```

Considerations for this approach:

- You can access Iceberg tables but no other tables.
- The catalog name cannot be **spark_catalog**. This is the name of the initial catalog in Spark. It always connects to a Hive metastore. It is the default catalog in Spark, unless the user overwrites it using `spark.sql.defaultCatalog`.
- You can set the `spark.sql.defaultCatalog` to your catalog name to make that the default catalog.

### Using Iceberg SparkSessionCatalog

The following shows the command for using **SparkSessionCatalog** as the Spark Iceberg catalog:

```
spark-shell \
    --conf spark.sql.catalog.spark_catalog=org.apache.iceberg.spark.SparkSessionCatalog
 \
```

```
    --conf spark.sql.catalog.spark_catalog.warehouse=s3://amzn-s3-demo-bucket1/prefix \
    --conf spark.sql.catalog.spark_catalog.type=glue
```

Considerations for this approach:

- If a table is not found as an Iceberg table, Spark will try to see if it is a table in the Hive metastore. See Using the Amazon Glue Data Catalog as the catalog for Hive for more information.
- The catalog name must be **spark_catalog**.

## Using Iceberg Spark extensions

Iceberg offers Spark extension `org.apache.iceberg.spark.extensions.IcebergSparkSessionExtensions` that users can set through the Spark extensions config `spark.sql.extensions`. The extensions enable key Iceberg features such as row level DELETE, UPDATE and MERGE, Iceberg-specific Spark data-definition language statements and procedures, such as compaction, snapshot expiration, branching and tagging, and so on. See the following for more details:

- Iceberg Spark write extensions: Spark Writes
- Iceberg Spark DDL extensions: ALTER TABLE SQL extensions
- Iceberg Spark procedure extensions: Spark Procedures

## Considerations for using Iceberg with Spark

- Amazon EMR 6.5.0 does not support Iceberg running on Amazon EMR on EKS by default. An Amazon EMR 6.5.0 custom image is available so that you can pass `--jars local:///usr/share/aws/iceberg/lib/iceberg-spark3-runtime.jar` as a `spark-submit` parameter to create Iceberg tables on Amazon EMR on EKS. For more information, see Submit a Spark workload in Amazon EMR using a custom image in the *Amazon EMR on EKS Development Guide*. You can also contact Amazon Web Services Support for assistance. Starting with Amazon EMR 6.6.0, Iceberg is supported on Amazon EMR on EKS.
- When using Amazon Glue as a catalog for Iceberg, make sure the database in which you are creating a table exists in Amazon Glue. If you are using services such as Amazon Lake Formation and you're unable to load the catalog, make sure you have proper access to the service to execute the command.

- If you use Iceberg SparkSessionCatalog, as described in Configuration differences when you use Iceberg SparkCatalog versus SparkSessionCatalog, you must follow the configuration steps described in Configure Amazon Glue Data Catalog as the Apache Hive metastore, in addition to configuring Spark Iceberg Amazon Glue Data Catalog settings.

## Use an Iceberg cluster with Trino

Starting with Amazon EMR version 6.6.0, you can use Iceberg with your Trino cluster.

In this tutorial, you use the Amazon CLI to work with Iceberg on an Amazon EMR Trino cluster. To use the console to create a cluster with Iceberg installed, follow the steps in Build an Apache Iceberg data lake using Amazon Athena, Amazon EMR, and Amazon Glue.

### Create an Iceberg cluster

To use Iceberg on Amazon EMR with the Amazon CLI, first create a cluster with the following steps. For information on specifying the Iceberg classification using the Amazon CLI, see Supply a configuration using the Amazon CLI when you create a cluster or Supply a configuration using the Java SDK when you create a cluster.

1. Create an `iceberg.properties` file and set a value for your chosen catalog. For example, if you want to use the Hive metastore as your catalog, your file should have the following content.

   ```
   connector.name=iceberg
   hive.metastore.uri=thrift://localhost:9083
   ```

   If you want to use the Amazon Glue Data Catalog as your store, your file should have the following content.

   ```
   connector.name=iceberg
   iceberg.catalog.type=glue
   ```

2. Create a bootstrap action that copies `iceberg.properties` from Amazon S3 to `/etc/trino/conf/catalog/iceberg.properties`, as in the following example. For information on bootstrap actions, see Create bootstrap actions to install additional software.

   ```
   set -ex
   ```

```
sudo aws s3 cp s3://amzn-s3-demo-bucket/iceberg.properties /etc/trino/conf/catalog/
iceberg.properties
```

3. Create a cluster with the following configuration, replacing the example bootstrap actions script path and key name with your own.

```
aws emr create-cluster --release-label emr-6.7.0 \
--applications Name=Trino \
--region us-east-1 \
--name My_Trino_Iceberg_Cluster \
--bootstrap-actions '[{"Path":"s3://amzn-s3-demo-bucket","Name":"Add
 iceberg.properties"}]' \
--instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=c3.4xlarge
 InstanceGroupType=CORE,InstanceCount=3,InstanceType=c3.4xlarge \
--use-default-roles \
--ec2-attributes KeyName=<key-name>
```

## Initialize a Trino session for Iceberg

To initialize a Trino session, run the following command.

```
trino-cli --catalog iceberg
```

## Write to an Iceberg table

Create and write to your table with the following SQL commands.

```
trino> SHOW SCHEMAS;
trino> CREATE TABLE default.iceberg_table (
            id int,
            data varchar,
            category varchar)
       WITH (
            format = 'PARQUET',
            partitioning = ARRAY['category', 'bucket(id, 16)'],
            location = 's3://amzn-s3-demo-bucket/<prefix>')

trino> INSERT INTO default.iceberg_table VALUES (1,'a','c1'), (2,'b','c2'),
 (3,'c','c3');
```

### Read from a table for Iceberg

To read from your Iceberg table, run the following command.

```
trino> SELECT * from default.iceberg_table;
```

### Considerations for using Iceberg with Trino

- Amazon EMR 6.5 does not offer Trino Iceberg Catalog support for Iceberg natively. Trino needs Iceberg v0.11, so we recommend launching an Amazon EMR cluster for Trino separate from the Spark cluster and including Iceberg v0.11 on that cluster.
- When using Amazon Glue as a catalog for Iceberg, make sure that the database in which you are creating a table exists in Amazon Glue. If you are using services such as Amazon Lake Formation and you're unable to load the catalog, make sure you have proper access to the service to execute the command.
- Iceberg Glue integration does not work with the Redshift Managed Storage catalog.

## Use an Iceberg cluster with Flink

Starting with Amazon EMR version 6.9.0, you can use Iceberg with a Flink cluster without the setup steps required when using the open source Iceberg Flink Integration.

### Creating an Iceberg cluster

You can create a cluster with Iceberg installed using the Amazon Web Services Management Console, the Amazon CLI, or the Amazon EMR API. In this tutorial, you use the Amazon CLI to work with Iceberg on an Amazon EMR cluster. To use the console to create a cluster with Iceberg installed, follow the steps in Build an Apache Iceberg data lake using Amazon Athena, Amazon EMR, and Amazon Glue.

To use Iceberg on Amazon EMR with the Amazon CLI, first create a cluster with the following steps. For information on specifying the Iceberg classification using the Amazon CLI, see Supply a configuration using the Amazon CLI when you create a cluster or Supply a configuration using the Java SDK when you create a cluster. Create a file called `configurations.json` with the following content:

```
[{
"Classification":"iceberg-defaults",
```

```
    "Properties":{"iceberg.enabled":"true"}
}]
```

Next, create a cluster with the following configuration, replacing the example Amazon S3 bucket path and subnet ID with your own values:

```
aws emr create-cluster --release-label emr-6.9.0 \
--applications Name=Flink \
--configurations file://iceberg_configurations.json \
--region us-east-1 \
--name My_flink_Iceberg_Cluster \
--log-uri s3://amzn-s3-demo-bucket/ \
--instance-type m5.xlarge \
--instance-count 2 \
--service-role EMR_DefaultRole \
--ec2-attributes InstanceProfile=EMR_EC2_DefaultRole,SubnetId=subnet-1234567890abcdef
```

Alternatively, you can create an Amazon EMR 6.9.0 cluster with a Flink application in it and use the file `/usr/share/aws/iceberg/lib/iceberg-flink-runtime.jar` as a JAR dependency in a Flink job.

## Using the Flink SQL Client

The SQL Client script is located under `/usr/lib/flink/bin`. You can run the script with the following command:

```
flink-yarn-session -d # starting the Flink YARN Session in detached mode
./sql-client.sh
```

This launches a Flink SQL Shell.

## Flink examples

### Create an Iceberg table

### Flink SQL

```
CREATE CATALOG glue_catalog WITH (
   'type'='iceberg',
   'warehouse'='<WAREHOUSE>',
   'catalog-type'='glue'
```

```
 );

USE CATALOG  glue_catalog;

CREATE DATABASE IF NOT EXISTS <DB>;

USE <DB>;

CREATE TABLE IF NOT EXISTS `glue_catalog`.`<DB>`.`sample` (id int, data string);
```

### Table API

```
EnvironmentSettings settings =
               EnvironmentSettings.newInstance().inBatchMode().build();

TableEnvironment tEnv = TableEnvironment.create(settings);

String warehouse = "<WAREHOUSE>";
String db = "<DB>";

tEnv.executeSql(
               "CREATE CATALOG glue_catalog WITH (\n"
                       + "   'type'='iceberg',\n"
                       + "   'warehouse'='"
                       + warehouse
                       + "',\n"
                       + "   'catalog-impl'='org.apache.iceberg.aws.glue.GlueCatalog',
\n"
                       + "   'io-impl'='org.apache.iceberg.aws.s3.S3FileIO'\n"
                       + " );");

tEnv.executeSql("USE CATALOG  glue_catalog;");
tEnv.executeSql("CREATE DATABASE IF NOT EXISTS " + db + ";");
tEnv.executeSql("USE " + db + ";");
tEnv.executeSql(
        "CREATE TABLE `glue_catalog`.`" + db + "`.`sample` (id bigint, data string);");
```

### Write to an Iceberg table

### Flink SQL

```
INSERT INTO `glue_catalog`.`<DB>`.`sample` values (1, 'a'),(2,'b'),(3,'c');
```

### Table API

```
tEnv.executeSql(
        "INSERT INTO `glue_catalog`.`"
                + db
                + "`.`sample` values (1, 'a'),(2,'b'),(3,'c');");
```

### Datastream API

```
final StreamExecutionEnvironment env =
 StreamExecutionEnvironment.getExecutionEnvironment();

final StreamTableEnvironment tableEnv = StreamTableEnvironment.create(env);

String db = "<DB Name>";

String warehouse = "<Warehouse Path>";

GenericRowData rowData1 = new GenericRowData(2);
rowData1.setField(0, 1L);
rowData1.setField(1, StringData.fromString("a"));

DataStream<RowData> input = env.fromElements(rowData1);

Map<String, String> props = new HashMap<();
props.put("type", "iceberg");
props.put("warehouse", warehouse);
props.put("io-impl", "org.apache.iceberg.aws.s3.S3FileIO");

CatalogLoader glueCatlogLoader =
        CatalogLoader.custom(
                "glue",
                props,
                new Configuration(),
                "org.apache.iceberg.aws.glue.GlueCatalog");

TableLoader tableLoader =
        TableLoader.fromCatalog(glueCatlogLoader, TableIdentifier.of(db, "sample"));

DataStreamSink<Void> dataStreamSink =
        FlinkSink.forRowData(input).tableLoader(tableLoader).append();

env.execute("Datastream Write");
```

### Read from an Iceberg table

### Flink SQL

```
SELECT * FROM `glue_catalog`.`<DB>`.`sample`;
```

### Table API

```
Table result = tEnv.sqlQuery("select * from `glue_catalog`.`" + db + "`.`sample`;");
```

### Datastream API

```
final StreamExecutionEnvironment env =
 StreamExecutionEnvironment.getExecutionEnvironment();

final StreamTableEnvironment tableEnv = StreamTableEnvironment.create(env);

String db = "<DB Name>";

String warehouse = "<Warehouse Path>";

Map<String, String> props = new HashMap<>();
props.put("type", "iceberg");
props.put("warehouse", warehouse);
props.put("io-impl", "org.apache.iceberg.aws.s3.S3FileIO");

CatalogLoader glueCatlogLoader =
        CatalogLoader.custom(
                "glue",
                props,
                new Configuration(),
                "org.apache.iceberg.aws.glue.GlueCatalog");

TableLoader tableLoader =
        TableLoader.fromCatalog(glueCatlogLoader, TableIdentifier.of(db, "sample"));

DataStream<RowData> batch =

 FlinkSource.forRowData().env(env).tableLoader(tableLoader).streaming(false).build();

batch.print().name("print-sink");
```

### Using the Hive catalog

Make sure the Flink and Hive dependencies are resolved as described in Configure Flink with Hive Metastore and Glue Catalog.

### Running a Flink Job

One way to submit a job to Flink is to use a per job Flink YARN session. This can be launched with the following command:

```
sudo flink run -m yarn-cluster -p 4 -yjm 1024m -ytm 4096m $JAR_FILE_NAME
```

### Considerations for using Iceberg with Flink

- When using Amazon Glue as a catalog for Iceberg, make sure the database in which you are creating a table exists in Amazon Glue. If you are using services such as Amazon Lake Formation and you're unable to load the catalog, make sure you have proper access to the service to execute the command.
- Iceberg Glue integration does not work with the Redshift Managed Storage catalog.

## Use an Iceberg cluster with Hive

With Amazon EMR releases 6.9.0 and higher, you can use Iceberg with a Hive cluster without having to perform the setup steps that are required for Open Source Iceberg Hive Integration. For Amazon EMR versions 6.8.0 and earlier, you can use a bootstrap action to install `iceberg-hive-runtime` jar for configuring Hive for Iceberg support.

Amazon EMR 6.9.0 includes all features for Hive 3.1.3 integration with Iceberg 0.14.1 and also includes Amazon EMR added features such as auto selection of supported execution engines at runtime (Amazon EMR on EKS 6.9.0).

### Create an Iceberg cluster

You can create a cluster with Iceberg installed using the Amazon Web Services Management Console, the Amazon CLI or the Amazon EMR API. In this tutorial, you use the Amazon CLI to work with Iceberg on an Amazon EMR cluster. To use the console to create a cluster with Iceberg installed, follow the steps in Build an Iceberg data lake using Amazon Athena, Amazon EMR, and Amazon Glue.

To use Iceberg on Amazon EMR with the Amazon CLI, first create a cluster using the steps below. For information on specifying the Iceberg classification using the Amazon CLI or the Java SDK, see Supply a configuration using the Amazon CLI when you create a cluster or Supply a configuration using the Java SDK when you create a cluster. Create a file named `configurations.json` with the following content:

```
[{
    "Classification":"iceberg-defaults",
    "Properties":{"iceberg.enabled":"true"}
}]
```

Next, create a cluster with the following configuration, replacing the example Amazon S3 bucket path and the subnet ID with your own:

```
aws emr create-cluster --release-label emr-6.9.0 \
--applications Name=Hive \
--configurations file://iceberg_configurations.json \
--region us-east-1 \
--name My_hive_Iceberg_Cluster \
--log-uri s3://amzn-s3-demo-bucket/ \
--instance-type m5.xlarge \
--instance-count 2 \
--service-role EMR_DefaultRole \
--ec2-attributes InstanceProfile=EMR_EC2_DefaultRole,SubnetId=subnet-1234567890abcdef
```

A Hive Iceberg cluster does the following things:

- Loads the Iceberg Hive runtime jar in Hive and enables Iceberg-related configuration for the Hive engine.
- Enables Amazon EMR Hive's dynamic execution engine selection to prevent users from setting supported execution engine for Iceberg compatibility.

> **Note**
>
> Hive Iceberg clusters do not currently support Amazon Glue Data Catalog. The default Iceberg catalog is `HiveCatalog`, which corresponds to the metastore configured for the Hive environment. For more information on catalog management, see Using HCatalog in the Apache Hive documentation.

## Feature support

Amazon EMR 6.9.0 supports Hive 3.1.3 and Iceberg 0.14.1. The feature support is limited to Iceberg-compatible features for Hive 3.1.2 and 3.1.3. The following commands are supported:

- With Amazon EMR releases 6.9.0 to 6.12.x, you must include the `libfb303` jar in the Hive `auxlib` directory. Use the following command to include it:

  ```
  sudo /usr/bin/ln -sf /usr/lib/hive/lib/libfb303-*.jar /usr/lib/hive/auxlib/
  libfb303.jar
  ```

  With Amazon EMR releases 6.13 and higher, the `libfb303` jar is automatically symlinked to the Hive `auxlib` directory.

- **Creating a table**
  - **Non-partitioned table** – External tables in Hive can be created by providing the storage handler as follows:

    ```
    CREATE EXTERNAL TABLE x (i int) STORED BY
     'org.apache.iceberg.mr.hive.HiveIcebergStorageHandler'
    ```

  - **Partitioned table** – External partitioned tables in Hive can be created as follows:

    ```
    CREATE EXTERNAL TABLE x (i int) PARTITIONED BY (j int) STORED BY
     'org.apache.iceberg.mr.hive.HiveIcebergStorageHandler'
    ```

  > **Note**
  >
  > The `STORED AS` file format of ORC/AVRO/PARQUET is not supported in Hive 3. The default and only option is Parquet.

- **Dropping a table** – The `DROP TABLE` command is used to drop tables, such as in the following example:

  ```
  DROP TABLE [IF EXISTS] table_name [PURGE];
  ```

- **Reading a table** – `SELECT` statements can be used to read Iceberg tables in Hive, such as in the following example. Supported execution engines are MR and Tez.

```
SELECT * FROM table_name
```

For information on Hive's select syntax, see LanguageManual Select. For information on select statements with Iceberg tables in Hive, see Apache Iceberg Select.

- **Inserting into a table** – HiveQL's `INSERT INTO` statement works on Iceberg tables with support for the Map Reduce execution engine only. Amazon EMR users don't need to explicitly set the execution engine because Amazon EMR Hive selects the engine for Iceberg Tables at runtime.
  - **Single table insert into** – Example:

    ```
    INSERT INTO table_name VALUES ('a', 1);
    INSERT INTO table_name SELECT...;
    ```

  - **Multi-table insert into** – Non-atomic multi-table insert into statements are supported. Example:

    ```
    FROM source
     INSERT INTO table_1 SELECT a, b
     INSERT INTO table_2 SELECT c,d;
    ```

Starting with Amazon EMR 7.3.0, Hive with Iceberg supports the Amazon Glue Data Catalog as a metastore. To use the Amazon Glue Data Catalog as the metastore, set the following property.

```
SET iceberg.catalog.<catalog_name>.catalog-
impl=org.apache.iceberg.aws.glue.GlueCatalog;
```

Alternatively, you can also set the following property.

```
SET iceberg.catalog.<catalog_name>.type=glue;
```

You can then create a table using the following example.

```
CREATE EXTERNAL TABLE table_name (col1 type1, col2 type2,..)
ROW FORMAT SERDE 'org.apache.iceberg.mr.hive.HiveIcebergSerDe'
STORED BY 'org.apache.iceberg.mr.hive.HiveIcebergStorageHandler'
location '<location>'
TBLPROPERTIES ('table_type'='iceberg', 'iceberg.catalog'='<catalog_name>');
```

### Considerations for using Iceberg with Hive

- Iceberg supports the following query types:
  - Create table
  - Drop table
  - Insert into table
  - Read table
- Only the MR (MapReduce) execution engine is supported for DML (data manipulation language) operations, and MR is deprecated in Hive 3.1.3.
- Amazon Glue Data Catalog is not currently supported for Iceberg with Hive.
- Error handling is insufficiently robust. In cases of misconfiguration, inserts into queries might complete successfully. However, failure to update metadata can result in data loss.
- Iceberg Glue integration does not work with the Redshift Managed Storage catalog.

## Iceberg release history

The following table lists the version of Iceberg included in each release version of Amazon EMR, along with the components installed with the application. For component versions in each release, see the Component Version section for your release in Amazon EMR 7.x release versions, Amazon EMR 6.x release versions, or Amazon EMR 5.x release versions.

#### Iceberg version information

| Amazon EMR Release label | Iceberg Version | Components installed with Iceberg |
|---|---|---|
| emr-7.9.0 | 1.7.1-amzn-2 | Not available. |
| emr-7.8.0 | 1.7.1-amzn-1 | Not available. |
| emr-7.7.0 | 1.7.1-amzn-0 | Not available. |
| emr-7.6.0 | 1.6.1-amzn-2 | Not available. |

| Amazon EMR Release label | Iceberg Version | Components installed with Iceberg |
|---|---|---|
| emr-7.5.0 | 1.6.1-amzn-1 | Not available. |
| emr-7.4.0 | 1.6.1-amzn-0 | Not available. |
| emr-7.3.0 | 1.5.2-amzn-0 | Not available. |
| emr-7.2.0 | 1.5.0-amzn-0 | Not available. |
| emr-7.1.0 | 1.4.3-amzn-0 | Not available. |
| emr-7.0.0 | 1.4.2-amzn-0 | Not available. |
| emr-6.15.0 | 1.4.0-amzn-0 | Not available. |
| emr-6.14.0 | 1.3.1-amzn-0 | Not available. |
| emr-6.13.0 | 1.3.0-amzn-1 | Not available. |
| emr-6.12.0 | 1.3.0-amzn-0 | Not available. |
| emr-6.11.1 | 1.2.0-amzn-0 | Not available. |
| emr-6.11.0 | 1.2.0-amzn-0 | Not available. |
| emr-6.10.1 | 1.1.0-amzn-0 | Not available. |
| emr-6.10.0 | 1.1.0-amzn-0 | Not available. |
| emr-6.9.1 | 0.14.1-amzn-0 | Not available. |
| emr-6.9.0 | 0.14.1-amzn-0 | Not available. |
| emr-6.8.1 | 0.14.0-amzn-0 | Not available. |
| emr-6.8.0 | 0.14.0-amzn-0 | Not available. |
| emr-6.7.0 | 0.13.1-amzn-0 | Not available. |
| emr-6.6.0 | 0.13.1 | Not available. |

| Amazon EMR Release label | Iceberg Version | Components installed with Iceberg |
|---|---|---|
| emr-6.5.0 | 0.12.0 | Not available. |

## Iceberg release notes by version

- Amazon EMR 6.9.0 - Iceberg release notes

### Amazon EMR 6.9.0 - Iceberg release notes

#### Amazon EMR 6.9.0 - Iceberg changes

| Type | Description |
|---|---|
| Feature | Amazon EMR Flink integration with Iceberg. |
| Feature | Amazon EMR Hive integration with Iceberg. |
| Feature | Support to cache Iceberg metadata files on Amazon FSx for Lustre to improve the query planning time. |
| Backport | PR 5050: Flink 1.15: Support write options in the in-line insert SQL comments. |
| Backport | PR 5282: Amazon: Fix PUT retry failures by opening new data file streams. |
| Backport | PR 5318: Flink 1.15: Bridge the gap between FlinkSource and IcebergSource (FLIP-27) and added an opt-in config to use FLIP-27 source in Flink SQL. |
| Backport | PR 5344: Flink 1.14: Bridge the gap between FlinkSource and IcebergSource (FLIP-27) and |

| Type | Description |
| --- | --- |
| | added an opt-in config to use FLIP-27 source in Flink SQL. |
| Backport | PR 5393: Flink 1.14, 1.15: Avoid convertin g Iceberg MetricContext to Flink metrics in FLIP-27 source reader. |
| Backport | PR 5401: Flink 1.14, 1.15: Missed IcebergSo urceReader group in PR #5393 for FLIP-27 source reader metrics. |
| Backport | PR 5679: Spark 3.2, 3.3: Fix nullability propagation for MergeRows node. |
| Backport | PR 5860: Spark 3.3: Fix QueryFailure when running RewriteManifestProcedure on Date partitioned tables. |
| Backport | PR 5880: Spark 3.3: Fix nullability in merge-on-read projections. |
| Backport | PR 5917: Spark 3.2: Fix nullability in merge-on-read projections. |

# Jupyter Notebook on Amazon EMR

Jupyter Notebook is an open-source web application that you can use to create and share documents that contain live code, equations, visualizations, and narrative text. Amazon EMR offers you three options to work with Jupyter notebooks:

**Topics**

- EMR Studio
- Amazon EMR Notebook based on Jupyter Notebook
- JupyterHub

## EMR Studio

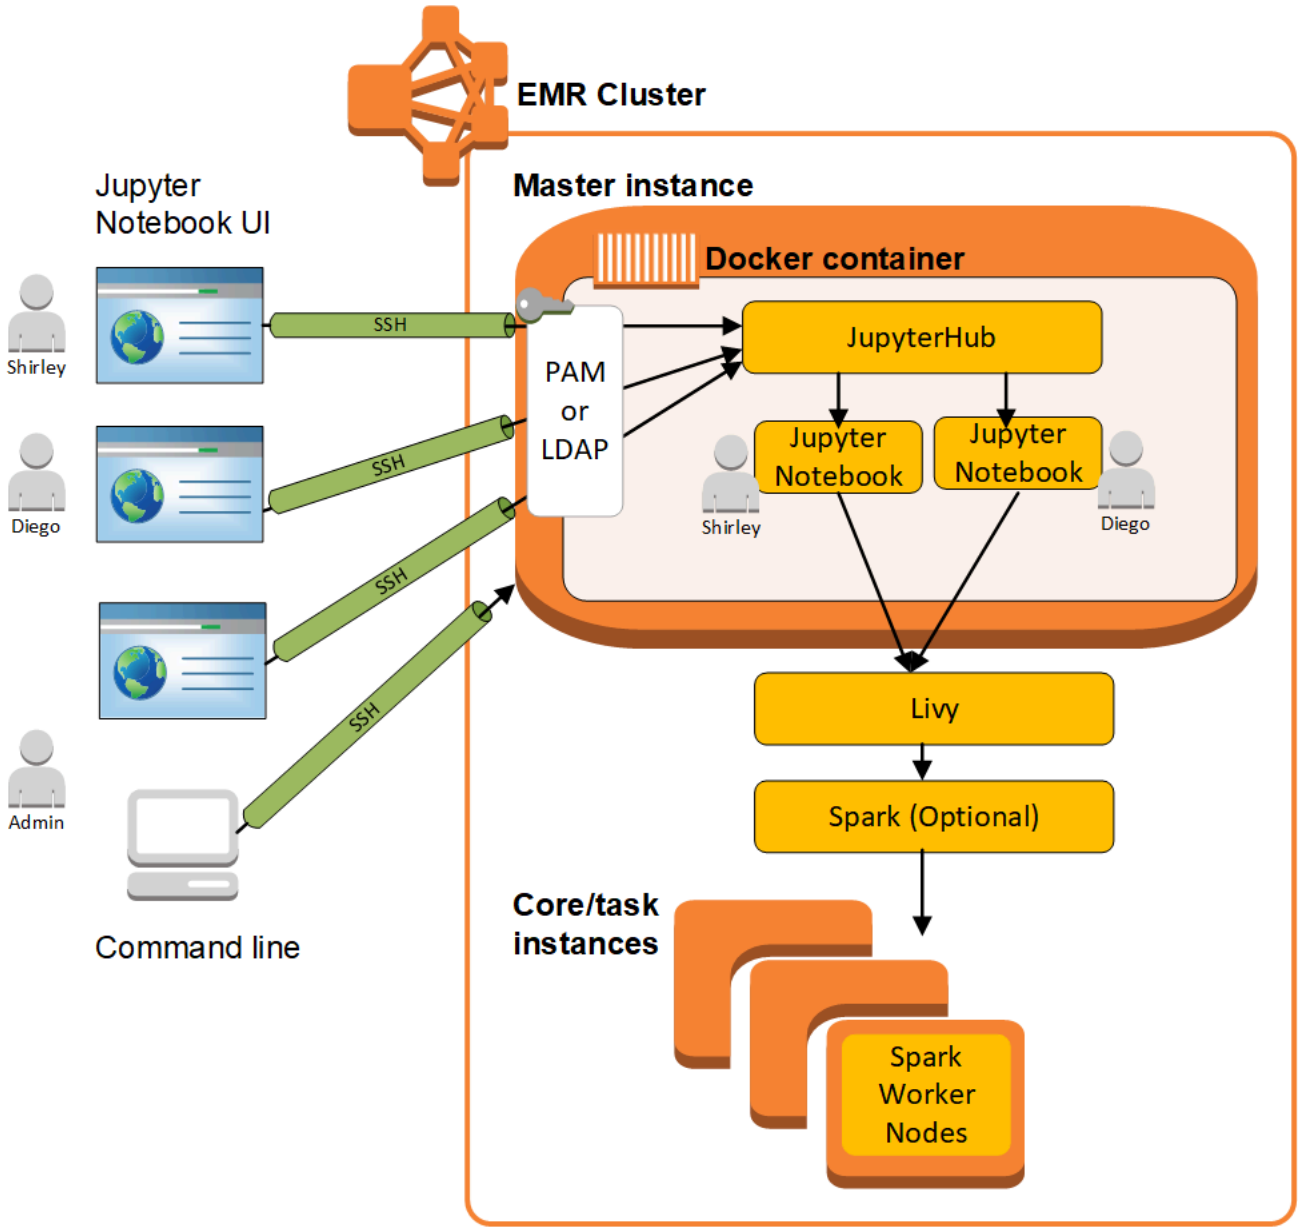
Amazon EMR Studio is a web-based integrated development environment (IDE) for fully managed Jupyter notebooks that run on Amazon EMR clusters. You can set up an EMR Studio for your team to develop, visualize, and debug applications written in R, Python, Scala, and PySpark.

We recommend using EMR Studio when using Jupyter notebooks on Amazon EMR. For more information, see EMR Studio in the *Amazon EMR Management Guide*.

## Amazon EMR Notebook based on Jupyter Notebook

EMR Notebooks is a Jupyter Notebook environment built in to the Amazon EMR console that allows you to quickly create Jupyter notebooks, attach them to Spark clusters, and then open the Jupyter Notebook editor in the console to remotely run queries and code. An EMR notebook is saved in Amazon S3 independently from clusters for durable storage, quick access, and flexibility. You can have multiple notebooks open, attach multiple notebooks to a single cluster, and re-use a notebook on different clusters.

For more information, see EMR notebooks in the *Amazon EMR Management Guide*.



## JupyterHub

Jupyter Notebook is an open-source web application that you can use to create and share documents that contain live code, equations, visualizations, and narrative text. JupyterHub allows

you to host multiple instances of a single-user Jupyter notebook server. When you create a cluster with JupyterHub, Amazon EMR creates a Docker container on the cluster's master node. JupyterHub, all the components required for Jupyter, and Sparkmagic run within the container.

Sparkmagic is a library of kernels that allows Jupyter notebooks to interact with Apache Spark running on Amazon EMR through Apache Livy, which is a REST server for Spark. Spark and Apache Livy are installed automatically when you create a cluster with JupyterHub. The default Python 3 kernel for Jupyter is available along with the PySpark 3, PySpark, and Spark kernels that are available with Sparkmagic. You can use these kernels to run ad-hoc Spark code and interactive SQL queries using Python and Scala. You can install additional kernels within the Docker container manually. For more information, see Installing additional kernels and libraries.

The following diagram depicts the components of JupyterHub on Amazon EMR with corresponding authentication methods for notebook users and the administrator. For more information, see Adding Jupyter Notebook users and administrators.

The following table lists the version of JupyterHub included in the latest release of the Amazon EMR 7.x series, along with the components that Amazon EMR installs with JupyterHub.

For the version of components installed with JupyterHub in this release, see Release 7.9.0 Component Versions.

**JupyterHub version information for emr-7.9.0**

| Amazon EMR Release Label | JupyterHub Version | Components Installed With JupyterHub |
| --- | --- | --- |
| emr-7.9.0 | JupyterHub 1.5.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, jupyterhub |

The following table lists the version of JupyterHub included in the latest release of the Amazon EMR 6.x series, along with the components that Amazon EMR installs with JupyterHub.

For the version of components installed with JupyterHub in this release, see Release 6.15.0 Component Versions.

**JupyterHub version information for emr-6.15.0**

| Amazon EMR Release Label | JupyterHub Version | Components Installed With JupyterHub |
| --- | --- | --- |
| emr-6.15.0 | JupyterHub 1.5.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resour |

| Amazon EMR Release Label | JupyterHub Version | Components Installed With JupyterHub |
| --- | --- | --- |
| | | cemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, jupyterhub |

The following table lists the version of JupyterHub included in the latest release of the Amazon EMR 5.x series, along with the components that Amazon EMR installs with JupyterHub.

For the version of components installed with JupyterHub in this release, see Release 5.36.2 Component Versions.

**JupyterHub version information for emr-5.36.2**

| Amazon EMR Release Label | JupyterHub Version | Components Installed With JupyterHub |
| --- | --- | --- |
| emr-5.36.2 | JupyterHub 1.4.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, jupyterhub |

The Python 3 kernel included with JupyterHub on Amazon EMR is 3.6.4.

The libraries installed within the `jupyterhub` container may vary between Amazon EMR release versions and Amazon EC2 AMI versions.

**To list installed libraries using `conda`**

- Run the following command on the master node command line:

```
sudo docker exec jupyterhub bash -c "conda list"
```

**To list installed libraries using `pip`**

- Run the following command on the master node command line:

```
sudo docker exec jupyterhub bash -c "pip freeze"
```

## Create a cluster with JupyterHub

You can create an Amazon EMR cluster with JupyterHub using the Amazon Web Services Management Console, Amazon Command Line Interface, or the Amazon EMR API. Ensure that the cluster is not created with the option to terminate automatically after completing steps (`--auto-terminate` option in the Amazon CLI). Also, make sure that administrators and notebook users can access the key pair that you use when you create the cluster. For more information, see Use a key pair for SSH credentials in the *Amazon EMR Management Guide*.

## Create a cluster with JupyterHub using the console

Use the following procedure to create a cluster with JupyterHub installed using **Advanced Options** in the Amazon EMR console.

**To create an Amazon EMR cluster with JupyterHub installed using the Amazon EMR console**

1. Navigate to the new Amazon EMR console and select **Switch to the old console** from the side navigation. For more information on what to expect when you switch to the old console, see Using the old console.
2. Choose **Create cluster**, **Go to advanced options**.
3. Under **Software Configuration**:
   - For **Release**, select emr-5.36.2, and choose JupyterHub.
   - If you use Spark, to use the Amazon Glue Data Catalog as the metastore for Spark SQL, select **Use for Spark table metadata**. For more information, see Use Amazon Glue Data Catalog catalog with Spark on Amazon EMR.
   - For **Edit software settings** choose **Enter configuration** and specify values, or choose **Load JSON from S3** and specify a JSON configuration file. For more information, see Configuring JupyterHub.
4. Under **Add steps (optional)** configure steps to run when the cluster is created, make sure that **Auto-terminate cluster after the last step is completed** is not selected, and choose **Next**.
5. Choose **Hardware Configuration** options, **Next**. For more information, see Configure cluster hardware and networking in the *Amazon EMR Management Guide*.
6. Choose options for **General Cluster Settings**, **Next**.
7. Choose **Security Options**, specifying a key pair, and choose **Create Cluster**.

## Create a cluster with JupyterHub using the Amazon CLI

To launch a cluster with JupyterHub, use the `aws emr create-cluster` command and, for the `--applications` option, specify `Name=JupyterHub`. The following example launches a JupyterHub cluster on Amazon EMR with two EC2 instances (one master and one core instance). Also, debugging is enabled, with logs stored in the Amazon S3 location as specified by `--log-uri`. The specified key pair provides access to Amazon EC2 instances in the cluster.

> **Note**
>
> Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

```
aws emr create-cluster --name="MyJupyterHubCluster" --release-label emr-5.36.2 \
--applications Name=JupyterHub --log-uri s3://amzn-s3-demo-bucket/MyJupyterClusterLogs
 \
--use-default-roles --instance-type m5.xlarge --instance-count 2 --ec2-attributes
 KeyName=MyKeyPair
```

## Considerations when using JupyterHub on Amazon EMR

Consider the following when using JupyterHub on Amazon EMR.

- > **Warning**
  >
  > User notebooks and files are saved to the file system on the master node. This is ephemeral storage that does not persist through cluster termination. When a cluster terminates, this data is lost if not backed up. We recommend that you schedule regular backups using `cron` jobs or another means suitable for your application.
  > In addition, configuration changes made within the container may not persist if the container restarts. We recommend that you script or otherwise automate container configuration so that you can reproduce customizations more readily.
- Kerberos authentication that has been set up using an Amazon EMR security configuration is not supported.
- OAuthenticator is not supported.

## Configuring JupyterHub

You can customize the configuration of JupyterHub on Amazon EMR and individual user notebooks by connecting to the cluster master node and editing configuration files. After you change values, restart the `jupyterhub` container.

Modify properties in the following files to configure JupyterHub and individual Jupyter notebooks:

- `jupyterhub_config.py`—By default, this file is saved in the `/etc/jupyter/conf/` directory on the master node. For more information, see Configuration basics in the JupyterHub documentation.
- `jupyter_notebook_config.py`—This file is saved in the `/etc/jupyter/` directory by default and copied to the `jupyterhub` container as the default. For more information, see Config file and command line options in the Jupyter Notebook documentation.

You can also use the `jupyter-sparkmagic-conf` configuration classification to customize Sparkmagic, which updates values in the `config.json` file for Sparkmagic. For more information about available settings, see the example_config.json on GitHub. For more information about using configuration classifications with applications in Amazon EMR, see Configure applications.

The following example launches a cluster using the Amazon CLI, referencing the file `MyJupyterConfig.json` for Sparkmagic configuration classification settings.

> **Note**
>
> Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

```
aws emr create-cluster --use-default-roles --release-label emr-5.14.0 \
--applications Name=Jupyter --instance-type m4.xlarge --instance-count 3 \
--ec2-attributes KeyName=MyKey,SubnetId=subnet-1234a5b6 --configurations file://
MyJupyterConfig.json
```

Sample contents of `MyJupyterConfig.json` are as follows:

```
[
    {
    "Classification":"jupyter-sparkmagic-conf",
    "Properties": {
      "kernel_python_credentials" : "{\"username\":\"diego\",\"base64_password\":
\"mypass\",\"url\":\"http:\/\/localhost:8998\",\"auth\":\"None\"}"
      }
    }
]
```

**Note**

With Amazon EMR version 5.21.0 and later, you can override cluster configurations and specify additional configuration classifications for each instance group in a running cluster. You do this by using the Amazon EMR console, the Amazon Command Line Interface (Amazon CLI), or the Amazon SDK. For more information, see Supplying a Configuration for an Instance Group in a Running Cluster.

## Configuring persistence for notebooks in Amazon S3

You can configure a JupyterHub cluster in Amazon EMR so that notebooks saved by a user persist in Amazon S3, outside of ephemeral storage on cluster EC2 instances.

You specify Amazon S3 persistence using the `jupyter-s3-conf` configuration classification when you create a cluster. For more information, see Configure applications.

In addition to enabling Amazon S3 persistence using the `s3.persistence.enabled` property, you specify a bucket in Amazon S3 where notebooks are saved using the `s3.persistence.bucket` property. Notebooks for each user are saved to a `jupyter/`*`jupyterhub-user-name`* folder in the specified bucket. The bucket must already exist in Amazon S3, and the role for the EC2 instance profile that you specify when you create the cluster must have permissions to the bucket (by default, the role is `EMR_EC2_DefaultRole`). For more information, see Configure IAM roles for Amazon EMR permissions to Amazon services.

When you launch a new cluster using the same configuration classification properties, users can open notebooks with the content from the saved location.

Note that when you import files as modules in a notebook when you have Amazon S3 enabled, this will result in the files uploading to Amazon S3. When you import files without enabling Amazon S3 persistence, they upload to your JupyterHub container.

The following example enables Amazon S3 persistence. Notebooks saved by users are saved in the `s3://MyJupyterBackups/jupyter/`*`jupyterhub-user-name`* folder for each user, where *`jupyterhub-user-name`* is a user name, such as `diego`.

```
[
    {
```

```
        "Classification": "jupyter-s3-conf",
        "Properties": {
            "s3.persistence.enabled": "true",
            "s3.persistence.bucket": "MyJupyterBackups"
        }
    }
]
```

## Connecting to the master node and Notebook servers

JupyterHub administrators and notebook users must connect to the cluster master node using an SSH tunnel and then connecting to web interfaces served by JupyterHub on the master node. For more information about configuring an SSH tunnel and using the tunnel to proxy Web connections, see Connect to the cluster in the *Amazon EMR Management Guide*.

By default, JupyterHub on Amazon EMR is available through **port 9443** on the master node. The internal JupyterHub proxy also serves notebook instances through port 9443. JupyterHub and Jupyter web interfaces can be accessed using a URL with the following pattern:

**https://*MasterNodeDNS*:9443**

You can specify a different port using the `c.JupyterHub.port` property in the `jupyterhub_config.py` file. For more information, see Networking basics in the JupyterHub documentation.

By default, JupyterHub on Amazon EMR uses a self-signed certificate for SSL encryption using HTTPS. Users are prompted to trust the self-signed certificate when they connect. You can use a trusted certificate and keys of your own. Replace the default certificate file, `server.crt`, and key file `server.key` in the `/etc/jupyter/conf/` directory on the master node with certificate and key files of your own. Use the `c.JupyterHub.ssl_key` and `c.JupyterHub.ssl_cert` properties in the `jupyterhub_config.py` file to specify your SSL materials. For more information, see Security settings in the JupyterHub documentation. After you update `jupyterhub_config.py`, restart the container.

## JupyterHub configuration and administration

JupyterHub and related components run inside a Docker container named `jupyterhub` that runs the Ubuntu operating system. There are several ways for you to administer components running inside the container.

> **Warning**
>
> Customizations that you perform within the container may not persist if the container restarts. We recommend that you script or otherwise automate container configuration so that you can reproduce customizations more readily.

### Administration using the command line

When connected to the master node using SSH, you can issue commands by using the Docker command-line interface (CLI) and specifying the container by name (`jupyterhub`) or ID. For example, `sudo docker exec jupyterhub` *`command`* runs commands recognized by the operating system or an application running inside the container. You can use this method to add users to the operating system and to install additional applications and libraries within the Docker container. For example, the default container image includes Conda for package installation, so you might run the following command on the master node command line to install an application, Keras, within the container:

```
sudo docker exec jupyterhub conda install keras
```

### Administration by submitting steps

Steps are a way to submit work to a cluster. You can submit steps when you launch a cluster, or you can submit steps to a running cluster. Commands that you run on the command line can be submitted as steps using `command-runner.jar`. For more information, see Work with steps using the CLI and console in the *Amazon EMR Management Guide* and Run commands and scripts on an Amazon EMR cluster.

For example, you could use the following Amazon CLI command on a local computer to install Keras in the same way that you did from the command line of the master node in the earlier example:

```
aws emr add-steps --cluster-id MyClusterID --steps Name="Command
 Runner",Jar="command-runner.jar",Args="/usr/bin/sudo","/usr/bin/
docker","exec","jupyterhub","conda","install","keras"
```

Also, you can script a sequence of steps, upload the script to Amazon S3, and then use `script-runner.jar` to run the script when you create the cluster or add the script as a step. For more

information, see Run commands and scripts on an Amazon EMR cluster. For an example, see the section called "Example: Bash script to add multiple users".

### Administration using REST APIs

Jupyter, JupyterHub, and the HTTP proxy for JupyterHub provide REST APIs that you can use to send requests. To send requests to JupyterHub, you must pass an API token with the request. You can use the `curl` command from the master node command line to execute REST commands. For more information, see the following resources:

- Using JupyterHub's REST API in the documentation for JupyterHub, which includes instructions for generating API tokens
- Jupyter Notebook server API on GitHub
- configurable-http-proxy on GitHub

The following example demonstrates using the REST API for JupyterHub to get a list of users. The command passes a previously generated admin token and uses the default port, 9443, for JupyterHub, piping the output to jq for easier viewing:

```
curl -XGET -s -k https://$HOST:9443/hub/api/users \
-H "Authorization: token $admin_token" | jq .
```

## Adding Jupyter Notebook users and administrators

You can use one of two methods for users to authenticate to JupyterHub so that they can create notebooks and, optionally, administer JupyterHub. The easiest method is to use JupyterHub's pluggable authentication module (PAM). In addition, JupyterHub on Amazon EMR supports the LDAP authenticator plugin for JupyterHub for obtaining user identities from an LDAP server, such as a Microsoft Active Directory server. Instructions and examples for adding users with each authentication method are provided in this section.

JupyterHub on Amazon EMR has a default user with administrator permissions. The user name is `jovyan` and the password is `jupyter`. We strongly recommend that you replace the user with another user who has administrative permissions. You can do this using a step when you create the cluster, or by connecting to the master node when the cluster is running.

**Topics**

- Using PAM authentication

- Using LDAP authentication
- User impersonation

## Using PAM authentication

Creating PAM users in JupyterHub on Amazon EMR is a two-step process. The first step is to add users to the operating system running in the `jupyterhub` container on the master node, and to add a corresponding user home directory for each user. The second step is to add these operating system users as JupyterHub users—a process known as *whitelisting* in JupyterHub. After a JupyterHub user is added, they can connect to the JupyterHub URL and provide their operating system credentials for access.

When a user logs in, JupyterHub opens the notebook server instance for that user, which is saved in the user's home directory on the master node, which is `/var/lib/jupyter/home/`*`username`*. If a notebook server instance doesn't exist, JupyterHub spawns a notebook instance in the user's home directory. The following sections demonstrate how to add users individually to the operating system and to JupyterHub, followed by a rudimentary bash script that adds multiple users.

### Adding an operating system user to the container

The following example first uses the useradd command within the container to add a single user, diego, and create a home directory for that user. The second command uses chpasswd to establish a password of diego for this user. Commands are run on the master node command line while connected using SSH. You could also run these commands using a step as described earlier in Administration by submitting steps.

```
sudo docker exec jupyterhub useradd -m -s /bin/bash -N diego
sudo docker exec jupyterhub bash -c "echo diego:diego | chpasswd"
```

### Adding a JupyterHub user

You can use the **Admin** panel in JupyterHub or the REST API to add users and administrators, or just users.

#### To add users and administrators using the admin panel in JupyterHub

1. Connect to the master node using SSH and log in to https://*MasterNodeDNS*:9443 with an identity that has administrator permissions.
2. Choose **Control Panel**, **Admin**.

3. Choose **User**, **Add Users**, or choose **Admin**, **Add Admins**.

### To add a user using the REST API

1. Connect to the master node using SSH and use the following command on the master node, or run the command as a step.
2. Acquire an administrative token to make API requests, and replace *AdminToken* in the following step with that token.
3. Use the following command, replacing *UserName* with an operating system user that has been created within the container.

```
curl -XPOST -H "Authorization: token AdminToken" "https://$(hostname):9443/hub/api/
users/UserName
```

> **Note**
>
> You are automatically added as a JupyterHub non-admin user when you log in to the JupyterHub web interface for the first time.

### Example: Bash script to add multiple users

The following sample bash script ties together the previous steps in this section to create multiple JupyterHub users. The script can be run directly on the master node, or it can be uploaded to Amazon S3 and then run as a step.

The script first establishes an array of user names, and uses the `jupyterhub token` command to create an API token for the default administrator, jovyan. It then creates an operating system user in the `jupyterhub` container for each user, assigning an initial password to each that is equal to their user name. Finally, it calls the REST API operation to create each user in JupyterHub. It passes the token generated earlier in the script and pipes the REST response to `jq` for easier viewing.

```
# Bulk add users to container and JupyterHub with temp password of username
set -x
USERS=(shirley diego ana richard li john mary anaya)
TOKEN=$(sudo docker exec jupyterhub /opt/conda/bin/jupyterhub token jovyan | tail -1)
for i in "${USERS[@]}";
```

```
do
   sudo docker exec jupyterhub useradd -m -s /bin/bash -N $i
   sudo docker exec jupyterhub bash -c "echo $i:$i | chpasswd"
   curl -XPOST --silent -k https://$(hostname):9443/hub/api/users/$i \
 -H "Authorization: token $TOKEN" | jq
done
```

Save the script to a location in Amazon S3 such as `s3://amzn-s3-demo-bucket/createjupyterusers.sh`. Then you can use `script-runner.jar` to run it as a step.

**Example: Running the script when creating a cluster (Amazon CLI)**

> **Note**
>
> Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

```
aws emr create-cluster --name="MyJupyterHubCluster" --release-label emr-5.36.2 \
--applications Name=JupyterHub --log-uri s3://amzn-s3-demo-bucket/MyJupyterClusterLogs
 \
--use-default-roles --instance-type m5.xlarge --instance-count 2 --ec2-attributes
 KeyName=MyKeyPair \
--steps Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,\
Jar=s3://region.elasticmapreduce/libs/script-runner/script-runner.jar,Args=["s3://amzn-
s3-demo-bucket/createjupyterusers.sh"]
```

**Running the script on an existing cluster (Amazon CLI)**

> **Note**
>
> Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=CUSTOM_JAR,\
Name=CustomJAR,ActionOnFailure=CONTINUE,\
Jar=s3://region.elasticmapreduce/libs/script-runner/script-runner.jar,Args=["s3://amzn-
s3-demo-bucket/createjupyterusers.sh"]
```

## Using LDAP authentication

Lightweight Directory Access Protocol (LDAP) is an application protocol for querying and modifying objects that correspond to resources such as users and computers stored in an LDAP-compatible directory service provider such as Active Directory or an OpenLDAP server. You can use the LDAP authenticator plugin for JupyterHub with JupyterHub on Amazon EMR to use LDAP for user authentication. The plugin handles login sessions for LDAP users and provides user information to Jupyter. This lets users connect to JupyterHub and notebooks by using the credentials for their identities stored in an LDAP-compatible server.

The steps in this section walk you through the following steps to set up and enable LDAP using the LDAP Authenticator Plugin for JupyterHub. You perform the steps while connected to the master node command line. For more information, see Connecting to the master node and Notebook servers.

1. Create an LDAP configuration file with information about the LDAP server, such as the host IP address, port, binding names, and so on.
2. Modify `/etc/jupyter/conf/jupyterhub_config.py` to enable the LDAP Authenticator Plugin for JupyterHub.
3. Create and run a script that configures LDAP within the `jupyterhub` container.
4. Query LDAP for users, and then create home directories within the container for each user. JupyterHub requires home directories to host notebooks.
5. Run a script that restarts JupyterHub

> **Important**
>
> Before you set up LDAP, test your network infrastructure to ensure that the LDAP server and the cluster master node can communicate as required. TLS typically uses port 389 over a plain TCP connection. If your LDAP connection uses SSL, the well-known TCP port for SSL is 636.

### Create the LDAP configuration file

The example below uses the following place-holder configuration values. Replace these with parameters that match your implementation.

- The LDAP server is running version 3 and available on port 389. This is the standard non-SSL port for LDAP.
- The base distinguished name (DN) is `dc=example, dc=org`.

Use a text editor to create the file ldap.conf, with contents similar to the following. Use values appropriate for your LDAP implementation. Replace *host* with the IP address or resolvable host name of your LDAP server.

```
base dc=example,dc=org
uri ldap://host
ldap_version 3
binddn cn=admin,dc=example,dc=org
bindpw admin
```

**Enable LDAP Authenticator Plugin for JupyterHub**

Use a text editor to modify the `/etc/jupyter/conf/jupyterhub_config.py` file and add ldapauthenticator properties similar to the following. Replace *host* with the IP address or resolvable host name of the LDAP server. The example assumes that the user objects are within an organizational unit (ou) named *people*, and uses the distinguished name components that you established earlier using `ldap.conf`.

```
c.JupyterHub.authenticator_class = 'ldapauthenticator.LDAPAuthenticator'
c.LDAPAuthenticator.use_ssl = False
c.LDAPAuthenticator.server_address = 'host'
c.LDAPAuthenticator.bind_dn_template = 'cn={username},ou=people,dc=example,dc=org'
```

**Configure LDAP within the container**

Use a text editor to create a bash script with the following contents:

```
#!/bin/bash

# Uncomment the following lines to install LDAP client libraries only if
# using Amazon EMR release version 5.14.0. Later versions install libraries by default.
# sudo docker exec jupyterhub bash -c "sudo apt-get update"
# sudo docker exec jupyterhub bash -c "sudo apt-get -y install libnss-ldap libpam-ldap
 ldap-utils nscd"

# Copy ldap.conf
```

```
sudo docker cp ldap.conf jupyterhub:/etc/ldap/
sudo docker exec jupyterhub bash -c "cat /etc/ldap/ldap.conf"

# configure nss switch
sudo docker exec jupyterhub bash -c "sed -i 's/\(^passwd.*\)/\1 ldap/g' /etc/
nsswitch.conf"
sudo docker exec jupyterhub bash -c "sed -i 's/\(^group.*\)/\1 ldap/g' /etc/
nsswitch.conf"
sudo docker exec jupyterhub bash -c "sed -i 's/\(^shadow.*\)/\1 ldap/g' /etc/
nsswitch.conf"
sudo docker exec jupyterhub bash -c "cat /etc/nsswitch.conf"

# configure PAM to create home directories
sudo docker exec jupyterhub bash -c "echo 'session required        pam_mkhomedir.so
 skel=/etc/skel umask=077' >> /etc/pam.d/common-session"
sudo docker exec jupyterhub bash -c "cat /etc/pam.d/common-session"

# restart nscd service
sudo docker exec jupyterhub bash -c "sudo service nscd restart"

# Test
sudo docker exec jupyterhub bash -c "getent passwd"

# Install ldap plugin
sudo docker exec jupyterhub bash -c "pip install jupyterhub-ldapauthenticator"
```

Save the script to the master node, and then run it from the master node command line. For example, with the script saved as `configure_ldap_client.sh`, make the file executable:

```
chmod +x configure_ldap_client.sh
```

And run the script:

```
./configure_ldap_client.sh
```

**Add attributes to Active Directory**

To find each user and create the appropriate entry in the database, the JupyterHub docker container requires the following UNIX properties for the corresponding user object in Active Directory. For more information, see the section *How do I continue to edit the GID/UID RFC 2307 attributes now that the Unix Attributes Plug-in is no longer available for the Active Directory Users and Computers MMC snap-in?* in the article Clarification regarding the status of identity

management for Unix (IDMU) and NIS server role in Windows Server 2016 technical preview and beyond.

- `homeDirectory`

  This is the location to the user's home directory, which is usually /home/*username*.

- `gidNumber`

  This is a value greater than 60000 that is not already used by a another user. Check the `etc/passwd` file for gids in use.

- `uidNumber`

  This is a value greater than 60000 that is not already used by a another group. Check the `etc/group` file for uids in use.

- `uid`

  This is the same as the *username*.

**Create user home directories**

JupyterHub needs home directories within the container to authenticate LDAP users and store instance data. The following example demonstrates two users, *shirley* and *diego*, in the LDAP directory.

The first step is to query the LDAP server for each user's user id and group id information using ldapsearch as shown in the following example, replacing *host* with the IP address or resolvable host name of your LDAP server:

```
ldapsearch -x -H ldap://host \
 -D "cn=admin,dc=example,dc=org" \
 -w admin \
 -b "ou=people,dc=example,dc=org" \
 -s sub \
 "(objectclass=*)" uidNumber gidNumber
```

The `ldapsearch` command returns an LDIF-formatted response that looks similar to the following for users *shirley* and *diego*.

```
# extended LDIF
```

```
# LDAPv3
# base <ou=people,dc=example,dc=org> with scope subtree
# filter: (objectclass=*)
# requesting: uidNumber gidNumber sn

# people, example.org
dn: ou=people,dc=example,dc=org

# diego, people, example.org
dn: cn=diego,ou=people,dc=example,dc=org
sn: B
uidNumber: 1001
gidNumber: 100

# shirley, people, example.org
dn: cn=shirley,ou=people,dc=example,dc=org
sn: A
uidNumber: 1002
gidNumber: 100

# search result
search: 2
result: 0 Success

# numResponses: 4
# numEntries: 3
```

Using information from the response, run commands within the container to create a home directory for each user common name (`cn`). Use the `uidNumber` and `gidNumber` to fix ownership for the home directory for that user. The following example commands do this for the user *`shirley`*.

```
sudo docker container exec jupyterhub bash -c "mkdir /home/shirley"
sudo docker container exec jupyterhub bash -c "chown -R $uidNumber /home/shirley"
sudo docker container exec jupyterhub bash -c "sudo chgrp -R $gidNumber /home/shirley"
```

**Note**

LDAP authenticator for JupyterHub does not support local user creation. For more information, see LDAP authenticator configuration note on local user creation.
To create a local user manually, use the following command.

```
sudo docker exec jupyterhub bash -c "echo 'shirley:x:$uidNumber:$gidNumber::/
home/shirley:/bin/bash' >> /etc/passwd"
```

#### Restart the JupyterHub container

Run the following commands to restart the `jupyterhub` container:

```
sudo docker stop jupyterhub
sudo docker start jupyterhub
```

## User impersonation

A Spark job running inside a Jupyter notebook traverses multiple applications during its execution on Amazon EMR. For example, PySpark3 code that a user runs inside Jupyter is received by Sparkmagic, which uses an HTTP POST request to submit it to Livy, which then creates a Spark job to execute on the cluster using YARN.

By default, YARN jobs submitted this way run as user `livy`, regardless of the user who initiated the job. By setting up *user impersonation* you can have the user ID of the notebook user also be the user associated with the YARN job. Rather than having jobs initiated by both `shirley` and `diego` associated with the user `livy`, jobs that each user initiates are associated with `shirley` and `diego` respectively. This helps you to audit Jupyter usage and manage applications within your organization.

This configuration is only supported when calls from Sparkmagic to Livy are unauthenticated. Applications that provide an authentication or proxying layer between Hadoop applications and Livy (such as Apache Knox Gateway) are not supported. The steps to configure user impersonation in this section assume that JupyterHub and Livy are running on the same master node. If your application has separate clusters, Step 3: Create HDFS home directories for users needs to be modified so that HDFS directories are created on the Livy master node.

#### Steps to configure user impersonation

- Step 1: Configure Livy
- Step 2: Add users
- Step 3: Create HDFS home directories for users

### Step 1: Configure Livy

You use the `livy-conf` and `core-site` configuration classifications when you create a cluster to enable Livy user impersonation as shown in the following example. Save the configuration classification as a JSON and then reference it when you create the cluster, or specify the configuration classification inline. For more information, see Configure applications.

```
[
  {
    "Classification": "livy-conf",
    "Properties": {
      "livy.impersonation.enabled": "true"
    }
  },
  {
    "Classification": "core-site",
    "Properties": {
      "hadoop.proxyuser.livy.groups": "*",
      "hadoop.proxyuser.livy.hosts": "*"
    }
  }
]
```

### Step 2: Add users

Add JupyterHub users using PAM or LDAP. For more information, see Using PAM authentication and Using LDAP authentication.

### Step 3: Create HDFS home directories for users

You connected to the master node to create users. While still connected to the master node, copy the contents below and save it to a script file. The script creates HDFS home directories for each JupyterHub user on the master node. The script assumes you are using the default administrator user ID, *jovyan*.

```
#!/bin/bash

CURL="curl --silent -k"
HOST=$(curl -s http://169.254.169.254/latest/meta-data/local-hostname)

admin_token() {
```

```
    local user=jovyan
    local pwd=jupyter
    local token=$($CURL https://$HOST:9443/hub/api/authorizations/token \
        -d "{\"username\":\"$user\", \"password\":\"$pwd\"}" | jq ".token")
    if [[ $token != null ]]; then
        token=$(echo $token | sed 's/"//g')
    else
        echo "Unable to get Jupyter API Token."
        exit 1
    fi
    echo $token
}

# Get Jupyter Admin token
token=$(admin_token)

# Get list of Jupyter users
users=$(curl -XGET -s -k https://$HOST:9443/hub/api/users \
 -H "Authorization: token $token" | jq '.[].name' | sed 's/"//g')

# Create HDFS home dir
for user in ${users[@]};
do
 echo "Create hdfs home dir for $user"
 hadoop fs -mkdir /user/$user
 hadoop fs -chmod 777 /user/$user
done
```

## Installing additional kernels and libraries

When you create a cluster with JupyterHub on Amazon EMR, the default Python 3 kernel for Jupyter along with the PySpark and Spark kernels for Sparkmagic are installed on the Docker container. You can install additional kernels. You can also install additional libraries and packages and then import them for the appropriate shell.

### Installing a kernel

Kernels are installed within the Docker container. The easiest way to accomplish this is to create a bash script with installation commands, save it to the master node, and then use the `sudo docker exec jupyterhub` *`script_name`* command to run the script within the `jupyterhub` container. The following example script installs the kernel, and then installs a few libraries for that kernel on the master node so that later you can import the libraries using the kernel in Jupyter.

```
#!/bin/bash

# Install Python 2 kernel
conda create -n py27 python=2.7 anaconda
source /opt/conda/envs/py27/bin/activate
apt-get update
apt-get install -y gcc
/opt/conda/envs/py27/bin/python -m pip install --upgrade ipykernel
/opt/conda/envs/py27/bin/python -m ipykernel install

# Install libraries for Python 2
/opt/conda/envs/py27/bin/pip install paramiko nltk scipy numpy scikit-learn pandas
```

To install the kernel and libraries within the container, open a terminal connection to the master node, save the script to `/etc/jupyter/install_kernels.sh`, and run the following command on the master node command line:

```
sudo docker exec jupyterhub bash /etc/jupyter/install_kernels.sh
```

## Using libraries and installing additional libraries

A core set of machine learning and data science libraries for Python 3 are pre-installed with JupyterHub on Amazon EMR. You can use `sudo docker exec jupyterhub bash -c "conda list"` and `sudo docker exec jupyterhub bash -c "pip freeze"`.

If a Spark job needs libraries on worker nodes, we recommend that you use a bootstrap action to run a script to install the libraries when you create the cluster. Bootstrap actions run on all cluster nodes during the cluster creation process, which simplifies installation. If you install libraries on core/worker nodes after a cluster is running, the operation is more complex. We provide an example Python program in this section that shows how to install these libraries.

The bootstrap action and Python program examples shown in this section use a bash script saved to Amazon S3 to install the libraries on all nodes.

The script referenced in the following example uses `pip` to install paramiko, nltk, scipy, scikit-learn, and pandas for the Python 3 kernel:

```
#!/bin/bash

sudo python3 -m pip install boto3 paramiko nltk scipy scikit-learn pandas
```

After you create the script, upload it to a location in Amazon S3, for example, `s3://amzn-s3-demo-bucket/install-my-jupyter-libraries.sh`. For more information, see Uploading objects in the *Amazon Simple Storage Service User Guide* so that you can use it in your bootstrap action or in your Python program.

**To specify a bootstrap action that installs libraries on all nodes when you create a cluster using the Amazon CLI**

1. Create a script similar to the earlier example and save it to a location in Amazon S3. We use the example `s3://amzn-s3-demo-bucket/install-my-jupyter-libraries.sh`.
2. Create the cluster with JupyterHub and use the `Path` argument of the `--bootstrap-actions` option to specify the script location as shown in the following example:

> **Note**
>
> Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

```
aws emr create-cluster --name="MyJupyterHubCluster" --release-label emr-5.36.2 \
--applications Name=JupyterHub --log-uri s3://amzn-s3-demo-bucket/
MyJupyterClusterLogs \
--use-default-roles --instance-type m5.xlarge --instance-count 2 --ec2-attributes
 KeyName=MyKeyPair \
--bootstrap-actions Path=s3://amzn-s3-demo-bucket/install-my-jupyter-
libraries.sh,Name=InstallJupyterLibs
```

**To specify a bootstrap action that installs libraries on all nodes when you create a cluster using the console**

1. Navigate to the new Amazon EMR console and select **Switch to the old console** from the side navigation. For more information on what to expect when you switch to the old console, see Using the old console.
2. Choose **Create cluster**, **Go to advanced options**.
3. Specify settings for **Software and Steps** and **Hardware** as appropriate for your application.
4. On the **General Cluster Settings** screen, expand **Bootstrap Actions**.
5. For **Add bootstrap action**, select **Custom action**, **Configure and add**.

6. For **Name**, enter a friendly name. For **Script location**, enter the location in Amazon S3 of your script (the example we use is *s3://amzn-s3-demo-bucket/install-my-jupyter-libraries.sh*). Leave **Optional arguments** blank, and choose **Add**.
7. Specify other settings for your cluster, and choose **Next**.
8. Specify security settings, and choose **Create cluster**.

**Example Installing libraries on core nodes of a running cluster**

After you install libraries on the master node from within Jupyter, you can install libraries on running core nodes in various ways. The following example shows a Python program written to run on a local machine. When you run the Python program locally, it uses the `AWS-RunShellScript` of Amazon Systems Manager to run the example script, shown earlier in this section, which installs libraries on the cluster's core nodes.

```
import argparse
import time
import boto3

def install_libraries_on_core_nodes(cluster_id, script_path, emr_client, ssm_client):
    """
    Copies and runs a shell script on the core nodes in the cluster.

    :param cluster_id: The ID of the cluster.
    :param script_path: The path to the script, typically an Amazon S3 object URL.
    :param emr_client: The Boto3 Amazon EMR client.
    :param ssm_client: The Boto3 AWS Systems Manager client.
    """
    core_nodes = emr_client.list_instances(
        ClusterId=cluster_id, InstanceGroupTypes=["CORE"]
    )["Instances"]
    core_instance_ids = [node["Ec2InstanceId"] for node in core_nodes]
    print(f"Found core instances: {core_instance_ids}.")

    commands = [
        # Copy the shell script from Amazon S3 to each node instance.
        f"aws s3 cp {script_path} /home/hadoop",
        # Run the shell script to install libraries on each node instance.
        "bash /home/hadoop/install_libraries.sh",
    ]
    for command in commands:
```

```
        print(f"Sending '{command}' to core instances...")
        command_id = ssm_client.send_command(
            InstanceIds=core_instance_ids,
            DocumentName="AWS-RunShellScript",
            Parameters={"commands": [command]},
            TimeoutSeconds=3600,
        )["Command"]["CommandId"]
        while True:
            # Verify the previous step succeeded before running the next step.
            cmd_result = ssm_client.list_commands(CommandId=command_id)["Commands"][0]
            if cmd_result["StatusDetails"] == "Success":
                print(f"Command succeeded.")
                break
            elif cmd_result["StatusDetails"] in ["Pending", "InProgress"]:
                print(f"Command status is {cmd_result['StatusDetails']}, waiting...")
                time.sleep(10)
            else:
                print(f"Command status is {cmd_result['StatusDetails']}, quitting.")
                raise RuntimeError(
                    f"Command {command} failed to run. "
                    f"Details: {cmd_result['StatusDetails']}"
                )

def main():
    parser = argparse.ArgumentParser()
    parser.add_argument("cluster_id", help="The ID of the cluster.")
    parser.add_argument("script_path", help="The path to the script in Amazon S3.")
    args = parser.parse_args()

    emr_client = boto3.client("emr")
    ssm_client = boto3.client("ssm")

    install_libraries_on_core_nodes(
        args.cluster_id, args.script_path, emr_client, ssm_client
    )

if __name__ == "__main__":
    main()
```

# JupyterHub release history

The following table lists the version of JupyterHub included in each release version of Amazon EMR, along with the components installed with the application. For component versions in each release, see the Component Version section for your release in Amazon EMR 7.x release versions, Amazon EMR 6.x release versions, or Amazon EMR 5.x release versions.

### JupyterHub version information

| Amazon EMR Release label | JupyterHub Version | Components installed with JupyterHub |
|---|---|---|
| emr-7.9.0 | 1.5.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, jupyterhub |
| emr-7.8.0 | 1.5.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, |

| Amazon EMR Release label | JupyterHub Version | Components installed with JupyterHub |
|---|---|---|
| | | spark-yarn-slave, livy-server, jupyterhub |
| emr-7.7.0 | 1.5.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, jupyterhub |
| emr-7.6.0 | 1.5.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, jupyterhub |

| Amazon EMR Release label | JupyterHub Version | Components installed with JupyterHub |
| --- | --- | --- |
| emr-7.5.0 | 1.5.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, jupyterhub |
| emr-7.4.0 | 1.5.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, jupyterhub |

| Amazon EMR Release label | JupyterHub Version | Components installed with JupyterHub |
| --- | --- | --- |
| emr-7.3.0 | 1.5.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, jupyterhub |
| emr-7.2.0 | 1.5.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, jupyterhub |

| Amazon EMR Release label | JupyterHub Version | Components installed with JupyterHub |
| --- | --- | --- |
| emr-5.36.2 | 1.4.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, jupyterhub |
| emr-7.1.0 | 1.5.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, jupyterhub |

| Amazon EMR Release label | JupyterHub Version | Components installed with JupyterHub |

# Apache Livy

Livy enables interaction over a REST interface with an EMR cluster running Spark. You can use the REST interface or an RPC client library to submit Spark jobs or snippets of Spark code, retrieve results synchronously or asynchronously, and manage Spark Context. For more information, see the Apache Livy website. Livy is included in Amazon EMR release version 5.9.0 and later.

To access the Livy web interface, set up an SSH tunnel to the master node and a proxy connection. For more information, see View web interfaces hosted on EMR clusters.

The following table lists the version of Livy included in the latest release of the Amazon EMR 7.x series, along with the components that Amazon EMR installs with Livy.

For the version of components installed with Livy in this release, see Release 7.9.0 Component Versions.

**Livy version information for emr-7.9.0**

| Amazon EMR Release Label | Livy Version | Components Installed With Livy |
|---|---|---|
| emr-7.9.0 | Livy 0.8.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |

The following table lists the version of Livy included in the latest release of the Amazon EMR 6.x series, along with the components that Amazon EMR installs with Livy.

For the version of components installed with Livy in this release, see Release 6.15.0 Component Versions.

**Livy version information for emr-6.15.0**

| Amazon EMR Release Label | Livy Version | Components Installed With Livy |
|---|---|---|
| emr-6.15.0 | Livy 0.7.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |

The following table lists the version of Livy included in the latest release of the Amazon EMR 5.x series, along with the components that Amazon EMR installs with Livy.

For the version of components installed with Livy in this release, see Release 5.36.2 Component Versions.

**Livy version information for emr-5.36.2**

| Amazon EMR Release Label | Livy Version | Components Installed With Livy |
|---|---|---|
| emr-5.36.2 | Livy 0.7.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs- |

| Amazon EMR Release Label | Livy Version | Components Installed With Livy |
| --- | --- | --- |
| | | namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |

- Enabling HTTPS with Apache Livy
- Livy release history

# Enabling HTTPS with Apache Livy

This topic is relevant if you are running Amazon EMR 7.3.0 or an earlier release. Beginning with release 7.4.0, HTTPS is enabled with Apache Livy by default.

1. Provision an Amazon EMR cluster with transit encryption enabled. To learn more about encryption, see Encrypt data at rest and in transit.
2. Create a file called `livy_ssl.sh` with the following contents.

```
#!/bin/bash

KEYSTORE_FILE=`awk '/ssl.server.keystore.location/{getline; print}' /etc/hadoop/
conf/ssl-server.xml | sed -e 's/<[^>]*>//g' | tr -d ' \t\n\r\f'`
KEYSTORE_PASS=`awk '/ssl.server.keystore.password/{getline; print}' /etc/hadoop/
conf/ssl-server.xml | sed -e 's/<[^>]*>//g' | tr -d ' \t\n\r\f'`
KEY_PASS=`awk '/ssl.server.keystore.keypassword/{getline; print}' /etc/hadoop/conf/
ssl-server.xml | sed -e 's/<[^>]*>//g' | tr -d ' \t\n\r\f'`

echo "livy.keystore $KEYSTORE_FILE
livy.keystore.password $KEYSTORE_PASS
```

```
livy.key-password $KEY_PASS" | sudo tee -a /etc/livy/conf/livy.conf >/dev/null

sudo systemctl restart livy-server.service
```

3. Run the following script as an Amazon EMR step. This script modifies `/etc/livy/conf/livy.conf` to activate SSL.

```
--steps '[{"Args":["s3://amzn-s3-demo-bucket/
livy_ssl.sh"],"Type":"CUSTOM_JAR","ActionOnFailure":"CONTINUE","Jar":"s3://
us-east-1.elasticmapreduce/libs/script-runner/script-
runner.jar","Properties":"","Name":"Custom JAR"}]'
```

4. Restart the Apache Livy service so that the changes take effect. To restart Apache Livy, see Stopping and restarting processes.
5. Test that the clients can now communicate using HTTPS. To submit a job, for example, run the following code.

```
curl -k -X POST --data '{"file": "local:///usr/lib/spark/examples/jars/spark-
examples.jar",
"className": "org.apache.spark.examples.SparkPi"}' \
-H "Content-Type: application/json" \
https://EMR_Master_Node_Host:8998/batches
```

If you've enabled HTTPS successfully, Livy sends a response indicating that the command was accepted and that the batch job was submitted.

```
{"id":1,"name":null,"owner":null,"proxyUser":null,"state":"starting","appId":null,"appInfo"
{"driverLogUrl":null,"sparkUiUrl":null},"log":["stdout: ","\nstderr: ","\nYARN
 Diagnostics: "]}
```

# Livy release history

The following table lists the version of Livy included in each release version of Amazon EMR, along with the components installed with the application. For component versions in each release, see the Component Version section for your release in Amazon EMR 7.x release versions, Amazon EMR 6.x release versions, or Amazon EMR 5.x release versions.

### Livy version information

| Amazon EMR Release label | Livy Version | Components installed with Livy |
|---|---|---|
| emr-7.9.0 | 0.8.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |
| emr-7.8.0 | 0.8.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |
| emr-7.7.0 | 0.8.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms- |

| Amazon EMR Release label | Livy Version | Components installed with Livy |
| --- | --- | --- |
| | | server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |
| emr-7.6.0 | 0.8.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |

| Amazon EMR Release label | Livy Version | Components installed with Livy |
| --- | --- | --- |
| emr-7.5.0 | 0.8.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |
| emr-7.4.0 | 0.8.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |

| Amazon EMR Release label | Livy Version | Components installed with Livy |
| --- | --- | --- |
| emr-7.3.0 | 0.8.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |
| emr-7.2.0 | 0.8.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |

| Amazon EMR Release label | Livy Version | Components installed with Livy |
| --- | --- | --- |
| emr-5.36.2 | 0.7.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |
| emr-7.1.0 | 0.8.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |

| Amazon EMR Release label | Livy Version | Components installed with Livy |
| --- | --- | --- |
| emr-7.0.0 | 0.7.1 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |
| emr-6.15.0 | 0.7.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |

| Amazon EMR Release label | Livy Version | Components installed with Livy |
| --- | --- | --- |
| emr-6.14.0 | 0.7.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |
| emr-6.13.0 | 0.7.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |

| Amazon EMR Release label | Livy Version | Components installed with Livy |
| --- | --- | --- |
| emr-6.12.0 | 0.7.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |
| emr-6.11.1 | 0.7.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |

| Amazon EMR Release label | Livy Version | Components installed with Livy |
| --- | --- | --- |
| emr-6.11.0 | 0.7.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |
| emr-6.10.1 | 0.7.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |

| Amazon EMR Release label | Livy Version | Components installed with Livy |
| --- | --- | --- |
| emr-6.10.0 | 0.7.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |
| emr-6.9.1 | 0.7.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |

| Amazon EMR Release label | Livy Version | Components installed with Livy |
| --- | --- | --- |
| emr-6.9.0 | 0.7.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |
| emr-6.8.1 | 0.7.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, livy-server, nginx |

| Amazon EMR Release label | Livy Version | Components installed with Livy |
| --- | --- | --- |

# Apache MXNet

> **Note**
>
> MXNet has reached end of life, and the project is archived. Amazon EMR 7.2.0 is the last release that includes MXNet.

Apache MXNet is an acceleration library designed for building neural networks and other deep learning applications. MXNet automates common work flows and optimizes numerical computations. MXNet helps you design neural network architectures without having to focus on implementing low-level computations, such as linear algebra operations. MXNet is included with Amazon EMR release version 5.10.0 and later.

For more information, see the Apache MXNet web site.

The following table lists the version of MXNet included in the latest release of the Amazon EMR 7.x series, along with the components that Amazon EMR installs with MXNet.

For the version of components installed with MXNet, see Release 7.2.0 Component Versions.

**MXNet version information for emr-7.2.0**

| Amazon EMR Release Label | MXNet Version | Components Installed With MXNet |
|---|---|---|
| emr-7.2.0 | MXNet 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

The following table lists the version of MXNet included in the latest release of the Amazon EMR 6.x series, along with the components that Amazon EMR installs with MXNet.

For the version of components installed with MXNet in this release, see Release 6.15.0 Component Versions.

**MXNet version information for emr-6.15.0**

| Amazon EMR Release Label | MXNet Version | Components Installed With MXNet |
|---|---|---|
| emr-6.15.0 | MXNet 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

The following table lists the version of MXNet included in the latest release of the Amazon EMR 5.x series, along with the components that Amazon EMR installs with MXNet.

For the version of components installed with MXNet in this release, see Release 5.36.2 Component Versions.

**MXNet version information for emr-5.36.2**

| Amazon EMR Release Label | MXNet Version | Components Installed With MXNet |
|---|---|---|
| emr-5.36.2 | MXNet 1.8.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop- |

| Amazon EMR Release Label | MXNet Version | Components Installed With MXNet |
| --- | --- | --- |
| | | yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

# MXNet release history

The following table lists the version of MXNet included in each release version of Amazon EMR, along with the components installed with the application. For component versions in each release, see the Component Version section for your release in Amazon EMR 7.x release versions, Amazon EMR 6.x release versions, or Amazon EMR 5.x release versions.

**MXNet version information**

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-7.2.0 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.36.2 | 1.8.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop- |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
|---|---|---|
| | | yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-7.1.0 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-7.0.0 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-6.15.0 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.14.0 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.13.0 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-6.12.0 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.11.1 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.11.0 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-6.10.1 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.10.0 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.9.1 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-6.9.0 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.8.1 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.8.0 | 1.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-6.7.0 | 1.8.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.36.1 | 1.8.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.36.0 | 1.8.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-6.6.0 | 1.8.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.35.0 | 1.8.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.5.0 | 1.8.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-6.4.0 | 1.8.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.3.1 | 1.7.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.3.0 | 1.7.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-6.2.1 | 1.7.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.2.0 | 1.7.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.1.1 | 1.6.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-6.1.0 | 1.6.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.0.1 | 1.5.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-6.0.0 | 1.5.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-5.34.0 | 1.8.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.33.1 | 1.7.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.33.0 | 1.7.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-5.32.1 | 1.7.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.32.0 | 1.7.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.31.1 | 1.6.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-5.31.0 | 1.6.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.30.2 | 1.5.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.30.1 | 1.5.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-5.30.0 | 1.5.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.29.0 | 1.5.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.28.1 | 1.5.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-5.28.0 | 1.5.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.27.1 | 1.4.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.27.0 | 1.4.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
| --- | --- | --- |
| emr-5.26.0 | 1.4.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.25.0 | 1.4.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.24.1 | 1.4.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |
|---|---|---|
| emr-5.24.0 | 1.4.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.23.1 | 1.3.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |
| emr-5.23.0 | 1.3.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mxnet, opencv |

| Amazon EMR Release label | MXNet Version | Components installed with MXNet |

# Apache Oozie

> **Note**
>
> *Oozie deprecation* – Since OSS Oozie has gone into attic mode, it will be removed from one of the upcoming EMR releases. We recommend that customers use MWAA as an alternative to Oozie. You can refer to the utility oozie-to-airflow-emr on GitHub to migrate existing Oozie workflows to MWAA.

Use the Apache Oozie Workflow Scheduler to manage and coordinate Hadoop jobs. For more information, see https://attic.apache.org/projects/oozie.html.

The Oozie native web interface is not supported on Amazon EMR. To use a front-end interface for Oozie, try the Hue Oozie application. For more information, see Hue. Oozie is included with Amazon EMR release version 5.0.0 and later. Oozie is included as a sandbox application in earlier releases. For more information, see Amazon EMR 4.x release versions.

If you use a custom Amazon Linux AMI based on an Amazon Linux AMI with a creation date of 2018-08-11, the Oozie server fails to start. If you use Oozie, create a custom AMI based on an Amazon Linux AMI ID with a different creation date. You can use the following Amazon CLI command to return a list of Image IDs for all HVM Amazon Linux AMIs with a 2018.03 version, along with the release date, so that you can choose an appropriate Amazon Linux AMI as your base. Replace MyRegion with your Region identifier, such as us-west-2.

```
aws ec2 --region MyRegion describe-images --owner amazon --query 'Images[?
Name!=`null`]|[?starts_with(Name, `amzn-ami-hvm-2018.03`) == `true`].
[CreationDate,ImageId,Name]' --output text | sort -rk1
```

The following table lists the version of Oozie included in the latest release of the Amazon EMR 7.x series, along with the components that Amazon EMR installs with Oozie.

For the version of components installed with Oozie in this release, see Release 7.9.0 Component Versions.

**Oozie version information for emr-7.9.0**

| Amazon EMR Release Label | Oozie Version | Components Installed With Oozie |
| --- | --- | --- |
| emr-7.9.0 | Oozie 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, oozie-client, oozie-server, tez-on-yarn, tez-on-worker |

The following table lists the version of Oozie included in the latest release of the Amazon EMR 6.x series, along with the components that Amazon EMR installs with Oozie.

For the version of components installed with Oozie in this release, see Release 6.15.0 Component Versions.

**Oozie version information for emr-6.15.0**

| Amazon EMR Release Label | Oozie Version | Components Installed With Oozie |
| --- | --- | --- |
| emr-6.15.0 | Oozie 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodema |

| Amazon EMR Release Label | Oozie Version | Components Installed With Oozie |
| --- | --- | --- |
| | | nager, hadoop-yarn-resour cemanager, hadoop-yarn-timeline-server, oozie-client, oozie-server, tez-on-yarn, tez-on-worker |

The following table lists the version of Oozie included in the latest release of the Amazon EMR 5.x series, along with the components that Amazon EMR installs with Oozie.

For the version of components installed with Oozie in this release, see Release 5.36.2 Component Versions.

**Oozie version information for emr-5.36.2**

| Amazon EMR Release Label | Oozie Version | Components Installed With Oozie |
| --- | --- | --- |
| emr-5.36.2 | Oozie 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, oozie-client, oozie-server, tez-on-yarn |

# Using Oozie with a remote database in Amazon RDS

By default, Oozie user information and query histories are stored in a local MySQL database on the master node. Alternatively, you can create one or more Oozie-enabled clusters using a configuration stored in Amazon S3 and a MySQL database in Amazon Relational Database Service(Amazon RDS). This allows you to persist user information and query history created by Oozie without keeping your Amazon EMR cluster running. We recommend using Amazon S3 server-side encryption to store the configuration file.

First, create the remote database for Oozie.

**To create the external MySQL database**

1. Open the Amazon RDS console at https://console.amazonaws.cn/rds/.
2. Choose **Launch a DB Instance**.
3. Choose MySQL and then choose **Select**.
4. Leave the default selection of **Multi-AZ Deployment and Provisioned IOPS Storage** and choose **Next**.
5. Leave the Instance Specifications at their defaults, specify Settings, and choose **Next**.
6. On the Configure Advanced Settings page, choose proper security group and database names. The security group you use must at least allow inbound TCP access for port 3306 from the master node of your cluster. If you have not created your cluster at this point, you can allow all hosts to connect to port 3306 and adjust the security group after you have launched the cluster. Choose **Launch DB Instance**.
7. From the RDS Dashboard, select **Instances** and select the instance you have just created. When your database is available, make a note of the dbname, username, password, and RDS instance hostname. You use this information when you create and configure your cluster.

**To specify an external MySQL database for Oozie when launching a cluster using the Amazon CLI**

To specify an external MySQL database for Oozie when launching a cluster using the Amazon CLI, use the information you noted when creating your RDS instance for configuring `oozie-site` with a configuration object.

> **Note**
>
> You can create multiple clusters that use the same external database, but each cluster will share query history and user information.

- Using the Amazon CLI, create a cluster with Oozie installed, using the external database you created, and referencing a configuration file with a configuration classification for Oozie that specifies the database properties. The following example creates a cluster with Oozie installed, referencing a configuration file in Amazon S3, `myConfig.json`, that specifies the database configuration.

  > **Note**
  >
  > Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

  ```
  aws emr create-cluster --release-label emr-7.9.0 --applications Name=Oozie
   Name=Spark Name=Hive \
  --instance-type m5.xlarge --instance-count 3 \
  --configurations https://s3.amazonaws.com/amzn-s3-demo-bucket/myfolder/
  myConfig.json --use-default-roles
  ```

  Example contents of the `myConfig.json` file are shown below. Replace *JDBC URL*, *username*, and *password* with the JDBC URL, user name, and password of your RDS instance.

  > **Important**
  >
  > The JDBC URL must include the database name as a suffix. For example, jdbc:mysql://oozie-external-db.xxxxxxxxxx.us-east-1.rds.amazonaws.com:3306/**dbname**.

  ```
  [{
    "Classification": "oozie-site",
      "Properties": {
          "oozie.service.JPAService.jdbc.driver": "org.mariadb.jdbc.Driver",
  ```

```
        "oozie.service.JPAService.jdbc.url": "JDBC URL",

        "oozie.service.JPAService.jdbc.username": "username",
        "oozie.service.JPAService.jdbc.password": "password"
    },
    "Configurations": []
}]
```

# Configure Java version for Oozie

Oozie runs multiple Java Virtual Machine (JVM) processes. This page explains how to configure the Java version for each process.

- **Oozie Server**: Set `JAVA_HOME` in the `oozie-env` classification to update the Java version for the `EmbeddedOozieServer`.
- **Oozie Launcher AM**: *Oozie Launcher AM* is a single-mapper MR job that invokes the appropriate application client libraries such as Hadoop and Hive. Unless otherwise configured, the runtime versions for Oozie Launcher AM are the same as the Java runtimes for Hadoop in the EMR cluster. To configure the Java runtime for Oozie Launcher AM, set the following property in the `workflow.xml` for the job:

  ```
  <property>
       <name>mapred.child.env</name>
       <value>JAVA_HOME=/path/to/JAVA_HOME</value>
   </property>
  ```

  This property ensures that the Oozie Launcher AM for the Oozie job runs on the Java version that you specify, rather than the Java version that is set in Hadoop.
- **Application Client Executable**: Because Oozie Launcher AM invokes the application client by default, the Java runtime for the client executable is the same as the Oozie Launcher AM.
- **Applications launched by an Oozie job**: Unless otherwise specified, the runtime versions for the actual application JVMs that are launched by an Oozie job are the same as the Java runtimes for Hadoop in the EMR cluster. Depending on the type of Oozie Workflow Action used to launch the application in an Oozie job (Spark or Hive action), you can update the default Java runtime for the actual application JVMs in the `workflow.xml` for the Oozie job.

# Oozie release history

The following table lists the version of Oozie included in each release version of Amazon EMR, along with the components installed with the application. For component versions in each release, see the Component Version section for your release in Amazon EMR 7.x release versions, Amazon EMR 6.x release versions, or Amazon EMR 5.x release versions.

### Oozie version information

| Amazon EMR Release label | Oozie Version | Components installed with Oozie |
|---|---|---|
| emr-7.9.0 | 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, oozie-client, oozie-server, tez-on-yarn, tez-on-worker |
| emr-7.8.0 | 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, oozie-client, |

| Amazon EMR Release label | Oozie Version | Components installed with Oozie |
|---|---|---|
| | | oozie-server, tez-on-yarn, tez-on-worker |
| emr-7.7.0 | 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, oozie-client, oozie-server, tez-on-yarn, tez-on-worker |
| emr-7.6.0 | 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, oozie-client, oozie-server, tez-on-yarn, tez-on-worker |

| Amazon EMR Release label | Oozie Version | Components installed with Oozie |
| --- | --- | --- |
| emr-7.5.0 | 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, oozie-client, oozie-server, tez-on-yarn, tez-on-worker |
| emr-7.4.0 | 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, oozie-client, oozie-server, tez-on-yarn, tez-on-worker |

| Amazon EMR Release label | Oozie Version | Components installed with Oozie |
| --- | --- | --- |
| emr-7.3.0 | 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, oozie-client, oozie-server, tez-on-yarn, tez-on-worker |
| emr-7.2.0 | 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, oozie-client, oozie-server, tez-on-yarn, tez-on-worker |

| Amazon EMR Release label | Oozie Version | Components installed with Oozie |

| Amazon EMR Release label | Oozie Version | Components installed with Oozie |
|---|---|---|
| emr-5.0.1 | 4.2.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, oozie-client, oozie-server, tez-on-yarn |
| emr-5.0.0 | 4.2.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, oozie-client, oozie-server, tez-on-yarn |

## Oozie release notes by version

### Topics

- Amazon EMR 7.6.0 - Oozie changes
- Amazon EMR 7.5.0 - Oozie changes
- Amazon EMR 7.4.0 - Oozie changes

- Amazon EMR 7.3.0 - Oozie changes
- Amazon EMR 7.1.0 - Oozie changes
- Amazon EMR 7.0.0 - Oozie changes

## Amazon EMR 7.6.0 - Oozie changes

**No changes for the 7.6.0 release.**

## Amazon EMR 7.5.0 - Oozie changes

| Type | Description |
| --- | --- |
| Upgrade | Remove support for orchestrating Sqoop jobs as Sqoop is not available in new EMR releases |

## Amazon EMR 7.4.0 - Oozie changes

*Oozie changes : NO CHANGES*

## Amazon EMR 7.3.0 - Oozie changes

| Type | Description |
| --- | --- |
| Upgrade | Upgrades guice to 4.0. |
| Default behaviour change | Defines two properties in `oozie-site.xml` :<br>• `oozie.service.SparkConfigurationService.spark.configurations=*=/etc/spark/conf/`<br>• `oozie.service.SparkConfigurationService.spark.configurations.blacklist=spark.yarn.dist.files` |

| Type | Description |
| --- | --- |
| | These properties let Oozie pick the default Amazon EMR Spark configurations when you install Oozie along with Spark. |

## Amazon EMR 7.1.0 - Oozie changes

| Type | Description |
| --- | --- |
| Upgrade | Upgrades Netty to 4.1.100.Final. |
| Upgrade | Upgrades Jetty to 9.4.53.v20231009. |

## Amazon EMR 7.0.0 - Oozie changes

| Type | Description |
| --- | --- |
| Upgrade | Oozie Client and Server now use Java 17 by default. Please refer EMR 7.0.0 Release Guide for more details. |

# Apache Phoenix

Apache Phoenix is used for OLTP and operational analytics, allowing you to use standard SQL queries and JDBC APIs to work with an Apache HBase backing store. For more information, see Phoenix in 15 minutes or less. Phoenix is included in Amazon EMR release version 4.7.0 and later.

If you upgrade from an earlier version of Amazon EMR to Amazon EMR release version 5.4.0 or later and use secondary indexing, upgrade local indexes as described in the Apache Phoenix documentation. Amazon EMR removes the required configurations from the `hbase-site` classification, but indexes need to be repopulated. Online and offline upgrade of indexes are supported. Online upgrades are the default, which means indexes are repopulated while initializing from Phoenix clients of version 4.8.0 or greater. To specify offline upgrades, set the `phoenix.client.localIndexUpgrade` configuration to false in the `phoenix-site` classification, and then SSH to the master node to run `psql [zookeeper] -1`.

The following table lists the version of Phoenix included in the latest release of the Amazon EMR 7.x series, along with the components that Amazon EMR installs with Phoenix.

For the version of components installed with Phoenix in this release, see Release 7.9.0 Component Versions.

**Phoenix version information for emr-7.9.0**

| Amazon EMR Release Label | Phoenix Version | Components Installed With Phoenix |
|---|---|---|
| emr-7.9.0 | Phoenix 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-dist-cp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase- |

| Amazon EMR Release Label | Phoenix Version | Components Installed With Phoenix |
| --- | --- | --- |
| | | region-server, hbase-operator-tools, phoenix-library, phoenix-connectors, phoenix-query-server, zookeeper-client, zookeeper-server |

The following table lists the version of Phoenix included in the latest release of the Amazon EMR 6.x series, along with the components that Amazon EMR installs with Phoenix.

For the version of components installed with Phoenix in this release, see Release 6.15.0 Component Versions.

**Phoenix version information for emr-6.15.0**

| Amazon EMR Release Label | Phoenix Version | Components Installed With Phoenix |
| --- | --- | --- |
| emr-6.15.0 | Phoenix 5.1.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, hbase-operator-tools, phoenix-library, phoenix-connectors, phoenix-query-server, zookeeper-client, zookeeper-server |

The following table lists the version of Phoenix included in the latest release of the Amazon EMR 5.x series, along with the components that Amazon EMR installs with Phoenix.

For the version of components installed with Phoenix in this release, see Release 5.36.2 Component Versions.

**Phoenix version information for emr-5.36.2**

| Amazon EMR Release Label | Phoenix Version | Components Installed With Phoenix |
|---|---|---|
| emr-5.36.2 | Phoenix 4.14.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-dist-cp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

**Topics**

- Creating a cluster with Phoenix
- Phoenix clients
- Phoenix release history

# Creating a cluster with Phoenix

You install Phoenix by choosing the application when you create a cluster in the console or using the Amazon CLI. The following procedures and examples show how to create a cluster with Phoenix and HBase. For more information about creating clusters using the console, including **Advanced Options** see Plan and configure clusters in the *Amazon EMR Management Guide*.

**To launch a cluster with Phoenix installed using Quick Options for creating a cluster in the console**

1. Open the Amazon EMR console at https://console.amazonaws.cn/emr.
2. Choose **Create cluster** to use **Quick Create**.
3. For **Software Configuration**, choose the most recent release appropriate for your application. Phoenix appears as an option only when **Amazon Release Version emr-4.7.0** or later is selected.
4. For **Applications**, choose the second option, **HBase: HBase *ver* with Ganglia *ver*, Hadoop *ver*, Hive *ver*, Hue *ver*, Phoenix *ver*, and ZooKeeper *ver***.
5. Select other options as necessary and then choose **Create cluster**.

> **Note**
>
> Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

The following example launches a cluster with Phoenix installed using default configuration settings.

**To launch a cluster with Phoenix and HBase using the Amazon CLI**

- Create the cluster with the following command:

```
aws emr create-cluster --name "Cluster with Phoenix" --release-label emr-7.9.0 \
--applications Name=Phoenix Name=HBase --ec2-attributes KeyName=myKey \
--instance-type m5.xlarge --instance-count 3 --use-default-roles
```

# Customizing Phoenix configurations

When creating a cluster, you configure Phoenix by setting values in `hbase-site.xml` using the `hbase-site` configuration classification.

For more information, see Configuration and tuning in the Phoenix documentation.

The following example demonstrates using a JSON file stored in Amazon S3 to specify the value of `false` for the `phoenix.schema.dropMetaData` property. Multiple properties can be specified for a single classification. For more information, see Configure applications. The `create-cluster` command then references the JSON file as the `--configurations` parameter.

The contents of the JSON file saved to /amzn-s3-demo-bucket/myfolder/myconfig.json is the following.

```
[
    {
      "Classification": "hbase-site",
      "Properties": {
        "phoenix.schema.dropMetaData": "false"
      }
    }
  ]
```

The `create cluster` command that references the JSON file is shown in the following example.

```
aws emr create-cluster --release-label emr-7.9.0 --applications Name=Phoenix \
Name=HBase --instance-type m5.xlarge --instance-count 2 \
--configurations https://s3.amazonaws.com/amzn-s3-demo-bucket/myfolder/myconfig.json
```

**Note**

Reconfiguration request for any Phoenix configuration classifications is only supported in Amazon EMR version 5.23.0 and later, and is not supported in Amazon EMR version 5.21.0 or 5.22.0. For more information, see Supplying a configuration for an instance group in a running cluster

# Phoenix clients

You connect to Phoenix using either a JDBC client built with full dependencies or using the "thin client" that uses the Phoenix Query Server and can only be run on a master node of a cluster (e.g. by using an SQL client, a step, command line, SSH port forwarding, etc.). When using the "fat" JDBC client, it still needs to have access to all nodes of the cluster because it connects to HBase services directly. The "thin" Phoenix client only needs access to the Phoenix Query Server at a default port 8765. There are several scripts within Phoenix that use these clients.

### Use an Amazon EMR step to query using Phoenix

The following procedure restores a snapshot from HBase and uses that data to run a Phoenix query. You can extend this example or create a new script that leverages Phoenix's clients to suit your needs.

1. Create a cluster with Phoenix installed, using the following command:

```
aws emr create-cluster --name "Cluster with Phoenix" --log-uri s3://amzn-s3-demo-bucket/myLogFolder --release-label emr-7.9.0 \
--applications Name=Phoenix Name=HBase --ec2-attributes KeyName=myKey \
--instance-type m5.xlarge --instance-count 3 --use-default-roles
```

2. Create then upload the following files to Amazon S3:

   copySnapshot.sh

```
sudo su hbase -s /bin/sh -c 'hbase snapshot export \
 -D hbase.rootdir=s3://us-east-1.elasticmapreduce.samples/hbase-demo-customer-data/snapshot/ \
-snapshot customer_snapshot1 \
-copy-to hdfs://masterDNSName:8020/user/hbase \
-mappers 2 -chuser hbase -chmod 700'
```

   runQuery.sh

```
aws s3 cp s3://amzn-s3-demo-bucket/phoenixQuery.sql /home/hadoop/
/usr/lib/phoenix/bin/sqlline-thin.py http://localhost:8765 /home/hadoop/phoenixQuery.sql
```

   phoenixQuery.sql

> **Note**
>
> You only need to include `COLUMN_ENCODED_BYTES=0` in the following example when you use Amazon EMR versions 5.26.0 and higher.

```
CREATE VIEW "customer" (
pk VARCHAR PRIMARY KEY,
"address"."state" VARCHAR,
"address"."street" VARCHAR,
"address"."city" VARCHAR,
"address"."zip" VARCHAR,
"cc"."number" VARCHAR,
"cc"."expire" VARCHAR,
"cc"."type" VARCHAR,
"contact"."phone" VARCHAR)
COLUMN_ENCODED_BYTES=0;

CREATE INDEX my_index ON "customer" ("customer"."state") INCLUDE("PK",
 "customer"."city", "customer"."expire", "customer"."type");

SELECT "customer"."type" AS credit_card_type, count(*) AS num_customers FROM
 "customer" WHERE "customer"."state" = 'CA' GROUP BY "customer"."type";
```

Use the Amazon CLI to submit the files to the S3 bucket:

```
aws s3 cp copySnapshot.sh s3://amzn-s3-demo-bucket/
aws s3 cp runQuery.sh s3://amzn-s3-demo-bucket/
aws s3 cp phoenixQuery.sql s3://amzn-s3-demo-bucket/
```

3. Create a table using the following step submitted to the cluster that you created in Step 1:

   createTable.json

```
[
  {
    "Name": "Create HBase Table",
    "Args": ["bash", "-c", "echo $'create \"customer\",\"address\",\"cc\",\"contact
\"' | hbase shell"],
    "Jar": "command-runner.jar",
```

```
    "ActionOnFailure": "CONTINUE",
    "Type": "CUSTOM_JAR"
  }
]
```

```
aws emr add-steps --cluster-id j-2AXXXXXXGAPLF \
--steps file://./createTable.json
```

4. Use `script-runner.jar` to run the `copySnapshot.sh` script that you previously uploaded to your S3 bucket:

```
aws emr add-steps --cluster-id j-2AXXXXXXGAPLF \
--steps Type=CUSTOM_JAR,Name="HBase Copy Snapshot",ActionOnFailure=CONTINUE,\
Jar=s3://region.elasticmapreduce/libs/script-runner/script-
runner.jar,Args=["s3://amzn-s3-demo-bucket/copySnapshot.sh"]
```

   This runs a MapReduce job to copy your snapshot data to the cluster HDFS.

5. Restore the snapshot that you copied to the cluster using the following step:

   restoreSnapshot.json

```
[
  {
    "Name": "restore",
    "Args": ["bash", "-c", "echo $'disable \"customer\"; restore_snapshot
 \"customer_snapshot1\"; enable \"customer\"' | hbase shell"],
    "Jar": "command-runner.jar",
    "ActionOnFailure": "CONTINUE",
    "Type": "CUSTOM_JAR"
  }
]
```

```
aws emr add-steps --cluster-id j-2AXXXXXXGAPLF \
--steps file://./restoreSnapshot.json
```

6. Use `script-runner.jar` to run the `runQuery.sh` script that you previously uploaded to your S3 bucket:

```
aws emr add-steps --cluster-id j-2AXXXXXXGAPLF \
--steps Type=CUSTOM_JAR,Name="Phoenix Run Query",ActionOnFailure=CONTINUE,\
```

```
Jar=s3://region.elasticmapreduce/libs/script-runner/script-
runner.jar,Args=["s3://amzn-s3-demo-bucket/runQuery.sh"]
```

The query runs and returns the results to the step's `stdout`. It may take a few minutes for this step to complete.

7. Inspect the results of the step's `stdout` at the log URI that you used when you created the cluster in Step 1. The results should look like the following:

```
+-----------------------------------------+-----------------------------------+
|             CREDIT_CARD_TYPE            |              NUM_CUSTOMERS        |
+-----------------------------------------+-----------------------------------+
| american_express                        | 5728                              |
| dankort                                 | 5782                              |
| diners_club                             | 5795                              |
| discover                                | 5715                              |
| forbrugsforeningen                      | 5691                              |
| jcb                                     | 5762                              |
| laser                                   | 5769                              |
| maestro                                 | 5816                              |
| mastercard                              | 5697                              |
| solo                                    | 5586                              |
| switch                                  | 5781                              |
| visa                                    | 5659                              |
+-----------------------------------------+-----------------------------------+
```

# Phoenix release history

The following table lists the version of Phoenix included in each release version of Amazon EMR, along with the components installed with the application. For component versions in each release, see the Component Version section for your release in Amazon EMR 7.x release versions, Amazon EMR 6.x release versions, or Amazon EMR 5.x release versions.

### Phoenix version information

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
|---|---|---|
| emr-7.9.0 | 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-dist- |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| | | cp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, hbase-operator-tools, phoenix-library, phoenix-connectors, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-7.8.0 | 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, hbase-operator-tools, phoenix-library, phoenix-connectors, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-7.7.0 | 5.2.1 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-dist-cp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, hbase-operator-tools, phoenix-library, phoenix-connectors, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-7.6.0 | 5.2.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-dist-cp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, hbase-operator-tools, phoenix-library, phoenix-connectors, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-7.5.0 | 5.2.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-dist-cp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, hbase-operator-tools, phoenix-library, phoenix-connectors, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-7.4.0 | 5.2.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-dist-cp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, hbase-operator-tools, phoenix-library, phoenix-connectors, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-7.3.0 | 5.1.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, hbase-operator-tools, phoenix-library, phoenix-connectors, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-7.2.0 | 5.1.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, hbase-operator-tools, phoenix-library, phoenix-connectors, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.36.2 | 4.14.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-6.8.1 | 5.1.2 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, hbase-operator-tools, phoenix-library, phoenix-connectors, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-6.8.0 | 5.1.2 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, hbase-operator-tools, phoenix-library, phoenix-connectors, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-6.7.0 | 5.1.2 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, hbase-operator-tools, phoenix-library, phoenix-connectors, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.36.1 | 4.14.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.36.0 | 4.14.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-6.6.0 | 5.1.2 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, hbase-operator-tools, phoenix-library, phoenix-connectors, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.35.0 | 4.14.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-6.5.0 | 5.1.2 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-6.4.0 | 5.1.2 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-6.3.1 | 5.0.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-6.3.0 | 5.0.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-6.2.1 | 5.0.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-6.2.0 | 5.0.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-6.1.1 | 5.0.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-6.1.0 | 5.0.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-6.0.1 | 5.0.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-6.0.0 | 5.0.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.34.0 | 4.14.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.33.1 | 4.14.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.33.0 | 4.14.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.32.1 | 4.14.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.32.0 | 4.14.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.31.1 | 4.14.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.31.0 | 4.14.3 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.18.1 | 4.14.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.18.0 | 4.14.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.17.2 | 4.14.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.17.1 | 4.14.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.17.0 | 4.14.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.16.1 | 4.14.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.16.0 | 4.14.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.15.1 | 4.13.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.15.0 | 4.13.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.14.2 | 4.13.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.14.1 | 4.13.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.14.0 | 4.13.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.13.1 | 4.13.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.13.0 | 4.13.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.12.3 | 4.13.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.12.2 | 4.13.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.12.1 | 4.13.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.12.0 | 4.13.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.11.4 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.11.3 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.11.2 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.11.1 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.11.0 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.10.1 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.10.0 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.9.1 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.9.0 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.8.3 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.8.2 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.8.1 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.8.0 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.7.1 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | Phoenix Version | Components installed with Phoenix |
| --- | --- | --- |
| emr-5.7.0 | 4.11.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |
| emr-5.6.1 | 4.9.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-mapred, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hbase-hmaster, hbase-client, hbase-region-server, phoenix-library, phoenix-query-server, zookeeper-client, zookeeper-server |

# Apache Pig

Apache Pig is an open-source Apache library that runs on top of Hadoop, providing a scripting language that you can use to transform large data sets without having to write complex code in a lower level computer language like Java. The library takes SQL-like commands written in a language called Pig Latin and converts those commands into Tez jobs based on directed acyclic graphs (DAGs) or MapReduce programs. Pig works with structured and unstructured data in a variety of formats. For more information about Pig, see http://pig.apache.org/.

You can execute Pig commands interactively or in batch mode. To use Pig interactively, create an SSH connection to the master node and submit commands using the Grunt shell. To use Pig in batch mode, write your Pig scripts, upload them to Amazon S3, and submit them as cluster steps. For more information on submitting work to a cluster, see Submit work to a cluster in the *Amazon EMR Management Guide*.

When you use Pig to write output to an HCatalog table in Amazon S3, disable Amazon EMR direct write by setting the `mapred.output.direct.NativeS3FileSystem` and `mapred.output.direct.EmrFileSystem` properties to `false`. For more information, see Using HCatalog. Within a Pig script, you can use the `SET mapred.output.direct.NativeS3FileSystem false` and `SET mapred.output.direct.EmrFileSystem false` commands.

The following table lists the version of Pig included in the latest release of the Amazon EMR 7.x series, along with the components that Amazon EMR installs with Pig.

For the version of components installed with Pig in this release, see Release 7.9.0 Component Versions.

**Pig version information for emr-7.9.0**

| Amazon EMR Release Label | Pig Version | Components Installed With Pig |
|---|---|---|
| emr-7.9.0 | Pig 0.17.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-dist-cp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop- |

| Amazon EMR Release Label | Pig Version | Components Installed With Pig |
| --- | --- | --- |
| | | hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, pig-client, tez-on-yarn, tez-on-worker |

The following table lists the version of Pig included in the latest release of the Amazon EMR 6.x series, along with the components that Amazon EMR installs with Pig.

For the version of components installed with Pig in this release, see Release 6.15.0 Component Versions.

**Pig version information for emr-6.15.0**

| Amazon EMR Release Label | Pig Version | Components Installed With Pig |
| --- | --- | --- |
| emr-6.15.0 | Pig 0.17.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-dist-cp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, pig-client, tez-on-yarn, tez-on-worker |

The following table lists the version of Pig included in the latest release of the Amazon EMR 5.x series, along with the components that Amazon EMR installs with Pig.

For the version of components installed with Pig in this release, see Release 5.36.2 Component Versions.

**Pig version information for emr-5.36.2**

| Amazon EMR Release Label | Pig Version | Components Installed With Pig |
|---|---|---|
| emr-5.36.2 | Pig 0.17.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-distcp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, pig-client, tez-on-yarn |

- Submit Pig work
- Call user-defined functions from Pig
- Pig release history

# Submit Pig work

This section demonstrates submitting Pig work to an Amazon EMR cluster. The examples that follow generate a report containing the total bytes transferred, a list of the top 50 IP addresses, a list of the top 50 external referrers, and the top 50 search terms using Bing and Google. The Pig script is located in the Amazon S3 bucket `s3://elasticmapreduce/samples/pig-apache/do-reports2.pig`. Input data is located in the Amazon S3 bucket `s3://elasticmapreduce/samples/pig-apache/input`. The output is saved to an Amazon S3 bucket.

# Submit Pig work using the Amazon EMR console

This example describes how to use the Amazon EMR console to add a Pig step to a cluster.

**To submit a Pig step**

1. Open the Amazon EMR console at https://console.amazonaws.cn/emr.
2. Choose **Create cluster** to create a cluster with Pig installed. For steps on how to create a cluster, see Plan and configure an Amazon EMR cluster.
3. Open a terminal and SSH into the master node of your cluster following the steps outlined in Connect to the master node using SSH. Once you've done that, run the following steps.

   ```
   sudo mkdir -p /home/hadoop/lib/pig/
   sudo aws s3 cp s3://elasticmapreduce/libs/pig/0.3/piggybank-0.3-amzn.jar /home/
   hadoop/lib/pig/piggybank.jar
   ```

4. In the console, click **Cluster List** and select the name of the cluster you created.
5. Scroll to the **Steps** section and expand it, then choose **Add step**.
6. In the **Add Step** dialog:
   - For **Step type**, choose **Pig program**.
   - For **Name**, accept the default name (Pig program) or type a new name.
   - For **Script S3 location**, type the location of the Pig script. For example: **`s3://elasticmapreduce/samples/pig-apache/do-reports2.pig`**.
   - For **Input S3 location**, type the location of the input data. For example: **`s3://elasticmapreduce/samples/pig-apache/input`**.
   - For **Output S3 location**, type or browse to the name of your Amazon S3 output bucket.
   - For **Arguments**, leave the field blank.
   - For **Action on failure**, accept the default option (**Continue**).
7. Choose **Add**. The step appears in the console with a status of Pending.
8. The status of the step changes from Pending to Running to Completed as the step runs. To update the status, choose the **Refresh** icon above the **Actions** column. When your step is complete, check your Amazon S3 bucket to confirm your Pig step's output files are there.

# Submit Pig work using the Amazon CLI

### To submit a Pig step using the Amazon CLI

When you launch a cluster using the Amazon CLI, use the `--applications` parameter to install Pig. To submit a Pig step, use the `--steps` parameter.

1. To launch a cluster with Pig installed, type the following command, replacing *myKey* and *amzn-s3-demo-bucket/* with the name of your EC2 key pair and Amazon S3 bucket.

```
aws emr create-cluster \
--name "Test cluster" \
--log-uri s3://amzn-s3-demo-bucket/ \
--release-label emr-5.36.2 \
--applications Name=Pig \
--use-default-roles \
--ec2-attributes KeyName=myKey \
--instance-type m5.xlarge \
--instance-count 3
```

> **Note**
>
> Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

When you specify the instance count without using the `--instance-groups` parameter, a single master node is launched, and the remaining instances are launched as core nodes. All nodes use the instance type specified in the command.

> **Note**
>
> If you have not previously created the default EMR service role and EC2 instance profile, type `aws emr create-default-roles` to create them before typing the `create-cluster` subcommand.

2. To submit a Pig step, enter the following command, replacing *myClusterId* and *amzn-s3-demo-bucket* with your cluster ID and name of your Amazon S3 bucket.

```
aws emr add-steps \
--cluster-id myClusterId \
--steps Type=PIG,Name="Pig Program",ActionOnFailure=CONTINUE,Args=[-f,s3://
elasticmapreduce/samples/pig-apache/do-reports2.pig,-p,INPUT=s3://elasticmapreduce/
samples/pig-apache/input,-p,OUTPUT=s3://amzn-s3-demo-bucket/pig-apache/output]
```

This command will return a step ID, which you can use to check the `State` of your step.

3. Query the status of your step with the `describe-step` command.

```
aws emr describe-step --cluster-id myClusterId --step-id s-1XXXXXXXXXXA
```

The `State` of the step changes from `PENDING` to `RUNNING` to `COMPLETED` as the step runs. When your step is complete, check your Amazon S3 bucket to confirm your Pig step's output files are there.

For more information about using Amazon EMR commands in the Amazon CLI, see the Amazon CLI Command Reference.

# Call user-defined functions from Pig

Pig provides the ability to call user-defined functions (UDFs) from within Pig scripts. You can do this to implement custom processing to use in your Pig scripts. The languages currently supported are Java, Python/Jython, and JavaScript (though JavaScript support is still experimental.)

The following sections describe how to register your functions with Pig so you can call them either from the Pig shell or from within Pig scripts. For more information about using UDFs with Pig, see Pig documentation for your version of Pig.

## Call JAR files from Pig

You can use custom JAR files with Pig using the `REGISTER` command in your Pig script. The JAR file is local or a remote file system such as Amazon S3. When the Pig script runs, Amazon EMR downloads the JAR file automatically to the master node and then uploads the JAR file to the Hadoop distributed cache. In this way, the JAR file is automatically used as necessary by all instances in the cluster.

**To use JAR files with Pig**

1. Upload your custom JAR file into Amazon S3.
2. Use the REGISTER command in your Pig script to specify the bucket on Amazon S3 of the custom JAR file.

```
REGISTER s3://amzn-s3-demo-bucket/path/mycustomjar.jar;
```

## Call Python/Jython scripts from Pig

You can register Python scripts with Pig and then call functions in those scripts from the Pig shell or in a Pig script. You do this by specifying the location of the script with the `register` keyword.

Because Pig in written in Java, it uses the Jython script engine to parse Python scripts. For more information about Jython, go to http://www.jython.org/.

**To call a Python/Jython script from Pig**

1. Write a Python script and upload the script to a location in Amazon S3. This should be a bucket owned by the same account that creates the Pig cluster, or that has permissions set so the account that created the cluster can access it. In this example, the script is uploaded to s3://amzn-s3-demo-bucket/pig/python.
2. Start a Pig cluster. If you are accessing Pig from the Grunt shell, run an interactive cluster. If you are running Pig commands from a script, start a scripted Pig cluster. This example starts an interactive cluster. For more information about how to create a Pig cluster, see Submit Pig work.
3. For an interactive cluster, use SSH to connect into the master node and run the Grunt shell. For more information, see SSH into the master node.
4. Run the Grunt shell for Pig by typing `pig` at the command line:

```
pig
```

5. Register the Jython library and your Python script with Pig using the `register` keyword at the Grunt command prompt, as shown in the following command, where you would specify the location of your script in Amazon S3:

```
grunt> register 'lib/jython.jar';
```

```
grunt> register 's3://amzn-s3-demo-bucket/pig/python/myscript.py' using jython as
 myfunctions;
```

6. Load the input data. The following example loads input from an Amazon S3 location:

```
grunt> input = load 's3://amzn-s3-demo-bucket/input/data.txt' using TextLoader as
 (line:chararray);
```

7. You can now call functions in your script from within Pig by referencing them using `myfunctions`:

```
grunt> output=foreach input generate myfunctions.myfunction($1);
```

# Pig release history

The following table lists the version of Pig included in each release version of Amazon EMR, along with the components installed with the application. For component versions in each release, see the Component Version section for your release in Amazon EMR 7.x release versions, Amazon EMR 6.x release versions, or Amazon EMR 5.x release versions.

**Pig version information**

| Amazon EMR Release label | Pig Version | Components installed with Pig |
|---|---|---|
| emr-7.9.0 | 0.17.0 | emrfs, emr-ddb, emr-goodies, emr-kinesis, emr-s3-dist-cp, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, pig-client, tez-on-yarn, tez-on-worker |

# Presto

> **Important**
>
> Presto, the previous version of Trino, is still available for use with Amazon EMR. However, we highly recommend Trino going forward for use with Amazon EMR. Also note that Trino and Presto can't run simultaneously on the same cluster. For more information, see Trino.

Presto is a fast SQL query engine designed for interactive analytic queries over large datasets from multiple sources. For more information, see the Presto website. Presto is included in Amazon EMR releases 5.0.0 and later. Earlier releases include Presto as a sandbox application. For more information, see Amazon EMR 4.x release versions. Amazon EMR release versions 6.1.0 and later support Trino in addition to Presto. For more information, see PrestoDB installation.

The following table lists the version of Presto included in the latest release of the Amazon EMR 7.x series, along with the components that Amazon EMR installs with Presto.

For the version of components installed with Presto in this release, see Release 7.9.0 Component Versions.

**Presto version information for emr-7.9.0**

| Amazon EMR Release Label | Presto Version | Components Installed With Presto |
|---|---|---|
| emr-7.9.0 | Presto 0.287 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hive-client, hudi, hudi-presto, hcatalog-server, mariadb-server, presto-coordinator, presto-worker |

The following table lists the version of Presto included in the latest release of the Amazon EMR 6.x series, along with the components that Amazon EMR installs with Presto.

For the version of components installed with Presto in this release, see Release 6.15.0 Component Versions.

**Presto version information for emr-6.15.0**

| Amazon EMR Release Label | Presto Version | Components Installed With Presto |
|---|---|---|
| emr-6.15.0 | Presto 0.283 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hive-client, hudi, hudi-presto, hcatalog-server, mariadb-server, presto-coordinator, presto-worker |

The following table lists the version of Presto included in the latest release of the Amazon EMR 5.x series, along with the components that Amazon EMR installs with Presto.

For the version of components installed with Presto in this release, see Release 5.36.2 Component Versions.

**Presto version information for emr-5.36.2**

| Amazon EMR Release Label | Presto Version | Components Installed With Presto |
|---|---|---|

# Using Presto with the Amazon Glue Data Catalog

Using Amazon EMR release version 5.10.0 and later, you can specify the Amazon Glue Data Catalog as the default Hive metastore for Presto. We recommend this configuration when you require a persistent metastore or a metastore shared by different clusters, services, applications, or Amazon Web Services accounts.

Amazon Glue is a fully managed extract, transform, and load (ETL) service that makes it simple and cost-effective to categorize your data, clean it, enrich it, and move it reliably between various data stores. The Amazon Glue Data Catalog provides a unified metadata repository across a variety of data sources and data formats, integrating with Amazon EMR as well as Amazon RDS,

Amazon Redshift, Redshift Spectrum, Athena, and any application compatible with the Apache Hive metastore. Amazon Glue crawlers can automatically infer schema from source data in Amazon S3 and store the associated metadata in the Data Catalog. For more information about the Data Catalog, see Populating the Amazon Glue Data Catalog in the *Amazon Glue Developer Guide*.

Separate charges apply for Amazon Glue. There is a monthly rate for storing and accessing the metadata in the Data Catalog, an hourly rate billed per minute for Amazon Glue ETL jobs and crawler runtime, and an hourly rate billed per minute for each provisioned development endpoint. The Data Catalog allows you to store up to a million objects at no charge. If you store more than a million objects, you are charged USD$1 for each 100,000 objects over a million. An object in the Data Catalog is a table, partition, or database. For more information, see Glue Pricing.

> **Important**
>
> If you created tables using Amazon Athena or Amazon Redshift Spectrum before August 14, 2017, databases and tables are stored in an Athena-managed catalog, which is separate from the Amazon Glue Data Catalog. To integrate Amazon EMR with these tables, you must upgrade to the Amazon Glue Data Catalog. For more information, see Upgrading to the Amazon Glue Data Catalog in the *Amazon Athena User Guide*.

## Specifying Amazon Glue Data Catalog as the metastore

You can specify the Amazon Glue Data Catalog as the metastore using the Amazon Web Services Management Console, Amazon CLI, or Amazon EMR API. When you use the CLI or API, you use the configuration classification for Presto to specify the Data Catalog. In addition, with Amazon EMR 5.16.0 and later, you can use the configuration classification to specify a Data Catalog in a different Amazon Web Services account. When you use the console, you can specify the Data Catalog using **Advanced Options** or **Quick Options**.

Console

**To specify Amazon Glue Data Catalog as the Hive metastore with the new console**

1. Sign in to the Amazon Web Services Management Console, and open the Amazon EMR console at https://console.amazonaws.cn/emr.
2. Under **EMR on EC2** in the left navigation pane, choose **Clusters**, and then choose **Create cluster**.

3. Under **Application bundle**, choose **Presto**.
4. Under **Amazon Glue Data Catalog settings**, select the **Use for Presto table metadata** check box.
5. Choose any other options that apply to your cluster.
6. To launch your cluster, choose **Create cluster**.

CLI

**To specify the Amazon Glue Data Catalog as the default Hive metastore using the Amazon CLI**

For examples of how to specify the following configuration classifications when you create a cluster, see Configure applications.

**Amazon EMR 5.16.0 and later**

- Set the `hive.metastore` property to `glue` as shown in the following JSON example.

```
[
  {
    "Classification": "presto-connector-hive",
    "Properties": {
      "hive.metastore": "glue"
    }
  }
]
```

To specify a Data Catalog in a different Amazon Web Services account, add the `hive.metastore.glue.catalogid` property as shown in the following JSON example. Replace *`acct-id`* with the Amazon account of the Data Catalog. Using a Data Catalog in another Amazon Web Services account is not available using Amazon EMR version 5.15.0 and earlier.

```
[
  {
    "Classification": "presto-connector-hive",
    "Properties": {
      "hive.metastore": "glue",
      "hive.metastore.glue.catalogid": "acct-id"
```

```
    }
  }
]
```

**Amazon EMR 5.10.0 through 5.15.0**

Set the `hive.metastore.glue.datacatalog.enabled` property to `true`, as shown in the following JSON example:

```
[
  {
    "Classification": "presto-connector-hive",
    "Properties": {
      "hive.metastore.glue.datacatalog.enabled": "true"
    }
  }
]
```

**Amazon EMR 6.1.0 and later using PrestoSQL (Trino)**

Starting with EMR version 6.1.0, PrestoSQL also supports Glue as the default Hive metastore. Use the `prestosql-connector-hive` configuration classification and set the `hive.metastore` property to `glue`, as shown in the following JSON example.

Amazon EMR versions 6.4.0 and later use the new name Trino instead of PrestoSQL. If you use Trino, replace *`prestosql-connector-hive`* in the following configuration classification with `trino-connector-hive`.

```
[
  {
    "Classification": "prestosql-connector-hive",
    "Properties": {
      "hive.metastore": "glue"
    }
  }
]
```

To switch metastores on a long-running cluster, you can manually set these values as appropriate for your release version by connecting to the master node, editing the property

values in the `/etc/presto/conf/catalog/hive.properties` file directly, and restarting the Presto server (`sudo restart presto-server`). If you use this method with Amazon EMR 5.15.0 and earlier, make sure that `hive.table-statistics-enabled` is set to `false`. This setting is not required when using release versions 5.16.0 and later; nevertheless, table and partition statistics are not supported.

## IAM permissions

The EC2 instance profile for a cluster must have IAM permissions for Amazon Glue actions. In addition, if you enable encryption for Amazon Glue Data Catalog objects, the role must also be allowed to encrypt, decrypt and generate the Amazon KMS key used for encryption.

### Permissions for Amazon Glue actions

If you use the default EC2 instance profile for Amazon EMR, no action is required. The `AmazonElasticMapReduceforEC2Role` managed policy that is attached to the `EMR_EC2_DefaultRole` allows all necessary Amazon Glue actions. However, if you specify a custom EC2 instance profile and permissions, you must configure the appropriate Amazon Glue actions. Use the `AmazonElasticMapReduceforEC2Role` managed policy as a starting point. For more information, see Service role for cluster EC2 instances (EC2 instance profile) in the *Amazon EMR Management Guide*.

### Permissions for encrypting and decrypting Amazon Glue Data Catalog

Your instance profile needs permission to encrypt and decrypt data using your key. You do *not* need to configure these permissions if both of the following statements apply:

- You enable encryption for Amazon Glue Data Catalog objects using managed keys for Amazon Glue.
- You use a cluster that's in the same Amazon Web Services account as the Amazon Glue Data Catalog.

Otherwise, you must add the following statement to the permissions policy attached to your EC2 instance profile.

```
[
    {
        "Version": "2012-10-17",
```

```
        "Statement": [
            {
                "Effect": "Allow",
                "Action": [
                    "kms:Decrypt",
                    "kms:Encrypt",
                    "kms:GenerateDataKey"
                ],
                "Resource": "arn:aws:kms:region:acct-
id:key/12345678-1234-1234-1234-123456789012"
            }
        ]
    }
]
```

For more information about Amazon Glue Data Catalog encryption, see Encrypting your data catalog in the *Amazon Glue Developer Guide*.

### Resource-based permissions

If you use Amazon Glue in conjunction with Hive, Spark, or Presto in Amazon EMR, Amazon Glue supports resource-based policies to control access to Data Catalog resources. These resources include databases, tables, connections, and user-defined functions. For more information, see Amazon Glue Resource Policies in the *Amazon Glue Developer Guide*.

When using resource-based policies to limit access to Amazon Glue from within Amazon EMR, the principal that you specify in the permissions policy must be the role ARN associated with the EC2 instance profile that is specified when a cluster is created. For example, for a resource-based policy attached to a catalog, you can specify the role ARN for the default service role for cluster EC2 instances, *EMR_EC2_DefaultRole* as the `Principal`, using the format shown in the following example:

```
arn:aws:iam::acct-id:role/EMR_EC2_DefaultRole
```

The *acct-id* can be different from the Amazon Glue account ID. This enables access from EMR clusters in different accounts. You can specify multiple principals, each from a different account.

## Considerations when using Amazon Glue Data Catalog

Consider the following items when using Amazon Glue Data Catalog as a metastore with Presto:

- Renaming tables from within Amazon Glue is not supported.
- When you create a Hive table without specifying a `LOCATION`, the table data is stored in the location specified by the `hive.metastore.warehouse.dir` property. By default, this is a location in HDFS. If another cluster needs to access the table, it fails unless it has adequate permissions to the cluster that created the table. Furthermore, because HDFS storage is transient, if the cluster terminates, the table data is lost, and the table must be recreated. We recommend that you specify a `LOCATION` in Amazon S3 when you create a Hive table using Amazon Glue. Alternatively, you can use the `hive-site` configuration classification to specify a location in Amazon S3 for `hive.metastore.warehouse.dir`, which applies to all Hive tables. If a table is created in an HDFS location and the cluster that created it is still running, you can update the table location to Amazon S3 from within Amazon Glue. For more information, see Working with Tables on the Amazon Glue Console in the *Amazon Glue Developer Guide*.
- Partition values containing quotes and apostrophes are not supported, for example, `PARTITION (owner="Doe's")`.
- Column statistics are supported for emr-5.31.0 and later.
- Using Hive authorization is not supported. As an alternative, consider using Amazon Glue Resource-Based Policies. For more information, see Use Resource-Based Policies for Amazon EMR Access to Amazon Glue Data Catalog.

# Using S3 Select Pushdown with Presto to improve performance

> **Important**
>
> Amazon S3 Select is no longer available to new customers. Existing customers of Amazon S3 Select can continue to use the feature as usual. Learn more

With Amazon EMR release version 5.18.0 and later, you can use S3 select Pushdown with Presto on Amazon EMR. This feature allows Presto to "push down" the computational work of projection operations (for example, `SELECT`) and predicate operations (for example, `WHERE`) to Amazon S3. This allows queries to retrieve only required data from Amazon S3, which can improve performance and reduce the amount of data transferred between Amazon EMR and Amazon S3 in some applications.

## Is S3 Select Pushdown right for my application?

We recommend that you benchmark your applications with and without S3 Select Pushdown to see if using it may be suitable for your application.

Use the following guidelines to determine if your application is a candidate for using S3 Select:

- Your query filters out more than half of the original data set.
- Your query filter predicates use columns that have a data type supported by Presto and S3 Select. The timestamp, real, and double data types are not supported by S3 Select Pushdown. We recommend using the decimal data type for numerical data. For more information about supported data types for S3 Select, see Data types in the *Amazon Simple Storage Service User Guide*.
- Your network connection between Amazon S3 and the Amazon EMR cluster has good transfer speed and available bandwidth. Amazon S3 does not compress HTTP responses, so the response size is likely to increase for compressed input files.

## Considerations and limitations

- Only objects stored in CSV format are supported. Objects can be uncompressed or optionally compressed with gzip or bzip2.
- The `AllowQuotedRecordDelimiters` property is not supported. If this property is specified, the query fails.
- Amazon S3 server-side encryption with customer-provided encryption keys (SSE-C) and client-side encryption are not supported.
- S3 Select Pushdown is not a substitute for using columnar or compressed file formats such as ORC or Parquet.
- Amazon S3 Select does not support cross-region queries for Presto and Trino.

## Enabling S3 Select Pushdown with PrestoDB or Trino

To enable S3 Select Pushdown for PrestoDB on Amazon EMR, use the `presto-connector-hive` configuration classification to set `hive.s3select-pushdown.enabled` to `true` as shown in the example below. For more information, see Configure applications. The hive.s3select-pushdown.max-connections value must also be set. For most applications, the default setting

of *500* should be adequate. For more information, see Understanding and tuning hive.s3select-pushdown.max-connections below.

For PrestoSQL on EMR versions 6.1.0 - 6.3.0, replace *presto-connector-hive* in the example below with `prestosql-connector-hive`.

Amazon EMR versions 6.4.0 and later use the new name Trino instead of PrestoSQL. If you use Trino, replace *presto-connector-hive* in the example below with `trino-connector-hive`

```
[
    {
        "classification": "presto-connector-hive",
        "properties": {
            "hive.s3select-pushdown.enabled": "true",
            "hive.s3select-pushdown.max-connections": "500"
        }
    }
]
```

### Understanding and tuning hive.s3select-pushdown.max-connections

By default, Presto uses EMRFS as its file system. The setting `fs.s3.maxConnections` in the `emrfs-site` configuration classification specifies the maximum allowable client connections to Amazon S3 through EMRFS for Presto. By default, this is 500. S3 Select Pushdown bypasses EMRFS when accessing Amazon S3 for predicate operations. In this case, the value of `hive.s3select-pushdown.max-connections` determines the maximum number of client connections allowed for those operations from worker nodes. However, any requests to Amazon S3 that Presto initiates that are not pushed down—for example, GET operations—continue to be governed by the value of `fs.s3.maxConnections`.

If your application experiences the error "Timeout waiting for connection from pool," increase the value of both `hive.s3select-pushdown.max-connections` and `fs.s3.maxConnections`.

## Adding database connectors

You can use configuration classifications to configure JDBC connector properties when you create a cluster. Configuration classifications begin with `presto-connector`, for example, `presto-connector-postgresql`. The available configuration classifications depend on the Amazon EMR release version. For the configuration classifications available with the most recent release

version, see the section called "5.36.2 configuration classifications" for Amazon EMR 5.36.2. If you are using a different version of Amazon EMR, see Amazon EMR 5.x release versions for the configuration classifications. For more information about the properties that can be configured with each connector, see https://prestodb.io/docs/current/connector.html.

**Example —configuring a cluster with the PostgreSQL JDBC connector**

To launch a cluster with the PostgreSQL connector installed and configured, first create a JSON file that specifies the configuration classification—for example, `myConfig.json`—with the following content, and save it locally.

Replace the connection properties as appropriate for your setup and as shown in the PostgreSQL connector topic in Presto Documentation.

```
[
  {
    "Classification": "presto-connector-postgresql",
    "Properties": {
      "connection-url": "jdbc:postgresql://example.net:5432/database",
      "connection-user": "MYUSER",
      "connection-password": "MYPASS"
    },
    "Configurations": []
  }
]
```

When you create the cluster, reference the path to the JSON file using the `--configurations` option as shown in the following example, where `myConfig.json` is in the same directory where you run the command:

```
aws emr create-cluster --name PrestoConnector --release-label emr-5.36.2 --instance-
type m5.xlarge \
--instance-count 2 --applications Name=Hadoop Name=Hive Name=Pig Name=Presto \
--use-default-roles --ec2-attributes KeyName=myKey \
--log-uri s3://amzn-s3-demo-bucket/logs --enable-debugging \
--configurations file://myConfig.json
```

# Using SSL/TLS and configuring LDAPS with Presto on Amazon EMR

With Amazon EMR release version 5.6.0 and later, you can enable SSL/TLS to help secure internal communication between Presto nodes. You do this by setting up a security configuration for in-transit encryption. For more information, see Encryption options and Use security configurations to set up cluster security in the *Amazon EMR Management Guide*.

When you use a security configuration with in-transit encryption, Amazon EMR does the following for Presto:

- Distributes the encryption artifacts, or certificates, that you specify for in-transit encryption throughout the Presto cluster. For more information, see Providing certificates for in-transit data encryption.
- Sets the following properties using the `presto-config` configuration classification, which corresponds to the `config.properties` file for Presto:
  - Sets `http-server.http.enabled` to `false` on all nodes, which disables HTTP in favor of HTTPS. This requires you to provide certificates that work for public and private DNS when setting up the security configuration for in-transit encryption. One way to do this is to use SAN (Subject Alternative Name) certificates which support multiple domains.
  - Sets `http-server.https.*` values. For configuration details, see LDAP authentication in Presto documentation.

In addition, with Amazon EMR release version 5.10.0 and later, you can set up LDAP authentication for client connections to the Presto coordinator using HTTPS. This setup uses secure LDAP (LDAPS). TLS must be enabled on your LDAP server, and the Presto cluster must use a security configuration with in-transit data encryption enabled. Additional configuration is required. The configuration options are different depending on the release version of Amazon EMR that you use. For more information, see Using LDAP authentication for Presto on Amazon EMR.

Presto on Amazon EMR uses port 8446 for internal HTTPS by default. The port used for internal communication must be the same port used for client HTTPS access to the Presto coordinator. The `http-server.https.port` property in the `presto-config` configuration classification specifies the port.

# Using LDAP authentication for Presto on Amazon EMR

Follow the steps in this section to configure LDAP. See each step for examples and links to more information.

**Steps to Configure LDAP Authentication**

- Step 1: Gather information about your LDAP server and copy the server certificate to Amazon S3
- Step 2: Set up a security configuration
- Step 3: Create a configuration JSON with Presto properties for LDAP
- Step 4: Create the script to copy the LDAP server certificate and upload it to Amazon S3
- Step 5: Create the cluster

## Step 1: Gather information about your LDAP server and copy the server certificate to Amazon S3

You'll need the information and items in the following section from your LDAP server to configure LDAP authentication.

**The IP address or host name of the LDAP server**

The Presto coordinator on the Amazon EMR master node must be able to reach the LDAP server at the specified IP address or host name. By default, Presto communicates with the LDAP server using LDAPS over port 636. If your LDAP implementation requires a custom port, you can specify it using the `ldap.url` property with Amazon EMR 5.16.0 or later, or using `authentication.ldap.url` with earlier versions. Substitute the custom port for 636 as shown in the `presto-config` configuration classification examples in Step 3: Create a configuration JSON with Presto properties for LDAP. Ensure that any firewalls and security groups allow inbound and outbound traffic on port 636 (or your custom port) and also port 8446 (or your custom port), which is used for internal cluster communications.

**The LDAP server certificate**

You must upload the certificate file to a secure location in Amazon S3. For more information, see How do I upload files and folders to an S3 Bucket in the *Amazon Simple Storage Service User Guide*. You create a bootstrap action that copies this certificate from Amazon S3 to each node in the cluster when the cluster launches. In Step 4: Create the script to copy the LDAP server

certificate and upload it to Amazon S3. The example certificate is *s3://amzn-s3-demo-bucket/ldap_server.crt*.

**The LDAP server's settings for anonymous binding**

If anonymous binding is disabled on PrestoDB, you need the user ID (UID) and password of an account with permissions to bind to the LDAP server so that the PrestoDB server can establish a connection. You specify the UID and password using the `internal-communication.authentication.ldap.user` and `internal-communication.authentication.ldap.password` properties in the `presto-config` configuration classification. Amazon EMR 5.10.0 does not support these settings, so anonymous binding must be supported on the LDAP server when you use this release version.

Note that Trino doesn't require the anonymous binding configuration.

**To get the status of anonymous binding on the LDAP server**

- Use the ldapwhoami command from a Linux client, as shown in the following example:

  ```
  ldapwhoami -x -H ldaps://LDAPServerHostNameOrIPAddress
  ```

  If anonymous binding is not allowed, the command returns the following:

  ```
  ldap_bind: Inappropriate authentication (48)
  additional info: anonymous bind disallowed
  ```

**To verify that an account has permissions to an LDAP server that uses simple authentication**

- Use theldapwhoami command from a Linux client, as shown in the following example. The example uses a fictitious user, *presto*, stored in an Open LDAP server running on an EC2 instance with the fictitious host name *ip-xxx-xxx-xxx-xxx.ec2.internal*. The user is associated with the organizational unit (OU) *admins* and with the password *123456*:

  ```
  ldapwhoami -x -w "123456" -D uid=presto,ou=admins,dc=ec2,dc=internal -H ldaps://ip-xxx-xxx-xxx-xxx.ec2.internal
  ```

  If the account is valid and has appropriate permissions, the command returns:

```
dn:uid=presto,ou=admins,dc=ec2,dc=internal
```

The example configurations in Step 3: Create a configuration JSON with Presto properties for LDAP include this account for clarity, with the exception of the 5.10.0 example, where it is not supported. If the LDAP server uses anonymous binding, remove the `internal-communication.authentication.ldap.user` and `internal-communication.authentication.ldap.password` name/value pairs.

**The LDAP distinguished name (DN) for Presto users**

When you specify the LDAP configuration for Presto, you specify a bind pattern that consists of `${USER}` along with an organizational unit (OU) and additional domain components (DCs). Presto replaces `${USER}` with the actual User ID (UID) of each user during password authentication to match the distinguished name (DN) that this bind pattern specifies. You need the OUs that eligible users belong to and their DCs. For example, to allow users from the `admins` OU in the `corp.example.com` domain to authenticate to Presto, you specify `${USER},ou=admins,dc=corp,dc=example,dc=com` as the user bind pattern.

> **Note**
>
> When you use Amazon CloudFormation, you need to use the Fn::Sub function in order to replace `${USER}` with the actual User ID (UID). For more information, see the Fn::Sub topic in the *Amazon CloudFormation User Guide*.

When using Amazon EMR 5.10.0, you can specify only one such pattern. Using Amazon EMR 5.11.0 or later, you can specify multiple patterns separated by a colon (:). Users attempting to authenticate to Presto are compared to the first pattern, then the second, and so on. For an example, see Step 3: Create a configuration JSON with Presto properties for LDAP.

## Step 2: Set up a security configuration

Create a security configuration with in-transit encryption enabled. For more information, see Create a security configuration in the *Amazon EMR Management Guide*. The encryption artifacts that you provide when you set up in-transit encryption are used to encrypt internal communication between Presto nodes. For more information, see Providing certificates for in-transit data

encryption. The LDAP server certificate is used to authenticate client connections to the Presto server.

### Step 3: Create a configuration JSON with Presto properties for LDAP

You use the `presto-config` configuration classification to set Presto properties for LDAP. The format and contents of `presto-config` are slightly different depending on the Amazon EMR release version and the Presto installation (PrestoDB or Trino). Examples of configuration differences are provided later in this section. For more information, see Configure applications.

The following steps assume that you save the JSON data to a file, *`MyPrestoConfig.json`*. If you use the console, upload the file to a secure location in Amazon S3 so that you can reference it when you create the cluster. If you use the Amazon CLI, you can reference the file locally.

**Example Amazon EMR 6.1.0 and later with PrestoSQL (Trino)**

The following example uses the LDAP host name from Step 1: Gather information about your LDAP server and copy the server certificate to Amazon S3 to authenticate to the LDAP server for binding. Two user bind patterns are specified, which indicates that users within the `admins` OU and the `datascientists` OU on the LDAP server are eligible for authentication to the Trino server as users. The bind patterns are separated by a colon (`:`).

Amazon EMR versions 6.4.0 and later use the new name Trino instead of PrestoSQL. If you use Trino, replace *`prestosql-config`* in the following configuration classification with `trino-config` and *`prestosql-password-authenticator`* with `trino-password-authenticator`.

```
[
   {
      "Classification":"prestosql-config",
      "Properties":{
         "http-server.authentication.type":"PASSWORD"
      }
   },
   {
      "Classification":"prestosql-password-authenticator",
      "Properties":{
         "password-authenticator.name":"ldap",
         "ldap.url":"ldaps://ip-xxx-xxx-xxx-xxx.ec2.internal:636",
         "ldap.user-bind-pattern": "uid=${USER},ou=admins,dc=ec2,dc=internal:uid=
${USER},ou=datascientists,dc=ec2,dc=internal"
      }
```

```
    }
]
```

### Example Amazon EMR 5.16.0 and later

The following example uses the LDAP user ID and password, and the LDAP host name from Step 1: Gather information about your LDAP server and copy the server certificate to Amazon S3 to authenticate to the LDAP server for binding. Two user bind patterns are specified, which indicates that users within the `admins` OU and the `datascientists` OU on the LDAP server are eligible for authentication to the Presto server as users. The bind patterns are separated by a colon (`:`).

```
[{
        "Classification": "presto-config",
                "Properties": {
                        "http-server.authentication.type": "PASSWORD"
                }
        },
        {
                "Classification": "presto-password-authenticator",
                "Properties": {
                        "password-authenticator.name": "ldap",
                        "ldap.url": "ldaps://ip-xxx-xxx-xxx-xxx.ec2.internal:636",
                        "ldap.user-bind-pattern": "uid=
${USER},ou=admins,dc=ec2,dc=internal:uid=${USER},ou=datascientists,dc=ec2,dc=internal",
                        "internal-communication.authentication.ldap.user": "presto",
                        "internal-communication.authentication.ldap.password": "123456"
                }
        }]
```

### Example Amazon EMR 5.11.0 through 5.15.0

The format of the `presto-config` configuration classification is slightly different for these release versions. The following example specifies the same parameters as the previous example.

```
[{
        "Classification": "presto-config",
                "Properties": {
                        "http-server.authentication.type": "LDAP",
                        "authentication.ldap.url": "ldaps://ip-xxx-xxx-xxx-
xxx.ec2.internal:636",
                        "authentication.ldap.user-bind-pattern": "uid=
${USER},ou=admins,dc=ec2,dc=internal:uid=${USER},ou=datascientists,dc=ec2,dc=internal",
```

```
                        "internal-communication.authentication.ldap.user": "presto",
                        "internal-communication.authentication.ldap.password": "123456"
                }
        }]
```

**Example Amazon EMR 5.10.0**

Amazon EMR 5.10.0 supports anonymous binding only, so those entries are omitted. In addition, only a single bind pattern can be specified.

```
[{
        "Classification": "presto-config",
                "Properties": {
                        "http-server.authentication.type": "LDAP",
                        "authentication.ldap.url": "ldaps://ip-xxx-xxx-xxx-
xxx.ec2.internal:636",
                        "ldap.user-bind-pattern": "uid=
${USER},ou=prestousers,dc=ec2,dc=internal"
                }
        }]
```

## Step 4: Create the script to copy the LDAP server certificate and upload it to Amazon S3

Create a script that copies the certificate file to each node in the cluster and adds it to the keystore. Create the script using a text editor, save it, and then upload it to Amazon S3. In Step 5: Create the cluster, the script file is referenced as *s3://amzn-s3-demo-bucket/LoadLDAPCert.sh*.

The following example script uses the default keystore password, *changeit*. We recommend that you connect to the master node after you create the cluster and change the keystore password using the keytool command.

```
#!/bin/bash
aws s3 cp s3://amzn-s3-demo-bucket/ldap_server.crt .
sudo keytool -import -keystore /usr/lib/jvm/jre-1.8.0-openjdk.x86_64/lib/security/
cacerts -trustcacerts -alias ldap_server -file ./ldap_server.crt -storepass changeit -
noprompt
```

## Step 5: Create the cluster

When you create the cluster, you specify Presto and other applications that you want Amazon EMR to install. The following examples also reference the configuration classification properties within a JSON, but you can also specify the configuration classification inline.

**To create a Presto cluster with LDAP authentication using the Amazon EMR console**

1. Navigate to the new Amazon EMR console and select **Switch to the old console** from the side navigation. For more information on what to expect when you switch to the old console, see Using the old console.
2. Choose **Create cluster**, **Go to advanced options**.
3. Choose **Presto** along with other applications for Amazon EMR to install, and under **Software Configuration**, select the **Release** of Amazon EMR to use. LDAP authentication is supported only with Amazon EMR 5.10.0 and later.
4. Under **Edit software settings**, choose **Load JSON from S3** , enter the location in Amazon S3 of the JSON configuration file you created in Step 3: Create a configuration JSON with Presto properties for LDAP, and then choose **Next**.
5. Configure cluster hardware and networking, and then choose **Next**.
6. Choose **Bootstrap Actions**. For **Add bootstrap action**, select **Custom action**, and then choose **Configure and add**.
7. Enter a **Name** for the bootstrap action, enter the **Script location** that you created in Step 4: Create the script to copy the LDAP server certificate and upload it to Amazon S3, for example **s3://amzn-s3-demo-bucket/LoadLDAPCert.sh**, and then choose **Add**.
8. Under **General Options**, **Tags**, and **Additional Options** choose the settings that are appropriate for your application, and then choose **Next**.
9. Choose **Authentication and encryption**, and then select the **Security configuration** that you created in Step 2: Set up a security configuration.
10. Choose other security options as appropriate for your application, and then choose **Create cluster**.

**To create a Presto cluster with LDAP authentication using the Amazon CLI**

- Use the `aws emr create-cluster` command. At a minimum, specify the Presto application, and also the Presto configuration classification, the bootstrap script, and the security

configuration that you created in the previous steps. The following example references the configuration file as a JSON file saved in the same directory where you run the command. The bootstrap script, on the other hand, must be saved in Amazon S3. The following example uses `s3://amzn-s3-demo-bucket/LoadLDAPCert.sh`.

> **Note**
>
> Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

```
aws emr create-cluster  --applications Name=presto --release-label emr-5.16.0 \
--use-default-roles --ec2-attributes KeyName=MyKeyPair,SubnetId=subnet-1234ab5
 \ --instance-count 3 --instance-type m5.xlarge --region us-west-2 --name
 "MyPrestoWithLDAPAuth" \
--bootstrap-actions Name="Distribute LDAP server cert",Path="s3://amzn-s3-demo-
bucket/LoadLDAPCert.sh" \
--security-configuration MyPrestoLDAPSecCfg --configurations file://
MyPrestoConfig.json
```

## Activating Presto strict mode

In certain situations, long-running queries can lead to high costs and cause Amazon EMR to use more cluster resources. This takes resources away from other workloads on the cluster. With Amazon EMR versions 6.8 and later, you can use a strict mode feature that rejects or warns you about the following types of long-running queries:

- Queries without predicates on the partitioned columns that result in table scans of large amounts of data
- Queries with cross joins between two large tables
- Queries that sort large number of rows without limit

After Presto completely optimizes the query plan, strict mode runs. To use and customize strict mode to your query needs, you can configure Presto in the following ways.

**Presto configurations for strict mode**

| Setting | Description | Default |
| --- | --- | --- |
| `strict-mode-enabled` | Turns strict mode on and off. A value of `true` indicates that strict mode is on. | `false` |
| `strict-mode-fail-query` | Rejects queries if strict mode detects probable long-running queries. If `false`, Amazon EMR only raises a warning. | `false` |
| `strict-mode-restrictions` | Specifies the restrictions to apply when strict mode is turned on. Strict mode supports the following restrictions: MANDATORY_PARTITION_PREDICATE, DISALLOW_CROSS_JOIN, and LIMITED_SORT. | MANDATORY_PARTITION_PREDICATE,DISALLOW_CROSS_JOIN, LIMITED_SORT |

To experiment with strict mode, you can override these configurations, or set them as session properties when you use the Presto client.

**To set the configuration at cluster creation with the Amazon Web Services Management Console**

1. Choose **Create cluster** and select Amazon EMR version 6.8.0, and Presto or Trino. For more information, see Installing PrestoDB and Trino.
2. Specify the configuration properties for strict mode directly, or upload a JSON file to Amazon S3. Optionally, select the Amazon Glue data catalog for your metastore. Specify your VPC, subnets, bootstrap actions, key pair, and security group. Choose **Create cluster** to create your cluster.
3. Log in to the primary node of the cluster and run `presto-cli` or `trino-cli`.

4. Submit your queries. Strict mode validates each query and determines if it is long-running. Depending on your `strict-mode-fail-query` setting, Amazon EMR rejects the query or raises a warning.
5. When you're finished with your queries, terminate the cluster and delete your resources.

**To set the configuration on a running cluster with the Amazon CLI**

1. Log in to the primary node of your cluster with the Amazon CLI and run `presto-cli` or `trino-cli`.
2. Run the following commands with your desired values.

```
set session strict_mode_enabled = true;
set session strict_mode_fail_query = false;
set session strict_mode_restrictions = 'DISALLOW_CROSS_JOIN,LIMITED_SORT';
```

## Considerations

When you use strict mode, consider the following:

- In some cases, strict mode can reject short-running queries that don’t consume a lot of resources. For example, queries on small tables don’t apply dynamic filtering or replace inner joins with cross joins. This can lead the query to use the mandatory partition predicate or disallow cross join. When this happens, strict mode rejects the query.
- The strict mode check is only applied on SELECT, INSERT, CREATE TABLE AS SELECT, and EXPLAIN ANALYZE query types.
- You can only use the restriction on the mandatory partition predicate with the Hive connector.

# Handling Spot Instance loss in Presto

With Spot Instances in Amazon EMR, you can run big data workloads on spare Amazon EC2 capacity at a reduced cost. In exchange for the lower cost, Amazon EC2 can interrupt Spot Instances with a two-minute notification. When you terminate a node, Presto can take up to 10 minutes before it returns an error. This causes unnecessary delays in error reports and possible retries. Quick termination is a feature that gives you control over the way Presto handles terminated nodes.

The job of the Presto coordinator is to keep track of all the worker nodes with regular polls of their statuses. Without quick termination, the coordinator doesn't consult the YARN NodeManager for the status of each node. This can result in a long retry loop before the query fails. With quick termination, the Presto coordinator consults the node status in the NodeManager as soon as the poll fails to reach the host. If NodeManager shows that the node is inactive, Presto abandons further retries, fails the query, and returns a `NODE_DECOMMISSIONED` error.

The following set of configuration parameters allows you to control and customize Presto behavior in the event of node termination.

**Presto configurations for node failure handling**

| Setting | Description | Default |
| --- | --- | --- |
| `query.remote-task.max-backoff-duration` | The duration of time that the coordinator continues attempts to fetch the remote task status from worker nodes. | 10 minutes |
| `query.remote-task.quick-terminate-node-failure` | Activates quick node failure if the coordinator can't reach the node or can't connect to the worker that runs on that node. The value of `query.remote-task.terminate-on-connect-exception` determines if the coordinator must reach the node or connect to the worker.<br><br>The node fails the query and Amazon EMR removes the node from the list of available workers. When this happens, you can't use the node to schedule new queries. | `true` |

| Setting | Description | Default |
| --- | --- | --- |
| | When you set this value to `false`, Presto reverts to its previous behavior where the Presto coordinator again tries to reach the node (for `query.remote-task.max-backoff-duration` ) before it marks the node as unavailable and fails the ongoing query on the node. | |
| `query.remote-task.terminate-on-connect-exception` | Specifies if Amazon EMR should a node if the host is reachable but the coordinator fails to connect to the worker process of the host. When you set this value to `true`, you activate quick query failure if the host is unreachable. | `false` |

## Using Presto automatic scaling with Graceful Decommission

Amazon EMR release versions 5.30.0 and later include a feature you can use to set a grace period for certain scaling actions. The grace period allows Presto tasks to keep running before the node terminates because of a scale-in resize action or an automatic scaling policy request. For more information about scaling rules, see Understanding automatic scaling rules in the *Amazon EMR Management Guide*. Presto autoscaling with Graceful Decommission prevents new tasks from being scheduled on a node that is decommissioning, while at the same time allowing tasks that are already running to complete before the shut down timeout is reached. Queries that are running will complete execution before the node is decommissioned. Autoscaling is not supported on instance fleets.

You can control how much time to allow for Presto tasks to complete after an autoscale shut down request is received. By default, the shut down timeout for Amazon EMR is `0` minutes, which means that Amazon EMR immediately terminates the node and any Presto tasks running on it, if

required by a scale-in request. To set a longer timeout for Presto tasks on Amazon EMR to allow running queries to complete before scaling down a cluster, use the `presto-config` configuration classification to set the `graceful-shutdown-timeout` parameter to a value in seconds or minutes greater than zero. For more information, see Configure applications.

For example, increasing the `graceful-shutdown-timeout` value to `"30m"` specifies a timeout period of 30 minutes. After the shut down timeout period ends, the node marked for decommissioning is forcefully terminated if it is waiting for query tasks to complete, and the query fails. If the query tasks finish in five minutes, the node marked for decommissioning terminates at five minutes, provided other YARN applications have completed execution.

**Example Example Presto autoscale configuration with Graceful Decommission**

Replace the `graceful-shutdown-timeout` value with the number of minutes appropriate for your setup. There's no maximum value. The example below sets a timeout value of `1800` seconds (30 minutes).

```
[
    {
        "classification": "presto-config",
        "properties": {
            "graceful-shutdown-timeout": "1800s"
        }
    }
]
```

**Limitations**

PrestoDB Graceful Decommission does not work on EMR clusters where HTTP connectivity is disabled, such as when `http-server.http.enabled` is set to `false`. Trino does not support Graceful Decommission at all, regardless of the `http-server.http.enabled` setting.

# Considerations with Presto on Amazon EMR

Consider the following limitations when you run Presto on Amazon EMR.

## Presto command line executable

In Amazon EMR, PrestoDB and Trino both use the same command line executable, `presto-cli`, as in the following example.

```
presto-cli --catalog hive
```

## Non-configurable Presto deployment properties

The version of Amazon EMR that you use determines the Presto deployment configurations that are available. For more information about these configuration properties, see Deploying Presto in the Presto documentation. The following table shows the different configuration options for Presto `properties` files.

| File | Configurable |
| --- | --- |
| `log.properties` | PrestoDB: Configurable in Amazon EMR versions 4.0.0 and later. Use the `presto-log` configuration classification. |
| `config.properties` | PrestoDB: Configurable in Amazon EMR versions 4.0.0 and later. Use the `presto-config` configuration classification. |
| `hive.properties` | PrestoDB: Configurable in Amazon EMR versions 4.1.0 and later. Use the `presto-connector-hive` configuration classification. |
| `node.properties` | PrestoDB: Configurable in Amazon EMR version 5.6.0 and later. Use the `presto-node` configuration classification. |
| `jvm.config` | Not configurable. |

## PrestoDB installation

The application name *Presto* continues to be used to install PrestoDB on clusters.

You can install either PrestoDB or Trino, but you can't install both on a single cluster. If you specify both PrestoDB and Trino when you attempt to create a cluster, a validation error occurs and the cluster creation request fails.

# EMRFS and PrestoS3FileSystem configuration

With Amazon EMR versions 5.12.0 and later, PrestoDB can use EMRFS. For more information, see EMR File System (EMRFS) in the *Amazon EMR Management Guide*. With earlier versions of Amazon EMR, PrestoS3FileSystem is the only configuration option.

You can use a security configuration to set up encryption for EMRFS data in Amazon S3. You can also use IAM roles for EMRFS requests to Amazon S3. For more information, see Understanding encryption options and Configure IAM roles for EMRFS requests to Amazon S3 in the *Amazon EMR Management Guide*.

> **Note**
>
> If you query underlying data in Amazon S3 with Amazon EMR version 5.12.0, Presto errors can occur. This is because Presto fails to pick up configuration classification values from `emrfs-site.xml`. As a workaround, create an `emrfs` subdirectory under `usr/lib/presto/plugin/hive-hadoop2/` and create a symlink in `usr/lib/presto/plugin/hive-hadoop2/emrfs` to the existing `/usr/share/aws/emr/emrfs/conf/emrfs-site.xml` file. Then restart the presto-server process (`sudo presto-server stop` followed by `sudo presto-server start`).

You can override the EMRFS default and use the PrestoS3FileSystem instead. To do this, use the `presto-connector-hive` configuration classification to set `hive.s3-file-system-type` to PRESTO as shown in the following example. For more information, see Configure applications.

```
[
   {
      "Classification": "presto-connector-hive",
      "Properties": {
         "hive.s3-file-system-type": "PRESTO"
      }
   }
]
```

If you use PrestoS3FileSystem, use the `presto-connector-hive` configuration classification to configure PrestoS3FileSystem properties. For more information about available properties, see Amazon S3 configuration in the Hive Connector section of the Presto documentation. These settings do not apply to EMRFS.

## Default setting for end user impersonation

By default, Amazon EMR versions 5.12.0 and later enable end user impersonation for access to HDFS. For more information, see End user impersonation in the Presto documentation. To change this setting with the `presto-config` configuration classification, set the `hive.hdfs.impersonation.enabled` property to `false`.

## Default port for Presto web interface

By default, Amazon EMR configures the Presto web interface on the Presto coordinator to use port 8889 (for PrestoDB and Trino). To change the port, use the `presto-config` configuration classification to set the `http-server.http.port` property. For more information, see Config properties in the *Deploying Presto* section of Presto Documentation.

## Issue with Hive Bucket execution in some releases

Presto version 152.3 has an issue with Hive bucket execution that causes significantly slower Presto query performance in some circumstances. Amazon EMR versions 5.0.3, 5.1.0, and 5.2.0 include this version of Presto. To mitigate this issue, use the `presto-connector-hive` configuration classification to set the `hive.bucket-execution` property to `false`, as shown in the following example.

```
[
   {
      "Classification": "presto-connector-hive",
      "Properties": {
         "hive.bucket-execution": "false"
      }
   }
]
```

# Presto release history

The following table lists the version of Presto included in each release version of Amazon EMR, along with the components installed with the application. For component versions in each release, see the Component Version section for your release in Amazon EMR 7.x release versions, Amazon EMR 6.x release versions, or Amazon EMR 5.x release versions.

### Presto version information

| Amazon EMR Release label | Presto Version | Components installed with Presto |
|---|---|---|
| emr-7.9.0 | 0.287 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hive-client, hudi, hudi-presto, hcatalog-server, mariadb-server, presto-coordinator, presto-worker |
| emr-7.8.0 | 0.287 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hive-client, hudi, hudi-presto, hcatalog-server, mariadb-server, presto-coordinator, presto-worker |
| emr-7.7.0 | 0.287 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, |

| Amazon EMR Release label | Presto Version | Components installed with Presto |
|---|---|---|
| | | hadoop-yarn-timeline-server , hive-client, hudi, hudi-pres to, hcatalog-server, mariadb-server, presto-coordinator, presto-worker |
| emr-7.6.0 | 0.287 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datano de, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server , hive-client, hudi, hudi-pres to, hcatalog-server, mariadb-server, presto-coordinator, presto-worker |
| emr-7.5.0 | 0.287 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datano de, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server , hive-client, hudi, hudi-pres to, hcatalog-server, mariadb-server, presto-coordinator, presto-worker |

| Amazon EMR Release label | Presto Version | Components installed with Presto |
| --- | --- | --- |
| emr-7.4.0 | 0.287 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hive-client, hudi, hudi-presto, hcatalog-server, mariadb-server, presto-coordinator, presto-worker |
| emr-7.3.0 | 0.285 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hive-client, hudi, hudi-presto, hcatalog-server, mariadb-server, presto-coordinator, presto-worker |

| Amazon EMR Release label | Presto Version | Components installed with Presto |
| --- | --- | --- |
| emr-7.2.0 | 0.285 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hive-client, hudi, hudi-presto, hcatalog-server, mariadb-server, presto-coordinator, presto-worker |
| emr-5.36.2 | 0.267 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hive-client, hudi, hudi-presto, hcatalog-server, mariadb-server, presto-coordinator, presto-worker |

| Amazon EMR Release label | Presto Version | Components installed with Presto |
| --- | --- | --- |
| emr-7.1.0 | 0.284 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hive-client, hudi, hudi-presto, hcatalog-server, mariadb-server, presto-coordinator, presto-worker |
| emr-7.0.0 | 0.283 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hive-client, hudi, hudi-presto, hcatalog-server, mariadb-server, presto-coordinator, presto-worker |

| Amazon EMR Release label | Presto Version | Components installed with Presto |
| --- | --- | --- |
| emr-6.15.0 | 0.283 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hive-client, hudi, hudi-presto, hcatalog-server, mariadb-server, presto-coordinator, presto-worker |

# Apache Spark

Apache Spark is a distributed processing framework and programming model that helps you do machine learning, stream processing, or graph analytics with Amazon EMR clusters. Similar to Apache Hadoop, Spark is an open-source, distributed processing system commonly used for big data workloads. However, Spark has several notable differences from Hadoop MapReduce. Spark has an optimized directed acyclic graph (DAG) execution engine and actively caches data in-memory, which can boost performance, especially for certain algorithms and interactive queries.

Spark natively supports applications written in Scala, Python, and Java. It also includes several tightly integrated libraries for SQL (Spark), machine learning (MLlib), stream processing (Spark streaming), and graph processing (GraphX). These tools make it easier to leverage the Spark framework for a wide variety of use cases.

You can install Spark on an Amazon EMR cluster along with other Hadoop applications, and it can also leverage the Amazon EMR file system (EMRFS) to directly access data in Amazon S3. Hive is also integrated with Spark so that you can use a HiveContext object to run Hive scripts using Spark. A Hive context is included in the spark-shell as `sqlContext`.

For an example tutorial on setting up an EMR cluster with Spark and analyzing a sample data set, see Tutorial: Getting started with Amazon EMR on the Amazon News blog.

> **Important**
>
> Apache Spark version 2.3.1, available beginning with Amazon EMR release 5.16.0, addresses CVE-2018-8024 and CVE-2018-1334. We recommend that you migrate earlier versions of Spark to Spark version 2.3.1 or later.

The following table lists the version of Spark included in the latest release of the Amazon EMR 7.x series, along with the components that Amazon EMR installs with Spark.

For the version of components installed with Spark in this release, see Release 7.9.0 Component Versions.

**Spark version information for emr-7.9.0**

| Amazon EMR Release Label | Spark Version | Components Installed With Spark |
| --- | --- | --- |
| emr-7.9.0 | Spark 3.5.5 | delta, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

The following table lists the version of Spark included in the latest release of the Amazon EMR 6.x series, along with the components that Amazon EMR installs with Spark.

For the version of components installed with Spark in this release, see Release 6.15.0 Component Versions.

**Spark version information for emr-6.15.0**

| Amazon EMR Release Label | Spark Version | Components Installed With Spark |
| --- | --- | --- |
| emr-6.15.0 | Spark 3.4.1 | aws-sagemaker-spark-sdk, delta, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, |

| Amazon EMR Release Label | Spark Version | Components Installed With Spark |
| --- | --- | --- |
| | | hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

**Note**

Amazon EMR release 6.8.0 comes with Apache Spark 3.3.0. This Spark release uses Apache Log4j 2 and the `log4j2.properties` file to configure Log4j in Spark processes. If you use Spark in the cluster or create EMR clusters with custom configuration parameters, and you want to upgrade to Amazon EMR release 6.8.0, you must migrate to the new `spark-log4j2` configuration classification and key format for Apache Log4j 2. For more information, see Migrating from Apache Log4j 1.x to Log4j 2.x.

The following table lists the version of Spark included in the latest release of the Amazon EMR 5.x series, along with the components that Amazon EMR installs with Spark.

For the version of components installed with Spark in this release, see Release 5.36.2 Component Versions.

**Spark version information for emr-5.36.2**

| Amazon EMR Release Label | Spark Version | Components Installed With Spark |
| --- | --- | --- |
| emr-5.36.2 | Spark 2.4.8 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop- |

| Amazon EMR Release Label | Spark Version | Components Installed With Spark |

# Create a cluster with Apache Spark

The following procedure creates a cluster with Spark installed using **Quick Options** in the Amazon EMR console.

You can alternatively use **Advanced Options** to further customize your cluster setup, or to submit steps to programmatically install applications and then run custom applications. With either cluster creation option, you can choose to use Amazon Glue as your Spark SQL metastore. See Use Amazon Glue Data Catalog catalog with Spark on Amazon EMR for more information.

**To launch a cluster with Spark installed**

1. Open the Amazon EMR console at https://console.amazonaws.cn/emr.
2. Choose **Create cluster** to use **Quick Options**.
3. Enter a **Cluster name**. Your cluster name can't contain the characters <, >, $, |, or ` (backtick).
4. For **Software Configuration**, choose a **Release** option.
5. For **Applications**, choose the **Spark** application bundle.
6. Select other options as necessary and then choose **Create cluster**.

> **Note**
>
> To configure Spark when you are creating the cluster, see Configure Spark.

**To launch a cluster with Spark installed using the Amazon CLI**

- Create the cluster with the following command.

```
aws emr create-cluster --name "Spark cluster" --release-label emr-7.9.0 --
applications Name=Spark \
--ec2-attributes KeyName=myKey --instance-type m5.xlarge --instance-count 3 --use-
default-roles
```

**Note**

Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

**To launch a cluster with Spark installed using the SDK for Java**

Specify Spark as an application with `SupportedProductConfig` used in `RunJobFlowRequest`.

- The following example shows how to create a cluster with Spark using Java.

```
import com.amazonaws.AmazonClientException;
import com.amazonaws.auth.AWSCredentials;
import com.amazonaws.auth.AWSStaticCredentialsProvider;
import com.amazonaws.auth.profile.ProfileCredentialsProvider;
import com.amazonaws.services.elasticmapreduce.AmazonElasticMapReduce;
import com.amazonaws.services.elasticmapreduce.AmazonElasticMapReduceClientBuilder;
import com.amazonaws.services.elasticmapreduce.model.*;
import com.amazonaws.services.elasticmapreduce.util.StepFactory;

public class Main {

        public static void main(String[] args) {
                AWSCredentials credentials_profile = null;
                try {
                        credentials_profile = new
 ProfileCredentialsProvider("default").getCredentials();
                } catch (Exception e) {
                        throw new AmazonClientException(
                                        "Cannot load credentials from .aws/
credentials file. " +
                                                        "Make sure that the
 credentials file exists and the profile name is specified within it.",
                                        e);
                }

                AmazonElasticMapReduce emr =
 AmazonElasticMapReduceClientBuilder.standard()
                                .withCredentials(new
 AWSStaticCredentialsProvider(credentials_profile))
                                .withRegion(Regions.US_WEST_1)
```

```
                                .build();

                // create a step to enable debugging in the AWS Management Console
                StepFactory stepFactory = new StepFactory();
                StepConfig enabledebugging = new StepConfig()
                                .withName("Enable debugging")
                                .withActionOnFailure("TERMINATE_JOB_FLOW")

  .withHadoopJarStep(stepFactory.newEnableDebuggingStep());

                Application spark = new Application().withName("Spark");

                RunJobFlowRequest request = new RunJobFlowRequest()
                                .withName("Spark Cluster")
                                .withReleaseLabel("emr-5.20.0")
                                .withSteps(enabledebugging)
                                .withApplications(spark)
                                .withLogUri("s3://path/to/my/logs/")
                                .withServiceRole("EMR_DefaultRole")
                                .withJobFlowRole("EMR_EC2_DefaultRole")
                                .withInstances(new JobFlowInstancesConfig()
                                                .withEc2SubnetId("subnet-12ab3c45")
                                                .withEc2KeyName("myEc2Key")
                                                .withInstanceCount(3)

  .withKeepJobFlowAliveWhenNoSteps(true)
                                                .withMasterInstanceType("m4.large")

  .withSlaveInstanceType("m4.large"));
                RunJobFlowResult result = emr.runJobFlow(request);
                System.out.println("The cluster ID is " + result.toString());
        }
}
```

# Run Spark applications with Docker on Amazon EMR 6.x

With Amazon EMR 6.0.0, Spark applications can use Docker containers to define their library dependencies, instead of installing dependencies on the individual Amazon EC2 instances in the cluster. To run Spark with Docker, you must first configure the Docker registry and define additional parameters when submitting a Spark application. For more information, see Configure Docker integration.

When the application is submitted, YARN invokes Docker to pull the specified Docker image and run the Spark application inside a Docker container. This allows you to easily define and isolate dependencies. It reduces the time for bootstrapping or preparing instances in the Amazon EMR cluster with the libraries needed for job execution.

## Considerations when running Spark with Docker

When you run Spark with Docker, make sure the following prerequisites are met:

- The `docker` package and CLI are only installed on core and task nodes.
- On Amazon EMR 6.1.0 and later, you can alternatively install Docker on a primary node by using following commands.
  - ```
    sudo yum install -y docker
    sudo systemctl start docker
    ```
- The `spark-submit` command should always be run from a primary instance on the Amazon EMR cluster.
- The Docker registries used to resolve Docker images must be defined using the Classification API with the `container-executor` classification key to define additional parameters when launching the cluster:
  - `docker.trusted.registries`
  - `docker.privileged-containers.registries`
- To execute a Spark application in a Docker container, the following configuration options are necessary:
  - `YARN_CONTAINER_RUNTIME_TYPE=docker`
  - `YARN_CONTAINER_RUNTIME_DOCKER_IMAGE={DOCKER_IMAGE_NAME}`
- When using Amazon ECR to retrieve Docker images, you must configure the cluster to authenticate itself. To do so, you must use the following configuration option:
  - YARN_CONTAINER_RUNTIME_DOCKER_CLIENT_CONFIG={DOCKER_CLIENT_CONFIG_PATH_ON_HDFS
- In Amazon EMR 6.1.0 and later, you are not required to use the listed command `YARN_CONTAINER_RUNTIME_DOCKER_CLIENT_CONFIG={DOCKER_CLIENT_CONFIG_PATH_ON_HDFS` when the ECR auto authentication feature is enabled.
- Any Docker image used with Spark must have Java installed in the Docker image.

For more information about the prerequisites, see Configure Docker integration.
    ```

# Creating a Docker image

Docker images are created using a Dockerfile, which defines the packages and configuration to include in the image. The following two example Dockerfiles use PySpark and SparkR.

### PySpark Dockerfile

Docker images created from this Dockerfile include Python 3 and the NumPy Python package. This Dockerfile uses Amazon Linux 2 and the Amazon Corretto JDK 8.

```
FROM amazoncorretto:8

RUN yum -y update
RUN yum -y install yum-utils
RUN yum -y groupinstall development

RUN yum list python3*
RUN yum -y install python3 python3-dev python3-pip python3-virtualenv

RUN python -V
RUN python3 -V

ENV PYSPARK_DRIVER_PYTHON python3
ENV PYSPARK_PYTHON python3

RUN pip3 install --upgrade pip
RUN pip3 install numpy pandas

RUN python3 -c "import numpy as np"
```

### SparkR Dockerfile

Docker images created from this Dockerfile include R and the randomForest CRAN package. This Dockerfile includes Amazon Linux 2 and the Amazon Corretto JDK 8.

```
FROM amazoncorretto:8

RUN java -version

RUN yum -y update
RUN amazon-linux-extras install R4
```

```
RUN yum -y install curl hostname

#setup R configs
RUN echo "r <- getOption('repos'); r['CRAN'] <- 'http://cran.us.r-project.org';
 options(repos = r);" > ~/.Rprofile

RUN Rscript -e "install.packages('randomForest')"
```

For more information on Dockerfile syntax, see the Dockerfile reference documentation.

## Using Docker images from Amazon ECR

Amazon Elastic Container Registry (Amazon ECR) is a fully-managed Docker container registry, which makes it easy to store, manage, and deploy Docker container images. When using Amazon ECR, the cluster must be configured to trust your instance of ECR, and you must configure authentication in order for the cluster to use Docker images from Amazon ECR. For more information, see Configuring YARN to access Amazon ECR.

To make sure that Amazon EMR hosts can access the images stored in Amazon ECR, your cluster must have the permissions from the `AmazonEC2ContainerRegistryReadOnly` policy associated with the instance profile. For more information, see `AmazonEC2ContainerRegistryReadOnly` Policy.

In this example, the cluster must be created with the following additional configuration to ensure that the Amazon ECR registry is trusted. Replace the *`123456789123.dkr.ecr.us-east-1.amazonaws.com`* endpoint with your Amazon ECR endpoint.

```
[
  {
    "Classification": "container-executor",
    "Configurations": [
      {
        "Classification": "docker",
        "Properties": {
          "docker.privileged-containers.registries":
 "local,centos,123456789123.dkr.ecr.us-east-1.amazonaws.com",
          "docker.trusted.registries": "local,centos,123456789123.dkr.ecr.us-
east-1.amazonaws.com"
        }
      }
    ],
```

```
    "Properties": {}
  }
]
```

### Using PySpark with Amazon ECR

The following example uses the PySpark Dockerfile, which will be tagged and uploaded to Amazon ECR. After you upload the Dockerfile, you can run the PySpark job and refer to the Docker image from Amazon ECR.

After you launch the cluster, use SSH to connect to a core node and run the following commands to build the local Docker image from the PySpark Dockerfile example.

First, create a directory and a Dockerfile.

```
mkdir pyspark
vi pyspark/Dockerfile
```

Paste the contents of the PySpark Dockerfile and run the following commands to build a Docker image.

```
sudo docker build -t local/pyspark-example pyspark/
```

Create the `emr-docker-examples` ECR repository for the examples.

```
aws ecr create-repository --repository-name emr-docker-examples
```

Tag and upload the locally built image to ECR, replacing *123456789123.dkr.ecr.us-east-1.amazonaws.com* with your ECR endpoint.

```
sudo docker tag local/pyspark-example 123456789123.dkr.ecr.us-east-1.amazonaws.com/emr-
docker-examples:pyspark-example
sudo docker push 123456789123.dkr.ecr.us-east-1.amazonaws.com/emr-docker-
examples:pyspark-example
```

Use SSH to connect to the primary node and prepare a Python script with the filename `main.py`. Paste the following content into the `main.py` file and save it.

```
from pyspark.sql import SparkSession
spark = SparkSession.builder.appName("docker-numpy").getOrCreate()
```

```
sc = spark.sparkContext

import numpy as np
a = np.arange(15).reshape(3, 5)
print(a)
```

On Amazon EMR 6.0.0, to submit the job, reference the name of the Docker image. Define the additional configuration parameters to make sure that the job execution uses Docker as the runtime. When using Amazon ECR, the YARN_CONTAINER_RUNTIME_DOCKER_CLIENT_CONFIG must reference the config.json file containing the credentials used to authenticate to Amazon ECR.

```
DOCKER_IMAGE_NAME=123456789123.dkr.ecr.us-east-1.amazonaws.com/emr-docker-
examples:pyspark-example
DOCKER_CLIENT_CONFIG=hdfs:///user/hadoop/config.json
spark-submit --master yarn \
--deploy-mode cluster \
--conf spark.executorEnv.YARN_CONTAINER_RUNTIME_TYPE=docker \
--conf spark.executorEnv.YARN_CONTAINER_RUNTIME_DOCKER_IMAGE=$DOCKER_IMAGE_NAME \
--conf spark.executorEnv.YARN_CONTAINER_RUNTIME_DOCKER_CLIENT_CONFIG=
$DOCKER_CLIENT_CONFIG \
--conf spark.yarn.appMasterEnv.YARN_CONTAINER_RUNTIME_TYPE=docker \
--conf spark.yarn.appMasterEnv.YARN_CONTAINER_RUNTIME_DOCKER_IMAGE=$DOCKER_IMAGE_NAME \
--conf spark.yarn.appMasterEnv.YARN_CONTAINER_RUNTIME_DOCKER_CLIENT_CONFIG=
$DOCKER_CLIENT_CONFIG \
--num-executors 2 \
main.py -v
```

On Amazon EMR 6.1.0 and later, to submit the job, reference the name of the Docker image. When ECR auto authentication is enabled, run the following command.

```
DOCKER_IMAGE_NAME=123456789123.dkr.ecr.us-east-1.amazonaws.com/emr-docker-
examples:pyspark-example
spark-submit --master yarn \
--deploy-mode cluster \
--conf spark.executorEnv.YARN_CONTAINER_RUNTIME_TYPE=docker \
--conf spark.executorEnv.YARN_CONTAINER_RUNTIME_DOCKER_IMAGE=$DOCKER_IMAGE_NAME \
--conf spark.yarn.appMasterEnv.YARN_CONTAINER_RUNTIME_TYPE=docker \
--conf spark.yarn.appMasterEnv.YARN_CONTAINER_RUNTIME_DOCKER_IMAGE=$DOCKER_IMAGE_NAME \
--num-executors 2 \
main.py -v
```

When the job completes, take note of the YARN application ID, and use the following command to obtain the output of the PySpark job.

```
yarn logs --applicationId application_id | grep -C2 '\[\['
LogLength:55
LogContents:
[[ 0  1  2  3  4]
 [ 5  6  7  8  9]
 [10 11 12 13 14]]
```

### Using SparkR with Amazon ECR

The following example uses the SparkR Dockerfile, which will be tagged and uploaded to ECR. Once the Dockerfile is uploaded, you can run the SparkR job and refer to the Docker image from Amazon ECR.

After you launch the cluster, use SSH to connect to a core node and run the following commands to build the local Docker image from the SparkR Dockerfile example.

First, create a directory and the Dockerfile.

```
mkdir sparkr
vi sparkr/Dockerfile
```

Paste the contents of the SparkR Dockerfile and run the following commands to build a Docker image.

```
sudo docker build -t local/sparkr-example sparkr/
```

Tag and upload the locally built image to Amazon ECR, replacing *123456789123.dkr.ecr.us-east-1.amazonaws.com* with your Amazon ECR endpoint.

```
sudo docker tag local/sparkr-example 123456789123.dkr.ecr.us-east-1.amazonaws.com/emr-
docker-examples:sparkr-example
sudo docker push 123456789123.dkr.ecr.us-east-1.amazonaws.com/emr-docker-
examples:sparkr-example
```

Use SSH to connect to the primary node and prepare an R script with the name `sparkR.R`. Paste the following contents into the `sparkR.R` file.

```
library(SparkR)
```

```
sparkR.session(appName = "R with Spark example", sparkConfig =
 list(spark.some.config.option = "some-value"))

sqlContext <- sparkRSQL.init(spark.sparkContext)
library(randomForest)
# check release notes of randomForest
rfNews()

sparkR.session.stop()
```

On Amazon EMR 6.0.0, to submit the job, refer to the name of the Docker image. Define the additional configuration parameters to make sure that the job execution uses Docker as the runtime. When using Amazon ECR, the `YARN_CONTAINER_RUNTIME_DOCKER_CLIENT_CONFIG` must refer to the `config.json` file containing the credentials used to authenticate to ECR.

```
DOCKER_IMAGE_NAME=123456789123.dkr.ecr.us-east-1.amazonaws.com/emr-docker-
examples:sparkr-example
DOCKER_CLIENT_CONFIG=hdfs:///user/hadoop/config.json
spark-submit --master yarn \
--deploy-mode cluster \
--conf spark.executorEnv.YARN_CONTAINER_RUNTIME_TYPE=docker \
--conf spark.executorEnv.YARN_CONTAINER_RUNTIME_DOCKER_IMAGE=$DOCKER_IMAGE_NAME \
--conf spark.executorEnv.YARN_CONTAINER_RUNTIME_DOCKER_CLIENT_CONFIG=
$DOCKER_CLIENT_CONFIG \
--conf spark.yarn.appMasterEnv.YARN_CONTAINER_RUNTIME_TYPE=docker \
--conf spark.yarn.appMasterEnv.YARN_CONTAINER_RUNTIME_DOCKER_IMAGE=$DOCKER_IMAGE_NAME \
--conf spark.yarn.appMasterEnv.YARN_CONTAINER_RUNTIME_DOCKER_CLIENT_CONFIG=
$DOCKER_CLIENT_CONFIG \
sparkR.R
```

On Amazon EMR 6.1.0 and later, to submit the job, reference the name of the Docker image. When ECR auto authentication is enabled, run following command.

```
DOCKER_IMAGE_NAME=123456789123.dkr.ecr.us-east-1.amazonaws.com/emr-docker-
examples:sparkr-example
spark-submit --master yarn \
--deploy-mode cluster \
--conf spark.executorEnv.YARN_CONTAINER_RUNTIME_TYPE=docker \
--conf spark.executorEnv.YARN_CONTAINER_RUNTIME_DOCKER_IMAGE=$DOCKER_IMAGE_NAME \
--conf spark.yarn.appMasterEnv.YARN_CONTAINER_RUNTIME_TYPE=docker \
--conf spark.yarn.appMasterEnv.YARN_CONTAINER_RUNTIME_DOCKER_IMAGE=$DOCKER_IMAGE_NAME \
sparkR.R
```

When the job has completed, note the YARN application ID, and use the following command to obtain the output of the SparkR job. This example includes testing to make sure that the randomForest library, version installed, and release notes are available.

```
yarn logs --applicationId application_id | grep -B4 -A10 "Type rfNews"
randomForest 4.6-14
Type rfNews() to see new features/changes/bug fixes.
Wishlist (formerly TODO):

* Implement the new scheme of handling classwt in classification.

* Use more compact storage of proximity matrix.

* Allow case weights by using the weights in sampling?

=============================================================================
Changes in 4.6-14:
```

# Use Amazon Glue Data Catalog catalog with Spark on Amazon EMR

Using Amazon EMR release 5.8.0 or later, you can configure Spark to use the Amazon Glue Data Catalog as its Apache Hive metastore. We recommend this configuration when you require a persistent Hive metastore or a Hive metastore shared by different clusters, services, applications, or Amazon accounts.

Using Amazon EMR release 6.5.0 or later, you can configure Spark to use the Amazon Glue Data Catalog with Apache Iceberg.

Using Amazon EMR release 7.5.0 or later, you can configure Spark to use the Amazon Glue Data Catalog as its Iceberg REST catalog.

Amazon Glue is a fully managed extract, transform, and load (ETL) service that makes it simple and cost-effective to categorize your data, clean it, enrich it, and move it reliably between various data stores. The Amazon Glue Data Catalog provides a unified metadata repository across a variety of data sources and data formats, integrating with Amazon EMR as well as Amazon RDS, Amazon Redshift, Redshift Spectrum, Athena, and any application compatible with the Apache Hive metastore. Amazon Glue crawlers can automatically infer schema from source data in Amazon

S3 and store the associated metadata in the Data Catalog. For more information about the Data Catalog, see Populating the Amazon Glue Data Catalog in the *Amazon Glue Developer Guide*.

Separate charges apply for Amazon Glue. There is a monthly rate for storing and accessing the metadata in the Data Catalog, an hourly rate billed per minute for Amazon Glue ETL jobs and crawler runtime, and an hourly rate billed per minute for each provisioned development endpoint. The Data Catalog allows you to store up to a million objects at no charge. If you store more than a million objects, you are charged USD$1 for each 100,000 objects over a million. An object in the Data Catalog is a table, partition, or database. For more information, see Glue Pricing.

**Important**

If you created tables using Amazon Athena or Amazon Redshift Spectrum before August 14, 2017, databases and tables are stored in an Athena-managed catalog, which is separate from the Amazon Glue Data Catalog. To integrate Amazon EMR with these tables, you must upgrade to the Amazon Glue Data Catalog. For more information, see Upgrading to the Amazon Glue Data Catalog in the *Amazon Athena User Guide*.

## Specifying Amazon Glue Data Catalog as the Apache Hive metastore

You can specify the Amazon Glue Data Catalog as the metastore using the Amazon Web Services Management Console, Amazon CLI, or Amazon EMR API. When you use the CLI or API, you use the configuration classification for Spark to specify the Data Catalog. In addition, with Amazon EMR 5.16.0 and later, you can use the configuration classification to specify a Data Catalog in a different Amazon Web Services account. When you use the console, you can specify the Data Catalog using **Advanced Options** or **Quick Options**.

**Note**

The option to use Amazon Glue Data Catalog is also available with Zeppelin because Zeppelin is installed with Spark components.

Console

**To specify Amazon Glue Data Catalog as the Apache Hive metastore with the new console**

1. Sign in to the Amazon Web Services Management Console, and open the Amazon EMR console at https://console.amazonaws.cn/emr.
2. Under **Amazon EMR on EC2** in the left navigation pane, choose **Clusters**, and then choose **Create cluster**.
3. Under **Application bundle**, choose **Spark** or **Custom**. If you customize your cluster, make sure that you select Zeppelin or Spark as one of your applications.
4. Under **Amazon Glue Data Catalog settings**, select the **Use for Spark table metadata** check box.
5. Choose any other options that apply to your cluster.
6. To launch your cluster, choose **Create cluster**.

Amazon CLI

**To specify the Amazon Glue Data Catalog as the Apache Hive metastore with the Amazon CLI**

For more information about specifying a configuration classification using the Amazon CLI and Amazon EMR API, see Configure applications.

- Specify the value for `hive.metastore.client.factory.class` using the `spark-hive-site` classification as shown in the following example:

```
[
  {
    "Classification": "spark-hive-site",
    "Properties": {
      "hive.metastore.client.factory.class":
 "com.amazonaws.glue.catalog.metastore.AWSGlueDataCatalogHiveClientFactory"
    }
  }
]
```

To specify a Data Catalog in a different Amazon account, add the `hive.metastore.glue.catalogid` property as shown in the following example. Replace *`acct-id`* with the Amazon account of the Data Catalog.

```
[
  {
    "Classification": "spark-hive-site",
    "Properties": {
      "hive.metastore.client.factory.class":
 "com.amazonaws.glue.catalog.metastore.AWSGlueDataCatalogHiveClientFactory",
      "hive.metastore.glue.catalogid": "acct-id"
    }
  }
]
```

## Specifying Amazon Glue Data Catalog as the Apache Iceberg catalog

You can specify the Amazon Glue Data Catalog as the Apache Iceberg catalog implementation, or the Apache Iceberg REST catalog endpoint, using the Amazon Web Services Management Console, the Amazon CLI, or the Amazon EMR API, or at Spark session runtime configuration. When you use the CLI or API, you use the configuration classification for Spark to specify the Data Catalog. For more details, see Specifying Amazon Glue Data Catalog as the Apache Iceberg catalog.

## IAM permissions

The EC2 instance profile for a cluster must have IAM permissions for Amazon Glue actions. In addition, if you enable encryption for Amazon Glue Data Catalog objects, the role must also be allowed to encrypt, decrypt and generate the Amazon KMS key used for encryption.

### Permissions for Amazon Glue actions

If you use the default EC2 instance profile for Amazon EMR, no action is required. The `AmazonElasticMapReduceforEC2Role` managed policy that is attached to the `EMR_EC2_DefaultRole` allows all necessary Amazon Glue actions. However, if you specify a custom EC2 instance profile and permissions, you must configure the appropriate Amazon Glue actions. Use the `AmazonElasticMapReduceforEC2Role` managed policy as a starting point. For

more information, see Service role for cluster EC2 instances (EC2 instance profile) in the *Amazon EMR Management Guide*.

### Permissions for encrypting and decrypting Amazon Glue Data Catalog

Your instance profile needs permission to encrypt and decrypt data using your key. You do *not* need to configure these permissions if both of the following statements apply:

- You enable encryption for Amazon Glue Data Catalog objects using managed keys for Amazon Glue.
- You use a cluster that's in the same Amazon Web Services account as the Amazon Glue Data Catalog.

Otherwise, you must add the following statement to the permissions policy attached to your EC2 instance profile.

```
[
    {
        "Version": "2012-10-17",
        "Statement": [
            {
                "Effect": "Allow",
                "Action": [
                    "kms:Decrypt",
                    "kms:Encrypt",
                    "kms:GenerateDataKey"
                ],
                "Resource": "arn:aws:kms:region:acct-
id:key/12345678-1234-1234-1234-123456789012"
            }
        ]
    }
]
```

For more information about Amazon Glue Data Catalog encryption, see Encrypting your data catalog in the *Amazon Glue Developer Guide*.

### Resource-based permissions

If you use Amazon Glue in conjunction with Hive, Spark, or Presto in Amazon EMR, Amazon Glue supports resource-based policies to control access to Data Catalog resources. These resources

include databases, tables, connections, and user-defined functions. For more information, see Amazon Glue Resource Policies in the *Amazon Glue Developer Guide*.

When using resource-based policies to limit access to Amazon Glue from within Amazon EMR, the principal that you specify in the permissions policy must be the role ARN associated with the EC2 instance profile that is specified when a cluster is created. For example, for a resource-based policy attached to a catalog, you can specify the role ARN for the default service role for cluster EC2 instances, *EMR_EC2_DefaultRole* as the `Principal`, using the format shown in the following example:

```
arn:aws:iam::acct-id:role/EMR_EC2_DefaultRole
```

The *acct-id* can be different from the Amazon Glue account ID. This enables access from EMR clusters in different accounts. You can specify multiple principals, each from a different account.

## Considerations when using Amazon Glue Data Catalog

Consider the following items when using Amazon Glue Data Catalog as an Apache Hive metastore with Spark:

- Having a default database without a location URI causes failures when you create a table. As a workaround, use the `LOCATION` clause to specify a bucket location, such as `s3://amzn-s3-demo-bucket1`, when you use `CREATE TABLE`. Alternatively create tables within a database other than the default database.
- Renaming tables from within Amazon Glue is not supported.
- When you create a Hive table without specifying a `LOCATION`, the table data is stored in the location specified by the `hive.metastore.warehouse.dir` property. By default, this is a location in HDFS. If another cluster needs to access the table, it fails unless it has adequate permissions to the cluster that created the table. Furthermore, because HDFS storage is transient, if the cluster terminates, the table data is lost, and the table must be recreated. We recommend that you specify a `LOCATION` in Amazon S3 when you create a Hive table using Amazon Glue. Alternatively, you can use the `hive-site` configuration classification to specify a location in Amazon S3 for `hive.metastore.warehouse.dir`, which applies to all Hive tables. If a table is created in an HDFS location and the cluster that created it is still running, you can update the table location to Amazon S3 from within Amazon Glue. For more information, see Working with Tables on the Amazon Glue Console in the *Amazon Glue Developer Guide*.

- Partition values containing quotes and apostrophes are not supported, for example, `PARTITION (owner="Doe's")`.
- Column statistics are supported for emr-5.31.0 and later.
- Using Hive authorization is not supported. As an alternative, consider using Amazon Glue Resource-Based Policies. For more information, see Use Resource-Based Policies for Amazon EMR Access to Amazon Glue Data Catalog.

Consider the following when using Amazon Glue Data Catalog as Apache Iceberg REST Catalog with Spark:

- If you use the Spark session catalog with Iceberg, which is described in Configuration differences when you use Iceberg SparkCatalog versus SparkSessionCatalog, you must configure the Amazon Glue Data Catalog as the Apache Hive metastore, in addition to configuring the Amazon Glue Data Catalog as the Apache Iceberg REST catalog.
- The Amazon Glue Data Catalog IRC endpoint supports only the Amazon SigV4 authentication scheme. OAuth is not supported. For OAuth users, please use IAM Identity Center to configure access. See Connecting Lake Formation with IAM Identity Center.
- The Amazon Glue Iceberg REST catalog does not support all operations in open source.

# Working with a multi-catalog hierarchy in Amazon Glue Data Catalog with Spark on Amazon EMR

You can register your Amazon EMR cluster to access the Amazon Glue Data Catalog, which makes tables and other catalog resources available to various consumers. Amazon Glue Data Catalog supports a multi-catalog hierarchy, which unifies your data across Amazon S3 data lakes. It also provides both a Hive metastore API and an open-source Apache Iceberg REST API for accessing the data. These features are available to Amazon EMR and other services like Amazon Athena and Amazon Redshift.

## How catalog resources are organized

When you create resources in the Amazon Glue Data Catalog, you can access them from any SQL engine that supports the Apache Iceberg REST API or Hive metastore. Amazon Lake Formation manages permissions.

In Amazon Glue Data Catalog, data is organized in a logical hierarchy of catalogs, databases and tables:

- **Catalog** – A logical container that holds objects from a data store, such as schemas or tables.
- **Catalog to store Redshift Managed Storage (RMS) tables** – When you manage catalogs to store RMS tables, you can access these tables using Iceberg.
- **Database** – Organizes data objects such as tables and views in a catalog.
- **Tables and views** – Data objects in a database that provide an abstraction layer with an understandable schema. They provide a layer to access underlying data, which can be in various formats and in different locations.

## Configuring a data catalog for use with Amazon EMR

To get started, you configure the catalog to support Amazon EMR tools. The Amazon Glue Data Catalog provides Hive metastore compatibility and Iceberg REST compatible APIs.

#### Configuring Amazon EMR with a Hive metastore

For information about how to set this up, see Amazon Glue Data Catalog support for Spark jobs in the Amazon Glue User Guide. This topic describes how to configure Amazon Glue Data Catalog as a Hive metastore and make it available as an endpoint. Additionally, there is Amazon EMR documentation available that shows you how to specify Amazon Glue Data Catalog as a Spark metastore, in Use the Amazon Glue Data Catalog as the Apache Hive metastore for Spark.

## Permissions for accessing resources in Amazon Glue Data Catalog

This section describes the IAM policy requirements for using Amazon EMR tools with catalog data. After you register your cluster with the Amazon Glue Data Catalog, you need the following permissions to discover the creation of and changes to the subsequently created data catalog:

- **glue:GetCatalog**
- **glue:GetCatalogs**
- **sts:AssumeRole**
- **sts:TagSession**
- **sts:SetContext**

- **sts:SetSourceIdentity**

In most cases, when you assign permissions, we recommend creating an IAM role and assigning permissions to it.

Additionally, to query catalog data, you must set permissions for the data catalog using Amazon Lake Formation. For more information on setting permissions for data catalogs in Amazon Lake Formation, see Granting and revoking permissions on Data Catalog resources.

After you create and configure your cluster, and set permissions on your catalog objects, you can submit jobs to query and process data.

## Configure Spark to access a multi-catalog hierarchy in Amazon Glue Data Catalog

With EMR 7.5, you can configure Spark to use Amazon Glue's multi-catalog heirarchy. A multi-catalog hierarchy allows you to:

- Bring your Redshift Managed Storage (RMS) data, such as tables, views, and materialized views from existing Amazon Redshift data warehouses to Amazon Glue Data Catalog. You can query these objects using EMR on EC2 and EMR Serverless.
- Create RMS catalogs, Amazon Glue Data Catalog and store data in RMS using ZeroETL and query the data with Iceberg-compatible query engines.
- Create managed Iceberg tables in Amazon Glue Data Catalog with full-featured storage management that includes compaction, snapshots, and retention.

### Connecting to multi-catalog when you initialize a Spark session

The following examples demonstrate how to use interactive Spark shell, Spark submit, or Amazon EMR Notebooks to work with Amazon Glue’s multi-catalog hierarchy.

spark-shell

1. Connect to the master node using SSH. For more information, see Connect to the master node using SSH in the *Amazon EMR Management Guide*.
2. Enter the following command to launch the Spark shell. To use the PySpark shell, replace `spark-shell` with `pyspark`.

```
spark-shell \
    --conf spark.sql.catalog.my_catalog=org.apache.iceberg.spark.SparkCatalog \
    --conf spark.sql.catalog.my_catalog.warehouse=s3://amzn-s3-demo-bucket/prefix/
    --conf spark.sql.catalog.my_catalog.type=glue \
    --conf spark.sql.catalog.my_catalog.glue.id=Glue RMS catalog ID \
    --conf spark.sql.defaultCatalog=my_catalog \
    --conf
 spark.sql.extensions=org.apache.iceberg.spark.extensions.IcebergSparkSessionExtensions
```

spark-submit

1. Connect to the master node using SSH. For more information, see Connect to the master node using SSH in the *Amazon EMR Management Guide*.
2. Enter the following command to launch the Spark session for Spark.

```
spark-submit \
--conf spark.sql.catalog.my_catalog=org.apache.iceberg.spark.SparkCatalog \
--conf spark.sql.catalog.my_catalog.warehouse=s3://amzn-s3-demo-bucket1/prefix \
--conf spark.sql.catalog.my_catalog.type=glue \
--conf spark.sql.catalog.my_catalog.glue.id=Glue RMS catalog ID \
--conf spark.sql.defaultCatalog=my_catalog \
--conf
 spark.sql.extensions=org.apache.iceberg.spark.extensions.IcebergSparkSessionExtensions
```

EMR Studio notebooks

To initialize a Spark session using EMR Studio notebooks, configure your Spark session using the `%%configure` magic command in your Amazon EMR notebook, as in the following example. For more information, see Use EMR Notebooks magics in the *Amazon EMR Management Guide*.

```
%%configure -f{
"conf":{
    "spark.sql.catalog.my_catalog":"org.apache.iceberg.spark.SparkCatalog",
    "spark.sql.catalog.my_catalog.type":"glue",
    "spark.sql.catalog.my_catalog.glue.id":"Glue RMS catalog ID",
    "spark.sql.catalog.my_catalog.warehouse":"s3://amzn-s3-demo-bucket1/prefix/",
    "spark.sql.defaultCatalog", "my_catalog",

 "spark.sql.extensions":"org.apache.iceberg.spark.extensions.IcebergSparkSessionExtensions"
```

```
    }
}
```

CLI

To initialize a Spark session using the CLI, run the following sample. For more information about specifying a configuration classification using the Amazon CLI and Amazon EMR API, see Configure applications.

```
[
  {
    "Classification": "spark-defaults",
    "Properties": {
      "spark.sql.catalog.my_catalog":"org.apache.iceberg.spark.SparkCatalog",
      "spark.sql.catalog.my_catalog.type":"glue",
      "spark.sql.catalog.my_catalog.glue.id":"Glue RMS catalog ID",
      "spark.sql.catalog.my_catalog.warehouse":"s3://amzn-s3-demo-bucket1/prefix/",
      "spark.sql.defaultCatalog", "my_catalog",

 "spark.sql.extensions":"org.apache.iceberg.spark.extensions.IcebergSparkSessionExtensions"
    }
  }
]
```

**Initialize a Spark session to Redshift Managed Storage with Amazon Glue Data Catalog**

The following sample command initializes a Spark session with the Amazon Glue Data Catalog.

```
spark-sql \
  --conf spark.sql.catalog.rms=org.apache.iceberg.spark.SparkCatalog \
  --conf spark.sql.catalog.rms.type=glue \
  --conf spark.sql.catalog.rms.glue.id=Glue RMS catalog ID \
  --conf spark.sql.defaultCatalog=rms
  --conf
 spark.sql.extensions=org.apache.iceberg.spark.extensions.IcebergSparkSessionExtensions
```

The following sample initializes a Spark session using the Iceberg REST API and Redshift Managed Storage with Amazon Glue Data Catalog.

```
spark-sql \
```

```
  --conf spark.sql.catalog.rms=org.apache.iceberg.spark.SparkCatalog \
  --conf spark.sql.catalog.rms.type=rest \
  --conf spark.sql.catalog.rms.warehouse=glue RMS catalog ID \
  --conf spark.sql.catalog.rms.uri=Glue endpoint URI/iceberg \
  --conf spark.sql.catalog.rms.rest.sigv4-enabled=true \
  --conf spark.sql.catalog.rms.rest.signing-name=glue \
  --conf spark.sql.defaultCatalog=rms \
  --conf
spark.sql.extensions=org.apache.iceberg.spark.extensions.IcebergSparkSessionExtensions
```

For more information about using an Amazon Glue multi-catalog hierarchy with Spark Iceberg, see Use an Iceberg cluster with Spark.

### Considerations and limitations for a multi-catalog configuration

- Using a multi-catalog hierarchy with Apache Hive metastore is not supported.
- Using a multi-catalog hierarchy with Apache Iceberg cannot support fallback to Apache Hive metastore, when using `SparkSessionCatalog`.
- EMR on EC2 clusters with Runtime role don't support multi-catalog hierarchy.
- EMR on EC2 clusters enabled with Amazon Lake Formation don't support multi-catalog hierarchy.

## Configure Spark

You can configure Spark on Amazon EMR with configuration classifications. For more information about configuration classifications, see Configure applications.

Configuration classifications for Spark on Amazon EMR include the following:

- **`spark`** – Sets the `maximizeResourceAllocation` property to true or false. When true, Amazon EMR automatically configures `spark-defaults` properties based on cluster hardware configuration. For more information, see Using `maximizeResourceAllocation`.
- **`spark-defaults`** – Sets values in the `spark-defaults.conf` file. For more information, see Spark configuration in the Spark documentation.
- **`spark-env`** – Sets values in the `spark-env.sh` file. For more information, see Environment variables in the Spark documentation.
- **`spark-hive-site`** – Sets values in the `hive-site.xml` for Spark.

- **`spark-log4j`** – (Amazon EMR releases 6.7.x and lower) Sets values in the `log4j.properties` file. For more information, see the log4j.properties.template file on Github.
- **`spark-log4j2`** – (Amazon EMR releases 6.8.0 and higher) Sets values in the `log4j2.properties` file. For more information, see the log4j2.properties.template file on Github.
- **`spark-metrics`** – Sets values in the `metrics.properties` file. For settings and more information, see the metrics.properties.template file on Github, and Metrics in Spark documentation.

> **Note**
>
> If you're migrating Spark workloads to Amazon EMR from another platform, we recommend that you test your workloads with the Spark defaults set by Amazon EMR before you add custom configurations. Most customers see improved performance with our default settings.

**Topics**

- Spark defaults set by Amazon EMR
- Configuring Spark garbage collection on Amazon EMR 6.1.0
- Using maximizeResourceAllocation
- Configuring node decommissioning behavior
- Spark ThriftServer environment variable
- Changing Spark default settings
- Migrating from Apache Log4j 1.x to Log4j 2.x

## Spark defaults set by Amazon EMR

The following table shows how Amazon EMR sets default values in `spark-defaults` that affect applications.

### Spark defaults set by Amazon EMR

| Setting | Description | Default value |
| --- | --- | --- |
| `spark.executor.memory` | The amount of memory to use per executor process. For example: 1g, 2g. | This setting is determined by the core and task instance types in the cluster. |
| `spark.executor.cores` | The number of cores to use on each executor. | This setting is determined by the core and task instance types in the cluster. |
| `spark.dynamicAllocation.enabled` | When true, use dynamic resource allocation to scale the number of executors registered with an application up and down based on the workload. | `true` (with Amazon EMR 4.4.0 and higher)<br>**Note**<br>Spark shuffle service is automatically configured by Amazon EMR . |
| `spark.sql.hive.advancedPartitionPredicatePushdown.enabled` | When true, advanced partition predicate pushdown into Hive metastore is enabled. | `true` |
| `spark.sql.hive.stringLikePartitionPredicatePushdown.enabled` | Pushes down `startsWith` , `contains`, and `endsWith` filters into Hive metastore.<br>**Note**<br>Glue doesn't support predicate push down for `startsWith` , `contains`, or `endsWith`. If you are | `true` |

| Setting | Description | Default value |
| --- | --- | --- |
| | using Glue metastore and you encounter errors due to the predicate pushdown for these functions, set this configuration to `false`. | |

## Configuring Spark garbage collection on Amazon EMR 6.1.0

Setting custom garbage collection configurations with `spark.driver.extraJavaOptions` and `spark.executor.extraJavaOptions` results in driver or executor launch failure with Amazon EMR 6.1 because of a conflicting garbage collection configuration with Amazon EMR 6.1.0. For Amazon EMR 6.1.0, the default garbage collection configuration is set through `spark.driver.defaultJavaOptions` and `spark.executor.defaultJavaOptions`. This configuration applies only to Amazon EMR 6.1.0. JVM options not related to garbage collection, such as those for configuring logging (`-verbose:class`), can still be set through `extraJavaOptions`. For more information, see Spark application properties.

## Using `maximizeResourceAllocation`

To configure your executors to use the maximum resources possible on each node in a cluster, set `maximizeResourceAllocation` to `true` in your `spark` configuration classification. The `maximizeResourceAllocation` is specific to Amazon EMR . When you enable `maximizeResourceAllocation`, Amazon EMR calculates the maximum compute and memory resources available for an executor on an instance in the core instance group. It then sets the corresponding `spark-defaults` settings based on the calculated maximum values.

Amazon EMR calculates the maximum compute and memory resources available for an executor based on an instance type from the core instance fleet. Since each instance fleet can have different instance types and sizes within a fleet, the executor configuration that Amazon EMR uses might not be the best for your clusters, so we don't recommend using the default settings when using maximum resource allocation. Configure custom settings for your instance fleet clusters.

> **Note**
>
> You should not use the `maximizeResourceAllocation` option on clusters with other distributed applications like HBase. Amazon EMR uses custom YARN configurations for distributed applications, which can conflict with `maximizeResourceAllocation` and cause Spark applications to fail.

The following is an example Spark configuration classification with `maximizeResourceAllocation` set to `true`.

```
[
  {
    "Classification": "spark",
    "Properties": {
      "maximizeResourceAllocation": "true"
    }
  }
]
```

**Settings configured in `spark-defaults` when `maximizeResourceAllocation` is enabled**

| Setting | Description | Value |
|---|---|---|
| spark.default.parallelism | Default number of partition s in RDDs returned by transformations like join, reduceByKey, and parallelize when not set by user. | 2X number of CPU cores available to YARN containers. |
| spark.driver.memory | Amount of memory to use for the driver process, i.e. where SparkContext is initialized. (for example, 1g, 2g). | Setting is configured based on the instance types in the cluster. However, because the Spark driver application may run on either the primary or one of the core instances (for example, in YARN client and cluster modes, respectiv ely), this is set based on the |

| Setting | Description | Value |
| --- | --- | --- |
| | | smaller of the instance types in these two instance groups. |
| spark.executor.memory | Amount of memory to use per executor process. (for example, 1g, 2g) | Setting is configured based on the core and task instance types in the cluster. |
| spark.executor.cores | The number of cores to use on each executor. | Setting is configured based on the core and task instance types in the cluster. |
| spark.executor.instances | The number of executors. | Setting is configured based on the core and task instance types in the cluster. Set unless `spark.dynamicAllocation.enabled` explicitly set to true at the same time. |

## Configuring node decommissioning behavior

With Amazon EMR release 5.9.0 and higher, Spark on Amazon EMR includes a set of features to help ensure that Spark gracefully handles node termination because of a manual resize or an automatic scaling policy request. Amazon EMR implements a deny listing mechanism in Spark that is built on top of the YARN decommissioning mechanism. This mechanism helps ensure that no new tasks are scheduled on a node that is decommissioning, while at the same time allowing tasks that are already running to complete. In addition, there are features to help recover Spark jobs faster if shuffle blocks are lost when a node terminates. The recomputation process is triggered sooner and optimized to recompute faster with fewer stage retries, and jobs can be prevented from failing because of fetch failures that are caused by missing shuffle blocks.

**Important**

The `spark.decommissioning.timeout.threshold` setting was added in Amazon EMR release 5.11.0 to improve Spark resiliency when you use Spot instances. In earlier releases, when a node uses a Spot instance, and the instance is terminated because of bid price, Spark may not be able to handle the termination gracefully. Jobs may fail, and shuffle

recomputations could take a significant amount of time. For this reason, we recommend using release 5.11.0 or later if you use Spot instances.

### Spark node decommissioning settings

| Setting | Description | Default value |
| --- | --- | --- |
| `spark.blacklist.decommissioning.enabled` | When set to `true`, Spark deny lists nodes that are in the `decommissioning` state in YARN. Spark does not schedule new tasks on executors running on that node. Tasks already running are allowed to complete. | `true` |
| `spark.blacklist.decommissioning.timeout` | The amount of time that a node in the `decommissioning` state is deny listed. By default, this value is set to one hour, which is also the default for `yarn.resourcemanager.decommissioning.timeout`. To ensure that a node is deny listed for its entire decommissioning period, set this value equal to or greater than `yarn.resourcemanager.decommissioning.timeout`. After the decommissioning timeout expires, the node transitions to a `decommissioned` state, and Amazon EMR can terminate the node's | `1h` |

| Setting | Description | Default value |
| --- | --- | --- |
| | EC2 instance. If any tasks are still running after the timeout expires, they are lost or killed and rescheduled on executors running on other nodes. | |
| `spark.decommissioning.timeout.threshold` | Available in Amazon EMR release 5.11.0 or later. Specified in seconds. When a node transitions to the decommissioning state, if the host will decommission within a time period equal to or less than this value, Amazon EMR not only deny lists the node, but also cleans up the host state (as specified by `spark.resourceManager.cleanupExpiredHost` ) without waiting for the node to transition to a decommissioned state. This allows Spark to handle Spot instance terminations better because Spot instances decommission within a 20-second timeout regardless of the value of `yarn.resourcemager.decommissioning.timeout` , which may not provide other nodes enough time to read shuffle files. | `20s` |

| Setting | Description | Default value |
| --- | --- | --- |
| spark.resourceManager.cleanupExpiredHost | When set to true, Spark unregisters all cached data and shuffle blocks that are stored in executors on nodes that are in the decommissioned state. This speeds up the recovery process. | true |
| spark.stage.attempt.ignoreOnDecommissionFetchFailure | When set to true, helps prevent Spark from failing stages and eventually failing the job because of too many failed fetches from decommissioned nodes. Failed fetches of shuffle blocks from a node in the decommissioned state will not count toward the maximum number of consecutive fetch failures. | true |

## Spark ThriftServer environment variable

Spark sets the Hive Thrift Server Port environment variable, HIVE_SERVER2_THRIFT_PORT, to 10001.

## Changing Spark default settings

You change the defaults in spark-defaults.conf using the spark-defaults configuration classification or the maximizeResourceAllocation setting in the spark configuration classification.

The following procedures show how to modify settings using the CLI or console.

**To create a cluster with spark.executor.memory set to 2g using the CLI**

- Create a cluster with Spark installed and `spark.executor.memory` set to 2g, using the following command, which references a file, `myConfig.json` stored in Amazon S3.

```
aws emr create-cluster --release-label emr-7.9.0 --applications Name=Spark \
--instance-type m5.xlarge --instance-count 2 --service-role EMR_DefaultRole_V2
 --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole --configurations https://
s3.amazonaws.com/amzn-s3-demo-bucket/myfolder/myConfig.json
```

> **Note**
>
> Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

`myConfig.json`:

```
[
    {
      "Classification": "spark-defaults",
      "Properties": {
        "spark.executor.memory": "2G"
      }
    }
  ]
```

**To create a cluster with spark.executor.memory set to 2g using the console**

1. Navigate to the new Amazon EMR console and select **Switch to the old console** from the side navigation. For more information on what to expect when you switch to the old console, see Using the old console.
2. Choose **Create cluster**, **Go to advanced options**.
3. Choose **Spark**.
4. Under **Edit software settings**, leave **Enter configuration** selected and enter the following configuration:

```
classification=spark-defaults,properties=[spark.executor.memory=2G]
```

5. Select other options, choose  and then choose **Create cluster**.

### To set maximizeResourceAllocation

- Create a cluster with Spark installed and `maximizeResourceAllocation` set to true using the Amazon CLI, referencing a file, `myConfig.json`, stored in Amazon S3.

```
aws emr create-cluster --release-label emr-7.9.0 --applications Name=Spark \
--instance-type m5.xlarge --instance-count 2 --service-role EMR_DefaultRole_V2
 --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole --configurations https://
s3.amazonaws.com/amzn-s3-demo-bucket/myfolder/myConfig.json
```

> **Note**
>
> Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

`myConfig.json`:

```
[
  {
    "Classification": "spark",
    "Properties": {
      "maximizeResourceAllocation": "true"
    }
  }
]
```

> **Note**
>
> With Amazon EMR version 5.21.0 and later, you can override cluster configurations and specify additional configuration classifications for each instance group in a running cluster. You do this by using the Amazon EMR console, the Amazon Command Line Interface

(Amazon CLI), or the Amazon SDK. For more information, see Supplying a Configuration for an Instance Group in a Running Cluster.

## Migrating from Apache Log4j 1.x to Log4j 2.x

Apache Spark releases 3.2.x and earlier use the legacy Apache Log4j 1.x and the `log4j.properties` file to configure Log4j in Spark processes. Apache Spark releases 3.3.0 and later use Apache Log4j 2.x and the `log4j2.properties` file to configure Log4j in Spark processes.

If you have configured Apache Spark Log4j using an Amazon EMR release lower than 6.8.0, then you must remove the legacy `spark-log4j` configuration classification and migrate to the `spark-log4j2` configuration classification and key format before you can upgrade to Amazon EMR 6.8.0 or later. The legacy `spark-log4j` classification causes cluster creation to fail with a `ValidationException` error in Amazon EMR releases 6.8.0 and later. You will not be charged for a failure related to the Log4j incompatibility, but you must remove the defunct `spark-log4j` configuration classification to continue.

For more information about migrating from Apache Log4j 1.x to Log4j 2.x, see the Apache Log4j Migration Guide and the Spark Log4j 2 Template on Github.

**Note**

With Amazon EMR , Apache Spark uses a `log4j2.properties` file rather than the .xml file described in the Apache Log4j Migration Guide. Also, we do not recommend using the Log4j 1.x bridge method to convert to Log4j 2.x.

# Optimize Spark performance

Amazon EMR provides multiple performance optimization features for Spark. This topic explains each optimization feature in detail.

For more information on how to set Spark configuration, see Configure Spark.

# Adaptive query execution

Adaptive query execution is a framework for reoptimizing query plans based on runtime statistics. Starting with Amazon EMR 5.30.0, the following adaptive query execution optimizations from Apache Spark 3 are available on Apache Amazon EMR Runtime for Spark 2.

- Adaptive join conversion
- Adaptive coalescing of shuffle partitions

### Adaptive Join Conversion

Adaptive join conversion improves query performance by converting sort-merge-join operations to broadcast-hash-joins operations based on runtime sizes of query stages. Broadcast-hash-joins tend to perform better when one side of the join is small enough to efficiently broadcast its output across all executors, thereby avoiding the need to shuffle exchange and sort both sides of the join. Adaptive join conversion broadens the range of cases when Spark automatically performs broadcast-hash-joins.

This feature is enabled by default. It can be disabled by setting `spark.sql.adaptive.enabled` to `false`, which also disables the adaptive query execution framework. Spark decides to convert a sort-merge-join to a broadcast-hash-join when the runtime size statistic of one of the join sides does not exceed `spark.sql.autoBroadcastJoinThreshold`, which defaults to 10,485,760 bytes (10 MiB).

### Adaptive Coalescing of Shuffle Partitions

Adaptive coalescing of shuffle partitions improves query performance by coalescing small contiguous shuffle partitions to avoid the overhead of having too many small tasks. This allows you to configure a higher number of initial shuffle partitions upfront that then gets reduced at runtime to a targeted size, improving the chances of having more evenly distributed shuffle partitions.

This feature is enabled by default unless `spark.sql.shuffle.partitions` is explicitly set. It can be enabled by setting `spark.sql.adaptive.coalescePartitions.enabled` to `true`. Both the initial number of shuffle partitions and target partition size can be tuned using the `spark.sql.adaptive.coalescePartitions.minPartitionNum` and `spark.sql.adaptive.advisoryPartitionSizeInBytes` properties respectively. See the following table for further details on the related Spark properties for this feature.

**Spark adaptive coalesce partition properties**

| Property | Default value | Description |
| --- | --- | --- |
| `spark.sql.adaptive.coalescePartitions.enabled` | true, unless `spark.sql.shuffle.partitions` is explicitly set | When true and spark.sql.adaptive.enabled is true, Spark coalesces contiguous shuffle partitions according to the target size (specified by `spark.sql.adaptive.advisoryPartitionSizeInBytes` ), to avoid too many small tasks. |
| `spark.sql.adaptive.advisoryPartitionSizeInBytes` | 64MB | The advisory size in bytes of the shuffle partition when coalescing. This configuration only has an effect when `spark.sql.adaptive.enabled` and `spark.sql.adaptive.coalescePartitions.enabled` are both `true`. |
| `spark.sql.adaptive.coalescePartitions.minPartitionNum` | 25 | The minimum number of shuffle partitions after coalescing. This configuration only has an effect when `spark.sql.adaptive.enabled` and `spark.sql.adaptive.coalescePartitions.enabled` are both `true`. |
| `spark.sql.adaptive.coalescePartitions.initialPartitionNum` | 1000 | The initial number of shuffle partitions before coalescing. This configuration only has an effect when `spark.sql` |

| Property | Default value | Description |
| --- | --- | --- |
| | | `.adaptive.enabled` and `spark.sql.adaptive.coalescePartitions.enabled` are both `true`. |

## Dynamic partition pruning

Dynamic partition pruning improves job performance by more accurately selecting the specific partitions within a table that need to be read and processed for a specific query. By reducing the amount of data read and processed, significant time is saved in job execution. With Amazon EMR 5.26.0, this feature is enabled by default. With Amazon EMR 5.24.0 and 5.25.0, you can enable this feature by setting the Spark property `spark.sql.dynamicPartitionPruning.enabled` from within Spark or when creating clusters.

**Spark dynamic partition pruning partition properties**

| Property | Default Value | Description |
| --- | --- | --- |
| `spark.sql.dynamicPartitionPruning.enabled` | `true` | When true, enable dynamic partition pruning. |
| `spark.sql.optimizer.dynamicPartitionPruning.enforceBroadcastReuse` | `true` | When `true`, Spark performs a defensive check before query execution to ensure that reuse of broadcast exchanges in dynamic pruning filters is not broken by later preparation rules, such as user-defined columnar rules. When reuse is broken and this config is `true`, Spark removes the affected dynamic pruning filters to guard against performance and correctness issues. Correctness issues |

| Property | Default Value | Description |
| --- | --- | --- |
| | | may arise when the broadcast exchange of the dynamic pruning filter yields different , inconsistent results from the broadcast exchange of the corresponding join operation . Setting this configuration to `false` should be done with caution; it allows working around scenarios, such as when reuse is broken by user-defined columnar rules. When Adaptive Query Execution is enabled, broadcast reuse is always enforced. |

This optimization improves upon the existing capabilities of Spark 2.4.2, which only supports pushing down static predicates that can be resolved at plan time.

The following are examples of static predicate push down in Spark 2.4.2.

```
partition_col = 5

partition_col IN (1,3,5)

partition_col between 1 and 3

partition_col = 1 + 3
```

Dynamic partition pruning allows the Spark engine to dynamically infer at runtime which partitions need to be read and which can be safely eliminated. For example, the following query involves two tables: the `store_sales` table that contains all of the total sales for all stores and is partitioned by region, and the `store_regions` table that contains a mapping of regions for each country. The tables contain data about stores distributed around the globe, but we are only querying data for North America.

```
select ss.quarter, ss.region, ss.store, ss.total_sales
from store_sales ss, store_regions sr
where ss.region = sr.region and sr.country = 'North America'
```

Without dynamic partition pruning, this query will read all regions before filtering out the subset of regions that match the results of the subquery. With dynamic partition pruning, this query will read and process only the partitions for the regions returned in the subquery. This saves time and resources by reading less data from storage and processing less records.

## Flattening scalar subqueries

This optimization improves the performance of queries that have scalar subqueries over the same table. With Amazon EMR 5.26.0, this feature is enabled by default. With Amazon EMR 5.24.0 and 5.25.0, you can enable it by setting the Spark property `spark.sql.optimizer.flattenScalarSubqueriesWithAggregates.enabled` from within Spark or when creating clusters. When this property is set to true, the query optimizer flattens aggregate scalar subqueries that use the same relation if possible. The scalar subqueries are flattened by pushing any predicates present in the subquery into the aggregate functions and then performing one aggregation, with all the aggregate functions, per relation.

Following is a sample of a query that will benefit from this optimization.

```
select (select avg(age) from students                    /* Subquery 1 */
                where age between 5 and 10) as group1,
       (select avg(age) from students                    /* Subquery 2 */
                where age between 10 and 15) as group2,
       (select avg(age) from students                    /* Subquery 3 */
                where age between 15 and 20) as group3
```

The optimization rewrites the previous query as:

```
select c1 as group1, c2 as group2, c3 as group3
from (select avg (if(age between 5 and 10, age, null)) as c1,
             avg (if(age between 10 and 15, age, null)) as c2,
             avg (if(age between 15 and 20, age, null)) as c3 from students);
```

Notice that the rewritten query reads the student table only once, and the predicates of the three subqueries are pushed into the `avg` function.

# DISTINCT before INTERSECT

This optimization optimizes joins when using INTERSECT. With Amazon EMR 5.26.0, this feature is enabled by default. With Amazon EMR 5.24.0 and 5.25.0, you can enable it by setting the Spark property `spark.sql.optimizer.distinctBeforeIntersect.enabled` from within Spark or when creating clusters. Queries using INTERSECT are automatically converted to use a left-semi join. When this property is set to true, the query optimizer pushes the DISTINCT operator to the children of INTERSECT if it detects that the DISTINCT operator can make the left-semi join a BroadcastHashJoin instead of a SortMergeJoin.

Following is a sample of a query that will benefit from this optimization.

```
(select item.brand brand from store_sales, item
     where store_sales.item_id = item.item_id)
intersect
(select item.brand cs_brand from catalog_sales, item
     where catalog_sales.item_id = item.item_id)
```

Without enabling this property `spark.sql.optimizer.distinctBeforeIntersect.enabled`, the query will be rewritten as follows.

```
select distinct brand from
  (select item.brand brand from store_sales, item
     where store_sales.item_id = item.item_id)
left semi join
   (select item.brand cs_brand from catalog_sales, item
     where catalog_sales.item_id = item.item_id)
 on brand <=> cs_brand
```

When you enable this property `spark.sql.optimizer.distinctBeforeIntersect.enabled`, the query will be rewritten as follows.

```
select brand from
  (select distinct item.brand brand from store_sales, item
     where store_sales.item_id = item.item_id)
left semi join
   (select distinct item.brand cs_brand from catalog_sales, item
     where catalog_sales.item_id = item.item_id)
```

```
 on brand <=> cs_brand
```

## Bloom filter join

This optimization can improve the performance of some joins by pre-filtering one side of a join using a Bloom filter generated from the values from the other side of the join. With Amazon EMR 5.26.0, this feature is enabled by default. With Amazon EMR 5.25.0, you can enable this feature by setting the Spark property `spark.sql.bloomFilterJoin.enabled` to `true` from within Spark or when creating clusters.

The following is an example query that can benefit from a Bloom filter.

```
select count(*)
from sales, item
where sales.item_id = item.id
and item.category in (1, 10, 16)
```

When this feature is enabled, the Bloom filter is built from all item ids whose category is in the set of categories being queried. While scanning the sales table, the Bloom filter is used to determine which sales are for items that are definitely not in the set defined by the Bloom filter. Thus these identified sales can be filtered out as early as possible.

## Optimized join reorder

This optimization can improve query performance by reordering joins involving tables with filters. With Amazon EMR 5.26.0, this feature is enabled by default. With Amazon EMR 5.25.0, you can enable this feature by setting the Spark configuration parameter `spark.sql.optimizer.sizeBasedJoinReorder.enabled` to true. The default behavior in Spark is to join tables from left to right, as listed in the query. This strategy can miss opportunities to execute smaller joins with filters first, in order to benefit more expensive joins later.

The example query below reports all returned items from all stores in a country. Without optimized join reorder, Spark joins the two large tables `store_sales` and `store_returns` first, and then joins them with `store` and eventually with `item`.

```
select ss.item_value, sr.return_date, s.name, i.desc,
from store_sales ss, store_returns sr, store s, item i
where ss.id = sr.id and ss.store_id = s.id and ss.item_id = i.id
and s.country = 'USA'
```

With optimized join reorder, Spark joins `store_sales` with `store` first since `store` has a filter and is smaller than `store_returns` and `broadcastable`. Then Spark joins with `store_returns` and finally with `item`. If `item` had a filter and was broadcastable, it would also qualify for reorder, resulting in `store_sales` joining with `store`, then `item`, and eventually with `store_returns`.

## Spark Result Fragment Caching

Amazon EMR 6.6.0 and higher include the optional Spark Result Fragment Caching feature that automatically caches result fragments. These result fragments are parts of results from subtrees of queries that are stored in an Amazon S3 bucket of your choosing. The stored query result fragments are reused on subsequent query executions, resulting in faster queries.

Result Fragment Caching analyzes your Spark queries, and caches eligible result fragments in your specified S3 location. On subsequent query runs, the usable query result fragments are automatically detected and fetched from S3. Result Fragment Caching differs from Result Set Caching, where subsequent queries have to exactly match the original query to return results from the cache. When used for queries that repeatedly target a static subset of your data, result fragment caching speeds performance significantly.

Consider the following query, which counts orders until the year 2022:

```
select
    l_returnflag,
    l_linestatus,
    count(*) as count_order
from
    lineitem
where
    l_shipdate <= current_date
    and year(l_shipdate) == '2022'
group by
    l_returnflag,
    l_linestatus
```

As time progresses, this query needs to run every day to report the total sales for the year. Without Result Fragment Caching, the results for all days of the year will need to be recomputed every day. The query will get slower over time and will be slowest at the end of the year, when all 365 days of results will need to be recomputed.

When you activate Result Fragment Caching, you use results for the all previous days of the year from the cache. Each day, the feature must recompute only one day of results. After the feature computes the result fragment, the feature caches the fragment. As a result, cache-enabled query times are fast and they remain constant for each subsequent query.

## Enabling Spark Result Fragment Caching

To enable Spark Result Fragment Caching, perform the following steps:

1. Create a cache bucket in Amazon S3 and authorize read/write access for EMRFS. For more information, see Authorizing access to EMRFS data in Amazon S3.
2. Set Amazon EMR Spark config to enable the feature.

```
spark.subResultCache.enabled = true
spark.subResultCache.fs.root.path = s3://&example-s3-bucket;/cache_dir/
```

3. Enable S3 lifecycle management for the bucket to automatically clean cache files.
4. Optionally, configure the reductionRationThreshold and maxBufferSize properties to further tune the feature.

```
spark.sql.subResultCache.reductionRatioThreshold
spark.sql.subResultCache.maxBufferSize
```

## Considerations when using Result Fragment Caching

The cost savings when you use results already cached in Amazon S3 rather than recompute them grows with the number of times the same cached results can be used. Queries with large table scans followed by filters or hash aggregations that reduce the result size by factor of at least 8 (that is, a ratio of at least 8:1 in input size:results) will benefit most from this feature. The greater the reduction ratio between the input and the results, the greater is the cost benefit. Queries with smaller reduction ratios, but that contain expensive computation steps between the table scan and filter or aggregations will also benefit, as long as the cost to produce the results is greater than the cost to fetch them from Amazon S3. By default, Result Fragment Caching takes effect only when it detects that a reduction ratio will be at least 8:1.

When your queries repeatedly reuse cached results, the benefits of this feature are greatest. Rolling and incremental window queries are good examples. For instance, a 30-day rolling window query

that has already run for 29 days, would only need to pull 1/30th of the target data from its original input source and would use cached result fragments for the 29 previous days. An incremental window query would benefit even more, since the start of the window remains fixed: on every invocation of the query, a smaller percentage of the processing will require reading from the input source.

The following are additional considerations when using Result Fragment Caching:

- Queries that don't target the same data with the same query fragments will have a low cache hit rate, hence will not benefit from this feature.
- Queries with low reduction ratios that do not contain expensive computation steps will result in cached results that are roughly as expensive to read as they were to initially process.
- The first query will always demonstrate a minor regression due to the cost of writing to cache.
- The Result Fragment Caching feature works exclusively with Parquet files. Other file formats are not supported.
- The Result Fragment Caching feature buffers will only attempt to cache scans with file split sizes of 128 MB or larger. With the default Spark configuration, Result Fragment Caching will be disabled if the scan size (total size across all files being scanned) divided by the number of executor cores is less than 128 MB. When any of the Spark configurations listed below are set, the file split size will be:

  ```
  min(maxPartitionBytes, max(openCostInBytes, scan size / minPartitionNum))
  ```

  - spark.sql.leafNodeDefaultParallelism (default value is spark.default.parallelism)
  - spark.sql.files.minPartitionNum (default value is spark.sql.leafNodeDefaultParallelism)
  - spark.sql.files.openCostInBytes
  - spark.sql.files.maxPartitionBytes
- The Result Fragment Caching feature caches at the RDD partition granularity. The previously described reduction ratio that defaults to 8:1 is assessed per RDD partition. Workloads with per-RDD reduction ratios both greater and less than 8:1 may see smaller performance benefits than workloads with per-RDD reduction ratios that are consistently less than 8:1.
- The Result Fragment Caching feature uses a 16MB write buffer by default for each RDD partition being cached.If more than 16mb will be cached per RDD partition, the cost of determining that a write is not possible may result in a performance regression.

- While, by default, Result Fragment Caching will not attempt to cache RDD partition results with a reduction ratio smaller than 8:1 and will cap its write buffer at 16MB, both of these values are tunable through the following configurations:

```
spark.sql.subResultCache.reductionRatioThreshold (default: 8.0)
spark.sql.subResultCache.maxBufferSize (default: 16MB, max: 64MB)
```

- Multiple clusters using the same Amazon EMR release can share the same cache location. To ensure result correctness, Result Fragment Caching will not use cache results written by different releases of Amazon EMR .
- Result Fragment Caching will be disabled automatically for Spark Streaming use cases or when RecordServer, Apache Ranger, or Amazon Lake Formation is used.
- The result fragment cache read/writes use EMRFS / S3A and Amazon S3 buckets. CSE (only with EMRFS)/ SSE S3/ SSE KMS encryption are supported. For context, S3A provides a Hadoop implementation to enable a cluster to read and write data to and from Amazon S3. Note that support for S3A is available with EMR-7.4.0 and higher.

# Use the Nvidia RAPIDS Accelerator for Apache Spark

With Amazon EMR release 6.2.0 and later, you can use the RAPIDS Accelerator for Apache Spark plugin by Nvidia to accelerate Spark using EC2 graphics processing unit (GPU) instance types. RAPIDS Accelerator will GPU-accelerate your Apache Spark 3.0 data science pipelines without code changes, and speed up data processing and model training while substantially lowering infrastructure costs.

The following sections guide you through configuring your EMR cluster to use the Spark-RAPIDS Plugin for Spark.

## Choose instance types

To use the Nvidia Spark-RAPIDS plugin for Spark, the core and task instance groups must use EC2 GPU instance types that meet the Hardware requirements of Spark-RAPIDS. To view a complete list of Amazon EMR supported GPU instance types, please see Supported instance types in the *Amazon EMR Management Guide*. Instance type for the primary instance group can be either GPU or non-GPU types, but ARM instance types aren't supported.

# Set up application configurations for your cluster

### 1. Enable Amazon EMR to install the plugins on your new cluster

To install plugins, supply the following configuration when you create your cluster:

```
{
 "Classification":"spark",
 "Properties":{
  "enableSparkRapids":"true"
 }
}
```

### 2. Configure YARN to use GPU

For details on how to use GPU on YARN, see Using GPU on YARN in Apache Hadoop documentation. The following examples show sample YARN configurations for Amazon EMR 6.x and 7.x releases:

Amazon EMR 7.x

#### Example YARN configuration for Amazon EMR 7.x

```
{
    "Classification":"yarn-site",
    "Properties":{
        "yarn.nodemanager.resource-plugins":"yarn.io/gpu",
        "yarn.resource-types":"yarn.io/gpu",
        "yarn.nodemanager.resource-plugins.gpu.allowed-gpu-devices":"auto",
        "yarn.nodemanager.resource-plugins.gpu.path-to-discovery-executables":"/usr/
bin",
        "yarn.nodemanager.linux-container-executor.cgroups.mount":"true",
        "yarn.nodemanager.linux-container-executor.cgroups.mount-path":"/spark-
rapids-cgroup",
        "yarn.nodemanager.linux-container-executor.cgroups.hierarchy":"yarn",
        "yarn.nodemanager.container-
executor.class":"org.apache.hadoop.yarn.server.nodemanager.LinuxContainerExecutor"
    }
},{
    "Classification":"container-executor",
    "Properties":{

    },
```

```
    "Configurations":[
        {
            "Classification":"gpu",
            "Properties":{
                "module.enabled":"true"
            }
        },
        {
            "Classification":"cgroups",
            "Properties":{
                "root":"/spark-rapids-cgroup",
                "yarn-hierarchy":"yarn"
            }
        }
    ]
}
```

Amazon EMR 6.x

**Example YARN configuration for Amazon EMR 6.x**

```
{
    "Classification":"yarn-site",
    "Properties":{
        "yarn.nodemanager.resource-plugins":"yarn.io/gpu",
        "yarn.resource-types":"yarn.io/gpu",
        "yarn.nodemanager.resource-plugins.gpu.allowed-gpu-devices":"auto",
        "yarn.nodemanager.resource-plugins.gpu.path-to-discovery-executables":"/usr/
bin",
        "yarn.nodemanager.linux-container-executor.cgroups.mount":"true",
        "yarn.nodemanager.linux-container-executor.cgroups.mount-path":"/sys/fs/
cgroup",
        "yarn.nodemanager.linux-container-executor.cgroups.hierarchy":"yarn",
        "yarn.nodemanager.container-
executor.class":"org.apache.hadoop.yarn.server.nodemanager.LinuxContainerExecutor"
    }
},{
    "Classification":"container-executor",
    "Properties":{

    },
    "Configurations":[
        {
            "Classification":"gpu",
```

```
            "Properties":{
                "module.enabled":"true"
            }
        },
        {
            "Classification":"cgroups",
            "Properties":{
                "root":"/sys/fs/cgroup",
                "yarn-hierarchy":"yarn"
            }
        }
    ]
}
```

### 3. Configure Spark to use RAPIDS

Here are the required configurations to enable Spark to use RAPIDS plugin:

```
{
 "Classification":"spark-defaults",
 "Properties":{
  "spark.plugins":"com.nvidia.spark.SQLPlugin",
  "spark.executor.resource.gpu.discoveryScript":"/usr/lib/spark/scripts/gpu/
getGpusResources.sh",
  "spark.executor.extraLibraryPath":"/usr/local/cuda/targets/x86_64-linux/lib:/usr/
local/cuda/extras/CUPTI/lib64:/usr/local/cuda/compat/lib:/usr/local/cuda/lib:/usr/
local/cuda/lib64:/usr/lib/hadoop/lib/native:/usr/lib/hadoop-lzo/lib/native:/docker/usr/
lib/hadoop/lib/native:/docker/usr/lib/hadoop-lzo/lib/native"
 }
}
```

XGBoost4J-Spark library in XGBoost documentation is also available when the Spark RAPIDS plugin is enabled on your cluster. You can use the following configuration to integrate XGBoost with you Spark job:

```
{
 "Classification":"spark-defaults",
 "Properties":{
  "spark.submit.pyFiles":"/usr/lib/spark/jars/xgboost4j-spark_3.0-1.4.2-0.3.0.jar"
 }
}
```

For additional Spark configurations that you can use to tune a GPU-accelerated EMR cluster, please refer to the Rapids Accelerator for Apache Spark tuning guide in Nvidia.github.io documentation.

**4. Configure YARN Capacity Scheduler**

`DominantResourceCalculator` must be configured to enable GPU scheduling and isolation. For more information, please refer to Using GPU on YARN in Apache Hadoop documentation.

```
{
 "Classification":"capacity-scheduler",
 "Properties":{
  "yarn.scheduler.capacity.resource-
calculator":"org.apache.hadoop.yarn.util.resource.DominantResourceCalculator"
 }
}
```

**5. Create a JSON file to include your configurations**

You can create a JSON file that contains your configuration to use the RAPIDS plugin for your Spark cluster. You supply the file later when you launch your cluster.

You can store the file locally or on S3. For more information of how to supply application configurations for your clusters, see Configure applications.

Use the following sample files as templates to build your own configurations.

Amazon EMR 7.x

**Example `my-configurations.json` file for Amazon EMR 7.x**

```
[
    {
        "Classification":"spark",
        "Properties":{
            "enableSparkRapids":"true"
        }
    },
    {
        "Classification":"yarn-site",
        "Properties":{
            "yarn.nodemanager.resource-plugins":"yarn.io/gpu",
            "yarn.resource-types":"yarn.io/gpu",
            "yarn.nodemanager.resource-plugins.gpu.allowed-gpu-devices":"auto",
```

```
            "yarn.nodemanager.resource-plugins.gpu.path-to-discovery-executables":"/
usr/bin",
            "yarn.nodemanager.linux-container-executor.cgroups.mount":"true",
            "yarn.nodemanager.linux-container-executor.cgroups.mount-path":"/spark-
rapids-cgroup",
            "yarn.nodemanager.linux-container-executor.cgroups.hierarchy":"yarn",
            "yarn.nodemanager.container-
executor.class":"org.apache.hadoop.yarn.server.nodemanager.LinuxContainerExecutor"
        }
    },
    {
        "Classification":"container-executor",
        "Properties":{

        },
        "Configurations":[
            {
                "Classification":"gpu",
                "Properties":{
                    "module.enabled":"true"
                }
            },
            {
                "Classification":"cgroups",
                "Properties":{
                    "root":"/spark-rapids-cgroup",
                    "yarn-hierarchy":"yarn"
                }
            }
        ]
    },
    {
        "Classification":"spark-defaults",
        "Properties":{
            "spark.plugins":"com.nvidia.spark.SQLPlugin",
            "spark.executor.resource.gpu.discoveryScript":"/usr/lib/spark/scripts/
gpu/getGpusResources.sh",
            "spark.executor.extraLibraryPath":"/usr/local/cuda/targets/x86_64-
linux/lib:/usr/local/cuda/extras/CUPTI/lib64:/usr/local/cuda/compat/lib:/usr/local/
cuda/lib:/usr/local/cuda/lib64:/usr/lib/hadoop/lib/native:/usr/lib/hadoop-lzo/lib/
native:/docker/usr/lib/hadoop/lib/native:/docker/usr/lib/hadoop-lzo/lib/native",
            "spark.submit.pyFiles":"/usr/lib/spark/jars/xgboost4j-
spark_3.0-1.4.2-0.3.0.jar",
            "spark.rapids.sql.concurrentGpuTasks":"1",
```

```
            "spark.executor.resource.gpu.amount":"1",
            "spark.executor.cores":"2",
            "spark.task.cpus":"1",
            "spark.task.resource.gpu.amount":"0.5",
            "spark.rapids.memory.pinnedPool.size":"0",
            "spark.executor.memoryOverhead":"2G",
            "spark.locality.wait":"0s",
            "spark.sql.shuffle.partitions":"200",
            "spark.sql.files.maxPartitionBytes":"512m"
        }
    },
    {
        "Classification":"capacity-scheduler",
        "Properties":{
            "yarn.scheduler.capacity.resource-
calculator":"org.apache.hadoop.yarn.util.resource.DominantResourceCalculator"
        }
    }
]
```

Amazon EMR 6.x

**Example `my-configurations.json` file for Amazon EMR 6.x**

```
[
    {
        "Classification":"spark",
        "Properties":{
            "enableSparkRapids":"true"
        }
    },
    {
        "Classification":"yarn-site",
        "Properties":{
            "yarn.nodemanager.resource-plugins":"yarn.io/gpu",

spark_3.0-1.4.2-0.3.0.jar",
            "spark.rapids.sql.concurrentGpuTasks":"1",
            "spark.executor.resource.gpu.amount":"1",
            "spark.executor.cores":"2",
            "spark.task.cpus":"1",
            "spark.task.resource.gpu.amount":"0.5",
            "spark.rapids.memory.pinnedPool.size":"0",
            "spark.executor.memoryOverhead":"2G",
```

```
            "spark.locality.wait":"0s",
            "spark.sql.shuffle.partitions":"200",
            "spark.sql.files.maxPartitionBytes":"512m"
        }
    },
    {
        "Classification":"capacity-scheduler",
        "Properties":{
            "yarn.scheduler.capacity.resource-
calculator":"org.apache.hadoop.yarn.util.resource.DominantResourceCalculator"
        }
    }
]
```

## Add a bootstrap action for your cluster

For more information on how to supply bootstrap action scripts when you create your cluster, see Bootstrap action basics in the *Amazon EMR Management Guide*.

The following example scripts show how to make a bootstrap action file for Amazon EMR 6.x and 7.x:

Amazon EMR 7.x

**Example `my-bootstrap-action.sh` file for Amazon EMR 7.x**

To use YARN to manage GPU resources with Amazon EMR 7.x releases, you must manually mount CGroup v1 on your cluster. You can do this with as bootstrap action script, as shown in this example.

```
#!/bin/bash
set -ex

sudo mkdir -p /spark-rapids-cgroup/devices
sudo mount -t cgroup -o devices cgroupv1-devices /spark-rapids-cgroup/devices
sudo chmod a+rwx -R /spark-rapids-cgroup
```

Amazon EMR 6.x

**Example `my-bootstrap-action.sh` file for Amazon EMR 6.x**

For Amazon EMR 6.x releases, you must open CGroup permissions to YARN on your cluster. You can do this with a bootstrap action script, as shown in this example.

```
#!/bin/bash
set -ex

sudo chmod a+rwx -R /sys/fs/cgroup/cpu,cpuacct
sudo chmod a+rwx -R /sys/fs/cgroup/devices
```

### Launch your cluster

The last step is to launch your cluster with the cluster configurations mentioned above. Here's an example command to launch a cluster from the Amazon EMR CLI:

```
 aws emr create-cluster \
--release-label emr-7.9.0 \
--applications Name=Hadoop Name=Spark \
--service-role EMR_DefaultRole_V2 \
--ec2-attributes KeyName=my-key-pair,InstanceProfile=EMR_EC2_DefaultRole \
--instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.4xlarge \

                  InstanceGroupType=CORE,InstanceCount=1,InstanceType=g4dn.2xlarge \

                  InstanceGroupType=TASK,InstanceCount=1,InstanceType=g4dn.2xlarge \
--configurations file:///my-configurations.json \
--bootstrap-actions Name='My Spark Rapids Bootstrap action',Path=s3://amzn-s3-demo-
bucket/my-bootstrap-action.sh
```

## Access the Spark shell

The Spark shell is based on the Scala REPL (Read-Eval-Print-Loop). It allows you to create Spark programs interactively and submit work to the framework. You can access the Spark shell by connecting to the primary node with SSH and invoking `spark-shell`. For more information about connecting to the primary node, see Connect to the primary node using SSH in the *Amazon EMR Management Guide*. The following examples use Apache HTTP Server access logs stored in Amazon S3.

> **Note**
>
> The bucket in these examples is available to clients that can access US East (N. Virginia).

By default, the Spark shell creates its own SparkContext object called `sc`. You can use this context if it is required within the REPL. sqlContext is also available in the shell and it is a HiveContext.

**Example Use the Spark shell to count the occurrences of a string in a file stored in Amazon S3**

This example uses `sc` to read a text file that's stored in Amazon S3.

```
scala> sc
res0: org.apache.spark.SparkContext = org.apache.spark.SparkContext@404721db

scala> val textFile = sc.textFile("s3://elasticmapreduce/samples/hive-ads/tables/
impressions/dt=2009-04-13-08-05/ec2-0-51-75-39.amazon.com-2009-04-13-08-05.log")
```

Spark creates the textFile and associated data structure. Next, the example counts the number of lines in the log file with the string "cartoonnetwork.com":

```
scala> val linesWithCartoonNetwork = textFile.filter(line =>
 line.contains("cartoonnetwork.com")).count()
linesWithCartoonNetwork: org.apache.spark.rdd.RDD[String] = MapPartitionsRDD[2] at
 filter at <console>:23
<snip>
<Spark program runs>
scala> linesWithCartoonNetwork
res2: Long = 9
```

**Example Use the Python-based Spark shell to count the occurrences of a string in a file stored in Amazon S3**

Spark also includes a Python-based shell, `pyspark`, that you can use to prototype Spark programs written in Python. Just as with `spark-shell`, invoke `pyspark` on the primary node; it also has the same SparkContext object.

```
>>> sc
<pyspark.context.SparkContext object at 0x7fe7e659fa50>
>>> textfile = sc.textFile("s3://elasticmapreduce/samples/hive-ads/tables/impressions/
dt=2009-04-13-08-05/ec2-0-51-75-39.amazon.com-2009-04-13-08-05.log")
```

Spark creates the textFile and associated data structure. Next, the example counts the number of lines in the log file with the string "cartoonnetwork.com".

```
>>> linesWithCartoonNetwork = textfile.filter(lambda line: "cartoonnetwork.com" in
 line).count()
15/06/04 17:12:22 INFO lzo.GPLNativeCodeLoader: Loaded native gpl library from the
 embedded binaries
15/06/04 17:12:22 INFO lzo.LzoCodec: Successfully loaded & initialized native-lzo
 library [hadoop-lzo rev EXAMPLE]
15/06/04 17:12:23 INFO fs.EmrFileSystem: Consistency disabled, using
 com.amazon.ws.emr.hadoop.fs.s3n.S3NativeFileSystem as filesystem implementation
<snip>
<Spark program continues>
>>> linesWithCartoonNetwork
9
```

# Use Amazon SageMaker Spark for machine learning

When using Amazon EMR release 5.11.0 and later, the `aws-sagemaker-spark-sdk` component is installed along with Spark. This component installs Amazon SageMaker Spark and associated dependencies for Spark integration with Amazon SageMaker. You can use Amazon SageMaker Spark to construct Spark machine learning (ML) pipelines using Amazon SageMaker stages. For more information, see the Amazon SageMaker Spark README on GitHub and Using Apache Spark with Amazon SageMaker in the *Amazon SageMaker Developer Guide*.

# Write a Spark application

Spark applications can be written in Scala, Java, or Python. There are several examples of Spark applications located on Spark examples topic in the Apache Spark documentation. The Estimating Pi example is shown below in the three natively supported applications. You can also view complete examples in `$SPARK_HOME/examples` and at GitHub. For more information about how to build JARs for Spark, see the Quick start topic in the Apache Spark documentation.

## Scala

To avoid Scala compatibility issues, we suggest you use Spark dependencies for the correct Scala version when you compile a Spark application for an Amazon EMR cluster. The Scala version you should use depends on the version of Spark installed on your cluster. For example, Amazon EMR release 5.30.1 uses Spark 2.4.5, which is built with Scala 2.11. If your cluster uses Amazon EMR

release 5.30.1, use Spark dependencies for Scala 2.11. For more information about the Scala versions used by Spark, see the Apache Spark documentation.

```
package org.apache.spark.examples
import scala.math.random
import org.apache.spark._

/** Computes an approximation to pi */
object SparkPi {
  def main(args: Array[String]) {
    val conf = new SparkConf().setAppName("Spark Pi")
    val spark = new SparkContext(conf)
    val slices = if (args.length > 0) args(0).toInt else 2
    val n = math.min(100000L * slices, Int.MaxValue).toInt // avoid overflow
    val count = spark.parallelize(1 until n, slices).map { i =>
      val x = random * 2 - 1
      val y = random * 2 - 1
      if (x*x + y*y < 1) 1 else 0
    }.reduce(_ + _)
    println("Pi is roughly " + 4.0 * count / n)
    spark.stop()
  }
}
```

## Java

```
package org.apache.spark.examples;

import org.apache.spark.SparkConf;
import org.apache.spark.api.java.JavaRDD;
import org.apache.spark.api.java.JavaSparkContext;
import org.apache.spark.api.java.function.Function;
import org.apache.spark.api.java.function.Function2;

import java.util.ArrayList;
import java.util.List;

/**
 * Computes an approximation to pi
 * Usage: JavaSparkPi [slices]
 */
public final class JavaSparkPi {
```

```
  public static void main(String[] args) throws Exception {
    SparkConf sparkConf = new SparkConf().setAppName("JavaSparkPi");
    JavaSparkContext jsc = new JavaSparkContext(sparkConf);

    int slices = (args.length == 1) ? Integer.parseInt(args[0]) : 2;
    int n = 100000 * slices;
    List<Integer> l = new ArrayList<Integer>(n);
    for (int i = 0; i < n; i++) {
      l.add(i);
    }

    JavaRDD<Integer> dataSet = jsc.parallelize(l, slices);

    int count = dataSet.map(new Function<Integer, Integer>() {
      @Override
      public Integer call(Integer integer) {
        double x = Math.random() * 2 - 1;
        double y = Math.random() * 2 - 1;
        return (x * x + y * y < 1) ? 1 : 0;
      }
    }).reduce(new Function2<Integer, Integer, Integer>() {
      @Override
      public Integer call(Integer integer, Integer integer2) {
        return integer + integer2;
      }
    });

    System.out.println("Pi is roughly " + 4.0 * count / n);

    jsc.stop();
  }
}
```

## Python

```
import argparse
import logging
from operator import add
from random import random

from pyspark.sql import SparkSession
```

```
logger = logging.getLogger(__name__)
logging.basicConfig(level=logging.INFO, format="%(levelname)s: %(message)s")

def calculate_pi(partitions, output_uri):
    """
    Calculates pi by testing a large number of random numbers against a unit circle
    inscribed inside a square. The trials are partitioned so they can be run in
    parallel on cluster instances.

    :param partitions: The number of partitions to use for the calculation.
    :param output_uri: The URI where the output is written, typically an Amazon S3
                       bucket, such as 's3://example-bucket/pi-calc'.
    """

    def calculate_hit(_):
        x = random() * 2 - 1
        y = random() * 2 - 1
        return 1 if x**2 + y**2 < 1 else 0

    tries = 100000 * partitions
    logger.info(
        "Calculating pi with a total of %s tries in %s partitions.", tries, partitions
    )
    with SparkSession.builder.appName("My PyPi").getOrCreate() as spark:
        hits = (
            spark.sparkContext.parallelize(range(tries), partitions)
            .map(calculate_hit)
            .reduce(add)
        )
        pi = 4.0 * hits / tries
        logger.info("%s tries and %s hits gives pi estimate of %s.", tries, hits, pi)
        if output_uri is not None:
            df = spark.createDataFrame([(tries, hits, pi)], ["tries", "hits", "pi"])
            df.write.mode("overwrite").json(output_uri)

if __name__ == "__main__":
    parser = argparse.ArgumentParser()
    parser.add_argument(
        "--partitions",
        default=2,
        type=int,
        help="The number of parallel partitions to use when calculating pi.",
```

```
    )
    parser.add_argument(
        "--output_uri", help="The URI where output is saved, typically an S3 bucket."
    )
    args = parser.parse_args()

    calculate_pi(args.partitions, args.output_uri)
```

# Improve Spark performance with Amazon S3

Amazon EMR offers features to help optimize performance when using Spark to query, read and write data saved in Amazon S3.

S3 Select can improve query performance for CSV and JSON files in some applications by "pushing down" processing to Amazon S3.

The EMRFS S3-optimized committer is an alternative to the OutputCommitter class, which uses the multipart uploads feature of EMRFS to improve performance when writing Parquet files to Amazon S3 using Spark, DataFrames, and Datasets.

**Topics**

- Use S3 Select with Spark to improve query performance
- Use the EMRFS S3-optimized committer
- Use the EMRFS S3-optimized commit protocol
- Retry Amazon S3 requests with EMRFS

## Use S3 Select with Spark to improve query performance

> **Important**
>
> Amazon S3 Select is no longer available to new customers. Existing customers of Amazon S3 Select can continue to use the feature as usual. Learn more

With Amazon EMR release 5.17.0 and later, you can use S3 Select with Spark on Amazon EMR . *S3 Select* allows applications to retrieve only a subset of data from an object. For Amazon EMR , the

computational work of filtering large data sets for processing is "pushed down" from the cluster to Amazon S3, which can improve performance in some applications and reduces the amount of data transferred between Amazon EMR and Amazon S3.

S3 Select is supported with CSV and JSON files using `s3selectCSV` and `s3selectJSON` values to specify the data format. For more information and examples, see Specify S3 Select in your code.

## Is S3 Select right for my application?

We recommend that you benchmark your applications with and without S3 Select to see if using it may be suitable for your application.

Use the following guidelines to determine if your application is a candidate for using S3 Select:

- Your query filters out more than half of the original data set.
- Your network connection between Amazon S3 and the Amazon EMR cluster has good transfer speed and available bandwidth. Amazon S3 does not compress HTTP responses, so the response size is likely to increase for compressed input files.

## Considerations and limitations

- Amazon S3 server-side encryption with customer-provided encryption keys (SSE-C) and client-side encryption are not supported.
- The `AllowQuotedRecordDelimiters` property is not supported. If this property is specified, the query fails.
- Only CSV and JSON files in UTF-8 format are supported. Multi-line CSVs are not supported.
- Only uncompressed or gzip files are supported.
- Spark CSV and JSON options such as `nanValue`, `positiveInf`, `negativeInf`, and options related to corrupt records (for example, failfast and dropmalformed mode) are not supported.
- Using commas (,) within decimals is not supported. For example, `10,000` is not supported and `10000` is.
- Comment characters in the last line are not supported.
- Empty lines at the end of a file are not processed.
- The following filters are not pushed down to Amazon S3:
  - Aggregate functions such as `COUNT()` and `SUM()`.
  - Filters that `CAST()` an attribute. For example, `CAST(stringColumn as INT) = 1`.

- Filters with an attribute that is an object or is complex. For example, `intArray[1] = 1`, `objectColumn.objectNumber = 1`.
- Filters for which the value is not a literal value. For example, `intColumn1 = intColumn2`
- Only S3 Select supported data types are supported with the documented limitations.

## Specify S3 Select in your code

The following examples demonstrate how to specify S3 Select for CSV using Scala, SQL, R, and PySpark. You can use S3 Select for JSON in the same way. For a listing of options, their default values, and limitations, see Options.

PySpark

```
spark
  .read
  .format("s3selectCSV") // "s3selectJson" for Json
  .schema(...) // optional, but recommended
  .options(...) // optional
  .load("s3://path/to/my/datafiles")
```

R

```
read.df("s3://path/to/my/datafiles", "s3selectCSV", schema, header = "true",
 delimiter = "\t")
```

Scala

```
spark
  .read
  .format("s3selectCSV") // "s3selectJson" for Json
  .schema(...) // optional, but recommended
  .options(...) // optional. Examples:
  // .options(Map("quote" -> "\'", "header" -> "true")) or
  // .option("quote", "\'").option("header", "true")
  .load("s3://path/to/my/datafiles")
```

SQL

```
CREATE TEMPORARY VIEW MyView (number INT, name STRING) USING s3selectCSV OPTIONS
 (path "s3://path/to/my/datafiles", header "true", delimiter "\t")
```

### Options

The following options are available when using `s3selectCSV` and `s3selectJSON`. If not specified, default values are used.

### Options with S3selectCSV

| Option | Default | Usage |
|---|---|---|
| `compression` | `"none"` | Indicates whether compressi on is used. `"gzip"` is the only setting supported besides `"none"`. |
| `delimiter` | `","` | Specifies the field delimiter. |
| `quote` | `'\"'` | Specifies the quote character . Specifying an empty string is not supported and results in a malformed XML error. |
| `escape` | `'\\'` | Specifies the escape character . |
| `header` | `"false"` | `"false"` specifies that there is no header. `"true"` specifies that a header is in the first line. Only headers in the first line are supported, and empty lines before a header are not supported. |
| comment | `"#"` | Specifies the comment character. The comment |

| Option | Default | Usage |
| --- | --- | --- |
| | | indicator cannot be disabled. In other words, a value of `\u0000` is not supported. |
| `nullValue` | `""` | |

**Options with S3selectJSON**

| Option | Default | Usage |
| --- | --- | --- |
| `compression` | `"none"` | Indicates whether compressi on is used. `"gzip"` is the only setting supported besides `"none"`. |
| `multiline` | "false" | `"false"` specifies that the JSON is in S3 Select `LINES` format, meaning that each line in the input data contains a single JSON object. `"true"` specifies that the JSON is in S3 Select `DOCUMENT` format, meaning that a JSON object can span multiple lines in the input data. |

## Use the EMRFS S3-optimized committer

The EMRFS S3-optimized committer is an alternative OutputCommitter implementation that is optimized for writing files to Amazon S3 when using EMRFS. The EMRFS S3-optimized committer improves application performance by avoiding list and rename operations done in Amazon S3 during job and task commit phases. The committer is available with Amazon EMR release 5.19.0 and later, and is enabled by default with Amazon EMR 5.20.0 and later. The committer is used for Spark jobs that use Spark, DataFrames, or Datasets. Starting with Amazon EMR 6.4.0, this

committer can be used for all common formats including parquet, ORC, and text-based formats (including CSV and JSON). For releases prior to Amazon EMR 6.4.0, only the Parquet format is supported. There are circumstances under which the committer is not used. For more information, see Requirements for the EMRFS S3-optimized committer.

**Topics**

- Requirements for the EMRFS S3-optimized committer
- The EMRFS S3-optimized committer and multipart uploads
- Job tuning considerations
- Enable the EMRFS S3-optimized committer for Amazon EMR 5.19.0

## Requirements for the EMRFS S3-optimized committer

The EMRFS S3-optimized committer is used when the following conditions are met:

- You run Spark jobs that use Spark, DataFrames, or Datasets to write files to Amazon S3. Starting with Amazon EMR 6.4.0, this committer can be used for all common formats including parquet, ORC, and text-based formats (including CSV and JSON). For releases prior to Amazon EMR 6.4.0, only the Parquet format is supported.
- Multipart uploads are enabled in Amazon EMR . This is the default. For more information, see The EMRFS S3-optimized committer and multipart uploads.
- Spark's built-in file format support is used. The built-in file format support is used in the following circumstances:
  - For Hive metastore tables, when `spark.sql.hive.convertMetastoreParquet` is set to `true` for Parquet tables, or `spark.sql.hive.convertMetastoreOrc` is set to `true` for Orc tables with Amazon EMR 6.4.0 or above. These are the default settings.
  - When jobs write to file format data sources or tables—for example, the target table is created with the `USING parquet` clause.
  - When jobs write to non-partitioned Hive metastore Parquet tables. Spark's built-in Parquet support does not support partitioned Hive tables, which is a known limitation. For more information, see Hive metastore Parquet table conversion in the Apache Spark, DataFrames and Datasets Guide.
- Spark job operations that write to a default partition location—for example, `${table_location}/k1=v1/k2=v2/`—use the committer. The committer is not used if a job

operation writes to a custom partition location—for example, if a custom partition location is set using the `ALTER TABLE SQL` command.

- The following values for Spark must be used:
  - The `spark.sql.parquet.fs.optimized.committer.optimization-enabled` property must be set to `true`. This is the default setting with Amazon EMR 5.20.0 and later. With Amazon EMR 5.19.0, the default value is `false`. For information about configuring this value, see Enable the EMRFS S3-optimized committer for Amazon EMR 5.19.0.
  - If writing to non-partitioned Hive metastore tables, only Parquet and Orc file formats are supported. `spark.sql.hive.convertMetastoreParquet` must be set to `true` if writing to non-partitioned Parquet Hive metastore tables. `spark.sql.hive.convertMetastoreOrc` must be set to `true` if writing to non-partitioned Orc Hive metastore tables. These are the default settings.
  - `spark.sql.parquet.output.committer.class` must be set to `com.amazon.emr.committer.EmrOptimizedSparkSqlParquetOutputCommitter`. This is the default setting.
  - `spark.sql.sources.commitProtocolClass` must be set to `org.apache.spark.sql.execution.datasources.SQLEmrOptimizedCommitProtocol` or `org.apache.spark.sql.execution.datasources.SQLHadoopMapReduceCommitProtocol`. `org.apache.spark.sql.execution.datasources.SQLEmrOptimizedCommitProtocol` is the default setting for the Amazon EMR 5.x series version 5.30.0 and higher, and for the Amazon EMR 6.x series version 6.2.0 and higher. `org.apache.spark.sql.execution.datasources.SQLHadoopMapReduceCommitProtocol` is the default setting for previous Amazon EMR versions.
  - If Spark jobs overwrite partitioned Parquet datasets with dynamic partition columns, then the `partitionOverwriteMode` write option and `spark.sql.sources.partitionOverwriteMode` must be set to `static`. This is the default setting.

> **Note**
>
> The `partitionOverwriteMode` write option was introduced in Spark 2.4.0. For Spark version 2.3.2, included with Amazon EMR release 5.19.0, set the `spark.sql.sources.partitionOverwriteMode` property.

### Occasions when EMRFS S3-optimized committer is not used

Generally, the EMRFS S3-optimized committer isn't used in the following situations.

| Situation | Why the committer is not used |
| --- | --- |
| When you write to HDFS | The committer only supports writing to Amazon S3 using EMRFS. |
| When you use the S3A file system | The committer only supports EMRFS. |
| When you use MapReduce or Spark's RDD API | The committer only supports using SparkSQL, DataFrame, or Dataset APIs. |

The following Scala examples demonstrate some additional situations that prevent the EMRFS S3-optimized committer from being used in whole (the first example) and in part (the second example).

### Example – Dynamic partition overwrite mode

The following Scala example instructs Spark to use a different commit algorithm, which prevents use of the EMRFS S3-optimized committer altogether. The code sets the `partitionOverwriteMode` property to `dynamic` to overwrite only those partitions to which you're writing data. Then, dynamic partition columns are specified by `partitionBy`, and the write mode is set to `overwrite`.

```
val dataset = spark.range(0, 10)
  .withColumn("dt", expr("date_sub(current_date(), id)"))

dataset.write.mode("overwrite")
  .option("partitionOverwriteMode", "dynamic")
  .partitionBy("dt")
  .parquet("s3://amzn-s3-demo-bucket1/output")
```

You must configure all three settings to avoid using the EMRFS S3-optimized committer. When you do so, Spark executes a different commit algorithm that's specified in Spark's commit protocol. For Amazon EMR 5.x releases earlier than 5.30.0 and for Amazon EMR 6.x releases earlier than 6.2.0, the commit protocol uses Spark's staging directory, which is a temporary directory created under the output location that starts with `.spark-staging`. The algorithm sequentially renames

partition directories, which can negatively impact performance. For more information about Amazon EMR releases 5.30.0 and later and 6.2.0 and later, see Use the EMRFS S3-optimized commit protocol.

The algorithm in Spark 2.4.0 follows these steps:

1. Task attempts write their output to partition directories under Spark's staging directory—for example, `${outputLocation}/spark-staging-${jobID}/k1=v1/k2=v2/`.
2. For each partition written, the task attempt keeps track of relative partition paths—for example, `k1=v1/k2=v2`.
3. When a task completes successfully, it provides the driver with all relative partition paths that it tracked.
4. After all tasks complete, the job commit phase collects all the partition directories that successful task attempts wrote under Spark's staging directory. Spark sequentially renames each of these directories to its final output location using directory tree rename operations.
5. The staging directory is deleted before the job commit phase completes.

**Example – Custom partition location**

In this example, the Scala code inserts into two partitions. One partition has a custom partition location. The other partition uses the default partition location. The EMRFS S3-optimized committer is only used for writing task output to the partition that uses the default partition location.

```
val table = "dataset"
val location = "s3://bucket/table"

spark.sql(s"""
  CREATE TABLE $table (id bigint, dt date)
  USING PARQUET PARTITIONED BY (dt)
  LOCATION '$location'
""")

// Add a partition using a custom location
val customPartitionLocation = "s3://bucket/custom"
spark.sql(s"""
  ALTER TABLE $table ADD PARTITION (dt='2019-01-28')
  LOCATION '$customPartitionLocation'
```

```
""")

// Add another partition using default location
spark.sql(s"ALTER TABLE $table ADD PARTITION (dt='2019-01-29')")

def asDate(text: String) = lit(text).cast("date")

spark.range(0, 10)
  .withColumn("dt",
    when($"id" > 4, asDate("2019-01-28")).otherwise(asDate("2019-01-29")))
  .write.insertInto(table)
```

The Scala code creates the following Amazon S3 objects:

```
custom/part-00001-035a2a9c-4a09-4917-8819-e77134342402.c000.snappy.parquet
custom_$folder$
table/_SUCCESS
table/dt=2019-01-29/part-00000-035a2a9c-4a09-4917-8819-e77134342402.c000.snappy.parquet
table/dt=2019-01-29_$folder$
table_$folder$
```

When writing to partitions at custom locations, Spark uses a commit algorithm similar to the previous example, which is outlined below. As with the earlier example, the algorithm results in sequential renames, which may negatively impact performance.

1. When writing output to a partition at a custom location, tasks write to a file under Spark's staging directory, which is created under the final output location. The name of the file includes a random UUID to protect against file collisions. The task attempt keeps track of each file along with the final desired output path.
2. When a task completes successfully, it provides the driver with the files and their final desired output paths.
3. After all tasks complete, the job commit phase sequentially renames all files that were written for partitions at custom locations to their final output paths.
4. The staging directory is deleted before the job commit phase completes.

## The EMRFS S3-optimized committer and multipart uploads

To use the EMRFS S3-optimized committer, you must enable multipart uploads for Amazon EMR . Multipart uploads are enabled by default. You can re-enable it if required. For more information, see Configure multipart upload for Amazon S3 in the *Amazon EMR Management Guide*.

The EMRFS S3-optimized committer uses the transaction-like characteristics of multipart uploads to ensure files written by task attempts only appear in the job's output location upon task commit. By using multipart uploads in this way, the committer improves task commit performance over the default FileOutputCommitter algorithm version 2. When using the EMRFS S3-optimized committer, there are some key differences from traditional multipart upload behavior to consider:

- Multipart uploads are always performed regardless of the file size. This differs from the default behavior of EMRFS, where the `fs.s3n.multipart.uploads.split.size` property controls the file size at which multipart uploads are triggered.
- Multipart uploads are left in an incomplete state for a longer period of time until the task commits or aborts. This differs from the default behavior of EMRFS where a multipart upload completes when a task finishes writing a given file.

Because of these differences, if a Spark Executor JVM crashes or is killed while tasks are running and writing data to Amazon S3, incomplete multipart uploads are more likely to be left behind. For this reason, when you use the EMRFS S3-optimized committer, be sure to follow the best practices for managing failed multipart uploads. For more information, see Best practices for working with Amazon S3 buckets in the *Amazon EMR Management Guide*.

## Job tuning considerations

The EMRFS S3-optimized committer consumes a small amount of memory for each file written by a task attempt until the task gets committed or aborted. In most jobs, the amount of memory consumed is negligible. For jobs that have long-running tasks that write a large number of files, the memory that the committer consumes may be noticeable and require adjustments to the memory allocated for Spark executors. You can tune executor memory using the `spark.executor.memory` property. As a guideline, a single task writing 100,000 files would typically require an additional 100MB of memory. For more information, see Application properties in the Apache Spark Configuration documentation.

### Enable the EMRFS S3-optimized committer for Amazon EMR 5.19.0

If you are using Amazon EMR 5.19.0 , you can manually set the `spark.sql.parquet.fs.optimized.committer.optimization-enabled` property to `true` when you create a cluster or from within Spark if you are using Amazon EMR .

#### Enabling the EMRFS S3-optimized committer when creating a cluster

Use the `spark-defaults` configuration classification to set the `spark.sql.parquet.fs.optimized.committer.optimization-enabled` property to `true`. For more information, see Configure applications.

#### Enabling the EMRFS S3-optimized committer from Spark

You can set `spark.sql.parquet.fs.optimized.committer.optimization-enabled` to `true` by hard-coding it in a `SparkConf`, passing it as a `--conf` parameter in the Spark shell or `spark-submit` and `spark-sql` tools, or in `conf/spark-defaults.conf`. For more information, see Spark configuration in Apache Spark documentation.

The following example shows how to enable the committer while running a spark-sql command.

```
spark-sql \
  --conf spark.sql.parquet.fs.optimized.committer.optimization-enabled=true \
  -e "INSERT OVERWRITE TABLE target_table SELECT * FROM source_table;"
```

## Use the EMRFS S3-optimized commit protocol

The EMRFS S3-optimized commit protocol is an alternative FileCommitProtocol implementation that is optimized for writing files with Spark dynamic partition overwrite to Amazon S3 when using EMRFS. The protocol improves application performance by avoiding rename operations in Amazon S3 during the Spark dynamic partition overwrite job commit phase.

Note that the Use the EMRFS S3-optimized committer also improves performance by avoiding rename operations. However, it doesn't work for dynamic partition overwrite cases, while the commit protocol's improvements only target dynamic partition overwrite cases.

The commit protocol is available with Amazon EMR release 5.30.0 and later and 6.2.0 and later and is enabled by default. Amazon EMR added a parallelism improvement starting with release 5.31.0. The protocol is used for Spark jobs that use Spark, DataFrames, or Datasets. There are circumstances under which the commit protocol is not used. For more information, see Requirements for the EMRFS S3-optimized commit protocol.

**Topics**

- Requirements for the EMRFS S3-optimized commit protocol
- The EMRFS S3-optimized commit protocol and multipart uploads
- Job tuning considerations

## Requirements for the EMRFS S3-optimized commit protocol

The EMRFS S3-optimized commit protocol is used when the following conditions are met:

- You run Spark jobs that use Spark, DataFrames, or Datasets to overwrite partitioned tables.
- You run Spark jobs whose partition overwrite mode is `dynamic`.
- Multipart uploads are enabled in Amazon EMR . This is the default. For more information, see The EMRFS S3-optimized commit protocol and multipart uploads.
- The filesystem cache for EMRFS is enabled. This is the default. Check that the setting `fs.s3.impl.disable.cache` is set to `false`.
- Spark's built-in data source support is used. Built-in data source support is used in the following circumstances:
  - When jobs write to built-in data sources or tables.
  - When jobs write to the Hive metastore Parquet table. This happens when `spark.sql.hive.convertInsertingPartitionedTable` and `spark.sql.hive.convertMetastoreParquet` are both set to true. These are the default settings.
  - When jobs write to the Hive metastore ORC table. This happens when `spark.sql.hive.convertInsertingPartitionedTable` and `spark.sql.hive.convertMetastoreOrc` are both set to `true`. These are the default settings.
- Spark job operations that write to a default partition location – for example, `${table_location}/k1=v1/k2=v2/` – use the commit protocol. The protocol is not used if a job operation writes to a custom partition location – for example, if a custom partition location is set using the `ALTER TABLE SQL` command.
- The following values for Spark must be used:
  - `spark.sql.sources.commitProtocolClass` must be set to `org.apache.spark.sql.execution.datasources.SQLEmrOptimizedCommitProtocol`. This is the default setting for Amazon EMR releases 5.30.0 and higher, and 6.2.0 and higher.

- The `partitionOverwriteMode` write option or `spark.sql.sources.partitionOverwriteMode` must be set to `dynamic`. The default setting is `static`.

  > **Note**
  >
  > The `partitionOverwriteMode` write option was introduced in Spark 2.4.0. For Spark version 2.3.2, included with Amazon EMR release 5.19.0, set the `spark.sql.sources.partitionOverwriteMode` property.

- If Spark jobs overwrite to the Hive metastore Parquet table, `spark.sql.hive.convertMetastoreParquet`, `spark.sql.hive.convertInsertingPartitionedTable`, and `spark.sql.hive.convertMetastore.partitionOverwriteMode` must be set to `true`. There are the default settings.
- If Spark jobs overwrite to the Hive metastore ORC table, `spark.sql.hive.convertMetastoreOrc`, `spark.sql.hive.convertInsertingPartitionedTable`, and `spark.sql.hive.convertMetastore.partitionOverwriteMode` must be set to `true`. There are the default settings.

**Example – Dynamic partition overwrite mode**

In this Scala example, optimization is triggered. First, you set the `partitionOverwriteMode` property to `dynamic`. This only overwrites those partitions to which you're writing data. Then, you specify dynamic partition columns with `partitionBy` and set the write mode to `overwrite`.

```
val dataset = spark.range(0, 10)
  .withColumn("dt", expr("date_sub(current_date(), id)"))

dataset.write.mode("overwrite")                 // "overwrite" instead of "insert"
  .option("partitionOverwriteMode", "dynamic")  // "dynamic" instead of "static"
  .partitionBy("dt")                            // partitioned data instead of
 unpartitioned data
  .parquet("s3://amzn-s3-demo-bucket1/output")    // "s3://" to use Amazon EMR file
 system, instead of "s3a://" or "hdfs://"
```

### When the EMRFS S3-optimized commit protocol is not used

Generally, the EMRFS S3-optimized commit protocol works the same as open source default Spark commit protocol, `org.apache.spark.sql.execution.datasources.SQLHadoopMapReduceCommitProtocol`. Optimization won't occur in the following situations.

| Situation | Why the commit protocol is not used |
| --- | --- |
| When you write to HDFS | The commit protocol only supports writing to Amazon S3 using EMRFS. |
| When you use the S3A file system | The commit protocol only supports EMRFS. |
| When you use MapReduce or Spark's RDD API | The commit protocol only supports using SparkSQL, DataFrame, or Dataset APIs. |
| When the dynamic partition overwrite isn't triggered | The commit protocol only optimizes dynamic partition overwrite cases. For other cases, see Use the EMRFS S3-optimized committer. |

The following Scala examples demonstrate some additional situations that the EMRFS S3-optimized commit protocol delegates to `SQLHadoopMapReduceCommitProtocol`.

### Example – Dynamic partition overwrite mode with custom partition location

In this example, the Scala programs overwrites two partitions in dynamic partition overwrite mode. One partition has a custom partition location. The other partition uses the default partition location. The EMRFS S3-optimized commit protocol only improves the partition that uses the default partition location.

```
val table = "dataset"
val inputView = "tempView"
val location = "s3://bucket/table"

spark.sql(s"""
  CREATE TABLE $table (id bigint, dt date)
  USING PARQUET PARTITIONED BY (dt)
  LOCATION '$location'
```

```
""")

// Add a partition using a custom location
val customPartitionLocation = "s3://bucket/custom"
spark.sql(s"""
  ALTER TABLE $table ADD PARTITION (dt='2019-01-28')
  LOCATION '$customPartitionLocation'
""")

// Add another partition using default location
spark.sql(s"ALTER TABLE $table ADD PARTITION (dt='2019-01-29')")

def asDate(text: String) = lit(text).cast("date")

spark.range(0, 10)
  .withColumn("dt",
    when($"id" > 4, asDate("2019-01-28")).otherwise(asDate("2019-01-29")))
  .createTempView(inputView)

// Set partition overwrite mode to 'dynamic'
spark.sql(s"SET spark.sql.sources.partitionOverwriteMode=dynamic")

spark.sql(s"INSERT OVERWRITE TABLE $table SELECT * FROM $inputView")
```

The Scala code creates the following Amazon S3 objects:

```
custom/part-00001-035a2a9c-4a09-4917-8819-e77134342402.c000.snappy.parquet
custom_$folder$
table/_SUCCESS
table/dt=2019-01-29/part-00000-035a2a9c-4a09-4917-8819-e77134342402.c000.snappy.parquet
table/dt=2019-01-29_$folder$
table_$folder$
```

**Note**

Writing to custom partition locations in earlier Spark versions may result in data loss. In this example, partition `dt='2019-01-28'` would be lost. For more details, see SPARK-35106. This is fixed in Amazon EMR release 5.33.0 and later, excluding 6.0.x and 6.1.x.

When writing to partitions at custom locations, Spark uses a commit algorithm similar to the previous example, which is outlined below. As with the earlier example, the algorithm results in sequential renames, which may negatively impact performance.

The algorithm in Spark 2.4.0 follows these steps:

1. When writing output to a partition at a custom location, tasks write to a file under Spark's staging directory, which is created under the final output location. The name of the file includes a random UUID to protect against file collisions. The task attempt keeps track of each file along with the final desired output path.
2. When a task completes successfully, it provides the driver with the files and their final desired output paths.
3. After all tasks complete, the job commit phase sequentially renames all files that were written for partitions at custom locations to their final output paths.
4. The staging directory is deleted before the job commit phase completes.

## The EMRFS S3-optimized commit protocol and multipart uploads

To use make use of the optimization for dynamic partition overwrite in the EMRFS S3-optimized commit protocol, multipart uploads must be enabled in Amazon EMR . Multipart uploads are enabled by default. You can re-enable it if required. For more information, see Configure multipart upload for Amazon S3 in the *Amazon EMR Management Guide*.

During dynamic partition overwrite, the EMRFS S3-optimized commit protocol uses the transaction-like characteristics of multipart uploads to ensure files written by task attempts only appear in the job's output location upon job commit. By using multipart uploads in this way, the commit protocol improves job commit performance over the default `SQLHadoopMapReduceCommitProtocol`. When using the EMRFS S3-optimized commit protocol, there are some key differences from traditional multipart upload behavior to consider:

- Multipart uploads are always performed regardless of the file size. This differs from the default behavior of EMRFS, where the `fs.s3n.multipart.uploads.split.size` property controls the file size at which multipart uploads are triggered.
- Multipart uploads are left in an incomplete state for a longer period of time until the task commits or aborts. This differs from the default behavior of EMRFS where a multipart upload completes when a task finishes writing a given file.

Because of these differences, if a Spark Executor JVM crashes or is killed while tasks are running and writing data to Amazon S3, or a Spark Driver JVM crashes or is killed while a job is running, incomplete multipart uploads are more likely to be left behind. For this reason, when you use the EMRFS S3-optimized commit protocol, be sure to follow the best practices for managing failed multipart uploads. For more information, see Best practices for working with Amazon S3 buckets in the *Amazon EMR Management Guide*.

### Job tuning considerations

On Spark executors, the EMRFS S3-optimized commit protocol consumes a small amount of memory for each file written by a task attempt until the task gets committed or aborted. In most jobs, the amount of memory consumed is negligible.

On Spark drivers, the EMRFS S3-optimized commit protocol requires memory to store metadata info of each committed file until the job gets committed or aborted. In most jobs, default Spark driver memory setting is negligible.

For jobs that have long-running tasks that write a large number of files, the memory that the commit protocol consumes may be noticeable and require adjustments to the memory allocated for Spark, especially for Spark executors. You can tune memory using the `spark.driver.memory` property for Spark drivers, and the `spark.executor.memory` property for Spark executors. As a guideline, a single task writing 100,000 files would typically require an additional 100MB of memory. For more information, see Application properties in the Apache Spark Configuration documentation.

## Retry Amazon S3 requests with EMRFS

This topic provides information about the retry strategies that you can use when making requests to Amazon S3 with EMRFS. When your request rate increases, S3 tries to scale to support the new rate. During this process S3 can throttle requests and return a `503 Slow Down` error. To improve the success rate of your S3 requests, you can adjust your retry strategy by configuring properties in your `emrfs-site` configuration.

You can adjust your retry strategy in the following ways.

- Increase the maximum retry limit for the default exponential backoff retry strategy.
- Enable and configure the additive-increase/multiplicative-decrease (AIMD) retry strategy. AIMD is supported for Amazon EMR releases 6.4.0 and later.

## Use the default exponential backoff strategy

By default, EMRFS uses an exponential backoff strategy to retry Amazon S3 requests. The default EMRFS retry limit is 15. To avoid an S3 `503 Slow Down` error, you can increase the retry limit when you create a new cluster, on a running cluster, or at application runtime.

To increase the retry limit, you must change the value for `fs.s3.maxRetries` in your `emrfs-site` configuration. The following example configuration sets `fs.s3.maxRetries` to a custom value of 30.

```
[
    {
      "Classification": "emrfs-site",
      "Properties": {
        "fs.s3.maxRetries": "30"
      }
    }
]
```

For more information about working with configuration objects, see Configure applications.

## Use the AIMD retry strategy

With Amazon EMR release 6.4.0 and later, EMRFS supports an alternative retry strategy based on an additive-increase/multiplicative-decrease (AIMD) model. The AIMD retry strategy is especially useful when you work with large Amazon EMR clusters.

AIMD calculates a custom request rate using data about recent successful requests. This strategy decreases the number of throttled requests and the total attempts required per request.

To enable the AIMD retry strategy, you must set the `fs.s3.aimd.enabled` property to `true` in your `emrfs-site` configuration as in the following example.

```
[
    {
      "Classification": "emrfs-site",
      "Properties": {
        "fs.s3.aimd.enabled": "true"
      }
    }
```

```
]
```

For more information about working with configuration objects, see Configure applications.

## Advanced AIMD retry settings

You can configure the properties listed in the following table to refine retry behavior when you use the AIMD retry strategy. For most use cases, we recommend that you use the default values.

**Advanced AIMD retry strategy properties**

| Property | Default value | Description |
|---|---|---|
| `fs.s3.aimd.increaseIncrement` | 0.1 | Controls how quickly the request rate increases when consecutive requests are successful. |
| `fs.s3.aimd.reductionFactor` | 2 | Controls how quickly the request rate decreases when Amazon S3 returns a 503 response. The default factor of 2 cuts the request rate in half. |
| `fs.s3.aimd.minRate` | 0.1 | Sets the lower bound for the request rate when requests experience sustained throttling by S3. |
| `fs.s3.aimd.initialRate` | 5500 | Sets the initial request rate, which then changes according to the values that you specify for `fs.s3.aimd.increaseIncrement` and `fs.s3.aimd.reductionFactor` .<br><br>The initial rate is also used for GET requests, and scaled |

| Property | Default value | Description |
| --- | --- | --- |
| | | proportionally (3500/5500) for PUT requests. |
| `fs.s3.aimd.adjustWindow` | 2 | Controls how frequently the request rate is adjusted, measured in number of responses. |
| `fs.s3.aimd.maxAttempts` | 100 | Sets the maximum number of attempts to try a request. |

# Add a Spark step

You can use Amazon EMR steps to submit work to the Spark framework installed on an EMR cluster. For more information, see Steps in the Amazon EMR Management Guide. In the console and CLI, you do this using a Spark application step, which runs the `spark-submit` script as a step on your behalf. With the API, you use a step to invoke `spark-submit` using `command-runner.jar`.

For more information about submitting applications to Spark, see the Submitting applications topic in the Apache Spark documentation.

**To submit a Spark step using the console**

1. Open the Amazon EMR console at https://console.amazonaws.cn/emr.
2. In the **Cluster List**, choose the name of your cluster.
3. Scroll to the **Steps** section and expand it, then choose **Add step**.
4. In the **Add Step** dialog box:
   - For **Step type**, choose **Spark application**.
   - For **Name**, accept the default name (Spark application) or type a new name.
   - For **Deploy mode**, choose **Client** or **Cluster** mode. Client mode launches the driver program on the cluster's primary instance, while cluster mode launches your driver program on the cluster. For client mode, the driver's log output appears in the step logs, while for cluster

mode, the driver's log output appears in the logs for the first YARN container. For more information, see Cluster mode overview in the Apache Spark documentation.

- Specify the desired **Spark-submit options**. For more information about `spark-submit` options, see Launching applications with spark-submit.
- For **Application location**, specify the local or S3 URI path of the application.
- For **Arguments**, leave the field blank.
- For **Action on failure**, accept the default option (**Continue**).

5. Choose **Add**. The step appears in the console with a status of Pending.
6. The status of the step changes from **Pending** to **Running** to **Completed** as the step runs. To update the status, choose the **Refresh** icon above the **Actions** column.
7. The results of the step are located in the Amazon EMR console Cluster Details page next to your step under **Log Files** if you have logging configured. You can optionally find step information in the log bucket you configured when you launched the cluster.

**To submit work to Spark using the Amazon CLI**

Submit a step when you create the cluster or use the `aws emr add-steps` subcommand in an existing cluster.

1. Use `create-cluster` as shown in the following example.

> **Note**
>
> Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

```
aws emr create-cluster --name "Add Spark Step Cluster" --release-label emr-7.9.0 --
applications Name=Spark \
--ec2-attributes KeyName=myKey --instance-type m5.xlarge --instance-count 3 \
--steps Type=Spark,Name="Spark Program",ActionOnFailure=CONTINUE,Args=[--
class,org.apache.spark.examples.SparkPi,/usr/lib/spark/examples/jars/spark-
examples.jar,10] --use-default-roles
```

As an alternative, you can use `command-runner.jar` as shown in the following example.

```
aws emr create-cluster --name "Add Spark Step Cluster" --release-label emr-7.9.0 \
--applications Name=Spark --ec2-attributes KeyName=myKey --instance-type m5.xlarge
 --instance-count 3 \
--steps Type=CUSTOM_JAR,Name="Spark Program",Jar="command-
runner.jar",ActionOnFailure=CONTINUE,Args=[spark-example,SparkPi,10] --use-default-
roles
```

> **Note**
>
> Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

2. Alternatively, add steps to a cluster already running. Use `add-steps`.

```
aws emr add-steps --cluster-id j-2AXXXXXXGAPLF --steps
 Type=Spark,Name="Spark Program",ActionOnFailure=CONTINUE,Args=[--
class,org.apache.spark.examples.SparkPi,/usr/lib/spark/examples/jars/spark-
examples.jar,10]
```

As an alternative, you can use `command-runner.jar` as shown in the following example.

```
aws emr add-steps --cluster-id j-2AXXXXXXGAPLF --steps Type=CUSTOM_JAR,Name="Spark
 Program",Jar="command-runner.jar",ActionOnFailure=CONTINUE,Args=[spark-
example,SparkPi,10]
```

**To submit work to Spark using the SDK for Java**

1. The following example shows how to add a step to a cluster with Spark using Java.

```
AWSCredentials credentials = new BasicAWSCredentials(accessKey, secretKey);
AmazonElasticMapReduce emr = new AmazonElasticMapReduceClient(credentials);

StepFactory stepFactory = new StepFactory();
AmazonElasticMapReduceClient emr = new AmazonElasticMapReduceClient(credentials);
AddJobFlowStepsRequest req = new AddJobFlowStepsRequest();
req.withJobFlowId("j-1K48XXXXXXHCB");

List<StepConfig> stepConfigs = new ArrayList<StepConfig>();
```

```
HadoopJarStepConfig sparkStepConf = new HadoopJarStepConfig()
   .withJar("command-runner.jar")
   .withArgs("spark-submit","--executor-memory","1g","--
class","org.apache.spark.examples.SparkPi","/usr/lib/spark/examples/jars/spark-
examples.jar","10");

StepConfig sparkStep = new StepConfig()
   .withName("Spark Step")
   .withActionOnFailure("CONTINUE")
   .withHadoopJarStep(sparkStepConf);

stepConfigs.add(sparkStep);
req.withSteps(stepConfigs);
AddJobFlowStepsResult result = emr.addJobFlowSteps(req);
```

2. View the results of the step by examining the logs for the step. You can do this in the Amazon Web Services Management Console if you have enabled logging by choosing **Steps**, selecting your step, and then, for **Log files**, choosing either `stdout` or `stderr`. To see the logs available, choose **View Logs**.

## Overriding Spark default configuration settings

You may want to override Spark default configuration values on a per-application basis. You can do this when you submit applications using a step, which essentially passes options to `spark-submit`. For example, you may wish to change the memory allocated to an executor process by changing `spark.executor.memory`. You would supply the `--executor-memory` switch with an argument like the following:

```
spark-submit --executor-memory 1g --class org.apache.spark.examples.SparkPi /usr/lib/
spark/examples/jars/spark-examples.jar 10
```

Similarly, you can tune `--executor-cores` and `--driver-memory`. In a step, you would provide the following arguments to the step:

```
--executor-memory 1g --class org.apache.spark.examples.SparkPi /usr/lib/spark/examples/
jars/spark-examples.jar 10
```

You can also tune settings that may not have a built-in switch using the `--conf` option. For more information about other settings that are tunable, see the Dynamically loading Spark properties topic in the Apache Spark documentation.

# View Spark application history

You can view Spark, YARN application, and Tez UI details using the **Application user interfaces** tab of a cluster's detail page in the console. Amazon EMR application user interfaces (UI) make it easier for you to troubleshoot and analyze active jobs and job history.

For more information, see View application history in the *Amazon EMR Management Guide*.

# Access the Spark web UIs

You can view the Spark web UIs by following the procedures to create an SSH tunnel or create a proxy in the section called Connect to the cluster in the Amazon EMR Management Guide and then navigating to the YARN ResourceManager for your cluster. Choose the link under **Tracking UI** for your application. If your application is running, you see **ApplicationMaster**. This takes you to the application master's web UI at port 20888 wherever the driver is located. The driver may be located on the cluster's primary node if you run in YARN client mode. If you are running an application in YARN cluster mode, the driver is located in the ApplicationMaster for the application on the cluster. If your application has finished, you see **History**, which takes you to the Spark HistoryServer UI port number at 18080 of the EMR cluster's primary node. This is for applications that have already completed. You can also navigate to the Spark HistoryServer UI directly at http://*master-public-dns-name*:18080/.

With Amazon EMR release 5.25.0 and later, you can access Spark history server UI from the console without setting up a web proxy through an SSH connection. For more information, see View persistent application user interfaces.

# Using the Spark structured streaming Amazon Kinesis Data Streams connector

Amazon EMR releases 7.1.0 and higher include a spark structured streaming Amazon Kinesis Data Streams connector in the release image. With this connector, you can use Spark on Amazon EMR to process data that's stored in Amazon Kinesis Data Streams. The connector supports both consumer types of `GetRecords` (shared throughput) and `SubscribeToShard` (enhanced fan-out). This integration is based on the `spark-sql-kinesis-connector`. For details about how to get started using the connector, see the README.

The following example demonstrates how to use the connector to launch a Spark application with Amazon EMR

```
spark-submit my_kinesis_streaming_script.py
```

# Using Amazon Redshift integration for Apache Spark with Amazon EMR

With Amazon EMR release 6.4.0 and later, every release image includes a connector between Apache Spark and Amazon Redshift. With this connector, you can use Spark on Amazon EMR to process data stored in Amazon Redshift. For Amazon EMR releases 6.4.0 through 6.8.0, the integration is based on the `spark-redshift` open-source connector. For Amazon EMR releases 6.9.0 and later, the Amazon Redshift integration for Apache Spark has been migrated from the community version to a native integration.

**Topics**

- Launching a Spark application using the Amazon Redshift integration for Apache Spark
- Authenticating with Amazon Redshift integration for Apache Spark
- Reading and writing from and to Amazon Redshift
- Considerations and limitations when using the Spark connector

## Launching a Spark application using the Amazon Redshift integration for Apache Spark

For Amazon EMR releases 6.4 through 6.9, you must use the `--jars` or `--packages` option to specify which of the following JAR files you want to use. The `--jars` option specifies dependencies stored locally, in HDFS, or using HTTP/S. To see other file locations supported by the `--jars` option, see Advanced Dependency Management in the Spark documentation. The `--packages` option specifies dependencies stored in the public Maven repo.

- `spark-redshift.jar`
- `spark-avro.jar`
- `RedshiftJDBC.jar`
- `minimal-json.jar`

Amazon EMR releases 6.10.0 and higher don't require the `minimal-json.jar` dependency, and automatically install the other dependencies to each cluster by default. The following examples show how to launch a Spark application with the Amazon Redshift integration for Apache Spark.

Amazon EMR 6.10.0 +

The following example shows how to launch a Spark application with the `spark-redshift` connector with Amazon EMR releases 6.10 and higher.

```
spark-submit my_script.py
```

Amazon EMR 6.4.0 - 6.9.x

To launch a Spark application with the `spark-redshift` connector on Amazon EMR releases 6.4 through 6.9, you must use the `--jars` or `--packages` option, as the following example shows. Note that the paths listed with the `--jars` option are the default paths for the JAR files.

```
spark-submit \
  --jars /usr/share/aws/redshift/jdbc/RedshiftJDBC.jar,/usr/share/aws/redshift/
spark-redshift/lib/spark-redshift.jar,/usr/share/aws/redshift/spark-redshift/lib/
spark-avro.jar,/usr/share/aws/redshift/spark-redshift/lib/minimal-json.jar \
  my_script.py
```

# Authenticating with Amazon Redshift integration for Apache Spark

## Using Amazon Secrets Manager to retrieve credentials and connect to Amazon Redshift

The following code sample shows how you can use Amazon Secrets Manager to retrieve credentials to connect to an Amazon Redshift cluster with the PySpark interface for Apache Spark in Python.

```
from pyspark.sql import SQLContext
import boto3

sc = # existing SparkContext
sql_context = SQLContext(sc)

secretsmanager_client = boto3.client('secretsmanager')
secret_manager_response = secretsmanager_client.get_secret_value(
```

```
    SecretId='string',
    VersionId='string',
    VersionStage='string'
)
username = # get username from secret_manager_response
password = # get password from secret_manager_response
url = "jdbc:redshift://redshifthost:5439/database?user=" + username + "&password=" +
 password

# Read data from a table
df = sql_context.read \
    .format("io.github.spark_redshift_community.spark.redshift") \
    .option("url", url) \
    .option("dbtable", "my_table") \
    .option("tempdir", "s3://path/for/temp/data") \
    .load()
```

## Using IAM to retrieve credentials and connect to Amazon Redshift

You can use the Amazon Redshift-provided JDBC version 2 driver to connect to Amazon Redshift with the Spark connector. To use Amazon Identity and Access Management (IAM), configure your JDBC URL to use IAM authentication. To connect to a Redshift cluster from Amazon EMR, you must give your IAM role permission to retrieve temporary IAM credentials. Assign the following permissions to your IAM role so that it can retrieve credentials and run Amazon S3 operations.

- Redshift:GetClusterCredentials (for provisioned Amazon Redshift clusters)
- Redshift:DescribeClusters (for provisioned Amazon Redshift clusters)
- Redshift:GetWorkgroup (for Amazon Redshift Serverless workgroups)
- Redshift:GetCredentials (for Amazon Redshift Serverless workgroups)
- s3:GetBucket
- s3:GetBucketLocation
- s3:GetObject
- s3:PutObject
- s3:GetBucketLifecycleConfiguration

For more information about `GetClusterCredentials`, see Resource policies for `GetClusterCredentials`.

You also must make sure that Amazon Redshift can assume the IAM role during COPY and UNLOAD operations.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "redshift.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

The following example uses IAM authentication between Spark and Amazon Redshift:

```
from pyspark.sql import SQLContext
import boto3

sc = # existing SparkContext
sql_context = SQLContext(sc)

url = "jdbc:redshift:iam://redshift-host:redshift-port/db-name"
iam_role_arn = "arn:aws:iam::account-id:role/role-name"

# Read data from a table
df = sql_context.read \
    .format("io.github.spark_redshift_community.spark.redshift") \
    .option("url", url) \
    .option("aws_iam_role", iam_role_arn) \
    .option("dbtable", "my_table") \
    .option("tempdir", "s3a://path/for/temp/data") \
    .mode("error") \
    .load()
```

## Reading and writing from and to Amazon Redshift

The following code examples use PySpark to read and write sample data from and to an Amazon Redshift database with data source API and using SparkSQL.

### Data source API

Use PySpark to read and write sample data from and to an Amazon Redshift database with data source API.

```
import boto3
from pyspark.sql import SQLContext

sc = # existing SparkContext
sql_context = SQLContext(sc)

url = "jdbc:redshift:iam://redshifthost:5439/database"
aws_iam_role_arn = "arn:aws:iam::accountID:role/roleName"

df = sql_context.read \
    .format("io.github.spark_redshift_community.spark.redshift") \
    .option("url", url) \
    .option("dbtable", "tableName") \
    .option("tempdir", "s3://path/for/temp/data") \
    .option("aws_iam_role", "aws_iam_role_arn") \
    .load()

df.write \
    .format("io.github.spark_redshift_community.spark.redshift") \
    .option("url", url) \
    .option("dbtable", "tableName_copy") \
    .option("tempdir", "s3://path/for/temp/data") \
    .option("aws_iam_role", "aws_iam_role_arn") \
    .mode("error") \
    .save()
```

### SparkSQL

Use PySpark to read and write sample data from and to an Amazon Redshift database with SparkSQL.

```
import boto3
import json
import sys
import os
from pyspark.sql import SparkSession

spark = SparkSession \
```

```
    .builder \
    .enableHiveSupport() \
    .getOrCreate()

url = "jdbc:redshift:iam://redshifthost:5439/database"
aws_iam_role_arn = "arn:aws:iam::accountID:role/roleName"

bucket = "s3://path/for/temp/data"
tableName = "tableName" # Redshift table name

s = f"""CREATE TABLE IF NOT EXISTS {tableName} (country string, data string)
    USING io.github.spark_redshift_community.spark.redshift
    OPTIONS (dbtable '{tableName}', tempdir '{bucket}', url '{url}', aws_iam_role
 '{aws_iam_role_arn}' ); """

spark.sql(s)

columns = ["country" ,"data"]
data = [("test-country","test-data")]
df = spark.sparkContext.parallelize(data).toDF(columns)

# Insert data into table
df.write.insertInto(tableName, overwrite=False)
df = spark.sql(f"SELECT * FROM {tableName}")
df.show()
```

## Considerations and limitations when using the Spark connector

- We recommend that you turn on SSL for the JDBC connection from Spark on Amazon EMR to Amazon Redshift.
- We recommend that you manage the credentials for the Amazon Redshift cluster in Amazon Secrets Manager as a best practice. See Using Amazon Secrets Manager to retrieve credentials for connecting to Amazon Redshift for an example.
- We recommend that you pass an IAM role with the parameter `aws_iam_role` for the Amazon Redshift authentication parameter.
- The `tempdir` URI points to an Amazon S3 location. This temp directory isn't cleaned up automatically and therefore could add additional cost.
- Consider the following recommendations for Amazon Redshift:
  - We recommend that you block public access to the Amazon Redshift cluster.

- We recommend that you turn on Amazon Redshift audit logging.
- We recommend that you turn on Amazon Redshift at-rest encryption.

- Consider the following recommendations for Amazon S3:
  - We recommend that you block public access to Amazon S3 buckets.
  - We recommend that you use Amazon S3 server-side encryption to encrypt the Amazon S3 buckets used.
  - We recommend that you use Amazon S3 lifecycle policies to define the retention rules for the Amazon S3 bucket.
  - Amazon EMR always verifies code imported from open-source into the image. For security, we don't support the following authentication methods from Spark to Amazon S3:
    - Setting Amazon access keys in the `hadoop-env` configuration classification
    - Encoding Amazon access keys in the `tempdir` URI

For more information on using the connector and its supported parameters, see the following resources:

- Amazon Redshift integration for Apache Spark in the *Amazon Redshift Management Guide*
- The `spark-redshift` community repository on Github

## Spark release history

The following table lists the version of Spark included in each release version of Amazon EMR, along with the components installed with the application. For component versions in each release, see the Component Version section for your release in Amazon EMR 7.x release versions, Amazon EMR 6.x release versions, or Amazon EMR 5.x release versions.

> **Important**
>
> Apache Spark version 2.3.1, available beginning with Amazon EMR release 5.16.0, addresses CVE-2018-8024 and CVE-2018-1334. We recommend that you migrate earlier versions of Spark to Spark version 2.3.1 or later.

### Spark version information

| Amazon EMR Release label | Spark Version | Components installed with Spark |
|---|---|---|
| emr-7.9.0 | 3.5.5 | delta, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-7.8.0 | 3.5.4 | delta, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-7.7.0 | 3.5.3 | delta, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hd |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| | | fs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-7.6.0 | 3.5.3 | delta, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-7.5.0 | 3.5.2 | delta, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-7.4.0 | 3.5.2 | delta, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-7.3.0 | 3.5.1 | delta, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-7.2.0 | 3.5.1 | delta, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.36.2 | 2.4.8 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-6.10.0 | 3.3.1 | aws-sagemaker-spark-sdk, delta, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-6.9.1 | 3.3.0 | aws-sagemaker-spark-sdk, delta, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-6.9.0 | 3.3.0 | aws-sagemaker-spark-sdk, delta, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-6.8.1 | 3.3.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-6.8.0 | 3.3.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-6.7.0 | 3.2.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.36.1 | 2.4.8 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.36.0 | 2.4.8 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-6.6.0 | 3.2.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.35.0 | 2.4.8 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-6.5.0 | 3.1.2 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, iceberg, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-6.4.0 | 3.1.2 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-6.3.1 | 3.1.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-6.3.0 | 3.1.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-6.2.1 | 3.0.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-6.2.0 | 3.0.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-6.1.1 | 3.0.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-6.1.0 | 3.0.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-6.0.1 | 2.4.4 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-6.0.0 | 2.4.4 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.34.0 | 2.4.8 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.33.1 | 2.4.7 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.33.0 | 2.4.7 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.32.1 | 2.4.7 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.32.0 | 2.4.7 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.31.1 | 2.4.6 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.31.0 | 2.4.6 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.30.2 | 2.4.5 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.30.1 | 2.4.5 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.30.0 | 2.4.5 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-notebook-env, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.29.0 | 2.4.4 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.28.1 | 2.4.4 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.28.0 | 2.4.4 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.27.1 | 2.4.4 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.27.0 | 2.4.4 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.26.0 | 2.4.3 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.25.0 | 2.4.3 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.24.1 | 2.4.2 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.24.0 | 2.4.2 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.23.1 | 2.4.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.19.0 | 2.3.2 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.18.1 | 2.3.2 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.18.0 | 2.3.2 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, nginx, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.17.2 | 2.3.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.17.1 | 2.3.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.17.0 | 2.3.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, emr-s3-select, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.16.1 | 2.3.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.16.0 | 2.3.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.15.1 | 2.3.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.15.0 | 2.3.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.14.2 | 2.3.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.14.1 | 2.3.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.14.0 | 2.3.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.13.1 | 2.3.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.13.0 | 2.3.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.12.3 | 2.2.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.12.2 | 2.2.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.12.1 | 2.2.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.12.0 | 2.2.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.11.4 | 2.2.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.11.3 | 2.2.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.11.2 | 2.2.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.11.1 | 2.2.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.11.0 | 2.2.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.10.1 | 2.2.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.10.0 | 2.2.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, livy-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.9.1 | 2.2.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.9.0 | 2.2.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.8.3 | 2.2.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.8.2 | 2.2.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.8.1 | 2.2.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.8.0 | 2.2.0 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.7.1 | 2.1.1 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.7.0 | 2.1.1 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.6.1 | 2.1.1 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.6.0 | 2.1.1 | emrfs, emr-goodies, emr-ddb, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.5.4 | 2.1.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.5.3 | 2.1.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.5.2 | 2.1.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.5.1 | 2.1.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.5.0 | 2.1.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.4.1 | 2.1.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.4.0 | 2.1.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.3.2 | 2.1.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-5.3.1 | 2.1.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-5.3.0 | 2.1.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |

| emr-4.7.2 | 1.6.2 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-4.7.1 | 1.6.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-4.7.0 | 1.6.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-4.6.1 | 1.6.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-4.6.0 | 1.6.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-4.5.0 | 1.6.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-4.4.0 | 1.6.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-4.3.0 | 1.6.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

| Amazon EMR Release label | Spark Version | Components installed with Spark |
| --- | --- | --- |
| emr-4.2.0 | 1.5.2 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-4.1.0 | 1.5.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |
| emr-4.0.0 | 1.4.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave |

# Apache Sqoop

> **Note**
>
> The last release to include Apache Sqoop was Amazon EMR Release 7.4. Apache Sqoop will be removed from Amazon EMR Release 7.5 and higher releases.

Apache Sqoop is a tool for transferring data between Amazon S3, Hadoop, HDFS, and RDBMS databases. For more information, see the Apache Sqoop website. Sqoop is included in Amazon EMR releases 5.0.0 and later. Earlier releases include Sqoop as a sandbox application. For more information, see Amazon EMR 4.x release versions.

**Topics**

- Sqoop version information
- Considerations with Sqoop on Amazon EMR
- Sqoop release history

## Sqoop version information

**Sqoop version for version 7.4.**

The following table lists the version of Sqoop included in the latest release of the Amazon EMR 7.x series, along with the components that Amazon EMR installs with Sqoop.

**Spark version information for emr-7.4.0**

| Amazon EMR Release Label | Sqoop Version | Components Installed With Sqoop |
|---|---|---|
| emr-7.4.0 | Sqoop 1.4.7 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms- |

| Amazon EMR Release Label | Sqoop Version | Components Installed With Sqoop |
| --- | --- | --- |
| | | server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mariadb-server, sqoop-client |

### Sqoop version for 6.15.0

The following table lists the version of Sqoop included in the latest release of the Amazon EMR 6.x series, along with the components that Amazon EMR installs with Sqoop.

For the version of components installed with Sqoop in this release, see Release 6.15.0 Component Versions.

### Sqoop version information for emr-6.15.0

| Amazon EMR Release Label | Sqoop Version | Components Installed With Sqoop |
| --- | --- | --- |
| emr-6.15.0 | Sqoop 1.4.7 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mariadb-server, sqoop-client |

### Sqoop version for 5.36.2

The following table lists the version of Sqoop included in the latest release of the Amazon EMR 5.x series, along with the components that Amazon EMR installs with Sqoop.

For the version of components installed with Sqoop in this release, see Release 5.36.2 Component Versions.

**Sqoop version information for emr-5.36.2**

| Amazon EMR Release Label | Sqoop Version | Components Installed With Sqoop |
|---|---|---|
| emr-5.36.2 | Sqoop 1.4.7 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mariadb-server, sqoop-client |

# Considerations with Sqoop on Amazon EMR

Consider the following items when you run Sqoop on Amazon EMR.

## Using Sqoop with HCatalog integration

Sqoop on Amazon EMR supports Sqoop-HCatalog integration. When you use Sqoop to write output to an HCatalog table in Amazon S3, disable Amazon EMR direct write by setting the `mapred.output.direct.NativeS3FileSystem` and `mapred.output.direct.EmrFileSystem` properties to `false`. For more information, see Using HCatalog. You can use the Hadoop `-D mapred.output.direct.NativeS3FileSystem=false` and `-D mapred.output.direct.EmrFileSystem=false` commands. If you don't disable direct write, no error occurs, but the table is created in Amazon S3 and no data is written.

## Sqoop JDBC and database support

By default, Sqoop has a MariaDB and PostgreSQL driver installed. The PostgreSQL driver installed for Sqoop only works for PostgreSQL 8.4. To install an alternate set of JDBC connectors for Sqoop,

connect to the cluster master node and install them in `/usr/lib/sqoop/lib`. The following are links for various JDBC connectors:

- MariaDB: About MariaDB Connector/J.
- PostgreSQL: PostgreSQL JDBC driver.
- SQLServer: Download Microsoft JDBC driver for SQL Server.
- MySQL: Download Connector/J
- Oracle: Get Oracle JDBC drivers and UCP from the Oracle Maven repository

The supported databases for Sqoop are listed at the following url, http://sqoop.apache.org/docs/*version*/SqoopUserGuide.html#_supported_databases, where *version* is the version of Sqoop you are using, for example 1.4.6. If the JDBC connect string does not match those in this list, you must specify a driver.

For example, you can export to an Amazon Redshift database table with the following command (for JDBC 4.1):

```
sqoop export --connect jdbc:redshift://$MYREDSHIFTHOST:5439/mydb --
table mysqoopexport --export-dir s3://amzn-s3-demo-bucket/myinputfiles/ --driver
 com.amazon.redshift.jdbc41.Driver --username master --password Mymasterpass1
```

You can use both the MariaDB and MySQL connection strings but if you specify the MariaDB connection string, you need to specify the driver:

```
sqoop export --connect jdbc:mariadb://$HOSTNAME:3306/mydb --table mysqoopexport --
export-dir s3://amzn-s3-demo-bucket/myinputfiles/ --driver org.mariadb.jdbc.Driver --
username master --password Mymasterpass1
```

If you are using Secure Socket Layer encryption to access your database, you need to use a JDBC URI like in the following Sqoop export example:

```
sqoop export --connect jdbc:mariadb://$HOSTNAME:3306/mydb?
verifyServerCertificate=false&useSSL=true&requireSSL=true --table mysqoopexport --
export-dir s3://amzn-s3-demo-bucket/myinputfiles/ --driver org.mariadb.jdbc.Driver --
username master --password Mymasterpass1
```

For more information about SSL encryption in RDS, see Using SSL to encrypt a connection to a DB instance in the Amazon RDS User Guide.

For more information, see the Apache Sqoop documentation.

## Securing your password

There are several methods that you might choose from to securely pass your password:

Java KeyStore

The preferred method encrypts the password with a Java KeyStore (JKS), eliminating the need to store the password in a readable format.

1. Create a password alias. On prompt, enter the password that you use to access the database.

```
hadoop credential create mydb.password.alias -provider jceks://hdfs/user/root/
mysql.password.jceks
```

2. Use the password alias to launch the Sqoop job:

```
sqoop export -Dhadoop.security.credential.provider.path=jceks://hdfs/user/
root/mysql.password.jceks --connect jdbc:mariadb://$HOSTNAME:3306/mydb --table
 mysqoopexport --export-dir s3://amzn-s3-demo-bucket/myinputfiles/ --driver
 org.mariadb.jdbc.Driver --username master --password-alias mydb.password.alias
```

--password-file

You can use the `--password-file` command to pass the password through a file as shown in the following example:

1. Create a new file that contains the password:

```
echo -n 'Mymasterpass1' > /home/hadoop/mysql-pass.password
```

2. Use the file to launch the Sqoop job:

```
sqoop export --connect jdbc:mariadb://$HOSTNAME:3306/mydb --table
 mysqoopexport --export-dir s3://amzn-s3-demo-bucket/myinputfiles/ --driver
 org.mariadb.jdbc.Driver --username master --password-file /home/hadoop/mysql-
pass.password
```

-P

You can use the `-P` command to enter the password through a prompt as shown in the following example:

```
sqoop export --connect jdbc:mariadb://$HOSTNAME:3306/mydb --table mysqoopexport --
export-dir s3://amzn-s3-demo-bucket/myinputfiles/ --driver org.mariadb.jdbc.Driver
 --username master -P
```

# Sqoop release history

The following table lists the version of Sqoop included in each release version of Amazon EMR, along with the components installed with the application. For component versions in each release, see the Component Version section for your release in Amazon EMR 7.x release versions, Amazon EMR 6.x release versions, or Amazon EMR 5.x release versions.

**Sqoop version information**

| Amazon EMR Release label | Sqoop Version | Components installed with Sqoop |
|---|---|---|
| emr-7.4.0 | 1.4.7 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mariadb-server, sqoop-client |
| emr-7.3.0 | 1.4.7 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop- |

| Amazon EMR Release label | Sqoop Version | Components installed with Sqoop |
| --- | --- | --- |
| | | httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mariadb-server, sqoop-client |
| emr-7.2.0 | 1.4.7 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mariadb-server, sqoop-client |
| emr-5.36.2 | 1.4.7 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mariadb-server, sqoop-client |

| Amazon EMR Release label | Sqoop Version | Components installed with Sqoop |
| --- | --- | --- |
| emr-7.1.0 | 1.4.7 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mariadb-server, sqoop-client |
| emr-7.0.0 | 1.4.7 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mariadb-server, sqoop-client |

| Amazon EMR Release label | Sqoop Version | Components installed with Sqoop |
| --- | --- | --- |
| emr-6.15.0 | 1.4.7 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mariadb-server, sqoop-client |
| emr-6.14.0 | 1.4.7 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, mariadb-server, sqoop-client |

| emr-5.2.2 | 1.4.6 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, mysql-server, sqoop-client |
| emr-5.2.1 | 1.4.6 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, mysql-server, sqoop-client |
| emr-5.2.0 | 1.4.6 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, mysql-server, sqoop-client |

| Amazon EMR Release label | Sqoop Version | Components installed with Sqoop |
| --- | --- | --- |
| emr-5.1.1 | 1.4.6 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, mysql-server, sqoop-client |
| emr-5.1.0 | 1.4.6 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, mysql-server, sqoop-client |
| emr-5.0.3 | 1.4.6 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, mysql-server, sqoop-client |

| Amazon EMR Release label | Sqoop Version | Components installed with Sqoop |
| --- | --- | --- |
| emr-5.0.2 | 1.4.6 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, mysql-server, sqoop-client |
| emr-5.0.1 | 1.4.6 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, mysql-server, sqoop-client |
| emr-5.0.0 | 1.4.6 | emrfs, emr-ddb, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, mysql-server, sqoop-client |

# TensorFlow

TensorFlow is an open-source symbolic math library for machine intelligence and deep learning applications. For more information, see the TensorFlow website. TensorFlow is available with Amazon EMR release version 5.17.0 and later.

The following table lists the version of TensorFlow included in the latest release of the Amazon EMR 7.x series, along with the components that Amazon EMR installs with TensorFlow.

For the version of components installed with TensorFlow in this release, see Release 7.9.0 Component Versions.

**TensorFlow version information for emr-7.9.0**

| Amazon EMR Release Label | TensorFlow Version | Components Installed With TensorFlow |
|---|---|---|
| emr-7.9.0 | TensorFlow 2.16.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |

The following table lists the version of TensorFlow included in the latest release of the Amazon EMR 6.x series, along with the components that Amazon EMR installs with TensorFlow.

For the version of components installed with TensorFlow in this release, see Release 6.15.0 Component Versions.

**TensorFlow version information for emr-6.15.0**

| Amazon EMR Release Label | TensorFlow Version | Components Installed With TensorFlow |
| --- | --- | --- |
| emr-6.15.0 | TensorFlow 2.11.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |

The following table lists the version of TensorFlow included in the latest release of the Amazon EMR 5.x series, along with the components that Amazon EMR installs with TensorFlow.

For the version of components installed with TensorFlow in this release, see Release 5.36.2 Component Versions.

**TensorFlow version information for emr-5.36.2**

| Amazon EMR Release Label | TensorFlow Version | Components Installed With TensorFlow |
| --- | --- | --- |
| emr-5.36.2 | TensorFlow 2.4.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |

# TensorFlow builds by Amazon EC2 instance type

Amazon EMR uses different builds of the TensorFlow library depending on the instance types that you choose for your cluster. Amazon EMR supports TensorFlow for clusters with **aarch64** (Graviton) instance types for EMR-7.5.0 and above. The following table lists builds by instance type.

| EC2 instance types | TensorFlow build |
| --- | --- |
| M5 and C5 | Tensorflow 2.16.1 with Intel MKL optimization |
| P2, P4D, P5, G4DN, G5, G6 and GR6 | Tensorflow 2.16.1 with CUDA 12.3, cuDNN 8.9.7.29 |
| P3, P3DN, G3 and G3S | Tensorflow 2.16.1 with CUDA 12.3, cuDNN 8.9.7.29, NCCL 2.20.3-1<br><br>Nvidia NCCL is available only on P3 instances. **End User License Agreement (EULA)**: By using Nvidia components on Amazon EMR, you agree to the terms and conditions outlined in the product EULA. |
| All others except Graviton instances | Tensorflow 2.16.1 |

# Security

In addition to following the guidance in Using TensorFlow securely we recommend that you launch your cluster in a private subnet to help you limit access to trusted sources. For more information, see Amazon VPC options in the *Amazon EMR Management Guide*.

# Using TensorBoard

TensorBoard is a suite of visualization tools for TensorFlow programs. For more information, see TensorBoard: Visualized learning on the Tensorflow website.

To use TensorBoard with Amazon EMR, you must start TensorBoard on the cluster master node.

**To use tensorboard with Tensorflow on Amazon EMR**

1. Connect to the master node of the cluster using SSH. For more information, see Connect to the master node using SSH in the *Amazon EMR Management Guide*.
2. Type the following command to start Tensorboard on the master node. Replace */my/log/directory* with a directory on the master node where you have generated and stored summary data using a summary writer.

   Amazon EMR 5.19.0 and later

   ```
   python3 -m tensorboard.main --logdir=/home/hadoop/tensor --bind_all
   ```

   Amazon EMR 5.18.1 and earlier

   ```
   python3 -m tensorboard.main --logdir=/my/log/dir
   ```

   By default, the master node hosts TensorBoard using port 6006 and the master public DNS name. After you start TensorBoard, the command line output presents the URL that can be used to connect to TensorBoard, as shown in the following example:

   ```
   TensorBoard 2.16.1 at http://master-public-dns-name:6006 (Press CTRL+C to quit)
   ```
3. Set up access to web interfaces on the master node from trusted clients. For more information, see View web interfaces hosted on Amazon EMR clusters in the *Amazon EMR Management Guide*.
4. Open TensorBoard at `http://master-public-dns-name:6006`.

# TensorFlow release history

The following table lists the version of TensorFlow included in each release version of Amazon EMR, along with the components installed with the application. For component versions in each release, see the Component Version section for your release in Amazon EMR 7.x release versions, Amazon EMR 6.x release versions, or Amazon EMR 5.x release versions.

### TensorFlow version information

| Amazon EMR Release label | TensorFlow Version | Components installed with TensorFlow |
| --- | --- | --- |
| emr-7.9.0 | 2.16.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |
| emr-7.8.0 | 2.16.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |
| emr-7.7.0 | 2.16.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |

| Amazon EMR Release label | TensorFlow Version | Components installed with TensorFlow |
| --- | --- | --- |
| emr-7.6.0 | 2.16.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |
| emr-7.5.0 | 2.16.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |
| emr-7.4.0 | 2.16.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |

| Amazon EMR Release label | TensorFlow Version | Components installed with TensorFlow |
| --- | --- | --- |
| emr-7.3.0 | 2.16.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |
| emr-7.2.0 | 2.11.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |
| emr-5.36.2 | 2.4.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |

| Amazon EMR Release label | TensorFlow Version | Components installed with TensorFlow |
| --- | --- | --- |
| emr-7.1.0 | 2.11.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |
| emr-7.0.0 | 2.11.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |
| emr-6.15.0 | 2.11.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |

| Amazon EMR Release label | TensorFlow Version | Components installed with TensorFlow |
| --- | --- | --- |
| emr-6.14.0 | 2.11.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |
| emr-6.13.0 | 2.11.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |
| emr-6.12.0 | 2.11.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |

| Amazon EMR Release label | TensorFlow Version | Components installed with TensorFlow |
| --- | --- | --- |
| emr-6.11.1 | 2.11.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |
| emr-6.11.0 | 2.11.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |
| emr-6.10.1 | 2.11.0 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tensorflow |

| Amazon EMR Release label | TensorFlow Version | Components installed with TensorFlow |
| --- | --- | --- |

# Apache Tez

Apache Tez is a framework that creates a complex directed acyclic graph (DAG) of tasks for processing data. You can use it as an alternative to Hadoop MapReduce for some use cases. For example, you can run Pig and Hive workflows with Hadoop MapReduce or you can use Tez as an execution engine. For more information, see https://tez.apache.org/. Amazon EMR releases 4.7.0 and higher include Tez.

The following table lists the version of Tez included in the latest release of the Amazon EMR 7.x series, along with the components that Amazon EMR installs with Tez.

For the version of components installed with Tez in this release, see Release 7.9.0 Component Versions.

**Tez version information for emr-7.9.0**

| Amazon EMR Release Label | Tez Version | Components Installed With Tez |
|---|---|---|
| emr-7.9.0 | Tez 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |

The following table lists the version of Tez included in the latest release of the Amazon EMR 6.x series, along with the components that Amazon EMR installs with Tez.

For the version of components installed with Tez in this release, see Release 6.15.0 Component Versions.

**Tez version information for emr-6.15.0**

| Amazon EMR Release Label | Tez Version | Components Installed With Tez |
| --- | --- | --- |
| emr-6.15.0 | Tez 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |

The following table lists the version of Tez included in the latest release of the Amazon EMR 5.x series, along with the components that Amazon EMR installs with Tez.

For the version of components installed with Tez in this release, see Release 5.36.2 Component Versions.

**Tez version information for emr-5.36.2**

| Amazon EMR Release Label | Tez Version | Components Installed With Tez |
| --- | --- | --- |
| emr-5.36.2 | Tez 0.9.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn |

# Creating a cluster with Tez

To install Tez, choose Apache Tez as an application when you create your cluster.

**To create a cluster with Tez installed using the console**

1. Navigate to the new Amazon EMR console and select **Switch to the old console** from the side navigation. For more information on what to expect when you switch to the old console, see Using the old console.
2. Choose **Create cluster**, **Go to advanced options**.
3. Under **Software Configuration**, select a **Release** of **emr-4.7.0** or higher.
4. Select **Tez** along with other applications you want Amazon EMR to install.
5. Select other options as necessary and then choose **Create cluster**.

**To create a cluster with Tez using the Amazon CLI**

- Use the `create-cluster` command along with the `-- applications` option to specify **Tez**. The following example creates a cluster with Tez installed.

  > **Note**
  >
  > Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

```
aws emr create-cluster --name "Cluster with Tez" --release-label emr-7.9.0 \
--applications Name=Tez --ec2-attributes KeyName=myKey \
--instance-type m5.xlarge --instance-count 3 --use-default-roles
```

# Configuring Tez

You can customize Tez by setting values using the `tez-site` configuration classification, which configures settings in the `tez-site.xml` configuration file. For more information, see TezConfiguration in the Apache Tez documentation. To change Hive or Pig to use the Tez execution engine, use the `hive-site` and `pig-properties` configuration classifications as appropriate. Examples are shown below.

## Example configuration

**Example Example: Customizing the Tez root logging level and setting Tez as the execution engine for Hive and Pig**

The example `create-cluster` command shown below creates a cluster with Tez, Hive, and Pig installed. The command references a file stored in Amazon S3, `myConfig.json`, which specifies properties for the `tez-site` classification that sets `tez.am.log.level` to DEBUG, and sets the execution engine to Tez for Hive and Pig using the `hive-site` and `pig-properties` configuration classifications.

> **Note**
>
> Linux line continuation characters (\) are included for readability. They can be removed or used in Linux commands. For Windows, remove them or replace with a caret (^).

```
aws emr create-cluster --release-label emr-7.9.0 \
--applications Name=Tez Name=Hive Name=Pig --ec2-attributes KeyName=myKey \
--instance-type m5.xlarge --instance-count 3 \
--configurations https://s3.amazonaws.com/amzn-s3-demo-bucket/myfolder/myConfig.json --
use-default-roles
```

Example contents of `myConfig.json` are shown below.

```
[
    {
      "Classification": "tez-site",
      "Properties": {
        "tez.am.log.level": "DEBUG"
```

```
    }
  },
  {
    "Classification": "hive-site",
    "Properties": {
      "hive.execution.engine": "tez"
    }
  },
  {
    "Classification": "pig-properties",
    "Properties": {
      "exectype": "tez"
    }
  }
]
```

**Note**

With Amazon EMR version 5.21.0 and later, you can override cluster configurations and specify additional configuration classifications for each instance group in a running cluster. You do this by using the Amazon EMR console, the Amazon Command Line Interface (Amazon CLI), or the Amazon SDK. For more information, see Supplying a Configuration for an Instance Group in a Running Cluster.

## Tez asynchronous split opening

When there is a large number of small files in the table path, and a query attempts to read them all, each small file that corresponds to each individual split gets combined under one Tez *grouped split*. A single mapper then processes the single Tez grouped split. Since the execution is synchronous, each individual split under the grouped split gets processed one by one. This requires `RecordReader` objects to synchronously process the splits.

Amazon EMR 6.15.0 introduces configurations that you can specify to asynchronously open the input splits in a Tez grouped split. The feature was initiated by TEZ-4397, but had regressions in OSS Hive. EMR Hive fixed the regressions and additional bugs in Hive ACID table. This improvement results in faster performance of read queries when there are a large number of input splits in a single Tez Grouped Split.

| Name | Classification | Description |
| --- | --- | --- |
| `tez.grouping.split .init.threads` | `tez-site` | Specifies the number of daemon threads that Tez uses to pre-initiate the `RecordReaders` and open splits. For ACID tables, the maximum supported value of `tez.grouping.split .init.threads` is 1. |
| `tez.grouping.split .init.recordreaders` | `tez-site` | Specifies the number of `RecordReaders` to keep pre-initialised by the daemon threads. This can help when Tez grouped split contains a large number of `InputSplits` . Initializ ation of `RecordReaders` to process those input splits can be done asynchronously with daemon threads instead of sequential processing. |

Configuration notes:

| Subject matter | Details |
| --- | --- |
| Recommended configuration settings | It is recommended to set the above configuration settings to the values you want in both `hive-site` and `tez-site`. |
| Matching values | The values of the configura tion settings should be the |

| Subject matter | Details |
| --- | --- |
| | same in both `hive-site` and `tez-site`. |
| LLAP recommendation | It isn't recommended to use this feature when LLAP is enabled. |

## Benchmarking for Tez asynchronous split opening

We used the following environments and configurations for benchmarking the Tez asynchronous split opening capability:

- **Benchmark environment** – Amazon EMR cluster with 1 primary node that uses m5.16xlarge, and 16 core nodes that use m5.16xlarge.
- **Benchmark configurations** – To simulate the scenario for benchmarking where a large number of input splits are in a single Tez grouped split, `tez.grouping.split-count` is set to 1.
- **Table used for benchmarking** – The table contains 200 partitions, with each partition containing a single file. The benchmark is done for when that table contains CSV files, and when that table contains parquet files. Hive query for benchmarking: `SELECT COUNT(*)` from the table ten times, and take the average runtime.
- **Configurations to enable Tez async split opening** – As follows:
  - `tez.grouping.split.init.threads` = `4`
  - `tez.grouping.split.init.recordreaders` = `10`

| Dataset | Feature disabled (baseline) | Feature enabled | Improvement |
| --- | --- | --- | --- |
| CSV dataset | 90.26 seconds | 79.20 seconds | 12.25% |
| Parquet dataset | 54.67 seconds | 42.23 seconds | 22.75% |

# Tez web UI

Tez has its own web user interface. To view the web UI, see the following URL.

```
http://masterDNS:8080/tez-ui
```

To enable the Hive Queries tab on the Tez web UI, set the following configuration.

```
[
  {
    "Classification": "hive-site",
    "Properties": {
      "hive.exec.pre.hooks": "org.apache.hadoop.hive.ql.hooks.ATSHook",
      "hive.exec.post.hooks": "org.apache.hadoop.hive.ql.hooks.ATSHook",
      "hive.exec.failure.hooks": "org.apache.hadoop.hive.ql.hooks.ATSHook"
    }
  }
]
```

You can also view Tez, Spark, and YARN application UI details using links on the **Application user interfaces** tab of a cluster's detail page in the console. Amazon EMR application user interfaces (UI) are hosted off-cluster and are available after the cluster has terminated. They don't require you to set up a SSH connection or web proxy, making it easier for you to troubleshoot and analyze active jobs and job history.

For more information, see View application history in the *Amazon EMR Management Guide*.

# Timeline Server

The YARN Timeline Server is configured to run when Tez is installed. To view jobs submitted through Tez or MapReduce execution engines using the Timeline Server, view the web UI using the URL `http://master-public-DNS:8188`. For more information, see View web interfaces hosted on Amazon EMR clusters in the *Amazon EMR Management Guide*.

# Tez release history

The following table lists the version of Tez included in each release version of Amazon EMR, along with the components installed with the application. For component versions in each release, see

the Component Version section for your release in Amazon EMR 7.x release versions, Amazon EMR 6.x release versions, or Amazon EMR 5.x release versions.

**Tez version information**

| Amazon EMR Release label | Tez Version | Components installed with Tez |
|---|---|---|
| emr-7.9.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |
| emr-7.8.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |
| emr-7.7.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-ya |

| Amazon EMR Release label | Tez Version | Components installed with Tez |
|---|---|---|
| | | rn-timeline-server, tez-on-ya rn, tez-on-worker |
| emr-7.6.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-ya rn-timeline-server, tez-on-ya rn, tez-on-worker |
| emr-7.5.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-ya rn-timeline-server, tez-on-ya rn, tez-on-worker |

| Amazon EMR Release label | Tez Version | Components installed with Tez |
| --- | --- | --- |
| emr-7.4.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |
| emr-7.3.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |
| emr-7.2.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |

| Amazon EMR Release label | Tez Version | Components installed with Tez |
| --- | --- | --- |
| emr-5.36.2 | 0.9.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn |
| emr-7.1.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |
| emr-7.0.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |

| Amazon EMR Release label | Tez Version | Components installed with Tez |
| --- | --- | --- |
| emr-6.15.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |
| emr-6.14.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |
| emr-6.13.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |

| Amazon EMR Release label | Tez Version | Components installed with Tez |
| --- | --- | --- |
| emr-6.12.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |
| emr-6.11.1 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |
| emr-6.11.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |

| Amazon EMR Release label | Tez Version | Components installed with Tez |
| --- | --- | --- |
| emr-6.10.1 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |
| emr-6.10.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn, tez-on-worker |
| emr-6.9.1 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn |

| Amazon EMR Release label | Tez Version | Components installed with Tez |
| --- | --- | --- |
| emr-6.9.0 | 0.10.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn |
| emr-6.8.1 | 0.9.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn |
| emr-6.8.0 | 0.9.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn |

| Amazon EMR Release label | Tez Version | Components installed with Tez |
| --- | --- | --- |
| emr-6.7.0 | 0.9.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn |
| emr-5.36.1 | 0.9.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn |
| emr-5.36.0 | 0.9.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn |

| Amazon EMR Release label | Tez Version | Components installed with Tez |
| --- | --- | --- |
| emr-6.6.0 | 0.9.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn |
| emr-5.35.0 | 0.9.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn |
| emr-6.5.0 | 0.9.2 | emrfs, emr-goodies, hadoop-client, hadoop-mapred, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, tez-on-yarn |

- Amazon EMR 6.13.0 - Tez release notes
- Amazon EMR 6.12.0 - Tez release notes
- Amazon EMR 6.11.0 - Tez release notes
- Amazon EMR 6.10.0 - Tez release notes
- Amazon EMR 6.9.0 - Tez release notes
- Amazon EMR 6.8.0 - Tez release notes
- Amazon EMR 6.7.0 - Tez release notes
- Amazon EMR 6.6.0 - Tez release notes

## Amazon EMR 7.8.0 - Tez release notes

### Amazon EMR 7.8.0 - Tez changes

| Type | Description |
| --- | --- |
| Improvement | Upgraded bouncycastle version to 1.78 to match hadoop |

## Amazon EMR 7.7.0 - Tez release notes

### Amazon EMR 7.7.0 - Tez changes

| Type | Description |
| --- | --- |
| Improvement | The `tez.task.relaxed.locality` property in Apache Tez controls whether task scheduling strictly follows data locality constraints (rack and node locality). When set to `true` (default in EMR-7.6+), Tez does not enforce locality, allowing tasks to be assigned to any available container, which improves |

| Type | Description |
| --- | --- |
| | resource utilization and reduces wait times in busy clusters. |

## Amazon EMR 7.6.0 - Tez release notes

### Amazon EMR 7.6.0 - Tez changes

| Type | Description |
| --- | --- |
| Improvement | Rack and node locality constraints won't be considered while requesting container for a task by changing default of `tez.task.relaxed.locality` to false |
| Improvement | Tune configs to disable delay due to locality and allow non-local fallback |
| Improvement | TEZ-4547: Add Tez AM JobID to the JobConf |

## Amazon EMR 7.5.0 - Tez release notes

### Amazon EMR 7.5.0 - Tez changes

| Type | Description |
| --- | --- |
| Improvement | Enabled preemption of task by default |
| Improvement | Increased number of record readers to asynchronously and proactively init to 10 |
| Improvement | TEZ-4580: Slow preemption of new containers when re-use is enabled |

## Amazon EMR 7.4.0 - Tez release notes

### Amazon EMR 7.4.0 - Tez changes

| Type | Description |
| --- | --- |
| Improvement | Remove EventCounter appender from Tez removed in Hadoop 3.4.0 via HADOOP-17524 |
| Upgrade | Upgrade commons-cli to 1.5.0 |
| Upgrade | Upgrade bouncy-castle version to 1.70.0 |

## Amazon EMR 7.2.0 - Tez release notes

### Amazon EMR 7.2.0 - Tez changes

| Type | Description |
| --- | --- |
| Improvement | Option provided to disable locality constraints when requesting containers for tasks. |
| Bug Fix | Make *TaskDependencies#addTaskDependency* thread safe |
| Upgrade | Upgrade TLS version to 1.3 for Tez. |

### Amazon EMR 7.2.0 - New configurations

| Classification | Name | Default | Description |
| --- | --- | --- | --- |
| tez-site | tez.task.relaxed.locality | false | When enabled, rack and node locality constraints are not considered while requesting a container for a task. |

## Amazon EMR 7.1.0 - Tez release notes

### Amazon EMR 7.1.0 - Tez changes

| Type | Description |
| --- | --- |
| Bug Fix | TEZ-4394 – Netty4 ShuffleHandler: should use 1 boss thread (#256) |
| Upgrade | Upgrades Netty to 4.1.100.Final. |
| Upgrade | Upgrades Jetty to 9.4.53.v20231009. |

## Amazon EMR 7.0.0 - Tez release notes

Amazon EMR 7.0.0 Tez contains all the changes and updates made up to and including Amazon EMR-6.15.0 Tez.

### Amazon EMR 7.0.0 - Tez changes

| Type | Description |
| --- | --- |
| Upgrade | Tez Runtime now uses Java 17 by default. Please refer EMR 7.0.0 Release Guide for more details. |

## Amazon EMR 6.15.0 - Tez release notes

### Amazon EMR 6.15.0 - Tez changes

| Type | Description |
| --- | --- |
| Feature | TEZ-4397: Open Tez Input splits asynchron ously |
| Upgrade | TEZ-4493: Upgrade Apache Hadoop to 3.3.6 |

### Amazon EMR 6.15.0 - Tez features

- **Tez asynchronous split opening** – Amazon EMR 6.15.0 introduces configurations that you can specify to asynchronously open the input splits in a Tez *grouped split*. The feature was initiated by TEZ-4397, but had regressions in OSS Hive. Amazon EMR Hive fixed the regressions and additional bugs in Hive ACID table. This improvement results in faster performance of read queries when there are a large number of input splits in a single Tez grouped split. For more information, see Tez asynchronous split opening.

## Amazon EMR 6.14.0 - Tez release notes

### Amazon EMR 6.14.0 - Tez changes

| Type | Description |
| --- | --- |
| Improvement | Upgrade TLS version in Tez to 1.2 |

## Amazon EMR 6.13.0 - Tez release notes

### Amazon EMR 6.13.0 - Tez changes

| Type | Description |
| --- | --- |
| Bug Fix | REVERT TEZ-4295: Could not decompress data. Buffer length is too small. |
| Bug Fix | REVERT TEZ-4302: `NullPointerException` in `CodecUtils` with `GzipCodec`. |
| Bug Fix | REVERT TEZ-4234: Compressor can cause `IllegalArgumentException` in `Buffer.limit` where limit exceeds capacity. |
| Bug Fix | REVERT TEZ-4135: Improve memory allocation when executing in-memory reads. |

# Amazon EMR 6.12.0 - Tez release notes

## Amazon EMR 6.12.0 - Tez changes

| Type | Description |
| --- | --- |
| Improvement | Added Support For JDK 11 and JDK 17 Runtime |
| Bug Fix | TEZ-4492: Update Bowerrc to use bower.herokuapp mirror to avoid Bower Registry CERT_EXPIRE issue (BOWER-2608) |
| Upgrade | Upgraded Surefire to 3.0.0-M7 |

# Amazon EMR 6.11.0 - Tez release notes

## Amazon EMR 6.11.0 - Tez changes

| Type | Description |
| --- | --- |
| Bug | Fixed invalid vertex state transition during vertex level cleanup of shuffle data |
| Bug | Fixed DAG or vertex level cleanup of shuffle data not working |
| Improvement | Enable tez.am.dag.cleanup.on.completion by default for clearing shuffle data of completed DAGs |

## Amazon EMR 6.10.0 - Tez release notes

### Amazon EMR 6.10.0 - Tez changes

| Type | Description |
| --- | --- |
| Feature | Enable `tez.runtime.transfer.data-via-events.enabled` by default |
| Backport | TEZ-4450: Fix shuffle data fetch failure when shuffle data is transferred via data movement events |
| Backport | TEZ-4460: Fix read timeout error in fetching shuffle data from Tez Shuffle Handler |
| Backport | TEZ-4455: Add LoggingHandler in ShuffleHandler pipeline for better debuggability |
| Bug | Fix Tez task getting stuck intermittently when preemption of task is enabled |

## Amazon EMR 6.9.0 - Tez release notes

### Amazon EMR 6.9.0 - Tez changes

| Type | Description |
| --- | --- |
| Upgrade | Tez is upgraded to 0.10.2. For more information, see the change log for Apache Tez 0.10.2. |
| Upgrade | Upgrade Hadoop to 3.3.3. |
| Bug | Disable `tez.runtime.transfer.data-via-events.enabled` by default due to TEZ-4450. |

## Amazon EMR 6.8.0 - Tez release notes

### Amazon EMR 6.8.0 - Tez changes

| Type | Description |
| --- | --- |
| Backport | TEZ-3363: Delete intermediate data at the vertex level for Shuffle Handler |
| Backport | TEZ-4129: Delete intermediate attempt data for failed attempts for Shuffle Handler |
| Backport | TEZ-4430: Fixed tez.task.launch.cmd-opts property not working |

## Amazon EMR 6.7.0 - Tez release notes

### Amazon EMR 6.7.0 - Tez changes

| Type | Description |
| --- | --- |
| Backport | TEZ-4403: Upgrade SLF4J version to 1.7.36 |
| Backport | TEZ-4405: Replace log4j 1.x with reload4j |
| Backport | TEZ-4411: Tez Build Failure: FileSaver.js not found |

## Amazon EMR 6.6.0 - Tez release notes

### Amazon EMR 6.6.0 - Tez changes

| Type | Description |
| --- | --- |
| Backport | TEZ-3918: Fixed tez.task.log.level property not working. |
| Backport | TEZ-4353: Update commons-io to 2.8.0. |

| Type | Description |
| --- | --- |
| Backport | TEZ-4114: Remove direct jetty dependency from tez. |
| Backport | TEZ-4323: Jetty jars were removed from dist package with TEZ-4114. |

# Trino

Trino is an open-source query engine that's designed for interactive queries on a wide range of data sources. These can include relational databases, file-based data, HDFS data, and others. The most common purpose for Trino with Amazon EMR is to run complex SQL queries on large datasets stored in Amazon S3. It's also compliant with ANSI SQL, which makes it familiar to database engineers, data analysts, and data scientists who are familiar with SQL.

**Note**

PrestoSQL was renamed to Trino in December 2020. Amazon EMR versions 6.4.0 and later generally refer to Trino, while earlier release versions refer to PrestoSQL.

**Important**

PrestoSQL, the previous version of Trino, is still available for use with Amazon EMR. However, we highly recommend Trino going forward for use with Amazon EMR. Also note that Trino and PrestoSQL can't run simultaneously on the same cluster.

The following table lists the version of Trino included in the latest release of Amazon EMR 7.x, along with components that Amazon EMR installs with Trino. For the version of components installed with Trino in this release, see Release 7.9.0 Component Versions.

**Trino version information for emr-7.9.0**

| Amazon EMR Release Label | Trino Version | Components Installed With Trino |
|---|---|---|
| emr-7.9.0 | Trino 467 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop- |

| Amazon EMR Release Label | Trino Version | Components Installed With Trino |
| --- | --- | --- |
| | | yarn-resourcemanager, hadoop-yarn-timeline-server, hive-client, hudi, hudi-trino, hcatalog-server, mariadb-server, trino-coordinator, trino-worker |

# Trino history and design

Trino is specialized for querying large datasets from many different sources. Trino can access and query HDFS in a traditional big-data use case, but it can also query additional sources like relational databases and NoSQL databases. Trino originally started as a fork of the Presto query engine, in 2019. Since then, it has been developed independently from the Presto code base.

For more information about the Trino query engine and how it's used, see the Trino website. To read the Trino source documentation, see Trino Overview.

## Architectural concepts

Trino can run quick and efficient queries because it processes data in parallel across a cluster. It's designed with querying a data lake in mind, as it's specialized for queries on large data volumes, typically in use cases involving Hadoop and HDFS. But it can also query traditional relational databases as well. For more information, see Architecture in the *Trino Documentation*.

### Components of Trino

Trino has a few key architecture components that work together to make queries run fast. It helps to have a working knowledge of these when you fine tune your cluster for better performance:

- The **coordinator** is responsible for query orchestration. It parses and optimizes incoming SQL queries, generates execution plans, assigns tasks to worker nodes, and collects and assembles query results. Additionally, it monitors resource usage and tracks the status of worker nodes. For more information, see Coordinator in the *Trino documentation*.
- **Worker nodes** handle data processing for queries. After the coordinator assigns tasks, workers retrieve data, perform necessary operations, like joins and aggregations, and exchange intermediate data with other workers. For more information, see Worker in the *Trino documentation*.
- **Connectors** are plugins that allow Trino to connect with and query various data sources. Each connector knows how to access and retrieve data from its source, such as Amazon S3, Apache Hive, or relational databases. These connectors map source data to Trino's schema structure.
- A **catalog** is a logical collection of schemas and tables associated with a specific connector. Defined in the coordinator, catalogs enable Trino to treat different data sources as a single namespace. This makes it so users can query multiple sources together, such as Hive and MySQL, in a unified way in the same query.
- **Clients** such as the Trino CLI connect by means of JDBC and ODBC drivers to the Trino coordinator to submit SQL queries. The coordinator manages the query lifecycle, providing results to the client for further analysis or reporting.

### Running queries

To understand how Trino takes SQL statements and runs them as queries, see Trino concepts in the *Trino Documentation*.

## Getting started with Trino

The procedures in this section show you how to set up an Amazon EMR cluster in order to query metastore data sources with Trino. These metastores, which include the Amazon Glue Data Catalog, store metadata and database objects and manage access permissions. The procedures cover prerequisites, recommended configuration settings, creating connectors, and running queries on metastore tables.

**Topics**

- Complete prerequisite steps for using Amazon EMR with Trino
- Launch an Amazon EMR cluster with Trino
- Connect to the primary node for the Amazon EMR cluster and run queries

# Complete prerequisite steps for using Amazon EMR with Trino

If you haven't used Amazon, or if you haven't created an Amazon EMR cluster, complete these prerequisite steps before you create an Amazon EMR cluster with Trino.

## Amazon environment set up

Complete these steps to configure your Amazon account if you haven't already:

1. Sign up for an Amazon account, if you don't have one already. For more information, see Create an Amazon account in the *Amazon Account Management Reference Guide*.
2. Sign in to your account as an administrative user.
3. Create a group and assign users to it.
4. Create an Amazon EC2 key pair, which you can use later to secure communication between resources with SSH. This step is required if you plan to connect to the primary node to perform tasks. For more information, see Connect to the Amazon EMR cluster primary node using SSH.

# Launch an Amazon EMR cluster with Trino

The following describes the correct configuration choices when you create a cluster with Trino.

## Using a Hive connector to make data available for querying

You can configure a Trino connector for a Hive metastore for the purpose of querying metastore data from your cluster. A metastore is an abstraction layer that makes file-based content or data available as tables, so it's easy to query. You have to configure a connector in Amazon EMR to make the Hive metastore tables available to the cluster. The following procedure shows you how to do this:

1. Choose Amazon Glue in the console and create a table, based on your source data in Amazon S3. A table in the Amazon Glue Data Catalog is the metadata definition for the data. It makes sense in this context to create the table manually, creating columns as you like, from your

source data. For more information about creating tables in Amazon Glue from semi-structured data in Amazon S3, see Creating tables using the console in the *Amazon Glue User Guide*.

2. Set your configuration as part of cluster creation. Select the **Configurations** tab. Configurations are optional specifications for your cluster. When you enter a configuration, add JSON like the following sample, which instructs Trino to use the Amazon Glue Data Catalog as its external Hive metastore for table metadata:

```
{
    "classification": "trino-connector-hive",
    "properties": {
        "hive.metastore": "glue"
    }
}
```

   Alternatively, you can apply configurations in the **Software settings** section when you create a cluster.

   Additionally, you can set up other connector types, such as for connecting with Apache Iceberg. For more information, see Use an Iceberg cluster with Trino in the *Amazon EMR Release Guide*. Configuring additional settings is optional.

To continue the getting-started steps, see Connect to the primary node for the Amazon EMR cluster and run queries.

## Create a cluster with Trino

The following describes the correct configuration choices when you create a cluster that you want to use with Trino.

> **Important**
>
> Before you create your cluster, complete Amazon Glue Data Catalog configuration as your Hive metastore, which we recommend for getting started. For more information, see Using a Hive connector to make data available for querying.

1. In the Amazon console, select Amazon EMR from the services. When you choose Amazon EMR, if you have existing clusters, your **EMR on EC2** clusters are listed.

2. Choose **Create cluster**. From here, you start the process for building a cluster.
3. Give your cluster a name and choose an **Amazon EMR release**. You can choose the most current release for the tutorial.
4. Choose the **Trino** bundle, which has the Trino application pre-selected. Bundles are set up for convenience when you know the purpose for the cluster ahead of time. Otherwise, you can simply select the check box for Trino.
5. For **Cluster configuration**, choose **Uniform instance groups**. Go ahead and remove additional instance groups.
6. Choose an **Instance type**. Generally we recommend you choose an instance type with at least 16 GiB memory. Also, for **Cluster scaling and provisioning** choose **Set cluster size manually**.
7. At this point, set your Hive metastore configuration to point to Amazon Glue. This is detailed in the section Using a Hive connector to make data available for querying. Complete this before you build the cluster.
8. Choose **Create cluster**. It can take a few minutes to finish.

   The steps here don't cover all of the configuration steps in detail. More information about setting up a cluster is available at Plan, configure and launch Amazon EMR clusters.

> **Note**
>
> Don't select both Presto and Trino for use on the same cluster. Running them together isn't supported. It's also recommended that if you run Trino, you don't run any other applications on the cluster, such as Spark.

## Connect to the primary node for the Amazon EMR cluster and run queries

### Provision test data and configure permissions

You can test Amazon EMR with Trino by using Amazon Glue Data Catalog and its Hive metastore. These prerequisite steps describe how to set up test data, if you haven't done so:

1. Create an SSH key to use for communication encryption, if you haven't already.

2. You can choose from several file systems to store data and log files. To start, create an Amazon S3 bucket. Give the bucket a unique name. When you create it, specify the encryption key that you created.

   > **Note**
   >
   > Choose the same region to create both your storage bucket and the Amazon EMR cluster.

3. Choose the bucket you created. Choose **Create folder** and give the folder a memorable name. When you create the folder, choose a security configuration. You can choose the security settings for the parent, or make the security settings more specialized.
4. Add test data to your folder. For the purposes of this tutorial, using a .csv of comma-separated records works well for completing this use case.
5. After you add data to an Amazon S3 bucket, configure a table in Amazon Glue to provide an abstraction layer for querying the data.

## Connect and run queries

The following describes how you connect to and run queries on a cluster running Trino. Before you do this, make sure you set up the Hive metastore connector, which is described in the previous procedure, so that metastore tables are visible.

1. We recommend using EC2 Instance Connect to connect to your cluster, because it provides a secure connection. Choose **Connect to the Primary node using SSH** from the cluster summary. The connection requires that the security group has an inbound rule to allow connections through port 22 to clients in the subnet. You also must use the user **hadoop** when connecting.
2. Start the Trino CLI by running `trino-cli`. This provides for you to run commands and query data with Trino.
3. Run `show catalogs;`. Check that the **hive** catalog is listed. This provides a list of catalogs available, which contain data stores or system settings.
4. To see the schemas available, run `show schemas in hive;`. From here, you can run `use` *`schema-name`*`;` and include the name of your schema. Then you can run `show tables;` to list tables.

5. Query a table by running a command like `SELECT * FROM table-name`, using the name of a table in your schema. If you already ran the USE statement to connect to a specific schema, you don't have to use two-part notation such as *schema*.*table*.

# Configuring Trino on Amazon EMR

**Topics**

- Configuring connectors for Trino
- Monitoring

## Configuring connectors for Trino

### Connecting to Amazon Glue as your Hive metastore

It's important and useful to understand that you can configure Amazon Glue Data Catalog as your Hive metastore when running queries with Trino. For additional information, including steps to set up a cluster with a Hive metastore, see Using the Amazon Glue Data Catalog as the metastore for Hive.

For information on integrating EMR on EKS with Amazon Glue, see the following best practices, EMR Containers integration with Amazon Glue.

### Connecting to Iceberg tables when using Trino with Amazon EMR

Iceberg is an open table format for analytic tables. It was created for engines like Spark and Trino to query big data from the same tables, using SQL queries. It includes features like isolating data reads and writes, so a reader can avoid querying data that's partially updated, for instance. It also supports state features, like snapshots. It provides an abstraction layer through the use of metadata and manifest files. These describe table schema and make it easy to query data without having to know a lot of details about how it's formatted or organized. When you're connected you can both read data from the tables update data, or write new data to the underlying files.

There's a workshop available that shows you how to configure Iceberg tables with Amazon EMR and Amazon Glue. For more information, see Analytics Workshop - Set Up and Use Apache Iceberg Tables on Your Data Lake.

### Connecting with Clients

You can connect with Trino using an available JDBC driver. For more information, see JDBC driver in the *Trino Documentation*.

## Monitoring

You can monitor Amazon EMR clusters through the Amazon Web Services Management Console. For more information, see View and monitor an Amazon EMR cluster as it performs work. Amazon EMR also sends its monitoring metrics to Amazon CloudWatch. For more information about monitoring an Amazon EMR cluster, see Amazon CloudWatch events and metrics from Amazon EMR.

# Best practices for Trino on Amazon EMR

Trino's architecture is designed for fast, distributed SQL queries on large datasets across multiple data sources, following a coordinator-worker model, where each component has a specialized role in query execution. There are a few areas or categories you can focus on in order to configure your Amazon EMR cluster running Trino for its best performance. These include the following:

- Adjusting cluster configuration settings for memory optimization.
- Optimizing settings for data partitioning and data distribution.
- Using dynamic filtering to reduce query-result counts.

Some of these settings are tuned automatically when you use Trino with Amazon EMR. Others can be set manually through the console or through CLI commands. The topics in this section help you configure your data and your cluster optimally.

**Topics**

- Key areas of focus for performance improvement
- Collect and Utilize table statistics
- Common challenges when scaling Trino workloads

# Key areas of focus for performance improvement

Trino maximizes query parallelism and memory optimization. This architecture provides flexibility by enabling it to query multiple, varied data sources while efficiently scaling. Key areas of performance improvement in Trino include those listed below.

## Memory optimization

Memory management in Trino is critical for achieving high performance and stability, especially when you run large, complex queries. Trino uses a distributed memory model. In this model, memory is allocated across worker nodes for processing tasks, aggregations, joins, and other operations. The following list introduces a collection of these settings:

- **query.max-memory** – Sets the maximum memory available for a single query across the entire cluster. This is a hard limit; if a query exceeds this memory, it will fail.
- **query.max-memory-per-node** – Defines the maximum memory a query can consume on each worker node. Setting this ensures no single query monopolizes resources on any worker.
- **JVM Heap Size** – Configured at the JVM level, it sets the maximum heap size for the Trino server process on each node. This value should generally be larger than the memory-related configurations (this is the sum of **query.max-memory-per-node** and **memory.heap-headroom-per-node**) in Trino to avoid the system running out of memory at the JVM level.
- **memory.heap-headroom-per-node** – Specifies a buffer amount of memory to leave out of the JVM heap size for non-query operations. This is crucial for ensuring enough overhead for internal operations and garbage collection.

## Dynamic Filtering

Dynamic filtering in Trino is an optimization technique that improves query performance by reducing the amount of data processed, particularly during joins. It dynamically applies filter conditions to limit the data scanned by one side of a join, based on the data seen on the other side, which is especially useful in queries where one side of the join is highly selective (meaning that it contains a small subset of data). It is enabled by default on Amazon EMR. The following is an example query:

```
SELECT orders.order_id, orders.total_amount
FROM orders
JOIN customers ON orders.customer_id = customers.customer_id
```

```
WHERE customers.country = 'France';
```

Without dynamic filtering, Trino scans the entire orders table in a join, even though only a small subset of customers (those from France) is relevant. This approach reads all rows in the **orders** table, resulting in high I/O and processing costs. With dynamic filtering, Trino initially scans the smaller **customers** table, retrieves customer_id values for only customers from France, and then applies this subset as a filter on orders. This means only relevant rows from **orders** — those with a customer_id matching the filtered subset — are scanned, significantly reducing the records processed.

### Spill to Disk

In Trino, disk spilling allows intermediate query results to be offloaded to disk, enabling memory-intensive queries to complete, even if they exceed memory limits set by `query_max_memory` or `query_max_memory_per_node`. By default, Trino enforces these limits to ensure fair memory allocation and to prevent cluster deadlock. However, when a large query surpasses these limits, it risks termination. Disk spilling addresses this by using `revocable memory`, allowing a query to borrow additional memory that can be revoked if resources are needed elsewhere. When memory is revoked, intermediate data spills to disk, enabling queries to continue processing without exceeding memory limits. Please note that a query that is forced to spill to disk may have longer execution time, hence it is disabled by default. To enable spill on Amazon EMR, use following configuration:

- `spill-enabled=true` – Enables disk spilling when memory usage exceeds available thresholds.
- `spill-paths` – Defines the directories where spilled data is stored, `spill-paths=/mnt/spill`.

## Collect and Utilize table statistics

Collecting table statistics allows Trino's cost-based optimizer to make informed decisions about join orders, filter pushdown, and partition pruning, resulting in better performance.

You can use the `ANALYZE` command to collect statistics for Hive or Iceberg tables:

```
ANALYZE sales;
```

Collecting statistics on wide tables can be taxing on resources. We recommend specifying a subset of columns that are used in joins, in filters, or in grouping operations.

This is another helpful command. It displays current statistics for a table to verify if statistics are up to date.

```
show stats for table_name;
```

## Common challenges when scaling Trino workloads

The primary benefits of using Amazon S3 with Trino are S3's ability to scale for large data volumes and S3's cost effectiveness. But when you query large data volumes, a collection of related performance issues can happen on occasion. These can result from how data is stored, or by configuration settings that restrict good performance, or from other reasons. When these issues occur, there are effective steps you can take to avoid or mitigate them.

This section begins with a list of general optimizations you can implement to increase query performance on large data volumes. Following that, common issues are detailed and mitigations are provided for each one.

This topic is sourced from the following conference presentation: Accelerate performance at scale: Best practices for Trino with Amazon S3.

### Optimizing data layout for large data sets

Performance bottlenecks aren't infrequent when you're querying large data sets. But there are best practices you can implement to give yourself a head start when you use Trino to query data in Amazon S3. These include the following:

- **Partitioning** – Partitioning means to organize data in a hierarchy and to store related data together, based on related attributes. Partitioning makes it so queries don't have to scan as much irrelevant data and it results in better query performance. You can use various partitioning strategies, such as arranging source data with prefixes, specifically by date ranges regions, or other attributes. For more detailed information about partitioning data in Amazon S3 to increase performance, see the blog post Get started managing partitions for Amazon S3 tables backed by the Amazon Glue Data Catalog or the post Top 10 Performance Tuning Tips for Amazon Athena.
- **Bucketing** – Bucketing is grouping related data together in common files. For instance, if you query data according to a geographic region, like a state, you can boost query performance by

grouping all data for a particular state in the same file or group of files. For this to work best, base your bucketing on a data attribute with high cardinality, such as a state or province, for instance. Also, you can take your query patterns into account. An example of this could mean grouping data for California and Oregon together, if your queries typically read data from those states together.

- **Managing S3 prefixes** – You can use Amazon S3 prefixes to implement a partitioning strategy. If you use only a single prefix for an Amazon S3 bucket, like a particular date, for instance, this can lead to a high number of requests and can result in an HTTP 503 error. We recommend using prefixes to add additional conditions and organize your source data more effectively. For more information, see Organizing objects using prefixes in the Amazon S3 documentation. The following brief example shows a prefix that results in better request throughput: `s3://bucket/country=US/dt=2024-06-13`. In this sample, both the country and date are included in the prefix, which results in fewer reads than a case where the prefix includes only the date.

  Mitigating HTTP 503 errors is discussed in more detail in the *HTTP slow down* section that follows in this topic.

- **Optimizing data size** – You can run the OPTIMIZE command to set configuration that's conducive to queries that perform better. To run it against Hive external tables, follow these steps:

  - Use `OPTIMIZE` with the following parameter: `hive.non-managed-table-writes-enabled=true`. For more information about this property, see Hive general configuration properties.
  - Set the following session parameter: `SET SESSION` *`catalog`*`.non_transactional_optimize_enabled=true`
  - Run the `OPTIMIZE` command: `ALTER TABLE` *`catalog.schema.table`* `EXECUTE optimize(file_size_threshold => '128MB')`. In this case, `file_size_threshold` is 100MB by default. Raising this threshold, as shown in the sample, will cause files below 128MB to be merged.

- **Configure retries** – You can increase the retry limit, which can mitigate the chance of HTTP 503 errors, by setting the following: `s3.max-error-retries`. This applies when you use the TrinoFileSystem API and Trino 449 version or later. On the other hand, in the case where you're using Amazon EMR with Trino, you use EMRFS to access Amazon S3. With EMRFS, you can increase the number of retires by changing the `fs.s3.maxRetries` parameter.

- **Choose an Amazon S3 storage class** – Choosing the appropriate storage class for data at different points in its lifecycle can help both with performance and cost, based on your

requirements for specific data collections. For more information, see Understanding and managing Amazon S3 storage classes in the Amazon S3 documentation.

- **Migrate to Iceberg** – Another solution to mitigate performance issues, specifically regarding running queries on small files, is to migrate to Iceberg tables. Iceberg has features that handle small files well.
- **Use automatic data compaction** – If you utilize Iceberg tables, automatic data compaction with the Amazon Glue Data Catalog can optimize data size and result in better query performance.

## Common challenges when you query large data sets

This section lists a collection of common issues that can occur when you accumulate a large data set in Amazon S3 and query it with Trino. Each section shows you ways to solve the issue or reduce its impact on queries. Each of the issues described in the following sections has been reproduced and tested, using a Hive connector.

### Large data scans

When your query has to scan large data sets, it can lead to issues like slow query performance and higher storage cost. Large data volumes can result from fast data growth or planning that doesn't result in moving legacy data within an appropriate time frame. This can lead to slower queries.

To mitigate performance hits from scanning large data sets, we recommend that you utilize partitioning and bucketing:

- Partitioning groups related data together, based on its attributes. Using partitioning effectively can greatly improve query performance.
- Bucketing refers to grouping data in files or buckets according to specific, related data columns. Bucketing typically means physically keeping related source data files together.

To illustrate how mitigation can work for large data scans, assume you store and query data that has records with a state attribute, which can be assigned to California or Alaska, and this state attribute is one of your query conditions. You can improve query performance by storing data for each state in a separate S3 bucket, or partitioning your data based on the state, using an S3 prefix. This partitioning and bucketing can also cause performance improvement if you base it on an additional column, like a date attribute, for example.

> **Note**
>
> If a column has high cardinality, and you want to use it to group data, we recommend using bucketing in this case. On the other hand, generally, partition keys should have lower cardinality.

### Using various S3 storage types

Generally, you choose storage types based on performance, data access, resiliency, and cost requirements for your workloads. There can be trade offs between cost and performance. It's important to choose the appropriate Amazon S3 storage class that matches your data access patterns. There are two main access patterns:

- Data that's accessed in a known or predictable manner. Generally, if you have data that is accessed infrequently, S3 Standard IA can be a good choice, because it helps reduce cost. If you have frequently accessed data, S3 Standard is best for access with Amazon EMR and Trino.
- Data that's accessed in an unknown or unpredictable manner. This can call for using other Amazon S3 storage classes, There are trade offs between S3 storage classes. These include latency, storage cost and availability. You can choose an appropriate S3 storage type, based on your workloads and access patterns. For descriptions of the benefits of each class, see Amazon S3 Storage Classes.

### Using compaction

You can also use Iceberg automatic compaction, if you use Iceberg tables, which results in more optimal file sizes, to increase query efficiency. For more information, see Amazon Glue Data Catalog now supports automatic compaction of Apache Iceberg tables.

### HTTP slow-down errors

This occurs when the request rate exceeds a pre-configured threshold on an Amazon S3 prefix. The HTTP error that occurs most commonly when this state is reached is the following: **Error 503: Please reduce your request rate**. The source for this issue can be rooted in the presence of a large number of small files, because of the number of *splits* that must be created in order to read the data. There are a couple ways to mitigate the issue:

- Increase the retry limit for Amazon S3 requests in Trino. This is set for EMRFS using `fs.s3.maxretries` in Trino 449.

- Optimize file sizes, which can also result in a lower request rate.

For more information about how Trino determines the number of splits in a set of data to query, see Performance tuning configuration properties in the Hive connector documentation.

**Difficulty querying small files**

Querying many small files can result in heavy I/O overhead, because of a high number of GET and LIST requests, and subsequently affect query performance negatively. Optimizing file size can improve query performance. There are a few ways to do this:

- Consolidate data into fewer larger files. (Generally, we recommend keeping file sizes at around 128 MB.) You can do this with tools when you ingest data, such as in an ETL pipeline, or you can consolidate data manually. If these solutions aren't available to you, the remaining options might be better suited for you.
- Run the `OPTIMIZE` command.
- Set the `SESSION` parameter.

Take note that Iceberg has a feature available to merge small files into larger files which is automatic compaction. It works with files managed with the Amazon Glue Data Catalog. For more information, see Amazon Glue Data Catalog now supports automatic compaction of Apache Iceberg tables.

**Queries that include data that isn't needed**

It's common for data to grow, which makes it imperative to track your data-access patterns and to move data appropriately as it ages or becomes irrelevant. This is because as data grows, query performance can degrade over time, mainly because of the sheer volume of data to scan when a query runs. Amazon S3 and other services offer guidance for data-lifecycle migration, which shows strategies for moving data to different storage locations as it becomes cold. There is also a storage cost benefit to doing this.

In addition to data migration, you can use other strategies like removing source data that isn't relevant to the queries you're running. This can take some work, as it might mean changing your source-data schema. But its positive result is to reduce data volume and result in faster queries. For more information, see Managing the lifecycle of objects.

# Trino Considerations

Consider the following when you run Trino on Amazon EMR.

## Non-configurable Trino deployment properties

The following table shows the different configuration options for Trino `properties` files.

| File | Configurable |
| --- | --- |
| `log.properties` | Trino: Configurable in Amazon EMR versions 6.1.0 and later. Use the `prestosql-log` or `trino-log` configuration classification. |
| `config.properties` | Trino: Configurable in Amazon EMR versions 6.1.0 and later. Use the `prestosql-config` or `trino-config` configuration classific ation. |
| `hive.properties` | Trino: Configurable in Amazon EMR versions 6.1.0 and later. Use the `prestosql-connector-hive` or `trino-connector-hive` configuration classification. |
| `node.properties` | Trino: Configurable in Amazon EMR versions 6.1.0 and later. Use the `prestosql-node` or `trino-node` configuration classification. |
| `jvm.config` | Not configurable. |

## Additional considerations

- For Trino on EMR version 6.1.0 and later, Amazon EMR automatically configures a shared secret key for secure internal communication between cluster nodes. You don't need to do any additional configuration to enable this security feature, and you can override the configuration with your own secret key. For information about Trino internal authentication, see Trino 353 documentation: Secure internal communication.

# Trino release history

The release notes sections detail changes and updates for specific version of Trino on Amazon EMR.

## Trino release notes by version

- Amazon EMR 7.6.0 - Trino release notes
- Amazon EMR 7.3.0 - Trino release notes
- Amazon EMR 6.9.0 - Trino release notes

## Amazon EMR 7.6.0 - Trino release notes

### Amazon EMR 7.6.0 - Trino new features

- To support long running queries, Trino now includes a fault-tolerant execution mechanism. Fault-tolerant execution mitigates query failures by retrying failed queries or their component tasks.

### Amazon EMR 7.6.0 - Trino changes

#### Amazon EMR 7.6.0 - Trino changes

| Type | Description |
| --- | --- |
| Upgrade | Trino upgrade to 457 |

## Amazon EMR 7.3.0 - Trino release notes

### Amazon EMR 7.3.0 - Trino changes

- This release upgrades Trino from version 436 to 442.
- This release redirects Hudi queries to the new Hudi corrector. The old Hive connector can no longer read Hudi tables. Note
- This release removes the Rubix module from Amazon EMR because it is now deprecated from open-source.
- This release removes legacy mode in the `hive.security` property. The default is now `allow-all`.

# Amazon EMR 6.9.0 - Trino release notes

## Amazon EMR 6.9.0 - Trino new features

- To support long running queries, Trino now includes a fault-tolerant execution mechanism. Fault-tolerant execution mitigates query failures by retrying failed queries or their component tasks.

## Amazon EMR 6.9.0 - Trino changes

### Amazon EMR 6.9.0 - Trino changes

| Type | Description |
| --- | --- |
| Upgrade | Trino Upgrade to 398 |
| Upgrade | Support for Hadoop 3.3.3 |
| Feature | Tardigrade support: Add support for exchange spooling on HDFS and Amazon S3. |
| Bug fix | When Trino Iceberg is used and Glue catalog is enabled, avoid adding metastore uri in `iceberg.properties`. |

## Amazon EMR 6.9.0 - Trino known issues

- For Amazon EMR release 6.9.0, Trino does not work on clusters enabled for Apache Ranger. If you need to use Trino with Ranger, contact Amazon Web Services Support.

# Apache Zeppelin

Use Apache Zeppelin as a notebook for interactive data exploration. For more information about Zeppelin, see https://zeppelin.apache.org/. Zeppelin is included in Amazon EMR releases 5.0.0 and later. Earlier releases include Zeppelin as a sandbox application. For more information, see Amazon EMR 4.x release versions.

To access the Zeppelin web interface, set up an SSH tunnel to the master node and a proxy connection. For more information, see View web interfaces hosted on EMR clusters.

The following table lists the version of Zeppelin included in the latest release of the Amazon EMR 7.x series, along with the components that Amazon EMR installs with Zeppelin.

For the version of components installed with Zeppelin in this release, see Release 7.9.0 Component Versions.

**Zeppelin version information for emr-7.9.0**

| Amazon EMR Release Label | Zeppelin Version | Components Installed With Zeppelin |
|---|---|---|
| emr-7.9.0 | Zeppelin 0.11.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, zeppelin-server |

The following table lists the version of Zeppelin included in the latest release of the Amazon EMR 6.x series, along with the components that Amazon EMR installs with Zeppelin.

For the version of components installed with Zeppelin in this release, see Release 6.15.0 Component Versions.

**Zeppelin version information for emr-6.15.0**

| Amazon EMR Release Label | Zeppelin Version | Components Installed With Zeppelin |
|---|---|---|
| emr-6.15.0 | Zeppelin 0.10.1 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, zeppelin-server |

The following table lists the version of Zeppelin included in the latest release of the Amazon EMR 5.x series, along with the components that Amazon EMR installs with Zeppelin.

For the version of components installed with Zeppelin in this release, see Release 5.36.2 Component Versions.

**Zeppelin version information for emr-5.36.2**

| Amazon EMR Release Label | Zeppelin Version | Components Installed With Zeppelin |
|---|---|---|
| emr-5.36.2 | Zeppelin 0.10.0 | aws-sagemaker-spark-sdk, emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-nameno |

| Amazon EMR Release Label | Zeppelin Version | Components Installed With Zeppelin |
| --- | --- | --- |
| | | de, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, zeppelin-server |

**Topics**

- Considerations when using Zeppelin on Amazon EMR
- Zeppelin release history

# Considerations when using Zeppelin on Amazon EMR

- Connect to Zeppelin using the same SSH tunneling method to connect to other web servers on the master node. Zeppelin server is found at port 8890.
- Zeppelin on Amazon EMR release versions 5.0.0 and later supports Shiro authentication.
- Zeppelin on Amazon EMR release versions 5.8.0 and later supports using Amazon Glue Data Catalog as the metastore for Spark SQL. For more information, see Using Amazon Glue Data Catalog as the metastore for Spark SQL.
- Zeppelin does not use some of the settings defined in your cluster's `spark-defaults.conf` configuration file, even though it instructs YARN to allocate executors dynamically if you have set `spark.dynamicAllocation.enabled` to `true`. You must set executor settings, such as memory and cores, using the Zeppelin **Interpreter** tab, and then restart the interpreter for them to be used.
- Amazon EMR releases 6.10.0 and higher support Apache Zeppelin integration with Apache Flink. See Working with Flink jobs from Zeppelin in Amazon EMR for more information.
- Zeppelin on Amazon EMR does not support the SparkR interpreter.

# Zeppelin release history

The following table lists the version of Zeppelin included in each release version of Amazon EMR, along with the components installed with the application. For component versions in each release, see the Component Version section for your release in Amazon EMR 7.x release versions, Amazon EMR 6.x release versions, or Amazon EMR 5.x release versions.

### Zeppelin version information

| Amazon EMR Release label | Zeppelin Version | Components installed with Zeppelin |
|---|---|---|
| emr-7.9.0 | 0.11.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, zeppelin-server |
| emr-7.8.0 | 0.11.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, r, spark-client, spark-history- |

| Amazon EMR Release label | Zeppelin Version | Components installed with Zeppelin |
|---|---|---|
| | | server, spark-on-yarn, spark-yarn-slave, zeppelin-server |
| emr-7.7.0 | 0.11.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, zeppelin-server |
| emr-7.6.0 | 0.11.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, zeppelin-server |

| Amazon EMR Release label | Zeppelin Version | Components installed with Zeppelin |
| --- | --- | --- |
| emr-7.5.0 | 0.11.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, zeppelin-server |
| emr-7.4.0 | 0.11.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, hudi, hudi-spark, livy-server, r, spark-client, spark-history-server, spark-on-yarn, spark-yarn-slave, zeppelin-server |

| Amazon EMR Release label | Zeppelin Version | Components installed with Zeppelin |

# Apache ZooKeeper

Apache ZooKeeper is a centralized service for maintaining configuration information, naming, providing distributed synchronization, and providing group services. For more information about ZooKeeper, see http://zookeeper.apache.org/.

The following table lists the version of ZooKeeper included in the latest release of the Amazon EMR 7.x series, along with the components that Amazon EMR installs with ZooKeeper.

For the version of components installed with ZooKeeper in this release, see Release 7.9.0 Component Versions.

**ZooKeeper version information for emr-7.9.0**

| Amazon EMR Release Label | ZooKeeper Version | Components Installed With ZooKeeper |
|---|---|---|
| emr-7.9.0 | ZooKeeper 3.9.3 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

The following table lists the version of ZooKeeper included in the latest release of the Amazon EMR 6.x series, along with the components that Amazon EMR installs with ZooKeeper.

For the version of components installed with ZooKeeper in this release, see Release 6.15.0 Component Versions.

**ZooKeeper version information for emr-6.15.0**

| Amazon EMR Release Label | ZooKeeper Version | Components Installed With ZooKeeper |
|---|---|---|
| emr-6.15.0 | ZooKeeper 3.5.10 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

The following table lists the version of ZooKeeper included in the latest release of the Amazon EMR 5.x series, along with the components that Amazon EMR installs with ZooKeeper.

For the version of components installed with ZooKeeper in this release, see Release 5.36.2 Component Versions.

**ZooKeeper version information for emr-5.36.2**

| Amazon EMR Release Label | ZooKeeper Version | Components Installed With ZooKeeper |
|---|---|---|
| emr-5.36.2 | ZooKeeper 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, |

| Amazon EMR Release Label | ZooKeeper Version | Components Installed With ZooKeeper |
| --- | --- | --- |
| | | zookeeper-client, zookeeper-server |

**Topics**

- ZooKeeper release history
- ZooKeeper release notes by version

# ZooKeeper release history

The following table lists the version of ZooKeeper included in each release version of Amazon EMR, along with the components installed with the application. For component versions in each release, see the Component Version section for your release in Amazon EMR 7.x release versions, Amazon EMR 6.x release versions, or Amazon EMR 5.x release versions.

**ZooKeeper version information**

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
| --- | --- | --- |
| emr-7.9.0 | 3.9.3 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-7.8.0 | 3.9.3 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| | | y, hadoop-hdfs-nameno de, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-7.7.0 | 3.9.2 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datano de, hadoop-hdfs-librar y, hadoop-hdfs-nameno de, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-7.6.0 | 3.9.2 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datano de, hadoop-hdfs-librar y, hadoop-hdfs-nameno de, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-7.5.0 | 3.9.2 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-7.4.0 | 3.9.2 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
| --- | --- | --- |
| emr-7.3.0 | 3.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-7.2.0 | 3.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
| --- | --- | --- |
| emr-5.36.2 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-7.1.0 | 3.9.1 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-7.0.0 | 3.5.10 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-6.15.0 | 3.5.10 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-6.14.0 | 3.5.10 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-6.13.0 | 3.5.10 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-6.10.0 | 3.5.10 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-6.9.1 | 3.5.10 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
| --- | --- | --- |
| emr-6.9.0 | 3.5.10 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-6.8.1 | 3.5.10 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-6.8.0 | 3.5.10 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-6.7.0 | 3.5.7 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-5.36.1 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-5.36.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
| --- | --- | --- |
| emr-6.6.0 | 3.5.7 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-5.35.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-6.5.0 | 3.5.7 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-6.4.0 | 3.5.7 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-6.3.1 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-6.3.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-6.2.1 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-6.2.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-6.1.1 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-6.1.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-6.0.1 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-6.0.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-5.34.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-5.33.1 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-5.33.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-5.32.1 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-5.32.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-5.31.1 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-5.31.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-5.30.2 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-5.30.1 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-5.30.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-5.29.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-5.28.1 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-5.28.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-5.27.1 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
| --- | --- | --- |
| emr-5.27.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-5.26.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-5.25.0 | 3.4.14 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-5.24.1 | 3.4.13 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-5.24.0 | 3.4.13 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-5.23.1 | 3.4.13 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-5.23.0 | 3.4.13 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-5.22.0 | 3.4.13 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

| Amazon EMR Release label | ZooKeeper Version | Components installed with ZooKeeper |
|---|---|---|
| emr-5.21.2 | 3.4.13 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |
| emr-5.21.1 | 3.4.13 | emrfs, emr-goodies, hadoop-client, hadoop-hdfs-datanode, hadoop-hdfs-library, hadoop-hdfs-namenode, hadoop-httpfs-server, hadoop-kms-server, hadoop-yarn-nodemanager, hadoop-yarn-resourcemanager, hadoop-yarn-timeline-server, zookeeper-client, zookeeper-server |

# ZooKeeper release notes by version

See the following sections for the full release notes.

## Amazon EMR 7.8.0 - ZooKeeper release notes

### Amazon EMR 7.8.0 - ZooKeeper Changes

**Upgrade** – Zookeeper is upgraded to version 3.9.3.

## Amazon EMR 7.5.0 - ZooKeeper release notes

### Amazon EMR 7.5.0 - ZooKeeper Changes

- Starting with EMR-7.5.0, Zookeeper is set to Java 17 by default at runtime. To use a different version for the Java runtime, override the JVM settings in the `zookeeper-server` file and set `JAVA_HOME` to the desired version.

## Amazon EMR 7.4.0 - ZooKeeper release notes

| Type | Description |
| --- | --- |
| Upgrade | Zookeeper version is upgraded to 3.9.2. |

| Type | Description |
| --- | --- |
| Improvement | ZOOKEEPER-4778: Patch jetty, netty, and logback to remove high severity vulnerabi lities. |
| Improvement | ZOOKEEPER-4799: Fixes CVE-2024-23944. |
| Bug Fix | ZOOKEEPER-4415: TLSv1.3 support is added. |

## Amazon EMR 7.4.0 - ZooKeeper Features

- Clusters with in-transit encryption security configuration provided will have TLS enabled by default for Quorum communication and Zookeeper Admin Server. Additionally, TLS secure port is exposed at 2281 for client communication with Zookeeper.

# Connectors and utilities

Amazon EMR provides a number of connectors and utilities to access other Amazon services as data sources. You can usually access data in these services within a program. For example, you can specify an Kinesis stream in a Hive query, Pig script, or MapReduce application and then operate on that data.

**Topics**

- Export, import, query, and join tables in DynamoDB using Amazon EMR
- Kinesis
- S3DistCp (s3-dist-cp)
- Cleaning up after failed S3DistCp jobs

# Export, import, query, and join tables in DynamoDB using Amazon EMR

> **Note**
>
> The Amazon EMR-DynamoDB Connector is open-sourced on GitHub. For more information, see https://github.com/awslabs/emr-dynamodb-connector.

DynamoDB is a fully managed NoSQL database service that provides fast and predictable performance with seamless scalability. Developers can create a database table and grow its request traffic or storage without limit. DynamoDB automatically spreads the data and traffic for the table over a sufficient number of servers to handle the request capacity specified by the customer and the amount of data stored, while maintaining consistent, fast performance. Using Amazon EMR and Hive you can quickly and efficiently process large amounts of data, such as data stored in DynamoDB. For more information about DynamoDB, see Amazon DynamoDB Developer Guide.

Apache Hive is a software layer that you can use to query map reduce clusters using a simplified, SQL-like query language called HiveQL. It runs on top of the Hadoop architecture. For more information about Hive and HiveQL, go to the HiveQL language manual. For more information about Hive and Amazon EMR, see Apache Hive .

You can use Amazon EMR with a customized version of Hive that includes connectivity to DynamoDB to perform operations on data stored in DynamoDB:

- Loading DynamoDB data into the Hadoop Distributed File System (HDFS) and using it as input into an Amazon EMR cluster.
- Querying live DynamoDB data using SQL-like statements (HiveQL).
- Joining data stored in DynamoDB and exporting it or querying against the joined data.
- Exporting data stored in DynamoDB to Amazon S3.
- Importing data stored in Amazon S3 to DynamoDB.

**Note**

The Amazon EMR-DynamoDB Connector does not support clusters configured to use Kerberos authentication.

To perform each of the following tasks, you'll launch an Amazon EMR cluster, specify the location of the data in DynamoDB, and issue Hive commands to manipulate the data in DynamoDB.

There are several ways to launch an Amazon EMR cluster: you can use the Amazon EMR console, the command line interface (CLI), or you can program your cluster using an Amazon SDK or the Amazon EMR API. You can also choose whether to run a Hive cluster interactively or from a script. In this section, we will show you how to launch an interactive Hive cluster from the Amazon EMR console and the CLI.

Using Hive interactively is a great way to test query performance and tune your application. After you have established a set of Hive commands that will run on a regular basis, consider creating a Hive script that Amazon EMR can run for you.

**Warning**

Amazon EMR read or write operations on an DynamoDB table count against your established provisioned throughput, potentially increasing the frequency of provisioned throughput exceptions. For large requests, Amazon EMR implements retries with exponential backoff to manage the request load on the DynamoDB table. Running Amazon EMR jobs concurrently with other traffic may cause you to exceed the allocated provisioned throughput level. You can monitor this by checking the **ThrottleRequests** metric in Amazon

CloudWatch. If the request load is too high, you can relaunch the cluster and set the Read percent setting or Write percent setting to a lower value to throttle the Amazon EMR operations. For information about DynamoDB throughput settings, see Provisioned throughput.
If a table is configured for On-Demand mode, you should change the table back to provisioned mode before running an export or import operation. Pipelines need a throughput ratio in order to calculate resources to use from a DynamoDBtable. On-demand mode removes provisioned throughput. To provision throughput capacity, you can use Amazon CloudWatch Events metrics to evaluate the aggregate throughput that a table has used.

**Topics**

- Set up a Hive table to run Hive commands
- Hive command examples for exporting, importing, and querying data in DynamoDB
- Optimizing performance for Amazon EMR operations in DynamoDB

## Set up a Hive table to run Hive commands

Apache Hive is a data warehouse application you can use to query data contained in Amazon EMR clusters using a SQL-like language. For more information about Hive, see http://hive.apache.org/.

The following procedure assumes you have already created a cluster and specified an Amazon EC2 key pair. To learn how to get started creating clusters, see Getting started with Amazon EMR in the *Amazon EMR Management Guide*.

### Configure Hive to use MapReduce

When you use Hive on Amazon EMR to query DynamoDB tables, errors can occur if Hive uses the default execution engine, Tez. For this reason, when you create a cluster with Hive that integrates with DynamoDB as described in this section, we recommend that you use a configuration classification that sets Hive to use MapReduce. For more information, see Configure applications.

The following snippet shows the configuration classification and property to use to set MapReduce as the execution engine for Hive:

```
[
```

```
    {
        "Classification": "hive-site",
        "Properties": {
            "hive.execution.engine": "mr"
        }
    }
]
```

**To run Hive commands interactively**

1. Connect to the master node. For more information, see Connect to the master node using SSH in the *Amazon EMR Management Guide*.
2. At the command prompt for the current master node, type `hive`.

   You should see a hive prompt: `hive>`
3. Enter a Hive command that maps a table in the Hive application to the data in DynamoDB. This table acts as a reference to the data stored in Amazon DynamoDB; the data is not stored locally in Hive and any queries using this table run against the live data in DynamoDB, consuming the table's read or write capacity every time a command is run. If you expect to run multiple Hive commands against the same dataset, consider exporting it first.

   The following shows the syntax for mapping a Hive table to a DynamoDB table.

   ```
   CREATE EXTERNAL TABLE hive_tablename
    (hive_column1_name column1_datatype, hive_column2_name column2_datatype...)
   STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
   TBLPROPERTIES ("dynamodb.table.name" = "dynamodb_tablename",
   "dynamodb.column.mapping" =
    "hive_column1_name:dynamodb_attribute1_name,hive_column2_name:dynamodb_attribute2_name..."
   ```

   When you create a table in Hive from DynamoDB, you must create it as an external table using the keyword `EXTERNAL`. The difference between external and internal tables is that the data in internal tables is deleted when an internal table is dropped. This is not the desired behavior when connected to Amazon DynamoDB, and thus only external tables are supported.

   For example, the following Hive command creates a table named *hivetable1* in Hive that references the DynamoDB table named *dynamodbtable1*. The DynamoDB table *dynamodbtable1* has a hash-and-range primary key schema. The hash key element is `name`

(string type), the range key element is `year` (numeric type), and each item has an attribute value for `holidays` (string set type).

```
CREATE EXTERNAL TABLE hivetable1 (col1 string, col2 bigint, col3 array<string>)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "dynamodbtable1",
"dynamodb.column.mapping" = "col1:name,col2:year,col3:holidays");
```

Line 1 uses the HiveQL `CREATE EXTERNAL TABLE` statement. For *hivetable1*, you need to establish a column for each attribute name-value pair in the DynamoDB table, and provide the data type. These values are not case-sensitive, and you can give the columns any name (except reserved words).

Line 2 uses the `STORED BY` statement. The value of `STORED BY` is the name of the class that handles the connection between Hive and DynamoDB. It should be set to `'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'`.

Line 3 uses the `TBLPROPERTIES` statement to associate "hivetable1" with the correct table and schema in DynamoDB. Provide `TBLPROPERTIES` with values for the `dynamodb.table.name` parameter and `dynamodb.column.mapping` parameter. These values *are* case-sensitive.

**Note**

All DynamoDB attribute names for the table must have corresponding columns in the Hive table. Depending on your Amazon EMR version, the following scenarios occur if the one-to-one mapping does not exist:

- On Amazon EMR version 5.27.0 and later, the connector has validations that ensure a one-to-one mapping between DynamoDB attribute names and columns in the Hive table. An error will occur if the one-to-one mapping does not exist.
- On Amazon EMR version 5.26.0 and earlier, the Hive table won't contain the name-value pair from DynamoDB. If you do not map the DynamoDB primary key attributes, Hive generates an error. If you do not map a non-primary key attribute, no error is generated, but you won't see the data in the Hive table. If the data types do not match, the value is null.

Then you can start running Hive operations on *hivetable1*. Queries run against *hivetable1* are internally run against the DynamoDB table *dynamodbtable1* of your DynamoDB account, consuming read or write units with each execution.

When you run Hive queries against a DynamoDB table, you need to ensure that you have provisioned a sufficient amount of read capacity units.

For example, suppose that you have provisioned 100 units of read capacity for your DynamoDB table. This will let you perform 100 reads, or 409,600 bytes, per second. If that table contains 20GB of data (21,474,836,480 bytes), and your Hive query performs a full table scan, you can estimate how long the query will take to run:

*21,474,836,480 / 409,600 = 52,429 seconds = 14.56 hours*

The only way to decrease the time required would be to adjust the read capacity units on the source DynamoDB table. Adding more Amazon EMR nodes will not help.

In the Hive output, the completion percentage is updated when one or more mapper processes are finished. For a large DynamoDB table with a low provisioned read capacity setting, the completion percentage output might not be updated for a long time; in the case above, the job will appear to be 0% complete for several hours. For more detailed status on your job's progress, go to the Amazon EMR console; you will be able to view the individual mapper task status, and statistics for data reads. You can also log on to Hadoop interface on the master node and see the Hadoop statistics. This will show you the individual map task status and some data read statistics. For more information, see the following topics:

- Web interfaces hosted on the master node
- View the Hadoop web interfaces

For more information about sample HiveQL statements to perform tasks such as exporting or importing data from DynamoDB and joining tables, see Hive command examples for exporting, importing, and querying data in DynamoDB.

**To cancel a Hive request**

When you execute a Hive query, the initial response from the server includes the command to cancel the request. To cancel the request at any time in the process, use the **Kill Command** from the server response.

1. Enter `Ctrl+C` to exit the command line client.

2. At the shell prompt, enter the **Kill Command** from the initial server response to your request.

   Alternatively, you can run the following command from the command line of the master node to kill the Hadoop job, where *job-id* is the identifier of the Hadoop job and can be retrieved from the Hadoop user interface.

   ```
   hadoop job -kill job-id
   ```

## Data types for Hive and DynamoDB

The following table shows the available Hive data types, the default DynamoDB type that they correspond to, and the alternate DynamoDB types that they can also map to.

| Hive type | Default DynamoDB type | Alternate DynamoDB type(s) |
|---|---|---|
| string | string (S) | |
| bigint or double | number (N) | |
| binary | binary (B) | |
| boolean | boolean (BOOL) | |
| array | list (L) | number set (NS), string set (SS), or binary set (BS) |
| map<string,string> | item | map (M) |
| map<string,?> | map (M) | |
| | null (NULL) | |

If you want to write your Hive data as a corresponding alternate DynamoDB type, or if your DynamoDB data contains attribute values of an alternate DynamoDB type, you can specify the column and the DynamoDB type with the `dynamodb.type.mapping` parameter. The following example shows the syntax for specifying an alternate type mapping.

```
CREATE EXTERNAL TABLE hive_tablename (hive_column1_name column1_datatype,
 hive_column2_name column2_datatype...)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "dynamodb_tablename",
"dynamodb.column.mapping" =
 "hive_column1_name:dynamodb_attribute1_name,hive_column2_name:dynamodb_attribute2_name...",
"dynamodb.type.mapping" = "hive_column1_name:dynamodb_attribute1_datatype");
```

The type mapping parameter is optional, and only has to be specified for the columns that use alternate types.

For example, the following Hive command creates a table named `hivetable2` that references the DynamoDB table `dynamodbtable2`. It is similar to `hivetable1`, except that it maps the `col3` column to the string set (SS) type.

```
CREATE EXTERNAL TABLE hivetable2 (col1 string, col2 bigint, col3 array<string>)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "dynamodbtable2",
"dynamodb.column.mapping" = "col1:name,col2:year,col3:holidays",
"dynamodb.type.mapping" = "col3:SS");
```

In Hive, `hivetable1` and `hivetable2` are identical. However, when data from those tables are written to their corresponding DynamoDB tables, `dynamodbtable1` will contain lists, while `dynamodbtable2` will contain string sets.

If you want to write Hive `null` values as attributes of DynamoDB `null` type, you can do so with the `dynamodb.null.serialization` parameter. The following example shows the syntax for specifying `null` serialization.

```
CREATE EXTERNAL TABLE hive_tablename (hive_column1_name column1_datatype,
 hive_column2_name column2_datatype...)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "dynamodb_tablename",
"dynamodb.column.mapping" =
 "hive_column1_name:dynamodb_attribute1_name,hive_column2_name:dynamodb_attribute2_name...",
```

```
"dynamodb.null.serialization" = "true");
```

The null serialization parameter is optional, and is set to `false` if not specified. Note that DynamoDB `null` attributes are read as `null` values in Hive regardless of the parameter setting. Hive collections with `null` values can be written to DynamoDB only if the null serialization parameter is specified as `true`. Otherwise, a Hive error occurs.

The bigint type in Hive is the same as the Java long type, and the Hive double type is the same as the Java double type in terms of precision. This means that if you have numeric data stored in DynamoDB that has precision higher than is available in the Hive datatypes, using Hive to export, import, or reference the DynamoDB data could lead to a loss in precision or a failure of the Hive query.

Exports of the binary type from DynamoDB to Amazon Simple Storage Service (Amazon S3) or HDFS are stored as a Base64-encoded string. If you are importing data from Amazon S3 or HDFS into the DynamoDB binary type, it should be encoded as a Base64 string.

### Hive options

You can set the following Hive options to manage the transfer of data out of Amazon DynamoDB. These options only persist for the current Hive session. If you close the Hive command prompt and reopen it later on the cluster, these settings will have returned to the default values.

| Hive options | Description |
| --- | --- |
| `dynamodb.throughput.read.percent` | Set the rate of read operations to keep your DynamoDB provisioned throughput rate in the allocated range for your table. The value is between `0.1` and `1.5`, inclusively.<br><br>The value of 0.5 is the default read rate, which means that Hive will attempt to consume half of the read provisioned throughout resources in the table. Increasing this value above 0.5 increases the read request rate. Decreasing it below 0.5 decreases the read request rate. This read rate is approxima te. The actual read rate will depend on factors such as whether there is a uniform distribution of keys in DynamoDB. |

| Hive options | Description |
| --- | --- |
| | If you find your provisioned throughput is frequently exceeded by the Hive operation, or if live read traffic is being throttled too much, then reduce this value below `0.5`. If you have enough capacity and want a faster Hive operation, set this value above `0.5`. You can also oversubscribe by setting it up to 1.5 if you believe there are unused input/output operations available. |
| `dynamodb.throughput.write.percent` | Set the rate of write operations to keep your DynamoDB provisioned throughput rate in the allocated range for your table. The value is between `0.1` and `1.5`, inclusively.<br><br>The value of 0.5 is the default write rate, which means that Hive will attempt to consume half of the write provisioned throughout resources in the table. Increasing this value above 0.5 increases the write request rate. Decreasing it below 0.5 decreases the write request rate. This write rate is approximate. The actual write rate will depend on factors such as whether there is a uniform distribution of keys in DynamoDB<br><br>If you find your provisioned throughput is frequently exceeded by the Hive operation, or if live write traffic is being throttled too much, then reduce this value below `0.5`. If you have enough capacity and want a faster Hive operation, set this value above `0.5`. You can also oversubscribe by setting it up to 1.5 if you believe there are unused input/output operations available or this is the initial data upload to the table and there is no live traffic yet. |

| Hive options | Description |
| --- | --- |
| `dynamodb.endpoint` | Specify the endpoint for the DynamoDB service. For more information about the available DynamoDB endpoints, see Regions and endpoints. |
| `dynamodb.max.map.tasks` | Specify the maximum number of map tasks when reading data from DynamoDB. This value must be equal to or greater than 1. |
| `dynamodb.retry.duration` | Specify the number of minutes to use as the timeout duration for retrying Hive commands. This value must be an integer equal to or greater than 0. The default timeout duration is two minutes. |

These options are set using the SET command as shown in the following example.

```
SET dynamodb.throughput.read.percent=1.0;

INSERT OVERWRITE TABLE s3_export SELECT *
FROM hiveTableName;
```

## Hive command examples for exporting, importing, and querying data in DynamoDB

The following examples use Hive commands to perform operations such as exporting data to Amazon S3 or HDFS, importing data to DynamoDB, joining tables, querying tables, and more.

Operations on a Hive table reference data stored in DynamoDB. Hive commands are subject to the DynamoDB table's provisioned throughput settings, and the data retrieved includes the data written to the DynamoDB table at the time the Hive operation request is processed by DynamoDB. If the data retrieval process takes a long time, some data returned by the Hive command may have been updated in DynamoDB since the Hive command began.

Hive commands DROP TABLE and CREATE TABLE only act on the local tables in Hive and do not create or drop tables in DynamoDB. If your Hive query references a table in DynamoDB, that table must already exist before you run the query. For more information about creating and deleting tables in DynamoDB, see Working with tables in DynamoDB in the *Amazon DynamoDB Developer Guide*.

> **Note**
>
> When you map a Hive table to a location in Amazon S3, do not map it to the root path of the bucket, s3://amzn-s3-demo-bucket, as this may cause errors when Hive writes the data to Amazon S3. Instead map the table to a subpath of the bucket, s3://amzn-s3-demo-bucket/mypath.

## Exporting data from DynamoDB

You can use Hive to export data from DynamoDB.

**To export a DynamoDB table to an Amazon S3 bucket**

- Create a Hive table that references data stored in DynamoDB. Then you can call the INSERT OVERWRITE command to write the data to an external directory. In the following example, *s3://amzn-s3-demo-bucket/path/subpath/* is a valid path in Amazon S3. Adjust the columns and datatypes in the CREATE command to match the values in your DynamoDB. You can use this to create an archive of your DynamoDB data in Amazon S3.

```
CREATE EXTERNAL TABLE hiveTableName (col1 string, col2 bigint, col3 array<string>)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "dynamodbtable1",
"dynamodb.column.mapping" = "col1:name,col2:year,col3:holidays");

INSERT OVERWRITE DIRECTORY 's3://amzn-s3-demo-bucket/path/subpath/' SELECT *
FROM hiveTableName;
```

**To export a DynamoDB table to an Amazon S3 bucket using formatting**

- Create an external table that references a location in Amazon S3. This is shown below as s3_export. During the CREATE call, specify row formatting for the table. Then, when you use INSERT OVERWRITE to export data from DynamoDB to s3_export, the data is written out in the specified format. In the following example, the data is written out as comma-separated values (CSV).

```
CREATE EXTERNAL TABLE hiveTableName (col1 string, col2 bigint, col3 array<string>)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "dynamodbtable1",
"dynamodb.column.mapping" = "col1:name,col2:year,col3:holidays");

CREATE EXTERNAL TABLE s3_export(a_col string, b_col bigint, c_col array<string>)
ROW FORMAT DELIMITED FIELDS TERMINATED BY ','
LOCATION 's3://amzn-s3-demo-bucket/path/subpath/';

INSERT OVERWRITE TABLE s3_export SELECT *
FROM hiveTableName;
```

**To export a DynamoDB table to an Amazon S3 bucket without specifying a column mapping**

- Create a Hive table that references data stored in DynamoDB. This is similar to the preceding example, except that you are not specifying a column mapping. The table must have exactly one column of type `map<string, string>`. If you then create an `EXTERNAL` table in Amazon S3 you can call the `INSERT OVERWRITE` command to write the data from DynamoDB to Amazon S3. You can use this to create an archive of your DynamoDB data in Amazon S3. Because there is no column mapping, you cannot query tables that are exported this way. Exporting data without specifying a column mapping is available in Hive 0.8.1.5 or later, which is supported on Amazon EMR AMI 2.2.*x* and later.

```
CREATE EXTERNAL TABLE hiveTableName (item map<string,string>)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "dynamodbtable1");

CREATE EXTERNAL TABLE s3TableName (item map<string, string>)
```

```
ROW FORMAT DELIMITED FIELDS TERMINATED BY '\t' LINES TERMINATED BY '\n'
LOCATION 's3://amzn-s3-demo-bucket/path/subpath/';

INSERT OVERWRITE TABLE s3TableName SELECT *
FROM hiveTableName;
```

**To export a DynamoDB table to an Amazon S3 bucket using data compression**

- Hive provides several compression codecs you can set during your Hive session. Doing so causes the exported data to be compressed in the specified format. The following example compresses the exported files using the Lempel-Ziv-Oberhumer (LZO) algorithm.

```
SET hive.exec.compress.output=true;
SET io.seqfile.compression.type=BLOCK;
SET mapred.output.compression.codec = com.hadoop.compression.lzo.LzopCodec;

CREATE EXTERNAL TABLE hiveTableName (col1 string, col2 bigint, col3 array<string>)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "dynamodbtable1",
"dynamodb.column.mapping" = "col1:name,col2:year,col3:holidays");

CREATE EXTERNAL TABLE lzo_compression_table (line STRING)
ROW FORMAT DELIMITED FIELDS TERMINATED BY '\t' LINES TERMINATED BY '\n'
LOCATION 's3://amzn-s3-demo-bucket/path/subpath/';

INSERT OVERWRITE TABLE lzo_compression_table SELECT *
FROM hiveTableName;
```

  The available compression codecs are:

  - org.apache.hadoop.io.compress.GzipCodec
  - org.apache.hadoop.io.compress.DefaultCodec
  - com.hadoop.compression.lzo.LzoCodec
  - com.hadoop.compression.lzo.LzopCodec
  - org.apache.hadoop.io.compress.BZip2Codec

- org.apache.hadoop.io.compress.SnappyCodec

**To export a DynamoDB table to HDFS**

- Use the following Hive command, where *hdfs:///directoryName* is a valid HDFS path and *hiveTableName* is a table in Hive that references DynamoDB. This export operation is faster than exporting a DynamoDB table to Amazon S3 because Hive 0.7.1.1 uses HDFS as an intermediate step when exporting data to Amazon S3. The following example also shows how to set `dynamodb.throughput.read.percent` to 1.0 in order to increase the read request rate.

```
CREATE EXTERNAL TABLE hiveTableName (col1 string, col2 bigint, col3 array<string>)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "dynamodbtable1",
"dynamodb.column.mapping" = "col1:name,col2:year,col3:holidays");

SET dynamodb.throughput.read.percent=1.0;

INSERT OVERWRITE DIRECTORY 'hdfs:///directoryName' SELECT * FROM hiveTableName;
```

  You can also export data to HDFS using formatting and compression as shown above for the export to Amazon S3. To do so, simply replace the Amazon S3 directory in the examples above with an HDFS directory.

**To read non-printable UTF-8 character data in Hive**

- You can read and write non-printable UTF-8 character data with Hive by using the `STORED AS SEQUENCEFILE` clause when you create the table. A SequenceFile is Hadoop binary file format; you need to use Hadoop to read this file. The following example shows how to export data from DynamoDB into Amazon S3. You can use this functionality to handle non-printable UTF-8 encoded characters.

```
CREATE EXTERNAL TABLE hiveTableName (col1 string, col2 bigint, col3 array<string>)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "dynamodbtable1",
```

```
"dynamodb.column.mapping" = "col1:name,col2:year,col3:holidays");

CREATE EXTERNAL TABLE s3_export(a_col string, b_col bigint, c_col array<string>)
STORED AS SEQUENCEFILE
LOCATION 's3://amzn-s3-demo-bucket/path/subpath/';

INSERT OVERWRITE TABLE s3_export SELECT *
FROM hiveTableName;
```

## Importing data to DynamoDB

When you write data to DynamoDB using Hive you should ensure that the number of write capacity units is greater than the number of mappers in the cluster. For example, clusters that run on m1.xlarge EC2 instances produce 8 mappers per instance. In the case of a cluster that has 10 instances, that would mean a total of 80 mappers. If your write capacity units are not greater than the number of mappers in the cluster, the Hive write operation may consume all of the write throughput, or attempt to consume more throughput than is provisioned. For more information about the number of mappers produced by each EC2 instance type, see Configure Hadoop.

The number of mappers in Hadoop are controlled by the input splits. If there are too few splits, your write command might not be able to consume all the write throughput available.

If an item with the same key exists in the target DynamoDB table, it is overwritten. If no item with the key exists in the target DynamoDB table, the item is inserted.

**To import a table from Amazon S3 to DynamoDB**

- You can use Amazon EMR (Amazon EMR) and Hive to write data from Amazon S3 to DynamoDB.

```
CREATE EXTERNAL TABLE s3_import(a_col string, b_col bigint, c_col array<string>)
ROW FORMAT DELIMITED FIELDS TERMINATED BY ','
LOCATION 's3://amzn-s3-demo-bucket/path/subpath/';

CREATE EXTERNAL TABLE hiveTableName (col1 string, col2 bigint, col3 array<string>)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "dynamodbtable1",
"dynamodb.column.mapping" = "col1:name,col2:year,col3:holidays");
```

```
INSERT OVERWRITE TABLE hiveTableName SELECT * FROM s3_import;
```

**To import a table from an Amazon S3 bucket to DynamoDB without specifying a column mapping**

- Create an EXTERNAL table that references data stored in Amazon S3 that was previously exported from DynamoDB. Before importing, ensure that the table exists in DynamoDB and that it has the same key schema as the previously exported DynamoDB table. In addition, the table must have exactly one column of type `map<string, string>`. If you then create a Hive table that is linked to DynamoDB, you can call the `INSERT OVERWRITE` command to write the data from Amazon S3 to DynamoDB. Because there is no column mapping, you cannot query tables that are imported this way. Importing data without specifying a column mapping is available in Hive 0.8.1.5 or later, which is supported on Amazon EMR AMI 2.2.3 and later.

```
CREATE EXTERNAL TABLE s3TableName (item map<string, string>)
ROW FORMAT DELIMITED FIELDS TERMINATED BY '\t' LINES TERMINATED BY '\n'
LOCATION 's3://amzn-s3-demo-bucket/path/subpath/';

CREATE EXTERNAL TABLE hiveTableName (item map<string,string>)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "dynamodbtable1");

INSERT OVERWRITE TABLE hiveTableName SELECT *
FROM s3TableName;
```

**To import a table from HDFS to DynamoDB**

- You can use Amazon EMR and Hive to write data from HDFS to DynamoDB.

```
CREATE EXTERNAL TABLE hdfs_import(a_col string, b_col bigint, c_col array<string>)
ROW FORMAT DELIMITED FIELDS TERMINATED BY ','
LOCATION 'hdfs:///directoryName';

CREATE EXTERNAL TABLE hiveTableName (col1 string, col2 bigint, col3 array<string>)
```

```
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "dynamodbtable1",
"dynamodb.column.mapping" = "col1:name,col2:year,col3:holidays");

INSERT OVERWRITE TABLE hiveTableName SELECT * FROM hdfs_import;
```

## Querying data in DynamoDB

The following examples show the various ways you can use Amazon EMR to query data stored in DynamoDB.

### To find the largest value for a mapped column (max)

- Use Hive commands like the following. In the first command, the CREATE statement creates a Hive table that references data stored in DynamoDB. The SELECT statement then uses that table to query data stored in DynamoDB. The following example finds the largest order placed by a given customer.

```
CREATE EXTERNAL TABLE hive_purchases(customerId bigint, total_cost double,
 items_purchased array<String>)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "Purchases",
"dynamodb.column.mapping" =
 "customerId:CustomerId,total_cost:Cost,items_purchased:Items");

SELECT max(total_cost) from hive_purchases where customerId = 717;
```

### To aggregate data using the GROUP BY clause

- You can use the GROUP BY clause to collect data across multiple records. This is often used with an aggregate function such as sum, count, min, or max. The following example returns a list of the largest orders from customers who have placed more than three orders.

```
CREATE EXTERNAL TABLE hive_purchases(customerId bigint, total_cost double,
 items_purchased array<String>)
```

```
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "Purchases",
"dynamodb.column.mapping" =
 "customerId:CustomerId,total_cost:Cost,items_purchased:Items");

SELECT customerId, max(total_cost) from hive_purchases GROUP BY customerId HAVING
 count(*) > 3;
```

**To join two DynamoDB tables**

- The following example maps two Hive tables to data stored in DynamoDB. It then calls a join across those two tables. The join is computed on the cluster and returned. The join does not take place in DynamoDB. This example returns a list of customers and their purchases for customers that have placed more than two orders.

```
CREATE EXTERNAL TABLE hive_purchases(customerId bigint, total_cost double,
 items_purchased array<String>)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "Purchases",
"dynamodb.column.mapping" =
 "customerId:CustomerId,total_cost:Cost,items_purchased:Items");

CREATE EXTERNAL TABLE hive_customers(customerId bigint, customerName string,
 customerAddress array<String>)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "Customers",
"dynamodb.column.mapping" =
 "customerId:CustomerId,customerName:Name,customerAddress:Address");

Select c.customerId, c.customerName, count(*) as count from hive_customers c
JOIN hive_purchases p ON c.customerId=p.customerId
GROUP BY c.customerId, c.customerName HAVING count > 2;
```

**To join two tables from different sources**

- In the following example, Customer_S3 is a Hive table that loads a CSV file stored in Amazon S3 and hive_purchases is a table that references data in DynamoDB. The following example

joins together customer data stored as a CSV file in Amazon S3 with order data stored in DynamoDB to return a set of data that represents orders placed by customers who have "Miller" in their name.

```
CREATE EXTERNAL TABLE hive_purchases(customerId bigint, total_cost double,
 items_purchased array<String>)
STORED BY 'org.apache.hadoop.hive.dynamodb.DynamoDBStorageHandler'
TBLPROPERTIES ("dynamodb.table.name" = "Purchases",
"dynamodb.column.mapping" =
 "customerId:CustomerId,total_cost:Cost,items_purchased:Items");

CREATE EXTERNAL TABLE Customer_S3(customerId bigint, customerName string,
 customerAddress array<String>)
ROW FORMAT DELIMITED FIELDS TERMINATED BY ','
LOCATION 's3://amzn-s3-demo-bucket/path/subpath/';

Select c.customerId, c.customerName, c.customerAddress from
Customer_S3 c
JOIN hive_purchases p
ON c.customerid=p.customerid
where c.customerName like '%Miller%';
```

**Note**

In the preceding examples, the CREATE TABLE statements were included in each example for clarity and completeness. When running multiple queries or export operations against a given Hive table, you only need to create the table one time, at the beginning of the Hive session.

## Optimizing performance for Amazon EMR operations in DynamoDB

Amazon EMR operations on a DynamoDB table count as read operations, and are subject to the table's provisioned throughput settings. Amazon EMR implements its own logic to try to balance the load on your DynamoDB table to minimize the possibility of exceeding your provisioned throughput. At the end of each Hive query, Amazon EMR returns information about the cluster used to process the query, including how many times your provisioned throughput was exceeded.

You can use this information, as well as CloudWatch metrics about your DynamoDB throughput, to better manage the load on your DynamoDB table in subsequent requests.

The following factors influence Hive query performance when working with DynamoDB tables.

## Provisioned read capacity units

When you run Hive queries against a DynamoDB table, you need to ensure that you have provisioned a sufficient amount of read capacity units.

For example, suppose that you have provisioned 100 units of Read Capacity for your DynamoDB table. This will let you perform 100 reads, or 409,600 bytes, per second. If that table contains 20GB of data (21,474,836,480 bytes), and your Hive query performs a full table scan, you can estimate how long the query will take to run:

*21,474,836,480 / 409,600 = 52,429 seconds = 14.56 hours*

The only way to decrease the time required would be to adjust the read capacity units on the source DynamoDB table. Adding more nodes to the Amazon EMR cluster will not help.

In the Hive output, the completion percentage is updated when one or more mapper processes are finished. For a large DynamoDB table with a low provisioned Read Capacity setting, the completion percentage output might not be updated for a long time; in the case above, the job will appear to be 0% complete for several hours. For more detailed status on your job's progress, go to the Amazon EMR console; you will be able to view the individual mapper task status, and statistics for data reads.

You can also log on to Hadoop interface on the master node and see the Hadoop statistics. This shows you the individual map task status and some data read statistics. For more information, see Web interfaces hosted on the master node in the *Amazon EMR Management Guide*.

## Read percent setting

By default, Amazon EMR manages the request load against your DynamoDB table according to your current provisioned throughput. However, when Amazon EMR returns information about your job that includes a high number of provisioned throughput exceeded responses, you can adjust the default read rate using the `dynamodb.throughput.read.percent` parameter when you set up the Hive table. For more information about setting the read percent parameter, see Hive options.

### Write percent setting

By default, Amazon EMR manages the request load against your DynamoDB table according to your current provisioned throughput. However, when Amazon EMR returns information about your job that includes a high number of provisioned throughput exceeded responses, you can adjust the default write rate using the `dynamodb.throughput.write.percent` parameter when you set up the Hive table. For more information about setting the write percent parameter, see Hive options.

### Retry duration setting

By default, Amazon EMR re-runs a Hive query if it has not returned a result within two minutes, the default retry interval. You can adjust this interval by setting the `dynamodb.retry.duration` parameter when you run a Hive query. For more information about setting the write percent parameter, see Hive options.

### Number of map tasks

The mapper daemons that Hadoop launches to process your requests to export and query data stored in DynamoDB are capped at a maximum read rate of 1 MiB per second to limit the read capacity used. If you have additional provisioned throughput available on DynamoDB, you can improve the performance of Hive export and query operations by increasing the number of mapper daemons. To do this, you can either increase the number of EC2 instances in your cluster *or* increase the number of mapper daemons running on each EC2 instance.

You can increase the number of EC2 instances in a cluster by stopping the current cluster and re-launching it with a larger number of EC2 instances. You specify the number of EC2 instances in the **Configure EC2 Instances** dialog box if you're launching the cluster from the Amazon EMR console, or with the `--num-instances` option if you're launching the cluster from the CLI.

The number of map tasks run on an instance depends on the EC2 instance type. For more information about the supported EC2 instance types and the number of mappers each one provides, see Task configuration. There, you will find a "Task Configuration" section for each of the supported configurations.

Another way to increase the number of mapper daemons is to change the `mapreduce.tasktracker.map.tasks.maximum` configuration parameter of Hadoop to a higher value. This has the advantage of giving you more mappers without increasing either the number or the size of EC2 instances, which saves you money. A disadvantage is that setting

this value too high can cause the EC2 instances in your cluster to run out of memory. To set `mapreduce.tasktracker.map.tasks.maximum`, launch the cluster and specify a value for `mapreduce.tasktracker.map.tasks.maximum` as a property of the mapred-site configuration classification. This is shown in the following example. For more information, see Configure applications.

```
{
    "configurations": [
    {
        "classification": "mapred-site",
        "properties": {
            "mapred.tasktracker.map.tasks.maximum": "10"
        }
    }
    ]
}
```

### Parallel data requests

Multiple data requests, either from more than one user or more than one application to a single table may drain read provisioned throughput and slow performance.

### Process duration

Data consistency in DynamoDB depends on the order of read and write operations on each node. While a Hive query is in progress, another application might load new data into the DynamoDB table or modify or delete existing data. In this case, the results of the Hive query might not reflect changes made to the data while the query was running.

### Avoid exceeding throughput

When running Hive queries against DynamoDB, take care not to exceed your provisioned throughput, because this will deplete capacity needed for your application's calls to `DynamoDB::Get`. To ensure that this is not occurring, you should regularly monitor the read volume and throttling on application calls to `DynamoDB::Get` by checking logs and monitoring metrics in Amazon CloudWatch.

### Request time

Scheduling Hive queries that access a DynamoDB table when there is lower demand on the DynamoDB table improves performance. For example, if most of your application's users live in

San Francisco, you might choose to export daily data at 4 a.m. PST, when the majority of users are asleep, and not updating records in your DynamoDB database.

### Time-based tables

If the data is organized as a series of time-based DynamoDB tables, such as one table per day, you can export the data when the table becomes no longer active. You can use this technique to back up data to Amazon S3 on an ongoing fashion.

### Archived data

If you plan to run many Hive queries against the data stored in DynamoDB and your application can tolerate archived data, you may want to export the data to HDFS or Amazon S3 and run the Hive queries against a copy of the data instead of DynamoDB. This conserves your read operations and provisioned throughput.

## Kinesis

Amazon EMR clusters can read and process Amazon Kinesis streams directly, using familiar tools in the Hadoop ecosystem such as Hive, Pig, MapReduce, the Hadoop Streaming API, and Cascading. You can also join real-time data from Amazon Kinesis with existing data on Amazon S3, Amazon DynamoDB, and HDFS in a running cluster. You can directly load the data from Amazon EMR to Amazon S3 or DynamoDB for post-processing activities. For information about Amazon Kinesis service highlights and pricing, see the Amazon Kinesis page.

### What can I do with Amazon EMR and Amazon Kinesis integration?

Integration between Amazon EMR and Amazon Kinesis makes certain scenarios much easier; for example:

- **Streaming log analysis**–You can analyze streaming web logs to generate a list of top 10 error types every few minutes by region, browser, and access domain.
- **Customer engagement**–You can write queries that join clickstream data from Amazon Kinesis with advertising campaign information stored in a DynamoDB table to identify the most effective categories of ads that are displayed on particular websites.
- **Ad-hoc interactive queries**–You can periodically load data from Amazon Kinesis streams into HDFS and make it available as a local Impala table for fast, interactive, analytic queries.

# Checkpointed analysis of Amazon Kinesis streams

Users can run periodic, batched analysis of Amazon Kinesis streams in what are called *iterations*. Because Amazon Kinesis stream data records are retrieved by using a sequence number, iteration boundaries are defined by starting and ending sequence numbers that Amazon EMR stores in a DynamoDB table. For example, when `iteration0` ends, it stores the ending sequence number in DynamoDB so that when the `iteration1` job begins, it can retrieve subsequent data from the stream. This mapping of iterations in stream data is called *checkpointing*. For more information, see Kinesis connector.

If an iteration was checkpointed and the job failed processing an iteration, Amazon EMR attempts to reprocess the records in that iteration.

Checkpointing is a feature that allows you to:

- Start data processing after a sequence number processed by a previous query that ran on same stream and logical name
- Re-process the same batch of data from Kinesis that was processed by an earlier query

To enable checkpointing, set the `kinesis.checkpoint.enabled` parameter to `true` in your scripts. Also, configure the following parameters:

| Configuration setting | Description |
|---|---|
| kinesis.checkpoint.metastore.table.name | DynamoDB table name where checkpoint information will be stored |
| kinesis.checkpoint.metastore.hash.key.name | Hash key name for the DynamoDB table |
| kinesis.checkpoint.metastore.hash.range.name | Range key name for the DynamoDB table |
| kinesis.checkpoint.logical.name | A logical name for current processing |
| kinesis.checkpoint.iteration.no | Iteration number for processing associated with the logical name |

| Configuration setting | Description |
| --- | --- |
| kinesis.rerun.iteration.without.wait | Boolean value that indicates if a failed iteration can be rerun without waiting for timeout; the default is `false` |

### Provisioned IOPS recommendations for Amazon DynamoDB tables

The Amazon EMR connector for Amazon Kinesis uses the DynamoDB database as its backing for checkpointing metadata. You must create a table in DynamoDB before consuming data in an Amazon Kinesis stream with an Amazon EMR cluster in checkpointed intervals. The table must be in the same region as your Amazon EMR cluster. The following are general recommendations for the number of IOPS you should provision for your DynamoDB tables; let `j` be the maximum number of Hadoop jobs (with different logical name+iteration number combination) that can run concurrently and `s` be the maximum number of shards that any job will process:

For **Read Capacity Units**: `j*s/5`

For **Write Capacity Units**: `j*s`

## Performance considerations

Amazon Kinesis shard throughput is directly proportional to the instance size of nodes in Amazon EMR clusters and record size in the stream. We recommend that you use m5.xlarge or larger instances on master and core nodes.

## Schedule Amazon Kinesis analysis with Amazon EMR

When you are analyzing data on an active Amazon Kinesis stream, limited by timeouts and a maximum duration for any iteration, it is important that you run the analysis frequently to gather periodic details from the stream. There are multiple ways to execute such scripts and queries at periodic intervals; we recommend using Amazon Data Pipeline for recurrent tasks like these. For more information, see Amazon Data Pipeline PigActivity and Amazon Data Pipeline HiveActivity in the *Amazon Data Pipeline Developer Guide*.

## Migrating Spark Kinesis connector to SDK 2.x for Amazon EMR 7.0

The Amazon SDK provides a rich set of APIs and libraries to interact with Amazon cloud computing services, such as managing credentials, connecting to S3 and Kinesis services. The Spark

Kinesis connector is used to consume data from Kinesis Data Streams, and the received data is transformed and processed in Spark's execution engine. Currently this connector is built on top of 1.x of Amazon SDK and Kinesis-client-library (KCL).

As part of the Amazon SDK 2.x migration, the Spark Kinesis connector is also updated accordingly to run with the SDK 2.x. In the Amazon EMR 7.0 release, Spark contains the SDK 2.x upgrade that is not yet available in the community version of Apache Spark. If you use the Spark Kinesis connector from a release that's lower than 7.0, you must migrate your application codes to run on SDK 2.x before you can migrate to Amazon EMR 7.0.

## Migration guides

This section describes the steps to migrate an application to the upgraded Spark Kinesis connector. It includes guides to migrate to the Kinesis Client Library (KCL) 2.x, Amazon credential providers, and Amazon service clients in Amazon SDK 2.x. For reference, it also includes a sample WordCount program that uses the Kinesis connector.

### Topics

- Migrating KCL from 1.x to 2.x
- Migrating Amazon credentials providers from Amazon SDK 1.x to 2.x
- Migrating Amazon service clients from Amazon SDK 1.x to 2.x
- Code examples for streaming applications
- Considerations when using the upgraded Spark Kinesis connector

### Migrating KCL from 1.x to 2.x

- **Metrics level and dimensions in `KinesisInputDStream`**

  When you instantiate a `KinesisInputDStream`, you can control the metrics level and dimensions for the stream. The following example demonstrates how you might customize these parameters with KCL 1.x:

```
import
 com.amazonaws.services.kinesis.clientlibrary.lib.worker.KinesisClientLibConfiguration
import com.amazonaws.services.kinesis.metrics.interfaces.MetricsLevel

val kinesisStream = KinesisInputDStream.builder
  .streamingContext(ssc)
```

```
  .streamName(streamName)
  .endpointUrl(endpointUrl)
  .regionName(regionName)
  .initialPosition(new Latest())
  .checkpointAppName(appName)
  .checkpointInterval(kinesisCheckpointInterval)
  .storageLevel(StorageLevel.MEMORY_AND_DISK_2)
  .metricsLevel(MetricsLevel.DETAILED)

 .metricsEnabledDimensions(KinesisClientLibConfiguration.DEFAULT_METRICS_ENABLED_DIMENSIONS.a
  .build()
```

In KCL 2.x, these config settings have different package names. To migrate to 2.x:

1. Change the import statements for `com.amazonaws.services.kinesis.clientlibrary.lib.worker.KinesisClientLibCon` and `com.amazonaws.services.kinesis.metrics.interfaces.MetricsLevel` to `software.amazon.kinesis.metrics.MetricsLevel` and `software.amazon.kinesis.metrics.MetricsUtil` respectively.

   ```
   // import com.amazonaws.services.kinesis.metrics.interfaces.MetricsLevel
   import software.amazon.kinesis.metrics.MetricsLevel

   // import
    com.amazonaws.services.kinesis.clientlibrary.lib.worker.KinesisClientLibConfiguration
   import software.amazon.kinesis.metrics.MetricsUtil
   ```

2. Replace the line `metricsEnabledDimensionsKinesisClientLibConfiguration.DEFAULT_METRICS_ENABL` with `metricsEnabledDimensionsSet(MetricsUtil.OPERATION_DIMENSION_NAME, MetricsUtil.SHARD_ID_DIMENSION_NAME)`

Following is an updated version of the `KinesisInputDStream` with customized metrics level and metrics dimensions:

```
import software.amazon.kinesis.metrics.MetricsLevel
import software.amazon.kinesis.metrics.MetricsUtil

val kinesisStream = KinesisInputDStream.builder
  .streamingContext(ssc)
```

```
  .streamName(streamName)
  .endpointUrl(endpointUrl)
  .regionName(regionName)
  .initialPosition(new Latest())
  .checkpointAppName(appName)
  .checkpointInterval(kinesisCheckpointInterval)
  .storageLevel(StorageLevel.MEMORY_AND_DISK_2)
  .metricsLevel(MetricsLevel.DETAILED)
  .metricsEnabledDimensions(Set(MetricsUtil.OPERATION_DIMENSION_NAME,
 MetricsUtil.SHARD_ID_DIMENSION_NAME))
  .build()
```

- Message handler function in `KinesisInputDStream`

  When instantiating a `KinesisInputDStream`, you may also provide a "message handler function" that takes a Kinesis Record and returns a generic object T, in case you would like to use other data included in a Record such as partition key.

  In KCL 1.x, the message handler function signature is: `Record => T`, where Record is `com.amazonaws.services.kinesis.model.Record`. In KCL 2.x, the handler's signature is changed to: `KinesisClientRecord => T`, where KinesisClientRecord is `software.amazon.kinesis.retrieval.KinesisClientRecord`.

  Following is an example of providing a message handler in KCL 1.x:

```
import com.amazonaws.services.kinesis.model.Record

def addFive(r: Record): Int = JavaUtils.bytesToString(r.getData).toInt + 5
val stream = KinesisInputDStream.builder
  .streamingContext(ssc)
  .streamName(streamName)
  .endpointUrl(endpointUrl)
  .regionName(regionName)
  .initialPosition(new Latest())
  .checkpointAppName(appName)
  .checkpointInterval(Seconds(10))
  .storageLevel(StorageLevel.MEMORY_ONLY)
  .buildWithMessageHandler(addFive)
```

  To migrate the message handler:

1. Change the import statement for `com.amazonaws.services.kinesis.model.Record` to `software.amazon.kinesis.retrieval.KinesisClientRecord`.

```
// import com.amazonaws.services.kinesis.model.Record
import software.amazon.kinesis.retrieval.KinesisClientRecord
```

2. Update the the method signature of the message handler.

```
//def addFive(r: Record): Int = JavaUtils.bytesToString(r.getData).toInt + 5
def addFive = (r: KinesisClientRecord) => JavaUtils.bytesToString(r.data()).toInt
 + 5
```

Following is an updated example of providing the message handler in KCL 2.x:

```
import software.amazon.kinesis.retrieval.KinesisClientRecord

def addFive = (r: KinesisClientRecord) => JavaUtils.bytesToString(r.data()).toInt + 5
val stream = KinesisInputDStream.builder
  .streamingContext(ssc)
  .streamName(streamName)
  .endpointUrl(endpointUrl)
  .regionName(regionName)
  .initialPosition(new Latest())
  .checkpointAppName(appName)
  .checkpointInterval(Seconds(10))
  .storageLevel(StorageLevel.MEMORY_ONLY)
  .buildWithMessageHandler(addFive)
```

For more information about migrating from KCL 1.x to 2.x, see Migrating Consumers from KCL 1.x to KCL 2.x.

### Migrating Amazon credentials providers from Amazon SDK 1.x to 2.x

Credentials providers are used to obtain Amazon credentials for interactions with Amazon. There are several interface and class changes related to the credentials providers in SDK 2.x, which can be found here. Spark Kinesis connector has defined an interface (`org.apache.spark.streaming.kinesis.SparkAWSCredentials`) and implementation

classes that returns 1.x version of Amazon credential providers. These credentials providers are needed when initializing Kinesis clients. For instance, if you are using the method `SparkAWSCredentials.provider` in the applications, you would need to update codes to consume 2.x version of Amazon credential providers.

Following is an example of using the credential providers in Amazon SDK 1.x:

```
import org.apache.spark.streaming.kinesis.SparkAWSCredentials
import com.amazonaws.auth.AWSCredentialsProvider

val basicSparkCredentials = SparkAWSCredentials.builder
    .basicCredentials("accessKey", "secretKey")
    .build()

val credentialProvider = basicSparkCredentials.provider
assert(credentialProvider.isInstanceOf[AWSCredentialsProvider], "Type should be
 AWSCredentialsProvider")
```

**To migrate to SDK 2.x:**

1. Change the import statement for `com.amazonaws.auth.AWSCredentialsProvider` to `software.amazon.awssdk.auth.credentials.AwsCredentialsProvider`

   ```
   //import com.amazonaws.auth.AWSCredentialsProvider
   import software.amazon.awssdk.auth.credentials.AwsCredentialsProvider
   ```

2. Update the remaining codes that use this class.

   ```
   import org.apache.spark.streaming.kinesis.SparkAWSCredentials
   import software.amazon.awssdk.auth.credentials.AwsCredentialsProvider

   val basicSparkCredentials = SparkAWSCredentials.builder
       .basicCredentials("accessKey", "secretKey")
       .build()

   val credentialProvider = basicSparkCredentials.provider
   assert (credentialProvider.isInstanceOf[AwsCredentialsProvider], "Type should be
    AwsCredentialsProvider")
   ```

### Migrating Amazon service clients from Amazon SDK 1.x to 2.x

Amazon service clients have different package names in 2.x (i.e. `software.amazon.awssdk`). whereas the SDK 1.x uses `com.amazonaws`. For more information about the client changes, see here. If you are using these service clients in the codes, you would need to migrate the clients accordingly.

Following is an example of creating a client in SDK 1.x:

```
import com.amazonaws.services.dynamodbv2.AmazonDynamoDBClient
import com.amazonaws.services.dynamodbv2.document.DynamoDB

AmazonDynamoDB ddbClient = AmazonDynamoDBClientBuilder.defaultClient();
AmazonDynamoDBClient ddbClient = new AmazonDynamoDBClient();
```

**To migrate to 2.x:**

1. Change the import statements for service clients. Take DynamoDB clients as an example. You would need to change `com.amazonaws.services.dynamodbv2.AmazonDynamoDBClient` or `com.amazonaws.services.dynamodbv2.document.DynamoDB` to `software.amazon.awssdk.services.dynamodb.DynamoDbClient`.

   ```
   // import com.amazonaws.services.dynamodbv2.AmazonDynamoDBClient
   // import com.amazonaws.services.dynamodbv2.document.DynamoDB
   import software.amazon.awssdk.services.dynamodb.DynamoDbClient
   ```

2. Update the codes that initialize the clients

   ```
   // AmazonDynamoDB ddbClient = AmazonDynamoDBClientBuilder.defaultClient();
   // AmazonDynamoDBClient ddbClient = new AmazonDynamoDBClient();

   DynamoDbClient ddbClient = DynamoDbClient.create();
   DynamoDbClient ddbClient = DynamoDbClient.builder().build();
   ```

   For more information about migrating Amazon SDK from 1.x to 2.x, see What's different between the Amazon SDK for Java 1.x and 2.x

### Code examples for streaming applications

```
import java.net.URI
```

```
import software.amazon.awssdk.auth.credentials.DefaultCredentialsProvider
import software.amazon.awssdk.http.apache.ApacheHttpClient
import software.amazon.awssdk.services.kinesis.KinesisClient
import software.amazon.awssdk.services.kinesis.model.DescribeStreamRequest
import software.amazon.awssdk.regions.Region
import software.amazon.kinesis.metrics.{MetricsLevel, MetricsUtil}

import org.apache.spark.SparkConf
import org.apache.spark.storage.StorageLevel
import org.apache.spark.streaming.{Milliseconds, StreamingContext}
import org.apache.spark.streaming.dstream.DStream.toPairDStreamFunctions
import org.apache.spark.streaming.kinesis.KinesisInitialPositions.Latest
import org.apache.spark.streaming.kinesis.KinesisInputDStream

object KinesisWordCountASLSDKV2 {

  def main(args: Array[String]): Unit = {
    val appName = "demo-app"
    val streamName = "demo-kinesis-test"
    val endpointUrl = "https://kinesis.us-west-2.amazonaws.com"
    val regionName = "us-west-2"

    // Determine the number of shards from the stream using the low-level Kinesis
 Client
    // from the AWS Java SDK.
    val credentialsProvider = DefaultCredentialsProvider.create
    require(credentialsProvider.resolveCredentials() != null,
      "No AWS credentials found. Please specify credentials using one of the methods
 specified " +
        "in https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/
credentials.html")
    val kinesisClient = KinesisClient.builder()
      .credentialsProvider(credentialsProvider)
      .region(Region.US_WEST_2)
      .endpointOverride(URI.create(endpointUrl))
      .httpClientBuilder(ApacheHttpClient.builder())
      .build()
    val describeStreamRequest = DescribeStreamRequest.builder()
      .streamName(streamName)
      .build()
    val numShards = kinesisClient.describeStream(describeStreamRequest)
      .streamDescription
      .shards
```

```
      .size

   // In this example, we are going to create 1 Kinesis Receiver/input DStream for
each shard.
   // This is not a necessity; if there are less receivers/DStreams than the number of
shards,
   // then the shards will be automatically distributed among the receivers and each
receiver
   // will receive data from multiple shards.
   val numStreams = numShards

   // Spark Streaming batch interval
   val batchInterval = Milliseconds(2000)

   // Kinesis checkpoint interval is the interval at which the DynamoDB is updated
with information
   // on sequence number of records that have been received. Same as batchInterval for
this
   // example.
   val kinesisCheckpointInterval = batchInterval

   // Setup the SparkConfig and StreamingContext
   val sparkConfig = new SparkConf().setAppName("KinesisWordCountASLSDKV2")
   val ssc = new StreamingContext(sparkConfig, batchInterval)

   // Create the Kinesis DStreams
   val kinesisStreams = (0 until numStreams).map { i =>
     KinesisInputDStream.builder
       .streamingContext(ssc)
       .streamName(streamName)
       .endpointUrl(endpointUrl)
       .regionName(regionName)
       .initialPosition(new Latest())
       .checkpointAppName(appName)
       .checkpointInterval(kinesisCheckpointInterval)
       .storageLevel(StorageLevel.MEMORY_AND_DISK_2)
       .metricsLevel(MetricsLevel.DETAILED)
       .metricsEnabledDimensions(Set(MetricsUtil.OPERATION_DIMENSION_NAME,
MetricsUtil.SHARD_ID_DIMENSION_NAME))
       .build()
   }

   // Union all the streams
```

```
    val unionStreams = ssc.union(kinesisStreams)

    // Convert each line of Array[Byte] to String, and split into words
    val words = unionStreams.flatMap(byteArray => new String(byteArray).split(" "))

    // Map each word to a (word, 1) tuple so we can reduce by key to count the words
    val wordCounts = words.map(word => (word, 1)).reduceByKey(_ + _)

    // Print the first 10 wordCounts
    wordCounts.print()

    // Start the streaming context and await termination
    ssc.start()
    ssc.awaitTermination()
  }
}
```

**Considerations when using the upgraded Spark Kinesis connector**

- If your applications uses the `Kinesis-producer-library` with JDK version lower than 11, you may run into exceptions like `java.lang.NoClassDefFoundError: javax/xml/bind/DatatypeConverter`. This happens because EMR 7.0 comes with JDK 17 by default and J2EE modules have been removed from the standard libraries since Java 11+. This could be fixed by adding the following dependency in the pom file. Replace the library version with one as you see fit.

  ```
  <dependency>
        <groupId>javax.xml.bind</groupId>
        <artifactId>jaxb-api</artifactId>
        <version>${jaxb-api.version}</version>
      </dependency>
  ```

- The Spark Kinesis connector jar can be found under this path after an EMR cluster is created: `/usr/lib/spark/connector/lib/`

# S3DistCp (s3-dist-cp)

Apache DistCp is an open-source tool you can use to copy large amounts of data. *S3DistCp* is similar to DistCp, but optimized to work with Amazon, particularly Amazon S3. The command for S3DistCp in Amazon EMR version 4.0 and later is `s3-dist-cp`, which you add as a step in a cluster

or at the command line. Using S3DistCp, you can efficiently copy large amounts of data from Amazon S3 into HDFS where it can be processed by subsequent steps in your Amazon EMR cluster. You can also use S3DistCp to copy data between Amazon S3 buckets or from HDFS to Amazon S3. S3DistCp is more scalable and efficient for parallel copying large numbers of objects across buckets and across Amazon accounts.

For specific commands that demonstrate the flexibility of S3DistCP in real-world scenarios, see Seven tips for using S3DistCp on the Amazon Big Data blog.

Like DistCp, S3DistCp uses MapReduce to copy in a distributed manner. It shares the copy, error handling, recovery, and reporting tasks across several servers. For more information about the Apache DistCp open source project, see the DistCp guide in the Apache Hadoop documentation.

If S3DistCp is unable to copy some or all of the specified files, the cluster step fails and returns a non-zero error code. If this occurs, S3DistCp does not clean up partially copied files.

> **Important**
>
> S3DistCp does not support Amazon S3 bucket names that contain the underscore character.
> S3DistCp does not support concatenation for Parquet files. Use PySpark instead. For more information, see Concatenating parquet files in Amazon EMR.
> To avoid copy errors when using S3DistCP to copy a single file (instead of a directory) from S3 to HDFS, use Amazon EMR version 5.33.0 or later, or Amazon EMR version 6.3.0 or later.

## S3DistCp options

Though similar to DistCp, S3DistCp supports a different set of options to change how it copies and compresses data.

When you call S3DistCp, you can specify the options described in the following table. The options are added to the step using the arguments list. Examples of the S3DistCp arguments are shown in the following table.

| Option | Description | Required |
| --- | --- | --- |
| `--src=LOCATION` | Location of the data to copy. This can be either an HDFS or Amazon S3 location. | Yes |

| Option | Description | Required |
| --- | --- | --- |
| | Example: `--src=s3://amzn-s3-demo-bucket/logs/j-3GYXXXXXX9I0J/node`<br><br>**Important**<br>S3DistCp does not support Amazon S3 bucket names that contain the underscore character. | |
| `--dest=LOCATION` | Destination for the data. This can be either an HDFS or Amazon S3 location.<br><br>Example: `--dest=hdfs:///output`<br><br>**Important**<br>S3DistCp does not support Amazon S3 bucket names that contain the underscore character. | Yes |
| `--srcPattern=PATTERN` | A regular expression that filters the copy operation to a subset of the data at `--src`. If neither `--srcPattern` nor `--groupBy` is specified, all data at `--src` is copied to `--dest`.<br><br>If the regular expression argument contains special characters, such as an asterisk (*), either the regular expression or the entire `--args` string must be enclosed in single quotes (').<br><br>Example: `--srcPattern=.*daemons.*-hadoop-.*` | No |

| Option | Description | Required |
| --- | --- | --- |
| `--groupBy=PATTERN` | A regular expression that causes S3DistCp to concatenate files that match the expression. For example, you could use this option to combine all of the log files written in one hour into a single file. The concatenated filename is the value matched by the regular expression for the grouping.<br><br>Parentheses indicate how files should be grouped, with all of the items that match the parenthetical statement being combined into a single output file. If the regular expression does not include a parenthetical statement, the cluster fails on the S3DistCp step and return an error.<br><br>If the regular expression argument contains special characters, such as an asterisk (*), either the regular expression or the entire `--args` string must be enclosed in single quotes (').<br><br>When `--groupBy` is specified, only files that match the specified pattern are copied. You do not need to specify `--groupBy` and `--srcPattern` at the same time.<br><br>Example: `--groupBy=.*subnetid.*([0-9]+-[0-9]+-[0-9]+-[0-9]+).*` | No |

| Option | Description | Required |
| --- | --- | --- |
| `--targetSize=SIZE` | The size, in mebibytes (MiB), of the files to create based on the `--groupBy` option. This value must be an integer. When `--targetSize` is set, S3DistCp attempts to match this size; the actual size of the copied files may be larger or smaller than this value. Jobs are aggregated based on the size of the data file, thus it is possible that the target file size will match the source data file size.<br><br>If the files concatenated by `--groupBy` are larger than the value of `--targetSize`, they are broken up into part files, and named sequentia lly with a numeric value appended to the end. For example, a file concatenated into `myfile.gz` would be broken into parts as: `myfile0.gz`, `myfile1.gz`, etc.<br><br>Example: `--targetSize=2` | No |
| `--appendToLastFile` | Specifies the behavior of S3DistCp when copying to files from Amazon S3 to HDFS which are already present. It appends new file data to existing files. If you use `--appendToLastFile` with `--groupBy`, new data is appended to files which match the same groups. This option also respects the `--targetSize` behavior when used with `--groupBy`. | No |

| Option | Description | Required |
| --- | --- | --- |
| `--outputCodec=CODEC` | Specifies the compression codec to use for the copied files. This can take the values: `gzip`, `gz`, `lzo`, `snappy`, or `none`. You can use this option, for example, to convert input files compressed with Gzip into output files with LZO compression, or to uncompress the files as part of the copy operation. If you choose an output codec, the filename will be appended with the appropriate extension (e.g. for `gz` and `gzip`, the extension is `.gz`) If you do not specify a value for `--outputCodec` , the files are copied over with no change in their compression.<br><br>Example: `--outputCodec=lzo` | No |
| `--s3ServerSideEncryption` | Ensures that the target data is transferred using SSL and automatically encrypted in Amazon S3 using an Amazon service-side key. When retrieving data using S3DistCp, the objects are automatically unencrypted. If you attempt to copy an unencrypted object to an encryption-required Amazon S3 bucket, the operation fails. For more information, see Using data encryption.<br><br>Example: `--s3ServerSideEncryption` | No |
| `--deleteOnSuccess` | If the copy operation is successful, this option causes S3DistCp to delete the copied files from the source location. This is useful if you are copying output files, such as log files, from one location to another as a scheduled task, and you don't want to copy the same files twice.<br><br>Example: `--deleteOnSuccess` | No |

| Option | Description | Required |
| --- | --- | --- |
| `--disableMultipartUpload` | Disables the use of multipart upload.<br><br>Example: `--disableMultipartUpload` | No |
| `--multipartUploadChunkSize=SIZE` | The size, in MiB, of each part in an Amazon S3 multipart upload. S3DistCp uses multipart upload when it copies data larger than the `multipartUploadChunkSize` . To improve job performance, you can increase the size of each part. The default size is 128 MiB.<br><br>Example: `--multipartUploadChunkSize=1000` | No |
| `--numberFiles` | Prepends output files with sequential numbers. The count starts at 0 unless a different value is specified by `--startingIndex` .<br><br>Example: `--numberFiles` | No |
| `--startingIndex=INDEX` | Used with `--numberFiles` to specify the first number in the sequence.<br><br>Example: `--startingIndex=1` | No |
| `--outputManifest=FILENAME` | Creates a text file, compressed with Gzip, that contains a list of all the files copied by S3DistCp.<br><br>Example: `--outputManifest=manifest-1.gz` | No |

| Option | Description | Required |
| --- | --- | --- |
| `--previousManifest=PATH` | Reads a manifest file that was created during a previous call to S3DistCp using the `--outputManifest` flag. When the `--previousManifest` flag is set, S3DistCp excludes the files listed in the manifest from the copy operation. If `--outputManifest` is specified along with `--previousManifest`, files listed in the previous manifest also appear in the new manifest file, although the files are not copied.<br><br>Example: `--previousManifest=/usr/bin/manifest-1.gz` | No |
| `--requirePreviousManifest` | Requires a previous manifest created during a previous call to S3DistCp. If this is set to false, no error is generated when a previous manifest is not specified. The default is true. | No |
| `--copyFromManifest` | Reverses the behavior of `--previousManifest` to cause S3DistCp to use the specified manifest file as a list of files to copy, instead of a list of files to exclude from copying.<br><br>Example: `--copyFromManifest --previousManifest=/usr/bin/manifest-1.gz` | No |
| `--s3Endpoint=ENDPOINT` | Specifies the Amazon S3 endpoint to use when uploading a file. This option sets the endpoint for both the source and destination. If not set, the default endpoint is `s3.amazonaws.com`. For a list of the Amazon S3 endpoints, see Regions and endpoints.<br><br>Example: `--s3Endpoint=s3.eu-west-1.amazonaws.com.cn` | No |

| Option | Description | Required |
| --- | --- | --- |
| `--storageClass=CLASS` | The storage class to use when the destination is Amazon S3. Valid values are STANDARD and REDUCED_REDUNDANCY. If this option is not specified, S3DistCp tries to preserve the storage class.<br><br>Example: `--storageClass=STANDARD` | No |
| `--srcPrefixesFile=PATH` | a text file in Amazon S3 (s3://), HDFS (hdfs:///) or local file system (file:/) that contains a list of `src` prefixes, one prefix per line.<br><br>If `srcPrefixesFile` is provided, S3DistCp will not list the src path. Instead, it generates a source list as the combined result of listing all prefixes specified in this file. The relative path as compared to src path, instead of these prefixes, will be used to generate the destination paths. If `srcPattern` is also specified, it will be applied to the combined list results of the source prefixes to further filter the input. If `copyFromManifest` is used, objects in the manifest will be copied and `srcPrefixesFile` will be ignored.<br><br>Example: `--srcPrefixesFile=PATH` | No |

In addition to the options above, S3DistCp implements the Tool interface which means that it supports the generic options.

## Adding S3DistCp as a step in a cluster

You can call S3DistCp by adding it as a step in your cluster. Steps can be added to a cluster at launch or to a running cluster using the console, CLI, or API. The following examples demonstrate adding an S3DistCp step to a running cluster. For more information on adding steps to a cluster, see Submit work to a cluster in the *Amazon EMR Management Guide*.

**To add a S3DistCp step to a running cluster using the Amazon CLI**

For more information on using Amazon EMR commands in the Amazon CLI, see the Amazon CLI Command Reference.

- To add a step to a cluster that calls S3DistCp, pass the parameters that specify how S3DistCp should perform the copy operation as arguments.

  The following example copies daemon logs from Amazon S3 to `hdfs:///output`. In the following command:

  - `--cluster-id` specifies the cluster
  - `Jar` is the location of the S3DistCp JAR file. For an example of how to run a command on a cluster using command-runner.jar, see Submit a custom JAR step to run a script or command.
  - `Args` is a comma-separated list of the option name-value pairs to pass in to S3DistCp. For a complete list of the available options, see S3DistCp options.

  To add an S3DistCp copy step to a running cluster, put the following in a JSON file saved in Amazon S3 or your local file system as *`myStep.json`* for this example. Replace *`j-3GYXXXXXX9IOK`* with your cluster ID and replace *`amzn-s3-demo-bucket`* with your Amazon S3 bucket name.

```
[
    {
        "Name":"S3DistCp step",
        "Args":["s3-dist-cp","--s3Endpoint=s3.amazonaws.com","--src=s3://amzn-s3-
demo-bucket/logs/j-3GYXXXXXX9IOJ/node/","--dest=hdfs:///output","--srcPattern=.*[a-
zA-Z,]+"],
        "ActionOnFailure":"CONTINUE",
        "Type":"CUSTOM_JAR",
        "Jar":"command-runner.jar"
    }
]
```

```
aws emr add-steps --cluster-id j-3GYXXXXXX9IOK --steps file://./myStep.json
```

**Example Copy log files from Amazon S3 to HDFS**

This example also illustrates how to copy log files stored in an Amazon S3 bucket into HDFS by adding a step to a running cluster. In this example the `--srcPattern` option is used to limit the data copied to the daemon logs.

To copy log files from Amazon S3 to HDFS using the `--srcPattern` option, put the following in a JSON file saved in Amazon S3 or your local file system as *`myStep.json`* for this example. Replace *`j-3GYXXXXXX9IOK`* with your cluster ID and replace *`amzn-s3-demo-bucket`* with your Amazon S3 bucket name.

```
[
    {
        "Name":"S3DistCp step",
        "Args":["s3-dist-cp","--s3Endpoint=s3.amazonaws.com","--src=s3://amzn-s3-demo-
bucket/logs/j-3GYXXXXXX9IOJ/node/","--dest=hdfs:///output","--srcPattern=.*daemons.*-
hadoop-.*"],
        "ActionOnFailure":"CONTINUE",
        "Type":"CUSTOM_JAR",
        "Jar":"command-runner.jar"
    }
]
```

# Cleaning up after failed S3DistCp jobs

If S3DistCp cannot copy some or all of the specified files, the command or cluster step fails and returns a non-zero error code. If this occurs, S3DistCp does not clean up partially copied files. You must delete them manually.

Partially copied files are saved to the HDFS `tmp` directory in sub-directories with the unique identifier of the S3DistCp job. You can find this ID in the standard output of the job.

For example, for an S3DistCp job with the ID `4b1c37bb-91af-4391-aaf8-46a6067085a6`, you can connect to the master node of the cluster and run the following command to view output files associated with the job.

```
hdfs dfs -ls /tmp/4b1c37bb-91af-4391-aaf8-46a6067085a6/output
```

The command returns a list of files similar to the following:

```
Found 8 items
-rw-r--r--   1 hadoop hadoop          0 2018-12-10 06:03 /tmp/4b1c37bb-91af-4391-
aaf8-46a6067085a6/output/_SUCCESS
-rw-r--r--   1 hadoop hadoop          0 2018-12-10 06:02 /tmp/4b1c37bb-91af-4391-
aaf8-46a6067085a6/output/part-r-00000
-rw-r--r--   1 hadoop hadoop          0 2018-12-10 06:02 /tmp/4b1c37bb-91af-4391-
aaf8-46a6067085a6/output/part-r-00001
-rw-r--r--   1 hadoop hadoop          0 2018-12-10 06:02 /tmp/4b1c37bb-91af-4391-
aaf8-46a6067085a6/output/part-r-00002
-rw-r--r--   1 hadoop hadoop          0 2018-12-10 06:03 /tmp/4b1c37bb-91af-4391-
aaf8-46a6067085a6/output/part-r-00003
-rw-r--r--   1 hadoop hadoop          0 2018-12-10 06:03 /tmp/4b1c37bb-91af-4391-
aaf8-46a6067085a6/output/part-r-00004
-rw-r--r--   1 hadoop hadoop          0 2018-12-10 06:03 /tmp/4b1c37bb-91af-4391-
aaf8-46a6067085a6/output/part-r-00005
-rw-r--r--   1 hadoop hadoop          0 2018-12-10 06:03 /tmp/4b1c37bb-91af-4391-
aaf8-46a6067085a6/output/part-r-00006
```

You can then run the following command to delete the directory and all contents.

```
hdfs dfs rm -rf /tmp/4b1c37bb-91af-4391-aaf8-46a6067085a6
```

# Run commands and scripts on an Amazon EMR cluster

This topic covers how to run a command or a script as a step on your cluster. Running a command or script as a step is one of the many ways you can Submit work to a cluster and is useful in the following situations:

- When you don't have SSH access to your Amazon EMR cluster
- When you want to run a bash or shell command to troubleshoot your cluster

You can run a script either when you create a cluster or when your cluster is in the `WAITING` state. To run a script before step processing begins, you use a bootstrap action instead. For more information about bootstrap actions, see Create bootstrap actions to install additional software in the *Amazon EMR Management Guide*.

Amazon EMR provides the following tools to help you run scripts, commands, and other on-cluster programs. You can invoke both tools using the Amazon EMR management console or the Amazon CLI.

`command-runner.jar`

Located on the Amazon EMR AMI for your cluster. You can use `command-runner.jar` to run commands on your cluster. You specify `command-runner.jar` without using its full path.

`script-runner.jar`

Hosted on Amazon S3 at `s3://<region>.elasticmapreduce/libs/script-runner/script-runner.jar` where *<region>* is the Region in which your Amazon EMR cluster resides. You can use `script-runner.jar` to run scripts saved locally or on Amazon S3 on your cluster. You must specify the full URI of `script-runner.jar` when you submit a step.

## Submit a custom JAR step to run a script or command

The following Amazon CLI examples illustrate some common use cases of `command-runner.jar` and `script-runner.jar` on Amazon EMR.

**Example : Running a command on a cluster using `command-runner.jar`**

When you use `command-runner.jar`, you specify commands, options, and values in your step's list of arguments.

The following Amazon CLI example submits a step to a running cluster that invokes `command-runner.jar`. The specified command in the `Args` list downloads a script called *`my-script.sh`* from Amazon S3 into the hadoop user home directory. The command then modifies the script's permissions and runs *`my-script.sh`*.

When you use the Amazon CLI, the items in your `Args` list should be comma separated with no whitespace between list elements. For example, `Args=[example-command,example-option,"example option value"]` instead of `Args=[example-command, example-option, "example option value"]`.

```
aws emr add-steps \
--cluster-id j-2AXXXXXXGAPLF \
--steps Type=CUSTOM_JAR,Name="Download a script from S3, change its permissions, and
 run it",ActionOnFailure=CONTINUE,Jar=command-runner.jar,Args=[bash,-c,"aws s3 cp s3://
amzn-s3-demo-bucket/my-script.sh /home/hadoop; chmod u+x /home/hadoop/my-script.sh;
 cd /home/hadoop; ./my-script.sh"]
```

**Example : Running a script on a cluster using `script-runner.jar`**

When you use `script-runner.jar`, you specify the script that you want to run in your step's list of arguments.

The following Amazon CLI example submits a step to a running cluster that invokes `script-runner.jar`. In this case, the script called *`my-script.sh`* is stored on Amazon S3. You can also specify local scripts that are stored on the master node of your cluster.

```
aws emr add-steps \
--cluster-id j-2AXXXXXXGAPLF \
--steps Type=CUSTOM_JAR,Name="Run a script from S3 with script-
runner.jar",ActionOnFailure=CONTINUE,Jar=s3://us-west-2.elasticmapreduce/libs/script-
runner/script-runner.jar,Args=[s3://amzn-s3-demo-bucket/my-script.sh]
```

# Other ways to use `command-runner.jar`

You can also use `command-runner.jar` to submit work to a cluster with tools such as `spark-submit` or `hadoop-streaming`. When you launch an application using `command-runner.jar`, you specify `CUSTOM_JAR` as the step type instead of using a value like `SPARK`, `STREAMING`, or `PIG`. Tool availability varies depending on which applications you've installed on the cluster.

The following example command uses `command-runner.jar` to submit a step using `spark-submit`. The `Args` list specifies `spark-submit` as the command, followed by the Amazon S3 URI of the Spark application *`my-app.py`* with arguments and values.

```
aws emr add-steps \
--cluster-id j-2AXXXXXXGAPLF \
--steps Type=CUSTOM_JAR,Name="Run spark-submit using command-
runner.jar",ActionOnFailure=CONTINUE,Jar=command-runner.jar,Args=[spark-submit,S3://
amzn-s3-demo-bucket/my-app.py,ArgName1,ArgValue1,ArgName2,ArgValue2]
```

The following table identifies additional tools that you can run using `command-runner.jar`.

| Tool name | Description |
|---|---|
| `hadoop-streaming` | Submits an Hadoop streaming program. In the console and some SDKs, this is a streaming step. |
| `hive-script` | Runs a Hive script. In the console and SDKs, this is a Hive step. |
| `pig-script` | Runs a Pig script. In the console and SDKs, this is a Pig step. |
| `spark-submit` | Runs a Spark application. In the console, this is a Spark step. |
| `hadoop-lzo` | Runs the Hadoop LZO indexer on a directory. |
| `s3-dist-cp` | Distributed copy large amounts of data from Amazon S3 into HDFS. For more information, see S3DistCp (s3-dist-cp). |

# Amazon Glossary

For the latest Amazon terminology, see the Amazon glossary in the *Amazon Web Services Glossary Reference*.
