section	Added a new section describin g how to access the CLI using multi-factor authentication and roles.	May 3, 2019
Update to "Using the CLI" section	Major improvements and additions to the usage instructions and procedures.	March 7, 2019
Update to "Installing the CLI" section	Major improvements and additions to the Amazon CLI installation instructions and procedures.	March 7, 2019
Update to "Configuring the CLI" section	Major improvements and additions to the Amazon CLI configuration instructions and procedures.	March 7, 2019
