- `InternalServerErrorException`
- `IntegrationNotFoundFault`
- `EntityNotFoundException`
- `InternalServiceException`
- `InvalidInputException`

DeleteIntegration action (Python: `delete_integration`)

Deletes the specified Zero-ETL integration.

Request

- `IntegrationIdentifier` – *Required:* UTF-8 string, not less than 1 or more than 128 bytes long.

The Amazon Resource Name (ARN) for the integration.

Response

- `SourceArn` – *Required:* UTF-8 string, not less than 1 or more than 128 bytes long.

The ARN of the source for the integration.

- `TargetArn` – *Required:* UTF-8 string, not less than 1 or more than 128 bytes long.

The ARN of the target for the integration.

- `IntegrationName` – *Required:* UTF-8 string, not less than 1 or more than 128 bytes long.

A unique name for an integration in Amazon Glue.

- **Description** – UTF-8 string, not more than 1000 bytes long, matching the [Custom string pattern #12](#).

A description of the integration.

- **IntegrationArn** – *Required*: UTF-8 string, not less than 1 or more than 128 bytes long.

The Amazon Resource Name (ARN) for the integration.

- **KmsKeyId** – UTF-8 string, not less than 1 or more than 2048 bytes long.

The ARN of a KMS key used for encrypting the channel.

- **AdditionalEncryptionContext** – A map array of key-value pairs.

Each key is a UTF-8 string.

Each value is a UTF-8 string.

An optional set of non-secret key-value pairs that contains additional contextual information for encryption.

- **Tags** – An array of [Tag](#) objects.

Metadata assigned to the resource consisting of a list of key-value pairs.

- **Status** – *Required*: UTF-8 string (valid values: CREATING | ACTIVE | MODIFYING | FAILED | DELETING | SYNCING | NEEDS_ATTENTION).

The status of the integration being deleted.

The possible statuses are:

- **CREATING**: The integration is being created.
 - **ACTIVE**: The integration creation succeeds.
 - **MODIFYING**: The integration is being modified.
 - **FAILED**: The integration creation fails.
 - **DELETING**: The integration is deleted.
 - **SYNCING**: The integration is synchronizing.
 - **NEEDS_ATTENTION**: The integration needs attention, such as synchronization.
- **CreateTime** – *Required*: Timestamp.

The time when the integration was created, in UTC.

- **Errors** – An array of [IntegrationError](#) objects.

A list of errors associated with the integration.

- **DataFilter** – UTF-8 string, not less than 1 or more than 2048 bytes long.

Selects source tables for the integration using Maxwell filter syntax.

Errors

- `ValidationException`
- `AccessDeniedException`
- `InternalServerErrorException`
- `IntegrationNotFoundFault`
- `IntegrationConflictOperationFault`
- `InvalidIntegrationStateFault`
- `EntityNotFoundException`
- `InternalServiceException`
- `ConflictException`
- `InvalidStateException`
- `InvalidInputException`

DescribeInboundIntegrations action (Python: `describe_inbound_integrations`)

Returns a list of inbound integrations for the specified integration.

Request

- **IntegrationArn** – UTF-8 string, not less than 1 or more than 128 bytes long.

The Amazon Resource Name (ARN) of the integration.

- **Marker** – UTF-8 string, not less than 1 or more than 128 bytes long.

A token to specify where to start paginating. This is the marker from a previously truncated response.

- **MaxRecords** – Number (integer).

The total number of items to return in the output.

- **TargetArn** – UTF-8 string, not less than 1 or more than 128 bytes long.

The Amazon Resource Name (ARN) of the target resource in the integration.

Response

- **InboundIntegrations** – An array of [InboundIntegration](#) objects.

A list of inbound integrations.

- **Marker** – UTF-8 string, not less than 1 or more than 128 bytes long.

A value that indicates the starting point for the next set of response records in a subsequent request.

Errors

- `ValidationException`
- `AccessDeniedException`
- `InternalServerErrorException`
- `IntegrationNotFoundFault`
- `TargetResourceNotFound`
- `OperationNotSupportedException`
- `EntityNotFoundException`
- `InternalServiceException`
- `InvalidInputException`

CreateIntegrationTableProperties action (Python: `create_integration_table_properties`)

This API is used to provide optional override properties for the the tables that need to be replicated. These properties can include properties for filtering and partitioning for the source and target tables. To set both source and target properties the same API need to be invoked with the

Amazon Glue connection ARN as ResourceArn with SourceTableConfig, and the Amazon Glue database ARN as ResourceArn with TargetTableConfig respectively.

Request

- ResourceArn – *Required*: UTF-8 string, not less than 1 or more than 128 bytes long.

The Amazon Resource Name (ARN) of the target table for which to create integration table properties. Currently, this API only supports creating integration table properties for target tables, and the provided ARN should be the ARN of the target table in the Amazon Glue Data Catalog. Support for creating integration table properties for source connections (using the connection ARN) is not yet implemented and will be added in a future release.

- TableName – *Required*: UTF-8 string, not less than 1 or more than 128 bytes long.

The name of the table to be replicated.

- SourceTableConfig – A [SourceTableConfig](#) object.

A structure for the source table configuration. See the SourceTableConfig structure to see list of supported source properties.

- TargetTableConfig – A [TargetTableConfig](#) object.

A structure for the target table configuration.

Response

- *No Response parameters.*

Errors

- ValidationException
- AccessDeniedException
- ResourceNotFoundException
- InternalServerException
- EntityNotFoundException
- InternalServiceException
- InvalidInputException

UpdateIntegrationTableProperties action (Python: update_integration_table_properties)

This API is used to provide optional override properties for the tables that need to be replicated. These properties can include properties for filtering and partitioning for the source and target tables. To set both source and target properties the same API need to be invoked with the Amazon Glue connection ARN as ResourceArn with SourceTableConfig, and the Amazon Glue database ARN as ResourceArn with TargetTableConfig respectively.

The override will be reflected across all the integrations using same ResourceArn and source table.

Request

- ResourceArn – *Required:* UTF-8 string, not less than 1 or more than 128 bytes long.

The connection ARN of the source, or the database ARN of the target.

- TableName – *Required:* UTF-8 string, not less than 1 or more than 128 bytes long.

The name of the table to be replicated.

- SourceTableConfig – A [SourceTableConfig](#) object.

A structure for the source table configuration.

- TargetTableConfig – A [TargetTableConfig](#) object.

A structure for the target table configuration.

Response

- *No Response parameters.*

Errors

- ValidationException
- AccessDeniedException
- ResourceNotFoundException
- InternalServerErrorException

- EntityNotFoundException
- InternalServiceException
- InvalidInputException

GetIntegrationTableProperties action (Python: `get_integration_table_properties`)

This API is used to retrieve optional override properties for the tables that need to be replicated. These properties can include properties for filtering and partition for source and target tables.

Request

- `ResourceArn` – *Required*: UTF-8 string, not less than 1 or more than 128 bytes long.

The Amazon Resource Name (ARN) of the target table for which to retrieve integration table properties. Currently, this API only supports retrieving properties for target tables, and the provided ARN should be the ARN of the target table in the Amazon Glue Data Catalog. Support for retrieving integration table properties for source connections (using the connection ARN) is not yet implemented and will be added in a future release.

- `TableName` – *Required*: UTF-8 string, not less than 1 or more than 128 bytes long.

The name of the table to be replicated.

Response

- `ResourceArn` – UTF-8 string, not less than 1 or more than 128 bytes long.

The Amazon Resource Name (ARN) of the target table for which to retrieve integration table properties. Currently, this API only supports retrieving properties for target tables, and the provided ARN should be the ARN of the target table in the Amazon Glue Data Catalog. Support for retrieving integration table properties for source connections (using the connection ARN) is not yet implemented and will be added in a future release.

- `TableName` – UTF-8 string, not less than 1 or more than 128 bytes long.

The name of the table to be replicated.

- `SourceTableConfig` – A [SourceTableConfig](#) object.

A structure for the source table configuration.

- `TargetTableConfig` – A [TargetTableConfig](#) object.

A structure for the target table configuration.

Errors

- `ValidationException`
- `AccessDeniedException`
- `ResourceNotFoundException`
- `InternalServerErrorException`
- `EntityNotFoundException`
- `InternalServiceException`
- `InvalidInputException`

DeleteIntegrationTableProperties action (Python: `delete_integration_table_properties`)

Deletes the table properties that have been created for the tables that need to be replicated.

Request

- `ResourceArn` – *Required:* UTF-8 string, not less than 1 or more than 128 bytes long.

The connection ARN of the source, or the database ARN of the target.

- `TableName` – *Required:* UTF-8 string, not less than 1 or more than 128 bytes long.

The name of the table to be replicated.

Response

- *No Response parameters.*

Errors

- `ValidationException`
- `AccessDeniedException`
- `ResourceNotFoundException`
- `InternalServerErrorException`
- `EntityNotFoundException`
- `InternalServiceException`
- `InvalidInputException`

CreateIntegrationResourceProperty action (Python: `create_integration_resource_property`)

This API can be used for setting up the `ResourceProperty` of the Amazon Glue connection (for the source) or Amazon Glue database ARN (for the target). These properties can include the role to access the connection or database. To set both source and target properties the same API needs to be invoked with the Amazon Glue connection ARN as `ResourceArn` with `SourceProcessingProperties` and the Amazon Glue database ARN as `ResourceArn` with `TargetProcessingProperties` respectively.

Request

- `ResourceArn` – *Required*: UTF-8 string, not less than 1 or more than 128 bytes long.

The connection ARN of the source, or the database ARN of the target.

- `SourceProcessingProperties` – A [SourceProcessingProperties](#) object.

The resource properties associated with the integration source.

- `TargetProcessingProperties` – A [TargetProcessingProperties](#) object.

The resource properties associated with the integration target.

Response

- `ResourceArn` – *Required*: UTF-8 string, not less than 1 or more than 128 bytes long.

The connection ARN of the source, or the database ARN of the target.

- `SourceProcessingProperties` – A [SourceProcessingProperties](#) object.

The resource properties associated with the integration source.

- `TargetProcessingProperties` – A [TargetProcessingProperties](#) object.

The resource properties associated with the integration target.

Errors

- `ValidationException`
- `AccessDeniedException`
- `ConflictException`
- `InternalServerErrorException`
- `ResourceNotFoundException`
- `EntityNotFoundException`
- `InternalServiceException`
- `InvalidInputException`

UpdateIntegrationResourceProperty action (Python: `update_integration_resource_property`)

This API can be used for updating the `ResourceProperty` of the Amazon Glue connection (for the source) or Amazon Glue database ARN (for the target). These properties can include the role to access the connection or database. Since the same resource can be used across multiple integrations, updating resource properties will impact all the integrations using it.

Request

- `ResourceArn` – *Required:* UTF-8 string, not less than 1 or more than 128 bytes long.

The connection ARN of the source, or the database ARN of the target.

- `SourceProcessingProperties` – A [SourceProcessingProperties](#) object.

The resource properties associated with the integration source.

- `TargetProcessingProperties` – A [TargetProcessingProperties](#) object.

The resource properties associated with the integration target.

Response

- `ResourceArn` – UTF-8 string, not less than 1 or more than 128 bytes long.

The connection ARN of the source, or the database ARN of the target.

- `SourceProcessingProperties` – A [SourceProcessingProperties](#) object.

The resource properties associated with the integration source.

- `TargetProcessingProperties` – A [TargetProcessingProperties](#) object.

The resource properties associated with the integration target.

Errors

- `ValidationException`
- `AccessDeniedException`
- `InternalServerErrorException`
- `ResourceNotFoundException`
- `EntityNotFoundException`
- `InternalServiceException`
- `InvalidInputException`

GetIntegrationResourceProperty action (Python: `get_integration_resource_property`)

This API is used for fetching the `ResourceProperty` of the Amazon Glue connection (for the source) or Amazon Glue database ARN (for the target)

Request

- `ResourceArn` – *Required*: UTF-8 string, not less than 1 or more than 128 bytes long.

The connection ARN of the source, or the database ARN of the target.

Response

- `ResourceArn` – UTF-8 string, not less than 1 or more than 128 bytes long.

The connection ARN of the source, or the database ARN of the target.

- `SourceProcessingProperties` – A [SourceProcessingProperties](#) object.

The resource properties associated with the integration source.

- `TargetProcessingProperties` – A [TargetProcessingProperties](#) object.

The resource properties associated with the integration target.

Errors

- `ValidationException`
- `AccessDeniedException`
- `InternalServerErrorException`
- `ResourceNotFoundException`
- `EntityNotFoundException`
- `InternalServiceException`
- `InvalidInputException`

UntagResource action (Python: `untag_resource`)

Removes the specified tags from an integration resource.

Request

- `ResourceArn` – *Required:* UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) for the integration resource.

- `TagsToRemove` – *Required:* An array of UTF-8 strings, not more than 50 strings.

A list of metadata tags to be removed from the resource.

Response

- *No Response parameters.*

Errors

- `ResourceNotFoundException`

ListTagsForResource action (Python: `list_tags_for_resource`)

Lists the metadata tags assigned to the specified resource.

Request

- `ResourceARN` – *Required:* UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The resource ARN for the resource.

Response

- `Tags` – An array of [Tag](#) objects, not more than 10 structures.

A list of tags.

Errors

- `ResourceNotFoundException`

Exceptions

- [ResourceNotFoundException structure](#)
- [InternalServerError structure](#)
- [IntegrationAlreadyExistsFault structure](#)
- [IntegrationConflictOperationFault structure](#)
- [IntegrationQuotaExceededFault structure](#)
- [KMSKeyNotAccessibleFault structure](#)

- [IntegrationNotFoundFault structure](#)
- [TargetResourceNotFound structure](#)
- [InvalidIntegrationStateFault structure](#)

ResourceNotFoundException structure

The resource could not be found.

Fields

- Message – UTF-8 string.

A message describing the problem.

InternalServerError structure

An internal server error occurred.

Fields

- Message – UTF-8 string.

A message describing the problem.

IntegrationAlreadyExistsFault structure

The specified integration already exists.

Fields

- Message – UTF-8 string.

A message describing the problem.

IntegrationConflictOperationFault structure

The requested operation conflicts with another operation.

Fields

- Message – UTF-8 string.

A message describing the problem.

IntegrationQuotaExceededFault structure

The data processed through your integration exceeded your quota.

Fields

- Message – UTF-8 string.

A message describing the problem.

KMSKeyNotAccessibleFault structure

The KMS key specified is not accessible.

Fields

- Message – UTF-8 string.

A message describing the problem.

IntegrationNotFoundFault structure

The specified integration could not be found.

Fields

- Message – UTF-8 string.

A message describing the problem.

TargetResourceNotFound structure

The target resource could not be found.

Fields

- Message – UTF-8 string.

A message describing the problem.

InvalidIntegrationStateFault structure

The integration is in an invalid state.

Fields

- Message – UTF-8 string.

A message describing the problem.

Interactive sessions API

The interactive sessions API describes the Amazon Glue API related to using Amazon Glue interactive sessions to build and test extract, transform, and load (ETL) scripts for data integration.

Data types

- [Session structure](#)
- [SessionCommand structure](#)
- [Statement structure](#)
- [StatementOutput structure](#)
- [StatementOutputData structure](#)
- [ConnectionsList structure](#)

Session structure

The period in which a remote Spark runtime environment is running.

Fields

- Id – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of the session.

- `CreatedOn` – Timestamp.

The time and date when the session was created.

- `Status` – UTF-8 string (valid values: `PROVISIONING` | `READY` | `FAILED` | `TIMEOUT` | `STOPPING` | `STOPPED`).

The session status.

- `ErrorMessage` – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

The error message displayed during the session.

- `Description` – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

The description of the session.

- `Role` – UTF-8 string, not less than 20 or more than 2048 bytes long, matching the [Custom string pattern #30](#).

The name or Amazon Resource Name (ARN) of the IAM role associated with the Session.

- `Command` – A [SessionCommand](#) object.

The command object. See [SessionCommand](#).

- `DefaultArguments` – A map array of key-value pairs, not more than 75 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

Each value is a UTF-8 string, not more than 4096 bytes long, matching the [URI address multi-line string pattern](#).

A map array of key-value pairs. Max is 75 pairs.

- `Connections` – A [ConnectionsList](#) object.

The number of connections used for the session.

- `Progress` – Number (double).

The code execution progress of the session.

- `MaxCapacity` – Number (double).

The number of Amazon Glue data processing units (DPUs) that can be allocated when the job runs. A DPU is a relative measure of processing power that consists of 4 vCPUs of compute capacity and 16 GB memory.

- `SecurityConfiguration` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the `SecurityConfiguration` structure to be used with the session.

- `GlueVersion` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #48](#).

The Amazon Glue version determines the versions of Apache Spark and Python that Amazon Glue supports. The `GlueVersion` must be greater than 2.0.

- `DataAccessId` – UTF-8 string, not less than 1 or more than 36 bytes long.

The data access ID of the session.

- `PartitionId` – UTF-8 string, not less than 1 or more than 36 bytes long.

The partition ID of the session.

- `NumberOfWorkers` – Number (integer).

The number of workers of a defined `WorkerType` to use for the session.

- `WorkerType` – UTF-8 string (valid values: `Standard=""` | `G.1X=""` | `G.2X=""` | `G.025X=""` | `G.4X=""` | `G.8X=""` | `Z.2X=""`).

The type of predefined worker that is allocated when a session runs. Accepts a value of `G.1X`, `G.2X`, `G.4X`, or `G.8X` for Spark sessions. Accepts the value `Z.2X` for Ray sessions.

- `CompletedOn` – Timestamp.

The date and time that this session is completed.

- `ExecutionTime` – Number (double).

The total time the session ran for.

- `DPUSeconds` – Number (double).

The DPUs consumed by the session (formula: `ExecutionTime * MaxCapacity`).

- `IdleTimeout` – Number (integer).

The number of minutes when idle before the session times out.

- `ProfileName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of an Amazon Glue usage profile associated with the session.

SessionCommand structure

The `SessionCommand` that runs the job.

Fields

- `Name` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Specifies the name of the `SessionCommand`. Can be 'glueetl' or 'gluestreaming'.

- `PythonVersion` – UTF-8 string, matching the [Custom string pattern #49](#).

Specifies the Python version. The Python version indicates the version supported for jobs of type Spark.

Statement structure

The statement or request for a particular action to occur in a session.

Fields

- `Id` – Number (integer).

The ID of the statement.

- `Code` – UTF-8 string.

The execution code of the statement.

- `State` – UTF-8 string (valid values: WAITING | RUNNING | AVAILABLE | CANCELLING | CANCELLED | ERROR).

The state while request is actioned.

- `Output` – A [StatementOutput](#) object.

The output in JSON.

- `Progress` – Number (double).

The code execution progress.

- `StartedOn` – Number (long).

The unix time and date that the job definition was started.

- `CompletedOn` – Number (long).

The unix time and date that the job definition was completed.

StatementOutput structure

The code execution output in JSON format.

Fields

- `Data` – A [StatementOutputData](#) object.

The code execution output.

- `ExecutionCount` – Number (integer).

The execution count of the output.

- `Status` – UTF-8 string (valid values: `WAITING` | `RUNNING` | `AVAILABLE` | `CANCELLING` | `CANCELLED` | `ERROR`).

The status of the code execution output.

- `ErrorMessage` – UTF-8 string.

The name of the error in the output.

- `ErrorValue` – UTF-8 string.

The error value of the output.

- `Traceback` – An array of UTF-8 strings.

The traceback of the output.

StatementOutputData structure

The code execution output in JSON format.

Fields

- `TextPlain` – UTF-8 string.

The code execution output in text format.

ConnectionsList structure

Specifies the connections used by a job.

Fields

- `Connections` – An array of UTF-8 strings, not more than 1000 strings.

A list of connections used by the job.

Operations

- [CreateSession action \(Python: `create_session`\)](#)
- [StopSession action \(Python: `stop_session`\)](#)
- [DeleteSession action \(Python: `delete_session`\)](#)
- [GetSession action \(Python: `get_session`\)](#)
- [ListSessions action \(Python: `list_sessions`\)](#)
- [RunStatement action \(Python: `run_statement`\)](#)
- [CancelStatement action \(Python: `cancel_statement`\)](#)
- [GetStatement action \(Python: `get_statement`\)](#)
- [ListStatements action \(Python: `list_statements`\)](#)
- [GetGlueIdentityCenterConfiguration action \(Python: `get_glue_identity_center_configuration`\)](#)
- [UpdateGlueIdentityCenterConfiguration action \(Python: `update_glue_identity_center_configuration`\)](#)
- [CreateGlueIdentityCenterConfiguration action \(Python: `create_glue_identity_center_configuration`\)](#)

- [DeleteGlueIdentityCenterConfiguration action \(Python: delete_glue_identity_center_configuration\)](#)

CreateSession action (Python: create_session)

Creates a new session.

Request

Request to create a new session.

- **Id** – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of the session request.

- **Description** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

The description of the session.

- **Role** – *Required:* UTF-8 string, not less than 20 or more than 2048 bytes long, matching the [Custom string pattern #30](#).

The IAM Role ARN

- **Command** – *Required:* A [SessionCommand](#) object.

The SessionCommand that runs the job.

- **Timeout** – Number (integer), at least 1.

The number of minutes before session times out. Default for Spark ETL jobs is 48 hours (2880 minutes). Consult the documentation for other job types.

- **IdleTimeout** – Number (integer), at least 1.

The number of minutes when idle before session times out. Default for Spark ETL jobs is value of Timeout. Consult the documentation for other job types.

- **DefaultArguments** – A map array of key-value pairs, not more than 75 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

Each value is a UTF-8 string, not more than 4096 bytes long, matching the [URI address multi-line string pattern](#).

A map array of key-value pairs. Max is 75 pairs.

- `Connections` – A [ConnectionsList](#) object.

The number of connections to use for the session.

- `MaxCapacity` – Number (double).

The number of Amazon Glue data processing units (DPUs) that can be allocated when the job runs. A DPU is a relative measure of processing power that consists of 4 vCPUs of compute capacity and 16 GB memory.

- `NumberOfWorkers` – Number (integer).

The number of workers of a defined `WorkerType` to use for the session.

- `WorkerType` – UTF-8 string (valid values: `Standard=""` | `G.1X=""` | `G.2X=""` | `G.025X=""` | `G.4X=""` | `G.8X=""` | `Z.2X=""`).

The type of predefined worker that is allocated when a job runs. Accepts a value of `G.1X`, `G.2X`, `G.4X`, or `G.8X` for Spark jobs. Accepts the value `Z.2X` for Ray notebooks.

- For the `G.1X` worker type, each worker maps to 1 DPU (4 vCPUs, 16 GB of memory) with 94GB disk, and provides 1 executor per worker. We recommend this worker type for workloads such as data transforms, joins, and queries, to offers a scalable and cost effective way to run most jobs.
- For the `G.2X` worker type, each worker maps to 2 DPU (8 vCPUs, 32 GB of memory) with 138GB disk, and provides 1 executor per worker. We recommend this worker type for workloads such as data transforms, joins, and queries, to offers a scalable and cost effective way to run most jobs.
- For the `G.4X` worker type, each worker maps to 4 DPU (16 vCPUs, 64 GB of memory) with 256GB disk, and provides 1 executor per worker. We recommend this worker type for jobs whose workloads contain your most demanding transforms, aggregations, joins, and queries. This worker type is available only for Amazon Glue version 3.0 or later Spark ETL jobs in the following Amazon Regions: US East (Ohio), US East (N. Virginia), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm).

- For the G.8X worker type, each worker maps to 8 DPU (32 vCPUs, 128 GB of memory) with 512GB disk, and provides 1 executor per worker. We recommend this worker type for jobs whose workloads contain your most demanding transforms, aggregations, joins, and queries. This worker type is available only for Amazon Glue version 3.0 or later Spark ETL jobs, in the same Amazon Regions as supported for the G.4X worker type.
- For the Z.2X worker type, each worker maps to 2 M-DPU (8vCPUs, 64 GB of memory) with 128 GB disk, and provides up to 8 Ray workers based on the autoscaler.
- `SecurityConfiguration` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the `SecurityConfiguration` structure to be used with the session

- `GlueVersion` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #48](#).

The Amazon Glue version determines the versions of Apache Spark and Python that Amazon Glue supports. The `GlueVersion` must be greater than 2.0.

- `DataAccessId` – UTF-8 string, not less than 1 or more than 36 bytes long.

The data access ID of the session.

- `PartitionId` – UTF-8 string, not less than 1 or more than 36 bytes long.

The partition ID of the session.

- `Tags` – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

The map of key value pairs (tags) belonging to the session.

- `RequestOrigin` – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The origin of the request.

- `ProfileName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of an Amazon Glue usage profile associated with the session.

Response

- Session – A [Session](#) object.

Returns the session object in the response.

Errors

- AccessDeniedException
- IdempotentParameterMismatchException
- InternalServiceException
- OperationTimeoutException
- InvalidInputException
- ValidationException
- AlreadyExistsException
- ResourceNumberLimitExceededException

StopSession action (Python: stop_session)

Stops the session.

Request

- Id – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of the session to be stopped.

- RequestOrigin – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The origin of the request.

Response

- Id – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Returns the Id of the stopped session.

Errors

- `AccessDeniedException`
- `InternalServiceException`
- `OperationTimeoutException`
- `InvalidInputException`
- `IllegalSessionStateException`
- `ConcurrentModificationException`

DeleteSession action (Python: `delete_session`)

Deletes the session.

Request

- `Id` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of the session to be deleted.

- `RequestOrigin` – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The name of the origin of the delete session request.

Response

- `Id` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Returns the ID of the deleted session.

Errors

- `AccessDeniedException`

- `InternalServiceException`
- `OperationTimeoutException`
- `InvalidInputException`
- `IllegalSessionStateException`
- `ConcurrentModificationException`

GetSession action (Python: `get_session`)

Retrieves the session.

Request

- `Id` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of the session.

- `RequestOrigin` – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The origin of the request.

Response

- `Session` – A [Session](#) object.

The session object is returned in the response.

Errors

- `AccessDeniedException`
- `EntityNotFoundException`
- `InternalServiceException`
- `OperationTimeoutException`
- `InvalidInputException`

ListSessions action (Python: list_sessions)

Retrieve a list of sessions.

Request

- `NextToken` – UTF-8 string, not more than 400000 bytes long.

The token for the next set of results, or null if there are no more result.

- `MaxResults` – Number (integer), not less than 1 or more than 1000.

The maximum number of results.

- `Tags` – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

Tags belonging to the session.

- `RequestOrigin` – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The origin of the request.

Response

- `Ids` – An array of UTF-8 strings.

Returns the ID of the session.

- `Sessions` – An array of [Session](#) objects.

Returns the session object.

- `NextToken` – UTF-8 string, not more than 400000 bytes long.

The token for the next set of results, or null if there are no more result.

Errors

- `AccessDeniedException`

- `InvalidInputException`
- `InternalServiceException`
- `OperationTimeoutException`

RunStatement action (Python: `run_statement`)

Executes the statement.

Request

- `SessionId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Session Id of the statement to be run.

- `Code` – *Required*: UTF-8 string, not more than 68000 bytes long.

The statement code to be run.

- `RequestOrigin` – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The origin of the request.

Response

- `Id` – Number (integer).

Returns the Id of the statement that was run.

Errors

- `EntityNotFoundException`
- `AccessDeniedException`
- `InternalServiceException`
- `OperationTimeoutException`
- `InvalidInputException`
- `ValidationException`

- ResourceNumberLimitExceededException
- IllegalSessionStateException

CancelStatement action (Python: cancel_statement)

Cancels the statement.

Request

- SessionId – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Session ID of the statement to be cancelled.

- Id – *Required:* Number (integer).

The ID of the statement to be cancelled.

- RequestOrigin – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The origin of the request to cancel the statement.

Response

- *No Response parameters.*

Errors

- AccessDeniedException
- EntityNotFoundException
- InternalServiceException
- OperationTimeoutException
- InvalidInputException
- IllegalSessionStateException

GetStatement action (Python: `get_statement`)

Retrieves the statement.

Request

- `SessionId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Session ID of the statement.

- `Id` – *Required*: Number (integer).

The Id of the statement.

- `RequestOrigin` – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The origin of the request.

Response

- `Statement` – A [Statement](#) object.

Returns the statement.

Errors

- `AccessDeniedException`
- `EntityNotFoundException`
- `InternalServiceException`
- `OperationTimeoutException`
- `InvalidInputException`
- `IllegalSessionStateException`

ListStatements action (Python: `list_statements`)

Lists statements for the session.

Request

- `SessionId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Session ID of the statements.

- `RequestOrigin` – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The origin of the request to list statements.

- `NextToken` – UTF-8 string, not more than 400000 bytes long.

A continuation token, if this is a continuation call.

Response

- `Statements` – An array of [Statement](#) objects.

Returns the list of statements.

- `NextToken` – UTF-8 string, not more than 400000 bytes long.

A continuation token, if not all statements have yet been returned.

Errors

- `AccessDeniedException`
- `EntityNotFoundException`
- `InternalServiceException`
- `OperationTimeoutException`
- `InvalidInputException`
- `IllegalSessionStateException`

GetGlueIdentityCenterConfiguration action (Python: `get_glue_identity_center_configuration`)

Retrieves the current Amazon Glue Identity Center configuration details, including the associated Identity Center instance and application information.

Request

- *No Request parameters.*

Response

Response containing the Amazon Glue Identity Center configuration details.

- `ApplicationArn` – UTF-8 string, not less than 10 or more than 1224 bytes long.

The Amazon Resource Name (ARN) of the Identity Center application associated with the Amazon Glue configuration.

- `InstanceArn` – UTF-8 string, not less than 10 or more than 1224 bytes long.

The Amazon Resource Name (ARN) of the Identity Center instance associated with the Amazon Glue configuration.

- `Scopes` – An array of UTF-8 strings.

A list of Identity Center scopes that define the permissions and access levels for the Amazon Glue configuration.

Errors

- `InvalidInputException`
- `EntityNotFoundException`
- `InternalServiceException`
- `OperationTimeoutException`
- `AccessDeniedException`
- `ConcurrentModificationException`

UpdateGlueIdentityCenterConfiguration action (Python: `update_glue_identity_center_configuration`)

Updates the existing Amazon Glue Identity Center configuration, allowing modification of scopes and permissions for the integration.

Request

Request to update an existing Amazon Glue Identity Center configuration.

- Scopes – An array of UTF-8 strings, not less than 1 or more than 50 strings.

A list of Identity Center scopes that define the updated permissions and access levels for the Amazon Glue configuration.

Response

- *No Response parameters.*

Errors

- `InvalidInputException`
- `EntityNotFoundException`
- `InternalServiceException`
- `OperationTimeoutException`
- `AccessDeniedException`
- `ConcurrentModificationException`

CreateGlueIdentityCenterConfiguration action (Python: `create_glue_identity_center_configuration`)

Creates a new Amazon Glue Identity Center configuration to enable integration between Amazon Glue and Amazon IAM Identity Center for authentication and authorization.

Request

Request to create a new Amazon Glue Identity Center configuration.

- `InstanceArn` – *Required*: UTF-8 string, not less than 10 or more than 1224 bytes long.

The Amazon Resource Name (ARN) of the Identity Center instance to be associated with the Amazon Glue configuration.

- `Scopes` – An array of UTF-8 strings, not less than 1 or more than 50 strings.

A list of Identity Center scopes that define the permissions and access levels for the Amazon Glue configuration.

Response

Response from creating a new Amazon Glue Identity Center configuration.

- `ApplicationArn` – UTF-8 string, not less than 10 or more than 1224 bytes long.

The Amazon Resource Name (ARN) of the Identity Center application that was created for the Amazon Glue configuration.

Errors

- `InvalidInputException`
- `AlreadyExistsException`
- `InternalServiceException`
- `OperationTimeoutException`
- `AccessDeniedException`
- `ConcurrentModificationException`

DeleteGlueIdentityCenterConfiguration action (Python: `delete_glue_identity_center_configuration`)

Deletes the existing Amazon Glue Identity Center configuration, removing the integration between Amazon Glue and Amazon IAM Identity Center.

Request

- *No Request parameters.*

Response

- *No Response parameters.*

Errors

- `InvalidInputException`
- `EntityNotFoundException`
- `InternalServiceException`
- `OperationTimeoutException`
- `AccessDeniedException`
- `ConcurrentModificationException`

Development endpoints API

The Development endpoints API describes the Amazon Glue API related to testing using a custom `DevEndpoint`.

Data types

- [DevEndpoint structure](#)
- [DevEndpointCustomLibraries structure](#)

DevEndpoint structure

A development endpoint where a developer can remotely debug extract, transform, and load (ETL) scripts.

Fields

- `EndpointName` – UTF-8 string.

The name of the `DevEndpoint`.

- `RoleArn` – UTF-8 string, matching the [AWS IAM ARN string pattern](#).

The Amazon Resource Name (ARN) of the IAM role used in this `DevEndpoint`.

- `SecurityGroupIds` – An array of UTF-8 strings.

A list of security group identifiers used in this `DevEndpoint`.

- `SubnetId` – UTF-8 string.

The subnet ID for this `DevEndpoint`.

- `YarnEndpointAddress` – UTF-8 string.

The YARN endpoint address used by this `DevEndpoint`.

- `PrivateAddress` – UTF-8 string.

A private IP address to access the `DevEndpoint` within a VPC if the `DevEndpoint` is created within one. The `PrivateAddress` field is present only when you create the `DevEndpoint` within your VPC.

- `ZeppelinRemoteSparkInterpreterPort` – Number (integer).

The Apache Zeppelin port for the remote Apache Spark interpreter.

- `PublicAddress` – UTF-8 string.

The public IP address used by this `DevEndpoint`. The `PublicAddress` field is present only when you create a non-virtual private cloud (VPC) `DevEndpoint`.

- `Status` – UTF-8 string.

The current status of this `DevEndpoint`.

- `WorkerType` – UTF-8 string (valid values: `Standard=""` | `G.1X=""` | `G.2X=""` | `G.025X=""` | `G.4X=""` | `G.8X=""` | `Z.2X=""`).

The type of predefined worker that is allocated to the development endpoint. Accepts a value of `Standard`, `G.1X`, or `G.2X`.

- For the `Standard` worker type, each worker provides 4 vCPU, 16 GB of memory and a 50GB disk, and 2 executors per worker.
- For the `G.1X` worker type, each worker maps to 1 DPU (4 vCPU, 16 GB of memory, 64 GB disk), and provides 1 executor per worker. We recommend this worker type for memory-intensive jobs.
- For the `G.2X` worker type, each worker maps to 2 DPU (8 vCPU, 32 GB of memory, 128 GB disk), and provides 1 executor per worker. We recommend this worker type for memory-intensive jobs.

Known issue: when a development endpoint is created with the `G.2X WorkerType` configuration, the Spark drivers for the development endpoint will run on 4 vCPU, 16 GB of memory, and a 64 GB disk.

- `GlueVersion` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #48](#).

Glue version determines the versions of Apache Spark and Python that Amazon Glue supports. The Python version indicates the version supported for running your ETL scripts on development endpoints.

For more information about the available Amazon Glue versions and corresponding Spark and Python versions, see [Glue version](#) in the developer guide.

Development endpoints that are created without specifying a Glue version default to Glue 0.9.

You can specify a version of Python support for development endpoints by using the `Arguments` parameter in the `CreateDevEndpoint` or `UpdateDevEndpoint` APIs. If no arguments are provided, the version defaults to Python 2.

- `NumberOfWorkers` – Number (integer).

The number of workers of a defined `workerType` that are allocated to the development endpoint.

The maximum number of workers you can define are 299 for `G.1X`, and 149 for `G.2X`.

- `NumberOfNodes` – Number (integer).

The number of Amazon Glue Data Processing Units (DPUs) allocated to this `DevEndpoint`.

- `AvailabilityZone` – UTF-8 string.

The Amazon Availability Zone where this `DevEndpoint` is located.

- `VpcId` – UTF-8 string.

The ID of the virtual private cloud (VPC) used by this `DevEndpoint`.

- `ExtraPythonLibsS3Path` – UTF-8 string.

The paths to one or more Python libraries in an Amazon S3 bucket that should be loaded in your `DevEndpoint`. Multiple values must be complete paths separated by a comma.

Note

You can only use pure Python libraries with a DevEndpoint. Libraries that rely on C extensions, such as the [pandas](#) Python data analysis library, are not currently supported.

- `ExtraJarsS3Path` – UTF-8 string.

The path to one or more Java `.jar` files in an S3 bucket that should be loaded in your DevEndpoint.

Note

You can only use pure Java/Scala libraries with a DevEndpoint.

- `FailureReason` – UTF-8 string.

The reason for a current failure in this DevEndpoint.

- `LastUpdateStatus` – UTF-8 string.

The status of the last update.

- `CreatedTimestamp` – Timestamp.

The point in time at which this DevEndpoint was created.

- `LastModifiedTimestamp` – Timestamp.

The point in time at which this DevEndpoint was last modified.

- `PublicKey` – UTF-8 string.

The public key to be used by this DevEndpoint for authentication. This attribute is provided for backward compatibility because the recommended attribute to use is public keys.

- `PublicKeys` – An array of UTF-8 strings, not more than 5 strings.

A list of public keys to be used by the DevEndpoints for authentication. Using this attribute is preferred over a single public key because the public keys allow you to have a different private key per client.

Note

If you previously created an endpoint with a public key, you must remove that key to be able to set a list of public keys. Call the `UpdateDevEndpoint` API operation with the public key content in the `deletePublicKeys` attribute, and the list of new keys in the `addPublicKeys` attribute.

- `SecurityConfiguration` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the `SecurityConfiguration` structure to be used with this `DevEndpoint`.

- `Arguments` – A map array of key-value pairs, not more than 100 pairs.

Each key is a UTF-8 string.

Each value is a UTF-8 string.

A map of arguments used to configure the `DevEndpoint`.

Valid arguments are:

- `"--enable-glue-datacatalog": ""`

You can specify a version of Python support for development endpoints by using the `Arguments` parameter in the `CreateDevEndpoint` or `UpdateDevEndpoint` APIs. If no arguments are provided, the version defaults to Python 2.

DevEndpointCustomLibraries structure

Custom libraries to be loaded into a development endpoint.

Fields

- `ExtraPythonLibsS3Path` – UTF-8 string.

The paths to one or more Python libraries in an Amazon Simple Storage Service (Amazon S3) bucket that should be loaded in your `DevEndpoint`. Multiple values must be complete paths separated by a comma.

Note

You can only use pure Python libraries with a DevEndpoint. Libraries that rely on C extensions, such as the [pandas](#) Python data analysis library, are not currently supported.

- ExtraJarsS3Path – UTF-8 string.

The path to one or more Java .jar files in an S3 bucket that should be loaded in your DevEndpoint.

Note

You can only use pure Java/Scala libraries with a DevEndpoint.

Operations

- [CreateDevEndpoint](#) action (Python: `create_dev_endpoint`)
- [UpdateDevEndpoint](#) action (Python: `update_dev_endpoint`)
- [DeleteDevEndpoint](#) action (Python: `delete_dev_endpoint`)
- [GetDevEndpoint](#) action (Python: `get_dev_endpoint`)
- [GetDevEndpoints](#) action (Python: `get_dev_endpoints`)
- [BatchGetDevEndpoints](#) action (Python: `batch_get_dev_endpoints`)
- [ListDevEndpoints](#) action (Python: `list_dev_endpoints`)

CreateDevEndpoint action (Python: `create_dev_endpoint`)

Creates a new development endpoint.

Request

- `EndpointName` – *Required:* UTF-8 string.

The name to be assigned to the new DevEndpoint.

- `RoleArn` – *Required:* UTF-8 string, matching the [AWS IAM ARN string pattern](#).

The IAM role for the DevEndpoint.

- `SecurityGroupIds` – An array of UTF-8 strings.

Security group IDs for the security groups to be used by the new DevEndpoint.

- `SubnetId` – UTF-8 string.

The subnet ID for the new DevEndpoint to use.

- `PublicKey` – UTF-8 string.

The public key to be used by this DevEndpoint for authentication. This attribute is provided for backward compatibility because the recommended attribute to use is public keys.

- `PublicKeys` – An array of UTF-8 strings, not more than 5 strings.

A list of public keys to be used by the development endpoints for authentication. The use of this attribute is preferred over a single public key because the public keys allow you to have a different private key per client.

 **Note**

If you previously created an endpoint with a public key, you must remove that key to be able to set a list of public keys. Call the `UpdateDevEndpoint` API with the public key content in the `deletePublicKeys` attribute, and the list of new keys in the `addPublicKeys` attribute.

- `NumberOfNodes` – Number (integer).

The number of Amazon Glue Data Processing Units (DPUs) to allocate to this DevEndpoint.

- `WorkerType` – UTF-8 string (valid values: `Standard=""` | `G.1X=""` | `G.2X=""` | `G.025X=""` | `G.4X=""` | `G.8X=""` | `Z.2X=""`).

The type of predefined worker that is allocated to the development endpoint. Accepts a value of `Standard`, `G.1X`, or `G.2X`.

- For the `Standard` worker type, each worker provides 4 vCPU, 16 GB of memory and a 50GB disk, and 2 executors per worker.
- For the `G.1X` worker type, each worker maps to 1 DPU (4 vCPU, 16 GB of memory, 64 GB disk), and provides 1 executor per worker. We recommend this worker type for memory-intensive jobs.

- For the G.2X worker type, each worker maps to 2 DPU (8 vCPU, 32 GB of memory, 128 GB disk), and provides 1 executor per worker. We recommend this worker type for memory-intensive jobs.

Known issue: when a development endpoint is created with the G.2X WorkerType configuration, the Spark drivers for the development endpoint will run on 4 vCPU, 16 GB of memory, and a 64 GB disk.

- `GlueVersion` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #48](#).

Glue version determines the versions of Apache Spark and Python that Amazon Glue supports. The Python version indicates the version supported for running your ETL scripts on development endpoints.

For more information about the available Amazon Glue versions and corresponding Spark and Python versions, see [Glue version](#) in the developer guide.

Development endpoints that are created without specifying a Glue version default to Glue 0.9.

You can specify a version of Python support for development endpoints by using the `Arguments` parameter in the `CreateDevEndpoint` or `UpdateDevEndpoint` APIs. If no arguments are provided, the version defaults to Python 2.

- `NumberOfWorkers` – Number (integer).

The number of workers of a defined `workerType` that are allocated to the development endpoint.

The maximum number of workers you can define are 299 for G.1X, and 149 for G.2X.

- `ExtraPythonLibsS3Path` – UTF-8 string.

The paths to one or more Python libraries in an Amazon S3 bucket that should be loaded in your `DevEndpoint`. Multiple values must be complete paths separated by a comma.

Note

You can only use pure Python libraries with a `DevEndpoint`. Libraries that rely on C extensions, such as the [pandas](#) Python data analysis library, are not yet supported.

- `ExtraJarsS3Path` – UTF-8 string.

The path to one or more Java `.jar` files in an S3 bucket that should be loaded in your DevEndpoint.

- `SecurityConfiguration` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the `SecurityConfiguration` structure to be used with this DevEndpoint.

- `Tags` – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

The tags to use with this DevEndpoint. You may use tags to limit access to the DevEndpoint. For more information about tags in Amazon Glue, see [Amazon Tags in Amazon Glue](#) in the developer guide.

- `Arguments` – A map array of key-value pairs, not more than 100 pairs.

Each key is a UTF-8 string.

Each value is a UTF-8 string.

A map of arguments used to configure the DevEndpoint.

Response

- `EndpointName` – UTF-8 string.

The name assigned to the new DevEndpoint.

- `Status` – UTF-8 string.

The current status of the new DevEndpoint.

- `SecurityGroupIds` – An array of UTF-8 strings.

The security groups assigned to the new DevEndpoint.

- `SubnetId` – UTF-8 string.

The subnet ID assigned to the new DevEndpoint.

- `RoleArn` – UTF-8 string, matching the [AWS IAM ARN string pattern](#).

The Amazon Resource Name (ARN) of the role assigned to the new DevEndpoint.

- `YarnEndpointAddress` – UTF-8 string.

The address of the YARN endpoint used by this DevEndpoint.

- `ZeppelinRemoteSparkInterpreterPort` – Number (integer).

The Apache Zeppelin port for the remote Apache Spark interpreter.

- `NumberOfNodes` – Number (integer).

The number of Amazon Glue Data Processing Units (DPUs) allocated to this DevEndpoint.

- `WorkerType` – UTF-8 string (valid values: `Standard=""` | `G.1X=""` | `G.2X=""` | `G.025X=""` | `G.4X=""` | `G.8X=""` | `Z.2X=""`).

The type of predefined worker that is allocated to the development endpoint. May be a value of `Standard`, `G.1X`, or `G.2X`.

- `GlueVersion` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #48](#).

Glue version determines the versions of Apache Spark and Python that Amazon Glue supports. The Python version indicates the version supported for running your ETL scripts on development endpoints.

For more information about the available Amazon Glue versions and corresponding Spark and Python versions, see [Glue version](#) in the developer guide.

- `NumberOfWorkers` – Number (integer).

The number of workers of a defined `workerType` that are allocated to the development endpoint.

- `AvailabilityZone` – UTF-8 string.

The Amazon Availability Zone where this DevEndpoint is located.

- `VpcId` – UTF-8 string.

The ID of the virtual private cloud (VPC) used by this DevEndpoint.

- `ExtraPythonLibsS3Path` – UTF-8 string.

The paths to one or more Python libraries in an S3 bucket that will be loaded in your DevEndpoint.

- `ExtraJarsS3Path` – UTF-8 string.

Path to one or more Java `.jar` files in an S3 bucket that will be loaded in your DevEndpoint.

- `FailureReason` – UTF-8 string.

The reason for a current failure in this DevEndpoint.

- `SecurityConfiguration` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the `SecurityConfiguration` structure being used with this DevEndpoint.

- `CreatedTimestamp` – Timestamp.

The point in time at which this DevEndpoint was created.

- `Arguments` – A map array of key-value pairs, not more than 100 pairs.

Each key is a UTF-8 string.

Each value is a UTF-8 string.

The map of arguments used to configure this DevEndpoint.

Valid arguments are:

- `--enable-glue-datacatalog`: ""

You can specify a version of Python support for development endpoints by using the `Arguments` parameter in the `CreateDevEndpoint` or `UpdateDevEndpoint` APIs. If no arguments are provided, the version defaults to Python 2.

Errors

- `AccessDeniedException`
- `AlreadyExistsException`
- `IdempotentParameterMismatchException`
- `InternalServiceException`
- `OperationTimeoutException`

- `InvalidInputException`
- `ValidationException`
- `ResourceNumberLimitExceededException`

UpdateDevEndpoint action (Python: `update_dev_endpoint`)

Updates a specified development endpoint.

Request

- `EndpointName` – *Required:* UTF-8 string.

The name of the `DevEndpoint` to be updated.

- `PublicKey` – UTF-8 string.

The public key for the `DevEndpoint` to use.

- `AddPublicKeys` – An array of UTF-8 strings, not more than 5 strings.

The list of public keys for the `DevEndpoint` to use.

- `DeletePublicKeys` – An array of UTF-8 strings, not more than 5 strings.

The list of public keys to be deleted from the `DevEndpoint`.

- `CustomLibraries` – A [DevEndpointCustomLibraries](#) object.

Custom Python or Java libraries to be loaded in the `DevEndpoint`.

- `UpdateEtlLibraries` – Boolean.

True if the list of custom libraries to be loaded in the development endpoint needs to be updated, or False if otherwise.

- `DeleteArguments` – An array of UTF-8 strings.

The list of argument keys to be deleted from the map of arguments used to configure the `DevEndpoint`.

- `AddArguments` – A map array of key-value pairs, not more than 100 pairs.

Each key is a UTF-8 string.

Each value is a UTF-8 string.

The map of arguments to add the map of arguments used to configure the DevEndpoint.

Valid arguments are:

- "--enable-glue-datacatalog": ""

You can specify a version of Python support for development endpoints by using the Arguments parameter in the CreateDevEndpoint or UpdateDevEndpoint APIs. If no arguments are provided, the version defaults to Python 2.

Response

- *No Response parameters.*

Errors

- EntityNotFoundException
- InternalServiceException
- OperationTimeoutException
- InvalidInputException
- ValidationException

DeleteDevEndpoint action (Python: delete_dev_endpoint)

Deletes a specified development endpoint.

Request

- EndpointName – *Required:* UTF-8 string.

The name of the DevEndpoint.

Response

- *No Response parameters.*

Errors

- EntityNotFoundException
- InternalServiceException
- OperationTimeoutException
- InvalidInputException

GetDevEndpoint action (Python: `get_dev_endpoint`)

Retrieves information about a specified development endpoint.

Note

When you create a development endpoint in a virtual private cloud (VPC), Amazon Glue returns only a private IP address, and the public IP address field is not populated. When you create a non-VPC development endpoint, Amazon Glue returns only a public IP address.

Request

- `EndpointName` – *Required*: UTF-8 string.

Name of the `DevEndpoint` to retrieve information for.

Response

- `DevEndpoint` – A [DevEndpoint](#) object.

A `DevEndpoint` definition.

Errors

- EntityNotFoundException
- InternalServiceException
- OperationTimeoutException
- InvalidInputException

GetDevEndpoints action (Python: `get_dev_endpoints`)

Retrieves all the development endpoints in this Amazon account.

Note

When you create a development endpoint in a virtual private cloud (VPC), Amazon Glue returns only a private IP address and the public IP address field is not populated. When you create a non-VPC development endpoint, Amazon Glue returns only a public IP address.

Request

- `MaxResults` – Number (integer), not less than 1 or more than 1000.

The maximum size of information to return.

- `NextToken` – UTF-8 string.

A continuation token, if this is a continuation call.

Response

- `DevEndpoints` – An array of [DevEndpoint](#) objects.

A list of `DevEndpoint` definitions.

- `NextToken` – UTF-8 string.

A continuation token, if not all `DevEndpoint` definitions have yet been returned.

Errors

- `EntityNotFoundException`
- `InternalServiceException`
- `OperationTimeoutException`
- `InvalidInputException`

BatchGetDevEndpoints action (Python: batch_get_dev_endpoints)

Returns a list of resource metadata for a given list of development endpoint names. After calling the `ListDevEndpoints` operation, you can call this operation to access the data to which you have been granted permissions. This operation supports all IAM permissions, including permission conditions that uses tags.

Request

- `customerAccountId` – UTF-8 string.

The Amazon account ID.

- `DevEndpointNames` – *Required*: An array of UTF-8 strings, not less than 1 or more than 25 strings.

The list of `DevEndpoint` names, which might be the names returned from the `ListDevEndpoint` operation.

Response

- `DevEndpoints` – An array of [DevEndpoint](#) objects.

A list of `DevEndpoint` definitions.

- `DevEndpointsNotFound` – An array of UTF-8 strings, not less than 1 or more than 25 strings.

A list of `DevEndpoints` not found.

Errors

- `AccessDeniedException`
- `InternalServiceException`
- `OperationTimeoutException`
- `InvalidInputException`

ListDevEndpoints action (Python: list_dev_endpoints)

Retrieves the names of all `DevEndpoint` resources in this Amazon account, or the resources with the specified tag. This operation allows you to see which resources are available in your account, and their names.

This operation takes the optional `Tags` field, which you can use as a filter on the response so that tagged resources can be retrieved as a group. If you choose to use tags filtering, only resources with the tag are retrieved.

Request

- `NextToken` – UTF-8 string.

A continuation token, if this is a continuation request.

- `MaxResults` – Number (integer), not less than 1 or more than 1000.

The maximum size of a list to return.

- `Tags` – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

Specifies to return only these tagged resources.

Response

- `DevEndpointNames` – An array of UTF-8 strings.

The names of all the `DevEndpoints` in the account, or the `DevEndpoints` with the specified tags.

- `NextToken` – UTF-8 string.

A continuation token, if the returned list does not contain the last metric available.

Errors

- `InvalidInputException`

- `EntityNotFoundException`
- `InternalServiceException`
- `OperationTimeoutException`

Schema registry

The Schema registry API describes the data types and API related to working with schemas in Amazon Glue.

Data types

- [RegistryId structure](#)
- [RegistryListItem structure](#)
- [MetadataInfo structure](#)
- [OtherMetadataValueListItem structure](#)
- [SchemaListItem structure](#)
- [SchemaVersionListItem structure](#)
- [MetadataKeyValuePair structure](#)
- [SchemaVersionErrorItem structure](#)
- [ErrorDetails structure](#)
- [SchemaVersionNumber structure](#)
- [SchemaId structure](#)

RegistryId structure

A wrapper structure that may contain the registry name and Amazon Resource Name (ARN).

Fields

- `RegistryName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

Name of the registry. Used only for lookup. One of `RegistryArn` or `RegistryName` has to be provided.

- `RegistryArn` – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

Arn of the registry to be updated. One of `RegistryArn` or `RegistryName` has to be provided.

RegistryListItem structure

A structure containing the details for a registry.

Fields

- `RegistryName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the registry.

- `RegistryArn` – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the registry.

- `Description` – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the registry.

- `Status` – UTF-8 string (valid values: AVAILABLE | DELETING).

The status of the registry.

- `CreatedTime` – UTF-8 string.

The data the registry was created.

- `UpdatedTime` – UTF-8 string.

The date the registry was updated.

MetadataInfo structure

A structure containing metadata information for a schema version.

Fields

- `MetadataValue` – UTF-8 string, not less than 1 or more than 256 bytes long, matching the [Custom string pattern #14](#).

The metadata key's corresponding value.

- `CreateTime` – UTF-8 string.

The time at which the entry was created.

- `OtherMetadataValueList` – An array of [OtherMetadataValueListItem](#) objects.

Other metadata belonging to the same metadata key.

OtherMetadataValueListItem structure

A structure containing other metadata for a schema version belonging to the same metadata key.

Fields

- `MetadataValue` – UTF-8 string, not less than 1 or more than 256 bytes long, matching the [Custom string pattern #14](#).

The metadata key's corresponding value for the other metadata belonging to the same metadata key.

- `CreateTime` – UTF-8 string.

The time at which the entry was created.

SchemaListItem structure

An object that contains minimal details for a schema.

Fields

- `RegistryName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

the name of the registry where the schema resides.

- `SchemaName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the schema.

- `SchemaArn` – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) for the schema.

- `Description` – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description for the schema.

- `SchemaStatus` – UTF-8 string (valid values: AVAILABLE | PENDING | DELETING).

The status of the schema.

- `CreatedTime` – UTF-8 string.

The date and time that a schema was created.

- `UpdatedTime` – UTF-8 string.

The date and time that a schema was updated.

SchemaVersionListItem structure

An object containing the details about a schema version.

Fields

- `SchemaArn` – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the schema.

- `SchemaVersionId` – UTF-8 string, not less than 36 or more than 36 bytes long, matching the [Custom string pattern #45](#).

The unique identifier of the schema version.

- `VersionNumber` – Number (long), not less than 1 or more than 100000.

The version number of the schema.

- **Status** – UTF-8 string (valid values: AVAILABLE | PENDING | FAILURE | DELETING).

The status of the schema version.

- **CreatedTime** – UTF-8 string.

The date and time the schema version was created.

MetadataKeyValuePair structure

A structure containing a key value pair for metadata.

Fields

- **MetadataKey** – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #14](#).

A metadata key.

- **MetadataValue** – UTF-8 string, not less than 1 or more than 256 bytes long, matching the [Custom string pattern #14](#).

A metadata key's corresponding value.

SchemaVersionErrorItem structure

An object that contains the error details for an operation on a schema version.

Fields

- **VersionNumber** – Number (long), not less than 1 or more than 100000.

The version number of the schema.

- **ErrorDetails** – An [ErrorDetails](#) object.

The details of the error for the schema version.

ErrorDetails structure

An object containing error details.

Fields

- `ErrorCode` – UTF-8 string.

The error code for an error.

- `ErrorMessage` – UTF-8 string.

The error message for an error.

SchemaVersionNumber structure

A structure containing the schema version information.

Fields

- `LatestVersion` – Boolean.

The latest version available for the schema.

- `VersionNumber` – Number (long), not less than 1 or more than 100000.

The version number of the schema.

Schemald structure

The unique ID of the schema in the Amazon Glue schema registry.

Fields

- `SchemaArn` – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the schema. One of `SchemaArn` or `SchemaName` has to be provided.

- `SchemaName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the schema. One of `SchemaArn` or `SchemaName` has to be provided.

- `RegistryName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the schema registry that contains the schema.

Operations

- [CreateRegistry action \(Python: create_registry\)](#)
- [CreateSchema action \(Python: create_schema\)](#)
- [GetSchema action \(Python: get_schema\)](#)
- [ListSchemaVersions action \(Python: list_schema_versions\)](#)
- [GetSchemaVersion action \(Python: get_schema_version\)](#)
- [GetSchemaVersionsDiff action \(Python: get_schema_versions_diff\)](#)
- [ListRegistries action \(Python: list_registries\)](#)
- [ListSchemas action \(Python: list_schemas\)](#)
- [RegisterSchemaVersion action \(Python: register_schema_version\)](#)
- [UpdateSchema action \(Python: update_schema\)](#)
- [CheckSchemaVersionValidity action \(Python: check_schema_version_validity\)](#)
- [UpdateRegistry action \(Python: update_registry\)](#)
- [GetSchemaByDefinition action \(Python: get_schema_by_definition\)](#)
- [GetRegistry action \(Python: get_registry\)](#)
- [PutSchemaVersionMetadata action \(Python: put_schema_version_metadata\)](#)
- [QuerySchemaVersionMetadata action \(Python: query_schema_version_metadata\)](#)
- [RemoveSchemaVersionMetadata action \(Python: remove_schema_version_metadata\)](#)
- [DeleteRegistry action \(Python: delete_registry\)](#)
- [DeleteSchema action \(Python: delete_schema\)](#)
- [DeleteSchemaVersions action \(Python: delete_schema_versions\)](#)

CreateRegistry action (Python: create_registry)

Creates a new registry which may be used to hold a collection of schemas.

Request

- **RegistryName** – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

Name of the registry to be created of max length of 255, and may only contain letters, numbers, hyphen, underscore, dollar sign, or hash mark. No whitespace.

- **Description** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the registry. If description is not provided, there will not be any default value for this.

- **Tags** – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

Amazon tags that contain a key value pair and may be searched by console, command line, or API.

Response

- **RegistryArn** – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the newly created registry.

- **RegistryName** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the registry.

- **Description** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the registry.

- **Tags** – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

The tags for the registry.

Errors

- `InvalidInputException`
- `AccessDeniedException`
- `AlreadyExistsException`
- `ResourceNumberLimitExceededException`
- `ConcurrentModificationException`
- `ThrottlingException`
- `InternalServiceException`

CreateSchema action (Python: `create_schema`)

Creates a new schema set and registers the schema definition. Returns an error if the schema set already exists without actually registering the version.

When the schema set is created, a version checkpoint will be set to the first version. Compatibility mode "DISABLED" restricts any additional schema versions from being added after the first schema version. For all other compatibility modes, validation of compatibility settings will be applied only from the second version onwards when the `RegisterSchemaVersion` API is used.

When this API is called without a `RegistryId`, this will create an entry for a "default-registry" in the registry database tables, if it is not already present.

Request

- `RegistryId` – A [RegistryId](#) object.

This is a wrapper shape to contain the registry identity fields. If this is not provided, the default registry will be used. The ARN format for the same will be: `arn:aws:glue:us-east-2:<customer id>:registry/default-registry:random-5-letter-id`.

- `SchemaName` – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

Name of the schema to be created of max length of 255, and may only contain letters, numbers, hyphen, underscore, dollar sign, or hash mark. No whitespace.

- `DataFormat` – *Required*: UTF-8 string (valid values: AVRO | JSON | PROTOBUF).

The data format of the schema definition. Currently AVRO, JSON and PROTOBUF are supported.

- `Compatibility` – UTF-8 string (valid values: NONE | DISABLED | BACKWARD | BACKWARD_ALL | FORWARD | FORWARD_ALL | FULL | FULL_ALL).

The compatibility mode of the schema. The possible values are:

- *NONE*: No compatibility mode applies. You can use this choice in development scenarios or if you do not know the compatibility mode that you want to apply to schemas. Any new version added will be accepted without undergoing a compatibility check.
- *DISABLED*: This compatibility choice prevents versioning for a particular schema. You can use this choice to prevent future versioning of a schema.
- *BACKWARD*: This compatibility choice is recommended as it allows data receivers to read both the current and one previous schema version. This means that for instance, a new schema version cannot drop data fields or change the type of these fields, so they can't be read by readers using the previous version.
- *BACKWARD_ALL*: This compatibility choice allows data receivers to read both the current and all previous schema versions. You can use this choice when you need to delete fields or add optional fields, and check compatibility against all previous schema versions.
- *FORWARD*: This compatibility choice allows data receivers to read both the current and one next schema version, but not necessarily later versions. You can use this choice when you need to add fields or delete optional fields, but only check compatibility against the last schema version.
- *FORWARD_ALL*: This compatibility choice allows data receivers to read written by producers of any new registered schema. You can use this choice when you need to add fields or delete optional fields, and check compatibility against all previous schema versions.
- *FULL*: This compatibility choice allows data receivers to read data written by producers using the previous or next version of the schema, but not necessarily earlier or later versions. You can use this choice when you need to add or remove optional fields, but only check compatibility against the last schema version.

- *FULL_ALL*: This compatibility choice allows data receivers to read data written by producers using all previous schema versions. You can use this choice when you need to add or remove optional fields, and check compatibility against all previous schema versions.
- *Description* – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

An optional description of the schema. If description is not provided, there will not be any automatic default value for this.

- *Tags* – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

Amazon tags that contain a key value pair and may be searched by console, command line, or API. If specified, follows the Amazon tags-on-create pattern.

- *SchemaDefinition* – UTF-8 string, not less than 1 or more than 170000 bytes long, matching the [Custom string pattern #13](#).

The schema definition using the *DataFormat* setting for *SchemaName*.

Response

- *RegistryName* – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the registry.

- *RegistryArn* – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the registry.

- *SchemaName* – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the schema.

- *SchemaArn* – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the schema.

- **Description** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the schema if specified when created.

- **DataFormat** – UTF-8 string (valid values: AVRO | JSON | PROTOBUF).

The data format of the schema definition. Currently AVRO, JSON and PROTOBUF are supported.

- **Compatibility** – UTF-8 string (valid values: NONE | DISABLED | BACKWARD | BACKWARD_ALL | FORWARD | FORWARD_ALL | FULL | FULL_ALL).

The schema compatibility mode.

- **SchemaCheckpoint** – Number (long), not less than 1 or more than 100000.

The version number of the checkpoint (the last time the compatibility mode was changed).

- **LatestSchemaVersion** – Number (long), not less than 1 or more than 100000.

The latest version of the schema associated with the returned schema definition.

- **NextSchemaVersion** – Number (long), not less than 1 or more than 100000.

The next version of the schema associated with the returned schema definition.

- **SchemaStatus** – UTF-8 string (valid values: AVAILABLE | PENDING | DELETING).

The status of the schema.

- **Tags** – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

The tags for the schema.

- **SchemaVersionId** – UTF-8 string, not less than 36 or more than 36 bytes long, matching the [Custom string pattern #45](#).

The unique identifier of the first schema version.

- **SchemaVersionStatus** – UTF-8 string (valid values: AVAILABLE | PENDING | FAILURE | DELETING).

The status of the first schema version created.

Errors

- `InvalidInputException`
- `AccessDeniedException`
- `EntityNotFoundException`
- `AlreadyExistsException`
- `ResourceNumberLimitExceededException`
- `ConcurrentModificationException`
- `ThrottlingException`
- `InternalServiceException`

GetSchema action (Python: `get_schema`)

Describes the specified schema in detail.

Request

- `SchemaId` – *Required:* A [Schemald](#) object.

This is a wrapper structure to contain schema identity fields. The structure contains:

- `Schemald$SchemaArn`: The Amazon Resource Name (ARN) of the schema. Either `SchemaArn` or `SchemaName` and `RegistryName` has to be provided.
- `Schemald$SchemaName`: The name of the schema. Either `SchemaArn` or `SchemaName` and `RegistryName` has to be provided.

Response

- `RegistryName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the registry.

- `RegistryArn` – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the registry.

- `SchemaName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the schema.

- `SchemaArn` – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the schema.

- `Description` – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of schema if specified when created

- `DataFormat` – UTF-8 string (valid values: AVRO | JSON | PROTOBUF).

The data format of the schema definition. Currently AVRO, JSON and PROTOBUF are supported.

- `Compatibility` – UTF-8 string (valid values: NONE | DISABLED | BACKWARD | BACKWARD_ALL | FORWARD | FORWARD_ALL | FULL | FULL_ALL).

The compatibility mode of the schema.

- `SchemaCheckpoint` – Number (long), not less than 1 or more than 100000.

The version number of the checkpoint (the last time the compatibility mode was changed).

- `LatestSchemaVersion` – Number (long), not less than 1 or more than 100000.

The latest version of the schema associated with the returned schema definition.

- `NextSchemaVersion` – Number (long), not less than 1 or more than 100000.

The next version of the schema associated with the returned schema definition.

- `SchemaStatus` – UTF-8 string (valid values: AVAILABLE | PENDING | DELETING).

The status of the schema.

- `CreatedTime` – UTF-8 string.

The date and time the schema was created.

- `UpdatedTime` – UTF-8 string.

The date and time the schema was updated.

Errors

- `InvalidInputException`
- `AccessDeniedException`
- `EntityNotFoundException`
- `ThrottlingException`
- `InternalServiceException`

ListSchemaVersions action (Python: `list_schema_versions`)

Returns a list of schema versions that you have created, with minimal information. Schema versions in Deleted status will not be included in the results. Empty results will be returned if there are no schema versions available.

Request

- `SchemaId` – *Required:* A [SchemaId](#) object.

This is a wrapper structure to contain schema identity fields. The structure contains:

- `SchemaId$SchemaArn`: The Amazon Resource Name (ARN) of the schema. Either `SchemaArn` or `SchemaName` and `RegistryName` has to be provided.
- `SchemaId$SchemaName`: The name of the schema. Either `SchemaArn` or `SchemaName` and `RegistryName` has to be provided.
- `MaxResults` – Number (integer), not less than 1 or more than 100.

Maximum number of results required per page. If the value is not supplied, this will be defaulted to 25 per page.

- `NextToken` – UTF-8 string.

A continuation token, if this is a continuation call.

Response

- `Schemas` – An array of [SchemaVersionListItem](#) objects.

An array of `SchemaVersionList` objects containing details of each schema version.

- `NextToken` – UTF-8 string.

A continuation token for paginating the returned list of tokens, returned if the current segment of the list is not the last.

Errors

- `InvalidInputException`
- `AccessDeniedException`
- `EntityNotFoundException`
- `ThrottlingException`
- `InternalServiceException`

GetSchemaVersion action (Python: `get_schema_version`)

Get the specified schema by its unique ID assigned when a version of the schema is created or registered. Schema versions in Deleted status will not be included in the results.

Request

- `SchemaId` – A [SchemaId](#) object.

This is a wrapper structure to contain schema identity fields. The structure contains:

- `SchemaId$SchemaArn`: The Amazon Resource Name (ARN) of the schema. Either `SchemaArn` or `SchemaName` and `RegistryName` has to be provided.
- `SchemaId$SchemaName`: The name of the schema. Either `SchemaArn` or `SchemaName` and `RegistryName` has to be provided.
- `SchemaVersionId` – UTF-8 string, not less than 36 or more than 36 bytes long, matching the [Custom string pattern #45](#).

The `SchemaVersionId` of the schema version. This field is required for fetching by schema ID. Either this or the `SchemaId` wrapper has to be provided.

- `SchemaVersionNumber` – A [SchemaVersionNumber](#) object.

The version number of the schema.

Response

- `SchemaVersionId` – UTF-8 string, not less than 36 or more than 36 bytes long, matching the [Custom string pattern #45](#).

The `SchemaVersionId` of the schema version.

- `SchemaDefinition` – UTF-8 string, not less than 1 or more than 170000 bytes long, matching the [Custom string pattern #13](#).

The schema definition for the schema ID.

- `DataFormat` – UTF-8 string (valid values: AVRO | JSON | PROTOBUF).

The data format of the schema definition. Currently AVRO, JSON and PROTOBUF are supported.

- `SchemaArn` – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the schema.

- `VersionNumber` – Number (long), not less than 1 or more than 100000.

The version number of the schema.

- `Status` – UTF-8 string (valid values: AVAILABLE | PENDING | FAILURE | DELETING).

The status of the schema version.

- `CreatedTime` – UTF-8 string.

The date and time the schema version was created.

Errors

- `InvalidInputException`
- `AccessDeniedException`
- `EntityNotFoundException`
- `ThrottlingException`
- `InternalServiceException`

GetSchemaVersionsDiff action (Python: `get_schema_versions_diff`)

Fetches the schema version difference in the specified difference type between two stored schema versions in the Schema Registry.

This API allows you to compare two schema versions between two schema definitions under the same schema.

Request

- `SchemaId` – *Required:* A [SchemaId](#) object.

This is a wrapper structure to contain schema identity fields. The structure contains:

- `SchemaId$SchemaArn`: The Amazon Resource Name (ARN) of the schema. One of `SchemaArn` or `SchemaName` has to be provided.
- `SchemaId$SchemaName`: The name of the schema. One of `SchemaArn` or `SchemaName` has to be provided.
- `FirstSchemaVersionNumber` – *Required:* A [SchemaVersionNumber](#) object.

The first of the two schema versions to be compared.

- `SecondSchemaVersionNumber` – *Required:* A [SchemaVersionNumber](#) object.

The second of the two schema versions to be compared.

- `SchemaDiffType` – *Required:* UTF-8 string (valid values: `SYNTAX_DIFF`).

Refers to `SYNTAX_DIFF`, which is the currently supported diff type.

Response

- `Diff` – UTF-8 string, not less than 1 or more than 340000 bytes long, matching the [Custom string pattern #13](#).

The difference between schemas as a string in JsonPatch format.

Errors

- `InvalidInputException`
- `EntityNotFoundException`

- `AccessDeniedException`
- `ThrottlingException`
- `InternalServiceException`

ListRegistries action (Python: `list_registries`)

Returns a list of registries that you have created, with minimal registry information. Registries in the `Deleting` status will not be included in the results. Empty results will be returned if there are no registries available.

Request

- `MaxResults` – Number (integer), not less than 1 or more than 100.

Maximum number of results required per page. If the value is not supplied, this will be defaulted to 25 per page.

- `NextToken` – UTF-8 string.

A continuation token, if this is a continuation call.

Response

- `Registries` – An array of [RegistryListItem](#) objects.

An array of `RegistryDetailedListItem` objects containing minimal details of each registry.

- `NextToken` – UTF-8 string.

A continuation token for paginating the returned list of tokens, returned if the current segment of the list is not the last.

Errors

- `InvalidInputException`
- `AccessDeniedException`
- `ThrottlingException`
- `InternalServiceException`

ListSchemas action (Python: list_schemas)

Returns a list of schemas with minimal details. Schemas in Deleting status will not be included in the results. Empty results will be returned if there are no schemas available.

When the RegistryId is not provided, all the schemas across registries will be part of the API response.

Request

- RegistryId – A [RegistryId](#) object.

A wrapper structure that may contain the registry name and Amazon Resource Name (ARN).

- MaxResults – Number (integer), not less than 1 or more than 100.

Maximum number of results required per page. If the value is not supplied, this will be defaulted to 25 per page.

- NextToken – UTF-8 string.

A continuation token, if this is a continuation call.

Response

- Schemas – An array of [SchemaListItem](#) objects.

An array of SchemaListItem objects containing details of each schema.

- NextToken – UTF-8 string.

A continuation token for paginating the returned list of tokens, returned if the current segment of the list is not the last.

Errors

- InvalidInputException
- AccessDeniedException
- EntityNotFoundException
- ThrottlingException
- InternalServiceException

RegisterSchemaVersion action (Python: register_schema_version)

Adds a new version to the existing schema. Returns an error if new version of schema does not meet the compatibility requirements of the schema set. This API will not create a new schema set and will return a 404 error if the schema set is not already present in the Schema Registry.

If this is the first schema definition to be registered in the Schema Registry, this API will store the schema version and return immediately. Otherwise, this call has the potential to run longer than other operations due to compatibility modes. You can call the GetSchemaVersion API with the SchemaVersionId to check compatibility modes.

If the same schema definition is already stored in Schema Registry as a version, the schema ID of the existing schema is returned to the caller.

Request

- SchemaId – *Required:* A [Schemald](#) object.

This is a wrapper structure to contain schema identity fields. The structure contains:

- Schemald\$SchemaArn: The Amazon Resource Name (ARN) of the schema. Either SchemaArn or SchemaName and RegistryName has to be provided.
- Schemald\$SchemaName: The name of the schema. Either SchemaArn or SchemaName and RegistryName has to be provided.
- SchemaDefinition – *Required:* UTF-8 string, not less than 1 or more than 170000 bytes long, matching the [Custom string pattern #13](#).

The schema definition using the DataFormat setting for the SchemaName.

Response

- SchemaVersionId – UTF-8 string, not less than 36 or more than 36 bytes long, matching the [Custom string pattern #45](#).

The unique ID that represents the version of this schema.

- VersionNumber – Number (long), not less than 1 or more than 100000.

The version of this schema (for sync flow only, in case this is the first version).

- Status – UTF-8 string (valid values: AVAILABLE | PENDING | FAILURE | DELETING).

The status of the schema version.

Errors

- `InvalidInputException`
- `AccessDeniedException`
- `EntityNotFoundException`
- `ResourceNumberLimitExceededException`
- `ThrottlingException`
- `ConcurrentModificationException`
- `InternalServiceException`

UpdateSchema action (Python: `update_schema`)

Updates the description, compatibility setting, or version checkpoint for a schema set.

For updating the compatibility setting, the call will not validate compatibility for the entire set of schema versions with the new compatibility setting. If the value for `Compatibility` is provided, the `VersionNumber` (a checkpoint) is also required. The API will validate the checkpoint version number for consistency.

If the value for the `VersionNumber` (checkpoint) is provided, `Compatibility` is optional and this can be used to set/reset a checkpoint for the schema.

This update will happen only if the schema is in the `AVAILABLE` state.

Request

- `SchemaId` – *Required:* A [Schemald](#) object.

This is a wrapper structure to contain schema identity fields. The structure contains:

- `Schemald$SchemaArn`: The Amazon Resource Name (ARN) of the schema. One of `SchemaArn` or `SchemaName` has to be provided.
- `Schemald$SchemaName`: The name of the schema. One of `SchemaArn` or `SchemaName` has to be provided.

- `SchemaVersionNumber` – A [SchemaVersionNumber](#) object.

Version number required for check pointing. One of `VersionNumber` or `Compatibility` has to be provided.

- `Compatibility` – UTF-8 string (valid values: NONE | DISABLED | BACKWARD | BACKWARD_ALL | FORWARD | FORWARD_ALL | FULL | FULL_ALL).

The new compatibility setting for the schema.

- `Description` – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

The new description for the schema.

Response

- `SchemaArn` – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the schema.

- `SchemaName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the schema.

- `RegistryName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the registry that contains the schema.

Errors

- `InvalidInputException`
- `AccessDeniedException`
- `EntityNotFoundException`
- `ConcurrentModificationException`
- `ThrottlingException`
- `InternalServiceException`

CheckSchemaVersionValidity action (Python: `check_schema_version_validity`)

Validates the supplied schema. This call has no side effects, it simply validates using the supplied schema using `DataFormat` as the format. Since it does not take a schema set name, no compatibility checks are performed.

Request

- `DataFormat` – *Required*: UTF-8 string (valid values: AVRO | JSON | PROTOBUF).

The data format of the schema definition. Currently AVRO, JSON and PROTOBUF are supported.

- `SchemaDefinition` – *Required*: UTF-8 string, not less than 1 or more than 170000 bytes long, matching the [Custom string pattern #13](#).

The definition of the schema that has to be validated.

Response

- `Valid` – Boolean.

Return true, if the schema is valid and false otherwise.

- `Error` – UTF-8 string, not less than 1 or more than 5000 bytes long.

A validation failure error message.

Errors

- `InvalidInputException`
- `AccessDeniedException`
- `ThrottlingException`
- `InternalServiceException`

UpdateRegistry action (Python: `update_registry`)

Updates an existing registry which is used to hold a collection of schemas. The updated properties relate to the registry, and do not modify any of the schemas within the registry.

Request

- `RegistryId` – *Required:* A [RegistryId](#) object.

This is a wrapper structure that may contain the registry name and Amazon Resource Name (ARN).

- `Description` – *Required:* Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the registry. If description is not provided, this field will not be updated.

Response

- `RegistryName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the updated registry.

- `RegistryArn` – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource name (ARN) of the updated registry.

Errors

- `InvalidInputException`
- `AccessDeniedException`
- `EntityNotFoundException`
- `ConcurrentModificationException`
- `ThrottlingException`
- `InternalServiceException`

GetSchemaByDefinition action (Python: `get_schema_by_definition`)

Retrieves a schema by the `SchemaDefinition`. The schema definition is sent to the Schema Registry, canonicalized, and hashed. If the hash is matched within the scope of the `SchemaName` or ARN (or the default registry, if none is supplied), that schema's metadata is returned. Otherwise, a

404 or NotFound error is returned. Schema versions in Deleted statuses will not be included in the results.

Request

- **SchemaId** – *Required:* A [Schemald](#) object.

This is a wrapper structure to contain schema identity fields. The structure contains:

- **Schemald\$SchemaArn**: The Amazon Resource Name (ARN) of the schema. One of SchemaArn or SchemaName has to be provided.
- **Schemald\$SchemaName**: The name of the schema. One of SchemaArn or SchemaName has to be provided.
- **SchemaDefinition** – *Required:* UTF-8 string, not less than 1 or more than 170000 bytes long, matching the [Custom string pattern #13](#).

The definition of the schema for which schema details are required.

Response

- **SchemaVersionId** – UTF-8 string, not less than 36 or more than 36 bytes long, matching the [Custom string pattern #45](#).

The schema ID of the schema version.

- **SchemaArn** – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the schema.

- **DataFormat** – UTF-8 string (valid values: AVRO | JSON | PROTOBUF).

The data format of the schema definition. Currently AVRO, JSON and PROTOBUF are supported.

- **Status** – UTF-8 string (valid values: AVAILABLE | PENDING | FAILURE | DELETING).

The status of the schema version.

- **CreatedTime** – UTF-8 string.

The date and time the schema was created.

Errors

- `InvalidInputException`
- `AccessDeniedException`
- `EntityNotFoundException`
- `ThrottlingException`
- `InternalServiceException`

GetRegistry action (Python: `get_registry`)

Describes the specified registry in detail.

Request

- `RegistryId` – *Required:* A [RegistryId](#) object.

This is a wrapper structure that may contain the registry name and Amazon Resource Name (ARN).

Response

- `RegistryName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the registry.

- `RegistryArn` – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the registry.

- `Description` – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the registry.

- `Status` – UTF-8 string (valid values: AVAILABLE | DELETING).

The status of the registry.

- `CreatedTime` – UTF-8 string.

The date and time the registry was created.

- UpdatedTime – UTF-8 string.

The date and time the registry was updated.

Errors

- InvalidInputException
- AccessDeniedException
- EntityNotFoundException
- ThrottlingException
- InternalServiceException

PutSchemaVersionMetadata action (Python: `put_schema_version_metadata`)

Puts the metadata key value pair for a specified schema version ID. A maximum of 10 key value pairs will be allowed per schema version. They can be added over one or more calls.

Request

- SchemaId – A [SchemaId](#) object.

The unique ID for the schema.

- SchemaVersionNumber – A [SchemaVersionNumber](#) object.

The version number of the schema.

- SchemaVersionId – UTF-8 string, not less than 36 or more than 36 bytes long, matching the [Custom string pattern #45](#).

The unique version ID of the schema version.

- MetadataKeyValue – *Required:* A [MetadataKeyValuePair](#) object.

The metadata key's corresponding value.

Response

- `SchemaArn` – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) for the schema.

- `SchemaName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name for the schema.

- `RegistryName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name for the registry.

- `LatestVersion` – Boolean.

The latest version of the schema.

- `VersionNumber` – Number (long), not less than 1 or more than 100000.

The version number of the schema.

- `SchemaVersionId` – UTF-8 string, not less than 36 or more than 36 bytes long, matching the [Custom string pattern #45](#).

The unique version ID of the schema version.

- `MetadataKey` – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #14](#).

The metadata key.

- `MetadataValue` – UTF-8 string, not less than 1 or more than 256 bytes long, matching the [Custom string pattern #14](#).

The value of the metadata key.

Errors

- `InvalidInputException`
- `AccessDeniedException`
- `AlreadyExistsException`

- EntityNotFoundException
- ThrottlingException
- ResourceNumberLimitExceededException

QuerySchemaVersionMetadata action (Python: `query_schema_version_metadata`)

Queries for the schema version metadata information.

Request

- SchemaId – A [SchemaId](#) object.

A wrapper structure that may contain the schema name and Amazon Resource Name (ARN).

- SchemaVersionNumber – A [SchemaVersionNumber](#) object.

The version number of the schema.

- SchemaVersionId – UTF-8 string, not less than 36 or more than 36 bytes long, matching the [Custom string pattern #45](#).

The unique version ID of the schema version.

- MetadataList – An array of [MetadataKeyValuePair](#) objects.

Search key-value pairs for metadata, if they are not provided all the metadata information will be fetched.

- MaxResults – Number (integer), not less than 1 or more than 50.

Maximum number of results required per page. If the value is not supplied, this will be defaulted to 25 per page.

- NextToken – UTF-8 string.

A continuation token, if this is a continuation call.

Response

- MetadataInfoMap – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #14](#).

Each value is a [MetadataInfo](#) object.

A map of a metadata key and associated values.

- SchemaVersionId – UTF-8 string, not less than 36 or more than 36 bytes long, matching the [Custom string pattern #45](#).

The unique version ID of the schema version.

- NextToken – UTF-8 string.

A continuation token for paginating the returned list of tokens, returned if the current segment of the list is not the last.

Errors

- InvalidInputException
- AccessDeniedException
- ThrottlingException
- EntityNotFoundException

RemoveSchemaVersionMetadata action (Python: `remove_schema_version_metadata`)

Removes a key value pair from the schema version metadata for the specified schema version ID.

Request

- SchemaId – A [Schemald](#) object.

A wrapper structure that may contain the schema name and Amazon Resource Name (ARN).

- SchemaVersionNumber – A [SchemaVersionNumber](#) object.

The version number of the schema.

- SchemaVersionId – UTF-8 string, not less than 36 or more than 36 bytes long, matching the [Custom string pattern #45](#).

The unique version ID of the schema version.

- `MetadataKeyValuE` – *Required:* A [MetadataKeyValuePair](#) object.

The value of the metadata key.

Response

- `SchemaArn` – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the schema.

- `SchemaName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the schema.

- `RegistryName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the registry.

- `LatestVersion` – Boolean.

The latest version of the schema.

- `VersionNumber` – Number (long), not less than 1 or more than 100000.

The version number of the schema.

- `SchemaVersionId` – UTF-8 string, not less than 36 or more than 36 bytes long, matching the [Custom string pattern #45](#).

The version ID for the schema version.

- `MetadataKey` – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #14](#).

The metadata key.

- `MetadataValue` – UTF-8 string, not less than 1 or more than 256 bytes long, matching the [Custom string pattern #14](#).

The value of the metadata key.

Errors

- `InvalidInputException`
- `AccessDeniedException`
- `ThrottlingException`
- `EntityNotFoundException`

DeleteRegistry action (Python: `delete_registry`)

Delete the entire registry including schema and all of its versions. To get the status of the delete operation, you can call the `GetRegistry` API after the asynchronous call. Deleting a registry will deactivate all online operations for the registry such as the `UpdateRegistry`, `CreateSchema`, `UpdateSchema`, and `RegisterSchemaVersion` APIs.

Request

- `RegistryId` – *Required:* A [RegistryId](#) object.

This is a wrapper structure that may contain the registry name and Amazon Resource Name (ARN).

Response

- `RegistryName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the registry being deleted.

- `RegistryArn` – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the registry being deleted.

- `Status` – UTF-8 string (valid values: `AVAILABLE` | `DELETING`).

The status of the registry. A successful operation will return the `Deleting` status.

Errors

- `InvalidInputException`

- EntityNotFoundException
- AccessDeniedException
- ThrottlingException
- ConcurrentModificationException

DeleteSchema action (Python: delete_schema)

Deletes the entire schema set, including the schema set and all of its versions. To get the status of the delete operation, you can call GetSchema API after the asynchronous call. Deleting a registry will deactivate all online operations for the schema, such as the GetSchemaByDefinition, and RegisterSchemaVersion APIs.

Request

- SchemaId – *Required:* A [Schemald](#) object.

This is a wrapper structure that may contain the schema name and Amazon Resource Name (ARN).

Response

- SchemaArn – UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the schema being deleted.

- SchemaName – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #46](#).

The name of the schema being deleted.

- Status – UTF-8 string (valid values: AVAILABLE | PENDING | DELETING).

The status of the schema.

Errors

- InvalidInputException
- EntityNotFoundException

- `AccessDeniedException`
- `ThrottlingException`
- `ConcurrentModificationException`

DeleteSchemaVersions action (Python: `delete_schema_versions`)

Remove versions from the specified schema. A version number or range may be supplied. If the compatibility mode forbids deleting of a version that is necessary, such as `BACKWARDS_FULL`, an error is returned. Calling the `GetSchemaVersions` API after this call will list the status of the deleted versions.

When the range of version numbers contain check pointed version, the API will return a 409 conflict and will not proceed with the deletion. You have to remove the checkpoint first using the `DeleteSchemaCheckpoint` API before using this API.

You cannot use the `DeleteSchemaVersions` API to delete the first schema version in the schema set. The first schema version can only be deleted by the `DeleteSchema` API. This operation will also delete the attached `SchemaVersionMetadata` under the schema versions. Hard deletes will be enforced on the database.

If the compatibility mode forbids deleting of a version that is necessary, such as `BACKWARDS_FULL`, an error is returned.

Request

- `SchemaId` – *Required:* A [Schemald](#) object.

This is a wrapper structure that may contain the schema name and Amazon Resource Name (ARN).

- `Versions` – *Required:* UTF-8 string, not less than 1 or more than 100000 bytes long, matching the [Custom string pattern #15](#).

A version range may be supplied which may be of the format:

- a single version number, 5
- a range, 5-8 : deletes versions 5, 6, 7, 8

Response

- `SchemaVersionErrors` – An array of [SchemaVersionErrorItem](#) objects.

A list of `SchemaVersionErrorItem` objects, each containing an error and schema version.

Errors

- `InvalidInputException`
- `EntityNotFoundException`
- `AccessDeniedException`
- `ThrottlingException`
- `ConcurrentModificationException`

Workflows

The Workflows API describes the data types and API related to creating, updating, or viewing workflows in Amazon Glue. Job run history is accessible for 90 days for your workflow and job run.

Data types

- [JobNodeDetails structure](#)
- [CrawlerNodeDetails structure](#)
- [TriggerNodeDetails structure](#)
- [Crawl structure](#)
- [Node structure](#)
- [Edge structure](#)
- [Workflow structure](#)
- [WorkflowGraph structure](#)
- [WorkflowRun structure](#)
- [WorkflowRunStatistics structure](#)
- [StartingEventBatchCondition structure](#)
- [Blueprint structure](#)

- [BlueprintDetails structure](#)
- [LastActiveDefinition structure](#)
- [BlueprintRun structure](#)

JobNodeDetails structure

The details of a Job node present in the workflow.

Fields

- JobRuns – An array of [JobRun](#) objects.

The information for the job runs represented by the job node.

CrawlerNodeDetails structure

The details of a Crawler node present in the workflow.

Fields

- Crawls – An array of [Crawl](#) objects.

A list of crawls represented by the crawl node.

TriggerNodeDetails structure

The details of a Trigger node present in the workflow.

Fields

- Trigger – A [Trigger](#) object.

The information of the trigger represented by the trigger node.

Crawl structure

The details of a crawl in the workflow.

Fields

- **State** – UTF-8 string (valid values: RUNNING | CANCELLING | CANCELLED | SUCCEEDED | FAILED | ERROR).

The state of the crawler.

- **StartedOn** – Timestamp.

The date and time on which the crawl started.

- **CompletedOn** – Timestamp.

The date and time on which the crawl completed.

- **ErrorMessage** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

The error message associated with the crawl.

- **LogGroup** – UTF-8 string, not less than 1 or more than 512 bytes long, matching the [Log group string pattern](#).

The log group associated with the crawl.

- **LogStream** – UTF-8 string, not less than 1 or more than 512 bytes long, matching the [Log-stream string pattern](#).

The log stream associated with the crawl.

Node structure

A node represents an Amazon Glue component (trigger, crawler, or job) on a workflow graph.

Fields

- **Type** – UTF-8 string (valid values: CRAWLER | JOB | TRIGGER).

The type of Amazon Glue component represented by the node.

- **Name** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the Amazon Glue component represented by the node.

- **UniqueId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique Id assigned to the node within the workflow.

- **TriggerDetails** – A [TriggerNodeDetails](#) object.

Details of the Trigger when the node represents a Trigger.

- **JobDetails** – A [JobNodeDetails](#) object.

Details of the Job when the node represents a Job.

- **CrawlerDetails** – A [CrawlerNodeDetails](#) object.

Details of the crawler when the node represents a crawler.

Edge structure

An edge represents a directed connection between two Amazon Glue components that are part of the workflow the edge belongs to.

Fields

- **SourceId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique of the node within the workflow where the edge starts.

- **DestinationId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique of the node within the workflow where the edge ends.

Workflow structure

A workflow is a collection of multiple dependent Amazon Glue jobs and crawlers that are run to complete a complex ETL task. A workflow manages the execution and monitoring of all its jobs and crawlers.

Fields

- **Name** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the workflow.

- **Description** – UTF-8 string.

A description of the workflow.

- **DefaultRunProperties** – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a UTF-8 string.

A collection of properties to be used as part of each execution of the workflow. The run properties are made available to each job in the workflow. A job can modify the properties for the next jobs in the flow.

- **CreatedOn** – Timestamp.

The date and time when the workflow was created.

- **LastModifiedOn** – Timestamp.

The date and time when the workflow was last modified.

- **LastRun** – A [WorkflowRun](#) object.

The information about the last execution of the workflow.

- **Graph** – A [WorkflowGraph](#) object.

The graph representing all the Amazon Glue components that belong to the workflow as nodes and directed connections between them as edges.

- **CreationStatus** – UTF-8 string (valid values: CREATING | CREATED | CREATION_FAILED).

The creation status of the workflow.

- **MaxConcurrentRuns** – Number (integer).

You can use this parameter to prevent unwanted multiple updates to data, to control costs, or in some cases, to prevent exceeding the maximum number of concurrent runs of any of the

component jobs. If you leave this parameter blank, there is no limit to the number of concurrent workflow runs.

- `BlueprintDetails` – A [BlueprintDetails](#) object.

This structure indicates the details of the blueprint that this particular workflow is created from.

WorkflowGraph structure

A workflow graph represents the complete workflow containing all the Amazon Glue components present in the workflow and all the directed connections between them.

Fields

- `Nodes` – An array of [Node](#) objects.

A list of the the Amazon Glue components belong to the workflow represented as nodes.

- `Edges` – An array of [Edge](#) objects.

A list of all the directed connections between the nodes belonging to the workflow.

WorkflowRun structure

A workflow run is an execution of a workflow providing all the runtime information.

Fields

- `Name` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Name of the workflow that was run.

- `WorkflowRunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of this workflow run.

- `PreviousRunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of the previous workflow run.

- `WorkflowRunProperties` – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a UTF-8 string.

The workflow run properties which were set during the run.

- `StartedOn` – Timestamp.

The date and time when the workflow run was started.

- `CompletedOn` – Timestamp.

The date and time when the workflow run completed.

- `Status` – UTF-8 string (valid values: RUNNING | COMPLETED | STOPPING | STOPPED | ERROR).

The status of the workflow run.

- `ErrorMessage` – UTF-8 string.

This error message describes any error that may have occurred in starting the workflow run. Currently the only error message is "Concurrent runs exceeded for workflow: foo."

- `Statistics` – A [WorkflowRunStatistics](#) object.

The statistics of the run.

- `Graph` – A [WorkflowGraph](#) object.

The graph representing all the Amazon Glue components that belong to the workflow as nodes and directed connections between them as edges.

- `StartingEventBatchCondition` – A [StartingEventBatchCondition](#) object.

The batch condition that started the workflow run.

WorkflowRunStatistics structure

Workflow run statistics provides statistics about the workflow run.

Fields

- `TotalActions` – Number (integer).

Total number of Actions in the workflow run.

- `TimeoutActions` – Number (integer).

Total number of Actions that timed out.

- `FailedActions` – Number (integer).

Total number of Actions that have failed.

- `StoppedActions` – Number (integer).

Total number of Actions that have stopped.

- `SucceededActions` – Number (integer).

Total number of Actions that have succeeded.

- `RunningActions` – Number (integer).

Total number Actions in running state.

- `ErroredActions` – Number (integer).

Indicates the count of job runs in the ERROR state in the workflow run.

- `WaitingActions` – Number (integer).

Indicates the count of job runs in WAITING state in the workflow run.

StartingEventBatchCondition structure

The batch condition that started the workflow run. Either the number of events in the batch size arrived, in which case the `BatchSize` member is non-zero, or the batch window expired, in which case the `BatchWindow` member is non-zero.

Fields

- `BatchSize` – Number (integer).

Number of events in the batch.

- `BatchWindow` – Number (integer).

Duration of the batch window in seconds.

Blueprint structure

The details of a blueprint.

Fields

- **Name** – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The name of the blueprint.

- **Description** – UTF-8 string, not less than 1 or more than 512 bytes long.

The description of the blueprint.

- **CreatedOn** – Timestamp.

The date and time the blueprint was registered.

- **LastModifiedOn** – Timestamp.

The date and time the blueprint was last modified.

- **ParameterSpec** – UTF-8 string, not less than 1 or more than 131072 bytes long.

A JSON string that indicates the list of parameter specifications for the blueprint.

- **BlueprintLocation** – UTF-8 string.

Specifies the path in Amazon S3 where the blueprint is published.

- **BlueprintServiceLocation** – UTF-8 string.

Specifies a path in Amazon S3 where the blueprint is copied when you call `CreateBlueprint/UpdateBlueprint` to register the blueprint in Amazon Glue.

- **Status** – UTF-8 string (valid values: `CREATING` | `ACTIVE` | `UPDATING` | `FAILED`).

The status of the blueprint registration.

- **Creating** — The blueprint registration is in progress.
 - **Active** — The blueprint has been successfully registered.
 - **Updating** — An update to the blueprint registration is in progress.
 - **Failed** — The blueprint registration failed.
- **ErrorMessage** – UTF-8 string.

An error message.

- LastActiveDefinition – A [LastActiveDefinition](#) object.

When there are multiple versions of a blueprint and the latest version has some errors, this attribute indicates the last successful blueprint definition that is available with the service.

BlueprintDetails structure

The details of a blueprint.

Fields

- BlueprintName – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The name of the blueprint.

- RunId – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The run ID for this blueprint.

LastActiveDefinition structure

When there are multiple versions of a blueprint and the latest version has some errors, this attribute indicates the last successful blueprint definition that is available with the service.

Fields

- Description – UTF-8 string, not less than 1 or more than 512 bytes long.

The description of the blueprint.

- LastModifiedOn – Timestamp.

The date and time the blueprint was last modified.

- ParameterSpec – UTF-8 string, not less than 1 or more than 131072 bytes long.

A JSON string specifying the parameters for the blueprint.

- BlueprintLocation – UTF-8 string.

Specifies a path in Amazon S3 where the blueprint is published by the Amazon Glue developer.

- `BlueprintServiceLocation` – UTF-8 string.

Specifies a path in Amazon S3 where the blueprint is copied when you create or update the blueprint.

BlueprintRun structure

The details of a blueprint run.

Fields

- `BlueprintName` – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The name of the blueprint.

- `RunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The run ID for this blueprint run.

- `WorkflowName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of a workflow that is created as a result of a successful blueprint run. If a blueprint run has an error, there will not be a workflow created.

- `State` – UTF-8 string (valid values: `RUNNING` | `SUCCEEDED` | `FAILED` | `ROLLING_BACK`).

The state of the blueprint run. Possible values are:

- `Running` — The blueprint run is in progress.
- `Succeeded` — The blueprint run completed successfully.
- `Failed` — The blueprint run failed and rollback is complete.
- `Rolling Back` — The blueprint run failed and rollback is in progress.
- `StartedOn` – Timestamp.

The date and time that the blueprint run started.

- `CompletedOn` – Timestamp.

The date and time that the blueprint run completed.

- `ErrorMessage` – UTF-8 string.

Indicates any errors that are seen while running the blueprint.

- `RollbackErrorMessage` – UTF-8 string.

If there are any errors while creating the entities of a workflow, we try to roll back the created entities until that point and delete them. This attribute indicates the errors seen while trying to delete the entities that are created.

- `Parameters` – UTF-8 string, not less than 1 or more than 131072 bytes long.

The blueprint parameters as a string. You will have to provide a value for each key that is required from the parameter spec that is defined in the `Blueprint$ParameterSpec`.

- `RoleArn` – UTF-8 string, not less than 1 or more than 1024 bytes long, matching the [Custom string pattern #30](#).

The role ARN. This role will be assumed by the Amazon Glue service and will be used to create the workflow and other entities of a workflow.

Operations

- [CreateWorkflow action \(Python: `create_workflow`\)](#)
- [UpdateWorkflow action \(Python: `update_workflow`\)](#)
- [DeleteWorkflow action \(Python: `delete_workflow`\)](#)
- [GetWorkflow action \(Python: `get_workflow`\)](#)

CreateWorkflow action (Python: create_workflow)

Creates a new workflow.

Request

- **Name** – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name to be assigned to the workflow. It should be unique within your account.

- **Description** – UTF-8 string, not more than 120000 bytes long.

A description of the workflow.

- **DefaultRunProperties** – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a UTF-8 string.

A collection of properties to be used as part of each execution of the workflow.

Run properties may be logged. Do not pass plaintext secrets as properties. Retrieve secrets from a Amazon Glue Connection, Amazon Secrets Manager or other secret management mechanism if you intend to use them within the workflow run.

- **Tags** – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

The tags to be used with this workflow.

- MaxConcurrentRuns – Number (integer).

You can use this parameter to prevent unwanted multiple updates to data, to control costs, or in some cases, to prevent exceeding the maximum number of concurrent runs of any of the component jobs. If you leave this parameter blank, there is no limit to the number of concurrent workflow runs.

Response

- Name – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the workflow which was provided as part of the request.

Errors

- AlreadyExistsException
- InvalidInputException
- InternalServiceException
- OperationTimeoutException
- ResourceNumberLimitExceededException
- ConcurrentModificationException

UpdateWorkflow action (Python: update_workflow)

Updates an existing workflow.

Request

- Name – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Name of the workflow to be updated.

- `Description` – UTF-8 string, not more than 120000 bytes long.

The description of the workflow.

- `DefaultRunProperties` – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a UTF-8 string.

A collection of properties to be used as part of each execution of the workflow.

Run properties may be logged. Do not pass plaintext secrets as properties. Retrieve secrets from a Amazon Glue Connection, Amazon Secrets Manager or other secret management mechanism if you intend to use them within the workflow run.

- `MaxConcurrentRuns` – Number (integer).

You can use this parameter to prevent unwanted multiple updates to data, to control costs, or in some cases, to prevent exceeding the maximum number of concurrent runs of any of the component jobs. If you leave this parameter blank, there is no limit to the number of concurrent workflow runs.

Response

- `Name` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the workflow which was specified in input.

Errors

- `InvalidInputException`
- `EntityNotFoundException`
- `InternalServiceException`
- `OperationTimeoutException`
- `ConcurrentModificationException`

DeleteWorkflow action (Python: delete_workflow)

Deletes a workflow.

Request

- Name – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Name of the workflow to be deleted.

Response

- Name – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Name of the workflow specified in input.

Errors

- `InvalidInputException`
- `InternalServiceException`
- `OperationTimeoutException`
- `ConcurrentModificationException`

GetWorkflow action (Python: get_workflow)

Retrieves resource metadata for a workflow.

Request

- Name – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the workflow to retrieve.

- `IncludeGraph` – Boolean.

Specifies whether to include a graph when returning the workflow resource metadata.

Response

- `Workflow` – A [Workflow](#) object.

The resource metadata for the workflow.

Errors

- `InvalidInputException`
- `EntityNotFoundException`
- `InternalServiceException`
- `OperationTimeoutException`

ListWorkflows action (Python: `list_workflows`)

Lists names of workflows created in the account.

Request

- `NextToken` – UTF-8 string.

A continuation token, if this is a continuation request.

- `MaxResults` – Number (integer), not less than 1 or more than 25.

The maximum size of a list to return.

Response

- `Workflows` – An array of UTF-8 strings, not less than 1 or more than 25 strings.

List of names of workflows in the account.

- `NextToken` – UTF-8 string.

A continuation token, if not all workflow names have been returned.

Errors

- `InvalidInputException`

- `InternalServiceException`
- `OperationTimeoutException`

BatchGetWorkflows action (Python: `batch_get_workflows`)

Returns a list of resource metadata for a given list of workflow names. After calling the `ListWorkflows` operation, you can call this operation to access the data to which you have been granted permissions. This operation supports all IAM permissions, including permission conditions that uses tags.

Request

- `Names` – *Required:* An array of UTF-8 strings, not less than 1 or more than 25 strings.

A list of workflow names, which may be the names returned from the `ListWorkflows` operation.

- `IncludeGraph` – Boolean.

Specifies whether to include a graph when returning the workflow resource metadata.

Response

- `Workflows` – An array of [Workflow](#) objects, not less than 1 or more than 25 structures.

A list of workflow resource metadata.

- `MissingWorkflows` – An array of UTF-8 strings, not less than 1 or more than 25 strings.

A list of names of workflows not found.

Errors

- `InternalServiceException`
- `OperationTimeoutException`
- `InvalidInputException`

GetWorkflowRun action (Python: `get_workflow_run`)

Retrieves the metadata for a given workflow run. Job run history is accessible for 90 days for your workflow and job run.

Request

- **Name** – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Name of the workflow being run.

- **RunId** – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of the workflow run.

- **IncludeGraph** – Boolean.

Specifies whether to include the workflow graph in response or not.

Response

- **Run** – A [WorkflowRun](#) object.

The requested workflow run metadata.

Errors

- `InvalidInputException`
- `EntityNotFoundException`
- `InternalServiceException`
- `OperationTimeoutException`

GetWorkflowRuns action (Python: `get_workflow_runs`)

Retrieves metadata for all runs of a given workflow.

Request

- Name – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Name of the workflow whose metadata of runs should be returned.

- IncludeGraph – Boolean.

Specifies whether to include the workflow graph in response or not.

- NextToken – UTF-8 string.

The maximum size of the response.

- MaxResults – Number (integer), not less than 1 or more than 1000.

The maximum number of workflow runs to be included in the response.

Response

- Runs – An array of [WorkflowRun](#) objects, not less than 1 or more than 1000 structures.

A list of workflow run metadata objects.

- NextToken – UTF-8 string.

A continuation token, if not all requested workflow runs have been returned.

Errors

- InvalidInputException
- EntityNotFoundException
- InternalServiceException
- OperationTimeoutException

GetWorkflowRunProperties action (Python: `get_workflow_run_properties`)

Retrieves the workflow run properties which were set during the run.

Request

- **Name** – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Name of the workflow which was run.

- **RunId** – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of the workflow run whose run properties should be returned.

Response

- **RunProperties** – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a UTF-8 string.

The workflow run properties which were set during the specified run.

Errors

- `InvalidInputException`
- `EntityNotFoundException`
- `InternalServiceException`
- `OperationTimeoutException`

PutWorkflowRunProperties action (Python: `put_workflow_run_properties`)

Puts the specified workflow run properties for the given workflow run. If a property already exists for the specified run, then it overrides the value otherwise adds the property to existing properties.

Request

- **Name** – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Name of the workflow which was run.

- **RunId** – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of the workflow run for which the run properties should be updated.

- **RunProperties** – *Required*: A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a UTF-8 string.

The properties to put for the specified run.

Run properties may be logged. Do not pass plaintext secrets as properties. Retrieve secrets from a Amazon Glue Connection, Amazon Secrets Manager or other secret management mechanism if you intend to use them within the workflow run.

Response

- *No Response parameters.*

Errors

- `AlreadyExistsException`
- `EntityNotFoundException`
- `InvalidInputException`
- `InternalServiceException`
- `OperationTimeoutException`
- `ResourceNumberLimitExceededException`
- `ConcurrentModificationException`

CreateBlueprint action (Python: create_blueprint)

Registers a blueprint with Amazon Glue.

Request

- Name – *Required*: UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The name of the blueprint.

- Description – UTF-8 string, not less than 1 or more than 512 bytes long.

A description of the blueprint.

- BlueprintLocation – *Required*: UTF-8 string, not less than 1 or more than 8192 bytes long, matching the [Custom string pattern #32](#).

Specifies a path in Amazon S3 where the blueprint is published.

- Tags – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

The tags to be applied to this blueprint.

Response

- Name – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Returns the name of the blueprint that was registered.

Errors

- AlreadyExistsException
- InvalidInputException
- OperationTimeoutException
- InternalServiceException

- ResourceNumberLimitExceededException

UpdateBlueprint action (Python: update_blueprint)

Updates a registered blueprint.

Request

- Name – *Required*: UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The name of the blueprint.

- Description – UTF-8 string, not less than 1 or more than 512 bytes long.

A description of the blueprint.

- BlueprintLocation – *Required*: UTF-8 string, not less than 1 or more than 8192 bytes long, matching the [Custom string pattern #32](#).

Specifies a path in Amazon S3 where the blueprint is published.

Response

- Name – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Returns the name of the blueprint that was updated.

Errors

- EntityNotFoundException
- ConcurrentModificationException
- InvalidInputException
- OperationTimeoutException
- InternalServiceException
- IllegalBlueprintStateException

DeleteBlueprint action (Python: delete_blueprint)

Deletes an existing blueprint.

Request

- **Name** – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the blueprint to delete.

Response

- **Name** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Returns the name of the blueprint that was deleted.

Errors

- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

ListBlueprints action (Python: list_blueprints)

Lists all the blueprint names in an account.

Request

- **NextToken** – UTF-8 string.

A continuation token, if this is a continuation request.

- **MaxResults** – Number (integer), not less than 1 or more than 25.

The maximum size of a list to return.

- **Tags** – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

Filters the list by an Amazon resource tag.

Response

- **Blueprints** – An array of UTF-8 strings.

List of names of blueprints in the account.

- **NextToken** – UTF-8 string.

A continuation token, if not all blueprint names have been returned.

Errors

- **InvalidInputException**
- **InternalServerErrorException**
- **OperationTimeoutException**

BatchGetBlueprints action (Python: `batch_get_blueprints`)

Retrieves information about a list of blueprints.

Request

- **Names** – *Required*: An array of UTF-8 strings, not less than 1 or more than 25 strings.

A list of blueprint names.

- **IncludeBlueprint** – Boolean.

Specifies whether or not to include the blueprint in the response.

- **IncludeParameterSpec** – Boolean.

Specifies whether or not to include the parameters, as a JSON string, for the blueprint in the response.

Response

- **Blueprints** – An array of [Blueprint](#) objects.

Returns a list of blueprint as a Blueprints object.

- **MissingBlueprints** – An array of UTF-8 strings.

Returns a list of BlueprintNames that were not found.

Errors

- `InternalServerError`
- `OperationTimeoutException`
- `InvalidInputException`

StartBlueprintRun action (Python: `start_blueprint_run`)

Starts a new run of the specified blueprint.

Request

- **BlueprintName** – *Required:* UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The name of the blueprint.

- **Parameters** – UTF-8 string, not less than 1 or more than 131072 bytes long.

Specifies the parameters as a `BlueprintParameters` object.

- **RoleArn** – *Required:* UTF-8 string, not less than 1 or more than 1024 bytes long, matching the [Custom string pattern #30](#).

Specifies the IAM role used to create the workflow.

Response

- **RunId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The run ID for this blueprint run.

Errors

- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`
- `ResourceNumberLimitExceededException`
- `EntityNotFoundException`
- `IllegalBlueprintStateException`

GetBlueprintRun action (Python: `get_blueprint_run`)

Retrieves the details of a blueprint run.

Request

- `BlueprintName` – *Required:* UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #31](#).

The name of the blueprint.

- `RunId` – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The run ID for the blueprint run you want to retrieve.

Response

- `BlueprintRun` – A [BlueprintRun](#) object.

Returns a `BlueprintRun` object.

Errors

- `EntityNotFoundException`
- `InternalServiceException`

- `OperationTimeoutException`

GetBlueprintRuns action (Python: `get_blueprint_runs`)

Retrieves the details of blueprint runs for a specified blueprint.

Request

- `BlueprintName` – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the blueprint.

- `NextToken` – UTF-8 string.

A continuation token, if this is a continuation request.

- `MaxResults` – Number (integer), not less than 1 or more than 1000.

The maximum size of a list to return.

Response

- `BlueprintRuns` – An array of [BlueprintRun](#) objects.

Returns a list of `BlueprintRun` objects.

- `NextToken` – UTF-8 string.

A continuation token, if not all blueprint runs have been returned.

Errors

- `EntityNotFoundException`
- `InternalServerErrorException`
- `OperationTimeoutException`
- `InvalidInputException`

StartWorkflowRun action (Python: start_workflow_run)

Starts a new run of the specified workflow.

Request

- **Name** – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the workflow to start.

- **RunProperties** – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a UTF-8 string.

The workflow run properties for the new workflow run.

Run properties may be logged. Do not pass plaintext secrets as properties. Retrieve secrets from a Amazon Glue Connection, Amazon Secrets Manager or other secret management mechanism if you intend to use them within the workflow run.

Response

- **RunId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

An Id for the new run.

Errors

- `InvalidInputException`
- `EntityNotFoundException`
- `InternalServiceException`
- `OperationTimeoutException`
- `ResourceNumberLimitExceededException`
- `ConcurrentRunsExceededException`

StopWorkflowRun action (Python: stop_workflow_run)

Stops the execution of the specified workflow run.

Request

- Name – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the workflow to stop.

- RunId – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of the workflow run to stop.

Response

- *No Response parameters.*

Errors

- InvalidInputException
- EntityNotFoundException
- InternalServiceException
- OperationTimeoutException
- IllegalWorkflowStateException

ResumeWorkflowRun action (Python: resume_workflow_run)

Restarts selected nodes of a previous partially completed workflow run and resumes the workflow run. The selected nodes and all nodes that are downstream from the selected nodes are run.

Request

- Name – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the workflow to resume.

- **RunId** – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of the workflow run to resume.

- **NodeIds** – *Required:* An array of UTF-8 strings.

A list of the node IDs for the nodes you want to restart. The nodes that are to be restarted must have a run attempt in the original run.

Response

- **RunId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The new ID assigned to the resumed workflow run. Each resume of a workflow run will have a new run ID.

- **NodeIds** – An array of UTF-8 strings.

A list of the node IDs for the nodes that were actually restarted.

Errors

- `InvalidInputException`
- `EntityNotFoundException`
- `InternalServiceException`
- `OperationTimeoutException`
- `ConcurrentRunsExceededException`
- `IllegalWorkflowStateException`

Usage profiles

The Usage profiles API describes the data types and API related to creating, updating, or viewing usage profiles in Amazon Glue.

Data types

- [ProfileConfiguration structure](#)
- [ConfigurationObject structure](#)
- [UsageProfileDefinition structure](#)

ProfileConfiguration structure

Specifies the job and session values that an admin configures in an Amazon Glue usage profile.

Fields

- `SessionConfiguration` – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a [ConfigurationObject](#) object.

A key-value map of configuration parameters for Amazon Glue sessions.

- `JobConfiguration` – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a [ConfigurationObject](#) object.

A key-value map of configuration parameters for Amazon Glue jobs.

ConfigurationObject structure

Specifies the values that an admin sets for each job or session parameter configured in a Amazon Glue usage profile.

Fields

- `DefaultValue` – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #35](#).

A default value for the parameter.

- AllowedValues – An array of UTF-8 strings.

A list of allowed values for the parameter.

- MinValue – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #35](#).

A minimum allowed value for the parameter.

- MaxValue – UTF-8 string, not less than 1 or more than 128 bytes long, matching the [Custom string pattern #35](#).

A maximum allowed value for the parameter.

UsageProfileDefinition structure

Describes an Amazon Glue usage profile.

Fields

- Name – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the usage profile.

- Description – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the usage profile.

- CreatedOn – Timestamp.

The date and time when the usage profile was created.

- LastModifiedOn – Timestamp.

The date and time when the usage profile was last modified.

Operations

- [CreateUsageProfile action \(Python: create_usage_profile\)](#)

- [GetUsageProfile action \(Python: get_usage_profile\)](#)
- [UpdateUsageProfile action \(Python: update_usage_profile\)](#)
- [DeleteUsageProfile action \(Python: delete_usage_profile\)](#)
- [ListUsageProfiles action \(Python: list_usage_profiles\)](#)

CreateUsageProfile action (Python: create_usage_profile)

Creates an Amazon Glue usage profile.

Request

- **Name** – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the usage profile.

- **Description** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the usage profile.

- **Configuration** – *Required:* A [ProfileConfiguration](#) object.

A ProfileConfiguration object specifying the job and session values for the profile.

- **Tags** – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

A list of tags applied to the usage profile.

Response

- **Name** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the usage profile that was created.

Errors

- `InvalidInputException`
- `InternalServiceException`
- `AlreadyExistsException`
- `OperationTimeoutException`
- `ResourceNumberLimitExceededException`
- `OperationNotSupportedException`

GetUsageProfile action (Python: `get_usage_profile`)

Retrieves information about the specified Amazon Glue usage profile.

Request

- **Name** – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the usage profile to retrieve.

Response

- **Name** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the usage profile.

- **Description** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the usage profile.

- **Configuration** – A [ProfileConfiguration](#) object.

A `ProfileConfiguration` object specifying the job and session values for the profile.

- **CreatedOn** – Timestamp.

The date and time when the usage profile was created.

- **LastModifiedOn** – Timestamp.

The date and time when the usage profile was last modified.

Errors

- `InvalidInputException`
- `InternalServerErrorException`
- `EntityNotFoundException`
- `OperationTimeoutException`
- `OperationNotSupportedException`

UpdateUsageProfile action (Python: `update_usage_profile`)

Update an Amazon Glue usage profile.

Request

- **Name** – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the usage profile.

- **Description** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the usage profile.

- **Configuration** – *Required:* A [ProfileConfiguration](#) object.

A `ProfileConfiguration` object specifying the job and session values for the profile.

Response

- **Name** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the usage profile that was updated.

Errors

- `InvalidInputException`
- `InternalServiceException`
- `EntityNotFoundException`
- `OperationTimeoutException`
- `OperationNotSupportedException`
- `ConcurrentModificationException`

DeleteUsageProfile action (Python: `delete_usage_profile`)

Deletes the Amazon Glue specified usage profile.

Request

- Name – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the usage profile to delete.

Response

- *No Response parameters.*

Errors

- `InvalidInputException`
- `InternalServiceException`
- `OperationTimeoutException`
- `OperationNotSupportedException`

ListUsageProfiles action (Python: `list_usage_profiles`)

List all the Amazon Glue usage profiles.

Request

- `NextToken` – UTF-8 string, not more than 400000 bytes long.

A continuation token, included if this is a continuation call.

- `MaxResults` – Number (integer), not less than 1 or more than 200.

The maximum number of usage profiles to return in a single response.

Response

- `Profiles` – An array of [UsageProfileDefinition](#) objects.

A list of usage profile (`UsageProfileDefinition`) objects.

- `NextToken` – UTF-8 string, not more than 400000 bytes long.

A continuation token, present if the current list segment is not the last.

Errors

- `InternalServiceException`
- `OperationTimeoutException`
- `InvalidInputException`
- `OperationNotSupportedException`

Machine learning API

The Machine learning API describes the machine learning data types, and includes the API for creating, deleting, or updating a transform, or starting a machine learning task run.

Data types

- [TransformParameters structure](#)
- [EvaluationMetrics structure](#)
- [MLTransform structure](#)
- [FindMatchesParameters structure](#)

- [FindMatchesMetrics structure](#)
- [ConfusionMatrix structure](#)
- [GlueTable structure](#)
- [TaskRun structure](#)
- [TransformFilterCriteria structure](#)
- [TransformSortCriteria structure](#)
- [TaskRunFilterCriteria structure](#)
- [TaskRunSortCriteria structure](#)
- [TaskRunProperties structure](#)
- [FindMatchesTaskRunProperties structure](#)
- [ImportLabelsTaskRunProperties structure](#)
- [ExportLabelsTaskRunProperties structure](#)
- [LabelingSetGenerationTaskRunProperties structure](#)
- [SchemaColumn structure](#)
- [TransformEncryption structure](#)
- [MLUserDataEncryption structure](#)
- [ColumnImportance structure](#)

TransformParameters structure

The algorithm-specific parameters that are associated with the machine learning transform.

Fields

- `TransformType` – *Required:* UTF-8 string (valid values: FIND_MATCHES).

The type of machine learning transform.

For information about the types of machine learning transforms, see [Creating Machine Learning Transforms](#).

- `FindMatchesParameters` – A [FindMatchesParameters](#) object.

The parameters for the find matches algorithm.

EvaluationMetrics structure

Evaluation metrics provide an estimate of the quality of your machine learning transform.

Fields

- `TransformType` – *Required:* UTF-8 string (valid values: FIND_MATCHES).

The type of machine learning transform.

- `FindMatchesMetrics` – A [FindMatchesMetrics](#) object.

The evaluation metrics for the find matches algorithm.

MLTransform structure

A structure for a machine learning transform.

Fields

- `TransformId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique transform ID that is generated for the machine learning transform. The ID is guaranteed to be unique and does not change.

- `Name` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A user-defined name for the machine learning transform. Names are not guaranteed unique and can be changed at any time.

- `Description` – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A user-defined, long-form description text for the machine learning transform. Descriptions are not guaranteed to be unique and can be changed at any time.

- `Status` – UTF-8 string (valid values: NOT_READY | READY | DELETING).

The current status of the machine learning transform.

- `CreatedOn` – Timestamp.

A timestamp. The time and date that this machine learning transform was created.

- `LastModifiedOn` – Timestamp.

A timestamp. The last point in time when this machine learning transform was modified.

- `InputRecordTables` – An array of [GlueTable](#) objects, not more than 10 structures.

A list of Amazon Glue table definitions used by the transform.

- `Parameters` – A [TransformParameters](#) object.

A `TransformParameters` object. You can use parameters to tune (customize) the behavior of the machine learning transform by specifying what data it learns from and your preference on various tradeoffs (such as precision vs. recall, or accuracy vs. cost).

- `EvaluationMetrics` – An [EvaluationMetrics](#) object.

An `EvaluationMetrics` object. Evaluation metrics provide an estimate of the quality of your machine learning transform.

- `LabelCount` – Number (integer).

A count identifier for the labeling files generated by Amazon Glue for this transform. As you create a better transform, you can iteratively download, label, and upload the labeling file.

- `Schema` – An array of [SchemaColumn](#) objects, not more than 100 structures.

A map of key-value pairs representing the columns and data types that this transform can run against. Has an upper bound of 100 columns.

- `Role` – UTF-8 string.

The name or Amazon Resource Name (ARN) of the IAM role with the required permissions.

The required permissions include both Amazon Glue service role permissions to Amazon Glue resources, and Amazon S3 permissions required by the transform.

- This role needs Amazon Glue service role permissions to allow access to resources in Amazon Glue. See [Attach a Policy to IAM Users That Access Amazon Glue](#).
- This role needs permission to your Amazon Simple Storage Service (Amazon S3) sources, targets, temporary directory, scripts, and any libraries used by the task run for this transform.
- `GlueVersion` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #48](#).

This value determines which version of Amazon Glue this machine learning transform is compatible with. Glue 1.0 is recommended for most customers. If the value is not set, the Glue compatibility defaults to Glue 0.9. For more information, see [Amazon Glue Versions](#) in the developer guide.

- `MaxCapacity` – Number (double).

The number of Amazon Glue data processing units (DPUs) that are allocated to task runs for this transform. You can allocate from 2 to 100 DPUs; the default is 10. A DPU is a relative measure of processing power that consists of 4 vCPUs of compute capacity and 16 GB of memory. For more information, see the [Amazon Glue pricing page](#).

`MaxCapacity` is a mutually exclusive option with `NumberOfWorkers` and `WorkerType`.

- If either `NumberOfWorkers` or `WorkerType` is set, then `MaxCapacity` cannot be set.
- If `MaxCapacity` is set then neither `NumberOfWorkers` or `WorkerType` can be set.
- If `WorkerType` is set, then `NumberOfWorkers` is required (and vice versa).
- `MaxCapacity` and `NumberOfWorkers` must both be at least 1.

When the `WorkerType` field is set to a value other than `Standard`, the `MaxCapacity` field is set automatically and becomes read-only.

- `WorkerType` – UTF-8 string (valid values: `Standard=""` | `G.1X=""` | `G.2X=""` | `G.025X=""` | `G.4X=""` | `G.8X=""` | `Z.2X=""`).

The type of predefined worker that is allocated when a task of this transform runs. Accepts a value of `Standard`, `G.1X`, or `G.2X`.

- For the `Standard` worker type, each worker provides 4 vCPU, 16 GB of memory and a 50GB disk, and 2 executors per worker.
- For the `G.1X` worker type, each worker provides 4 vCPU, 16 GB of memory and a 64GB disk, and 1 executor per worker.
- For the `G.2X` worker type, each worker provides 8 vCPU, 32 GB of memory and a 128GB disk, and 1 executor per worker.

`MaxCapacity` is a mutually exclusive option with `NumberOfWorkers` and `WorkerType`.

- If either `NumberOfWorkers` or `WorkerType` is set, then `MaxCapacity` cannot be set.
- If `MaxCapacity` is set then neither `NumberOfWorkers` or `WorkerType` can be set.
- If `WorkerType` is set, then `NumberOfWorkers` is required (and vice versa).

- `MaxCapacity` and `NumberOfWorkers` must both be at least 1.
- `NumberOfWorkers` – Number (integer).

The number of workers of a defined `workerType` that are allocated when a task of the transform runs.

If `WorkerType` is set, then `NumberOfWorkers` is required (and vice versa).

- `Timeout` – Number (integer), at least 1.

The timeout in minutes of the machine learning transform.

- `MaxRetries` – Number (integer).

The maximum number of times to retry after an `MLTaskRun` of the machine learning transform fails.

- `TransformEncryption` – A [TransformEncryption](#) object.

The encryption-at-rest settings of the transform that apply to accessing user data. Machine learning transforms can access user data encrypted in Amazon S3 using KMS.

FindMatchesParameters structure

The parameters to configure the find matches transform.

Fields

- `PrimaryKeyColumnName` – UTF-8 string, not less than 1 or more than 1024 bytes long, matching the [Single-line string pattern](#).

The name of a column that uniquely identifies rows in the source table. Used to help identify matching records.

- `PrecisionRecallTradeoff` – Number (double), not more than 1.0.

The value selected when tuning your transform for a balance between precision and recall. A value of 0.5 means no preference; a value of 1.0 means a bias purely for precision, and a value of 0.0 means a bias for recall. Because this is a tradeoff, choosing values close to 1.0 means very low recall, and choosing values close to 0.0 results in very low precision.

The precision metric indicates how often your model is correct when it predicts a match.

The recall metric indicates that for an actual match, how often your model predicts the match.

- `AccuracyCostTradeoff` – Number (double), not more than 1.0.

The value that is selected when tuning your transform for a balance between accuracy and cost. A value of 0.5 means that the system balances accuracy and cost concerns. A value of 1.0 means a bias purely for accuracy, which typically results in a higher cost, sometimes substantially higher. A value of 0.0 means a bias purely for cost, which results in a less accurate `FindMatches` transform, sometimes with unacceptable accuracy.

Accuracy measures how well the transform finds true positives and true negatives. Increasing accuracy requires more machine resources and cost. But it also results in increased recall.

Cost measures how many compute resources, and thus money, are consumed to run the transform.

- `EnforceProvidedLabels` – Boolean.

The value to switch on or off to force the output to match the provided labels from users. If the value is `True`, the `find matches` transform forces the output to match the provided labels. The results override the normal conflation results. If the value is `False`, the `find matches` transform does not ensure all the labels provided are respected, and the results rely on the trained model.

Note that setting this value to true may increase the conflation execution time.

FindMatchesMetrics structure

The evaluation metrics for the find matches algorithm. The quality of your machine learning transform is measured by getting your transform to predict some matches and comparing the results to known matches from the same dataset. The quality metrics are based on a subset of your data, so they are not precise.

Fields

- `AreaUnderPRCurve` – Number (double), not more than 1.0.

The area under the precision/recall curve (AUPRC) is a single number measuring the overall quality of the transform, that is independent of the choice made for precision vs. recall. Higher values indicate that you have a more attractive precision vs. recall tradeoff.

For more information, see [Precision and recall](#) in Wikipedia.

- `Precision` – Number (double), not more than 1.0.

The precision metric indicates when often your transform is correct when it predicts a match. Specifically, it measures how well the transform finds true positives from the total true positives possible.

For more information, see [Precision and recall](#) in Wikipedia.

- `Recall` – Number (double), not more than 1.0.

The recall metric indicates that for an actual match, how often your transform predicts the match. Specifically, it measures how well the transform finds true positives from the total records in the source data.

For more information, see [Precision and recall](#) in Wikipedia.

- `F1` – Number (double), not more than 1.0.

The maximum F1 metric indicates the transform's accuracy between 0 and 1, where 1 is the best accuracy.

For more information, see [F1 score](#) in Wikipedia.

- `ConfusionMatrix` – A [ConfusionMatrix](#) object.

The confusion matrix shows you what your transform is predicting accurately and what types of errors it is making.

For more information, see [Confusion matrix](#) in Wikipedia.

- `ColumnImportances` – An array of [ColumnImportance](#) objects, not more than 100 structures.

A list of `ColumnImportance` structures containing column importance metrics, sorted in order of descending importance.

ConfusionMatrix structure

The confusion matrix shows you what your transform is predicting accurately and what types of errors it is making.

For more information, see [Confusion matrix](#) in Wikipedia.

Fields

- NumTruePositives – Number (long).

The number of matches in the data that the transform correctly found, in the confusion matrix for your transform.

- NumFalsePositives – Number (long).

The number of nonmatches in the data that the transform incorrectly classified as a match, in the confusion matrix for your transform.

- NumTrueNegatives – Number (long).

The number of nonmatches in the data that the transform correctly rejected, in the confusion matrix for your transform.

- NumFalseNegatives – Number (long).

The number of matches in the data that the transform didn't find, in the confusion matrix for your transform.

GlueTable structure

The database and table in the Amazon Glue Data Catalog that is used for input or output data.

Fields

- DatabaseName – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A database name in the Amazon Glue Data Catalog.

- TableName – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A table name in the Amazon Glue Data Catalog.

- CatalogId – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique identifier for the Amazon Glue Data Catalog.

- **ConnectionName** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the connection to the Amazon Glue Data Catalog.

- **AdditionalOptions** – A map array of key-value pairs, not less than 1 or more than 10 pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

Additional options for the table. Currently there are two keys supported:

- **pushDownPredicate**: to filter on partitions without having to list and read all the files in your dataset.
- **catalogPartitionPredicate**: to use server-side partition pruning using partition indexes in the Amazon Glue Data Catalog.

TaskRun structure

The sampling parameters that are associated with the machine learning transform.

Fields

- **TransformId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier for the transform.

- **TaskRunId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier for this task run.

- **Status** – UTF-8 string (valid values: RUNNING | FINISHED | FAILED | PENDING_EXECUTION | TIMED_OUT | CANCELING | CANCELED | RECEIVED_BY_TASKRUNNER).

The current status of the requested task run.

- **LogGroupName** – UTF-8 string.

The names of the log group for secure logging, associated with this task run.

- `Properties` – A [TaskRunProperties](#) object.

Specifies configuration properties associated with this task run.

- `ErrorString` – UTF-8 string.

The list of error strings associated with this task run.

- `StartedOn` – Timestamp.

The date and time that this task run started.

- `LastModifiedOn` – Timestamp.

The last point in time that the requested task run was updated.

- `CompletedOn` – Timestamp.

The last point in time that the requested task run was completed.

- `ExecutionTime` – Number (integer).

The amount of time (in seconds) that the task run consumed resources.

TransformFilterCriteria structure

The criteria used to filter the machine learning transforms.

Fields

- `Name` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique transform name that is used to filter the machine learning transforms.

- `TransformType` – UTF-8 string (valid values: FIND_MATCHES).

The type of machine learning transform that is used to filter the machine learning transforms.

- `Status` – UTF-8 string (valid values: NOT_READY | READY | DELETING).

Filters the list of machine learning transforms by the last known status of the transforms (to indicate whether a transform can be used or not). One of "NOT_READY", "READY", or "DELETING".

- `GlueVersion` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #48](#).

This value determines which version of Amazon Glue this machine learning transform is compatible with. Glue 1.0 is recommended for most customers. If the value is not set, the Glue compatibility defaults to Glue 0.9. For more information, see [Amazon Glue Versions](#) in the developer guide.

- `CreatedBefore` – Timestamp.

The time and date before which the transforms were created.

- `CreatedAfter` – Timestamp.

The time and date after which the transforms were created.

- `LastModifiedBefore` – Timestamp.

Filter on transforms last modified before this date.

- `LastModifiedAfter` – Timestamp.

Filter on transforms last modified after this date.

- `Schema` – An array of [SchemaColumn](#) objects, not more than 100 structures.

Filters on datasets with a specific schema. The `Map<Column, Type>` object is an array of key-value pairs representing the schema this transform accepts, where `Column` is the name of a column, and `Type` is the type of the data such as an integer or string. Has an upper bound of 100 columns.

TransformSortCriteria structure

The sorting criteria that are associated with the machine learning transform.

Fields

- `Column` – *Required:* UTF-8 string (valid values: NAME | TRANSFORM_TYPE | STATUS | CREATED | LAST_MODIFIED).

The column to be used in the sorting criteria that are associated with the machine learning transform.

- `SortDirection` – *Required:* UTF-8 string (valid values: DESCENDING | ASCENDING).

The sort direction to be used in the sorting criteria that are associated with the machine learning transform.

TaskRunFilterCriteria structure

The criteria that are used to filter the task runs for the machine learning transform.

Fields

- **TaskRunType** – UTF-8 string (valid values: EVALUATION | LABELING_SET_GENERATION | IMPORT_LABELS | EXPORT_LABELS | FIND_MATCHES).

The type of task run.

- **Status** – UTF-8 string (valid values: RUNNING | FINISHED | FAILED | PENDING_EXECUTION | TIMED_OUT | CANCELING | CANCELED | RECEIVED_BY_TASKRUNNER).

The current status of the task run.

- **StartedBefore** – Timestamp.

Filter on task runs started before this date.

- **StartedAfter** – Timestamp.

Filter on task runs started after this date.

TaskRunSortCriteria structure

The sorting criteria that are used to sort the list of task runs for the machine learning transform.

Fields

- **Column** – *Required:* UTF-8 string (valid values: TASK_RUN_TYPE | STATUS | STARTED).

The column to be used to sort the list of task runs for the machine learning transform.

- **SortDirection** – *Required:* UTF-8 string (valid values: DESCENDING | ASCENDING).

The sort direction to be used to sort the list of task runs for the machine learning transform.

TaskRunProperties structure

The configuration properties for the task run.

Fields

- `TaskType` – UTF-8 string (valid values: EVALUATION | LABELING_SET_GENERATION | IMPORT_LABELS | EXPORT_LABELS | FIND_MATCHES).

The type of task run.

- `ImportLabelsTaskRunProperties` – An [ImportLabelsTaskRunProperties](#) object.

The configuration properties for an importing labels task run.

- `ExportLabelsTaskRunProperties` – An [ExportLabelsTaskRunProperties](#) object.

The configuration properties for an exporting labels task run.

- `LabelingSetGenerationTaskRunProperties` – A [LabelingSetGenerationTaskRunProperties](#) object.

The configuration properties for a labeling set generation task run.

- `FindMatchesTaskRunProperties` – A [FindMatchesTaskRunProperties](#) object.

The configuration properties for a find matches task run.

FindMatchesTaskRunProperties structure

Specifies configuration properties for a Find Matches task run.

Fields

- `JobId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The job ID for the Find Matches task run.

- `JobName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name assigned to the job for the Find Matches task run.

- JobRunId – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The job run ID for the Find Matches task run.

ImportLabelsTaskRunProperties structure

Specifies configuration properties for an importing labels task run.

Fields

- InputS3Path – UTF-8 string.

The Amazon Simple Storage Service (Amazon S3) path from where you will import the labels.

- Replace – Boolean.

Indicates whether to overwrite your existing labels.

ExportLabelsTaskRunProperties structure

Specifies configuration properties for an exporting labels task run.

Fields

- OutputS3Path – UTF-8 string.

The Amazon Simple Storage Service (Amazon S3) path where you will export the labels.

LabelingSetGenerationTaskRunProperties structure

Specifies configuration properties for a labeling set generation task run.

Fields

- OutputS3Path – UTF-8 string.

The Amazon Simple Storage Service (Amazon S3) path where you will generate the labeling set.

SchemaColumn structure

A key-value pair representing a column and data type that this transform can run against. The Schema parameter of the `MLTransform` may contain up to 100 of these structures.

Fields

- Name – UTF-8 string, not less than 1 or more than 1024 bytes long, matching the [Single-line string pattern](#).

The name of the column.

- DataType – UTF-8 string, not more than 131072 bytes long, matching the [Single-line string pattern](#).

The type of data in the column.

TransformEncryption structure

The encryption-at-rest settings of the transform that apply to accessing user data. Machine learning transforms can access user data encrypted in Amazon S3 using KMS.

Additionally, imported labels and trained transforms can now be encrypted using a customer provided KMS key.

Fields

- `MLUserDataEncryption` – A [MLUserDataEncryption](#) object.

An `MLUserDataEncryption` object containing the encryption mode and customer-provided KMS key ID.

- `TaskRunSecurityConfigurationName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the security configuration.

MLUserDataEncryption structure

The encryption-at-rest settings of the transform that apply to accessing user data.

Fields

- `MLUserDataEncryptionMode` – *Required*: UTF-8 string (valid values: DISABLED | SSE-KMS="SSEKMS").

The encryption mode applied to user data. Valid values are:

- **DISABLED**: encryption is disabled
- **SSEKMS**: use of server-side encryption with Amazon Key Management Service (SSE-KMS) for user data stored in Amazon S3.
- `KmsKeyId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID for the customer-provided KMS key.

ColumnImportance structure

A structure containing the column name and column importance score for a column.

Column importance helps you understand how columns contribute to your model, by identifying which columns in your records are more important than others.

Fields

- `ColumnName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of a column.

- `Importance` – Number (double), not more than 1.0.

The column importance score for the column, as a decimal.

Operations

- [CreateMLTransform action \(Python: `create_ml_transform`\)](#)
- [UpdateMLTransform action \(Python: `update_ml_transform`\)](#)
- [DeleteMLTransform action \(Python: `delete_ml_transform`\)](#)
- [GetMLTransform action \(Python: `get_ml_transform`\)](#)

- [GetMLTransforms action \(Python: `get_ml_transforms`\)](#)
- [ListMLTransforms action \(Python: `list_ml_transforms`\)](#)
- [StartMLEvaluationTaskRun action \(Python: `start_ml_evaluation_task_run`\)](#)
- [StartMLLabelingSetGenerationTaskRun action \(Python: `start_ml_labeling_set_generation_task_run`\)](#)
- [GetMLTaskRun action \(Python: `get_ml_task_run`\)](#)
- [GetMLTaskRuns action \(Python: `get_ml_task_runs`\)](#)
- [CancelMLTaskRun action \(Python: `cancel_ml_task_run`\)](#)
- [StartExportLabelsTaskRun action \(Python: `start_export_labels_task_run`\)](#)
- [StartImportLabelsTaskRun action \(Python: `start_import_labels_task_run`\)](#)

CreateMLTransform action (Python: `create_ml_transform`)

Creates an Amazon Glue machine learning transform. This operation creates the transform and all the necessary parameters to train it.

Call this operation as the first step in the process of using a machine learning transform (such as the `FindMatches` transform) for deduplicating data. You can provide an optional `Description`, in addition to the parameters that you want to use for your algorithm.

You must also specify certain parameters for the tasks that Amazon Glue runs on your behalf as part of learning from your data and creating a high-quality machine learning transform. These parameters include `Role`, and optionally, `AllocatedCapacity`, `Timeout`, and `MaxRetries`. For more information, see [Jobs](#).

Request

- `Name` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique name that you give the transform when you create it.

- `Description` – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the machine learning transform that is being defined. The default is an empty string.

- `InputRecordTables` – *Required*: An array of [GlueTable](#) objects, not more than 10 structures.

A list of Amazon Glue table definitions used by the transform.

- `Parameters` – *Required:* A [TransformParameters](#) object.

The algorithmic parameters that are specific to the transform type used. Conditionally dependent on the transform type.

- `Role` – *Required:* UTF-8 string.

The name or Amazon Resource Name (ARN) of the IAM role with the required permissions.

The required permissions include both Amazon Glue service role permissions to Amazon Glue resources, and Amazon S3 permissions required by the transform.

- This role needs Amazon Glue service role permissions to allow access to resources in Amazon Glue. See [Attach a Policy to IAM Users That Access Amazon Glue](#).
- This role needs permission to your Amazon Simple Storage Service (Amazon S3) sources, targets, temporary directory, scripts, and any libraries used by the task run for this transform.
- `GlueVersion` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #48](#).

This value determines which version of Amazon Glue this machine learning transform is compatible with. Glue 1.0 is recommended for most customers. If the value is not set, the Glue compatibility defaults to Glue 0.9. For more information, see [Amazon Glue Versions](#) in the developer guide.

- `MaxCapacity` – Number (double).

The number of Amazon Glue data processing units (DPUs) that are allocated to task runs for this transform. You can allocate from 2 to 100 DPUs; the default is 10. A DPU is a relative measure of processing power that consists of 4 vCPUs of compute capacity and 16 GB of memory. For more information, see the [Amazon Glue pricing page](#).

`MaxCapacity` is a mutually exclusive option with `NumberOfWorkers` and `WorkerType`.

- If either `NumberOfWorkers` or `WorkerType` is set, then `MaxCapacity` cannot be set.
- If `MaxCapacity` is set then neither `NumberOfWorkers` or `WorkerType` can be set.
- If `WorkerType` is set, then `NumberOfWorkers` is required (and vice versa).
- `MaxCapacity` and `NumberOfWorkers` must both be at least 1.

When the `WorkerType` field is set to a value other than `Standard`, the `MaxCapacity` field is set automatically and becomes read-only.

When the `WorkerType` field is set to a value other than `Standard`, the `MaxCapacity` field is set automatically and becomes read-only.

- `WorkerType` – UTF-8 string (valid values: `Standard=""` | `G.1X=""` | `G.2X=""` | `G.025X=""` | `G.4X=""` | `G.8X=""` | `Z.2X=""`).

The type of predefined worker that is allocated when this task runs. Accepts a value of `Standard`, `G.1X`, or `G.2X`.

- For the `Standard` worker type, each worker provides 4 vCPU, 16 GB of memory and a 50GB disk, and 2 executors per worker.
- For the `G.1X` worker type, each worker provides 4 vCPU, 16 GB of memory and a 64GB disk, and 1 executor per worker.
- For the `G.2X` worker type, each worker provides 8 vCPU, 32 GB of memory and a 128GB disk, and 1 executor per worker.

`MaxCapacity` is a mutually exclusive option with `NumberOfWorkers` and `WorkerType`.

- If either `NumberOfWorkers` or `WorkerType` is set, then `MaxCapacity` cannot be set.
- If `MaxCapacity` is set then neither `NumberOfWorkers` or `WorkerType` can be set.
- If `WorkerType` is set, then `NumberOfWorkers` is required (and vice versa).
- `MaxCapacity` and `NumberOfWorkers` must both be at least 1.
- `NumberOfWorkers` – Number (integer).

The number of workers of a defined `workerType` that are allocated when this task runs.

If `WorkerType` is set, then `NumberOfWorkers` is required (and vice versa).

- `Timeout` – Number (integer), at least 1.

The timeout of the task run for this transform in minutes. This is the maximum time that a task run for this transform can consume resources before it is terminated and enters `TIMEOUT` status. The default is 2,880 minutes (48 hours).

- `MaxRetries` – Number (integer).

The maximum number of times to retry a task for this transform after a task run fails.

- `Tags` – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

The tags to use with this machine learning transform. You may use tags to limit access to the machine learning transform. For more information about tags in Amazon Glue, see [Amazon Tags in Amazon Glue](#) in the developer guide.

- `TransformEncryption` – A [TransformEncryption](#) object.

The encryption-at-rest settings of the transform that apply to accessing user data. Machine learning transforms can access user data encrypted in Amazon S3 using KMS.

Response

- `TransformId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique identifier that is generated for the transform.

Errors

- `AlreadyExistsException`
- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`
- `AccessDeniedException`
- `ResourceNumberLimitExceededException`
- `IdempotentParameterMismatchException`

UpdateMLTransform action (Python: `update_ml_transform`)

Updates an existing machine learning transform. Call this operation to tune the algorithm parameters to achieve better results.

After calling this operation, you can call the `StartMLEvaluationTaskRun` operation to assess how well your new parameters achieved your goals (such as improving the quality of your machine learning transform, or making it more cost-effective).

Request

- `TransformId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique identifier that was generated when the transform was created.

- `Name` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique name that you gave the transform when you created it.

- `Description` – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the transform. The default is an empty string.

- `Parameters` – A [TransformParameters](#) object.

The configuration parameters that are specific to the transform type (algorithm) used. Conditionally dependent on the transform type.

- `Role` – UTF-8 string.

The name or Amazon Resource Name (ARN) of the IAM role with the required permissions.

- `GlueVersion` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #48](#).

This value determines which version of Amazon Glue this machine learning transform is compatible with. Glue 1.0 is recommended for most customers. If the value is not set, the Glue compatibility defaults to Glue 0.9. For more information, see [Amazon Glue Versions](#) in the developer guide.

- `MaxCapacity` – Number (double).

The number of Amazon Glue data processing units (DPUs) that are allocated to task runs for this transform. You can allocate from 2 to 100 DPUs; the default is 10. A DPU is a relative measure of processing power that consists of 4 vCPUs of compute capacity and 16 GB of memory. For more information, see the [Amazon Glue pricing page](#).

When the `WorkerType` field is set to a value other than `Standard`, the `MaxCapacity` field is set automatically and becomes read-only.

- `WorkerType` – UTF-8 string (valid values: `Standard=""` | `G.1X=""` | `G.2X=""` | `G.025X=""` | `G.4X=""` | `G.8X=""` | `Z.2X=""`).

The type of predefined worker that is allocated when this task runs. Accepts a value of `Standard`, `G.1X`, or `G.2X`.

- For the `Standard` worker type, each worker provides 4 vCPU, 16 GB of memory and a 50GB disk, and 2 executors per worker.
- For the `G.1X` worker type, each worker provides 4 vCPU, 16 GB of memory and a 64GB disk, and 1 executor per worker.
- For the `G.2X` worker type, each worker provides 8 vCPU, 32 GB of memory and a 128GB disk, and 1 executor per worker.
- `NumberOfWorkers` – Number (integer).

The number of workers of a defined `workerType` that are allocated when this task runs.

- `Timeout` – Number (integer), at least 1.

The timeout for a task run for this transform in minutes. This is the maximum time that a task run for this transform can consume resources before it is terminated and enters `TIMEOUT` status. The default is 2,880 minutes (48 hours).

- `MaxRetries` – Number (integer).

The maximum number of times to retry a task for this transform after a task run fails.

Response

- `TransformId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier for the transform that was updated.

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

- `AccessDeniedException`

DeleteMLTransform action (Python: `delete_ml_transform`)

Deletes an Amazon Glue machine learning transform. Machine learning transforms are a special type of transform that use machine learning to learn the details of the transformation to be performed by learning from examples provided by humans. These transformations are then saved by Amazon Glue. If you no longer need a transform, you can delete it by calling `DeleteMLTransforms`. However, any Amazon Glue jobs that still reference the deleted transform will no longer succeed.

Request

- `TransformId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier of the transform to delete.

Response

- `TransformId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier of the transform that was deleted.

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

GetMLTransform action (Python: `get_ml_transform`)

Gets an Amazon Glue machine learning transform artifact and all its corresponding metadata. Machine learning transforms are a special type of transform that use machine learning to learn the details of the transformation to be performed by learning from examples provided by humans.

These transformations are then saved by Amazon Glue. You can retrieve their metadata by calling `GetMLTransform`.

Request

- `TransformId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier of the transform, generated at the time that the transform was created.

Response

- `TransformId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier of the transform, generated at the time that the transform was created.

- `Name` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique name given to the transform when it was created.

- `Description` – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the transform.

- `Status` – UTF-8 string (valid values: NOT_READY | READY | DELETING).

The last known status of the transform (to indicate whether it can be used or not). One of "NOT_READY", "READY", or "DELETING".

- `CreatedOn` – Timestamp.

The date and time when the transform was created.

- `LastModifiedOn` – Timestamp.

The date and time when the transform was last modified.

- `InputRecordTables` – An array of [GlueTable](#) objects, not more than 10 structures.

A list of Amazon Glue table definitions used by the transform.

- `Parameters` – A [TransformParameters](#) object.

The configuration parameters that are specific to the algorithm used.

- `EvaluationMetrics` – An [EvaluationMetrics](#) object.

The latest evaluation metrics.

- `LabelCount` – Number (integer).

The number of labels available for this transform.

- `Schema` – An array of [SchemaColumn](#) objects, not more than 100 structures.

The `Map<Column, Type>` object that represents the schema that this transform accepts. Has an upper bound of 100 columns.

- `Role` – UTF-8 string.

The name or Amazon Resource Name (ARN) of the IAM role with the required permissions.

- `GlueVersion` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #48](#).

This value determines which version of Amazon Glue this machine learning transform is compatible with. Glue 1.0 is recommended for most customers. If the value is not set, the Glue compatibility defaults to Glue 0.9. For more information, see [Amazon Glue Versions](#) in the developer guide.

- `MaxCapacity` – Number (double).

The number of Amazon Glue data processing units (DPUs) that are allocated to task runs for this transform. You can allocate from 2 to 100 DPUs; the default is 10. A DPU is a relative measure of processing power that consists of 4 vCPUs of compute capacity and 16 GB of memory. For more information, see the [Amazon Glue pricing page](#).

When the `WorkerType` field is set to a value other than `Standard`, the `MaxCapacity` field is set automatically and becomes read-only.

- `WorkerType` – UTF-8 string (valid values: `Standard=""` | `G.1X=""` | `G.2X=""` | `G.025X=""` | `G.4X=""` | `G.8X=""` | `Z.2X=""`).

The type of predefined worker that is allocated when this task runs. Accepts a value of `Standard`, `G.1X`, or `G.2X`.

- For the `Standard` worker type, each worker provides 4 vCPU, 16 GB of memory and a 50GB disk, and 2 executors per worker.

- For the G.1X worker type, each worker provides 4 vCPU, 16 GB of memory and a 64GB disk, and 1 executor per worker.
- For the G.2X worker type, each worker provides 8 vCPU, 32 GB of memory and a 128GB disk, and 1 executor per worker.
- `NumberOfWorkers` – Number (integer).

The number of workers of a defined `workerType` that are allocated when this task runs.

- `Timeout` – Number (integer), at least 1.

The timeout for a task run for this transform in minutes. This is the maximum time that a task run for this transform can consume resources before it is terminated and enters `TIMEOUT` status. The default is 2,880 minutes (48 hours).

- `MaxRetries` – Number (integer).

The maximum number of times to retry a task for this transform after a task run fails.

- `TransformEncryption` – A [TransformEncryption](#) object.

The encryption-at-rest settings of the transform that apply to accessing user data. Machine learning transforms can access user data encrypted in Amazon S3 using KMS.

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

GetMLTransforms action (Python: `get_ml_transforms`)

Gets a sortable, filterable list of existing Amazon Glue machine learning transforms. Machine learning transforms are a special type of transform that use machine learning to learn the details of the transformation to be performed by learning from examples provided by humans. These transformations are then saved by Amazon Glue, and you can retrieve their metadata by calling `GetMLTransforms`.

Request

- `NextToken` – UTF-8 string.

A paginated token to offset the results.

- `MaxResults` – Number (integer), not less than 1 or more than 1000.

The maximum number of results to return.

- `Filter` – A [TransformFilterCriteria](#) object.

The filter transformation criteria.

- `Sort` – A [TransformSortCriteria](#) object.

The sorting criteria.

Response

- `Transforms` – *Required:* An array of [MLTransform](#) objects.

A list of machine learning transforms.

- `NextToken` – UTF-8 string.

A pagination token, if more results are available.

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

ListMLTransforms action (Python: `list_ml_transforms`)

Retrieves a sortable, filterable list of existing Amazon Glue machine learning transforms in this Amazon account, or the resources with the specified tag. This operation takes the optional `Tags` field, which you can use as a filter of the responses so that tagged resources can be retrieved as a group. If you choose to use tag filtering, only resources with the tags are retrieved.

Request

- `NextToken` – UTF-8 string.

A continuation token, if this is a continuation request.

- `MaxResults` – Number (integer), not less than 1 or more than 1000.

The maximum size of a list to return.

- `Filter` – A [TransformFilterCriteria](#) object.

A `TransformFilterCriteria` used to filter the machine learning transforms.

- `Sort` – A [TransformSortCriteria](#) object.

A `TransformSortCriteria` used to sort the machine learning transforms.

- `Tags` – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

Specifies to return only these tagged resources.

Response

- `TransformIds` – *Required*: An array of UTF-8 strings.

The identifiers of all the machine learning transforms in the account, or the machine learning transforms with the specified tags.

- `NextToken` – UTF-8 string.

A continuation token, if the returned list does not contain the last metric available.

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

StartMLEvaluationTaskRun action (Python: start_ml_evaluation_task_run)

Starts a task to estimate the quality of the transform.

When you provide label sets as examples of truth, Amazon Glue machine learning uses some of those examples to learn from them. The rest of the labels are used as a test to estimate quality.

Returns a unique identifier for the run. You can call GetMLTaskRun to get more information about the stats of the EvaluationTaskRun.

Request

- TransformId – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier of the machine learning transform.

Response

- TaskRunId – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier associated with this run.

Errors

- EntityNotFoundException
- InvalidInputException
- OperationTimeoutException
- InternalServiceException
- ConcurrentRunsExceededException
- MLTransformNotReadyException

StartMLLabelingSetGenerationTaskRun action (Python: start_ml_labeling_set_generation_task_run)

Starts the active learning workflow for your machine learning transform to improve the transform's quality by generating label sets and adding labels.

When the `StartMLLabelingSetGenerationTaskRun` finishes, Amazon Glue will have generated a "labeling set" or a set of questions for humans to answer.

In the case of the `FindMatches` transform, these questions are of the form, "What is the correct way to group these rows together into groups composed entirely of matching records?"

After the labeling process is finished, you can upload your labels with a call to `StartImportLabelsTaskRun`. After `StartImportLabelsTaskRun` finishes, all future runs of the machine learning transform will use the new and improved labels and perform a higher-quality transformation.

Note: The role used to write the generated labeling set to the `OutputS3Path` is the role associated with the Machine Learning Transform, specified in the `CreateMLTransform` API.

Request

- `TransformId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier of the machine learning transform.

- `OutputS3Path` – *Required*: UTF-8 string.

The Amazon Simple Storage Service (Amazon S3) path where you generate the labeling set.

Response

- `TaskRunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run identifier that is associated with this task run.

Errors

- `EntityNotFoundException`

- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`
- `ConcurrentRunsExceededException`

GetMLTaskRun action (Python: `get_ml_task_run`)

Gets details for a specific task run on a machine learning transform. Machine learning task runs are asynchronous tasks that Amazon Glue runs on your behalf as part of various machine learning workflows. You can check the stats of any task run by calling `GetMLTaskRun` with the `TaskRunID` and its parent transform's `TransformID`.

Request

- `TransformId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier of the machine learning transform.

- `TaskRunId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier of the task run.

Response

- `TransformId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier of the task run.

- `TaskRunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run identifier associated with this run.

- `Status` – UTF-8 string (valid values: `RUNNING` | `FINISHED` | `FAILED` | `PENDING_EXECUTION` | `TIMED_OUT` | `CANCELING` | `CANCELED` | `RECEIVED_BY_TASKRUNNER`).

The status for this task run.

- `LogGroupName` – UTF-8 string.

The names of the log groups that are associated with the task run.

- `Properties` – A [TaskRunProperties](#) object.

The list of properties that are associated with the task run.

- `ErrorString` – UTF-8 string.

The error strings that are associated with the task run.

- `StartedOn` – Timestamp.

The date and time when this task run started.

- `LastModifiedOn` – Timestamp.

The date and time when this task run was last modified.

- `CompletedOn` – Timestamp.

The date and time when this task run was completed.

- `ExecutionTime` – Number (integer).

The amount of time (in seconds) that the task run consumed resources.

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

GetMLTaskRuns action (Python: `get_ml_task_runs`)

Gets a list of runs for a machine learning transform. Machine learning task runs are asynchronous tasks that Amazon Glue runs on your behalf as part of various machine learning workflows. You can get a sortable, filterable list of machine learning task runs by calling `GetMLTaskRuns` with their parent transform's `TransformID` and other optional parameters as documented in this section.

This operation returns a list of historic runs and must be paginated.

Request

- `TransformId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier of the machine learning transform.

- `NextToken` – UTF-8 string.

A token for pagination of the results. The default is empty.

- `MaxResults` – Number (integer), not less than 1 or more than 1000.

The maximum number of results to return.

- `Filter` – A [TaskRunFilterCriteria](#) object.

The filter criteria, in the `TaskRunFilterCriteria` structure, for the task run.

- `Sort` – A [TaskRunSortCriteria](#) object.

The sorting criteria, in the `TaskRunSortCriteria` structure, for the task run.

Response

- `TaskRuns` – An array of [TaskRun](#) objects.

A list of task runs that are associated with the transform.

- `NextToken` – UTF-8 string.

A pagination token, if more results are available.

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

CancelMLTaskRun action (Python: `cancel_ml_task_run`)

Cancels (stops) a task run. Machine learning task runs are asynchronous tasks that Amazon Glue runs on your behalf as part of various machine learning workflows. You can cancel a machine learning task run at any time by calling `CancelMLTaskRun` with a task run's parent transform's `TransformID` and the task run's `TaskRunId`.

Request

- `TransformId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier of the machine learning transform.

- `TaskRunId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique identifier for the task run.

Response

- `TransformId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier of the machine learning transform.

- `TaskRunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier for the task run.

- `Status` – UTF-8 string (valid values: `RUNNING` | `FINISHED` | `FAILED` | `PENDING_EXECUTION` | `TIMED_OUT` | `CANCELING` | `CANCELED` | `RECEIVED_BY_TASKRUNNER`).

The status for this run.

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `OperationTimeoutException`

- `InternalServerErrorException`

StartExportLabelsTaskRun action (Python: `start_export_labels_task_run`)

Begins an asynchronous task to export all labeled data for a particular transform. This task is the only label-related API call that is not part of the typical active learning workflow. You typically use `StartExportLabelsTaskRun` when you want to work with all of your existing labels at the same time, such as when you want to remove or change labels that were previously submitted as truth. This API operation accepts the `TransformId` whose labels you want to export and an Amazon Simple Storage Service (Amazon S3) path to export the labels to. The operation returns a `TaskRunId`. You can check on the status of your task run by calling the `GetMLTaskRun` API.

Request

- `TransformId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier of the machine learning transform.

- `OutputS3Path` – *Required*: UTF-8 string.

The Amazon S3 path where you export the labels.

Response

- `TaskRunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier for the task run.

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServerErrorException`

StartImportLabelsTaskRun action (Python: start_import_labels_task_run)

Enables you to provide additional labels (examples of truth) to be used to teach the machine learning transform and improve its quality. This API operation is generally used as part of the active learning workflow that starts with the `StartMLLabelingSetGenerationTaskRun` call and that ultimately results in improving the quality of your machine learning transform.

After the `StartMLLabelingSetGenerationTaskRun` finishes, Amazon Glue machine learning will have generated a series of questions for humans to answer. (Answering these questions is often called 'labeling' in the machine learning workflows). In the case of the `FindMatches` transform, these questions are of the form, "What is the correct way to group these rows together into groups composed entirely of matching records?" After the labeling process is finished, users upload their answers/labels with a call to `StartImportLabelsTaskRun`. After `StartImportLabelsTaskRun` finishes, all future runs of the machine learning transform use the new and improved labels and perform a higher-quality transformation.

By default, `StartMLLabelingSetGenerationTaskRun` continually learns from and combines all labels that you upload unless you set `Replace` to true. If you set `Replace` to true, `StartImportLabelsTaskRun` deletes and forgets all previously uploaded labels and learns only from the exact set that you upload. Replacing labels can be helpful if you realize that you previously uploaded incorrect labels, and you believe that they are having a negative effect on your transform quality.

You can check on the status of your task run by calling the `GetMLTaskRun` operation.

Request

- `TransformId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier of the machine learning transform.

- `InputS3Path` – *Required*: UTF-8 string.

The Amazon Simple Storage Service (Amazon S3) path from where you import the labels.

- `ReplaceAllLabels` – Boolean.

Indicates whether to overwrite your existing labels.

Response

- TaskRunId – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique identifier for the task run.

Errors

- EntityNotFoundException
- InvalidInputException
- OperationTimeoutException
- ResourceNumberLimitExceededException
- InternalServiceException

Data Quality API

The Data Quality API describes the data quality data types, and includes the API for creating, deleting, or updating data quality rulesets, runs and evaluations.

Data types

- [DataSource structure](#)
- [DataQualityRulesetListDetails structure](#)
- [DataQualityTargetTable structure](#)
- [DataQualityRulesetEvaluationRunDescription structure](#)
- [DataQualityRulesetEvaluationRunFilter structure](#)
- [DataQualityEvaluationRunAdditionalRunOptions structure](#)
- [DataQualityRuleRecommendationRunDescription structure](#)
- [DataQualityRuleRecommendationRunFilter structure](#)
- [DataQualityResult structure](#)
- [DataQualityAnalyzerResult structure](#)
- [DataQualityObservation structure](#)

- [MetricBasedObservation structure](#)
- [DataQualityMetricValues structure](#)
- [DataQualityRuleResult structure](#)
- [DataQualityResultDescription structure](#)
- [DataQualityResultFilterCriteria structure](#)
- [DataQualityRulesetFilterCriteria structure](#)
- [DataQualityAggregatedMetrics structure](#)
- [StatisticAnnotation structure](#)
- [TimestampedInclusionAnnotation structure](#)
- [AnnotationError structure](#)
- [DatapointInclusionAnnotation structure](#)
- [StatisticSummaryList list](#)
- [StatisticSummary structure](#)
- [RunIdentifier structure](#)
- [StatisticModelResult structure](#)
- [DataQualityGlueTable structure](#)

DataSource structure

A data source (an Amazon Glue table) for which you want data quality results.

Fields

- `GlueTable` – A [GlueTable](#) object.

An Amazon Glue table.

- `DataQualityGlueTable` – A [DataQualityGlueTable](#) object.

An Amazon Glue table for Data Quality Operations.

DataQualityRulesetListDetails structure

Describes a data quality ruleset returned by `GetDataQualityRuleset`.

Fields

- **Name** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the data quality ruleset.

- **Description** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the data quality ruleset.

- **CreatedOn** – Timestamp.

The date and time the data quality ruleset was created.

- **LastModifiedOn** – Timestamp.

The date and time the data quality ruleset was last modified.

- **TargetTable** – A [DataQualityTargetTable](#) object.

An object representing an Amazon Glue table.

- **RecommendationRunId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

When a ruleset was created from a recommendation run, this run ID is generated to link the two together.

- **RuleCount** – Number (integer).

The number of rules in the ruleset.

DataQualityTargetTable structure

An object representing an Amazon Glue table.

Fields

- **TableName** – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the Amazon Glue table.

- **DatabaseName** – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the database where the Amazon Glue table exists.

- **CatalogId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The catalog id where the Amazon Glue table exists.

DataQualityRulesetEvaluationRunDescription structure

Describes the result of a data quality ruleset evaluation run.

Fields

- **RunId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run identifier associated with this run.

- **Status** – UTF-8 string (valid values: RUNNING | FINISHED | FAILED | PENDING_EXECUTION | TIMED_OUT | CANCELING | CANCELED | RECEIVED_BY_TASKRUNNER).

The status for this run.

- **StartedOn** – Timestamp.

The date and time when the run started.

- **DataSource** – A [DataSource](#) object.

The data source (an Amazon Glue table) associated with the run.

DataQualityRulesetEvaluationRunFilter structure

The filter criteria.

Fields

- **DataSource** – *Required:* A [DataSource](#) object.

Filter based on a data source (an Amazon Glue table) associated with the run.

- `StartedBefore` – Timestamp.

Filter results by runs that started before this time.

- `StartedAfter` – Timestamp.

Filter results by runs that started after this time.

DataQualityEvaluationRunAdditionalRunOptions structure

Additional run options you can specify for an evaluation run.

Fields

- `CloudWatchMetricsEnabled` – Boolean.

Whether or not to enable CloudWatch metrics.

- `ResultsS3Prefix` – UTF-8 string.

Prefix for Amazon S3 to store results.

- `CompositeRuleEvaluationMethod` – UTF-8 string (valid values: COLUMN | ROW).

Set the evaluation method for composite rules in the ruleset to ROW/COLUMN

DataQualityRuleRecommendationRunDescription structure

Describes the result of a data quality rule recommendation run.

Fields

- `RunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run identifier associated with this run.

- `Status` – UTF-8 string (valid values: RUNNING | FINISHED | FAILED | PENDING_EXECUTION | TIMED_OUT | CANCELING | CANCELED | RECEIVED_BY_TASKRUNNER).

The status for this run.

- `StartedOn` – Timestamp.

The date and time when this run started.

- `DataSource` – A [DataSource](#) object.

The data source (Amazon Glue table) associated with the recommendation run.

DataQualityRuleRecommendationRunFilter structure

A filter for listing data quality recommendation runs.

Fields

- `DataSource` – *Required:* A [DataSource](#) object.

Filter based on a specified data source (Amazon Glue table).

- `StartedBefore` – Timestamp.

Filter based on time for results started before provided time.

- `StartedAfter` – Timestamp.

Filter based on time for results started after provided time.

DataQualityResult structure

Describes a data quality result.

Fields

- `ResultId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique result ID for the data quality result.

- `ProfileId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Profile ID for the data quality result.

- `Score` – Number (double), not more than 1.0.

An aggregate data quality score. Represents the ratio of rules that passed to the total number of rules.

- `DataSource` – A [DataSource](#) object.

The table associated with the data quality result, if any.

- `RulesetName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the ruleset associated with the data quality result.

- `EvaluationContext` – UTF-8 string.

In the context of a job in Amazon Glue Studio, each node in the canvas is typically assigned some sort of name and data quality nodes will have names. In the case of multiple nodes, the `evaluationContext` can differentiate the nodes.

- `StartedOn` – Timestamp.

The date and time when this data quality run started.

- `CompletedOn` – Timestamp.

The date and time when this data quality run completed.

- `JobName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The job name associated with the data quality result, if any.

- `JobRunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The job run ID associated with the data quality result, if any.

- `RulesetEvaluationRunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run ID for the ruleset evaluation for this data quality result.

- `RuleResults` – An array of [DataQualityRuleResult](#) objects, not more than 2000 structures.

A list of `DataQualityRuleResult` objects representing the results for each rule.

- `AnalyzerResults` – An array of [DataQualityAnalyzerResult](#) objects, not more than 2000 structures.

A list of `DataQualityAnalyzerResult` objects representing the results for each analyzer.

- `Observations` – An array of [DataQualityObservation](#) objects, not more than 50 structures.

A list of `DataQualityObservation` objects representing the observations generated after evaluating the rules and analyzers.

- `AggregatedMetrics` – A [DataQualityAggregatedMetrics](#) object.

A summary of `DataQualityAggregatedMetrics` objects showing the total counts of processed rows and rules, including their pass/fail statistics based on row-level results.

DataQualityAnalyzerResult structure

Describes the result of the evaluation of a data quality analyzer.

Fields

- `Name` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the data quality analyzer.

- `Description` – UTF-8 string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the data quality analyzer.

- `EvaluationMessage` – UTF-8 string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

An evaluation message.

- `EvaluatedMetrics` – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a `Number` (double).

A map of metrics associated with the evaluation of the analyzer.

DataQualityObservation structure

Describes the observation generated after evaluating the rules and analyzers.

Fields

- **Description** – UTF-8 string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the data quality observation.

- **MetricBasedObservation** – A [MetricBasedObservation](#) object.

An object of type `MetricBasedObservation` representing the observation that is based on evaluated data quality metrics.

MetricBasedObservation structure

Describes the metric based observation generated based on evaluated data quality metrics.

Fields

- **MetricName** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the data quality metric used for generating the observation.

- **StatisticId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Statistic ID.

- **MetricValues** – A [DataQualityMetricValues](#) object.

An object of type `DataQualityMetricValues` representing the analysis of the data quality metric value.

- **NewRules** – An array of UTF-8 strings.

A list of new data quality rules generated as part of the observation based on the data quality metric value.

DataQualityMetricValues structure

Describes the data quality metric value according to the analysis of historical data.

Fields

- `ActualValue` – Number (double).

The actual value of the data quality metric.

- `ExpectedValue` – Number (double).

The expected value of the data quality metric according to the analysis of historical data.

- `LowerLimit` – Number (double).

The lower limit of the data quality metric value according to the analysis of historical data.

- `UpperLimit` – Number (double).

The upper limit of the data quality metric value according to the analysis of historical data.

DataQualityRuleResult structure

Describes the result of the evaluation of a data quality rule.

Fields

- `Name` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the data quality rule.

- `Description` – UTF-8 string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the data quality rule.

- `EvaluationMessage` – UTF-8 string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

An evaluation message.

- `Result` – UTF-8 string (valid values: PASS | FAIL | ERROR).

A pass or fail status for the rule.

- `EvaluatedMetrics` – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a Number (double).

A map of metrics associated with the evaluation of the rule.

- `EvaluatedRule` – UTF-8 string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

The evaluated rule.

- `RuleMetrics` – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a Number (double).

A map containing metrics associated with the evaluation of the rule based on row-level results.

DataQualityResultDescription structure

Describes a data quality result.

Fields

- `ResultId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique result ID for this data quality result.

- `DataSource` – A [DataSource](#) object.

The table name associated with the data quality result.

- `JobName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The job name associated with the data quality result.

- `JobRunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The job run ID associated with the data quality result.

- `StartedOn` – Timestamp.

The time that the run started for this data quality result.

DataQualityResultFilterCriteria structure

Criteria used to return data quality results.

Fields

- `DataSource` – A [DataSource](#) object.

Filter results by the specified data source. For example, retrieving all results for an Amazon Glue table.

- `JobName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Filter results by the specified job name.

- `JobRunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Filter results by the specified job run ID.

- `StartedAfter` – Timestamp.

Filter results by runs that started after this time.

- `StartedBefore` – Timestamp.

Filter results by runs that started before this time.

DataQualityRulesetFilterCriteria structure

The criteria used to filter data quality rulesets.

Fields

- **Name** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the ruleset filter criteria.

- **Description** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

The description of the ruleset filter criteria.

- **CreatedBefore** – Timestamp.

Filter on rulesets created before this date.

- **CreatedAfter** – Timestamp.

Filter on rulesets created after this date.

- **LastModifiedBefore** – Timestamp.

Filter on rulesets last modified before this date.

- **LastModifiedAfter** – Timestamp.

Filter on rulesets last modified after this date.

- **TargetTable** – A [DataQualityTargetTable](#) object.

The name and database name of the target table.

DataQualityAggregatedMetrics structure

A summary of metrics showing the total counts of processed rows and rules, including their pass/fail statistics based on row-level results.

Fields

- **TotalRowsProcessed** – Number (double).

The total number of rows that were processed during the data quality evaluation.

- **TotalRowsPassed** – Number (double).

The total number of rows that passed all applicable data quality rules.

- `TotalRowsFailed` – Number (double).

The total number of rows that failed one or more data quality rules.

- `TotalRulesProcessed` – Number (double).

The total number of data quality rules that were evaluated.

- `TotalRulesPassed` – Number (double).

The total number of data quality rules that passed their evaluation criteria.

- `TotalRulesFailed` – Number (double).

The total number of data quality rules that failed their evaluation criteria.

StatisticAnnotation structure

A Statistic Annotation.

Fields

- `ProfileId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Profile ID.

- `StatisticId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Statistic ID.

- `StatisticRecordedOn` – Timestamp.

The timestamp when the annotated statistic was recorded.

- `InclusionAnnotation` – A [TimestampedInclusionAnnotation](#) object.

The inclusion annotation applied to the statistic.

TimestampedInclusionAnnotation structure

A timestamped inclusion annotation.

Fields

- `Value` – UTF-8 string (valid values: INCLUDE | EXCLUDE).

The inclusion annotation value.

- `LastModifiedOn` – Timestamp.

The timestamp when the inclusion annotation was last modified.

AnnotationError structure

A failed annotation.

Fields

- `ProfileId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Profile ID for the failed annotation.

- `StatisticId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Statistic ID for the failed annotation.

- `FailureReason` – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

The reason why the annotation failed.

DatapointInclusionAnnotation structure

An Inclusion Annotation.

Fields

- `ProfileId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of the data quality profile the statistic belongs to.

- **StatisticId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Statistic ID.

- **InclusionAnnotation** – UTF-8 string (valid values: INCLUDE | EXCLUDE).

The inclusion annotation value to apply to the statistic.

StatisticSummaryList list

A list of `StatisticSummary`.

An array of [StatisticSummary](#) objects.

A list of `StatisticSummary`.

StatisticSummary structure

Summary information about a statistic.

Fields

- **StatisticId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Statistic ID.

- **ProfileId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Profile ID.

- **RunIdentifier** – A [RunIdentifier](#) object.

The Run Identifier

- **StatisticName** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Custom string pattern #16](#).

The name of the statistic.

- **DoubleValue** – Number (double).

The value of the statistic.

- `EvaluationLevel` – UTF-8 string (valid values: `Dataset="DATASET" | Column="COLUMN" | Multicolumn="MULTICOLUMN"`).

The evaluation level of the statistic. Possible values: `Dataset`, `Column`, `Multicolumn`.

- `ColumnsReferenced` – An array of UTF-8 strings.

The list of columns referenced by the statistic.

- `ReferencedDatasets` – An array of UTF-8 strings.

The list of datasets referenced by the statistic.

- `StatisticProperties` – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A `StatisticPropertiesMap`, which contains a `NameString` and `DescriptionString`

- `RecordedOn` – Timestamp.

The timestamp when the statistic was recorded.

- `InclusionAnnotation` – A [TimestampedInclusionAnnotation](#) object.

The inclusion annotation for the statistic.

RunIdentifier structure

A run identifier.

Fields

- `RunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Run ID.

- `JobRunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Job Run ID.

StatisticModelResult structure

The statistic model result.

Fields

- `LowerBound` – Number (double).

The lower bound.

- `UpperBound` – Number (double).

The upper bound.

- `PredictedValue` – Number (double).

The predicted value.

- `ActualValue` – Number (double).

The actual value.

- `Date` – Timestamp.

The date.

- `InclusionAnnotation` – UTF-8 string (valid values: INCLUDE | EXCLUDE).

The inclusion annotation.

DataQualityGlueTable structure

The database and table in the Amazon Glue Data Catalog that is used for input or output data for Data Quality Operations.

Fields

- `DatabaseName` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A database name in the Amazon Glue Data Catalog.

- `TableName` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A table name in the Amazon Glue Data Catalog.

- `CatalogId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique identifier for the Amazon Glue Data Catalog.

- `ConnectionName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the connection to the Amazon Glue Data Catalog.

- `AdditionalOptions` – A map array of key-value pairs, not less than 1 or more than 10 pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

Additional options for the table. Currently there are two keys supported:

- `pushDownPredicate`: to filter on partitions without having to list and read all the files in your dataset.
- `catalogPartitionPredicate`: to use server-side partition pruning using partition indexes in the Amazon Glue Data Catalog.
- `PreProcessingQuery` – UTF-8 string, not more than 51200 bytes long, matching the [URI address multi-line string pattern](#).

SQL Query of SparkSQL format that can be used to pre-process the data for the table in Amazon Glue Data Catalog, before running the Data Quality Operation.

Operations

- [StartDataQualityRulesetEvaluationRun action \(Python: start_data_quality_ruleset_evaluation_run\)](#)
- [CancelDataQualityRulesetEvaluationRun action \(Python: cancel_data_quality_ruleset_evaluation_run\)](#)

- [GetDataQualityRulesetEvaluationRun action \(Python: `get_data_quality_ruleset_evaluation_run`\)](#)

- [PutDataQualityProfileAnnotation action \(Python: `put_data_quality_profile_annotation`\)](#)

StartDataQualityRulesetEvaluationRun action (Python: start_data_quality_ruleset_evaluation_run)

Once you have a ruleset definition (either recommended or your own), you call this operation to evaluate the ruleset against a data source (Amazon Glue table). The evaluation computes results which you can retrieve with the `GetDataQualityResult` API.

Request

- `DataSource` – *Required:* A [DataSource](#) object.

The data source (Amazon Glue table) associated with this run.

- `Role` – *Required:* UTF-8 string.

An IAM role supplied to encrypt the results of the run.

- `NumberOfWorkers` – Number (integer).

The number of G.1X workers to be used in the run. The default is 5.

- `Timeout` – Number (integer), at least 1.

The timeout for a run in minutes. This is the maximum time that a run can consume resources before it is terminated and enters `TIMEOUT` status. The default is 2,880 minutes (48 hours).

- `ClientToken` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Used for idempotency and is recommended to be set to a random ID (such as a UUID) to avoid creating or starting multiple instances of the same resource.

- `AdditionalRunOptions` – A [DataQualityEvaluationRunAdditionalRunOptions](#) object.

Additional run options you can specify for an evaluation run.

- `RulesetNames` – *Required:* An array of UTF-8 strings, not less than 1 or more than 10 strings.

A list of ruleset names.

- `AdditionalDataSources` – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a A [DataSource](#) object.

A map of reference strings to additional data sources you can specify for an evaluation run.

Response

- RunId – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run identifier associated with this run.

Errors

- InvalidInputException
- EntityNotFoundException
- OperationTimeoutException
- InternalServiceException
- ConflictException

CancelDataQualityRulesetEvaluationRun action (Python: `cancel_data_quality_ruleset_evaluation_run`)

Cancels a run where a ruleset is being evaluated against a data source.

Request

- RunId – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run identifier associated with this run.

Response

- *No Response parameters.*

Errors

- EntityNotFoundException

- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

GetDataQualityRulesetEvaluationRun action (Python: `get_data_quality_ruleset_evaluation_run`)

Retrieves a specific run where a ruleset is evaluated against a data source.

Request

- `RunId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run identifier associated with this run.

Response

- `RunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run identifier associated with this run.

- `DataSource` – A [DataSource](#) object.

The data source (an Amazon Glue table) associated with this evaluation run.

- `Role` – UTF-8 string.

An IAM role supplied to encrypt the results of the run.

- `NumberOfWorkers` – Number (integer).

The number of G.1X workers to be used in the run. The default is 5.

- `Timeout` – Number (integer), at least 1.

The timeout for a run in minutes. This is the maximum time that a run can consume resources before it is terminated and enters TIMEOUT status. The default is 2,880 minutes (48 hours).

- `AdditionalRunOptions` – A [DataQualityEvaluationRunAdditionalRunOptions](#) object.

Additional run options you can specify for an evaluation run.

- **Status** – UTF-8 string (valid values: RUNNING | FINISHED | FAILED | PENDING_EXECUTION | TIMED_OUT | CANCELING | CANCELED | RECEIVED_BY_TASKRUNNER).

The status for this run.

- **ErrorString** – UTF-8 string.

The error strings that are associated with the run.

- **StartedOn** – Timestamp.

The date and time when this run started.

- **LastModifiedOn** – Timestamp.

A timestamp. The last point in time when this data quality rule recommendation run was modified.

- **CompletedOn** – Timestamp.

The date and time when this run was completed.

- **ExecutionTime** – Number (integer).

The amount of time (in seconds) that the run consumed resources.

- **RulesetNames** – An array of UTF-8 strings, not less than 1 or more than 10 strings.

A list of ruleset names for the run. Currently, this parameter takes only one Ruleset name.

- **ResultIds** – An array of UTF-8 strings, not less than 1 or more than 10 strings.

A list of result IDs for the data quality results for the run.

- **AdditionalDataSources** – A map array of key-value pairs.

Each key is a UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Each value is a [DataSource](#) object.

A map of reference strings to additional data sources you can specify for an evaluation run.

Errors

- **EntityNotFoundException**

GetDataQualityRulesetEvaluationRun (get_data_quality_ruleset_evaluation_run)

- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

ListDataQualityRulesetEvaluationRuns action (Python: `list_data_quality_ruleset_evaluation_runs`)

Lists all the runs meeting the filter criteria, where a ruleset is evaluated against a data source.

Request

- `Filter` – A [DataQualityRulesetEvaluationRunFilter](#) object.

The filter criteria.

- `NextToken` – UTF-8 string.

A paginated token to offset the results.

- `MaxResults` – Number (integer), not less than 1 or more than 1000.

The maximum number of results to return.

Response

- `Runs` – An array of [DataQualityRulesetEvaluationRunDescription](#) objects.

A list of `DataQualityRulesetEvaluationRunDescription` objects representing data quality ruleset runs.

- `NextToken` – UTF-8 string.

A pagination token, if more results are available.

Errors

- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

StartDataQualityRuleRecommendationRun action (Python: start_data_quality_rule_recommendation_run)

Starts a recommendation run that is used to generate rules when you don't know what rules to write. Amazon Glue Data Quality analyzes the data and comes up with recommendations for a potential ruleset. You can then triage the ruleset and modify the generated ruleset to your liking.

Recommendation runs are automatically deleted after 90 days.

Request

The request of the Data Quality rule recommendation request.

- `DataSource` – *Required:* A [DataSource](#) object.

The data source (Amazon Glue table) associated with this run.

- `Role` – *Required:* UTF-8 string.

An IAM role supplied to encrypt the results of the run.

- `NumberOfWorkers` – Number (integer).

The number of G.1X workers to be used in the run. The default is 5.

- `Timeout` – Number (integer), at least 1.

The timeout for a run in minutes. This is the maximum time that a run can consume resources before it is terminated and enters TIMEOUT status. The default is 2,880 minutes (48 hours).

- `CreatedRulesetName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A name for the ruleset.

- `DataQualitySecurityConfiguration` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the security configuration created with the data quality encryption option.

- `ClientToken` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Used for idempotency and is recommended to be set to a random ID (such as a UUID) to avoid creating or starting multiple instances of the same resource.

Response

- RunId – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run identifier associated with this run.

Errors

- InvalidInputException
- OperationTimeoutException
- InternalServiceException
- ConflictException

CancelDataQualityRuleRecommendationRun action (Python: `cancel_data_quality_rule_recommendation_run`)

Cancels the specified recommendation run that was being used to generate rules.

Request

- RunId – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run identifier associated with this run.

Response

- *No Response parameters.*

Errors

- EntityNotFoundException
- InvalidInputException
- OperationTimeoutException
- InternalServiceException

GetDataQualityRuleRecommendationRun action (Python: `get_data_quality_rule_recommendation_run`)

Gets the specified recommendation run that was used to generate rules.

Request

- `RunId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run identifier associated with this run.

Response

The response for the Data Quality rule recommendation run.

- `RunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run identifier associated with this run.

- `DataSource` – A [DataSource](#) object.

The data source (an Amazon Glue table) associated with this run.

- `Role` – UTF-8 string.

An IAM role supplied to encrypt the results of the run.

- `NumberOfWorkers` – Number (integer).

The number of G.1X workers to be used in the run. The default is 5.

- `Timeout` – Number (integer), at least 1.

The timeout for a run in minutes. This is the maximum time that a run can consume resources before it is terminated and enters TIMEOUT status. The default is 2,880 minutes (48 hours).

- `Status` – UTF-8 string (valid values: RUNNING | FINISHED | FAILED | PENDING_EXECUTION | TIMED_OUT | CANCELING | CANCELED | RECEIVED_BY_TASKRUNNER).

The status for this run.

- `ErrorString` – UTF-8 string.

The error strings that are associated with the run.

- `StartedOn` – Timestamp.

The date and time when this run started.

- `LastModifiedOn` – Timestamp.

A timestamp. The last point in time when this data quality rule recommendation run was modified.

- `CompletedOn` – Timestamp.

The date and time when this run was completed.

- `ExecutionTime` – Number (integer).

The amount of time (in seconds) that the run consumed resources.

- `RecommendedRuleset` – UTF-8 string, not less than 1 or more than 65536 bytes long.

When a start rule recommendation run completes, it creates a recommended ruleset (a set of rules). This member has those rules in Data Quality Definition Language (DQDL) format.

- `CreatedRulesetName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the ruleset that was created by the run.

- `DataQualitySecurityConfiguration` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the security configuration created with the data quality encryption option.

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

ListDataQualityRuleRecommendationRuns action (Python: `list_data_quality_rule_recommendation_runs`)

Lists the recommendation runs meeting the filter criteria.

Request

- `Filter` – A [DataQualityRuleRecommendationRunFilter](#) object.

The filter criteria.

- `NextToken` – UTF-8 string.

A paginated token to offset the results.

- `MaxResults` – Number (integer), not less than 1 or more than 1000.

The maximum number of results to return.

Response

- `Runs` – An array of [DataQualityRuleRecommendationRunDescription](#) objects.

A list of `DataQualityRuleRecommendationRunDescription` objects.

- `NextToken` – UTF-8 string.

A pagination token, if more results are available.

Errors

- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

GetDataQualityResult action (Python: `get_data_quality_result`)

Retrieves the result of a data quality rule evaluation.

Request

- **ResultId** – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique result ID for the data quality result.

Response

The response for the data quality result.

- **ResultId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique result ID for the data quality result.

- **ProfileId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Profile ID for the data quality result.

- **Score** – Number (double), not more than 1.0.

An aggregate data quality score. Represents the ratio of rules that passed to the total number of rules.

- **DataSource** – A [DataSource](#) object.

The table associated with the data quality result, if any.

- **RulesetName** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the ruleset associated with the data quality result.

- **EvaluationContext** – UTF-8 string.

In the context of a job in Amazon Glue Studio, each node in the canvas is typically assigned some sort of name and data quality nodes will have names. In the case of multiple nodes, the `evaluationContext` can differentiate the nodes.

- **StartedOn** – Timestamp.

The date and time when the run for this data quality result started.

- **CompletedOn** – Timestamp.

The date and time when the run for this data quality result was completed.

- **JobName** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The job name associated with the data quality result, if any.

- **JobRunId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The job run ID associated with the data quality result, if any.

- **RulesetEvaluationRunId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run ID associated with the ruleset evaluation.

- **RuleResults** – An array of [DataQualityRuleResult](#) objects, not more than 2000 structures.

A list of [DataQualityRuleResult](#) objects representing the results for each rule.

- **AnalyzerResults** – An array of [DataQualityAnalyzerResult](#) objects, not more than 2000 structures.

A list of [DataQualityAnalyzerResult](#) objects representing the results for each analyzer.

- **Observations** – An array of [DataQualityObservation](#) objects, not more than 50 structures.

A list of [DataQualityObservation](#) objects representing the observations generated after evaluating the rules and analyzers.

- **AggregatedMetrics** – A [DataQualityAggregatedMetrics](#) object.

A summary of [DataQualityAggregatedMetrics](#) objects showing the total counts of processed rows and rules, including their pass/fail statistics based on row-level results.

Errors

- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`
- `EntityNotFoundException`

BatchGetDataQualityResult action (Python: `batch_get_data_quality_result`)

Retrieves a list of data quality results for the specified result IDs.

Request

- `ResultIds` – *Required*: An array of UTF-8 strings, not less than 1 or more than 100 strings.

A list of unique result IDs for the data quality results.

Response

- `Results` – *Required*: An array of [DataQualityResult](#) objects.

A list of `DataQualityResult` objects representing the data quality results.

- `ResultsNotFound` – An array of UTF-8 strings, not less than 1 or more than 100 strings.

A list of result IDs for which results were not found.

Errors

- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

ListDataQualityResults action (Python: `list_data_quality_results`)

Returns all data quality execution results for your account.

Request

- `Filter` – A [DataQualityResultFilterCriteria](#) object.

The filter criteria.

- `NextToken` – UTF-8 string.

A paginated token to offset the results.

- `MaxResults` – Number (integer), not less than 1 or more than 1000.

The maximum number of results to return.

Response

- `Results` – *Required*: An array of [DataQualityResultDescription](#) objects.

A list of `DataQualityResultDescription` objects.

- `NextToken` – UTF-8 string.

A pagination token, if more results are available.

Errors

- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

CreateDataQualityRuleset action (Python: `create_data_quality_ruleset`)

Creates a data quality ruleset with DQDL rules applied to a specified Amazon Glue table.

You create the ruleset using the Data Quality Definition Language (DQDL). For more information, see the Amazon Glue developer guide.

Request

A request to create a data quality ruleset.

- `Name` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique name for the data quality ruleset.

- `Description` – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the data quality ruleset.

- `Ruleset` – *Required*: UTF-8 string, not less than 1 or more than 65536 bytes long.

A Data Quality Definition Language (DQDL) ruleset. For more information, see the Amazon Glue developer guide.

- **Tags** – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

A list of tags applied to the data quality ruleset.

- **TargetTable** – A [DataQualityTargetTable](#) object.

A target table associated with the data quality ruleset.

- **RecommendationRunId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique run ID for the recommendation run.

- **DataQualitySecurityConfiguration** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the security configuration created with the data quality encryption option.

- **ClientToken** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Used for idempotency and is recommended to be set to a random ID (such as a UUID) to avoid creating or starting multiple instances of the same resource.

Response

- **Name** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique name for the data quality ruleset.

Errors

- **InvalidInputException**
- **AlreadyExistsException**

- `OperationTimeoutException`
- `InternalServiceException`
- `ResourceNumberLimitExceededException`

DeleteDataQualityRuleset action (Python: `delete_data_quality_ruleset`)

Deletes a data quality ruleset.

Request

- Name – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A name for the data quality ruleset.

Response

- *No Response parameters.*

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

GetDataQualityRuleset action (Python: `get_data_quality_ruleset`)

Returns an existing ruleset by identifier or name.

Request

- Name – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the ruleset.

Response

Returns the data quality ruleset response.

- **Name** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the ruleset.

- **Description** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the ruleset.

- **Ruleset** – UTF-8 string, not less than 1 or more than 65536 bytes long.

A Data Quality Definition Language (DQDL) ruleset. For more information, see the Amazon Glue developer guide.

- **TargetTable** – A [DataQualityTargetTable](#) object.

The name and database name of the target table.

- **CreatedOn** – Timestamp.

A timestamp. The time and date that this data quality ruleset was created.

- **LastModifiedOn** – Timestamp.

A timestamp. The last point in time when this data quality ruleset was modified.

- **RecommendationRunId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

When a ruleset was created from a recommendation run, this run ID is generated to link the two together.

- **DataQualitySecurityConfiguration** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the security configuration created with the data quality encryption option.

Errors

- **EntityNotFoundException**

- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

ListDataQualityRulesets action (Python: `list_data_quality_rulesets`)

Returns a paginated list of rulesets for the specified list of Amazon Glue tables.

Request

- `NextToken` – UTF-8 string.

A paginated token to offset the results.

- `MaxResults` – Number (integer), not less than 1 or more than 1000.

The maximum number of results to return.

- `Filter` – A [DataQualityRulesetFilterCriteria](#) object.

The filter criteria.

- `Tags` – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

A list of key-value pair tags.

Response

- `Rulesets` – An array of [DataQualityRulesetListDetails](#) objects.

A paginated list of rulesets for the specified list of Amazon Glue tables.

- `NextToken` – UTF-8 string.

A pagination token, if more results are available.

Errors

- EntityNotFoundException
- InvalidInputException
- OperationTimeoutException
- InternalServiceException

UpdateDataQualityRuleset action (Python: update_data_quality_ruleset)

Updates the specified data quality ruleset.

Request

- **Name** – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the data quality ruleset.

- **Description** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the ruleset.

- **Ruleset** – UTF-8 string, not less than 1 or more than 65536 bytes long.

A Data Quality Definition Language (DQDL) ruleset. For more information, see the Amazon Glue developer guide.

Response

- **Name** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the data quality ruleset.

- **Description** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the ruleset.

- `Ruleset` – UTF-8 string, not less than 1 or more than 65536 bytes long.

A Data Quality Definition Language (DQDL) ruleset. For more information, see the Amazon Glue developer guide.

Errors

- `EntityNotFoundException`
- `AlreadyExistsException`
- `IdempotentParameterMismatchException`
- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`
- `ResourceNumberLimitExceededException`

ListDataQualityStatistics action (Python: `list_data_quality_statistics`)

Retrieves a list of data quality statistics.

Request

- `StatisticId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Statistic ID.

- `ProfileId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Profile ID.

- `TimestampFilter` – A [TimestampFilter](#) object.

A timestamp filter.

- `MaxResults` – Number (integer), not less than 1 or more than 1000.

The maximum number of results to return in this request.

- `NextToken` – UTF-8 string.

A pagination token to request the next page of results.

Response

- `Statistics` – An array of [StatisticSummary](#) objects.

A `StatisticSummaryList`.

- `NextToken` – UTF-8 string.

A pagination token to request the next page of results.

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `InternalServiceException`

TimestampFilter structure

A timestamp filter.

Fields

- `RecordedBefore` – Timestamp.

The timestamp before which statistics should be included in the results.

- `RecordedAfter` – Timestamp.

The timestamp after which statistics should be included in the results.

CreateDataQualityRulesetRequest structure

A request to create a data quality ruleset.

Fields

- **Name** – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique name for the data quality ruleset.

- **Description** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the data quality ruleset.

- **Ruleset** – *Required*: UTF-8 string, not less than 1 or more than 65536 bytes long.

A Data Quality Definition Language (DQDL) ruleset. For more information, see the Amazon Glue developer guide.

- **Tags** – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

A list of tags applied to the data quality ruleset.

- **TargetTable** – A [DataQualityTargetTable](#) object.

A target table associated with the data quality ruleset.

- **RecommendationRunId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique run ID for the recommendation run.

- **DataQualitySecurityConfiguration** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the security configuration created with the data quality encryption option.

- **ClientToken** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Used for idempotency and is recommended to be set to a random ID (such as a UUID) to avoid creating or starting multiple instances of the same resource.

GetDataQualityRulesetResponse structure

Returns the data quality ruleset response.

Fields

- **Name** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the ruleset.

- **Description** – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A description of the ruleset.

- **Ruleset** – UTF-8 string, not less than 1 or more than 65536 bytes long.

A Data Quality Definition Language (DQDL) ruleset. For more information, see the Amazon Glue developer guide.

- **TargetTable** – A [DataQualityTargetTable](#) object.

The name and database name of the target table.

- **CreatedOn** – Timestamp.

A timestamp. The time and date that this data quality ruleset was created.

- **LastModifiedOn** – Timestamp.

A timestamp. The last point in time when this data quality ruleset was modified.

- **RecommendationRunId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

When a ruleset was created from a recommendation run, this run ID is generated to link the two together.

- **DataQualitySecurityConfiguration** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the security configuration created with the data quality encryption option.

GetDataQualityResultResponse structure

The response for the data quality result.

Fields

- `ResultId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A unique result ID for the data quality result.

- `ProfileId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Profile ID for the data quality result.

- `Score` – Number (double), not more than 1.0.

An aggregate data quality score. Represents the ratio of rules that passed to the total number of rules.

- `DataSource` – A [DataSource](#) object.

The table associated with the data quality result, if any.

- `RulesetName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the ruleset associated with the data quality result.

- `EvaluationContext` – UTF-8 string.

In the context of a job in Amazon Glue Studio, each node in the canvas is typically assigned some sort of name and data quality nodes will have names. In the case of multiple nodes, the `evaluationContext` can differentiate the nodes.

- `StartedOn` – Timestamp.

The date and time when the run for this data quality result started.

- `CompletedOn` – Timestamp.

The date and time when the run for this data quality result was completed.

- `JobName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The job name associated with the data quality result, if any.

- `JobRunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The job run ID associated with the data quality result, if any.

- `RulesetEvaluationRunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run ID associated with the ruleset evaluation.

- `RuleResults` – An array of [DataQualityRuleResult](#) objects, not more than 2000 structures.

A list of `DataQualityRuleResult` objects representing the results for each rule.

- `AnalyzerResults` – An array of [DataQualityAnalyzerResult](#) objects, not more than 2000 structures.

A list of `DataQualityAnalyzerResult` objects representing the results for each analyzer.

- `Observations` – An array of [DataQualityObservation](#) objects, not more than 50 structures.

A list of `DataQualityObservation` objects representing the observations generated after evaluating the rules and analyzers.

- `AggregatedMetrics` – A [DataQualityAggregatedMetrics](#) object.

A summary of `DataQualityAggregatedMetrics` objects showing the total counts of processed rows and rules, including their pass/fail statistics based on row-level results.

StartDataQualityRuleRecommendationRunRequest structure

The request of the Data Quality rule recommendation request.

Fields

- `DataSource` – *Required:* A [DataSource](#) object.

The data source (Amazon Glue table) associated with this run.

- `Role` – *Required:* UTF-8 string.

An IAM role supplied to encrypt the results of the run.

- `NumberOfWorkers` – Number (integer).

The number of G.1X workers to be used in the run. The default is 5.

- `Timeout` – Number (integer), at least 1.

The timeout for a run in minutes. This is the maximum time that a run can consume resources before it is terminated and enters TIMEOUT status. The default is 2,880 minutes (48 hours).

- `CreatedRulesetName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A name for the ruleset.

- `DataQualitySecurityConfiguration` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the security configuration created with the data quality encryption option.

- `ClientToken` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Used for idempotency and is recommended to be set to a random ID (such as a UUID) to avoid creating or starting multiple instances of the same resource.

GetDataQualityRuleRecommendationRunResponse structure

The response for the Data Quality rule recommendation run.

Fields

- `RunId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The unique run identifier associated with this run.

- `DataSource` – A [DataSource](#) object.

The data source (an Amazon Glue table) associated with this run.

- `Role` – UTF-8 string.

An IAM role supplied to encrypt the results of the run.

- `NumberOfWorkers` – Number (integer).

The number of G.1X workers to be used in the run. The default is 5.

- `Timeout` – Number (integer), at least 1.

The timeout for a run in minutes. This is the maximum time that a run can consume resources before it is terminated and enters `TIMEOUT` status. The default is 2,880 minutes (48 hours).

- `Status` – UTF-8 string (valid values: `RUNNING` | `FINISHED` | `FAILED` | `PENDING_EXECUTION` | `TIMED_OUT` | `CANCELING` | `CANCELED` | `RECEIVED_BY_TASKRUNNER`).

The status for this run.

- `ErrorMessage` – UTF-8 string.

The error strings that are associated with the run.

- `StartedOn` – Timestamp.

The date and time when this run started.

- `LastModifiedOn` – Timestamp.

A timestamp. The last point in time when this data quality rule recommendation run was modified.

- `CompletedOn` – Timestamp.

The date and time when this run was completed.

- `ExecutionTime` – Number (integer).

The amount of time (in seconds) that the run consumed resources.

- `RecommendedRuleset` – UTF-8 string, not less than 1 or more than 65536 bytes long.

When a start rule recommendation run completes, it creates a recommended ruleset (a set of rules). This member has those rules in Data Quality Definition Language (DQDL) format.

- `CreatedRulesetName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the ruleset that was created by the run.

- `DataQualitySecurityConfiguration` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the security configuration created with the data quality encryption option.

BatchPutDataQualityStatisticAnnotation action (Python: `batch_put_data_quality_statistic_annotation`)

Annotate datapoints over time for a specific data quality statistic. The API requires both `profileID` and `statisticID` as part of the `InclusionAnnotation` input. The API only works for a single `statisticID` across multiple profiles.

Request

- `InclusionAnnotations` – *Required:* An array of [DatapointInclusionAnnotation](#) objects.

A list of `DatapointInclusionAnnotation`'s. The `InclusionAnnotations` must contain a `profileID` and `statisticID`. If there are multiple `InclusionAnnotations`, the list must refer to a single `statisticID` across multiple `profileIDs`.

- `ClientToken` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Client Token.

Response

- `FailedInclusionAnnotations` – An array of [AnnotationError](#) objects.

A list of `AnnotationError`'s.

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `InternalServiceException`
- `ResourceNumberLimitExceededException`

GetDataQualityModel action (Python: `get_data_quality_model`)

Retrieve the training status of the model along with more information (`CompletedOn`, `StartedOn`, `FailureReason`).

Request

- `StatisticId` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Statistic ID.

- `ProfileId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Profile ID.

Response

- `Status` – UTF-8 string (valid values: RUNNING | SUCCEEDED | FAILED).

The training status of the data quality model.

- `StartedOn` – Timestamp.

The timestamp when the data quality model training started.

- `CompletedOn` – Timestamp.

The timestamp when the data quality model training completed.

- `FailureReason` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The training failure reason.

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

GetDataQualityModelResult action (Python: `get_data_quality_model_result`)

Retrieve a statistic's predictions for a given Profile ID.

Request

- `StatisticId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Statistic ID.

- `ProfileId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Profile ID.

Response

- `CompletedOn` – Timestamp.

The timestamp when the data quality model training completed.

- `Model` – An array of [StatisticModelResult](#) objects.

A list of `StatisticModelResult`

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `OperationTimeoutException`
- `InternalServiceException`

ListDataQualityStatisticAnnotations action (Python: `list_data_quality_statistic_annotations`)

Retrieve annotations for a data quality statistic.

Request

- **StatisticId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Statistic ID.

- **ProfileId** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The Profile ID.

- **TimestampFilter** – A [TimestampFilter](#) object.

A timestamp filter.

- **MaxResults** – Number (integer), not less than 1 or more than 1000.

The maximum number of results to return in this request.

- **NextToken** – UTF-8 string.

A pagination token to retrieve the next set of results.

Response

- **Annotations** – An array of [StatisticAnnotation](#) objects.

A list of `StatisticAnnotation` applied to the `Statistic`

- **NextToken** – UTF-8 string.

A pagination token to retrieve the next set of results.

Errors

- `InvalidInputException`
- `InternalServiceException`

PutDataQualityProfileAnnotation action (Python: `put_data_quality_profile_annotation`)

Annotate all datapoints for a Profile.

Request

- `ProfileId` – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of the data quality monitoring profile to annotate.

- `InclusionAnnotation` – *Required*: UTF-8 string (valid values: INCLUDE | EXCLUDE).

The inclusion annotation value to apply to the profile.

Response

- *No Response parameters.*

Errors

- `EntityNotFoundException`
- `InvalidInputException`
- `InternalServiceException`

Sensitive data detection API

The Sensitive data detection API describes the APIs used to detect sensitive data across the columns and rows of your structured data.

Data types

- [CustomEntityType structure](#)

CustomEntityType structure

An object representing a custom pattern for detecting sensitive data across the columns and rows of your structured data.

Fields

- **Name** – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A name for the custom pattern that allows it to be retrieved or deleted later. This name must be unique per Amazon account.

- **RegexString** – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A regular expression string that is used for detecting sensitive data in a custom pattern.

- **ContextWords** – An array of UTF-8 strings, not less than 1 or more than 20 strings.

A list of context words. If none of these context words are found within the vicinity of the regular expression the data will not be detected as sensitive data.

If no context words are passed only a regular expression is checked.

Operations

- [CreateCustomEntityType action \(Python: create_custom_entity_type\)](#)
- [DeleteCustomEntityType action \(Python: delete_custom_entity_type\)](#)
- [GetCustomEntityType action \(Python: get_custom_entity_type\)](#)
- [BatchGetCustomEntityTypes action \(Python: batch_get_custom_entity_types\)](#)
- [ListCustomEntityTypes action \(Python: list_custom_entity_types\)](#)

CreateCustomEntityType action (Python: create_custom_entity_type)

Creates a custom pattern that is used to detect sensitive data across the columns and rows of your structured data.

Each custom pattern you create specifies a regular expression and an optional list of context words. If no context words are passed only a regular expression is checked.

Request

- **Name** – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A name for the custom pattern that allows it to be retrieved or deleted later. This name must be unique per Amazon account.

- **RegexString** – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A regular expression string that is used for detecting sensitive data in a custom pattern.

- **ContextWords** – An array of UTF-8 strings, not less than 1 or more than 20 strings.

A list of context words. If none of these context words are found within the vicinity of the regular expression the data will not be detected as sensitive data.

If no context words are passed only a regular expression is checked.

- **Tags** – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

A list of tags applied to the custom entity type.

Response

- **Name** – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the custom pattern you created.

Errors

- `AccessDeniedException`
- `AlreadyExistsException`

- `IdempotentParameterMismatchException`
- `InternalServiceException`
- `InvalidInputException`
- `OperationTimeoutException`
- `ResourceNumberLimitExceededException`

DeleteCustomEntityType action (Python: `delete_custom_entity_type`)

Deletes a custom pattern by specifying its name.

Request

- Name – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the custom pattern that you want to delete.

Response

- Name – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the custom pattern you deleted.

Errors

- `EntityNotFoundException`
- `AccessDeniedException`
- `InternalServiceException`
- `InvalidInputException`
- `OperationTimeoutException`

GetCustomEntityType action (Python: `get_custom_entity_type`)

Retrieves the details of a custom pattern by specifying its name.

Request

- Name – *Required*: UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the custom pattern that you want to retrieve.

Response

- Name – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the custom pattern that you retrieved.

- `RegexString` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

A regular expression string that is used for detecting sensitive data in a custom pattern.

- `ContextWords` – An array of UTF-8 strings, not less than 1 or more than 20 strings.

A list of context words if specified when you created the custom pattern. If none of these context words are found within the vicinity of the regular expression the data will not be detected as sensitive data.

Errors

- `EntityNotFoundException`
- `AccessDeniedException`
- `InternalServiceException`
- `InvalidInputException`
- `OperationTimeoutException`

BatchGetCustomEntityTypes action (Python: `batch_get_custom_entity_types`)

Retrieves the details for the custom patterns specified by a list of names.

Request

- **Names** – *Required:* An array of UTF-8 strings, not less than 1 or more than 50 strings.

A list of names of the custom patterns that you want to retrieve.

Response

- **CustomEntityTypes** – An array of [CustomEntityType](#) objects.

A list of CustomEntityType objects representing the custom patterns that have been created.

- **CustomEntityTypesNotFound** – An array of UTF-8 strings, not less than 1 or more than 50 strings.

A list of the names of custom patterns that were not found.

Errors

- `InvalidInputException`
- `InternalServerErrorException`
- `OperationTimeoutException`

ListCustomEntityTypes action (Python: `list_custom_entity_types`)

Lists all the custom patterns that have been created.

Request

- **NextToken** – UTF-8 string.

A paginated token to offset the results.

- **MaxResults** – Number (integer), not less than 1 or more than 1000.

The maximum number of results to return.

- **Tags** – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

A list of key-value pair tags.

Response

- CustomEntityTypes – An array of [CustomEntityType](#) objects.

A list of CustomEntityType objects representing custom patterns.

- NextToken – UTF-8 string.

A pagination token, if more results are available.

Errors

- InvalidInputException
- OperationTimeoutException
- InternalServiceException

Tagging APIs in Amazon Glue

Data types

- [Tag structure](#)

Tag structure

The Tag object represents a label that you can assign to an Amazon resource. Each tag consists of a key and an optional value, both of which you define.

For more information about tags, and controlling access to resources in Amazon Glue, see [Amazon Tags in Amazon Glue](#) and [Specifying Amazon Glue Resource ARNs](#) in the developer guide.

Fields

- key – UTF-8 string, not less than 1 or more than 128 bytes long.

The tag key. The key is required when you create a tag on an object. The key is case-sensitive, and must not contain the prefix aws.

- `value` – UTF-8 string, not more than 256 bytes long.

The tag value. The value is optional when you create a tag on an object. The value is case-sensitive, and must not contain the prefix `aws`.

Operations

- [TagResource action \(Python: `tag_resource`\)](#)
- [UntagResource action \(Python: `untag_resource`\)](#)
- [GetTags action \(Python: `get_tags`\)](#)

TagResource action (Python: `tag_resource`)

Adds tags to a resource. A tag is a label you can assign to an Amazon resource. In Amazon Glue, you can tag only certain resources. For information about what resources you can tag, see [Amazon Tags in Amazon Glue](#).

In addition to the tagging permissions to call tag related APIs, you also need the `glue:GetConnection` permission to call tagging APIs on connections, and the `glue:GetDatabase` permission to call tagging APIs on databases.

Request

- `ResourceArn` – *Required:* UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The ARN of the Amazon Glue resource to which to add the tags. For more information about Amazon Glue resource ARNs, see the [Amazon Glue ARN string pattern](#).

- `TagsToAdd` – *Required:* A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

Tags to add to this resource.

Response

- *No Response parameters.*

Errors

- `ResourceNotFoundException`

UntagResource action (Python: `untag_resource`)

Removes the specified tags from an integration resource.

Request

- `ResourceArn` – *Required:* UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) for the integration resource.

- `TagsToRemove` – *Required:* An array of UTF-8 strings, not more than 50 strings.

A list of metadata tags to be removed from the resource.

Response

- *No Response parameters.*

Errors

- `ResourceNotFoundException`

GetTags action (Python: `get_tags`)

Retrieves a list of tags associated with a resource.

Request

- `ResourceArn` – *Required:* UTF-8 string, not less than 1 or more than 10240 bytes long, matching the [Custom string pattern #50](#).

The Amazon Resource Name (ARN) of the resource for which to retrieve tags.

Response

- **Tags** – A map array of key-value pairs, not more than 50 pairs.

Each key is a UTF-8 string, not less than 1 or more than 128 bytes long.

Each value is a UTF-8 string, not more than 256 bytes long.

The requested tags.

Errors

- `InvalidInputException`
- `InternalServiceException`
- `OperationTimeoutException`
- `EntityNotFoundException`

Common data types

The Common data types describes miscellaneous common data types in Amazon Glue.

Tag structure

The Tag object represents a label that you can assign to an Amazon resource. Each tag consists of a key and an optional value, both of which you define.

For more information about tags, and controlling access to resources in Amazon Glue, see [Amazon Tags in Amazon Glue](#) and [Specifying Amazon Glue Resource ARNs](#) in the developer guide.

Fields

- **key** – UTF-8 string, not less than 1 or more than 128 bytes long.

The tag key. The key is required when you create a tag on an object. The key is case-sensitive, and must not contain the prefix `aws`.

- **value** – UTF-8 string, not more than 256 bytes long.

The tag value. The value is optional when you create a tag on an object. The value is case-sensitive, and must not contain the prefix aws.

DecimalNumber structure

Contains a numeric value in decimal format.

Fields

- `UnscaledValue` – *Required:* Blob.

The unscaled numeric value.

- `Scale` – *Required:* Number (integer).

The scale that determines where the decimal point falls in the unscaled value.

ErrorDetail structure

Contains details about an error.

Fields

- `ErrorCode` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The code associated with this error.

- `ErrorMessage` – Description string, not more than 2048 bytes long, matching the [URI address multi-line string pattern](#).

A message describing the error.

PropertyPredicate structure

Defines a property predicate.

Fields

- `Key` – Value string, not less than 1 or more than 1024 bytes long.

The key of the property.

- `Value` – Value string, not less than 1 or more than 1024 bytes long.

The value of the property.

- `Comparator` – UTF-8 string (valid values: `EQUALS` | `GREATER_THAN` | `LESS_THAN` | `GREATER_THAN_EQUALS` | `LESS_THAN_EQUALS`).

The comparator used to compare this property to others.

ResourceUri structure

The URIs for function resources.

Fields

- `ResourceType` – UTF-8 string (valid values: `JAR` | `FILE` | `ARCHIVE`).

The type of the resource.

- `Uri` – Uniform resource identifier (uri), not less than 1 or more than 1024 bytes long, matching the [URI address multi-line string pattern](#).

The URI for accessing the resource.

ColumnStatistics structure

Represents the generated column-level statistics for a table or partition.

Fields

- `ColumnName` – *Required:* UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

Name of column which statistics belong to.

- `ColumnType` – *Required:* Type name, not more than 20000 bytes long, matching the [Single-line string pattern](#).

The data type of the column.

- `AnalyzedTime` – *Required:* Timestamp.

The timestamp of when column statistics were generated.

- `StatisticsData` – *Required:* A [ColumnStatisticsData](#) object.

A `ColumnStatisticData` object that contains the statistics data values.

ColumnStatisticsError structure

Encapsulates a `ColumnStatistics` object that failed and the reason for failure.

Fields

- `ColumnStatistics` – A [ColumnStatistics](#) object.

The `ColumnStatistics` of the column.

- `Error` – An [ErrorDetail](#) object.

An error message with the reason for the failure of an operation.

ColumnError structure

Encapsulates a column name that failed and the reason for failure.

Fields

- `ColumnName` – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The name of the column that failed.

- `Error` – An [ErrorDetail](#) object.

An error message with the reason for the failure of an operation.

ColumnStatisticsData structure

Contains the individual types of column statistics data. Only one data object should be set and indicated by the `Type` attribute.

Fields

- **Type** – *Required:* UTF-8 string (valid values: BOOLEAN | DATE | DECIMAL | DOUBLE | LONG | STRING | BINARY).

The type of column statistics data.

- **BooleanColumnStatisticsData** – A [BooleanColumnStatisticsData](#) object.

Boolean column statistics data.

- **DateColumnStatisticsData** – A [DateColumnStatisticsData](#) object.

Date column statistics data.

- **DecimalColumnStatisticsData** – A [DecimalColumnStatisticsData](#) object.

Decimal column statistics data. **UnscaledValues** within are Base64-encoded binary objects storing big-endian, two's complement representations of the decimal's unscaled value.

- **DoubleColumnStatisticsData** – A [DoubleColumnStatisticsData](#) object.

Double column statistics data.

- **LongColumnStatisticsData** – A [LongColumnStatisticsData](#) object.

Long column statistics data.

- **StringColumnStatisticsData** – A [StringColumnStatisticsData](#) object.

String column statistics data.

- **BinaryColumnStatisticsData** – A [BinaryColumnStatisticsData](#) object.

Binary column statistics data.

BooleanColumnStatisticsData structure

Defines column statistics supported for Boolean data columns.

Fields

- **NumberOfTrues** – *Required:* Number (long), not more than None.

The number of true values in the column.

- **NumberOfFalses** – *Required:* Number (long), not more than None.

The number of false values in the column.

- `NumberOfNulls` – *Required:* Number (long), not more than None.

The number of null values in the column.

DateColumnStatisticsData structure

Defines column statistics supported for timestamp data columns.

Fields

- `MinimumValue` – Timestamp.

The lowest value in the column.

- `MaximumValue` – Timestamp.

The highest value in the column.

- `NumberOfNulls` – *Required:* Number (long), not more than None.

The number of null values in the column.

- `NumberOfDistinctValues` – *Required:* Number (long), not more than None.

The number of distinct values in a column.

DecimalColumnStatisticsData structure

Defines column statistics supported for fixed-point number data columns.

Fields

- `MinimumValue` – A [DecimalNumber](#) object.

The lowest value in the column.

- `MaximumValue` – A [DecimalNumber](#) object.

The highest value in the column.

- `NumberOfNulls` – *Required:* Number (long), not more than None.

The number of null values in the column.

- `NumberOfDistinctValues` – *Required:* Number (long), not more than None.

The number of distinct values in a column.

DoubleColumnStatisticsData structure

Defines column statistics supported for floating-point number data columns.

Fields

- `MinimumValue` – Number (double).

The lowest value in the column.

- `MaximumValue` – Number (double).

The highest value in the column.

- `NumberOfNulls` – *Required:* Number (long), not more than None.

The number of null values in the column.

- `NumberOfDistinctValues` – *Required:* Number (long), not more than None.

The number of distinct values in a column.

LongColumnStatisticsData structure

Defines column statistics supported for integer data columns.

Fields

- `MinimumValue` – Number (long).

The lowest value in the column.

- `MaximumValue` – Number (long).

The highest value in the column.

- `NumberOfNulls` – *Required:* Number (long), not more than None.

The number of null values in the column.

- `NumberOfDistinctValues` – *Required:* Number (long), not more than None.

The number of distinct values in a column.

StringColumnStatisticsData structure

Defines column statistics supported for character sequence data values.

Fields

- `MaxLength` – *Required:* Number (long), not more than None.

The size of the longest string in the column.

- `AverageLength` – *Required:* Number (double), not more than None.

The average string length in the column.

- `NumberOfNulls` – *Required:* Number (long), not more than None.

The number of null values in the column.

- `NumberOfDistinctValues` – *Required:* Number (long), not more than None.

The number of distinct values in a column.

BinaryColumnStatisticsData structure

Defines column statistics supported for bit sequence data values.

Fields

- `MaxLength` – *Required:* Number (long), not more than None.

The size of the longest bit sequence in the column.

- `AverageLength` – *Required:* Number (double), not more than None.

The average bit sequence length in the column.

- `NumberOfNulls` – *Required:* Number (long), not more than None.

The number of null values in the column.

String patterns

The API uses the following regular expressions to define what is valid content for various string parameters and members:

- Single-line string pattern – "[\u0020-\u007F\u00E0\u0000-\u00FF\u0080\u00DC\u0000-\u00DBFF\u00DFFF\t]*"
- URI address multi-line string pattern – "[\u0020-\u007F\u00E0\u0000-\u00FF\u0080\u00DC\u0000-\u00DBFF\u00DFFF\r\n\t]*"
- A Logstash Grok string pattern – "[\u0020-\u007F\u00E0\u0000-\u00FF\u0080\u00DC\u0000-\u00DBFF\u00DFFF\r\t]*"
- Identifier string pattern – "[A-Za-z_][A-Za-z0-9_]*"
- AWS IAM ARN string pattern – "arn:aws:iam::\d{12}:role/.*"
 - Version string pattern – "^[a-zA-Z0-9-_.]+\$"
 - Log group string pattern – "[\.\-_/#A-Za-z0-9]+"
 - Log-stream string pattern – "[^:]*"
 - Custom string pattern #10 – "[a-zA-Z0-9-_.]+"
 - Custom string pattern #11 – "[-a-zA-Z0-9+="/:_.]*"
 - Custom string pattern #12 – "[\S\s]*"
 - Custom string pattern #13 – ".*\S.*"
 - Custom string pattern #14 – "[a-zA-Z0-9-=_./@]+"
 - Custom string pattern #15 – "[1-9][0-9]*|[1-9][0-9]*-[1-9][0-9]*"
 - Custom string pattern #16 – "[A-Z][A-Za-z\.\-]+"
 - Custom string pattern #17 – "[\S]*"
 - Custom string pattern #18 – "[\w]*"
 - Custom string pattern #19 – "arn:aws[a-zA-Z-]*:iam::\d{12}:role/?[a-zA-Z0-9+/,.\-_/]+"
 - Custom string pattern #20 – "subnet-[a-z0-9]+"

- Custom string pattern #21 – `"\d{12}"`
- Custom string pattern #22 – `"([a-z]+)-([a-z]+-)?([a-z]+)-[0-9]+[a-z]+"`
- Custom string pattern #23 – `"[a-zA-Z0-9.-]+"`
- Custom string pattern #24 – `"arn:aws[a-z0-9\-\-]*:lambda:[a-z0-9\-\-]:\d{12}:function:([\w\-\-]{1,64})"`
- Custom string pattern #25 – `"^(?!([.*[\.\\/\-\-]|aws:))).*$"`
- Custom string pattern #26 – `"^\x{1}\n"`
- Custom string pattern #27 – `"^\w+\.\w+\.\w+$"`
- Custom string pattern #28 – `"^\w+\.\w+$"`
- Custom string pattern #29 – `"^$|arn:aws[a-z0-9-]*:kms:.*"`
- Custom string pattern #30 – `"arn:aws[^:]*:iam::[0-9]*:role/.*"`
- Custom string pattern #31 – `"[\.\-_A-Za-z0-9]+"`
- Custom string pattern #32 – `"^s3://([^\s/]+)/([^\s/]+)*([^\s/]+)$"`
- Custom string pattern #33 – `".*"`
- Custom string pattern #34 – `"^(Sun|Mon|Tue|Wed|Thu|Fri|Sat):([01]?[0-9]|2[0-3])$"`
- Custom string pattern #35 – `"[a-zA-Z0-9_.-]+"`
- Custom string pattern #36 – `"^arn:aws(-(cn|us-gov|eusc|iso(-[bef]))?)?:secretsmanager:.*$"`
- Custom string pattern #37 – `"\S+"`
- Custom string pattern #38 – `"^\x20-\x7E*$"`
- Custom string pattern #39 – `"^([a-zA-Z0-9_=\-]+)\.([a-zA-Z0-9_=\-]+)\.([a-zA-Z0-9_-\+\/=]*)"`
- Custom string pattern #40 – `"^(https?):\/\/[-a-zA-Z0-9+&@#/%?~_!|:,.;]*[-a-zA-Z0-9+&@#/%?~_]"`
- Custom string pattern #41 – `"^(https?):\V\/[^\s/$.?\#].[\^\s]*$"`
- Custom string pattern #42 – `"arn:aws:kms:.*"`
- Custom string pattern #43 – `"^subnet-[a-z0-9]+$"`
- Custom string pattern #44 – `"[\p{L}\p{N}\p{P}]*"`

- Custom string pattern #45 – "[a-f0-9]{8}-[a-f0-9]{4}-[a-f0-9]{4}-[a-f0-9]{4}-[a-f0-9]{12}"
- Custom string pattern #46 – "[a-zA-Z0-9-_\$#.]+"
- Custom string pattern #47 – "^\\d{12}\$"
- Custom string pattern #48 – "^(\\w+\\.)+\\w+\$"
- Custom string pattern #49 – "^([2-3] | 3 [.] 9)\$"
- Custom string pattern #50 – "arn:aws(-(cn|us-gov|eusc|iso(-[bef]))?)?:glue:.*"
- Custom string pattern #51 – "[0-9a-fA-F]{8}-[0-9a-fA-F]{4}-[0-9a-fA-F]{4}-[0-9a-fA-F]{4}-[0-9a-fA-F]{12}"
- Custom string pattern #52 – "(^arn:aws(-(cn|us-gov|eusc|iso(-[bef]))?)?:iam: : \\w{12}:root)"
- Custom string pattern #53 – "^arn:aws(-(cn|us-gov|eusc|iso(-[bef]))?)?:iam: : [0-9]{12}:role/.+"
- Custom string pattern #54 – "[\\s\\S]*"
- Custom string pattern #55 – "([\\u0020-\\uD7FF\\uE000-\\uFFFF\\uD800\\uDC00-\\uDBFF \\uDFFF]| [^\\S\\r\\n"' = ;])*"
- Custom string pattern #56 – "^ [A-Z_]+ \$"
- Custom string pattern #57 – "^ [A-Za-z0-9]+ \$"
- Custom string pattern #58 – "[*A-Za-z0-9_-]*"
- Custom string pattern #59 – "([\\u0020-\\u007E\\r\\s\\n])*"
- Custom string pattern #60 – "[A-Za-z0-9_-]*"
- Custom string pattern #61 – "([\\u0009\\u000B\\u000C\\u0020-\\uD7FF\\uE000-\\uFFFF \\uD800\\uDC00-\\uDBFF\\uDFFF])*"
- Custom string pattern #62 – "([\\u0020-\\uD7FF\\uE000-\\uFFFF\\uD800\\uDC00-\\uDBFF \\uDFFF\\s])*"
- Custom string pattern #63 – "([\\^\\r\\n])*"

Exceptions

This section describes Amazon Glue exceptions that you can use to find the source of problems and fix them. For more information on HTTP error codes and strings for exceptions related to machine learning, see [the section called "Amazon Glue machine learning exceptions"](#).

AccessDeniedException structure

Access to a resource was denied.

Fields

- Message – UTF-8 string.

A message describing the problem.

AlreadyExistsException structure

A resource to be created or added already exists.

Fields

- Message – UTF-8 string.

A message describing the problem.

ConcurrentModificationException structure

Two processes are trying to modify a resource simultaneously.

Fields

- Message – UTF-8 string.

A message describing the problem.

ConcurrentRunsExceededException structure

Too many jobs are being run concurrently.

Fields

- Message – UTF-8 string.

A message describing the problem.

CrawlerNotRunningException structure

The specified crawler is not running.

Fields

- Message – UTF-8 string.
A message describing the problem.

CrawlerRunningException structure

The operation cannot be performed because the crawler is already running.

Fields

- Message – UTF-8 string.
A message describing the problem.

CrawlerStoppingException structure

The specified crawler is stopping.

Fields

- Message – UTF-8 string.
A message describing the problem.

EntityNotFoundException structure

A specified entity does not exist

Fields

- Message – UTF-8 string.
A message describing the problem.
- FromFederationSource – Boolean.

Indicates whether or not the exception relates to a federated source.

FederationSourceException structure

A federation source failed.

Fields

- FederationSourceErrorCode – UTF-8 string (valid values: AccessDeniedException | EntityNotFoundException | InvalidCredentialsException | InvalidInputException | InvalidResponseException | OperationTimeoutException | OperationNotSupportedException | InternalServiceException | PartialFailureException | ThrottlingException).

The error code of the problem.

- Message – UTF-8 string.

The message describing the problem.

FederationSourceRetryableException structure

A federation source failed, but the operation may be retried.

Fields

- Message – UTF-8 string.

A message describing the problem.

GlueEncryptionException structure

An encryption operation failed.

Fields

- Message – UTF-8 string.

The message describing the problem.

IdempotentParameterMismatchException structure

The same unique identifier was associated with two different records.

Fields

- Message – UTF-8 string.

A message describing the problem.

IllegalWorkflowStateException structure

The workflow is in an invalid state to perform a requested operation.

Fields

- Message – UTF-8 string.

A message describing the problem.

InternalServiceException structure

An internal service error occurred.

Fields

- Message – UTF-8 string.

A message describing the problem.

InvalidExecutionEngineException structure

An unknown or invalid execution engine was specified.

Fields

- message – UTF-8 string.

A message describing the problem.

InvalidInputException structure

The input provided was not valid.

Fields

- Message – UTF-8 string.

A message describing the problem.

- FromFederationSource – Boolean.

Indicates whether or not the exception relates to a federated source.

InvalidStateException structure

An error that indicates your data is in an invalid state.

Fields

- Message – UTF-8 string.

A message describing the problem.

InvalidTaskStatusTransitionException structure

Proper transition from one task to the next failed.

Fields

- message – UTF-8 string.

A message describing the problem.

JobDefinitionErrorException structure

A job definition is not valid.

Fields

- message – UTF-8 string.

A message describing the problem.

JobRunInTerminalStateException structure

The terminal state of a job run signals a failure.

Fields

- message – UTF-8 string.

A message describing the problem.

JobRunInvalidStateTransitionException structure

A job run encountered an invalid transition from source state to target state.

Fields

- jobRunId – UTF-8 string, not less than 1 or more than 255 bytes long, matching the [Single-line string pattern](#).

The ID of the job run in question.

- message – UTF-8 string.

A message describing the problem.

- sourceState – UTF-8 string (valid values: STARTING | RUNNING | STOPPING | STOPPED | SUCCEEDED | FAILED | TIMEOUT | ERROR | WAITING | EXPIRED).

The source state.

- targetState – UTF-8 string (valid values: STARTING | RUNNING | STOPPING | STOPPED | SUCCEEDED | FAILED | TIMEOUT | ERROR | WAITING | EXPIRED).

The target state.

JobRunNotInTerminalStateException structure

A job run is not in a terminal state.

Fields

- message – UTF-8 string.

A message describing the problem.

LateRunnerException structure

A job runner is late.

Fields

- Message – UTF-8 string.

A message describing the problem.

NoScheduleException structure

There is no applicable schedule.

Fields

- Message – UTF-8 string.

A message describing the problem.

OperationTimeoutException structure

The operation timed out.

Fields

- Message – UTF-8 string.

A message describing the problem.

ResourceNotReadyException structure

A resource was not ready for a transaction.

Fields

- Message – UTF-8 string.

A message describing the problem.

ResourceNumberLimitExceededException structure

A resource numerical limit was exceeded.

Fields

- Message – UTF-8 string.

A message describing the problem.

SchedulerNotRunningException structure

The specified scheduler is not running.

Fields

- Message – UTF-8 string.

A message describing the problem.

SchedulerRunningException structure

The specified scheduler is already running.

Fields

- Message – UTF-8 string.

A message describing the problem.

SchedulerTransitioningException structure

The specified scheduler is transitioning.

Fields

- Message – UTF-8 string.

A message describing the problem.

UnrecognizedRunnerException structure

The job runner was not recognized.

Fields

- Message – UTF-8 string.

A message describing the problem.

ValidationException structure

A value could not be validated.

Fields

- Message – UTF-8 string.

A message describing the problem.

VersionMismatchException structure

There was a version conflict.

Fields

- message – UTF-8 string.

A message describing the problem.

Amazon Glue API code examples using Amazon SDKs

The following code examples show how to use Amazon Glue with an Amazon software development kit (SDK).

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

For a complete list of Amazon SDK developer guides and code examples, see [Using this service with an Amazon SDK](#). This topic also includes information about getting started and details about previous SDK versions.

Hello Amazon Glue

The following code examples show how to get started using Amazon Glue.

.NET

Amazon SDK for .NET

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [Amazon Code Examples Repository](#).

```
namespace GlueActions;

public class HelloGlue
{
    private static ILogger logger = null!;

    static async Task Main(string[] args)
    {
        // Set up dependency injection for AWS Glue.
        using var host = Host.CreateDefaultBuilder(args)
            .ConfigureLogging(logging =>
                logging.AddFilter("System", LogLevel.Debug)
                    .AddFilter<DebugLoggerProvider>("Microsoft",
                        LogLevel.Information)
                    .AddFilter<ConsoleLoggerProvider>("Microsoft",
                        LogLevel.Trace))
            .ConfigureServices((_, services) =>
                services.AddAWSService<IAmazonGlue>()
                    .AddTransient<GlueWrapper>()
            )
            .Build();

        logger = LoggerFactory.Create(builder => { builder.AddConsole(); })
            .CreateLogger<HelloGlue>();

For a complete list of Amazon SDK developer guides and code examples, see [Using this service with an Amazon SDK](#). This topic also includes information about getting started and details about previous SDK versions.

Learn the basics of Amazon Glue with an Amazon SDK

The following code examples show how to:

- Create a crawler that crawls a public Amazon S3 bucket and generates a database of CSV-formatted metadata.
- List information about databases and tables in your Amazon Glue Data Catalog.
- Create a job to extract CSV data from the S3 bucket, transform the data, and load JSON-formatted output into another S3 bucket.
- List information about job runs, view transformed data, and clean up resources.

For more information, see [Tutorial: Getting started with Amazon Glue Studio](#).

.NET

Amazon SDK for .NET

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [Amazon Code Examples Repository](#).

Create a class that wraps Amazon Glue functions that are used in the scenario.

```
using System.Net;
```

```
namespace GlueActions;

public class GlueWrapper
{
    private readonly IAmazonGlue _amazonGlue;

    /// <summary>
    /// Constructor for the AWS Glue actions wrapper.
    /// </summary>
    /// <param name="amazonGlue"></param>
    public GlueWrapper(IAmazonGlue amazonGlue)
    {
        _amazonGlue = amazonGlue;
    }

    /// <summary>
    /// Create an AWS Glue crawler.
    /// </summary>
    /// <param name="crawlerName">The name for the crawler.</param>
    /// <param name="crawlerDescription">A description of the crawler.</param>
    /// <param name="role">The AWS Identity and Access Management (IAM) role to
    /// be assumed by the crawler.</param>
    /// <param name="schedule">The schedule on which the crawler will be
    executed.</param>
    /// <param name="s3Path">The path to the Amazon Simple Storage Service
    (Amazon S3)
    /// bucket where the Python script has been stored.</param>
    /// <param name="dbName">The name to use for the database that will be
    /// created by the crawler.</param>
    /// <returns>A Boolean value indicating the success of the action.</returns>
    public async Task<bool> CreateCrawlerAsync(
        string crawlerName,
        string crawlerDescription,
        string role,
        string schedule,
        string s3Path,
        string dbName)
    {
        var s3Target = new S3Target
        {
            Path = s3Path,
        };

        var targetList = new List<S3Target>
```

```
        {
            s3Target,
        };

        var targets = new CrawlerTargets
        {
            S3Targets = targetList,
        };

        var crawlerRequest = new CreateCrawlerRequest

Java

SDK for Java 2.x

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [Amazon Code Examples Repository](#).

```
/**
 * Before running this Java V2 code example, set up your development
 * environment, including your credentials.
 * <p>
 * For more information, see the following documentation topic:
 *
 * https://docs.aws.amazon.com/sdk-for-java/latest/developer-guide/get-started.html
 *
 * To set up the resources, see this documentation topic:
 *
 * https://docs.aws.amazon.com/glue/latest/ug/tutorial-add-crawler.html
 *
 * This example performs the following tasks:
 *
 * 1. Create a database.
 * 2. Create a crawler.
```

```
* 3. Get a crawler.
* 4. Start a crawler.
* 5. Get a database.
* 6. Get tables.
* 7. Create a job.
* 8. Start a job run.
* 9. List all jobs.
* 10. Get job runs.
* 11. Delete a job.
* 12. Delete a database.
* 13. Delete a crawler.
*/

    AWS Glue is a fully managed extract, transform, and load (ETL)
service provided by Amazon
    Web Services (AWS). It is designed to simplify the process of
building, running, and maintaining
    ETL pipelines, which are essential for data integration and data
warehousing tasks.

    One of the key features of AWS Glue is its ability to automatically
discover and catalog data
    stored in various sources, such as Amazon S3, Amazon RDS, Amazon
Redshift, and other databases.
    This cataloging process creates a central metadata repository, known
as the AWS Glue Data Catalog,
    which provides a unified view of an organization's data assets. This
metadata can then be used to
    create ETL jobs, which can be scheduled and run on-demand or on a
regular basis.

    Lets get started.

JavaScript

SDK for JavaScript (v3)

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [Amazon Code Examples Repository](#).

Create and run a crawler that crawls a public Amazon Simple Storage Service (Amazon S3) bucket and generates a metadata database that describes the CSV-formatted data it finds.

```
const createCrawler = (name, role, dbName, tablePrefix, s3TargetPath) => {
  const client = new GlueClient({});

  const command = new CreateCrawlerCommand({
    Name: name,
    Role: role,
    DatabaseName: dbName,
    TablePrefix: tablePrefix,
    Targets: {
      S3Targets: [{ Path: s3TargetPath }],
    },
  },
```

```
});

return client.send(command);
};

const getCrawler = (name) => {
  const client = new GlueClient({});

  const command = new GetCrawlerCommand({
    Name: name,
  });

  return client.send(command);
};

const startCrawler = (name) => {
  const client = new GlueClient({});

  const command = new StartCrawlerCommand({
    Name: name,
  });

  return client.send(command);
};

const crawlerExists = async ({ getCrawler }, crawlerName) => {
  try {
    await getCrawler(crawlerName);
    return true;
  } catch {
    return false;
  }
};

/**
 * @param {{ createCrawler: import('../actions/create-crawler.js').createCrawler }} actions
 */

Ruby

SDK for Ruby

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [Amazon Code Examples Repository](#).

Create a class that wraps Amazon Glue functions used in the scenario.

```
# The `GlueWrapper` class serves as a wrapper around the AWS Glue API, providing
a simplified interface for common operations.
# It encapsulates the functionality of the AWS SDK for Glue and provides methods
for interacting with Glue crawlers, databases, tables, jobs, and S3 resources.
# The class initializes with a Glue client and a logger, allowing it to make API
calls and log any errors or informational messages.
class GlueWrapper
  def initialize(glue_client, logger)
    @glue_client = glue_client
    @logger = logger
  end

  # Retrieves information about a specific crawler.
  #
  # @param name [String] The name of the crawler to retrieve information about.

Rust

SDK for Rust

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [Amazon Code Examples Repository](#).

Create and run a crawler that crawls a public Amazon Simple Storage Service (Amazon S3) bucket and generates a metadata database that describes the CSV-formatted data it finds.

```
let create_crawler = glue
    .create_crawler()
    .name(self.crawler())
    .database_name(self.database())
    .role(self.iam_role.expose_secret())
    .targets(
        CrawlerTargets::builder()
            .s3_targets(S3Target::builder().path(CRAWLER_TARGET).build())
            .build(),
    )
    .send()
    .await;

match create_crawler {
    Err(err) => {
        let glue_err: aws_sdk_glue::Error = err.into();
        match glue_err {
            aws_sdk_glue::Error::AlreadyExistsException(_) => {
                info!("Using existing crawler");
                Ok(())
            }
            _ => Err(GlueMvpError::GlueSdk(glue_err)),
        }
    }
    Ok(_) => Ok(()),
};

let start_crawler =
glue.start_crawler().name(self.crawler()).send().await;
```

```

match start_crawler {
  Ok(_) => Ok(()),
  Err(err) => {
    let glue_err: aws_sdk_glue::Error = err.into();
    match glue_err {
      aws_sdk_glue::Error::CrawlerRunningException(_) => Ok(()),
      _ => Err(GlueMvpError::GlueSdk(glue_err)),
    }
  }
}
}??;

```

List information about databases and tables in your Amazon Glue Data Catalog.

```

let database = glue
  .get_database()
  .name(self.database())
  .send()
  .await
  .map_err(GlueMvpError::from_glue_sdk)?
  .to_owned();
let database = database
  .database()
  .ok_or_else(|| GlueMvpError::Unknown("Could not find
database".into()))?;

let tables = glue
  .get_tables()
  .database_name(self.database())
  .send()
  .await
  .map_err(GlueMvpError::from_glue_sdk)?;

let tables = tables.table_list();

```

Create and run a job that extracts CSV data from the source Amazon S3 bucket, transforms it by removing and renaming fields, and loads JSON-formatted output into another Amazon S3 bucket.

```

let create_job = glue
  .create_job()

```

```

        .name(self.job())
        .role(self.iam_role.expose_secret())
        .command(
            JobCommand::builder()
                .name("glueetl")
                .python_version("3")
                .script_location(format!("s3://{}/job.py", self.bucket()))
                .build(),
        )
        .glue_version("3.0")
        .send()
        .await
        .map_err(GlueMvpError::from_glue_sdk)?;

    let job_name = create_job.name().ok_or_else(|| {
        GlueMvpError::Unknown("Did not get job name after creating
job".into())
    })?;

    let job_run_output = glue
        .start_job_run()
        .job_name(self.job())
        .arguments("--input_database", self.database())
        .arguments(
            "--input_table",
            self.tables
                .first()
                .ok_or_else(|| GlueMvpError::Unknown("Missing crawler
table".into()))?
                .name(),
        )
        .arguments("--output_bucket_url", self.bucket())
        .send()
        .await
        .map_err(GlueMvpError::from_glue_sdk)?;

    let job = job_run_output
        .job_run_id()
        .ok_or_else(|| GlueMvpError::Unknown("Missing run id from just
started job".into()))?
        .to_string();

```

Delete all resources created by the demo.

```
    glue.delete_job()
        .job_name(self.job())
        .send()
        .await
        .map_err(GlueMvpError::from_glue_sdk)?;

    for t in &self.tables {
        glue.delete_table()
            .name(t.name())
            .database_name(self.database())
            .send()
            .await
            .map_err(GlueMvpError::from_glue_sdk)?;
    }

    glue.delete_database()
        .name(self.database())
        .send()
        .await
        .map_err(GlueMvpError::from_glue_sdk)?;

    glue.delete_crawler()
        .name(self.crawler())

]
)

```

The Swift code file, entry.swift.

```

// An example that shows how to use the AWS SDK for Swift to demonstrate
// creating and using crawlers and jobs using AWS Glue.
//
// 0. Upload the Python job script to Amazon S3 so it can be used when
//    calling `startJobRun()` later.
// 1. Create a crawler, pass it the IAM role and the URL of the public Amazon
//    S3 bucket that contains the source data:
//    s3://crawler-public-us-east-1/flight/2016/csv.
// 2. Start the crawler. This takes time, so after starting it, use a loop
//    that calls `getCrawler()` until the state is "READY".
// 3. Get the database created by the crawler, and the tables in the
//    database. Display them to the user.
// 4. Create a job. Pass it the IAM role and the URL to a Python ETL script
//    previously uploaded to the user's S3 bucket.
// 5. Start a job run, passing the following custom arguments. These are
//    expected by the ETL script, so must exactly match.

```

```
// * `--input_database: <name of the database created by the crawler>`
// * `--input_table: <name of the table created by the crawler>`
// * `--output_bucket_url: <URL to the scaffold bucket created for the
//   user>`
// 6. Loop and get the job run until it returns one of the following states:
//   "SUCCEEDED", "STOPPED", "FAILED", or "TIMEOUT".
// 7. Output data is stored in a group of files in the user's S3 bucket.
//   Either direct the user to their location or download a file and display
//   the results inline.
// 8. List the jobs for the user's account.
// 9. Get job run details for a job run.
// 10. Delete the demo job.
// 11. Delete the database and tables created by the example.
// 12. Delete the crawler created by the example.

Actions for Amazon Glue using Amazon SDKs

The following code examples demonstrate how to perform individual Amazon Glue actions with Amazon SDKs. Each example includes a link to GitHub, where you can find instructions for setting up and running the code.

The following examples include only the most commonly used actions. For a complete list, see the [Amazon Glue API Reference](#).

Examples

- [Use CreateCrawler with an Amazon SDK](#)
- [Use CreateJob with an Amazon SDK or CLI](#)
- [Use DeleteCrawler with an Amazon SDK](#)
- [Use DeleteDatabase with an Amazon SDK](#)
- [Use DeleteJob with an Amazon SDK or CLI](#)
- [Use DeleteTable with an Amazon SDK](#)
- [Use GetCrawler with an Amazon SDK](#)
- [Use GetDatabase with an Amazon SDK](#)
- [Use GetDatabases with an Amazon SDK or CLI](#)
- [Use GetJob with an Amazon SDK or CLI](#)
- [Use GetJobRun with an Amazon SDK or CLI](#)
- [Use GetJobRuns with an Amazon SDK or CLI](#)
- [Use GetTables with an Amazon SDK or CLI](#)
- [Use ListJobs with an Amazon SDK](#)
- [Use StartCrawler with an Amazon SDK or CLI](#)
- [Use StartJobRun with an Amazon SDK or CLI](#)

Use CreateCrawler with an Amazon SDK

The following code examples show how to use CreateCrawler.

Action examples are code excerpts from larger programs and must be run in context. You can see this action in context in the following code example:

CLI

Amazon CLI

To create a job to transform data

The following create-job example creates a streaming job that runs a script stored in S3.

```

aws glue create-job \
  --name my-testing-job \
  --role AWSGlueServiceRoleDefault \
  --command '{ \
    "Name": "gluestreaming", \
    "ScriptLocation": "s3://amzn-s3-demo-bucket/folder/" \
  }' \
  --region us-east-1 \
  --output json \
  --default-arguments '{ \
    "--job-language": "scala", \
    "--class": "GlueApp" \
  }' \
  --profile my-profile \
  --endpoint https://glue.us-east-1.amazonaws.com

```

Contents of test_script.scala:

```
import com.amazonaws.services.glue.ChoiceOption
import com.amazonaws.services.glue.GlueContext
import com.amazonaws.services.glue.MappingSpec
import com.amazonaws.services.glue.ResolveSpec
import com.amazonaws.services.glue.errors.CallSite
import com.amazonaws.services.glue.util.GlueArgParser
import com.amazonaws.services.glue.util.Job
import com.amazonaws.services.glue.util.JsonOptions
import org.apache.spark.SparkContext
import scala.collection.JavaConverters._

object GlueApp {
  def main(sysArgs: Array[String]) {
    val spark: SparkContext = new SparkContext()
    val glueContext: GlueContext = new GlueContext(spark)
    // @params: [JOB_NAME]
    val args = GlueArgParser.getResolvedOptions(sysArgs,
Seq("JOB_NAME").toArray)
    Job.init(args("JOB_NAME"), glueContext, args.asJava)
    // @type: DataSource
    // @args: [database = "tempdb", table_name = "s3-source",
transformation_ctx = "datasource0"]
    // @return: datasource0

PowerShell

Tools for PowerShell V4

Example 1: This example creates a new job in Amazon Glue. The command name value is always `glueetl`. Amazon Glue supports running job scripts written in Python or Scala. In this example, the job script (`MyTestGlueJob.py`) is written in Python. Python parameters are specified in the `$DefArgs` variable, and then passed to the PowerShell command in the `DefaultArguments` parameter, which accepts a hashtable. The parameters in the `$JobParams` variable come from the `CreateJob` API, documented in the [Jobs](https://docs.aws.amazon.com/glue/latest/dg/aws-glue-api-jobs-job.html) (<https://docs.aws.amazon.com/glue/latest/dg/aws-glue-api-jobs-job.html>) topic of the Amazon Glue API reference.

```

$Command = New-Object Amazon.Glue.Model.JobCommand
$Command.Name = 'glueetl'

```

```

$Command.ScriptLocation = 's3://amzn-s3-demo-source-bucket/admin/
MyTestGlueJob.py'
$Command

$Source = "source_test_table"
$Target = "target_test_table"
$Connections = $Source, $Target

$DefArgs = @{
    '--TempDir' = 's3://amzn-s3-demo-bucket/admin'
    '--job-bookmark-option' = 'job-bookmark-disable'
    '--job-language' = 'python'
}
$DefArgs

$ExecutionProp = New-Object Amazon.Glue.Model.ExecutionProperty
$ExecutionProp.MaxConcurrentRuns = 1
$ExecutionProp

$JobParams = @{
    "AllocatedCapacity" = "5"
    "Command" = $Command
    "Connections_Connection" = $Connections
    "DefaultArguments" = $DefArgs
    "Description" = "This is a test"
    "ExecutionProperty" = $ExecutionProp
    "MaxRetries" = "1"
    "Name" = "MyOregonTestGlueJob"
    "Role" = "Amazon-GlueServiceRoleForSSM"
    "Timeout" = "20"
}

New-GlueJob @JobParams

```

- For API details, see [CreateJob](#) in *Amazon Tools for PowerShell Cmdlet Reference (V4)*.

Tools for PowerShell V5

Example 1: This example creates a new job in Amazon Glue. The command name value is always `glueetl`. Amazon Glue supports running job scripts written in Python or Scala. In this example, the job script (`MyTestGlueJob.py`) is written in Python. Python parameters are specified in the `$DefArgs` variable, and then passed to the PowerShell command in the `DefaultArguments` parameter, which accepts a hashtable. The parameters in the

\$JobParams variable come from the **CreateJob** API, documented in the **Jobs** (<https://docs.aws.amazon.com/glue/latest/dg/aws-glue-api-jobs-job.html>) topic of the **Amazon Glue API reference**.

```

$Command = New-Object Amazon.Glue.Model.JobCommand
$Command.Name = 'glueetl'
$Command.ScriptLocation = 's3://amzn-s3-demo-source-bucket/admin/
MyTestGlueJob.py'
$Command

$Source = "source_test_table"
$Target = "target_test_table"
$Connections = $Source, $Target

$DefArgs = @{
    '--TempDir' = 's3://amzn-s3-demo-bucket/admin'
    '--job-bookmark-option' = 'job-bookmark-disable'
    '--job-language' = 'python'
}
$DefArgs

$ExecutionProp = New-Object Amazon.Glue.Model.ExecutionProperty
$ExecutionProp.MaxConcurrentRuns = 1
$ExecutionProp

$JobParams = @{
    "AllocatedCapacity" = "5"
    "Command" = $Command
    "Connections_Connection" = $Connections
    "DefaultArguments" = $DefArgs
    "Description" = "This is a test"
    "ExecutionProperty" = $ExecutionProp
    "MaxRetries" = "1"
    "Name" = "MyOregonTestGlueJob"
    "Role" = "Amazon-GlueServiceRoleForSSM"
    "Timeout" = "20"
}

New-GlueJob @JobParams

```

- For API details, see [CreateJob](#) in *Amazon Tools for PowerShell Cmdlet Reference (V5)*.

```

- For API details, see [StartJobRun](#) in *Amazon SDK for SAP ABAP API reference*.

Swift

SDK for Swift

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [Amazon Code Examples Repository](#).

```

import AWSClientRuntime
import AWSGlue

/// Start an AWS Glue job run.
///
/// - Parameters:
///   - glueClient: The AWS Glue client to use.
///   - jobName: The name of the job to run.
///   - databaseName: The name of the AWS Glue database to run the job
against.
///   - tableName: The name of the table in the database to run the job
against.
///   - outputURL: The AWS S3 URI of the bucket location into which to
write the resulting output.
///

```

```
/// - Returns: `true` if the job run is started successfully, otherwise
`false`.
func startJobRun(glueClient: GlueClient, name jobName: String, databaseName:
String,
                tableName: String, outputURL: String) async -> String? {
do {
    let output = try await glueClient.startJobRun(
        input: StartJobRunInput(
            arguments: [
                "--input_database": databaseName,
                "--input_table": tableName,
                "--output_bucket_url": outputURL
            ],
            jobName: jobName,
            numberOfWorkers: 10,
            workerType: .g1x
        )
    )

    guard let id = output.jobRunId else {
        return nil
    }

    return id
} catch {
    return nil
}
}
```

- For API details, see [StartJobRun](#) in *Amazon SDK for Swift API reference*.

For a complete list of Amazon SDK developer guides and code examples, see [Using this service with an Amazon SDK](#). This topic also includes information about getting started and details about previous SDK versions.

Security in Amazon Glue

Cloud security at Amazon is the highest priority. As an Amazon customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between Amazon and you. The [shared responsibility model](#) describes this as security *of* the cloud and security *in* the cloud:

- **Security of the cloud** – Amazon is responsible for protecting the infrastructure that runs Amazon services in the Amazon Cloud. Amazon also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the [Amazon compliance programs](#). To learn about the compliance programs that apply to Amazon Glue, see [Amazon Services in Scope by Compliance Program](#).
- **Security in the cloud** – Your responsibility is determined by the Amazon service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using Amazon Glue. The following topics show you how to configure Amazon Glue to meet your security and compliance objectives. You also learn how to use other Amazon services that help you to monitor and secure your Amazon Glue resources.

Topics

- [Data protection in Amazon Glue](#)
- [Identity and access management for Amazon Glue](#)
- [Amazon Lake Formation access control models](#)
- [Using Amazon S3 Access Grants with Amazon Glue](#)
- [Trusted Identity Propagation with Amazon Glue ETL](#)
- [Logging and monitoring in Amazon Glue](#)
- [Compliance validation for Amazon Glue](#)
- [Resilience in Amazon Glue](#)
- [Infrastructure security in Amazon Glue](#)

Data protection in Amazon Glue

Amazon Glue offers several features that are designed to help protect your data.

Topics

- [Encrypting data at rest](#)
- [Encrypting data in transit](#)
- [FIPS compliance](#)
- [Key management](#)
- [Amazon Glue dependency on other Amazon services](#)
- [Development endpoints](#)

Encrypting data at rest

Amazon Glue supports data encryption at rest for [Building visual ETL jobs](#) and [Developing scripts using development endpoints](#). You can configure extract, transform, and load (ETL) jobs and development endpoints to use [Amazon Key Management Service \(Amazon KMS\)](#) keys to write encrypted data at rest. You can also encrypt the metadata stored in the [Amazon Glue Data Catalog](#) using keys that you manage with Amazon KMS. Additionally, you can use Amazon KMS keys to encrypt job bookmarks and the logs generated by [crawlers](#) and ETL jobs.

You can encrypt metadata objects in your Amazon Glue Data Catalog in addition to the data written to Amazon Simple Storage Service (Amazon S3) and Amazon CloudWatch Logs by jobs, crawlers, and development endpoints. When you create jobs, crawlers, and development endpoints in Amazon Glue, you can provide encryption settings by attaching a security configuration. Security configurations contain Amazon S3-managed server-side encryption keys (SSE-S3) or customer master keys (CMKs) stored in Amazon KMS (SSE-KMS). You can create security configurations using the Amazon Glue console.

You can also turn on encryption of the entire Data Catalog in your account. You do so by specifying CMKs stored in Amazon KMS.

Important

Amazon Glue supports only symmetric customer managed keys. For more information, see [Customer Managed Keys \(CMKs\)](#) in the *Amazon Key Management Service Developer Guide*.

With encryption turned on, when you add Data Catalog objects, run crawlers, run jobs, or start development endpoints, SSE-S3 or SSE-KMS keys are used to write data at rest. In addition, you can configure Amazon Glue to only access Java Database Connectivity (JDBC) data stores through a trusted Transport Layer Security (TLS) protocol.

In Amazon Glue, you control encryption settings in the following places:

- The settings of your Data Catalog.
- The security configurations that you create.
- The server-side encryption setting (SSE-S3 or SSE-KMS) that is passed as a parameter to your Amazon Glue ETL (extract, transform, and load) job.

For more information about how to set up encryption, see [Setting up encryption in Amazon Glue](#).

Topics

- [Encrypting your Data Catalog](#)
- [Encrypting connection passwords](#)
- [Encrypting data written by Amazon Glue](#)

Encrypting your Data Catalog

Amazon Glue Data Catalog encryption provides enhanced security for your sensitive data. Amazon Glue integrates with Amazon Key Management Service (Amazon KMS) to encrypt metadata that's stored in the Data Catalog. You can enable or disable encryption settings for resources in the Data Catalog using the Amazon Glue console or the Amazon CLI.

When you enable encryption for your Data Catalog, all new objects that you create will be encrypted. When you disable encryption, the new objects you create will not be encrypted, but existing encrypted objects will remain encrypted.

You can encrypt your entire Data Catalog using Amazon managed encryption keys or customer managed encryption keys. For more information on key types and states, see [Amazon Key Management Service concepts](#) in the Amazon Key Management Service Developer Guide.

Note

When you use the encrypted Data Catalog with a crawler, you must maintain the encryption settings. Removing encryption settings after a crawler has processed an

encrypted catalog results in errors. If you need to remove encryption settings, create a new crawler instead of modifying the existing one.

Amazon managed keys

Amazon managed keys are KMS keys in your account that are created, managed, and used on your behalf by an Amazon service that's integrated with Amazon KMS. You can view the Amazon managed keys in your account, view their key policies, and audit their use in Amazon CloudTrail logs. However, you can't manage these keys or change their permissions.

Encryption at rest automatically integrates with Amazon KMS for managing the Amazon managed keys for Amazon Glue that are used to encrypt your metadata. If an Amazon managed key doesn't exist when you enable metadata encryption, Amazon KMS automatically creates a new key for you.

For more information, see [Amazon managed keys](#).

Customer managed keys

Customer managed keys are KMS keys in your Amazon Web Services account that you create, own, and manage. You have full control over these KMS keys. You can:

- Establish and maintain their key policies, IAM policies, and grants
- Enable and disable them
- Rotate their cryptographic material
- Add tags
- Create aliases that refer to them
- Schedule them for deletion

For more information about managing the permissions of a customer managed key, see [Customer managed keys](#).

Important

Amazon Glue supports only symmetric customer managed keys. The KMS key list displays only symmetric keys. However, if you select **Choose a KMS key ARN**, the console lets you enter an ARN for any key type. Ensure that you enter only ARNs for symmetric keys.

To create a symmetric customer managed key, follow the steps for [creating symmetric customer managed keys](#) in the Amazon Key Management Service Developer Guide.

When you enable Data Catalog encryption at rest, the following resource types are encrypted using KMS keys:

- Databases
- Tables
- Partitions
- Table versions
- Column statistics
- User-defined functions
- Data Catalog views

Amazon Glue encryption context

An [encryption context](#) is an optional set of key-value pairs that contain additional contextual information about the data. Amazon KMS uses the encryption context as [additional authenticated data](#) to support [authenticated encryption](#). When you include an encryption context in a request to encrypt data, Amazon KMS binds the encryption context to the encrypted data. To decrypt data, you include the same encryption context in the request. Amazon Glue uses the same encryption context in all Amazon KMS cryptographic operations, where the key is `glue_catalog_id` and the value is the `catalogId`.

```
"encryptionContext": {  
  "glue_catalog_id": "111122223333"  
}
```

When you use an Amazon managed key or a symmetric customer managed key to encrypt your Data Catalog, you can also use the encryption context in audit records and logs to identify how the key is being used. The encryption context also appears in logs that are generated by Amazon CloudTrail or Amazon CloudWatch logs.

Enabling encryption

You can enable encryption for your Amazon Glue Data Catalog objects in the **Data Catalog settings** in the Amazon Glue console or by using the Amazon CLI.

Console

To enable encryption using the console

1. Sign in to the Amazon Web Services Management Console and open the Amazon Glue console at <https://console.amazonaws.cn/glue/>.
2. Choose **Data Catalog** in the navigation pane.
3. On the **Data Catalog settings** page, select the **Metadata encryption** check box, and choose an Amazon KMS key.

When you enable encryption, if you don't specify a customer managed key, the encryption settings use an Amazon managed KMS key.

4. (Optional) When you use a customer managed key to encrypt your Data Catalog, the Data Catalog provides an option to register an IAM role to encrypt and decrypt resources. You need to grant your IAM role permissions that Amazon Glue can assume on your behalf. This includes Amazon KMS permissions to encrypt and decrypt data.

When you create a new resource in the Data Catalog, Amazon Glue assumes the IAM role that's provided to encrypt the data. Similarly, when a consumer accesses the resource, Amazon Glue assumes the IAM role to decrypt data. If you register an IAM role with the required permissions, the calling principal no longer requires permissions to access the key and decrypt the data.

Important

You can delegate KMS operations to an IAM role only when you use a customer managed key to encrypt the Data Catalog resources. KMS role delegation feature doesn't support using Amazon managed keys for encrypting Data Catalog resources at this time.

⚠ Warning

When you enable an IAM role to delegate KMS operations, you can no longer access the Data Catalog resources that were encrypted previously with an Amazon managed key.

- a. To enable an IAM role that Amazon Glue can assume to encrypt and decrypt data on your behalf, select the **Delegate KMS operations to an IAM role** option.
- b. Next, choose an IAM role.

To create an IAM role, see [Create an IAM role for Amazon Glue](#).

The IAM role that Amazon Glue assumes to access the Data Catalog must have the permissions to encrypt and decrypt metadata in the Data Catalog. You can create an IAM role, and attach the following inline policies:

- Add the following policy to include Amazon KMS permissions to encrypt and decrypt the Data Catalog.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:Decrypt",
        "kms:Encrypt",
        "kms:GenerateDataKey"
      ],
      "Resource": "arn:aws:kms:us-east-1:111122223333:key/<key-id>"
    }
  ]
}
```

- Next, add the following trust policy to the role for Amazon Glue service to assume the IAM role.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "",
      "Effect": "Allow",
      "Principal": {
        "Service": "glue.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

- Next, add the `iam:PassRole` permission to the IAM role.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "iam:PassRole"
      ],
      "Resource": [
        "arn:aws:iam::111122223333:role/<encryption-role-name>"
      ]
    }
  ]
}
```

When you enable encryption, if you haven't specified an IAM role for Amazon Glue to assume, the principal accessing the Data Catalog must have permissions to perform the following API operations:

- `kms:Decrypt`
- `kms:Encrypt`

- kms:GenerateDataKey

Amazon CLI

To enable encryption using the SDK or Amazon CLI

- Use the PutDataCatalogEncryptionSettings API operation. If no key is specified, Amazon Glue uses Amazon managed encryption key for the customer account to encrypt the Data Catalog.

```
aws glue put-data-catalog-encryption-settings \  
  --data-catalog-encryption-settings '{  
    "EncryptionAtRest": {  
      "CatalogEncryptionMode": "SSE-KMS-WITH-SERVICE-ROLE",  
      "SseAwsKmsKeyId": "arn:aws:kms:<region>:<account-id>:key/<key-id>",  
      "CatalogEncryptionServiceRole": "arn:aws:iam::<account-  
id>:role/<encryption-role-name>"  
    }  
  }'
```

When you enable encryption, all objects that you create in the Data Catalog objects are encrypted. If you clear this setting, the objects you create in the Data Catalog are no longer encrypted. You can continue to access the existing encrypted objects in the Data Catalog with the required KMS permissions.

Important

The Amazon KMS key must remain available in the Amazon KMS key store for any objects that are encrypted with it in the Data Catalog. If you remove the key, the objects can no longer be decrypted. You might want this in some scenarios to prevent access to Data Catalog metadata.

Monitoring your KMS keys for Amazon Glue

When you use KMS keys with your Data Catalog resources, you can use Amazon CloudTrail or Amazon CloudWatch Logs to track requests that Amazon Glue sends to Amazon KMS. Amazon CloudTrail monitors and records KMS operations that Amazon Glue calls to access data that's encrypted by your KMS keys.

The following examples are Amazon CloudTrail events for the Decrypt and GenerateDataKey operations.

Decrypt

```
{
  "eventVersion": "1.08",

Encrypting connection passwords

You can retrieve connection passwords in the Amazon Glue Data Catalog by using the `GetConnection` and `GetConnections` API operations. These passwords are stored in the Data Catalog connection and are used when Amazon Glue connects to a Java Database Connectivity (JDBC) data store. When the connection was created or updated, an option in the Data Catalog settings determined whether the password was encrypted, and if so, what Amazon Key Management Service (Amazon KMS) key was specified.

On the Amazon Glue console, you can turn on this option on the **Data catalog settings** page.

To encrypt connection passwords

1. Sign in to the Amazon Web Services Management Console and open the Amazon Glue console at <https://console.amazonaws.cn/glue/>.
2. Choose **Settings** in the navigation pane.
3. On the **Data catalog settings** page, select **Encrypt connection passwords**, and choose an Amazon KMS key.

Important

Amazon Glue supports only symmetric customer master keys (CMKs). The **Amazon KMS key** list displays only symmetric keys. However, if you select **Choose a Amazon KMS key ARN**, the console lets you enter an ARN for any key type. Ensure that you enter only ARNs for symmetric keys.

For more information, see [Data Catalog settings](#).

Encrypting data written by Amazon Glue

A *security configuration* is a set of security properties that can be used by Amazon Glue. You can use a security configuration to encrypt data at rest. The following scenarios show some of the ways that you can use a security configuration.

- Attach a security configuration to an Amazon Glue crawler to write encrypted Amazon CloudWatch Logs. For more information about attaching security configurations to crawlers, see [the section called "Configure security settings"](#).
- Attach a security configuration to an extract, transform, and load (ETL) job to write encrypted Amazon Simple Storage Service (Amazon S3) targets and encrypted CloudWatch Logs.
- Attach a security configuration to an ETL job to write its jobs bookmarks as encrypted Amazon S3 data.
- Attach a security configuration to a development endpoint to write encrypted Amazon S3 targets.

Important

Currently, a security configuration overrides any server-side encryption (SSE-S3) setting that is passed as an ETL job parameter. Thus, if both a security configuration and an SSE-S3 parameter are associated with a job, the SSE-S3 parameter is ignored.

For more information about security configurations, see [Managing security configurations on the Amazon Glue console](#).

Topics

- [Setting Up Amazon Glue to use security configurations](#)
- [Creating a route to Amazon KMS for VPC jobs and crawlers](#)
- [Managing security configurations on the Amazon Glue console](#)

Setting Up Amazon Glue to use security configurations

Follow these steps to set up your Amazon Glue environment to use security configurations.

1. Create or update your Amazon Key Management Service (Amazon KMS) keys to grant Amazon KMS permissions to the IAM roles that are passed to Amazon Glue crawlers and jobs to encrypt CloudWatch Logs. For more information, see [Encrypt Log Data in CloudWatch Logs Using Amazon KMS](#) in the *Amazon CloudWatch Logs User Guide*.

In the following example, *"role1"*, *"role2"*, and *"role3"* are IAM roles that are passed to crawlers and jobs.

```
{
  "Effect": "Allow",
  "Principal": { "Service": "logs.region.amazonaws.com",
  "AWS": [
    "role1",
    "role2",
    "role3"
  ] },
  "Action": [
    "kms:Encrypt*",
    "kms:Decrypt*",
    "kms:ReEncrypt*",
    "kms:GenerateDataKey*",
    "kms:Describe*"
  ],
  "Resource": "*"
}
```

The Service statement, shown as "Service": "logs.*region*.amazonaws.com", is required if you use the key to encrypt CloudWatch Logs.

2. Ensure that the Amazon KMS key is ENABLED before it is used.

Note

If you are using Iceberg as your data lake framework, Iceberg tables have their own mechanisms to enable server-side encryption. You should enable these configuration in addition to Amazon Glue's security configurations. To enable server-side encryption on Iceberg tables, review the guidance from [Iceberg documentation](#).

Creating a route to Amazon KMS for VPC jobs and crawlers

You can connect directly to Amazon KMS through a private endpoint in your virtual private cloud (VPC) instead of connecting over the internet. When you use a VPC endpoint, communication between your VPC and Amazon KMS is conducted entirely within the Amazon network.

You can create an Amazon KMS VPC endpoint within a VPC. Without this step, your jobs or crawlers might fail with a `kms timeout` on jobs or an `internal service exception` on crawlers. For

detailed instructions, see [Connecting to Amazon KMS Through a VPC Endpoint](#) in the *Amazon Key Management Service Developer Guide*.

As you follow these instructions, on the [VPC console](#), you must do the following:

- Select **Enable Private DNS name**.
- Choose the **Security group** (with self-referencing rule) that you use for your job or crawler that accesses Java Database Connectivity (JDBC). For more information about Amazon Glue connections, see [Connecting to data](#).

When you add a security configuration to a crawler or job that accesses JDBC data stores, Amazon Glue must have a route to the Amazon KMS endpoint. You can provide the route with a network address translation (NAT) gateway or with an Amazon KMS VPC endpoint. To create a NAT gateway, see [NAT Gateways](#) in the *Amazon VPC User Guide*.

Managing security configurations on the Amazon Glue console

Warning

Amazon Glue security configurations are not currently supported in Ray jobs.

A *security configuration* in Amazon Glue contains the properties that are needed when you write encrypted data. You create security configurations on the Amazon Glue console to provide the encryption properties that are used by crawlers, jobs, and development endpoints.

To see a list of all the security configurations that you have created, open the Amazon Glue console at <https://console.amazonaws.cn/glue/> and choose **Security configurations** in the navigation pane.

The **Security configurations** list displays the following properties about each configuration:

Name

The unique name you provided when you created the configuration. The name may contain letters (A-Z), numbers (0-9), hypens (-), or underscores (_), and be up to 255 characters long.

Enable Amazon S3 encryption

If turned on, the Amazon Simple Storage Service (Amazon S3) encryption mode such as SSE-KMS or SSE-S3 is enabled for metadata store in the data catalog.

Enable Amazon CloudWatch logs encryption

If turned on, the Amazon S3 encryption mode such as SSE-KMS is enabled when writing logs to Amazon CloudWatch.

Advanced settings: Enable job bookmark encryption

If turned on, the Amazon S3 encryption mode such as CSE-KMS is enabled when jobs are bookmarked.

You can add or delete configurations in the **Security configurations** section on the console. To see more details for a configuration, choose the configuration name in the list. Details include the information that you defined when you created the configuration.

Adding a security configuration

To add a security configuration using the Amazon Glue console, on the **Security configurations** page, choose **Add security configuration**.

Add security configuration

Choose encryption and permission options for your accounts data catalog.

Security configuration properties

Name

Name may contain letters (A-Z), numbers (0-9), hyphens (-), or underscores (_), and can be up to 255 characters long.

Encryption settings

Enable and choose options for at-rest encryption.

Enable S3 encryption
Enable at-rest encryption for metadata stored in the data catalog.

Enable CloudWatch logs encryption
Enable at-rest encryption when writing logs to Amazon CloudWatch.

▼ **Advanced settings**

Enable job bookmark encryption
Enable at-rest encryption of job bookmark.

Cancel **Save**

Security configuration properties

Enter a unique security configuration name. The name may contain letters (A-Z), numbers (0-9), hyphens (-), or underscores (_), and can be up to 255 characters long.

Encryption settings

You can enable at-rest encryption for metadata stored in the Data Catalog in Amazon S3 and logs in Amazon CloudWatch. To set up encryption of data and metadata with Amazon Key Management Service (Amazon KMS) keys on the Amazon Glue console, add a policy to the console user. This policy must specify the allowed resources as key Amazon Resource Names (ARNs) that are used to encrypt Amazon S3 data stores, as in the following example.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Action": [
      "kms:GenerateDataKey",
      "kms:Decrypt",
      "kms:Encrypt"
    ],
    "Resource": "arn:aws-cn:kms:us-east-1:111122223333:key/key-id"
  }
}
```

Important

When a security configuration is attached to a crawler or job, the IAM role that is passed must have Amazon KMS permissions. For more information, see [Encrypting data written by Amazon Glue](#).

When you define a configuration, you can provide values for the following properties:

Enable S3 encryption

When you are writing Amazon S3 data, you use either server-side encryption with Amazon S3 managed keys (SSE-S3) or server-side encryption with Amazon KMS managed keys (SSE-KMS). This field is optional. To allow access to Amazon S3, choose an Amazon KMS key, or choose **Enter a key ARN** and provide the ARN for the key. Enter the ARN in the form `arn:aws-cn:kms:region:account-id:key/key-id`. You can also provide the ARN as a key alias, such as `arn:aws-cn:kms:region:account-id:alias/alias-name`.

If you enable Spark UI for your job, the Spark UI log file uploaded to Amazon S3 will be applied with the same encryption.

⚠ Important

Amazon Glue supports only symmetric customer master keys (CMKs). The **Amazon KMS key** list displays only symmetric keys. However, if you select **Choose a Amazon KMS key ARN**, the console lets you enter an ARN for any key type. Ensure that you enter only ARNs for symmetric keys.

Enable CloudWatch Logs encryption

Server-side (SSE-KMS) encryption is used to encrypt CloudWatch Logs. This field is optional. To turn it on, choose an Amazon KMS key, or choose **Enter a key ARN** and provide the ARN for the key. Enter the ARN in the form `arn:aws-cn:kms:region:account-id:key/key-id`. You can also provide the ARN as a key alias, such as `arn:aws-cn:kms:region:account-id:alias/alias-name`.

Advanced settings: Job bookmark encryption

Client-side (CSE-KMS) encryption is used to encrypt job bookmarks. This field is optional. The bookmark data is encrypted before it is sent to Amazon S3 for storage. To turn it on, choose an Amazon KMS key, or choose **Enter a key ARN** and provide the ARN for the key. Enter the ARN in the form `arn:aws-cn:kms:region:account-id:key/key-id`. You can also provide the ARN as a key alias, such as `arn:aws-cn:kms:region:account-id:alias/alias-name`.

For more information, see the following topics in the *Amazon Simple Storage Service User Guide*:

- For information about SSE-S3, see [Protecting Data Using Server-Side Encryption with Amazon S3-Managed Encryption Keys \(SSE-S3\)](#).
- For information about SSE-KMS, see [Protecting Data Using Server-Side Encryption with Amazon KMS keys](#).
- For information about CSE-KMS, see [Using a KMS key stored in Amazon KMS](#).

Encrypting data in transit

Amazon provides Transport Layer Security (TLS) encryption for data in motion. You can configure encryption settings for crawlers, ETL jobs, and development endpoints using [security](#)

[configurations](#) in Amazon Glue. You can turn on Amazon Glue Data Catalog encryption via the settings for the Data Catalog.

As of September 4, 2018, Amazon KMS (*bring your own key* and *server-side encryption*) for Amazon Glue ETL and the Amazon Glue Data Catalog is supported.

FIPS compliance

If you require FIPS 140-2 validated cryptographic modules when accessing Amazon through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see [Federal Information Processing Standard \(FIPS\) 140-2](#).

Key management

You can use Amazon Identity and Access Management (IAM) with Amazon Glue to define users, Amazon resources, groups, roles and fine-grained policies regarding access, denial, and more.

You can define the access to the metadata using both resource-based and identity-based policies, depending on your organization's needs. Resource-based policies list the principals that are allowed or denied access to your resources, allowing you to set up policies such as cross-account access. Identity policies are specifically attached to users, groups, and roles within IAM.

For a step-by-step example, see [Restrict access to your Amazon Glue Data Catalog with resource-level IAM permissions and resource-based policies](#) on the Amazon Big Data Blog.

The fine-grained access portion of the policy is defined within the `Resource` clause. This portion defines both the Amazon Glue Data Catalog object that the action can be performed on, and what resulting objects get returned by that operation.

A *development endpoint* is an environment that you can use to develop and test your Amazon Glue scripts. You can add, delete, or rotate the SSH key of a development endpoint.

As of September 4, 2018, Amazon KMS (*bring your own key* and *server-side encryption*) for Amazon Glue ETL and the Amazon Glue Data Catalog is supported.

Amazon Glue dependency on other Amazon services

For a user to work with the Amazon Glue console, that user must have a minimum set of permissions that allows them to work with the Amazon Glue resources for their Amazon account. In addition to these Amazon Glue permissions, the console requires permissions from the following services:

- Amazon CloudWatch Logs permissions to display logs.
- Amazon Identity and Access Management (IAM) permissions to list and pass roles.
- Amazon CloudFormation permissions to work with stacks.
- Amazon Elastic Compute Cloud (Amazon EC2) permissions to list virtual private clouds (VPCs), subnets, security groups, instances, and other objects (to set up Amazon EC2 items such as VPCs when running jobs, crawlers, and creating development endpoints).
- Amazon Simple Storage Service (Amazon S3) permissions to list buckets and objects, and to retrieve and save scripts.
- Amazon Redshift permissions to work with clusters.
- Amazon Relational Database Service (Amazon RDS) permissions to list instances.

Development endpoints

A development endpoint is an environment that you can use to develop and test your Amazon Glue scripts. You can use Amazon Glue to create, edit, and delete development endpoints. You can list all the development endpoints that are created. You can add, delete, or rotate the SSH key of a development endpoint. You can also create notebooks that use the development endpoint.

You provide configuration values to provision the development environments. These values tell Amazon Glue how to set up the network so that you can access the development endpoint securely, and so that your endpoint can access your data stores. Then, you can create a notebook that connects to the development endpoint. You use your notebook to author and test your ETL script.

Use an Amazon Identity and Access Management (IAM) role with permissions similar to the IAM role that you use to run Amazon Glue ETL jobs. Use a virtual private cloud (VPC), a subnet, and a security group to create a development endpoint that can connect to your data resources securely. You generate an SSH key pair to connect to the development environment using SSH.

You can create development endpoints for Amazon S3 data and within a VPC that you can use to access datasets using JDBC.

You can install a Jupyter notebook client on your local machine and use it to debug and test ETL scripts on a development endpoint. Or, you can use a SageMaker notebook to author ETL scripts in JupyterLab on Amazon. See [Use a SageMaker notebook with your development endpoint](#) .

Amazon Glue tags Amazon EC2 instances with a name that is prefixed with `aws-glue-dev-endpoint`.

You can set up a notebook server on a development endpoint to run PySpark with Amazon Glue extensions.

Identity and access management for Amazon Glue

Amazon Identity and Access Management (IAM) is an Amazon Web Services service that helps an administrator securely control access to Amazon resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use Amazon Glue resources. IAM is an Amazon Web Services service that you can use with no additional charge.

Note

You can grant access to your data in the Amazon Glue Data Catalog using either Amazon Glue methods or Amazon Lake Formation grants. You can use Amazon Identity and Access Management (IAM) policies to set fine-grained access control with Amazon Glue methods. Lake Formation uses a simpler GRANT/REVOKE permissions model that is similar to the GRANT/REVOKE commands in a relational database system.

This section includes information about how to use the Amazon Glue methods. For information about using Lake Formation grants, see [Granting Lake Formation permissions](#) in the *Amazon Lake Formation Developer Guide*.

Topics

- [Audience](#)
- [Authenticating with identities](#)
- [Managing access using policies](#)
- [How Amazon Glue works with IAM](#)
- [Configuring IAM permissions for Amazon Glue](#)
- [Amazon Glue access control policy examples](#)
- [Granting Amazon managed policies for Amazon Glue](#)
- [Granting dynamically scoped policies for job execution](#)

- [Specifying Amazon Glue resource ARNs](#)
- [Granting cross-account access](#)
- [Troubleshooting Amazon Glue identity and access](#)

Audience

How you use Amazon Identity and Access Management (IAM) differs based on your role:

- **Service user** - request permissions from your administrator if you cannot access features (see [Troubleshooting Amazon Glue identity and access](#))
- **Service administrator** - determine user access and submit permission requests (see [How Amazon Glue works with IAM](#))
- **IAM administrator** - write policies to manage access (see [Identity-based policy examples for Amazon Glue](#))

Authenticating with identities

Authentication is how you sign in to Amazon using your identity credentials. You must be authenticated as the Amazon Web Services account root user, an IAM user, or by assuming an IAM role.

For programmatic access, Amazon provides an SDK and CLI to cryptographically sign requests. For more information, see [Amazon Signature Version 4 for API requests](#) in the *IAM User Guide*.

Amazon Web Services account root user

When you create an Amazon Web Services account, you begin with one sign-in identity called the Amazon Web Services account *root user* that has complete access to all Amazon Web Services services and resources. We strongly recommend that you don't use the root user for everyday tasks. For tasks that require root user credentials, see [Tasks that require root user credentials](#) in the *IAM User Guide*.

Federated identity

As a best practice, require human users to use federation with an identity provider to access Amazon Web Services services using temporary credentials.

A *federated identity* is a user from your enterprise directory, web identity provider, or Amazon Directory Service that accesses Amazon Web Services services using credentials from an identity source. Federated identities assume roles that provide temporary credentials.

IAM users and groups

An *IAM user* is an identity with specific permissions for a single person or application. We recommend using temporary credentials instead of IAM users with long-term credentials. For more information, see [Require human users to use federation with an identity provider to access Amazon using temporary credentials](#) in the *IAM User Guide*.

An *IAM group* specifies a collection of IAM users and makes permissions easier to manage for large sets of users. For more information, see [Use cases for IAM users](#) in the *IAM User Guide*.

IAM roles

An *IAM role* is an identity with specific permissions that provides temporary credentials. You can assume a role by [switching from a user to an IAM role \(console\)](#) or by calling an Amazon CLI or Amazon API operation. For more information, see [Methods to assume a role](#) in the *IAM User Guide*.

IAM roles are useful for federated user access, temporary IAM user permissions, cross-account access, cross-service access, and applications running on Amazon EC2. For more information, see [Cross account resource access in IAM](#) in the *IAM User Guide*.

Managing access using policies

You control access in Amazon by creating policies and attaching them to Amazon identities or resources. A policy defines permissions when associated with an identity or resource. Amazon evaluates these policies when a principal makes a request. Most policies are stored in Amazon as JSON documents. For more information about JSON policy documents, see [Overview of JSON policies](#) in the *IAM User Guide*.

Using policies, administrators specify who has access to what by defining which **principal** can perform **actions** on what **resources**, and under what **conditions**.

By default, users and roles have no permissions. An IAM administrator creates IAM policies and adds them to roles, which users can then assume. IAM policies define permissions regardless of the method used to perform the operation.

Identity-based policies

Identity-based policies are JSON permissions policy documents that you attach to an identity (user, group, or role). These policies control what actions identities can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see [Define custom IAM permissions with customer managed policies](#) in the *IAM User Guide*.

Identity-based policies can be *inline policies* (embedded directly into a single identity) or *managed policies* (standalone policies attached to multiple identities). To learn how to choose between managed and inline policies, see [Choose between managed policies and inline policies](#) in the *IAM User Guide*.

Resource-based policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples include *IAM role trust policies* and *Amazon S3 bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. You must [specify a principal](#) in a resource-based policy.

Resource-based policies are inline policies that are located in that service. You can't use Amazon managed policies from IAM in a resource-based policy.

Other policy types

Amazon supports additional policy types that can set the maximum permissions granted by more common policy types:

- **Permissions boundaries** – Set the maximum permissions that an identity-based policy can grant to an IAM entity. For more information, see [Permissions boundaries for IAM entities](#) in the *IAM User Guide*.
- **Service control policies (SCPs)** – Specify the maximum permissions for an organization or organizational unit in Amazon Organizations. For more information, see [Service control policies](#) in the *Amazon Organizations User Guide*.
- **Resource control policies (RCPs)** – Set the maximum available permissions for resources in your accounts. For more information, see [Resource control policies \(RCPs\)](#) in the *Amazon Organizations User Guide*.
- **Session policies** – Advanced policies passed as a parameter when creating a temporary session for a role or federated user. For more information, see [Session policies](#) in the *IAM User Guide*.

Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how Amazon determines whether to allow a request when multiple policy types are involved, see [Policy evaluation logic](#) in the *IAM User Guide*.

How Amazon Glue works with IAM

Before you use IAM to manage access to Amazon Glue, learn what IAM features are available to use with Amazon Glue.

IAM features you can use with Amazon Glue

| IAM feature | Amazon Glue support |
|--|---------------------|
| Identity-based policies | Yes |
| Resource-based policies | Partial |
| Policy actions | Yes |
| Policy resources | Yes |
| Policy condition keys (service-specific) | Yes |
| ACLs | No |
| ABAC (tags in policies) | Partial |
| Temporary credentials | Yes |
| Principal permissions | No |
| Service roles | Yes |
| Service-linked roles | No |

To get a high-level view of how Amazon Glue and other Amazon services work with most IAM features, see [Amazon services that work with IAM](#) in the *IAM User Guide*.

Identity-based policies for Amazon Glue

Supports identity-based policies: Yes

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see [Define custom IAM permissions with customer managed policies](#) in the *IAM User Guide*.

With IAM identity-based policies, you can specify allowed or denied actions and resources as well as the conditions under which actions are allowed or denied. To learn about all of the elements that you can use in a JSON policy, see [IAM JSON policy elements reference](#) in the *IAM User Guide*.

Amazon Glue supports identity-based policies (IAM policies) for all Amazon Glue operations. By attaching a policy, you can grant permissions to create, access, or modify an Amazon Glue resource, such as a table in the Amazon Glue Data Catalog.

Identity-based policy examples for Amazon Glue

To view examples of Amazon Glue identity-based policies, see [Identity-based policy examples for Amazon Glue](#).

Resource-based policies within Amazon Glue

Supports resource-based policies: Partial

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM *role trust policies* and Amazon S3 *bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must [specify a principal](#) in a resource-based policy. Principals can include accounts, users, roles, federated users, or Amazon Web Services services.

To enable cross-account access, you can specify an entire account or IAM entities in another account as the principal in a resource-based policy. For more information, see [Cross account resource access in IAM](#) in the *IAM User Guide*.

Note

You can only use an Amazon Glue resource policy to manage permissions for Data Catalog resources. You can't attach it to any other Amazon Glue resources such as jobs, triggers, development endpoints, crawlers, or classifiers.

Only *one* resource policy is allowed per catalog, and its size is limited to 10 KB.

In Amazon Glue, a resource policy is attached to a *catalog*, which is a virtual container for all the kinds of Data Catalog resources mentioned previously. Each Amazon account owns a single catalog in an Amazon Region whose catalog ID is the same as the Amazon account ID. You cannot delete or modify a catalog.

A resource policy is evaluated for all API calls to the catalog where the caller principal is included in the "Principal" block of the policy document.

To view examples of Amazon Glue resource-based policies, see [Resource-based policy examples for Amazon Glue](#).

Policy actions for Amazon Glue

Supports policy actions: Yes

Administrators can use Amazon JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The **Action** element of a JSON policy describes the actions that you can use to allow or deny access in a policy. Include actions in a policy to grant permissions to perform the associated operation.

To see a list of Amazon Glue actions, see [Actions defined by Amazon Glue](#) in the *Service Authorization Reference*.

Policy actions in Amazon Glue use the following prefix before the action:

```
glue
```

To specify multiple actions in a single statement, separate them with commas.

```
"Action": [  
  "glue:action1",  
  "glue:action2"  
]
```

You can specify multiple actions using wildcards (*). For example, to specify all actions that begin with the word Get, include the following action:

```
"Action": "glue:Get*"
```

To view example policies, see [Amazon Glue access control policy examples](#).

Policy resources for Amazon Glue

Supports policy resources: Yes

Administrators can use Amazon JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The Resource JSON policy element specifies the object or objects to which the action applies. As a best practice, specify a resource using its [Amazon Resource Name \(ARN\)](#). For actions that don't support resource-level permissions, use a wildcard (*) to indicate that the statement applies to all resources.

```
"Resource": "*"
```

For more information about how to control access to Amazon Glue resources using ARNs, see [Specifying Amazon Glue resource ARNs](#).

To see a list of Amazon Glue resource types and their ARNs, see [Resources defined by Amazon Glue](#) in the *Service Authorization Reference*. To learn which actions you can use to specify the ARN of each resource, see [Actions defined by Amazon Glue](#).

Policy condition keys for Amazon Glue

Supports service-specific policy condition keys: Yes

Administrators can use Amazon JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The `Condition` element specifies when statements execute based on defined criteria. You can create conditional expressions that use [condition operators](#), such as equals or less than, to match the condition in the policy with values in the request. To see all Amazon global condition keys, see [Amazon global condition context keys](#) in the *IAM User Guide*.

To see a list of Amazon Glue condition keys, see [Condition keys for Amazon Glue](#) in the *Service Authorization Reference*. To learn which actions and resources you can use a condition key with, see [Actions defined by Amazon Glue](#).

To view example policies, see [Control settings using condition keys or context keys](#).

ACLs in Amazon Glue

Supports ACLs: No

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

ABAC with Amazon Glue

Supports ABAC (tags in policies): Partial

Attribute-based access control (ABAC) is an authorization strategy that defines permissions based on attributes called tags. You can attach tags to IAM entities and Amazon resources, then design ABAC policies to allow operations when the principal's tag matches the tag on the resource.

To control access based on tags, you provide tag information in the [condition element](#) of a policy using the `aws:ResourceTag/key-name`, `aws:RequestTag/key-name`, or `aws:TagKeys` condition keys.

If a service supports all three condition keys for every resource type, then the value is **Yes** for the service. If a service supports all three condition keys for only some resource types, then the value is **Partial**.

For more information about ABAC, see [Define permissions with ABAC authorization](#) in the *IAM User Guide*. To view a tutorial with steps for setting up ABAC, see [Use attribute-based access control \(ABAC\)](#) in the *IAM User Guide*.

⚠ Important

The condition context keys apply only to Amazon Glue API actions on crawlers, jobs, triggers, and development endpoints. For more information about which API operations are affected, see [Condition keys for Amazon Glue](#).

The Amazon Glue Data Catalog API operations don't currently support the `aws:referrer` and `aws:UserAgent` global condition context keys.

To view an example identity-based policy for limiting access to a resource based on the tags on that resource, see [Grant access using tags](#).

Using temporary credentials with Amazon Glue

Supports temporary credentials: Yes

Temporary credentials provide short-term access to Amazon resources and are automatically created when you use federation or switch roles. Amazon recommends that you dynamically generate temporary credentials instead of using long-term access keys. For more information, see [Temporary security credentials in IAM](#) and [Amazon Web Services services that work with IAM](#) in the *IAM User Guide*.

Cross-service principal permissions for Amazon Glue

Supports forward access sessions (FAS): No

Forward access sessions (FAS) use the permissions of the principal calling an Amazon Web Services service, combined with the requesting Amazon Web Services service to make requests to downstream services. For policy details when making FAS requests, see [Forward access sessions](#).

Service roles for Amazon Glue

Supports service roles: Yes

A service role is an [IAM role](#) that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see [Create a role to delegate permissions to an Amazon Web Services service](#) in the *IAM User Guide*.

Warning

Changing the permissions for a service role might break Amazon Glue functionality. Edit service roles only when Amazon Glue provides guidance to do so.

For detailed instructions on creating a service role for Amazon Glue, see [Step 1: Create an IAM policy for the Amazon Glue service](#) and [Step 2: Create an IAM role for Amazon Glue](#).

Service-linked roles for Amazon Glue

Supports service-linked roles: No

A service-linked role is a type of service role that is linked to an Amazon Web Services service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your Amazon Web Services account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.

For details about creating or managing service-linked roles, see [Amazon services that work with IAM](#). Find a service in the table that includes a Yes in the **Service-linked role** column. Choose the **Yes** link to view the service-linked role documentation for that service.

Configuring IAM permissions for Amazon Glue

You use Amazon Identity and Access Management (IAM) to define policies and roles that Amazon Glue uses to access resources. The following steps lead you through various options for setting up the permissions for Amazon Glue. Depending on your business needs, you might have to add or reduce access to your resources.

Note

To get started with basic IAM permissions for Amazon Glue instead, see [Setting up IAM permissions for Amazon Glue](#).

1. [Create an IAM policy for the Amazon Glue service](#): Create a service policy that allows access to Amazon Glue resources.

2. [Create an IAM role for Amazon Glue](#): Create an IAM role, and attach the Amazon Glue service policy and a policy for your Amazon Simple Storage Service (Amazon S3) resources that are used by Amazon Glue.
3. [Attach a policy to users or groups that access Amazon Glue](#): Attach policies to any users or groups that sign in to the Amazon Glue console.
4. [Create an IAM policy for notebooks](#): Create a notebook server policy to use in the creation of notebook servers on development endpoints.
5. [Create an IAM role for notebooks](#): Create an IAM role and attach the notebook server policy.
6. [Create an IAM policy for Amazon SageMaker AI notebooks](#): Create an IAM policy to use when creating Amazon SageMaker AI notebooks on development endpoints.
7. [Create an IAM role for Amazon SageMaker AI notebooks](#): Create an IAM role and attach the policy to grant permissions when creating Amazon SageMaker AI notebooks on development endpoints.

Step 1: Create an IAM policy for the Amazon Glue service

For any operation that accesses data on another Amazon resource, such as accessing your objects in Amazon S3, Amazon Glue needs permission to access the resource on your behalf. You provide those permissions by using Amazon Identity and Access Management (IAM).

Note

You can skip this step if you use the Amazon managed policy **AWSGlueServiceRole**.

In this step, you create a policy that is similar to **AWSGlueServiceRole**. You can find the most current version of **AWSGlueServiceRole** on the IAM console.

To create an IAM policy for Amazon Glue

This policy grants permission for some Amazon S3 actions to manage resources in your account that are needed by Amazon Glue when it assumes the role using this policy. Some of the resources that are specified in this policy refer to default names that are used by Amazon Glue for Amazon S3 buckets, Amazon S3 ETL scripts, CloudWatch Logs, and Amazon EC2 resources. For simplicity, Amazon Glue writes some Amazon S3 objects into buckets in your account prefixed with `aws-glue-*` by default.

1. Sign in to the Amazon Web Services Management Console and open the IAM console at <https://console.amazonaws.cn/iam/>.
2. In the left navigation pane, choose **Policies**.
3. Choose **Create Policy**.
4. On the **Create Policy** screen, navigate to a tab to edit JSON. Create a policy document with the following JSON statements, and then choose **Review policy**.

 **Note**

Add any permissions needed for Amazon S3 resources. You might want to scope the resources section of your access policy to only those resources that are required.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [

            "aws:TagKeys": [
                "aws-glue-service-resource"
            ]
        }
    },
    "Resource": [
        "arn:aws-cn:ec2:*:*:network-interface/*",
        "arn:aws-cn:ec2:*:*:security-group/*",
        "arn:aws-cn:ec2:*:*:instance/*"
    ]
}
]
}

```

The following table describes the permissions granted by this policy.

| Action | Resource | Description |
|--|----------|---|
| "glue:*" | "*" | Grants permission to run all Amazon Glue API operations. |
| "s3:GetBucketLocation", "s3:ListBucket", "s3:ListAllMyBuckets", "s3:GetBucketAcl", | "*" | Allows listing of Amazon S3 buckets from crawlers, jobs, development endpoints, and notebook servers. |

| Action | Resource | Description |
|--|------------------------------|---|
| "ec2:DescribeVpcEndpoints", "ec2:DescribeRouteTables", "ec2:CreateNetworkInterface", "ec2>DeleteNetworkInterface", "ec2:DescribeNetworkInterfaces", "ec2:DescribeSecurityGroups", "ec2:DescribeSubnets", "ec2:DescribeVpcAttribute", | "*" | Allows the setup of Amazon EC2 network items, such as virtual private clouds (VPCs) when running jobs, crawlers, and development endpoints. |
| "iam:ListRolePolicies", "iam:GetRole", "iam:GetRolePolicy" | "*" | Allows listing IAM roles from crawlers, jobs, development endpoints, and notebook servers. |
| "cloudwatch:PutMetricData" | "*" | Allows writing CloudWatch metrics for jobs. |
| "s3:CreateBucket", "s3:PutBucketPublicAccessBlock" | "arn:aws-cn:s3:::aws-glue-*" | <p>Allows the creation of Amazon S3 buckets in your account from jobs and notebook servers.</p> <p>Naming convention: Uses Amazon S3 folders named aws-glue-.</p> <p>Enables Amazon Glue to create buckets that block public access.</p> |

| Action | Resource | Description |
|--|--|---|
| "s3:GetObject",
"s3:PutObject",
"s3:DeleteObject" | "arn:aws-cn:s3:::aws-glue-*/*",
"arn:aws-cn:s3:::*/*aws-glue-*/*" | Allows get, put, and delete of Amazon S3 objects into your account when storing objects such as ETL scripts and notebook server locations.

Naming convention: Grants permission to Amazon S3 buckets or folders whose names are prefixed with aws-glue- . |
| "s3:GetObject" | "arn:aws-cn:s3:::crawler-public*",
"arn:aws-cn:s3:::aws-glue-*" | Allows get of Amazon S3 objects used by examples and tutorials from crawlers and jobs.

Naming convention: Amazon S3 bucket names begin with crawler-public and aws-glue- . |
| "logs:CreateLogGroup",
"logs:CreateLogStream",
"logs:PutLogEvents" | "arn:aws-cn:logs:*:*:log-group:/aws-glue/*" | Allows writing logs to CloudWatch Logs.

Naming convention: Amazon Glue writes logs to log groups whose names begin with aws-glue . |

| Action | Resource | Description |
|---------------------------------------|--|--|
| "ec2:CreateTags",
"ec2>DeleteTags" | "arn:aws-cn:ec2:*:*:
:network-interface/", "arn:aws-
cn:ec2:*:*:security-
group/*", "arn:aws-
cn:ec2:*:*:instance/*" | Allows tagging of Amazon EC2 resources created for development endpoints.

Naming convention: Amazon Glue tags Amazon EC2 network interfaces, security groups, and instances with aws-glue-service-resource . |

- On the **Review Policy** screen, enter your **Policy Name**, for example **GlueServiceRolePolicy**. Enter an optional description, and when you're satisfied with the policy, choose **Create policy**.

Step 2: Create an IAM role for Amazon Glue

You need to grant your IAM role permissions that Amazon Glue can assume when calling other services on your behalf. This includes access to Amazon S3 for any sources, targets, scripts, and temporary directories that you use with Amazon Glue. Permission is needed by crawlers, jobs, and development endpoints.

You provide those permissions by using Amazon Identity and Access Management (IAM). Add a policy to the IAM role that you pass to Amazon Glue.

To create an IAM role for Amazon Glue

- Sign in to the Amazon Web Services Management Console and open the IAM console at <https://console.amazonaws.cn/iam/>.
- In the left navigation pane, choose **Roles**.
- Choose **Create role**.
- Choose **Amazon service** as the trusted entity type. Then, for service or use case, find and choose **Amazon Glue**. Choose **Next**.
- On the **Add permissions** page, choose the policies that contain the required permissions; for example, the Amazon managed policy `AWSGlueServiceRole` for general Amazon Glue

permissions and the Amazon managed policy **AmazonS3FullAccess** for access to Amazon S3 resources. Then choose **Next**.

 **Note**

Ensure that one of the policies in this role grants permissions to your Amazon S3 sources and targets. You might want to provide your own policy for access to specific Amazon S3 resources. Data sources require `s3:ListBucket` and `s3:GetObject` permissions. Data targets require `s3:ListBucket`, `s3:PutObject`, and `s3:DeleteObject` permissions. For more information about creating an Amazon S3 policy for your resources, see [Specifying Resources in a Policy](#). For an example Amazon S3 policy, see [Writing IAM Policies: How to Grant Access to an Amazon S3 Bucket](#).

If you plan to access Amazon S3 sources and targets that are encrypted with SSE-KMS, attach a policy that allows Amazon Glue crawlers, jobs, and development endpoints to decrypt the data. For more information, see [Protecting Data Using Server-Side Encryption with Amazon KMS-Managed Keys \(SSE-KMS\)](#).

The following is an example.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:Decrypt"
      ],
      "Resource": [
        "arn:aws-cn:kms:*:111122223333:key/key-id"
      ]
    }
  ]
}
```

6. Name your role and add a description (optional), then review the trust policy and permissions. For **Role name**, enter a name for your role; for example, `AWSGlueServiceRoleDefault`.

Create the role with the name prefixed with the string `AWSGlueServiceRole` to allow the role to be passed from console users to the service. Amazon Glue provided policies expect IAM service roles to begin with `AWSGlueServiceRole`. Otherwise, you must add a policy to allow your users the `iam:PassRole` permission for IAM roles to match your naming convention. Choose **Create Role**.

Note

When you create a notebook with a role, that role is then passed to interactive sessions so that the same role can be used in both places. As such, the `iam:PassRole` permission needs to be part of the role's policy.

Create a new policy for your role using the following example. Replace the account number with your own and the role name.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "iam:PassRole",
      "Resource": "arn:aws:iam::090000000210:role/<role_name>"
    }
  ]
}
```

7. Add tags to your role (optional). Tags are key-value pairs that you can add to Amazon resources to help identify, organize, or search for resources. Then, choose **Create role**.

Step 3: Attach a policy to users or groups that access Amazon Glue

The administrator must assign permissions to any users, groups, or roles using the Amazon Glue console or Amazon Command Line Interface (Amazon CLI). You provide those permissions by using Amazon Identity and Access Management (IAM), through policies. This step describes assigning permissions to users or groups.

When you finish this step, your user or group has the following policies attached:

- The Amazon managed policy `AWSGlueConsoleFullAccess` or the custom policy `GlueConsoleAccessPolicy`
- `AWSGlueConsoleSageMakerNotebookFullAccess`
- `CloudWatchLogsReadOnlyAccess`
- `AWSCloudFormationReadOnlyAccess`
- `AmazonAthenaFullAccess`

To attach an inline policy and embed it in a user or group

You can attach an Amazon managed policy or an inline policy to a user or group to access the Amazon Glue console. Some of the resources specified in this policy refer to default names that are used by Amazon Glue for Amazon S3 buckets, Amazon S3 ETL scripts, CloudWatch Logs, Amazon CloudFormation, and Amazon EC2 resources. For simplicity, Amazon Glue writes some Amazon S3 objects into buckets in your account prefixed with `aws-glue-*` by default.

Note

You can skip this step if you use the Amazon managed policy `AWSGlueConsoleFullAccess`.

Important

Amazon Glue needs permission to assume a role that is used to perform work on your behalf. **To accomplish this, you add the `iam:PassRole` permissions to your Amazon Glue users or groups.** This policy grants permission to roles that begin with `AWSGlueServiceRole` for Amazon Glue service roles, and `AWSGlueServiceNotebookRole` for roles that are required when you create a notebook server. You can also create your own policy for `iam:PassRole` permissions that follows your naming convention.

Per security best practices, it is recommended to restrict access by tightening policies to further restrict access to Amazon S3 bucket and Amazon CloudWatch log groups. For an example Amazon S3 policy, see [Writing IAM Policies: How to Grant Access to an Amazon S3 Bucket](#).

In this step, you create a policy that is similar to `AWSGlueConsoleFullAccess`. You can find the most current version of `AWSGlueConsoleFullAccess` on the IAM console.

1. Sign in to the Amazon Web Services Management Console and open the IAM console at <https://console.amazonaws.cn/iam/>.
2. In the navigation pane, choose **Users** or **User groups**.
3. In the list, choose the name of the user or group to embed a policy in.
4. Choose the **Permissions** tab and, if necessary, expand the **Permissions policies** section.
5. Choose the **Add Inline policy** link.
6. On the **Create Policy** screen, navigate to a tab to edit JSON. Create a policy document with the following JSON statements, and then choose **Review policy**.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "glue:*",
        "redshift:DescribeClusters",
        "redshift:DescribeClusterSubnetGroups",
        "iam:ListRoles",
        "iam:ListUsers",
        "iam:ListGroups",
        "iam:ListRolePolicies",
        "iam:GetRole",
        "iam:GetRolePolicy",
        "iam:ListAttachedRolePolicies",
        "ec2:DescribeSecurityGroups",
        "ec2:DescribeSubnets",
        "ec2:DescribeVpcs",
        "ec2:DescribeVpcEndpoints",
        "ec2:DescribeRouteTables",
        "ec2:DescribeVpcAttribute",
        "ec2:DescribeKeyPairs",
        "ec2:DescribeInstances",
        "rds:DescribeDBInstances",
        "rds:DescribeDBClusters",
```

```

    "rds:DescribeDBSubnetGroups",
    "s3:ListAllMyBuckets",
    "s3:ListBucket",
    "s3:GetBucketAcl",
    "s3:GetBucketLocation",
    "cloudformation:DescribeStacks",
    "cloudformation:GetTemplateSummary",
    "dynamodb:ListTables",
    "kms:ListAliases",
    "kms:DescribeKey",
    "cloudwatch:GetMetricData",
    "cloudwatch:ListDashboards"
  ],
  "Resource": [
    "*"
  ]
},
{
  "Effect": "Allow",
  "Action": [
    "s3:GetObject",
    "s3:PutObject"
  ],
  "Resource": [
    "arn:aws-cn:s3:::/*aws-glue-*/",
    "arn:aws-cn:s3:::aws-glue-*"
  ]
},
{

    ],
    "Condition": {
      "StringLike": {
        "iam:PassedToService": [
          "glue.amazonaws.com"
        ]
      }
    }
  }
]
}

```

The following table describes the permissions granted by this policy.

| Action | Resource | Description |
|---|----------|--|
| "glue:*" | "*" | <p>Grants permission to run all Amazon Glue API operations.</p> <p>If you had previously created your policy without the "glue:*" action, you must add the following individual permissions to your policy:</p> <ul style="list-style-type: none"> • "glue:ListCrawlers" • "glue:BatchGetCrawlers" • "glue:ListTriggers" • "glue:BatchGetTriggers" • "glue:ListDevEndpoints" • "glue:BatchGetDevEndpoints" • "glue:ListJobs" • "glue:BatchGetJobs" |
| "redshift:DescribeClusters", "redshift:DescribeClusterSubnetGroups" | "*" | Allows creation of connections to Amazon Redshift. |

| Action | Resource | Description |
|---|----------|---|
| "iam:ListRoles", "iam:ListRolePolicies", "iam:GetRole", "iam:GetRolePolicy", "iam:ListAttachedRolePolicies" | "*" | Allows listing IAM roles when working with crawlers, jobs, development endpoints , and notebook servers. |
| "ec2:DescribeSecurityGroups", "ec2:DescribeSubnets", "ec2:DescribeVpcs", "ec2:DescribeVpcEndpoints", "ec2:DescribeRouteTables", "ec2:DescribeVpcAttribute", "ec2:DescribeKeyPairs", "ec2:DescribeInstances" | "*" | Allows setup of Amazon EC2 network items, such as VPCs, when running jobs, crawlers, and development endpoints . |
| "rds:DescribeDBInstances" | "*" | Allows creation of connections to Amazon RDS. |
| "s3:ListAllMyBuckets", "s3:ListBucket", "s3:GetBucketAcl", "s3:GetBucketLocation" | "*" | Allows listing of Amazon S3 buckets when working with crawlers, jobs, development endpoints , and notebook servers. |
| "dynamodb:ListTables" | "*" | Allows listing of DynamoDB tables. |
| "kms:ListAliases", "kms:DescribeKey" | "*" | Allows working with KMS keys. |

| Action | Resource | Description |
|---|---|--|
| "cloudwatch:GetMetricData", "cloudwatch:ListDashboards" | "*" | Allows working with CloudWatch metrics. |
| "s3:GetObject", "s3:PutObject" | "arn:aws-cn:s3:::aws-glue-*/*",
"arn:aws-cn:s3:::*/*aws-glue-*/*",
"arn:aws-cn:s3:::aws-glue-*" | Allows get and put of Amazon S3 objects into your account when storing objects such as ETL scripts and notebook server locations.

Naming convention: Grants permission to Amazon S3 buckets or folders whose names are prefixed with aws-glue- . |
| "tag:GetResources" | "*" | Allows retrieval of Amazon tags. |

| Action | Resource | Description |
|---|--|---|
| <p>"s3:CreateBucket",
"s3:PutBucketPublicAccessBlock"</p> | <p>"arn:aws-cn:s3:::
aws-glue-*</p> | <p>Allows creation of an Amazon S3 bucket into your account when storing objects such as ETL scripts and notebook server locations.</p> <p>Naming convention: Grants permission to Amazon S3 buckets whose names are prefixed with aws-glue-.</p> <p>Enables Amazon Glue to create buckets that block public access.</p> |
| <p>"logs:GetLogEvents"</p> | <p>"arn:aws-cn:logs:*
:*: /aws-glue/*"</p> | <p>Allows retrieval of CloudWatch Logs.</p> <p>Naming convention: Amazon Glue writes logs to log groups whose names begin with aws-glue-.</p> |

| Action | Resource | Description |
|--|---|--|
| "cloudformation:CreateStack", "cloudformation>DeleteStack" | "arn:aws-cn:cloudformation:*:*:stack/aws-glue*/**" | <p>Allows managing Amazon CloudFormation stacks when working with notebook servers.</p> <p>Naming convention: Amazon Glue creates stacks whose names begin with aws-glue.</p> |
| "ec2:RunInstances" | "arn:aws-cn:ec2:*:*:instance/**",
"arn:aws-cn:ec2:*:*:key-pair/**",
"arn:aws-cn:ec2:*:*:image/**",
"arn:aws-cn:ec2:*:*:security-group/**", "arn:aws-cn:ec2:*:*:network-interface/**",
"arn:aws-cn:ec2:*:*:subnet/**",
"arn:aws-cn:ec2:*:*:volume/**" | Allows running of development endpoints and notebook servers. |
| "iam:PassRole" | "arn:aws-cn:iam:*:*:role/AWSGlueServiceRole*" | Allows Amazon Glue to assume PassRole permission for roles that begin with AWSGlueServiceRole . |

| Action | Resource | Description |
|----------------|--|---|
| "iam:PassRole" | "arn:aws-cn:iam::*:role/ AWSGlueServiceNotebookRole*" | Allows Amazon EC2 to assume PassRole permission for roles that begin with AWSGlueServiceNotebookRole . |
| "iam:PassRole" | "arn:aws-cn:iam::*:role/service-role/ AWSGlueServiceRole*" | Allows Amazon Glue to assume PassRole permission for roles that begin with service-role/ AWSGlueServiceRole . |

- On the **Review policy** screen, enter a name for the policy, for example **GlueConsoleAccessPolicy**. When you're satisfied with the policy, choose **Create policy**. Ensure that no errors appear in a red box at the top of the screen. Correct any that are reported.

 **Note**

If **Use autofor**matting is selected, the policy is reformatted whenever you open a policy or choose **Validate Policy**.

To attach the AWSGlueConsoleFullAccess managed policy

You can attach the AWSGlueConsoleFullAccess policy to provide permissions that are required by the Amazon Glue console user.

 **Note**

You can skip this step if you created your own policy for Amazon Glue console access.

1. Sign in to the Amazon Web Services Management Console and open the IAM console at <https://console.amazonaws.cn/iam/>.
2. In the navigation pane, choose **Policies**.
3. In the list of policies, select the check box next to the **AWSGlueConsoleFullAccess**. You can use the **Filter** menu and the search box to filter the list of policies.
4. Choose **Policy actions**, and then choose **Attach**.
5. Choose the user to attach the policy to. You can use the **Filter** menu and the search box to filter the list of principal entities. After choosing the user to attach the policy to, choose **Attach policy**.

To attach the **AWSGlueConsoleSageMakerNotebookFullAccess** managed policy

You can attach the **AWSGlueConsoleSageMakerNotebookFullAccess** policy to a user to manage SageMaker AI notebooks created on the Amazon Glue console. In addition to other required Amazon Glue console permissions, this policy grants access to resources needed to manage SageMaker AI notebooks.

1. Sign in to the Amazon Web Services Management Console and open the IAM console at <https://console.amazonaws.cn/iam/>.
2. In the navigation pane, choose **Policies**.
3. In the list of policies, select the check box next to the **AWSGlueConsoleSageMakerNotebookFullAccess**. You can use the **Filter** menu and the search box to filter the list of policies.
4. Choose **Policy actions**, and then choose **Attach**.
5. Choose the user to attach the policy to. You can use the **Filter** menu and the search box to filter the list of principal entities. After choosing the user to attach the policy to, choose **Attach policy**.

To attach the **CloudWatchLogsReadOnlyAccess** managed policy

You can attach the **CloudWatchLogsReadOnlyAccess** policy to a user to view the logs created by Amazon Glue on the CloudWatch Logs console.

1. Sign in to the Amazon Web Services Management Console and open the IAM console at <https://console.amazonaws.cn/iam/>.

2. In the navigation pane, choose **Policies**.
3. In the list of policies, select the check box next to the **CloudWatchLogsReadOnlyAccess**. You can use the **Filter** menu and the search box to filter the list of policies.
4. Choose **Policy actions**, and then choose **Attach**.
5. Choose the user to attach the policy to. You can use the **Filter** menu and the search box to filter the list of principal entities. After choosing the user to attach the policy to, choose **Attach policy**.

To attach the **AWSCloudFormationReadOnlyAccess** managed policy

You can attach the **AWSCloudFormationReadOnlyAccess** policy to a user to view the Amazon CloudFormation stacks used by Amazon Glue on the Amazon CloudFormation console.

1. Sign in to the Amazon Web Services Management Console and open the IAM console at <https://console.amazonaws.cn/iam/>.
2. In the navigation pane, choose **Policies**.
3. In the list of policies, select the check box next to **AWSCloudFormationReadOnlyAccess**. You can use the **Filter** menu and the search box to filter the list of policies.
4. Choose **Policy actions**, and then choose **Attach**.
5. Choose the user to attach the policy to. You can use the **Filter** menu and the search box to filter the list of principal entities. After choosing the user to attach the policy to, choose **Attach policy**.

To attach the **AmazonAthenaFullAccess** managed policy

You can attach the **AmazonAthenaFullAccess** policy to a user to view Amazon S3 data in the Athena console.

1. Sign in to the Amazon Web Services Management Console and open the IAM console at <https://console.amazonaws.cn/iam/>.
2. In the navigation pane, choose **Policies**.
3. In the list of policies, select the check box next to the **AmazonAthenaFullAccess**. You can use the **Filter** menu and the search box to filter the list of policies.
4. Choose **Policy actions**, and then choose **Attach**.

5. Choose the user to attach the policy to. You can use the **Filter** menu and the search box to filter the list of principal entities. After choosing the user to attach the policy to, choose **Attach policy**.

Step 4: Create an IAM policy for notebook servers

If you plan to use notebooks with development endpoints, you must specify permissions when you create the notebook server. You provide those permissions by using Amazon Identity and Access Management (IAM).

This policy grants permission for some Amazon S3 actions to manage resources in your account that are needed by Amazon Glue when it assumes the role using this policy. Some of the resources that are specified in this policy refer to default names used by Amazon Glue for Amazon S3 buckets, Amazon S3 ETL scripts, and Amazon EC2 resources. For simplicity, Amazon Glue defaults writing some Amazon S3 objects into buckets in your account prefixed with `aws-glue-*`.

Note

You can skip this step if you use the Amazon managed policy **AWSGlueServiceNotebookRole**.

In this step, you create a policy that is similar to `AWSGlueServiceNotebookRole`. You can find the most current version of `AWSGlueServiceNotebookRole` on the IAM console.

To create an IAM policy for notebooks

1. Sign in to the Amazon Web Services Management Console and open the IAM console at <https://console.amazonaws.cn/iam/>.
2. In the left navigation pane, choose **Policies**.
3. Choose **Create Policy**.
4. On the **Create Policy** screen, navigate to a tab to edit JSON. Create a policy document with the following JSON statements, and then choose **Review policy**.

JSON

```
{  
  "Version": "2012-10-17",
```

```
"Statement": [  
  {  
    "Effect": "Allow",  
    "Action": [

}

```

The following table describes the permissions granted by this policy.

| Action | Resource | Description |
|---|--|---|
| "glue:*" | "*" | Grants permission to run all Amazon Glue API operations. |
| "s3:GetBucketLocation", "s3:ListBucket", "s3:ListAllMyBuckets", "s3:GetBucketAcl" | "*" | Allows listing of Amazon S3 buckets from notebook servers. |
| "s3:GetObject" | "arn:aws-cn:s3:::crawler-public*",
"arn:aws-cn:s3:::aws-glue-*" | Allows get of Amazon S3 objects used by examples and tutorials from notebooks.

Naming convention: Amazon S3 bucket names begin with crawler-public and aws-glue- . |

| Action | Resource | Description |
|---------------------------------------|--|--|
| "s3:PutObject",
"s3:DeleteObject" | "arn:aws-cn:s3:::aws-glue*" | Allows put and delete of Amazon S3 objects into your account from notebooks.

Naming convention: Uses Amazon S3 folders named aws-glue . |
| "ec2:CreateTags",
"ec2:DeleteTags" | "arn:aws-cn:ec2:*:*:network-interface/*", "arn:aws-cn:ec2:*:*:security-group/*", "arn:aws-cn:ec2:*:*:instance/*" | Allows tagging of Amazon EC2 resources created for notebook servers.

Naming convention: Amazon Glue tags Amazon EC2 instances with aws-glue-service-resource . |

- On the **Review Policy** screen, enter your **Policy Name**, for example **GlueServiceNotebookPolicyDefault**. Enter an optional description, and when you're satisfied with the policy, choose **Create policy**.

Step 5: Create an IAM role for notebook servers

If you plan to use notebooks with development endpoints, you need to grant the IAM role permissions. You provide those permissions by using Amazon Identity and Access Management IAM, through an IAM role.

Note

When you create an IAM role using the IAM console, the console creates an instance profile automatically and gives it the same name as the role to which it corresponds.

To create an IAM role for notebooks

1. Sign in to the Amazon Web Services Management Console and open the IAM console at <https://console.amazonaws.cn/iam/>.
2. In the left navigation pane, choose **Roles**.
3. Choose **Create role**.
4. For role type, choose **Amazon Service**, find and choose **EC2**, and choose the **EC2** use case, then choose **Next: Permissions**.
5. On the **Attach permissions policy** page, choose the policies that contain the required permissions; for example, **AWSGlueServiceNotebookRole** for general Amazon Glue permissions and the Amazon managed policy **AmazonS3FullAccess** for access to Amazon S3 resources. Then choose **Next: Review**.

Note

Ensure that one of the policies in this role grants permissions to your Amazon S3 sources and targets. Also confirm that your policy allows full access to the location where you store your notebook when you create a notebook server. You might want to provide your own policy for access to specific Amazon S3 resources. For more information about creating an Amazon S3 policy for your resources, see [Specifying Resources in a Policy](#).

If you plan to access Amazon S3 sources and targets that are encrypted with SSE-KMS, attach a policy that allows notebooks to decrypt the data. For more information, see [Protecting Data Using Server-Side Encryption with Amazon KMS-Managed Keys \(SSE-KMS\)](#).

The following is an example.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:Decrypt"
      ],
      "Resource": [
```

```

        "arn:aws-cn:kms:*:111122223333:key/key-id"
      ]
    }
  ]
}

```

- For **Role name**, enter a name for your role. Create the role with the name prefixed with the string `AWSGlueServiceNotebookRole` to allow the role to be passed from console users to the notebook server. Amazon Glue provided policies expect IAM service roles to begin with `AWSGlueServiceNotebookRole`. Otherwise you must add a policy to your users to allow the `iam:PassRole` permission for IAM roles to match your naming convention. For example, enter `AWSGlueServiceNotebookRoleDefault`. Then choose **Create role**.

Step 6: Create an IAM policy for SageMaker AI notebooks

If you plan to use SageMaker AI notebooks with development endpoints, you must specify permissions when you create the notebook. You provide those permissions by using Amazon Identity and Access Management (IAM).

To create an IAM policy for SageMaker AI notebooks

- Sign in to the Amazon Web Services Management Console and open the IAM console at <https://console.amazonaws.cn/iam/>.
- In the left navigation pane, choose **Policies**.
- Choose **Create Policy**.
- On the **Create Policy** page, navigate to a tab to edit the JSON. Create a policy document with the following JSON statements. Edit *bucket-name*, *region-code*, and *account-id* for your environment.

JSON

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Action": [
        "s3:ListBucket"
      ],

```

```

        "Effect": "Allow",
        "Resource": [
            "arn:aws-cn:s3:::amzn-s3-demo-bucket"
        ]
    },
    {
        "Action": [
            "s3:GetObject"
        ],
        "Effect": "Allow",
        "Resource": [
            "arn:aws-cn:s3:::amzn-s3-demo-bucket*"
        ]
    },
    {
        "Action": [
            "logs:CreateLogStream",
            "logs:DescribeLogStreams",
            "logs:PutLogEvents",
            "logs:CreateLogGroup"
        ],
        "Effect": "Allow",
        "Resource": [
            "arn:aws-cn:logs:us-east-1:111122223333:log-group:/aws/
sagemaker/*",
            "arn:aws-cn:logs:us-east-1:111122223333:log-group:/aws/
sagemaker/*:log-stream:aws-glue-*"
        ]
    },
    {
        "Action": [
            "glue:UpdateDevEndpoint",
            "glue:GetDevEndpoint",
            "glue:GetDevEndpoints"
        ],
        "Effect": "Allow",
        "Resource": [
            "arn:aws-cn:glue:us-east-1:111122223333:devEndpoint/*"
        ]
    },
    {
        "Action": [
            "sagemaker:ListTags"
        ],

```

```

        "Effect": "Allow",
        "Resource": [
            "arn:aws-cn:sagemaker:us-east-1:111122223333:notebook-
instance/*"
        ]
    }
]
}

```

Then choose **Review policy**.

The following table describes the permissions granted by this policy.

| Action | Resource | Description |
|---|--|---|
| "s3:ListBucket*" | "arn:aws-cn:s3:: <i>bucket-name</i> " | Grants permission to list Amazon S3 buckets. |
| "s3:GetObject" | "arn:aws-cn:s3:: <i>bucket-name</i> *" | Grants permission to get Amazon S3 objects that are used by SageMaker AI notebooks. |
| "logs:CreateLogStream", "logs:DescribeLogStreams", "logs:PutLogEvents", "logs:CreateLogGroup" | "arn:aws-cn:logs: <i>region-code</i> : <i>account-id</i> :log-group:/aws/sagemaker/*", "arn:aws-cn:logs: <i>region-code</i> : <i>account-id</i> :log-group:/aws/sagemaker/*:log-stream:aws-glue-*" | Grants permission to write logs to Amazon CloudWatch Logs from notebooks.

Naming convention: Writes to log groups whose names begin with aws-glue . |

| Action | Resource | Description |
|---|---|--|
| "glue:UpdateDevEndpoint", "glue:GetDevEndpoint", "glue:GetDevEndpoints" | "arn:aws-cn:glue: <i>region-code</i> : <i>account-id</i> :devEndpoint/*" | Grants permission to use a development endpoint from SageMaker AI notebooks. |
| "sagemaker:ListTags" | "arn:aws-cn:sagemaker: <i>region-code</i> : <i>account-id</i> :notebook-instance/*" | Grants permission to return tags for an SageMaker AI resource. The aws-glue-dev-endpoint tag is required on the SageMaker AI notebook for connecting the notebook to a development endpoint. |

- On the **Review Policy** screen, enter your **Policy Name**, for example `AWSGlueSageMakerNotebook`. Enter an optional description, and when you're satisfied with the policy, choose **Create policy**.

Step 7: Create an IAM role for SageMaker AI notebooks

If you plan to use SageMaker AI notebooks with development endpoints, you need to grant the IAM role permissions. You provide those permissions by using Amazon Identity and Access Management (IAM), through an IAM role.

To create an IAM role for SageMaker AI notebooks

- Sign in to the Amazon Web Services Management Console and open the IAM console at <https://console.amazonaws.cn/iam/>.
- In the left navigation pane, choose **Roles**.
- Choose **Create role**.
- For role type, choose **Amazon Service**, find and choose **SageMaker**, and then choose the **SageMaker - Execution** use case. Then choose **Next: Permissions**.
- On the **Attach permissions policy** page, choose the policies that contain the required permissions; for example, **AmazonSageMakerFullAccess**. Choose **Next: Review**.

If you plan to access Amazon S3 sources and targets that are encrypted with SSE-KMS, attach a policy that allows notebooks to decrypt the data, as shown in the following example. For more information, see [Protecting Data Using Server-Side Encryption with Amazon KMS-Managed Keys \(SSE-KMS\)](#).

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:Decrypt"
      ],
      "Resource": [
        "arn:aws-cn:kms:*:111122223333:key/key-id"
      ]
    }
  ]
}
```

6. For **Role name**, enter a name for your role. To allow the role to be passed from console users to SageMaker AI, use a name that is prefixed with the string `AWSGlueServiceSageMakerNotebookRole`. Amazon Glue provided policies expect IAM roles to begin with `AWSGlueServiceSageMakerNotebookRole`. Otherwise you must add a policy to your users to allow the `iam:PassRole` permission for IAM roles to match your naming convention.

For example, enter `AWSGlueServiceSageMakerNotebookRole-Default`, and then choose **Create role**.

7. After you create the role, attach the policy that allows additional permissions required to create SageMaker AI notebooks from Amazon Glue.

Open the role that you just created, `AWSGlueServiceSageMakerNotebookRole-Default`, and choose **Attach policies**. Attach the policy that you created named `AWSGlueSageMakerNotebook` to the role.

Amazon Glue access control policy examples

This section contains examples of both identity-based (IAM) access control policies and Amazon Glue resource policies.

Identity-based policy examples for Amazon Glue

By default, users and roles don't have permission to create or modify Amazon Glue resources. To grant users permission to perform actions on the resources that they need, an IAM administrator can create IAM policies.

To learn how to create an IAM identity-based policy by using these example JSON policy documents, see [Create IAM policies \(console\)](#) in the *IAM User Guide*.

For details about actions and resource types defined by Amazon Glue, including the format of the ARNs for each of the resource types, see [Actions, resources, and condition keys for Amazon Glue](#) in the *Service Authorization Reference*.

Note

The examples provided in this section all use the us-west-2 Region. You can replace this with the Amazon Region that you want to use.

Policy best practices

Identity-based policies determine whether someone can create, access, or delete Amazon Glue resources in your account. These actions can incur costs for your Amazon Web Services account. When you create or edit identity-based policies, follow these guidelines and recommendations:

- **Get started with Amazon managed policies and move toward least-privilege permissions**
 - To get started granting permissions to your users and workloads, use the *Amazon managed policies* that grant permissions for many common use cases. They are available in your Amazon Web Services account. We recommend that you reduce permissions further by defining Amazon

customer managed policies that are specific to your use cases. For more information, see [Amazon managed policies](#) or [Amazon managed policies for job functions](#) in the *IAM User Guide*.

- **Apply least-privilege permissions** – When you set permissions with IAM policies, grant only the permissions required to perform a task. You do this by defining the actions that can be taken on specific resources under specific conditions, also known as *least-privilege permissions*. For more information about using IAM to apply permissions, see [Policies and permissions in IAM](#) in the *IAM User Guide*.
- **Use conditions in IAM policies to further restrict access** – You can add a condition to your policies to limit access to actions and resources. For example, you can write a policy condition to specify that all requests must be sent using SSL. You can also use conditions to grant access to service actions if they are used through a specific Amazon Web Services service, such as Amazon CloudFormation. For more information, see [IAM JSON policy elements: Condition](#) in the *IAM User Guide*.
- **Use IAM Access Analyzer to validate your IAM policies to ensure secure and functional permissions** – IAM Access Analyzer validates new and existing policies so that the policies adhere to the IAM policy language (JSON) and IAM best practices. IAM Access Analyzer provides more than 100 policy checks and actionable recommendations to help you author secure and functional policies. For more information, see [Validate policies with IAM Access Analyzer](#) in the *IAM User Guide*.
- **Require multi-factor authentication (MFA)** – If you have a scenario that requires IAM users or a root user in your Amazon Web Services account, turn on MFA for additional security. To require MFA when API operations are called, add MFA conditions to your policies. For more information, see [Secure API access with MFA](#) in the *IAM User Guide*.

For more information about best practices in IAM, see [Security best practices in IAM](#) in the *IAM User Guide*.

Resource-level permissions only apply to specific Amazon Glue objects

You can only define fine-grained control for specific objects in Amazon Glue. Therefore you must write your client's IAM policy so that API operations that allow Amazon Resource Names (ARNs) for the Resource statement are not mixed with API operations that don't allow ARNs.

For example, the following IAM policy allows API operations for `GetClassifier` and `GetJobRun`. It defines the Resource as `*` because Amazon Glue doesn't allow ARNs for classifiers and job runs. Because ARNs are allowed for specific API operations such as `GetDatabase` and `GetTable`, ARNs can be specified in the second half of the policy.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "glue:GetClassifier*",
        "glue:GetJobRun*"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "glue:Get*"
      ],
      "Resource": [
        "arn:aws:glue:us-east-1:111122223333:catalog",
        "arn:aws:glue:us-east-1:111122223333:database/default",
        "arn:aws:glue:us-east-1:111122223333:table/default/e*1*",
        "arn:aws:glue:us-east-1:111122223333:connection/connection2"
      ]
    }
  ]
}
```

For a list of Amazon Glue objects that allow ARNs, see [Specifying Amazon Glue Resource ARNs](#).

Using the Amazon Glue console

To access the Amazon Glue console, you must have a minimum set of permissions. These permissions must allow you to list and view details about the Amazon Glue resources in your Amazon Web Services account. If you create an identity-based policy that is more restrictive than the minimum required permissions, the console won't function as intended for entities (users or roles) with that policy.

You don't need to allow minimum console permissions for users that are making calls only to the Amazon CLI or the Amazon API. Instead, allow access to only the actions that match the API operation that they're trying to perform.

To ensure that users and roles can still use the Amazon Glue console, also attach the Amazon Glue *ConsoleAccess* or *ReadOnly* Amazon managed policy to the entities. For more information, see [Adding permissions to a user](#) in the *IAM User Guide*.

For a user to work with the Amazon Glue console, that user must have a minimum set of permissions that allows them to work with the Amazon Glue resources for their Amazon account. In addition to these Amazon Glue permissions, the console requires permissions from the following services:

- Amazon CloudWatch Logs permissions to display logs.
- Amazon Identity and Access Management (IAM) permissions to list and pass roles.
- Amazon CloudFormation permissions to work with stacks.
- Amazon Elastic Compute Cloud (Amazon EC2) permissions to list VPCs, subnets, security groups, instances, and other objects.
- Amazon Simple Storage Service (Amazon S3) permissions to list buckets and objects, and to retrieve and save scripts.
- Amazon Redshift permissions to work with clusters.
- Amazon Relational Database Service (Amazon RDS) permissions to list instances.

For more information about the permissions that users require to view and work with the Amazon Glue console, see [Step 3: Attach a policy to users or groups that access Amazon Glue](#).

If you create an IAM policy that is more restrictive than the minimum required permissions, the console won't function as intended for users with that IAM policy. To ensure that those users can still use the Amazon Glue console, also attach the *AWSGlueConsoleFullAccess* managed policy as described in [Amazon managed \(predefined\) policies for Amazon Glue](#).

Allow users to view their own permissions

This example shows how you might create a policy that allows IAM users to view the inline and managed policies that are attached to their user identity. This policy includes permissions to complete this action on the console or programmatically using the Amazon CLI or Amazon API.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "ViewOwnUserInfo",
```

```

    "Effect": "Allow",
    "Action": [
      "iam:GetUserPolicy",
      "iam:ListGroupsForUser",
      "iam:ListAttachedUserPolicies",
      "iam:ListUserPolicies",
      "iam:GetUser"
    ],
    "Resource": ["arn:aws-cn:iam::*:user/${aws:username}"]
  },
  {
    "Sid": "NavigateInConsole",
    "Effect": "Allow",
    "Action": [
      "iam:GetGroupPolicy",
      "iam:GetPolicyVersion",
      "iam:GetPolicy",
      "iam:ListAttachedGroupPolicies",
      "iam:ListGroupPolicies",
      "iam:ListPolicyVersions",
      "iam:ListPolicies",
      "iam:ListUsers"
    ],
    "Resource": "*"
  }
]
}

```

Grant read-only permission to a table

The following policy grants read-only permission to a books table in database db1. For more information about resource Amazon Resource Names (ARNs), see [Data Catalog ARNs](#).

JSON

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GetTablesActionOnBooks",
      "Effect": "Allow",
      "Action": [
        "glue:GetTables",

```

```

    "glue:GetTable"
  ],
  "Resource": [
    "arn:aws:glue:us-east-1:111122223333:catalog",
    "arn:aws:glue:us-east-1:111122223333:database/db1",
    "arn:aws:glue:us-east-1:111122223333:table/db1/books"
  ]
}
]
}

```

This policy grants read-only permission to a table named books in the database named db1. To grant Get permission to a table, permission to the catalog and database resources is also required.

The following policy grants the minimum necessary permissions to create table tb1 in database db1:

JSON

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "glue:CreateTable"
      ],
      "Resource": [
        "arn:aws:glue:us-east-1:111122223333:table/db1/tb1",
        "arn:aws:glue:us-east-1:111122223333:database/db1",
        "arn:aws:glue:us-east-1:111122223333:catalog"
      ]
    }
  ]
}

```

Filter tables by GetTables permission

Assume that there are three tables—customers, stores, and store_sales—in database db1. The following policy grants GetTables permission to stores and store_sales, but

not to customers. When you call `GetTables` with this policy, the result contains only the two authorized tables (the `customers` table is not returned).

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GetTablesExample",
      "Effect": "Allow",
      "Action": [
        "glue:GetTables"
      ],
      "Resource": [
        "arn:aws:glue:us-east-1:111122223333:catalog",
        "arn:aws:glue:us-east-1:111122223333:database/db1",
        "arn:aws:glue:us-east-1:111122223333:table/db1/store_sales",
        "arn:aws:glue:us-east-1:111122223333:table/db1/stores"
      ]
    }
  ]
}
```

You can simplify the preceding policy by using `store*` to match any table names that start with `store`.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GetTablesExample2",
      "Effect": "Allow",
      "Action": [
        "glue:GetTables"
      ],
      "Resource": [
        "arn:aws:glue:us-east-1:111122223333:catalog",

```

```

        "arn:aws:glue:us-east-1:111122223333:database/db1",
        "arn:aws:glue:us-east-1:111122223333:table/db1/store*"
    ]
}
]
}

```

Similarly, using `/db1/*` to match all tables in db1, the following policy grants `GetTables` access to all the tables in db1.

JSON

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GetTablesReturnAll",
      "Effect": "Allow",
      "Action": [
        "glue:GetTables"
      ],
      "Resource": [
        "arn:aws:glue:us-east-1:111122223333:catalog",
        "arn:aws:glue:us-east-1:111122223333:database/db1",
        "arn:aws:glue:us-east-1:111122223333:table/db1/*"
      ]
    }
  ]
}

```

If no table ARN is provided, a call to `GetTables` succeeds, but it returns an empty list.

JSON

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GetTablesEmptyResults",

```

```
"Effect": "Allow",
"Action": [
  "glue:GetTables"
],
"Resource": [
  "arn:aws:glue:us-east-1:111122223333:catalog",
  "arn:aws:glue:us-east-1:111122223333:database/db1"
]
}
]
```

If the database ARN is missing in the policy, a call to `GetTables` fails with an `AccessDeniedException`.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "GetTablesAccessDeny",
      "Effect": "Allow",
      "Action": [
        "glue:GetTables"
      ],
      "Resource": [
        "arn:aws:glue:us-east-1:111122223333:catalog",
        "arn:aws:glue:us-east-1:111122223333:table/db1/*"
      ]
    }
  ]
}
```

Grant full access to a table and all partitions

The following policy grants all permissions on a table named `books` in database `db1`. This includes read and write permissions on the table itself, on archived versions of it, and on all its partitions.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "FullAccessOnTable",
      "Effect": "Allow",
      "Action": [
        "glue:CreateTable",
        "glue:GetTable",
        "glue:GetTables",
        "glue:UpdateTable",
        "glue>DeleteTable",
        "glue:BatchDeleteTable",
        "glue:GetTableVersion",
        "glue:GetTableVersions",
        "glue>DeleteTableVersion",
        "glue:BatchDeleteTableVersion",
        "glue:CreatePartition",
        "glue:BatchCreatePartition",
        "glue:GetPartition",
        "glue:GetPartitions",
        "glue:BatchGetPartition",
        "glue:UpdatePartition",
        "glue>DeletePartition",
        "glue:BatchDeletePartition"
      ],
      "Resource": [
        "arn:aws:glue:us-east-1:111122223333:catalog",
        "arn:aws:glue:us-east-1:111122223333:database/db1",
        "arn:aws:glue:us-east-1:111122223333:table/db1/books"
      ]
    }
  ]
}
```

The preceding policy can be simplified in practice.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "FullAccessOnTable",
      "Effect": "Allow",
      "Action": [
        "glue:*Table*",
        "glue:*Partition*"
      ],
      "Resource": [
        "arn:aws:glue:us-east-1:111122223333:catalog",
        "arn:aws:glue:us-east-1:111122223333:database/db1",
        "arn:aws:glue:us-east-1:111122223333:table/db1/books"
      ]
    }
  ]
}
```

Notice that the minimum granularity of fine-grained access control is at the table level. This means that you can't grant a user access to some partitions in a table but not others, or to some table columns but not to others. A user either has access to all of a table, or to none of it.

Control access by name prefix and explicit denial

In this example, suppose that the databases and tables in your Amazon Glue Data Catalog are organized using name prefixes. The databases in the development stage have the name prefix `dev-`, and those in production have the name prefix `prod-`. You can use the following policy to grant developers full access to all databases, tables, UDFs, and so on, that have the `dev-` prefix. But you grant read-only access to everything with the `prod-` prefix.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "DevAndProdFullAccess",
```

```

    "Effect": "Allow",
    "Action": [
      "glue:*Database*",
      "glue:*Table*",
      "glue:*Partition*",
      "glue:*UserDefinedFunction*",
      "glue:*Connection*"
    ],
    "Resource": [
      "arn:aws:glue:us-east-1:111122223333:catalog",
      "arn:aws:glue:us-east-1:111122223333:database/dev-*",
      "arn:aws:glue:us-east-1:111122223333:database/prod-*",
      "arn:aws:glue:us-east-1:111122223333:table/dev-*/*",
      "arn:aws:glue:us-east-1:111122223333:table/*/dev-*",
      "arn:aws:glue:us-east-1:111122223333:table/prod-*/*",

      "arn:aws:glue:us-east-1:111122223333:table/*/prod-*",
      "arn:aws:glue:us-east-1:111122223333:userDefinedFunction/prod-*/*",
      "arn:aws:glue:us-east-1:111122223333:userDefinedFunction/*/prod-*",
      "arn:aws:glue:us-east-1:111122223333:connection/prod-*"
    ]
  }
]
}

```

The second statement in the preceding policy uses explicit deny. You can use explicit deny to overwrite any allow permissions that are granted to the principal. This lets you lock down access to critical resources and prevent another policy from accidentally granting access to them.

In the preceding example, even though the first statement grants full access to prod- resources, the second statement explicitly revokes write access to them, leaving only read access to prod-resources.

Grant access using tags

For example, suppose that you want to limit access to a trigger t2 to a specific user named Tom in your account. All other users, including Sam, have access to trigger t1. The triggers t1 and t2 have the following properties.

```
aws glue get-triggers
{
  "Triggers": [
    {
      "State": "CREATED",
      "Type": "SCHEDULED",
      "Name": "t1",
      "Actions": [
        {
          "JobName": "j1"
        }
      ],
      "Schedule": "cron(0 0/1 * * ? *)"
    },
    {
      "State": "CREATED",
      "Type": "SCHEDULED",
      "Name": "t2",
      "Actions": [
        {
          "JobName": "j1"
        }
      ],
      "Schedule": "cron(0 0/1 * * ? *)"
    }
  ]
}
```

The Amazon Glue administrator attached a tag value Tom (`aws:ResourceTag/Name": "Tom"`) to trigger t2. The Amazon Glue administrator also gave Tom an IAM policy with a condition statement based on the tag. As a result, Tom can only use an Amazon Glue operation that acts on resources with the tag value Tom.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "glue:*",
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceTag/Name": "Tom"
        }
      }
    }
  ]
}
```

When Tom tries to access the trigger t1, he receives an access denied message. Meanwhile, he can successfully retrieve trigger t2.

```
aws glue get-trigger --name t1
```

An error occurred (AccessDeniedException) when calling the GetTrigger operation:

```
User: Tom is not authorized to perform: glue:GetTrigger on resource: arn:aws:glue:us-east-1:123456789012:trigger/t1
```

```
aws glue get-trigger --name t2
```

```
{
  "Trigger": {
    "State": "CREATED",
    "Type": "SCHEDULED",
    "Name": "t2",
    "Actions": [
      {
```

```
        "JobName": "j1"
      }
    ],
    "Schedule": "cron(0 0/1 * * ? *)"
  }
}
```

Tom can't use the plural `GetTriggers` API operation to list triggers because this operation doesn't support filtering on tags.

To give Tom access to `GetTriggers`, the Amazon Glue administrator creates a policy that splits the permissions into two sections. One section allows Tom access to all triggers with the `GetTriggers` API operation. The second section allows Tom access to API operations that are tagged with the value Tom. With this policy, Tom is allowed both `GetTriggers` and `GetTrigger` access to trigger t2.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "glue:GetTriggers",
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": "glue:*",
      "Resource": "*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceTag/Name": "Tom"
        }
      }
    }
  ]
}
```

Deny access using tags

Another resource policy approach is to explicitly deny access to resources.

Important

An explicit denial policy does not work for plural API operations such as `GetTriggers`.

In the following example policy, all Amazon Glue job operations are allowed. However, the second `Effect` statement *explicitly* denies access to jobs tagged with the `Team` key and `Special` value.

When an administrator attaches the following policy to an identity, the identity can access all jobs *except* those tagged with the `Team` key and `Special` value.

Use tags with list and batch API operations

A third approach to writing a resource policy is to allow access to resources using a `List` API operation to list out resources for a tag value. Then, use the corresponding `Batch` API operation to allow access to details of specific resources. With this approach, the administrator doesn't need to allow access to the plural `GetCrawlers`, `GetDevEndpoints`, `GetJobs`, or `GetTriggers` API operations. Instead, you can allow the ability to list the resources with the following API operations:

- `ListCrawlers`
- `ListDevEndpoints`
- `ListJobs`
- `ListTriggers`

And, you can allow the ability to get details about individual resources with the following API operations:

- `BatchGetCrawlers`
- `BatchGetDevEndpoints`
- `BatchGetJobs`
- `BatchGetTriggers`

As an administrator, to use this approach, you can do the following:

1. Add tags to your crawlers, development endpoints, jobs, and triggers.
2. Deny user access to Get API operations such as `GetCrawlers`, `GetDevEndpoints`, `GetJobs`, and `GetTriggers`.
3. To enable users to find out which tagged resources they have access to, allow user access to List API operations such as `ListCrawlers`, `ListDevEndpoints`, `ListJobs`, and `ListTriggers`.
4. Deny user access to Amazon Glue tagging APIs, such as `TagResource` and `UntagResource`.
5. Allow user access to resource details with BatchGet API operations such as `BatchGetCrawlers`, `BatchGetDevEndpoints`, `BatchGetJobs`, and `BatchGetTriggers`.

For example, when calling the `ListCrawlers` operation, provide a tag value to match the user name. Then the result is a list of crawlers that match the provided tag values. Provide the list of names to `BatchGetCrawlers` to get details about each crawler with the given tag.

For example, if Tom should only be able to retrieve details of triggers that are tagged with Tom, the administrator can add tags to triggers for Tom, deny access to the `GetTriggers` API operation to all users, and allow access to all users to `ListTriggers` and `BatchGetTriggers`.

The following is the resource policy that the Amazon Glue administrator grants to Tom. In the first section of the policy, Amazon Glue API operations are denied for `GetTriggers`. In the second section of the policy, `ListTriggers` is allowed for all resources. However, in the third section, those resources tagged with Tom are allowed access with the `BatchGetTriggers` access.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Deny",
      "Action": "glue:GetTriggers",
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "glue>ListTriggers"
      ],

```

```

    "Resource": [
      "*"
    ]
  },
  {
    "Effect": "Allow",
    "Action": [
      "glue:BatchGetTriggers"
    ],
    "Resource": [
      "*"
    ],
    "Condition": {
      "StringEquals": {
        "aws:ResourceTag/Name": "Tom"
      }
    }
  }
]
}

```

Using the same triggers as the previous example, Tom can access trigger t2, but not trigger t1. The following example shows the results when Tom tries to access t1 and t2 with `BatchGetTriggers`.

```

aws glue batch-get-triggers --trigger-names t2
{
  "Triggers": {
    "State": "CREATED",
    "Type": "SCHEDULED",
    "Name": "t2",
    "Actions": [
      {
        "JobName": "j2"
      }
    ],
    "Schedule": "cron(0 0/1 * * ? *)"
  }
}

aws glue batch-get-triggers --trigger-names t1

```

An error occurred (AccessDeniedException) when calling the BatchGetTriggers operation:
No access to any requested resource.

The following example shows the results when Tom tries to access both trigger t2 and trigger t3 (which does not exist) in the same BatchGetTriggers call. Notice that because Tom has access to trigger t2 and it exists, only t2 is returned. Although Tom is allowed to access trigger t3, trigger t3 does not exist, so t3 is returned in the response in a list of "TriggersNotFound": [].

```
aws glue batch-get-triggers --trigger-names t2 t3
{
  "Triggers": {
    "State": "CREATED",
    "Type": "SCHEDULED",
    "Name": "t2",
    "Actions": [
      {
        "JobName": "j2"
      }
    ],
    "TriggersNotFound": ["t3"],
    "Schedule": "cron(0 0/1 * * ? *)"
  }
}
```

Control settings using condition keys or context keys

You can use condition keys or context keys when granting permissions to create and update jobs. These sections discuss the keys:

- [Control policies that control settings using condition keys](#)
- [Control policies that control settings using context keys](#)

Control policies that control settings using condition keys

Amazon Glue provides three IAM condition keys `glue:VpcIds`, `glue:SubnetIds`, and `glue:SecurityGroupIds`. You can use the condition keys in IAM policies when granting permissions to create and update jobs. You can use this setting to ensure that jobs or sessions are not created (or updated to) to run outside of a desired VPC environment. The VPC setting information is not a direct input from the `CreateJob` request, but inferred from the job `"connections"` field that points to an Amazon Glue connection.

Example usage

Create an Amazon Glue network type connection named "traffic-monitored-connection" with the desired VpcId "vpc-id1234", SubnetIds, and SecurityGroupIds.

Specify the condition keys condition for the CreateJob and UpdateJob action in the IAM policy.

```
{
  "Effect": "Allow",
  "Action": [
    "glue:CreateJob",
    "glue:UpdateJob"
  ],
  "Resource": [
    "*"
  ],
  "Condition": {
    "ForAnyValue:StringLike": {
      "glue:VpcIds": [
        "vpc-id1234"
      ]
    }
  }
}
```

You can create a similar IAM policy to prohibit creating an Amazon Glue job without specifying connection information.

Restricting sessions on VPCs

To enforce created sessions to run within a specified VPC, you restrict role permission by adding a Deny effect on the `glue:CreateSession` action with the condition that the `glue:vpc-id` not equal to `vpc-123`. For example:

```
"Effect": "Deny",
"Action": [
  "glue:CreateSession"
],
"Condition": {
  "StringNotEquals" : {"glue:VpcIds" : ["vpc-123"]}
}
```

You also can enforce created sessions to run within a VPC by adding a Deny effect on the `glue:CreateSession` action with the condition that the `glue:vpc-id` is null. For example:

```
{
  "Effect": "Deny",
  "Action": [
    "glue:CreateSession"
  ],
  "Condition": {
    "Null": {"glue:vpcIds": true}
  }
},
{
  "Effect": "Allow",
  "Action": [
    "glue:CreateSession"
  ],
  "Resource": ["*"]
}
```

Control policies that control settings using context keys

Amazon Glue provides a context key (`glue:CredentialIssuingService=glue.amazonaws.com`) to each role session that Amazon Glue makes available to the job and developer endpoint. This allows you to implement security controls for the actions taken by Amazon Glue scripts. Amazon Glue provides another context key (`glue:RoleAssumedBy=glue.amazonaws.com`) to each role session where Amazon Glue makes a call to another Amazon service on the customer's behalf (not by a job/dev endpoint, but directly by the Amazon Glue service).

Example usage

Specify the conditional permission in an IAM policy and attach it to the role to be used by an Amazon Glue job. This ensures certain actions are allowed/denied based on whether the role session is used for an Amazon Glue job runtime environment.

```
{
  "Effect": "Allow",
  "Action": "s3:GetObject",
  "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/*",
```

```

    "Condition": {
      "StringEquals": {
        "glue:CredentialIssuingService": "glue.amazonaws.com"
      }
    }
  }
}

```

Deny an identity the ability to create data preview sessions

This section contains an IAM policy example used to deny an identity the ability to create data preview sessions. Attach this policy to the identity, which is separate from the role used by the data preview session during its run.

```

{
  "Sid": "DatapreviewDeny",
  "Effect": "Deny",
  "Action": [
    "glue:CreateSession"
  ],
  "Resource": [
    "arn:aws:glue:*:*:session/glue-studio-datapreview*"
  ]
}

```

Resource-based policy examples for Amazon Glue

This section contains example resource-based policies, including policies that grant cross-account access.

The examples use the Amazon Command Line Interface (Amazon CLI) to interact with Amazon Glue service API operations. You can perform the same operations on the Amazon Glue console or using one of the Amazon SDKs.

Important

By changing an Amazon Glue resource policy, you might accidentally revoke permissions for existing Amazon Glue users in your account and cause unexpected disruptions. Try these examples only in development or test accounts, and ensure that they don't break any existing workflows before you make the changes.

Topics

- [Considerations for using resource-based policies with Amazon Glue](#)
- [Use a resource policy to control access in the same account](#)

Considerations for using resource-based policies with Amazon Glue

Note

Both IAM policies and an Amazon Glue resource policy take a few seconds to propagate. After you attach a new policy, you might notice that the old policy is still in effect until the new policy has propagated through the system.

You use a policy document written in JSON format to create or modify a resource policy. The policy syntax is the same as for an identity-based IAM policy (see [IAM JSON policy reference](#)), with the following exceptions:

- A "Principal" or "NotPrincipal" block is required for each policy statement.
- The "Principal" or "NotPrincipal" must identify valid existing principals. Wildcard patterns (like `arn:aws-cn:iam::account-id:user/*`) are not allowed.
- The "Resource" block in the policy requires all resource ARNs to match the following regular expression syntax (where the first %s is the *region*, and the second %s is the *account-id*):

```
*arn:aws-cn:glue:%s:%s:(\*|[a-zA-Z\*]+\V/?.*)
```

For example, both `arn:aws:glue:us-west-2:account-id:*` and `arn:aws:glue:us-west-2:account-id:database/default` are allowed, but `*` is not allowed.

- Unlike identity-based policies, an Amazon Glue resource policy must only contain Amazon Resource Names (ARNs) of resources that belong to the catalog that the policy is attached to. Such ARNs always start with `arn:aws-cn:glue:.`
- A policy cannot cause the identity that creates it to be locked out of further policy creation or modification.
- A resource-policy JSON document cannot exceed 10 KB in size.

Use a resource policy to control access in the same account

In this example, an admin user in Account A creates a resource policy that grants IAM user Alice in Account A full access to the catalog. Alice has no IAM policy attached.

To do this, the admin user runs the following Amazon CLI command.

```
# Run as admin of Account A
$ aws glue put-resource-policy --profile administrator-name --region us-west-2 --
policy-in-json '{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Principal": {
        "AWS": [
          "arn:aws-cn:iam::account-A-id:user/Alice"
        ]
      },
      "Effect": "Allow",
      "Action": [
        "glue:*"
      ],
      "Resource": [
        "arn:aws:glue:us-west-2:account-A-id:*"
      ]
    }
  ]
}'
```

Instead of entering the JSON policy document as a part of your Amazon CLI command, you can save a policy document in a file and reference the file path in the Amazon CLI command, prefixed by `file://`. The following is an example of how you might do that.

```
$ echo '{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Principal": {
        "AWS": [
          "arn:aws-cn:iam::account-A-id:user/Alice"
        ]
      },
```

```

    "Effect": "Allow",
    "Action": [
      "glue:*"
    ],
    "Resource": [
      "arn:aws:glue:us-west-2:account-A-id:*"
    ]
  }
]
}' > /temp/policy.json

$ aws glue put-resource-policy --profile admin1 \
  --region us-west-2 --policy-in-json file:///temp/policy.json

```

After this resource policy has propagated, Alice can access all Amazon Glue resources in Account A, as follows.

```

# Run as user Alice
$ aws glue create-database --profile alice --region us-west-2 --database-input '{
  "Name": "new_database",
  "Description": "A new database created by Alice",
  "LocationUri": "s3://amzn-s3-demo-bucket"
}'

$ aws glue get-table --profile alice --region us-west-2 --database-name "default" --
table-name "tbl1"}

```

In response to Alice's `get-table` call, the Amazon Glue service returns the following.

```

{
  "Table": {
    "Name": "tbl1",
    "PartitionKeys": [],
    "StorageDescriptor": {
      .....
    },
    .....
  }
}

```

Granting Amazon managed policies for Amazon Glue

An Amazon managed policy is a standalone policy that is created and administered by Amazon. Amazon managed policies are designed to provide permissions for many common use cases so that you can start assigning permissions to users, groups, and roles.

Keep in mind that Amazon managed policies might not grant least-privilege permissions for your specific use cases because they're available for all Amazon customers to use. We recommend that you reduce permissions further by defining [customer managed policies](#) that are specific to your use cases.

You cannot change the permissions defined in Amazon managed policies. If Amazon updates the permissions defined in an Amazon managed policy, the update affects all principal identities (users, groups, and roles) that the policy is attached to. Amazon is most likely to update an Amazon managed policy when a new Amazon Web Services service is launched or new API operations become available for existing services.

For more information, see [Amazon managed policies](#) in the *IAM User Guide*.

Amazon managed (predefined) policies for Amazon Glue

Amazon addresses many common use cases by providing standalone IAM policies that are created and administered by Amazon. These Amazon managed policies grant necessary permissions for common use cases so that you can avoid having to investigate what permissions are needed. For more information, see [Amazon managed policies](#) in the *IAM User Guide*.

The following Amazon managed policies, which you can attach to identities in your account, are specific to Amazon Glue and are grouped by use case scenario:

- [AWSGlueConsoleFullAccess](#) – Grants full access to Amazon Glue resources when an identity that the policy is attached to uses the Amazon Web Services Management Console. If you follow the naming convention for resources specified in this policy, users have full console capabilities. This policy is typically attached to users of the Amazon Glue console.
- [AWSGlueServiceRole](#) – Grants access to resources that various Amazon Glue processes require to run on your behalf. These resources include Amazon Glue, Amazon S3, IAM, CloudWatch Logs, and Amazon EC2. If you follow the naming convention for resources specified in this policy, Amazon Glue processes have the required permissions. This policy is typically attached to roles specified when defining crawlers, jobs, and development endpoints.

- [AwsGlueSessionUserRestrictedServiceRole](#) – Provides full access to all Amazon Glue resources except for sessions. It allows users to create and use only the interactive sessions that are associated with the user. This policy includes other permissions needed by Amazon Glue to manage Amazon Glue resources in other Amazon services. The policy also allows adding tags to Amazon Glue resources in other Amazon services.

Note

To achieve the full security benefits, do not grant this policy to a user that was assigned the `AWSGlueServiceRole`, `AWSGlueConsoleFullAccess`, or `AWSGlueConsoleSageMakerNotebookFullAccess` policy.

- [AwsGlueSessionUserRestrictedPolicy](#) – Provides access to create Amazon Glue interactive sessions using the `CreateSession` API operation only if a tag key "owner" and value that match the assignee's Amazon user ID are provided. This identity policy is attached to the IAM user that invokes the `CreateSession` API operation. This policy also permits the assignee to interact with the Amazon Glue interactive session resources that were created with an "owner" tag and value that match their Amazon user ID. This policy denies permission to change or remove "owner" tags from an Amazon Glue session resource after the session is created.

Note

To achieve the full security benefits, do not grant this policy to a user that was assigned the `AWSGlueServiceRole`, `AWSGlueConsoleFullAccess`, or `AWSGlueConsoleSageMakerNotebookFullAccess` policy.

- [AwsGlueSessionUserRestrictedNotebookServiceRole](#) – Provides sufficient access to the Amazon Glue Studio notebook session to interact with specific Amazon Glue interactive session resources. These are resources that are created with the "owner" tag value that matches the Amazon user ID of the principal (IAM user or role) that creates the notebook. For more information about these tags, see the [Principal key values](#) chart in the *IAM User Guide*.

This service-role policy is attached to the role that is specified with a magic command within the notebook or is passed as a role to the `CreateSession` API operation. This policy also permits the principal to create an Amazon Glue interactive session from the Amazon Glue Studio notebook interface only if a tag key "owner" and value match the Amazon user ID of the principal. This policy denies permission to change or remove "owner" tags from an Amazon Glue session resource after the session is created. This policy also includes permissions for writing and

reading from Amazon S3 buckets, writing CloudWatch logs, and creating and deleting tags for Amazon EC2 resources used by Amazon Glue.

 **Note**

To achieve the full security benefits, do not grant this policy to a role that was assigned the `AWSGlueServiceRole`, `AWSGlueConsoleFullAccess`, or `AWSGlueConsoleSageMakerNotebookFullAccess` policy.

- [AwsGlueSessionUserRestrictedNotebookPolicy](#) – Provides access to create an Amazon Glue interactive session from the Amazon Glue Studio notebook interface only if there is a tag key “owner” and value that match the Amazon user ID of the principal (IAM user or role) that creates the notebook. For more information about these tags, see the [Principal key values](#) chart in the *IAM User Guide*.

This policy is attached to the principal (IAM user or role) that creates sessions from the Amazon Glue Studio notebook interface. This policy also permits sufficient access to the Amazon Glue Studio notebook to interact with specific Amazon Glue interactive session resources. These are resources that are created with the “owner” tag value that matches the Amazon user ID of the principal. This policy denies permission to change or remove “owner” tags from an Amazon Glue session resource after the session is created.

- [AWSGlueServiceNotebookRole](#) – Grants access to Amazon Glue sessions started in an Amazon Glue Studio notebook. This policy allows listing and getting session information for all sessions, but only permits users to create and use the sessions tagged with their Amazon user ID. This policy denies permission to change or remove “owner” tags from Amazon Glue session resources tagged with their Amazon ID.

Assign this policy to the Amazon user who creates jobs using the notebook interface in Amazon Glue Studio.

- [AWSGlueConsoleSageMakerNotebookFullAccess](#) – Grants full access to Amazon Glue and SageMaker AI resources when the identity that the policy is attached to uses the Amazon Web Services Management Console. If you follow the naming convention for resources specified in this policy, users have full console capabilities. This policy is typically attached to users of the Amazon Glue console who manage SageMaker AI notebooks.
- [AWSGlueSchemaRegistryFullAccess](#) – Grants full access to Amazon Glue Schema Registry resources when the identity that the policy is attached to uses the Amazon Web Services Management Console or Amazon CLI. If you follow the naming convention for resources

specified in this policy, users have full console capabilities. This policy is typically attached to users of the Amazon Glue console or Amazon CLI who manage the Amazon Glue Schema Registry.

- [AWSGlueSchemaRegistryReadOnlyAccess](#) – Grants read-only access to Amazon Glue Schema Registry resources when an identity that the policy is attached to uses the Amazon Web Services Management Console or Amazon CLI. If you follow the naming convention for resources specified in this policy, users have full console capabilities. This policy is typically attached to users of the Amazon Glue console or Amazon CLI who use the Amazon Glue Schema Registry.

 **Note**

You can review these permissions policies by signing in to the IAM console and searching for specific policies there.

You can also create your own custom IAM policies to allow permissions for Amazon Glue actions and resources. You can attach these custom policies to the IAM users or groups that require those permissions.

To create a connection with VPC configuration while using a custom IAM role, it must have the following VPC access actions:

- `secretsmanager:GetSecretValue`
- `secretsmanager:PutSecretValue`
- `secretsmanager:DescribeSecret`
- `ec2:CreateNetworkInterface`
- `ec2>DeleteNetworkInterface`
- `ec2:DescribeNetworkInterfaces`
- `ec2:DescribeSubnets`

Amazon Glue updates to Amazon managed policies

View details about updates to Amazon managed policies for Amazon Glue since this service began tracking these changes. For automatic alerts about changes to this page, subscribe to the RSS feed on the Amazon Glue Document history page.

| Change | Description | Date |
|--|---|------------------------|
| <p>AwsGlueSessionUserRestrictedNotebookPolicy – Minor update to an existing policy.</p> | <p>Add allow for <code>glue:TagResource</code> action on the owner tag key. Required for supporting on tag-on-create for sessions with owner tag key.</p> | <p>August 30, 2024</p> |
| <p>AwsGlueSessionUserRestrictedNotebookServiceRole – Minor update to an existing policy.</p> | <p>Add allow for <code>glue:TagResource</code> action on the owner tag key. Required for supporting on tag-on-create for sessions with owner tag key.</p> | <p>August 30, 2024</p> |
| <p>AwsGlueSessionUserRestrictedPolicy – Minor update to an existing policy.</p> | <p>Add allow for <code>glue:TagResource</code> action on the owner tag key. Required for supporting on tag-on-create for sessions with owner tag key.</p> | <p>August 5, 2024</p> |
| <p>AwsGlueSessionUserRestrictedServiceRole – Minor update to an existing policy.</p> | <p>Add allow for <code>glue:TagResource</code> action on the owner tag key. Required for supporting on tag-on-create for sessions with owner tag key.</p> | <p>August 5, 2024</p> |
| <p>AwsGlueSessionUserRestrictedPolicy – Minor update to an existing policy.</p> | <p>Add <code>glue:StartCompletion</code> and <code>glue:GetCompletion</code> to policy. Required for Amazon Q data integration in Amazon Glue.</p> | <p>April 30, 2024</p> |
| <p>AwsGlueSessionUserRestrictedNotebookServiceRole –</p> | <p>Add <code>glue:StartCompletion</code> and <code>glue:GetC</code></p> | <p>April 30, 2024</p> |

| Change | Description | Date |
|--|--|----------------|
| Minor update to an existing policy. | Completion to policy. Required for Amazon Q data integration in Amazon Glue. | April 30, 2024 |
| AwsGlueSessionUserRestrictedServiceRole – Minor update to an existing policy. | Add glue:StartCompletion and glue:GetCompletion to policy. Required for Amazon Q data integration in Amazon Glue. | |
| AWSGlueServiceNotebookRole – Minor update to an existing policy. | Add glue:StartCompletion and glue:GetCompletion to policy. Required for Amazon Q data integration in Amazon Glue. | Jan 30, 2024 |
| AwsGlueSessionUserRestrictedNotebookPolicy – Minor update to an existing policy. | Add glue:StartCompletion and glue:GetCompletion to policy. Required for Amazon Q data integration in Amazon Glue. | Nov 29, 2023 |
| AWSGlueServiceNotebookRole – Minor update to an existing policy. | Add codewhisperer:GenerateRecommendations to policy. Required for a new feature where Amazon Glue generates CodeWhisperer recommendations. | Oct 9, 2023 |
| AWSGlueServiceRole – Minor update to an existing policy. | Tighten scope of CloudWatch permissions to better reflect Amazon Glue logging. | Aug 4, 2023 |

| Change | Description | Date |
|--|--|-------------------|
| AWSGlueConsoleFullAccess – Minor update to an existing policy. | Add databrew recipe List and Describe permissions to policy. Required to provide full administrative access for new features where Amazon Glue can access recipes. | May 9, 2023 |
| AWSGlueConsoleFullAccess – Minor update to an existing policy. | Add cloudformation:ListStacks to policy. Preserves existing capabilities after changes to Amazon CloudFormation authorization requirements. | March 28, 2023 |
| <p>New managed policies added for the interactive sessions feature:</p> <ul style="list-style-type: none"> • AwsGlueSessionUserRestrictedServiceRole • AwsGlueSessionUserRestrictedPolicy • AwsGlueSessionUserRestrictedNotebookServiceRole • AwsGlueSessionUserRestrictedNotebookPolicy | These policies were designed to provide additional security for interactive sessions and notebooks in Amazon Glue Studio. The policies restrict access to the CreateSession API operation so that only the owner has access. | November 30, 2021 |

| Change | Description | Date |
|--|---|----------------------|
| <p>AWSGlueConsoleSageMakerNotebookFullAccess – Update to an existing policy.</p> | <p>Removed a redundant resource ARN (<code>arn:aws:s3:::aws-glue-*/*</code>) for the action that grants read/write permissions on Amazon S3 buckets that Amazon Glue uses to store scripts and temporary files.</p> <p>Fixed a syntax issue by changing <code>"StringEquals"</code> to <code>"ForAnyValue:StringLike"</code>, and moved the <code>"Effect": "Allow"</code> lines to precede the <code>"Action":</code> line in each place where they were out of order.</p> | <p>July 15, 2021</p> |
| <p>AWSGlueConsoleFullAccess – Update to an existing policy.</p> | <p>Removed a redundant resource ARN (<code>arn:aws:s3:::aws-glue-*/*</code>) for the action that grants read/write permissions on Amazon S3 buckets that Amazon Glue uses to store scripts and temporary files.</p> | <p>July 15, 2021</p> |
| <p>Amazon Glue started tracking changes.</p> | <p>Amazon Glue started tracking changes for its Amazon managed policies.</p> | <p>June 10, 2021</p> |

Granting dynamically scoped policies for job execution

Amazon Glue offers a powerful new capability: dynamic session policies for job executions. This feature allows you to specify custom, fine-grained permissions for each job run without creating multiple IAM roles.

When you start a Glue job using the `StartJobRun` API, you can include an inline session policy. This policy temporarily modifies the permissions of the job's execution role for the duration of that specific job run. It's similar to using temporary credentials with the `AssumeRole` API in other Amazon services.

- **Enhanced security:** You can limit job permissions to the minimum necessary for each run.
- **Simplified management:** Eliminates the need to create and maintain numerous IAM roles for different scenarios.
- **Flexibility:** You can be adjust permissions dynamically based on runtime parameters or tenant-specific needs.
- **Scalability:** This method excels in multi-tenant environments where you need to isolate resources between tenants.

Examples for granting dynamically scoped policies usage:

The following examples demonstrate granting jobs *read* and *write* access only to a specific Amazon S3 bucket path, where the path is dynamically determined by the job run ID. This illustrates how to implement granular, execution-specific permissions for each job run.

From CLI

```
aws glue start-job-run \  
  --job-name "your-job-name" \  
  --execution-role-session-policy '{  
    "Version": "2012-10-17",  
    "Statement": [  
      {  
        "Effect": "Allow",  
        "Action": [  
          "s3:GetObject",  
          "s3:PutObject"  
        ],  
        "Resource": [  
          "arn:aws:s3:::specific-bucket/${JobRunId}/*"  
        ]  
      }  
    ]  
  }'
```

```

    ]
  }
]
}'

```

Specifying Amazon Glue resource ARNs

In Amazon Glue, you can control access to resources using an Amazon Identity and Access Management (IAM) policy. In a policy, you use an Amazon Resource Name (ARN) to identify the resource that the policy applies to. Not all resources in Amazon Glue support ARNs.

Topics

- [Data Catalog ARNs](#)
- [ARNs for non-catalog objects in Amazon Glue](#)
- [Access control for Amazon Glue non-catalog singular API operations](#)
- [Access control for Amazon Glue non-catalog API operations that retrieve multiple items](#)
- [Access control for Amazon Glue non-catalog BatchGet API operations](#)

Data Catalog ARNs

Data Catalog resources have a hierarchical structure, with catalog as the root.

```
arn:aws-cn:glue:region:account-id:catalog
```

Each Amazon account has a single Data Catalog in an Amazon Region with the 12-digit account ID as the catalog ID. Resources have unique ARNs associated with them, as shown in the following table.

| Resource type | ARN format |
|---------------|--|
| Catalog | arn:aws-cn:glue: <i>region</i> : <i>account-id</i> :catalog

For example: arn:aws-cn:glue:us-east-1:123456789012:catalog |
| Database | arn:aws-cn:glue: <i>region</i> : <i>account-id</i> :database/ <i>database name</i> |

| Resource type | ARN format |
|---|---|
| | For example: <code>arn:aws-cn:glue:us-east-1:123456789012:database/db1</code> |
| Table | <p><code>arn:aws-cn:glue: <i>region:account-id</i> :table/<i>database name/table name</i></code></p> <p>For example: <code>arn:aws-cn:glue:us-east-1:123456789012:table/db1/tbl1</code></p> |
| Federated S3 tables catalog (All table buckets) | <p><code>arn:aws-cn:glue: <i>region:account-id</i> :catalog/s3tablescatalog</code></p> <p>For example: <code>arn:aws-cn:glue:us-east-1:123456789012:catalog/s3tablescatalog</code></p> |
| Federated S3 table bucket catalog (child catalog) | <p><code>arn:aws-cn:glue: <i>region:account-id</i> :catalog/s3tablescatalog/<i>bucket name</i></code></p> <p>For example: <code>arn:aws-cn:glue:us-east-1:123456789012:catalog/s3tablescatalog/amzn-s3-demo-bucket1</code></p> |
| Federated S3 tables database | <p><code>arn:aws-cn:glue: <i>region:account-id</i> :database/s3tablescatalog/<i>child catalog name/database name</i></code></p> <p>For example: <code>arn:aws-cn:glue:us-east-1:123456789012:database/s3tablescatalog/amzn-s3-demo-bucket1/nsdb1</code></p> |
| Federated S3 table | <p><code>arn:aws-cn:glue: <i>region:account-id</i> :table/s3tablescatalog/<i>child catalog name/database name/table name</i></code></p> <p>For example: <code>arn:aws-cn:glue:us-east-1:123456789012:table/s3tablescatalog/amzn-s3-demo-bucket1/nsdb1/s3tbl1</code></p> |

| Resource type | ARN format |
|--|---|
| Federated S3 tables catalog (A single table bucket registered with Lake Formation) | <p>arn:aws-cn:glue: <i>region:account-id</i> :catalog/<i>catalog name</i></p> <p>For example: arn:aws-cn:glue:us-east-1:123456789012:catalog/amzn-s3-demo-bucket1</p> |
| Federated S3 tables database | <p>arn:aws-cn:glue: <i>region:account-id</i> :catalog/<i>catalog name/database name</i></p> <p>For example: arn:aws-cn:glue:us-east-1:123456789012:database/amzn-s3-demo-bucket1/nsdb1</p> |
| Federated S3 table | <p>arn:aws-cn:glue: <i>region:account-id</i> :catalog/<i>catalog name/database name/table name</i></p> <p>For example: arn:aws-cn:glue:us-east-1:123456789012:table/amzn-s3-demo-bucket1/ <i>nsdb1/s3tbl1</i></p> |
| Federated or managed catalog (top-level catalog in a multi-catalog) | <p>arn:aws-cn:glue: <i>region:account-id</i> :catalog/ <i>top-level catalog name</i></p> <p>For example: arn:aws-cn:glue:us-east-1:123456789012:catalog/nscatalog</p> <p>ARN format for a managed catalog follows the same structure.</p> |
| Federated multi-level catalog (child catalog in a multi-level catalog) | <p>arn:aws-cn:glue: <i>region:account-id</i> :catalog/ <i>top-level catalog name /child catalog name</i></p> <p>For example: arn:aws-cn:glue:us-east-1:123456789012:catalog/nscatalog/dbcatalog</p> |
| Federated database | <p>arn:aws-cn:glue: <i>region:account-id</i> :database/ <i>name space catalog name/child catalog name/database name</i></p> <p>For example: arn:aws-cn:glue:us-east-1:123456789012:database/nscatalog/dbcatalog/schemadb</p> |

| Resource type | ARN format |
|------------------------|---|
| Federated table | <p>arn:aws-cn:glue: <i>region:account-id</i> :table/<i>name space catalog name/child catalog name/database name/table name</i></p> <p>For example: arn:aws-cn:glue:us-east-1:123456789012:table/nscatalog/dbcatalog/schemadb/rstbl1</p> |
| Catalog link container | <p>arn:aws-cn:glue: <i>region:account-id</i> :catalog/<i>link container name</i></p> <p>For example: arn:aws-cn:glue:glue:us-east-1:123456789012:catalog /linkcontainer-example</p> |
| Database | <p>arn:aws-cn:glue: <i>region:account-id</i> :catalog/<i>link container name/database name</i></p> <p>For example: arn:aws-cn:glue:glue:us-east-1:123456789012:database /linkcontainer-example/link-db</p> |
| User-defined function | <p>arn:aws-cn:glue: <i>region:account-id</i> :userDefinedFunction/<i>database name/user-defined function name</i></p> <p>For example: arn:aws-cn:glue:us-east-1:123456789012:userDefinedFunction/db1/func1</p> |
| Connection | <p>arn:aws-cn:glue: <i>region:account-id</i> :connection/<i>connection name</i></p> <p>For example: arn:aws-cn:glue:us-east-1:123456789012:connection/connection1</p> |
| Interactive Session | <p>arn:aws-cn:glue: <i>region:account-id</i> :session/<i>interactive session id</i></p> <p>For example: arn:aws-cn:glue:us-east-1:123456789012:session/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111</p> |

To enable fine-grained access control, you can use these ARNs in your IAM policies and resource policies to grant and deny access to specific resources. Wildcards are allowed in the policies. For example, the following ARN matches all tables in database default.

```
arn:aws-cn:glue:us-east-1:123456789012:table/default/*
```

Important

All operations performed on a Data Catalog resource require permission on the resource and all the ancestors of that resource. For example, to create a partition for a table requires permission on the table, database, and catalog where the table is located. The following example shows the permission required to create partitions on table `PrivateTable` in database `PrivateDatabase` in the Data Catalog.

```
{
  "Sid": "GrantCreatePartitions",
  "Effect": "Allow",
  "Action": [
    "glue:BatchCreatePartitions"
  ],
  "Resource": [
    "arn:aws-cn:glue:us-east-1:123456789012:table/PrivateDatabase/PrivateTable",
    "arn:aws-cn:glue:us-east-1:123456789012:database/PrivateDatabase",
    "arn:aws-cn:glue:us-east-1:123456789012:catalog"
  ]
}
```

In addition to permission on the resource and all its ancestors, all delete operations require permission on all children of that resource. For example, deleting a database requires permission on all the tables and user-defined functions in the database, in addition to the database and the catalog where the database is located. The following example shows the permission required to delete database `PrivateDatabase` in the Data Catalog.

```
{
  "Sid": "GrantDeleteDatabase",
  "Effect": "Allow",
  "Action": [
    "glue>DeleteDatabase"
  ],
}
```

```

"Resource": [
  "arn:aws-cn:glue:us-east-1:123456789012:table/PrivateDatabase/*",
  "arn:aws-cn:glue:us-east-1:123456789012:userDefinedFunction/
PrivateDatabase/*",
  "arn:aws-cn:glue:us-east-1:123456789012:database/PrivateDatabase",
  "arn:aws-cn:glue:us-east-1:123456789012:catalog"
]
}

```

In summary, actions on Data Catalog resources follow these permission rules:

- Actions on the catalog require permission on the catalog only.
- Actions on a database require permission on the database and catalog.
- Delete actions on a database require permission on the database and catalog plus all tables and user-defined functions in the database.
- Actions on a table, partition, or table version require permission on the table, database, and catalog.
- Actions on a user-defined function require permission on the user-defined function, database, and catalog.
- Actions on a connection require permission on the connection and catalog.

ARNs for non-catalog objects in Amazon Glue

Some Amazon Glue resources allow resource-level permissions to control access using an ARN. You can use these ARNs in your IAM policies to enable fine-grained access control. The following table lists the resources that can contain resource ARNs.

| Resource type | ARN format |
|---------------|--|
| Crawler | arn:aws-cn:glue: <i>region:account-id</i> :crawler/ <i>crawler-name</i>

For example: arn:aws-cn:glue:us-east-1:123456789012:crawler/mycrawler |
| Job | arn:aws-cn:glue: <i>region:account-id</i> :job/ <i>job-name</i> |

| Resource type | ARN format |
|----------------------------|---|
| | For example: <code>arn:aws-cn:glue:us-east-1:1234567890:12:job/testjob</code> |
| Trigger | <p><code>arn:aws-cn:glue: <i>region</i>:<i>account-id</i> :trigger/ <i>trigger-name</i></code></p> <p>For example: <code>arn:aws-cn:glue:us-east-1:1234567890:12:trigger/sampletrigger</code></p> |
| Development endpoint | <p><code>arn:aws-cn:glue: <i>region</i>:<i>account-id</i> :devEndpoint/ <i>development-endpoint-name</i></code></p> <p>For example: <code>arn:aws-cn:glue:us-east-1:1234567890:12:devEndpoint/temporarydevendpoint</code></p> |
| Machine learning transform | <p><code>arn:aws-cn:glue: <i>region</i>:<i>account-id</i> :mlTransform/ <i>transform-id</i></code></p> <p>For example: <code>arn:aws-cn:glue:us-east-1:1234567890:12:mlTransform/tfm-1234567890</code></p> |

Access control for Amazon Glue non-catalog singular API operations

Amazon Glue non-catalog *singular* API operations act on a single item (development endpoint). Examples are `GetDevEndpoint`, `CreateUpdateDevEndpoint`, and `UpdateDevEndpoint`. For these operations, a policy must put the API name in the "action" block and the resource ARN in the "resource" block.

Suppose that you want to allow a user to call the `GetDevEndpoint` operation. The following policy grants the minimum necessary permissions to an endpoint named `myDevEndpoint-1`.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
```

```

    "Sid": "MinimumPermissions",
    "Effect": "Allow",
    "Action": "glue:GetDevEndpoint",
    "Resource": "arn:aws-cn:glue:us-east-1:111122223333:devEndpoint/
myDevEndpoint-1"
  }
]
}

```

The following policy allows UpdateDevEndpoint access to resources that match myDevEndpoint- with a wildcard (*).

JSON

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "PermissionWithWildcard",
      "Effect": "Allow",
      "Action": "glue:UpdateDevEndpoint",
      "Resource": "arn:aws-cn:glue:us-east-1:111122223333:devEndpoint/
myDevEndpoint-*"
    }
  ]
}

```

You can combine the two policies as in the following example. You might see EntityNotFoundException for any development endpoint whose name begins with A. However, an access denied error is returned when you try to access other development endpoints.

JSON

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "CombinedPermissions",
      "Effect": "Allow",

```

```

    "Action": [
      "glue:UpdateDevEndpoint",
      "glue:GetDevEndpoint"
    ],
    "Resource": "arn:aws-cn:glue:us-east-1:111122223333:devEndpoint/A*"
  }
]
}

```

Access control for Amazon Glue non-catalog API operations that retrieve multiple items

Some Amazon Glue API operations retrieve multiple items (such as multiple development endpoints); for example, `GetDevEndpoints`. For this operation, you can specify only a wildcard (*) resource, and not specific ARNs.

For example, to include `GetDevEndpoints` in the policy, the resource must be scoped to the wildcard (*). The singular operations (`GetDevEndpoint`, `CreateDevEndpoint`, and `DeleteDevEndpoint`) are also scoped to all (*) resources in the example.

```

{
  "Sid": "PluralAPIIncluded",
  "Effect": "Allow",
  "Action": [
    "glue:GetDevEndpoints",
    "glue:GetDevEndpoint",
    "glue:CreateDevEndpoint",
    "glue:UpdateDevEndpoint"
  ],
  "Resource": [
    "*"
  ]
}

```

Access control for Amazon Glue non-catalog BatchGet API operations

Some Amazon Glue API operations retrieve multiple items (such as multiple development endpoints); for example, `BatchGetDevEndpoints`. For this operation, you can specify an ARN to limit the scope of resources that can be accessed.

For example, to allow access to a specific development endpoint, include `BatchGetDevEndpoints` in the policy with its resource ARN.

```
{
    "Sid": "BatchGetAPIIncluded",
    "Effect": "Allow",
    "Action": [
        "glue:BatchGetDevEndpoints"
    ],
    "Resource": [
        "arn:aws-cn:glue:us-east-1:123456789012:devEndpoint/de1"
    ]
}
```

With this policy, you can successfully access the development endpoint named `de1`. However, if you try to access the development endpoint named `de2`, an error is returned.

An error occurred (`AccessDeniedException`) when calling the `BatchGetDevEndpoints` operation: No access to any requested resource.

Important

For alternative approaches to setting up IAM policies, such as using `List` and `BatchGet` API operations, see [Identity-based policy examples for Amazon Glue](#).

Granting cross-account access

Granting access to Data Catalog resources across accounts enables your extract, transform, and load (ETL) jobs to query and join data from different accounts.

Topics

- [Methods for granting cross-account access in Amazon Glue](#)
- [Adding or updating the Data Catalog resource policy](#)
- [Making a cross-account API call](#)
- [Making a cross-account ETL call](#)
- [Cross-account CloudTrail logging](#)

- [Cross-account resource ownership and billing](#)
- [Cross-account access limitations](#)

Methods for granting cross-account access in Amazon Glue

You can grant access to your data to external Amazon accounts by using Amazon Glue methods or by using Amazon Lake Formation cross-account grants. The Amazon Glue methods use Amazon Identity and Access Management (IAM) policies to achieve fine-grained access control. Lake Formation uses a simpler GRANT/REVOKE permissions model similar to the GRANT/REVOKE commands in a relational database system.

This section describes using the Amazon Glue methods. For information about using Lake Formation cross-account grants, see [Granting Lake Formation Permissions](#) in the *Amazon Lake Formation Developer Guide*.

There are two Amazon Glue methods for granting cross-account access to a resource:

- Use a Data Catalog resource policy
- Use an IAM role

Granting cross-account access using a resource policy

The following are the general steps for granting cross-account access using a Data Catalog resource policy:

1. An administrator (or other authorized identity) in Account A attaches a resource policy to the Data Catalog in Account A. This policy grants Account B specific cross-account permissions to perform operations on a resource in Account A's catalog.
2. An administrator in Account B attaches an IAM policy to an IAM identity in Account B that delegates the permissions received from Account A.

The identity in Account B now has access to the specified resource in Account A.

The identity needs permission from *both* the resource owner (Account A) *and* their parent account (Account B) to be able to access the resource.

Granting cross-account access using an IAM role

The following are the general steps for granting cross-account access using an IAM role:

1. An administrator (or other authorized identity) in the account that owns the resource (Account A) creates an IAM role.
2. The administrator in Account A attaches a policy to the role that grants cross-account permissions for access to the resource in question.
3. The administrator in Account A attaches a trust policy to the role that identifies an IAM identity in a different account (Account B) as the principal who can assume the role.

The principal in the trust policy can also be an Amazon service principal if you want to grant an Amazon service permission to assume the role.

4. An administrator in Account B now delegates permissions to one or more IAM identities in Account B so that they can assume that role. Doing so gives those identities in Account B access to the resource in account A.

For more information about using IAM to delegate permissions, see [Access management](#) in the *IAM User Guide*. For more information about users, groups, roles, and permissions, see [Identities \(users, groups, and roles\)](#) in the *IAM User Guide*.

For a comparison of these two approaches, see [How IAM roles differ from resource-based policies](#) in the *IAM User Guide*. Amazon Glue supports both options, with the restriction that a resource policy can grant access only to Data Catalog resources.

For example, to give the Dev role in Account B access to database db1 in Account A, attach the following resource policy to the catalog in Account A.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "glue:GetDatabase"
      ],
      "Principal": {
        "AWS": [
```

```

        "arn:aws-cn:iam::111122223333:role/Dev"
    ]
  },
  "Resource": [
    "arn:aws:glue:us-east-1:111122223333:catalog",
    "arn:aws:glue:us-east-1:111122223333:database/db1"
  ]
}
]
}

```

In addition, Account B would have to attach the following IAM policy to the Dev role before it would actually get access to db1 in Account A.

JSON

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "glue:GetDatabase"
      ],
      "Resource": [
        "arn:aws:glue:us-east-1:111122223333:catalog",
        "arn:aws:glue:us-east-1:111122223333:database/db1"
      ]
    }
  ]
}

```

Adding or updating the Data Catalog resource policy

You can add or update the Amazon Glue Data Catalog resource policy using the console, API, or Amazon Command Line Interface (Amazon CLI).

⚠ Important

If you have already made cross-account permission grants from your account with Amazon Lake Formation, adding or updating the Data Catalog resource policy requires an extra step. For more information, see [Managing cross-account permissions using both Amazon Glue and Lake Formation](#) in the *Amazon Lake Formation Developer Guide*.

To determine if Lake Formation cross-account grants exist, use the `glue:GetResourcePolicies` API operation or the Amazon CLI. If `glue:GetResourcePolicies` returns any policies other than an already existing Data Catalog policy, then Lake Formation grants exist. For more information, see [Viewing all cross-account grants using the GetResourcePolicies API operation](#) in the *Amazon Lake Formation Developer Guide*.

To add or update the Data Catalog resource policy (console)

1. Open the Amazon Glue console at <https://console.amazonaws.cn/glue/>.

Sign in as an Amazon Identity and Access Management (IAM) administrative user who has the `glue:PutResourcePolicy` permission.

2. In the navigation pane, choose **Settings**.
3. On the **Data catalog settings** page, under **Permissions**, paste a resource policy into the text area. Then choose **Save**.

If the console displays a alert stating that the permissions in the policy will be in addition to any permissions granted using Lake Formation, choose **Proceed**.

To add or update the Data Catalog resource policy (Amazon CLI)

- Submit an `aws glue put-resource-policy` command. If Lake Formation grants already exist, ensure that you include the `--enable-hybrid` option with the value `'TRUE'`.

For examples of using this command, see [Resource-based policy examples for Amazon Glue](#).

Making a cross-account API call

All Amazon Glue Data Catalog operations have a `CatalogId` field. If the required permissions have been granted to enable cross-account access, a caller can make Data Catalog API calls across accounts. The caller does this by passing the target Amazon account ID in `CatalogId` so as to access the resource in that target account.

If no `CatalogId` value is provided, Amazon Glue uses the caller's own account ID by default, and the call is not cross-account.

Making a cross-account ETL call

Some Amazon Glue PySpark and Scala APIs have a catalog ID field. If all the required permissions have been granted to enable cross-account access, an ETL job can make PySpark and Scala calls to API operations across accounts by passing the target Amazon account ID in the catalog ID field to access Data Catalog resources in a target account.

If no catalog ID value is provided, Amazon Glue uses the caller's own account ID by default, and the call is not cross-account.

For PySpark APIs that support `catalog_id`, see [GlueContext class](#). For Scala APIs that support `catalogId`, see [Amazon Glue Scala GlueContext APIs](#).

The following example shows the permissions required by the grantee to run an ETL job. In this example, *grantee-account-id* is the `catalog-id` of the client running the job and *grantor-account-id* is the owner of the resource. This example grants permission to all catalog resources in the grantor's account. To limit the scope of resources granted, you can provide specific ARNs for the catalog, database, table, and connection.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "glue:GetConnection",
        "glue:GetDatabase",
```

```
    "glue:GetTable",
    "glue:GetPartition"
  ],
  "Principal": {
    "AWS": [
      "arn:aws-cn:iam::111122223333:root"
    ]
  },
  "Resource": [
    "arn:aws:glue:us-east-1:111122223333:*"
  ]
}
]
```

Note

If a table in the grantor's account points to an Amazon S3 location that is also in the grantor's account, the IAM role used to run an ETL job in the grantee's account must have permission to list and get objects from the grantor's account.

Given that the client in Account A already has permission to create and run ETL jobs, the following are the basic steps to set up an ETL job for cross-account access:

1. Allow cross-account data access (skip this step if Amazon S3 cross-account access is already set up).
 - a. Update the Amazon S3 bucket policy in Account B to allow cross-account access from Account A.
 - b. Update the IAM policy in Account A to allow access to the bucket in Account B.
2. Allow cross-account Data Catalog access.
 - a. Create or update the resource policy attached to the Data Catalog in Account B to allow access from Account A.
 - b. Update the IAM policy in Account A to allow access to the Data Catalog in Account B.

Cross-account CloudTrail logging

When an Amazon Glue extract, transform, and load (ETL) job accesses the underlying data of a Data Catalog table shared through Amazon Lake Formation cross-account grants, there is additional Amazon CloudTrail logging behavior.

For purposes of this discussion, the Amazon account that shared the table is the owner account, and the account that the table was shared with is the recipient account. When an ETL job in the recipient account accesses data in the table in the owner account, the data-access CloudTrail event that is added to the logs for the recipient account gets copied to the owner account's CloudTrail logs. This is so owner accounts can track data accesses by the various recipient accounts. By default, the CloudTrail events do not include a human-readable principal identifier (principal ARN). An administrator in the recipient account can opt in to include the principal ARN in the logs.

For more information, see [Cross-account CloudTrail logging](#) in the *Amazon Lake Formation Developer Guide*.

See Also

- [the section called "Logging and monitoring"](#)

Cross-account resource ownership and billing

When a user in one Amazon account (Account A) creates a new resource such as a database in a different account (Account B), that resource is then owned by Account B, the account where it was created. An administrator in Account B automatically gets full permissions to access the new resource, including reading, writing, and granting access permissions to a third account. The user in Account A can access the resource that they just created only if they have the appropriate permissions granted by Account B.

Storage costs and other costs that are directly associated with the new resource are billed to Account B, the resource owner. The cost of requests from the user who created the resource are billed to the requester's account, Account A.

For more information about Amazon Glue billing and pricing, see [How Amazon Pricing Works](#).

Cross-account access limitations

Amazon Glue cross-account access has the following limitations:

- Cross-account access to Amazon Glue is not allowed if you created databases and tables using Amazon Athena or Amazon Redshift Spectrum prior to a region's support for Amazon Glue and the resource owner account has not migrated the Amazon Athena data catalog to Amazon Glue. You can find the current migration status using the [GetCatalogImportStatus \(get_catalog_import_status\)](#). For more details on how to migrate an Athena catalog to Amazon Glue, see [Upgrading to the Amazon Glue Data Catalog step-by-step](#) in the *Amazon Athena User Guide*.
- Cross-account access is *only* supported for Data Catalog resources, including databases, tables, user-defined functions, and connections.
- Cross-account access to the Data Catalog from Athena requires you to register the catalog as an Athena DataCatalog resource. For instructions, see [Registering an Amazon Glue Data Catalog from another account](#) in the *Amazon Athena User Guide*.

Troubleshooting Amazon Glue identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with Amazon Glue and IAM.

Topics

- [I am not authorized to perform an action in Amazon Glue](#)
- [I am not authorized to perform iam:PassRole](#)
- [I want to allow people outside of my Amazon Web Services account to access my Amazon Glue resources](#)

I am not authorized to perform an action in Amazon Glue

If you receive an error that you're not authorized to perform an action, your policies must be updated to allow you to perform the action.

The following example error occurs when the `mateojackson` IAM user tries to use the console to view details about a fictional `my-example-widget` resource but doesn't have the fictional `glue:GetWidget` permissions.

```
User: arn:aws-cn:iam::123456789012:user/mateojackson is not authorized to perform:
glue:GetWidget on resource: my-example-widget
```

In this case, the policy for the `mateojackson` user must be updated to allow access to the `my-example-widget` resource by using the `glue:GetWidget` action.

If you need help, contact your Amazon administrator. Your administrator is the person who provided you with your sign-in credentials.

I am not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the `iam:PassRole` action, your policies must be updated to allow you to pass a role to Amazon Glue.

Some Amazon Web Services services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named `marymajor` tries to use the console to perform an action in Amazon Glue. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws-cn:iam::123456789012:user/marymajor is not authorized to perform:
iam:PassRole
```

In this case, Mary's policies must be updated to allow her to perform the `iam:PassRole` action.

If you need help, contact your Amazon administrator. Your administrator is the person who provided you with your sign-in credentials.

I want to allow people outside of my Amazon Web Services account to access my Amazon Glue resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether Amazon Glue supports these features, see [How Amazon Glue works with IAM](#).
- To learn how to provide access to your resources across Amazon Web Services accounts that you own, see [Providing access to an IAM user in another Amazon Web Services account that you own](#) in the *IAM User Guide*.

- To learn how to provide access to your resources to third-party Amazon Web Services accounts, see [Providing access to Amazon Web Services accounts owned by third parties](#) in the *IAM User Guide*.
- To learn how to provide access through identity federation, see [Providing access to externally authenticated users \(identity federation\)](#) in the *IAM User Guide*.
- To learn the difference between using roles and resource-based policies for cross-account access, see [Cross account resource access in IAM](#) in the *IAM User Guide*.

Amazon Lake Formation access control models

Amazon Glue 5.0 and above supports two models for accessing data through Amazon Lake Formation:

Topics

- [Using Amazon Glue with Amazon Lake Formation for Full Table Access](#)
- [Using Amazon Glue with Amazon Lake Formation for fine-grained access control](#)

Using Amazon Glue with Amazon Lake Formation for Full Table Access

Introduction to Full Table Access

Amazon Glue 5.0 and above supports Full Table Access (FTA) control in Apache Spark based on your policies defined in Amazon Lake Formation. This feature enables read and write operations from your Amazon Glue Spark jobs on Amazon Lake Formation registered tables when the job role has full table access. FTA is ideal for use cases that need to comply with security regulations at the table level and supports Spark capabilities including Resilient Distributed Datasets (RDDs), custom libraries, and User Defined Functions (UDFs) with Amazon Lake Formation tables.

When a Amazon Glue Spark job is configured for Full Table Access (FTA), Amazon Lake Formation credentials are used to read/write Amazon S3 data for Amazon Lake Formation registered tables, while the job's runtime role credentials will be used to read/write tables not registered with Amazon Lake Formation. This capability enables Data Manipulation Language (DML) operations including CREATE, ALTER, DELETE, UPDATE, and MERGE INTO statements on Apache Hive and Iceberg tables.

Note

Review your requirements and determine if Fine-Grained Access Control (FGAC) or Full Table Access (FTA) suits your needs. Only one Amazon Lake Formation permission method can be enabled for a given Amazon Glue job. A job cannot simultaneously run Full Table Access (FTA) and Fine-Grained Access Control (FGAC) at the same time.

How Full-Table Access (FTA) works on Amazon Glue

Amazon Lake Formation offers two approaches for data access control: Fine-Grained Access Control (FGAC) and Full Table Access (FTA). FGAC provides enhanced security through column, row, and cell-level filtering, ideal for scenarios requiring granular permissions. FTA is ideal for straightforward access control scenarios where you need table-level permissions. It simplifies implementation by eliminating the need to enable fine-grained access mode, improves performance and reduces cost by avoiding the system driver and system executors, and supports both read and write operations (including CREATE, ALTER, DELETE, UPDATE, and MERGE INTO commands).

In Amazon Glue 4.0, Amazon Lake Formation based data access worked through GlueContext class, the utility class provided by Amazon Glue. In Amazon Glue 5.0, Amazon Lake Formation based data access is available through native Spark SQL, Spark DataFrames, and continues to be supported through GlueContext class.

Implementing Full Table Access

Step 1: Enable Full Table Access in Amazon Lake Formation

To use Full Table Access (FTA) mode, you need to allow third-party query engines to access data without the IAM session tag validation in Amazon Lake Formation. To enable, follow the steps in [Application integration for full table access](#).

Step 2: Setup IAM permissions for job runtime role

For read or write access to underlying data, in addition to Amazon Lake Formation permissions, a job runtime role needs the `lakeformation:GetDataAccess` IAM permission. With this permission, Amazon Lake Formation grants the request for temporary credentials to access the data.

The following is an example policy of how to provide IAM permissions to access a script in Amazon S3, uploading logs to Amazon S3, Amazon Glue API permissions, and permission to access Amazon Lake Formation.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "ScriptAccess",
      "Effect": "Allow",
      "Action": [
        "s3:GetObject"
      ],
      "Resource": [
        "arn:aws:s3::amzn-s3-demo-bucket/scripts/*"
      ]
    },
    {
      "Sid": "LoggingAccess",
      "Effect": "Allow",
      "Action": [
        "s3:PutObject"
      ],
      "Resource": [
        "arn:aws:s3::amzn-s3-demo-bucket/logs/*"
      ]
    },
    {
      "Sid": "GlueCatalogAccess",
      "Effect": "Allow",
      "Action": [
        "glue:GetDatabase",
        "glue:GetDatabases",
        "glue:GetTable",
        "glue:GetTables",
        "glue:GetPartition",
        "glue:GetPartitions",
        "glue:CreateTable",
        "glue:UpdateTable"
      ],
    }
  ]
}
```

```

    "Resource": [
      "arn:aws:glue:us-east-1:111122223333:catalog",
      "arn:aws:glue:us-east-1:111122223333:database/default",
      "arn:aws:glue:us-east-1:111122223333:table/default/*"
    ]
  },
  {
    "Sid": "LakeFormationAccess",
    "Effect": "Allow",
    "Action": [
      "lakeformation:GetDataAccess"
    ],
    "Resource": "*"
  }
]
}

```

Step 2.1 Configure Amazon Lake Formation permissions

Amazon Glue Spark jobs that read data from Amazon S3 require Amazon Lake Formation SELECT permission.

Amazon Glue Spark jobs that write/delete data in Amazon S3 require Amazon Lake Formation ALL permission.

Amazon Glue Spark jobs that interact with Amazon Glue Data catalog require DESCRIBE, ALTER, DROP permission as appropriate.

Step 3: Initialize a Spark session for Full Table Access using Amazon Lake Formation

To access tables registered with Amazon Lake Formation, the following configurations need to be set during Spark initialization to configure Spark to use Amazon Lake Formation credentials.

To access tables registered with Amazon Lake Formation, you need to explicitly configure your Spark session to use Amazon Lake Formation credentials. Add the following configurations when initializing your Spark session:

```

from pyspark.sql import SparkSession

# Initialize Spark session with Lake Formation configurations
spark = SparkSession.builder \
    .appName("Lake Formation Full Table Access") \

```

```
.config("spark.sql.catalog.glue_catalog",
"org.apache.spark.sql.catalog.hive.GlueCatalog") \
.config("spark.sql.catalog.glue_catalog.glue.lakeformation-enabled", "true") \
.config("spark.sql.defaultCatalog", "glue_catalog") \
.getOrCreate()
```

Key configurations:

- `spark.sql.catalog.glue_catalog`: Registers a catalog named "glue_catalog" that uses the `GlueCatalog` implementation
- `spark.sql.catalog.glue_catalog.glue.lakeformation-enabled`: Explicitly enables Amazon Lake Formation integration for this catalog
- The catalog name ("glue_catalog" in this example) can be customized, but must be consistent in both configuration settings

Hive

```
--conf spark.hadoop.fs.s3.credentialsResolverClass=com.amazonaws.Amazon
Glue.accesscontrol.AWSLakeFormationCredentialResolver
--conf spark.hadoop.fs.s3.useDirectoryHeaderAsFolderObject=true
--conf spark.hadoop.fs.s3.folderObject.autoAction.disabled=true
--conf spark.sql.catalog.skipLocationValidationOnCreateTable.enabled=true
--conf spark.sql.catalog.createDirectoryAfterTable.enabled=true
--conf spark.sql.catalog.dropDirectoryBeforeTable.enabled=true
```

Iceberg

```
--conf spark.hadoop.fs.s3.credentialsResolverClass=com.amazonaws.Amazon
Glue.accesscontrol.AWSLakeFormationCredentialResolver
--conf spark.hadoop.fs.s3.useDirectoryHeaderAsFolderObject=true
--conf spark.hadoop.fs.s3.folderObject.autoAction.disabled=true
--conf spark.sql.catalog.skipLocationValidationOnCreateTable.enabled=true
--conf spark.sql.catalog.createDirectoryAfterTable.enabled=true
--conf spark.sql.catalog.dropDirectoryBeforeTable.enabled=true
--conf spark.sql.catalog.<catalog>.Amazon Glue.lakeformation-enabled=true
```

- `spark.hadoop.fs.s3.credentialsResolverClass=com.amazonaws.AmazonGlue.accesscontrol.AWSLakeFormationCredentialResolver`: Configure EMR Filesystem (EMRFS) to use Amazon Lake Formation S3 credentials for Amazon Lake Formation registered tables. If the table is not registered, use the job's runtime role credentials.
- `spark.hadoop.fs.s3.useDirectoryHeaderAsFolderObject=true` and `spark.hadoop.fs.s3.folderObject.autoAction.disabled=true`: Configure EMRFS to use content type header application/x-directory instead of `$folder$` suffix when creating S3 folders. This is required when reading Amazon Lake Formation tables, as Amazon Lake Formation credentials do not allow reading table folders with `$folder$` suffix.
- `spark.sql.catalog.skipLocationValidationOnCreateTable.enabled=true`: Configure Spark to skip validating the table location's emptiness before creation. This is necessary for Amazon Lake Formation registered tables, as Amazon Lake Formation credentials to verify the empty location are available only after Amazon Glue Data Catalog table creation. Without this configuration, the job's runtime role credentials will validate the empty table location.
- `spark.sql.catalog.createDirectoryAfterTable.enabled=true`: Configure Spark to create the Amazon S3 folder after table creation in the Hive metastore. This is required for Amazon Lake Formation registered tables, as Amazon Lake Formation credentials to create the Amazon S3 folder are available only after Amazon Glue Data Catalog table creation.
- `spark.sql.catalog.dropDirectoryBeforeTable.enabled=true`: Configure Spark to drop the Amazon S3 folder before table deletion in the Hive metastore. This is necessary for Amazon Lake Formation registered tables, as Amazon Lake Formation credentials to drop the S3 folder are not available after table deletion from the Amazon Glue Data Catalog.
- `spark.sql.catalog.<catalog>.AmazonGlue.lakeformation-enabled=true`: Configure Iceberg catalog to use Amazon Lake Formation Amazon S3 credentials for Amazon Lake Formation registered tables. If the table is not registered, use default environment credentials.

Usage Patterns

Using FTA with DataFrames

For users familiar with Spark, DataFrames can be used with Amazon Lake Formation Full Table Access.

Amazon Glue 5.0 adds native Spark support for Lake Formation Full Table Access, simplifying how you work with protected tables. This feature enables Amazon Glue 5.0 Amazon Glue Spark jobs to directly read and write data when full table access is granted, removing limitations that previously restricted certain Extract, Transform, and Load (ETL) operations. You can now leverage advanced Spark capabilities including Resilient Distributed Datasets (RDDs), custom libraries, and User Defined Functions (UDFs) with Amazon Lake Formation tables.

Native Spark FTA in Amazon Glue 5.0

Amazon Glue 5.0 supports full-table access (FTA) control in Apache Spark based on your policies defined in Amazon Lake Formation. This level of control is ideal for use cases that need to comply with security regulations at the table level.

Apache Iceberg Table Example

```
from pyspark.sql import SparkSession

catalog_name = "spark_catalog"
aws_region = "us-east-1"
aws_account_id = "123456789012"
warehouse_path = "s3://amzn-s3-demo-bucket/warehouse/"

spark = SparkSession.builder \

    .config("spark.sql.extensions", "org.apache.iceberg.spark.extensions.IcebergSparkSessionExtensions") \
    \
    .config(f"spark.sql.catalog.{catalog_name}",
"org.apache.iceberg.spark.SparkSessionCatalog") \
    .config(f"spark.sql.catalog.{catalog_name}.warehouse", f"{warehouse_path}") \
    .config(f"spark.sql.catalog.{catalog_name}.client.region", f"{aws_region}") \
    .config(f"spark.sql.catalog.{catalog_name}.glue.account-id", f"{aws_account_id}") \
    .config(f"spark.sql.catalog.{catalog_name}.glue.lakeformation-enabled", "true") \
    .config(f"spark.sql.catalog.dropDirectoryBeforeTable.enabled", "true") \
    .config(f"spark.sql.catalog.{catalog_name}.catalog-impl",
"org.apache.iceberg.aws.glue.GlueCatalog") \
    .config(f"spark.sql.catalog.{catalog_name}.io-impl",
"org.apache.iceberg.aws.s3.S3FileIO") \
    .config("spark.sql.defaultCatalog", catalog_name) \ # Add this line
    .getOrCreate()

database_name = "your_database"
table_name = "your_table"
```

```
df = spark.sql(f"select * from {database_name}.{table_name}")
df.show()
```

Required IAM Permissions

Your Amazon Glue job execution role must have:

```
{
  "Action": "lakeformation:GetDataAccess",
  "Resource": "*",
  "Effect": "Allow"
}
```

Plus appropriate S3 access permissions for your data locations.

Lake Formation Configuration

Before using native Spark FTA in Amazon Glue 5.0:

1. Allow third-party query engines to access data without IAM session tag validation in Amazon Lake Formation
2. Grant appropriate table permissions to your Amazon Glue job execution role through Amazon Lake Formation console
3. Configure your Spark session with the required parameters shown in the example above

Using FTA with DynamicFrames

Amazon Glue's native DynamicFrames can be used with Amazon Lake Formation Full Table Access for optimized ETL operations. Full Table Access (FTA) provides a security model that grants permissions at the table level, allowing for faster data processing compared to Fine-Grained Access Control (FGAC) since it bypasses the overhead of row and column-level permission checks. This approach is useful when you need to process entire tables and table-level permissions meet your security requirements.

In Amazon Glue 4.0, DynamicFrames with FTA required specific GlueContext configuration. While existing Amazon Glue 4.0 DynamicFrame code with FTA will continue to work in Amazon Glue 5.0, the newer version also offers native Spark FTA support with greater flexibility. For new development, consider using the native Spark approach described in the DataFrames section,

especially if you need additional capabilities such as Resilient Distributed Datasets (RDDs), custom libraries, and User Defined Functions (UDFs) with Amazon Lake Formation tables.

Required Permissions

The IAM role executing your Glue job must have:

- `lakeformation:GetDataAccess` permission
- Appropriate Lake Formation table permissions granted through the Lake Formation console

Example DynamicFrame Implementation in Amazon Glue 5.0

```
from awsglue.context import GlueContext
from pyspark.context import SparkContext

# Initialize Glue context
sc = SparkContext()
glueContext = GlueContext(sc)

# Configure catalog for Iceberg tables
catalog_name = "glue_catalog"
aws_region = "us-east-1"
aws_account_id = "123456789012"
warehouse_path = "s3://amzn-s3-demo-bucket/warehouse/"

spark = glueContext.spark_session
spark.conf.set(f"spark.sql.catalog.{catalog_name}",
               "org.apache.iceberg.spark.SparkCatalog")
spark.conf.set(f"spark.sql.catalog.{catalog_name}.warehouse", f"{warehouse_path}")
spark.conf.set(f"spark.sql.catalog.{catalog_name}.catalog-impl",
               "org.apache.iceberg.aws.glue.GlueCatalog")
spark.conf.set(f"spark.sql.catalog.{catalog_name}.io-impl",
               "org.apache.iceberg.aws.s3.S3FileIO")
spark.conf.set(f"spark.sql.catalog.{catalog_name}.glue.lakeformation-enabled", "true")
spark.conf.set(f"spark.sql.catalog.{catalog_name}.client.region", f"{aws_region}")
spark.conf.set(f"spark.sql.catalog.{catalog_name}.glue.id", f"{aws_account_id}")

# Read Lake Formation-protected table with DynamicFrame
df = glueContext.create_data_frame.from_catalog(
    database="your_database",
    table_name="your_table"
)
```

Additional Configuration

Configure full table access mode in Amazon Glue Studio notebooks

To access Amazon Lake Formation registered tables from interactive Spark sessions in Amazon Glue Studio notebooks, you must use compatibility permission mode. Use the `%%configure` magic command to set up your Spark configuration before starting your interactive session. This configuration must be the first command in your notebook, as it cannot be applied after the session has started. Choose the configuration based on your table type:

For Hive tables

```
%%configure
--conf
  spark.hadoop.fs.s3.credentialsResolverClass=com.amazonaws.glue.accesscontrol.AWSLakeFormationC
--conf spark.hadoop.fs.s3.useDirectoryHeaderAsFolderObject=true
--conf spark.hadoop.fs.s3.folderObject.autoAction.disabled=true
--conf spark.sql.catalog.skipLocationValidationOnCreateTable.enabled=true
--conf spark.sql.catalog.createDirectoryAfterTable.enabled=true
--conf spark.sql.catalog.dropDirectoryBeforeTable.enabled=true
```

For Iceberg tables

```
%%configure
--conf
  spark.hadoop.fs.s3.credentialsResolverClass=com.amazonaws.glue.accesscontrol.AWSLakeFormationC
--conf spark.hadoop.fs.s3.useDirectoryHeaderAsFolderObject=true
--conf spark.hadoop.fs.s3.folderObject.autoAction.disabled=true
--conf spark.sql.catalog.skipLocationValidationOnCreateTable.enabled=true
--conf spark.sql.catalog.createDirectoryAfterTable.enabled=true
--conf spark.sql.catalog.dropDirectoryBeforeTable.enabled=true
--conf spark.sql.catalog.glue_catalog.glue.lakeformation-enabled=true
--conf spark.sql.catalog.glue_catalog.warehouse=s3://example-s3-bucket_DATA_LOCATION
--conf spark.sql.catalog.glue_catalog.catalog-
impl=org.apache.iceberg.aws.glue.GlueCatalog
--conf spark.sql.catalog.glue_catalog.io-impl=org.apache.iceberg.aws.s3.S3FileIO
--conf spark.sql.catalog.glue_catalog.glue.account-id=ACCOUNT_ID
--conf spark.sql.catalog.glue_catalog.glue.region=REGION
```

Replace the placeholders:

- `S3_DATA_LOCATION`: *s3://amzn-s3-demo-bucket*

- REGION: *Amazon Region (e.g., us-east-1)*
- ACCOUNT_ID: *Your Amazon Account ID*

Note

You must set these configurations before executing any Spark operations in your notebook.

Supported Operations

These operations will use Amazon Lake Formation credentials to access the table data.

Note

On enabling Amazon Lake Formation:

- For FTA: Enable the Spark configuration `spark.sql.catalog.{catalog_name}.glue.lakeformation-enabled`

- CREATE TABLE
- ALTER TABLE
- INSERT INTO
- INSERT OVERWRITE
- SELECT
- UPDATE
- MERGE INTO
- DELETE FROM
- ANALYZE TABLE
- REPAIR TABLE
- DROP TABLE
- Spark datasource queries
- Spark datasource writes

Note

Operations not listed above will continue to use IAM permissions to access table data.

Migrating from Amazon Glue 4.0 to Amazon Glue 5.0 FTA

When migrating from Amazon Glue 4.0 GlueContext FTA to Amazon Glue 5.0 native Spark FTA:

1. Allow third-party query engines to access data without the IAM session tag validation in Amazon Lake Formation. Follow [Step 1: Enable Full Table Access in Amazon Lake Formation](#).
2. You do not need to change the job runtime role. However, verify that the Amazon Glue job execution role has `lakeformation:GetDataAccess` IAM permission.
3. Modify spark session configurations in the script. Ensure the following spark configurations are present:

```
--conf spark.sql.catalog.spark_catalog=org.apache.iceberg.spark.SparkSessionCatalog
--conf spark.sql.catalog.spark_catalog.warehouse=s3://<bucket-name>/warehouse/
--conf spark.sql.catalog.spark_catalog.client.region=<REGION>
--conf spark.sql.catalog.spark_catalog.glue.account-id=ACCOUNT_ID
--conf spark.sql.catalog.spark_catalog.glue.lakeformation-enabled=true
--conf spark.sql.catalog.dropDirectoryBeforeTable.enabled=true
```

4. Update script such that GlueContext DataFrames are changed to native spark DataFrames.
5. Update your Amazon Glue job to use Amazon Glue 5.0

Considerations and Limitations

- If a Hive table is created using a job that doesn't have full table access enabled, and no records are inserted, subsequent reads or writes from a job with full table access will fail. This is because Amazon Glue Spark without full table access adds the `$folder$` suffix to the table folder name. To resolve this, you can either:
 - Insert at least one row into the table from a job that does not have FTA enabled.
 - Configure the job that does not have FTA enabled to not use `$folder$` suffix in folder name in S3. This can be achieved by setting Spark configuration `spark.hadoop.fs.s3.useDirectoryHeaderAsFolderObject=true`.

- Create an Amazon S3 folder at the table location `s3://path/to/table/table_name` using the Amazon S3 console or Amazon S3 CLI.
- Full Table Access works exclusively with EMR Filesystem (EMRFS). S3A filesystem is not compatible.
- Full Table Access is supported for Hive and Iceberg tables. Support for Hudi and Delta tables has not yet been added.
- Jobs referencing tables with Amazon Lake Formation Fine-Grained Access Control (FGAC) rules or Amazon Glue Data Catalog Views will fail. To query a table with an FGAC rules or a Amazon Glue Data Catalog View, you need to use the FGAC mode. You can enable FGAC mode by following the steps outlined in the Amazon documentation: [Using Amazon Glue with Amazon Lake Formation for fine-grained access control](#).
- Full table access does not support Spark Streaming.
- Cannot be used simultaneously with FGAC.

Using Amazon Glue with Amazon Lake Formation for fine-grained access control

Overview

With Amazon Glue version 5.0 and higher, you can leverage Amazon Lake Formation to apply fine-grained access controls on Data Catalog tables that are backed by S3. This capability lets you configure table, row, column, and cell level access controls for read queries within your Amazon Glue for Apache Spark jobs. See the following sections to learn more about Lake Formation and how to use it with Amazon Glue.

GlueContext-based table-level access control with Amazon Lake Formation permissions supported in Glue 4.0 or before is not supported in Glue 5.0. Use the new Spark native fine-grained access control (FGAC) in Glue 5.0. Note the following details:

- If you need fine grained access control (FGAC) for row/column/cell access control, you will need to migrate from GlueContext/Glue DynamicFrame in Glue 4.0 and prior to Spark dataframe in Glue 5.0. For examples, see [Migrating from GlueContext/Glue DynamicFrame to Spark DataFrame](#)
- If you need Full Table Access control (FTA), you can leverage FTA with DynamicFrames in Amazon Glue 5.0. You can also migrate to native Spark approach for additional capabilities such as

Resilient Distributed Datasets (RDDs), custom libraries, and User Defined Functions (UDFs) with Amazon Lake Formation tables. For examples, see [Migrating from Amazon Glue 4.0 to Amazon Glue 5.0](#).

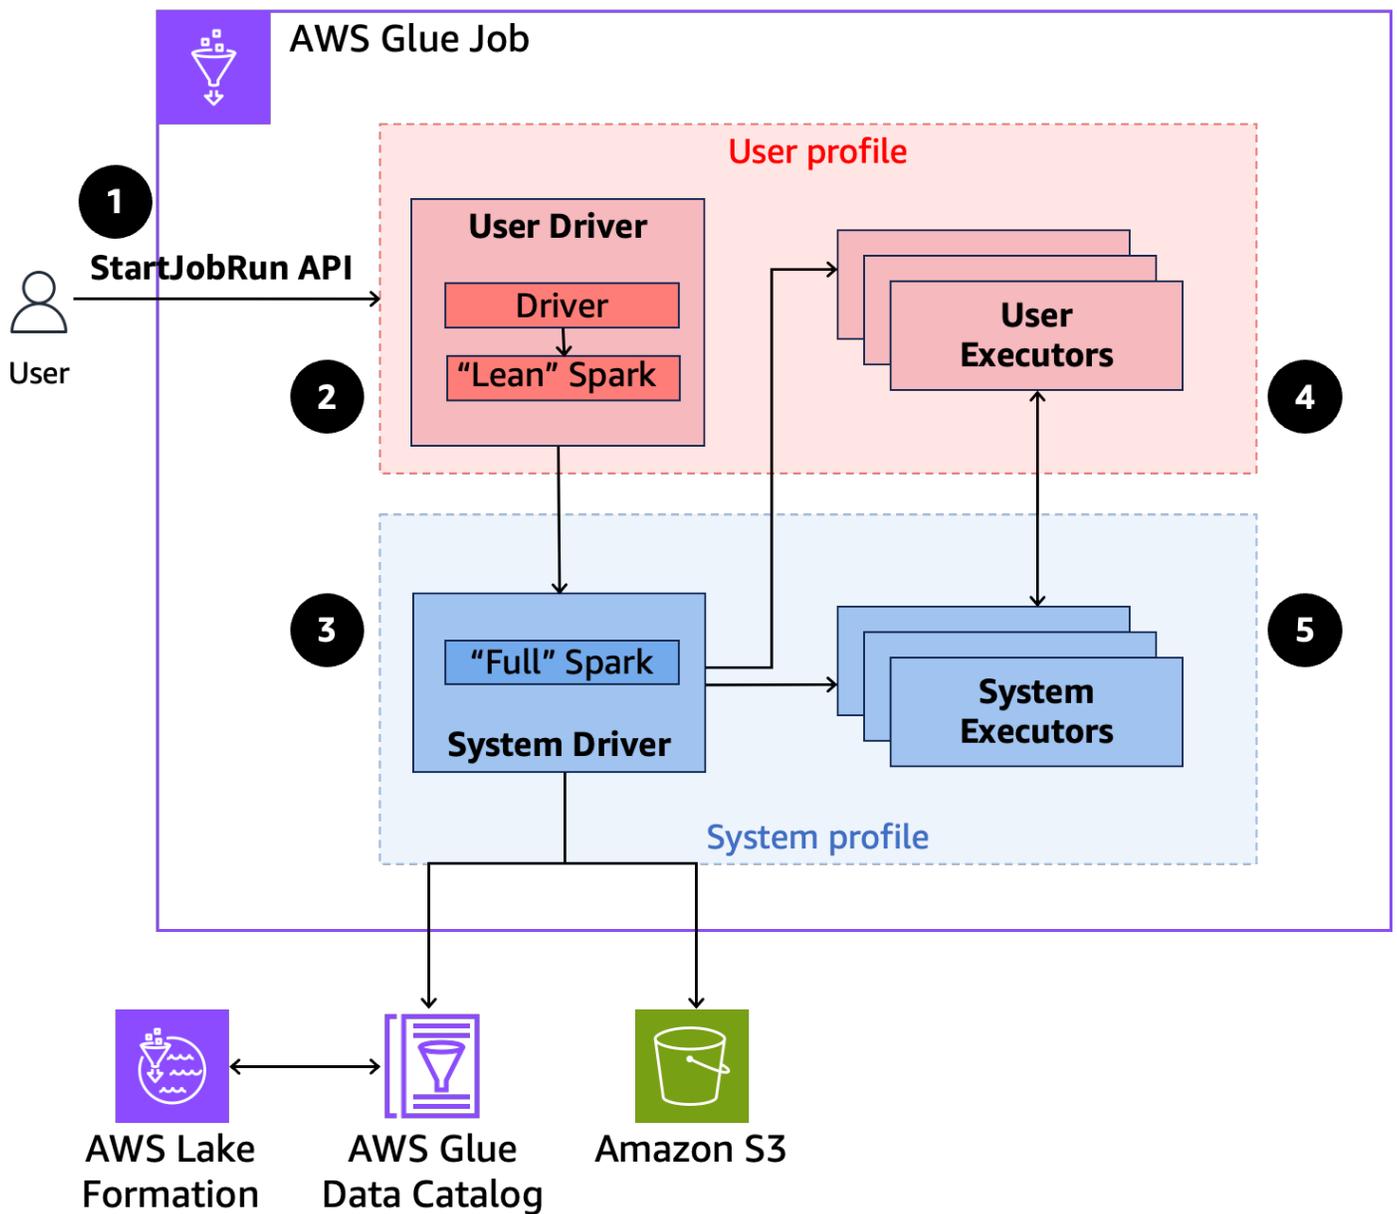

- If you don't need FGAC, then no migration to Spark dataframe is necessary and GlueContext features like job bookmarks, push down predicates will continue to work.
- Jobs with FGAC require a minimum of 4 workers: one user driver, one system driver, one system executor, and one standby user executor.

Using Amazon Glue with Amazon Lake Formation incurs additional charges.

How Amazon Glue works with Amazon Lake Formation

Using Amazon Glue with Lake Formation lets you enforce a layer of permissions on each Spark job to apply Lake Formation permissions control when Amazon Glue executes jobs. Amazon Glue uses [Spark resource profiles](#) to create two profiles to effectively execute jobs. The user profile executes user-supplied code, while the system profile enforces Lake Formation policies. For more information, see [What is Amazon Lake Formation](#) and [Considerations and limitations](#).

The following is a high-level overview of how Amazon Glue gets access to data protected by Lake Formation security policies.

1. A user calls the `StartJobRun` API on an Amazon Lake Formation-enabled Amazon Glue job.
2. Amazon Glue sends the job to a user driver and runs the job in the user profile. The user driver runs a lean version of Spark that has no ability to launch tasks, request executors, access S3 or the Glue Catalog. It builds a job plan.
3. Amazon Glue sets up a second driver called the system driver and runs it in the system profile (with a privileged identity). Amazon Glue sets up an encrypted TLS channel between the two drivers for communication. The user driver uses the channel to send the job plans to the system driver. The system driver does not run user-submitted code. It runs full Spark and

communicates with S3, and the Data Catalog for data access. It request executors and compiles the Job Plan into a sequence of execution stages.

4. Amazon Glue then runs the stages on executors with the user driver or system driver. User code in any stage is run exclusively on user profile executors.
5. Stages that read data from Data Catalog tables protected by Amazon Lake Formation or those that apply security filters are delegated to system executors.

Minimum worker requirement

A Lake Formation-enabled job in Amazon Glue requires a minimum of 4 workers: one user driver, one system driver, one system executor, and one standby User Executor. This is up from the minimum of 2 workers required for standard Amazon Glue jobs.

A Lake Formation-enabled job in Amazon Glue utilizes two Spark drivers—one for the system profile and another for the user profile. Similarly, the executors are also divided into two profiles:

- System executors: handle tasks where Lake Formation data filters are applied.
- User executors: are requested by the system driver as needed.

As Spark jobs are lazy in nature, Amazon Glue reserves 10% of the total workers (minimum of 1), after deducting the two drivers, for user executors.

All Lake Formation-enabled jobs have auto-scaling enabled, meaning the user executors will only start when needed.

For an example configuration, see [Considerations and limitations](#).

Job runtime role IAM permissions

Lake Formation permissions control access to Amazon Glue Data Catalog resources, Amazon S3 locations, and the underlying data at those locations. IAM permissions control access to the Lake Formation and Amazon Glue APIs and resources. Although you might have the Lake Formation permission to access a table in the Data Catalog (SELECT), your operation fails if you don't have the IAM permission on the `glue:Get*` API operation.

The following is an example policy of how to provide IAM permissions to access a script in S3, uploading logs to S3, Amazon Glue API permissions, and permission to access Lake Formation.

JSON

```
{
  "Version": "2012-10-17",

}
]
```

Setting up Lake Formation permissions for job runtime role

First, register the location of your Hive table with Lake Formation. Then create permissions for your job runtime role on your desired table. For more details about Lake Formation, see [What is Amazon Lake Formation?](#) in the *Amazon Lake Formation Developer Guide*.

After you set up the Lake Formation permissions, you can submit Spark jobs on Amazon Glue.

Submitting a job run

After you finish setting up the Lake Formation grants, you can submit Spark jobs on Amazon Glue. To run Iceberg jobs, you must provide the following Spark configurations. To configure through Glue job parameters, put the following parameter:

- Key:

```
--conf
```

- Value:

```
spark.sql.catalog.spark_catalog=org.apache.iceberg.spark.SparkSessionCatalog
--conf spark.sql.catalog.spark_catalog.warehouse=<S3_DATA_LOCATION>
--conf spark.sql.catalog.spark_catalog.glue.account-id=<ACCOUNT_ID>
--conf spark.sql.catalog.spark_catalog.client.region=<REGION>
--conf spark.sql.catalog.spark_catalog.glue.endpoint=https://
glue.<REGION>.amazonaws.com
```

Using an Interactive Session

After you finish setting up the Amazon Lake Formation grants, you can use Interactive Sessions on Amazon Glue. You must provide the following Spark configurations via the `%%configure` magic prior to executing code.

```
%%configure
{
  "--enable-lakeformation-fine-grained-access": "true",
  "--conf":
  "spark.sql.catalog.spark_catalog=org.apache.iceberg.spark.SparkSessionCatalog
  --conf spark.sql.catalog.spark_catalog.warehouse=<S3_DATA_LOCATION> --conf
  spark.sql.catalog.spark_catalog.catalog-impl=org.apache.iceberg.aws.glue.GlueCatalog
  --conf spark.sql.catalog.spark_catalog.io-impl=org.apache.iceberg.aws.s3.S3FileIO --
  conf
  spark.sql.extensions=org.apache.iceberg.spark.extensions.IcebergSparkSessionExtensions
  --conf spark.sql.catalog.spark_catalog.client.region=<REGION> --conf
  spark.sql.catalog.spark_catalog.glue.account-id=<ACCOUNT_ID> --conf
  spark.sql.catalog.spark_catalog.glue.endpoint=https://glue.<REGION>.amazonaws.com"
}
```

FGAC for Amazon Glue 5.0 Notebook or interactive sessions

To enable Fine-Grained Access Control (FGAC) in Amazon Glue you must specify the Spark configs required for Lake Formation as part of the `%%configure` magic before you create first cell.

Specifying it later using the calls `SparkSession.builder().conf("").get()` or `SparkSession.builder().conf("").create()` will not be enough. This is a change from the Amazon Glue 4.0 behavior.

Open-table format support

Amazon Glue version 5.0 or later includes support for fine-grained access control based on Lake Formation. Amazon Glue supports Hive and Iceberg table types. The following table describes all of the supported operations.

| Operations | Hive | Iceberg |
|--------------|--------------------------------|--------------------------------|
| DDL commands | With IAM role permissions only | With IAM role permissions only |

| Operations | Hive | Iceberg |
|---------------------|-------------------------------------|--|
| Incremental queries | Not applicable | Fully supported |
| Time travel queries | Not applicable to this table format | Fully supported |
| Metadata tables | Not applicable to this table format | Supported, but certain tables are hidden. See considerations and limitations for more information. |
| DML INSERT | With IAM permissions only | With IAM permissions only |
| DML UPDATE | Not applicable to this table format | With IAM permissions only |
| DML DELETE | Not applicable to this table format | With IAM permissions only |
| Read operations | Fully supported | Fully supported |
| Stored procedures | Not applicable | Supported with the exceptions of <code>register_table</code> and <code>migrate</code> . See considerations and limitations for more information. |

Migrating from GlueContext/Glue DynamicFrame to Spark DataFrame

The following are Python and Scala examples of migrating GlueContext/Glue DynamicFrame in Glue 4.0 to Spark DataFrame in Glue 5.0.

Python

Before:

```
escaped_table_name= '`<dbname>`.`<table_name>`'

additional_options = {
```

```

"query": f'select * from {escaped_table_name} WHERE column1 = 1 AND column7 = 7'
}

# DynamicFrame example
dataset = glueContext.create_data_frame_from_catalog(
    database="<dbname>",
    table_name=escaped_table_name,
    additional_options=additional_options)

```

After:

```

table_identifier= '`<catalogname>`.`<dbname>`.`<table_name>`' #catalogname is optional

# DataFrame example
dataset = spark.sql(f'select * from {table_identifier} WHERE column1 = 1 AND column7 = 7')

```

Scala**Before:**

```

val escapedTableName = "`<dbname>`.`<table_name>`"

val additionalOptions = JsonOptions(Map(
    "query" -> s"select * from $escapedTableName WHERE column1 = 1 AND column7 = 7"
))

# DynamicFrame example
val datasource0 = glueContext.getCatalogSource(
    database="<dbname>",
    tableName=escapedTableName,
    additionalOptions=additionalOptions).getDataFrame()

```

After:

```

val tableIdentifier = "`<catalogname>`.`<dbname>`.`<table_name>`" //catalogname is optional

# DataFrame example
val datasource0 = spark.sql(s"select * from $tableIdentifier WHERE column1 = 1 AND column7 = 7")

```

Considerations and limitations

Consider the following considerations and limitations when you use Lake Formation with Amazon Glue.

Amazon Glue with Lake Formation is available in all supported Regions except Amazon GovCloud (US-East) and Amazon GovCloud (US-West).

- Amazon Glue supports fine-grained access control via Lake Formation only for Apache Hive and Apache Iceberg tables. Apache Hive formats include Parquet, ORC, and CSV.
- You can only use Lake Formation with Spark jobs.
- Amazon Glue with Lake Formation only supports a single Spark session throughout a job.
- When Lake Formation is enabled, Amazon Glue requires a greater number of workers because it requires one system driver, system executors, one user driver, and optionally user executors (required when your job has UDFs or `spark.createDataFrame`).
- Amazon Glue with Lake Formation only supports cross-account table queries shared through resource links. The resource-link needs to be named identically to the source account's resource.
- To enable fine-grained access control for Amazon Glue jobs, pass the `--enable-lakeformation-fine-grained-access` job parameter.
- You can configure your Amazon Glue jobs to work with the Amazon Glue multi-catalog hierarchy. For information on the configuration parameters to use with the Amazon Glue `StartJobRun` API, see [Working with Amazon Glue multi-catalog hierarchy on EMR Serverless](#).
- The following aren't supported:
 - Resilient distributed datasets (RDD)
 - Spark streaming
 - Write with Lake Formation granted permissions
 - Access control for nested columns
- Amazon Glue blocks functionalities that might undermine the complete isolation of system driver, including the following:
 - UDTs, HiveUDFs, and any user-defined function that involves custom classes
 - Custom data sources
 - Supply of additional jars for Spark extension, connector, or metastore
 - `ANALYZE TABLE` command

- To enforce access controls, EXPLAIN PLAN and DDL operations such as DESCRIBE TABLE don't expose restricted information.
- Amazon Glue restricts access to system driver Spark logs on Lake Formation-enabled applications. Since the system driver runs with more access, events and logs that the system driver generates can include sensitive information. To prevent unauthorized users or code from accessing this sensitive data, Amazon Glue disabled access to system driver logs. For troubleshooting, contact Amazon support.
- If you registered a table location with Lake Formation, the data access path goes through the Lake Formation stored credentials regardless of the IAM permission for the Amazon Glue job runtime role. If you misconfigure the role registered with table location, jobs submitted that use the role with S3 IAM permission to the table location will fail.
- Writing to a Lake Formation table uses IAM permission rather than Lake Formation granted permissions. If your job runtime role has the necessary S3 permissions, you can use it to run write operations.

The following are considerations and limitations when using Apache Iceberg:

- You can only use Apache Iceberg with session catalog and not arbitrarily named catalogs.
- Iceberg tables that are registered in Lake Formation only support the metadata tables `history`, `metadata_log_entries`, `snapshots`, `files`, `manifests`, and `refs`. Amazon Glue hides the columns that might have sensitive data, such as `partitions`, `path`, and `summaries`. This limitation doesn't apply to Iceberg tables that aren't registered in Lake Formation.
- Tables that you don't register in Lake Formation support all Iceberg stored procedures. The `register_table` and `migrate` procedures aren't supported for any tables.
- We recommend that you use Iceberg `DataFrameWriterV2` instead of `V1`.

Example worker allocation

For a job configured with the following parameters:

```
--enable-lakeformation-fine-grained-access=true  
--number-of-workers=20
```

The worker allocation would be:

- One worker for the user driver.

- One worker for the system driver.
- 10% of the remaining 18 workers (that is, 2 workers) reserved for the user executors.
- Up to 16 workers allocated for system executors.

With auto-scaling enabled, the user executors can utilize any of the unallocated capacity from the system executors if needed.

Controlling user executor allocation

You can adjust the reservation percentage for user executors using the following configuration:

```
--conf spark.dynamicAllocation.maxExecutorsRatio=<value between 0 and 1>
```

This configuration allows fine-tuned control over how many user executors are reserved relative to the total available capacity.

Troubleshooting

See the following sections for troubleshooting solutions.

Logging

Amazon Glue uses Spark resources profiles to split job execution. Amazon Glue uses the user profile to run the code you supplied, while the system profile enforces Lake Formation policies. You can access the logs for the tasks ran as the user profile.

Live UI and Spark History Server

The Live UI and the Spark History Server have all Spark events generated from the user profile and redacted events generated from the system driver.

You can see all of the tasks from both the user and system drivers in the **Executors** tab. However, log links are available only for the user profile. Also, some information is redacted from Live UI, such as the number of output records.

Job failed with insufficient Lake Formation permissions

Make sure that your job runtime role has the permissions to run SELECT and DESCRIBE on the table that you are accessing.

Job with RDD execution failed

Amazon Glue currently doesn't support resilient distributed dataset (RDD) operations on Lake Formation-enabled jobs.

Unable to access data files in Amazon S3

Make sure you have registered the location of the data lake in Lake Formation.

Security validation exception

Amazon Glue detected a security validation error. Contact Amazon support for assistance.

Sharing Amazon Glue Data Catalog and tables across accounts

You can share databases and tables across accounts and still use Lake Formation. For more information, see [Cross-account data sharing in Lake Formation](#) and [How do I share Amazon Glue Data Catalog and tables cross-account using ?](#).

The following table describes summary of how to choose between Fine-grained access control (FGAC) and Full table access (FTA) for your workload.

| Feature | Fine-grained access control (FGAC) | Full table access (FTA) |
|--------------------|--|-------------------------|
| Access Level | Column/row level | Full table |
| Use Case | Queries and ETL with limited permissions | ETL |
| Performance Impact | Requires system/user space transitions for access control evaluation, adding latency | Optimized performance |

Using Amazon S3 Access Grants with Amazon Glue

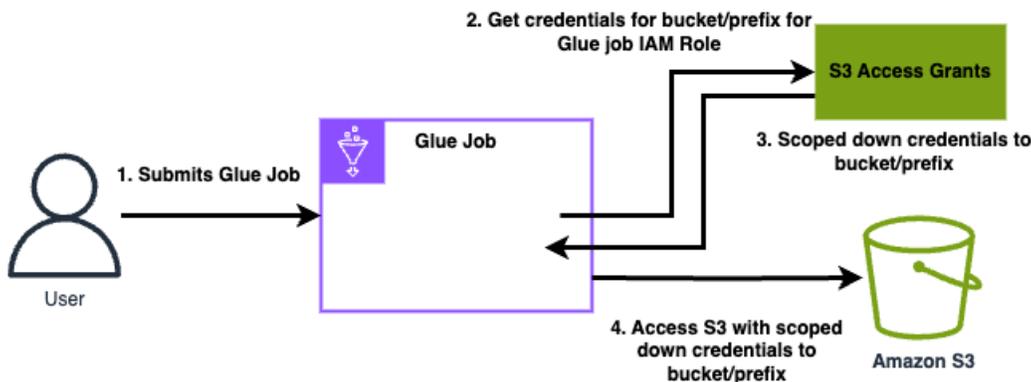

With Glue version 5.0, Amazon S3 Access Grants provide a scalable access control solution that you can use to augment access to your Amazon S3 data from Amazon Glue. If you have a complex or large permission configuration for your S3 data, you can use S3 Access Grants to scale S3 data permissions for users and roles.

Use S3 Access Grants to augment access to Amazon S3 data beyond the permissions that are granted by the runtime role or the IAM roles that are attached to the identities with access to your Amazon Glue job. For more information, see [Managing access with S3 Access Grants](#) in the *Amazon S3 User Guide*.

How Amazon Glue works with S3 Access Grants

Amazon Glue versions 5.0 and higher provide a native integration with S3 Access Grants. You can enable S3 Access Grants on Amazon Glue and run Spark jobs. When a Spark job makes a request for S3 data, Amazon S3 provides temporary credentials that are scoped to the specific bucket, prefix, or object.

The following is a high-level overview of how Amazon Glue gets access to data that S3 Access Grants manages access to.

1. A user submits an Amazon Glue Spark job that uses data stored in Amazon S3.
2. Amazon Glue makes a request for S3 Access Grants to vend temporary credentials for the user that give access to the bucket, prefix, or object.
3. Amazon Glue returns temporary credentials in the form of an Amazon Security Token Service (STS) token for the user. The token is scoped to access the S3 bucket, prefix, or object.
4. Amazon Glue uses the STS token to retrieve data from S3.
5. Amazon Glue receives the data from S3 and returns the results to the user.

S3 Access Grants considerations with Amazon Glue

Take note of the following behaviors and limitations when you use S3 Access Grants with Amazon Glue.

Feature support

- S3 Access Grants is supported with Amazon Glue versions 5.0 and higher.
- Spark is the only supported job type when you use S3 Access Grants with Amazon Glue.
- Delta Lake and Hudi are the only supported open-table formats when you use S3 Access Grants with Amazon Glue.
- The following capabilities are not supported for use with S3 Access Grants:
 - Apache Iceberg tables
 - Amazon CLI requests to Amazon S3 that use IAM roles
 - S3 access through the open-source S3A protocol

Behavioral considerations

- Amazon Glue provides a credentials cache to ensure that a user doesn't need to make repeated requests for the same credentials within a Spark job. Therefore, Amazon Glue always requests the default-level privilege when it requests credentials. For more information, see [Request access to S3 data](#) in the *Amazon S3 User Guide*.

Set up S3 Access Grants with Amazon Glue

Prerequisites

The caller or admin has created an S3 Access Grants instance.

Set up Amazon Glue policies and job configuration

To set up S3 Access Grants with Amazon Glue you must configure trust and IAM policies, and pass the configuration through job parameters.

1. Configure the following minimal trust and IAM policies on the role used for grants (the Amazon Glue role that runs sessions or jobs).

Trust policy:

```
{
    "Sid": "Stmt1234567891011",
    "Action": [
        "sts:AssumeRole",
```

```

        "sts:SetSourceIdentity",
        "sts:SetContext"
    ],
    "Effect": "Allow",
    "Principal": {
        "Service": "access-grants.s3.amazonaws.com"
    },
    "Condition": {
        "StringEquals": {
            "aws:SourceAccount": "123456789012",
            "aws:SourceArn": "arn:aws:s3:<region>:123456789012:access-grants/
default"
        }
    }
}

```

IAM policy:

```

{
    "Sid": "S3Grants",
    "Effect": "Allow",
    "Action": [
        "s3:GetDataAccess",
        "s3:GetAccessGrantsInstanceForPrefix"
    ],
    "Resource": "arn:aws:s3:<region>:123456789012:access-grants/default"
},
{
    "Sid": "BucketLevelReadPermissions",
    "Effect": "Allow",
    "Action": [
        "s3:ListBucket"
    ],
    "Resource": [
        "arn:aws:s3:::*"
    ],
    "Condition": {
        "StringEquals": {
            "aws:ResourceAccount": "123456789012"
        },
        "ArnEquals": {
            "s3:AccessGrantsInstanceArn": [
                "arn:aws:s3:<region>:123456789012:access-grants/default"
            ]
        }
    }
}

```

```

    ]
  }
}
},
{
  "Sid": "ObjectLevelReadPermissions",
  "Effect": "Allow",
  "Action": [
    "s3:GetObject",
    "s3:GetObjectVersion",
    "s3:GetObjectAcl",
    "s3:GetObjectVersionAcl",
    "s3:ListMultipartUploadParts"
  ],
  "Resource": [
    "arn:aws:s3:::*"
  ],
  "Condition": {
    "StringEquals": {
      "aws:ResourceAccount": "123456789012"
    },
    "ArnEquals": {
      "s3:AccessGrantsInstanceArn": [
        "arn:aws:s3:<region>:123456789012:access-grants/default"
      ]
    }
  }
}
}
}

```

2. In your Amazon Glue job, pass the following Spark configuration either through Amazon Glue job parameters or SparkConf.

```

--conf spark.hadoop.fs.s3.s3AccessGrants.enabled=true \
--conf spark.hadoop.fs.s3.s3AccessGrants.fallbackToIAM=false

```

Trusted Identity Propagation with Amazon Glue ETL

With IAM Identity Center, you can connect to identity providers (IdPs) and centrally manage access for users and groups across Amazon analytics services. You can integrate identity providers such as Okta, Ping, and Microsoft Entra ID (formerly Azure Active Directory) with IAM Identity Center for

users in your organization to access data using a single-sign on experience. IAM Identity Center also supports connecting additional third-party identity providers.

With Amazon Glue 5.0 and higher, you can propagate user-identities from IAM Identity Center to Amazon Glue interactive sessions. Amazon Glue Interactive Sessions will further propagate supplied identity to downstream services such as Amazon S3 Access Grants, Amazon Lake Formation, and Amazon Redshift, enabling secure data access via user identity in these downstream services.

Overview

[Identity Center](#) is the recommended approach for workforce authentication and authorization on Amazon for organizations of any size and type. With Identity Center, you can create and manage user identities in Amazon, or connect your existing identity source, including Microsoft Active Directory, Okta, Ping Identity, JumpCloud, Google Workspace, and Microsoft Entra ID (formerly Azure AD).

[Trusted identity propagation](#) is an IAM Identity Center feature that administrators of connected Amazon services can use to grant and audit access to service data. Access to this data is based on user attributes such as group associations. Setting up trusted identity propagation requires collaboration between the administrators of connected Amazon services and the IAM Identity Center administrators.

Features and benefits

The Amazon Glue interactive sessions integration with IAM Identity Center [Trusted identity propagation](#) provides the following benefits:

- The ability to enforce table-level authorization and fine grained access control with Identity Center identities on Lake Formation managed Amazon Glue data catalog tables.
- The ability to enforce authorization with Identity Center identities on Amazon Redshift clusters.
- Enables end to end tracking of user actions for auditing.
- The ability to enforce Amazon S3 prefix-level authorization with Identity Center identities on Amazon S3 Access Grants-managed Amazon S3 prefixes.

Use cases

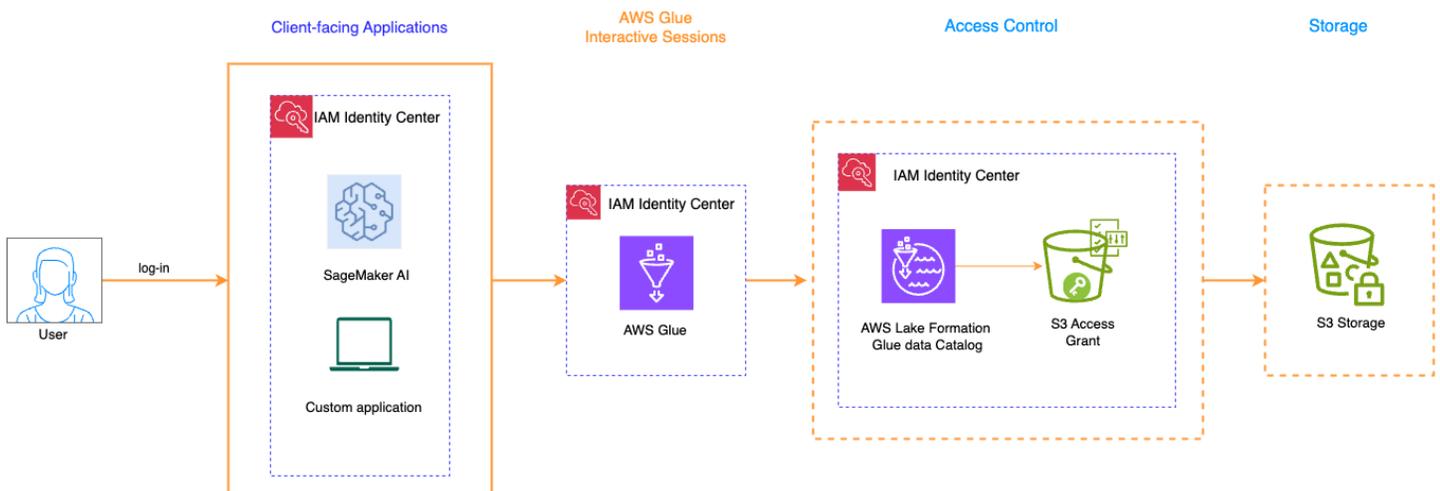

Interactive Data Exploration and Analysis

Data engineers use their corporate identities to seamlessly access and analyze data across multiple Amazon accounts. Through SageMaker Studio, they launch interactive Spark sessions via Amazon Glue ETL, connecting to various data sources including Amazon S3 and the Amazon Glue Data Catalog. As engineers explore datasets, Spark enforces fine-grained access controls defined in Lake Formation based on their identities, ensuring they can only view authorized data. All queries and data transformations are logged with the user's identity, creating a clear audit trail. This streamlined approach enables rapid prototyping of new analytics products while maintaining strict data governance across client environments.

Data Preparation and Feature Engineering

Data scientists from multiple research teams collaborate on complex projects using a unified data platform. They log into SageMaker Studio with their corporate credentials, immediately accessing a vast, shared data lake that spans multiple Amazon accounts. As they begin feature engineering for new machine learning models, Spark sessions launched through Amazon Glue ETL enforce Lake Formation's column and row-level security policies based on their propagated identities. Scientists can efficiently prepare data and engineer features using familiar tools, while compliance teams have assurance that every data interaction is automatically tracked and audited. This secure, collaborative environment accelerates research pipelines while maintaining the strict data protection standards required in regulated industries.

How it works

A user logs into client-facing applications (SageMaker AI, or custom applications) using their corporate identity through IAM Identity Center. This identity is then propagated through the entire data access pipeline.

The authenticated user launches Amazon Amazon Glue Interactive Sessions, which serve as the compute engine for data processing. These sessions maintain the user's identity context throughout the workflow.

Amazon Lake Formation and the Amazon Glue Data Catalog work together to enforce fine-grained access controls. Lake Formation applies security policies based on the user's propagated identity, while Amazon S3 Access Grant provides additional permission layers, ensuring users can only access data they're authorized to view.

Finally, the system connects to Amazon S3 Storage where the actual data resides. All access is governed by the combined security policies, maintaining data governance while enabling interactive data exploration and analysis. This architecture enables secure, identity-based data access across multiple Amazon services while maintaining a seamless user experience for data scientists and engineers working with large datasets.

Integrations

Amazon managed development environment

The following Amazon managed client-facing applications support trusted identity propagation with Amazon Glue interactive sessions:

- [Sagemaker Unified Studio](#)
- [Amazon SageMaker AI](#)

Sagemaker Unified Studio

To use trusted identity propagation with Sagemaker Unified Studio:

1. Set up Sagemaker Unified Studio project with trusted identity propagation enabled as the client-facing development environment.
2. Set up [Lake Formation](#) to enable fine-grained access control for Amazon Glue tables based on the user or group in IAM Identity Center.
3. [Set up Amazon S3 Access Grants](#) to enable temporary access to the underlying data locations in Amazon S3.
4. Open Sagemaker Unified Studio JupyterLab IDE space and select Amazon Glue as compute for notebook execution.

Customer managed self-hosted Notebook environment

To enable trusted identity propagation for users of custom-developed applications, see [Access Amazon services programmatically using trusted identity propagation](#) in the Amazon Security Blog.

Getting started with trusted identity propagation in Amazon Glue ETL

This section helps you configure Amazon Glue application with interactive sessions to integrate with IAM Identity Center and enable [Trusted identity propagation](#).

Prerequisites

- An Identity Center instance in the Amazon region where you want to create Trusted identity propagation enabled Amazon Glue interactive sessions. An Identity Center instance can only exist in a single region for an Amazon account. For more information, see [Enable IAM Identity Center](#) and [provision the users and groups from your source of identities into IAM Identity Center](#).
- Enable Trusted identity propagation for downstream services such as Lake Formation or Amazon S3 Access Grants or Amazon Redshift cluster with which interactive workload interacts to access data.

Permissions needed to connect Amazon Glue ETL with IAM Identity Center

Create an IAM role

The role that creates IAM Identity Center connection requires permissions to create and modify application configuration in Amazon Glue and IAM Identity Center as in the following inline policy.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "glue:CreateGlueIdentityCenterConfiguration",
        "sso:CreateApplication",

```

```

        "sso:PutApplicationAssignmentConfiguration",
        "sso:PutApplicationAuthenticationMethod",
        "sso:PutApplicationGrant",
        "sso:PutApplicationAccessScope",
        "sso:ListInstances"
    ],
    "Resource": [
        "*"
    ]
}
]
}

```

The following inline policies contain specific permissions required to view, update, and delete properties of Amazon Glue integration with IAM Identity Center.

Use the following inline policy to allow an IAM role to view a Amazon Glue integration with IAM Identity Center.

JSON

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "glue:GetGlueIdentityCenterConfiguration"
      ],
      "Resource": [
        "*"
      ]
    }
  ]
}

```

Use the following inline policy to allow an IAM role to update Amazon Glue integration with IAM Identity Center.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "glue:UpdateGlueIdentityCenterConfiguration",
        "sso:PutApplicationAccessScope",
        "sso>DeleteApplicationAccessScope"
      ],
      "Resource": [
        "*"
      ]
    }
  ]
}
```

Use the following inline policy to allow an IAM role to delete a Amazon Glue integration with IAM Identity Center.

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "glue>DeleteGlueIdentityCenterConfiguration",
        "sso>DeleteApplication"
      ],
      "Resource": [
        "*"
      ]
    }
  ]
}
```

Permissions description

- `glue:CreateGlueIdentityCenterConfiguration` – Grants permission to create the Amazon Glue IdC configuration.
- `glue:GetGlueIdentityCenterConfiguration` – Grants permission to get an existing IdC configuration.
- `glue>DeleteGlueIdentityCenterConfiguration` – Grants permission to delete an existing Amazon Glue IdC configuration.
- `glue:UpdateGlueIdentityCenterConfiguration` – Grants permission to update an existing Amazon Glue IdC configuration.
- `sso:CreateApplication` – Grants permission to create a Amazon Glue managed IAM Identity Center application.
- `sso:DescribeApplication` - Grants permission to describe a Amazon Glue managed IAM Identity Center application.
- `sso>DeleteApplication` – Grants permission to delete a Amazon Glue managed IAM Identity Center application.
- `sso:UpdateApplication` – Grants permission to update a Amazon Glue managed IAM Identity Center application.
- `sso:PutApplicationGrant` – Grants permission to apply token-exchange, introspectToken, refreshToken and RevokeToken grants on IdC Application.
- `sso:PutApplicationAuthenticationMethod` – Grants permission to put authenticationMethod on Amazon Glue managed IdC Application that allows Amazon Glue service principal to interact with IdC Application.
- `sso:PutApplicationAccessScope` – Grants permission to add or update the list of authorized down stream service scopes on the Amazon Glue managed IdC application.
- `sso>DeleteApplicationAccessScope` - Grants permission to delete downstream scopes if a scope is removed for the Amazon Glue managed IdC application.
- `sso:PutApplicationAssignmentConfiguration` – Grants permission to set "User-assignment-not-required" setting on IdC Application.
- `sso:ListInstances` – Grants permission to list instances and validate the IdC InstanceArn that you specify in identity-center-configuration parameter.

Connecting Amazon Glue with IAM Identity Center

When Amazon Glue is connected to IAM Identity Center, it creates a singleton managed IdC application per account. The following example shows how you can connect Amazon Glue with IAM Identity Center:

```
aws glue create-glue-identity-center-configuration \  
--instance-arn arn:aws:sso:::instance/ssoins-123456789 \  
--scopes '["s3:access_grants:read_write", "redshift:connect","lakeformation:query"]'
```

To update the scopes of the managed application (usually done to propagate to more downstream services), you can use:

```
aws glue update-glue-identity-center-configuration \  
--scopes '["s3:access_grants:read_write", "redshift:connect","lakeformation:query"]'
```

Scopes parameter is optional and all scopes will be added if not provided. The supported values are `s3:access_grants:read_write`, `redshift:connect` and `lakeformation:query`.

To get the details of the configuration, you can use:

```
aws glue get-glue-identity-center-configuration
```

You can delete the connection between Amazon Glue and IAM Identity Center by using the following command:

```
aws glue delete-glue-identity-center-configuration
```

Note

Amazon Glue creates a service managed Identity Center Application in your account that service leverages for identity validations and identity propagation to downstream services. Amazon Glue created managed Identity Center Application is shared across all trusted-identity-propagation sessions in your account.

Warning: Do not manually modify settings on the managed Identity Center Application. Any changes could affect all trusted-identity-propagation enabled Amazon Glue interactive sessions in your account.

Creating a Amazon Glue Interactive Session with Trusted Identity Propagation Enabled

After you connect Amazon Glue with IAM Identity Center, you can use [identity-enhanced role credentials](#) to create a Amazon Glue interactive session. You need not pass additional parameters when creating a 5.0 Amazon Glue session. Since Amazon Glue is connected with IAM identity center, if Amazon Glue detects identity-enhanced-role-credentials, it will automatically propagate the identity information to downstream services which are called as part of your statements. However, the runtime role for the session needs to have the `sts:SetContext` permission as depicted below.

Runtime Role permissions to propagate identity

As Amazon Glue sessions leverage [Identity-enhanced credentials](#) to propagate identity to downstream Amazon services, its runtime role's trust-policy need to have addition permission `sts:SetContext` to allow identity propagation to downstream services (Amazon S3 access-grant, Lake Formation, Amazon Redshift). To learn more about how to create a runtime role, see [Setting up a runtime role](#).

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "Service": "glue.amazonaws.com"
      },
      "Action": [
        "sts:AssumeRole",
        "sts:SetContext"
      ]
    }
  ]
}
```

Additionally, Runtime role would need permissions for downstream Amazon services which job-run would invoke to fetch data using user identity. Please refer to the following links to configure Amazon S3 Access Grants and Lake Formation:

- [Using Lake Formation with Amazon Glue](#)
- [Using Amazon S3 Access Grants with Amazon Glue](#)

Considerations and limitations for Amazon Glue ETL Trusted Identity Propagation integration

Important

By default sessions are not private which means one IdC user can access another IdC user's session. You can use [tagOnCreate](#) to make your sessions private. For example, the session can be tagged with an owner tag and the value of it as IDC User Id and then on the policy, you can use a global condition key like [identitystore:UserId](#) to validate against the owner tag in the client principal/runtime role policy for all session API operations to ensure that one IdC User isn't able to access another IdC user's session.

Consider the following points when you use IAM Identity Center Trusted Identity Propagation with Amazon Glue Application:

- Trusted Identity Propagation through Identity Center is supported on Amazon Glue 5.0 and higher, and only with Amazon Glue interactive sessions.
- Amazon Glue data catalog is covered under Lake Formation identity center integration.
- Trusted Identity Propagation is limited to interactive sessions in Amazon Glue, excluding other data processing entities like jobs, triggers, workflows, and ML tasks. All Amazon Glue APIs, however, record user identities in Amazon CloudTrail for auditing.
- Amazon Glue currently supports integration with IAM Identity Center exclusively through API and CLI interfaces, not via the console.
- Once an application is enabled on Amazon Glue side, make sure to create 5.0 sessions with IdC Credentials but don't create a 4.0 session with IdC credentials.
- Trusted Identity Propagation with Amazon Glue is supported in the following Amazon Regions:
 - af-south-1 – Africa (Cape Town)

- ap-east-1 – Asia Pacific (Hong Kong)
- ap-northeast-1 – Asia Pacific (Tokyo)
- ap-northeast-2 – Asia Pacific (Seoul)
- ap-northeast-3 – Asia Pacific (Osaka)
- ap-south-1 – Asia Pacific (Mumbai)
- ap-southeast-1 – Asia Pacific (Singapore)
- ap-southeast-2 – Asia Pacific (Sydney)
- ap-southeast-3 – Asia Pacific (Jakarta)
- ca-central-1 – Canada (Central)
- eu-central-1 – Europe (Frankfurt)
- eu-north-1 – Europe (Stockholm)
- eu-south-1 – Europe (Milan)
- eu-west-1 – Europe (Ireland)
- eu-west-2 – Europe (London)
- eu-west-3 – Europe (Paris)
- me-south-1 – Middle East (Bahrain)
- sa-east-1 – South America (São Paulo)
- us-east-1 – US East (N. Virginia)
- us-east-2 – US East (Ohio)
- us-west-1 – US West (N. California)
- us-west-2 – US West (Oregon)

User background sessions for Amazon Glue ETL

User background sessions enable long-running analytics and machine learning workloads to continue even after the user has logged off from their notebook interface. This capability is implemented through Amazon Glue's trusted identity propagation feature. The following page explains the configuration options and behaviors for user background sessions.

Note

User background sessions apply to Amazon Glue interactive sessions initiated through notebook interfaces like SageMaker Unified Studio. Enabling or disabling this feature affects only new interactive sessions; existing active sessions are not impacted.

Configure user background sessions

User background sessions must be enabled at two levels for proper functionality:

1. IAM Identity Center instance level (configured by IdC administrators)
2. Amazon Glue Identity Center configuration level (configured by Amazon Glue administrators)

Enable user background sessions for Amazon Glue

To enable user background sessions for Amazon Glue, you must set the `userBackgroundSessionsEnabled` parameter to `true` in the Identity Center configuration when creating or updating the configuration.

Prerequisites

- Your IAM role that is used to create/update the Amazon Glue Identity Center configuration must have the `sso:PutApplicationSessionConfiguration` permission. This permission allows Amazon Glue to enable user background sessions at the Amazon Glue-managed IdC application level.
- Your Amazon Glue interactive sessions must use Amazon Glue version 5.0 or later and must be Trusted Identity Propagation enabled.

To enable user background sessions using the Amazon CLI:

```
aws glue create-glue-identity-center-configuration \  
  --instance-arn "arn:aws:sso:::instance/ssoins-1234567890abcdef" \  
  --user-background-sessions-enabled
```

To update an existing configuration:

```
aws glue update-glue-identity-center-configuration \  
  --instance-arn "arn:aws:sso:::instance/ssoins-1234567890abcdef" \  
  --user-background-sessions-enabled
```

```
--user-background-sessions-enabled
```

Configuration matrix

The effective user background session configuration depends on both the Amazon Glue configuration setting and the IAM Identity Center instance-level settings:

| IAM Identity Center userBackgroundSession Enabled? | Amazon Glue userBackgroundSessionsEnabled | Behavior |
|--|---|---------------------------------------|
| Yes | TRUE | User background sessions enabled |
| Yes | FALSE | Session expires with user logout |
| No | TRUE | Session creation fails with Exception |
| No | FALSE | Session expires with user logout |

Default user background session duration

By default, all user background sessions have a duration limit of 7 days in IAM Identity Center. Administrators can modify this duration in the IAM Identity Center console. This setting applies at the IAM Identity Center instance level, affecting all supported IAM Identity Center applications within that instance.

- Duration can be set to any value from 15 minutes up to 90 days
- This setting is configured in the IAM Identity Center console under Settings → Authentication → Configure (Non-Interactive Jobs section)

Note

Amazon Glue interactive sessions have a separate idle timeout limit of 48 hours by default. Sessions will terminate when either the Amazon Glue session idle timeout or the user background session duration is reached, whichever comes first.

Impact of disabling user background sessions

When user background sessions are disabled at the Amazon Glue configuration level:

- **Existing interactive sessions:** Continue to run without interruption if they were started with user background sessions enabled. These sessions will continue using their existing background session tokens until they terminate naturally or are explicitly stopped.
- **New interactive sessions:** Will use the standard trusted identity propagation flow and will terminate when the user logs out or their interactive session expires (such as when closing a SageMaker Unified Studio JupyterLab notebook).

Changing user background sessions duration

When the duration setting for user background sessions is modified in IAM Identity Center:

- **Existing interactive sessions:** Continue to run with the same background session duration with which they were started
- **New interactive sessions:** Will use the new session duration for background sessions

Runtime considerations

Session termination conditions

When using user background sessions, a Amazon Glue interactive session will continue running until one of the following occurs:

- The user background session expires (based on IdC configuration, up to 90 days)
- The user background session is manually revoked by an administrator
- The Amazon Glue interactive session reaches its idle timeout (default: 48 hours after the last executed statement)

- The user explicitly stops or restarts the notebook kernel

Data persistence

When using user background sessions:

- Users cannot reconnect to their notebook interface to view results once they have logged out
- Configure your Spark statements to write results to persistent storage (such as Amazon S3) before execution completes

Cost implications

- Jobs will continue to run to completion even after users end their SageMaker Unified Studio JupyterLab session and will incur charges for the entire duration of the completed run
- Monitor your active background sessions to avoid unnecessary costs from forgotten or abandoned sessions

Feature availability

User background sessions for Amazon Glue are available for:

- Amazon Glue interactive sessions only (Amazon Glue jobs and streaming jobs are not supported)
- Amazon Glue version 5.0 and later
- Trusted Identity Propagation enabled configurations only

Logging and monitoring in Amazon Glue

You can automate the running of your ETL (extract, transform, and load) jobs. Amazon Glue provides metrics for crawlers and jobs that you can monitor. After you set up the Amazon Glue Data Catalog with the required metadata, Amazon Glue provides statistics about the health of your environment. You can automate the invocation of crawlers and jobs with a time-based schedule based on cron. You can also trigger jobs when an event-based trigger fires.

Amazon Glue is integrated with Amazon CloudTrail, a service that provides a record of actions taken by a user, role, or Amazon service in Amazon Glue. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon Simple Storage Service (Amazon S3) bucket,

Amazon CloudWatch Logs, and Amazon CloudWatch Events. Every event or log entry contains information about who generated the request.

Use Amazon CloudWatch Events to automate your Amazon services and respond automatically to system events such as application availability issues or resource changes. Events from Amazon services are delivered to CloudWatch Events in near-real time. You can write simple rules to indicate which events are of interest and what automated actions to take when an event matches a rule.

See also

- [Automating Amazon Glue with EventBridge](#)
- [Cross-account CloudTrail logging](#)

An important facet of security in the cloud is logging. You must configure logging in a way that does not capture secrets and confidential material while capturing information necessary to debug and secure your cloud infrastructure. Make sure to familiarize yourself with what is being logged.

Compliance validation for Amazon Glue

To learn whether an Amazon Web Services service is within the scope of specific compliance programs, see [Amazon Web Services services in Scope by Compliance Program](#) and choose the compliance program that you are interested in. For general information, see [Amazon Web Services Compliance Programs](#).

You can download third-party audit reports using Amazon Artifact. For more information, see [Downloading Reports in Amazon Artifact](#).

Your compliance responsibility when using Amazon Web Services services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. For more information about your compliance responsibility when using Amazon Web Services services, see [Amazon Security Documentation](#).

Resilience in Amazon Glue

The Amazon global infrastructure is built around Amazon Regions and Availability Zones. Amazon Regions provide multiple physically separated and isolated Availability Zones, which are connected

with low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between Availability Zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about Amazon Regions and Availability Zones, see [Amazon Global Infrastructure](#).

For more information about Amazon Glue job resiliency, see [Error: Failover behavior between VPCs in Amazon Glue](#).

Infrastructure security in Amazon Glue

As a managed service, Amazon Glue is protected by the Amazon global network security procedures that are described in the [Amazon Web Services: Overview of Security Processes](#) whitepaper.

You use Amazon published API calls to access Amazon Glue through the network. Clients must support Transport Layer Security (TLS) 1.0 or later. We recommend TLS 1.2 or later. Clients must also support cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the [Amazon Security Token Service](#) (Amazon STS) to generate temporary security credentials to sign requests.

Topics

- [Configuring interface VPC endpoints \(Amazon PrivateLink\) for Amazon Glue \(Amazon PrivateLink\)](#)
- [Configuring shared Amazon VPCs](#)

Configuring interface VPC endpoints (Amazon PrivateLink) for Amazon Glue (Amazon PrivateLink)

You can establish a private connection between your VPC and Amazon Glue by creating an *interface VPC endpoint*. Interface endpoints are powered by [Amazon PrivateLink](#), a technology

that enables you to privately access Amazon Glue APIs without an internet gateway, NAT device, VPN connection, or Amazon Direct Connect connection. Instances in your VPC don't need public IP addresses to communicate with Amazon Glue APIs. Traffic between your VPC and Amazon Glue does not leave the Amazon network.

Each interface endpoint is represented by one or more [Elastic Network Interfaces](#) in your subnets.

For more information, see [Interface VPC endpoints \(Amazon PrivateLink\)](#) in the *Amazon VPC User Guide*.

Considerations for Amazon Glue VPC endpoints

Before you set up an interface VPC endpoint for Amazon Glue, ensure that you review [Interface endpoint properties and limitations](#) in the *Amazon VPC User Guide*.

Amazon Glue supports making calls to all of its API actions from your VPC.

Creating an interface VPC endpoint for Amazon Glue

You can create a VPC endpoint for the Amazon Glue service using either the Amazon VPC console or the Amazon Command Line Interface (Amazon CLI). For more information, see [Creating an interface endpoint](#) in the *Amazon VPC User Guide*.

Create a VPC endpoint for Amazon Glue using the following service name:

- `com.amazonaws.region.glue`

If you enable private DNS for the endpoint, you can make API requests to Amazon Glue using its default DNS name for the Region, for example, `glue.us-east-1.amazonaws.com`.

For more information, see [Accessing a service through an interface endpoint](#) in the *Amazon VPC User Guide*.

Creating a VPC endpoint policy for Amazon Glue

You can attach an endpoint policy to your VPC endpoint that controls access to Amazon Glue. The policy specifies the following information:

- The principal that can perform actions.
- The actions that can be performed.

- The resources on which actions can be performed.

For more information, see [Controlling access to services with VPC endpoints](#) in the *Amazon VPC User Guide*.

Example: VPC endpoint policy for Amazon Glue to allow job creation and update

The following is an example of an endpoint policy for Amazon Glue. When attached to an endpoint, this policy grants access to the listed Amazon Glue actions for all principals on all resources.

```
{
  "Statement": [
    {
      "Sid": "RestrictPassRole",
      "Effect": "Allow",
      "Action": "iam:PassRole",
      "Resource": "arn:aws:iam::123456789012:role/GlueServiceRole*",
      "Condition": {
        "StringEquals": {
          "iam:PassedToService": "glue.amazonaws.com"
        }
      }
    }
  ]
}
```

Example: VPC endpoint policy to allow read-only Data Catalog access

The following is an example of an endpoint policy for Amazon Glue. When attached to an endpoint, this policy grants access to the listed Amazon Glue actions for all principals on all resources.

```
{
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "glue:GetDatabase",
        "glue:GetDatabases",
        "glue:GetTable",

```

```
    "glue:GetTables",
    "glue:GetTableVersion",
    "glue:GetTableVersions",
    "glue:GetPartition",
    "glue:GetPartitions",
    "glue:BatchGetPartition",
    "glue:SearchTables"
  ],
  "Resource": "*"
}
]
```

Configuring shared Amazon VPCs

Amazon Glue supports shared virtual private clouds (VPCs) in Amazon Virtual Private Cloud. Amazon VPC sharing allows multiple Amazon accounts to create their application resources, such as Amazon EC2 instances and Amazon Relational Database Service (Amazon RDS) databases, into shared, centrally-managed Amazon VPCs. In this model, the account that owns the VPC (owner) shares one or more subnets with other accounts (participants) that belong to the same organization from Amazon Organizations. After a subnet is shared, the participants can view, create, modify, and delete their application resources in the subnets that are shared with them.

In Amazon Glue, to create a connection with a shared subnet, you must create a security group within your account and attach the security group to the shared subnet.

For more information, see these topics:

- [Working with Shared VPCs](#) in the *Amazon VPC User Guide*
- [What Is Amazon Organizations?](#) in the *Amazon Organizations User Guide*

Troubleshooting Amazon Glue

If you encounter issues when working with Amazon Glue, consult the topics in this section.

For Apache Spark troubleshooting in Amazon Glue, see [Generative AI troubleshooting for Apache Spark in Amazon Glue](#) which provides AI-powered assistance for diagnosing and resolving Spark job issues.

Transform your Apache Spark troubleshooting with our AI-powered Troubleshooting Agent, now supporting all major deployment modes including Amazon Glue, Amazon EMR-EC2, Amazon EMR-Serverless and Amazon SageMaker AI Notebooks. This powerful agent eliminates complex debugging processes by combining natural language interactions, real-time workload analysis, and smart code recommendations into a seamless experience. For implementation details, refer to [What is Apache Spark Troubleshooting Agent for Amazon EMR](#).

Topics

- [Gathering Amazon Glue troubleshooting information](#)

Gathering Amazon Glue troubleshooting information

If you encounter errors or unexpected behavior in Amazon Glue and need to contact Amazon Web Services Support, you should first gather information about names, IDs, and logs that are associated with the failed action. Having this information available enables Amazon Web Services Support to help you resolve the problems you're experiencing.

Along with your *account ID*, gather the following information for each of these types of failures:

When a crawler fails, gather the following information:

- Crawler name

Logs from crawler runs are located in CloudWatch Logs under `/aws-glue/crawlers`.

When a test connection fails, gather the following information:

- Connection name
- Connection ID
- JDBC connection string in the form `jdbc:protocol://host:port/database-name`.

Logs from test connections are located in CloudWatch Logs under `/aws-glue/testconnection`.

When a job fails, gather the following information:

- Job name
- Job run ID in the form `jr_xxxxx`.

Logs from job runs are located in CloudWatch Logs under `/aws-glue/jobs`.

Troubleshooting Glue common setup errors

If you encounter errors in Amazon Glue, use the following information to help you find the source of the problems and fix them.

 **Note**

The Amazon Glue GitHub repository contains additional troubleshooting guidance in [Amazon Glue Frequently Asked Questions](#).

Error: Resource unavailable

If Amazon Glue returns a resource unavailable message, you can view error messages or logs to help you learn more about the issue. The following tasks describe general methods for troubleshooting.

- For any connections and development endpoints that you use, check that your cluster has not run out of elastic network interfaces.

Error: Could not find S3 endpoint or NAT gateway for subnetId in VPC

Check the subnet ID and VPC ID in the message to help you diagnose the issue.

- Check that you have an Amazon S3 VPC endpoint set up, which is required with Amazon Glue. In addition, check your NAT gateway if that's part of your configuration. For more information, see [Amazon VPC endpoints for Amazon S3](#).

Error: Inbound rule in security group required

At least one security group must open all ingress ports. To limit traffic, the source security group in your inbound rule can be restricted to the same security group.

- For any connections that you use, check your security group for an inbound rule that is self-referencing. For more information, see [Setting up network access to data stores](#).
- When you are using a development endpoint, check your security group for an inbound rule that is self-referencing. For more information, see [Setting up network access to data stores](#).

Error: Outbound rule in security group required

At least one security group must open all egress ports. To limit traffic, the source security group in your outbound rule can be restricted to the same security group.

- For any connections that you use, check your security group for an outbound rule that is self-referencing. For more information, see [Setting up network access to data stores](#).
- When you are using a development endpoint, check your security group for an outbound rule that is self-referencing. For more information, see [Setting up network access to data stores](#).

Error: Job run failed because the role passed should be given assume role permissions for the Amazon Glue service

The user who defines a job must have permission for `iam:PassRole` for Amazon Glue.

- When a user creates an Amazon Glue job, confirm that the user's role contains a policy that contains `iam:PassRole` for Amazon Glue. For more information, see [Step 3: Attach a policy to users or groups that access Amazon Glue](#).

Error: DescribeVpcEndpoints action is unauthorized. unable to validate VPC ID vpc-id

- Check the policy passed to Amazon Glue for the `ec2:DescribeVpcEndpoints` permission.

Error: DescribeRouteTables action is unauthorized. unable to validate subnet id: Subnet-id in VPC id: vpc-id

- Check the policy passed to Amazon Glue for the `ec2:DescribeRouteTables` permission.

Error: Failed to call ec2:DescribeSubnets

- Check the policy passed to Amazon Glue for the `ec2:DescribeSubnets` permission.

Error: Failed to call ec2:DescribeSecurityGroups

- Check the policy passed to Amazon Glue for the `ec2:DescribeSecurityGroups` permission.

Error: Could not find subnet for AZ

- The Availability Zone might not be available to Amazon Glue. Create and use a new subnet in a different Availability Zone from the one specified in the message.

Error: Job run exception when writing to a JDBC target

When you are running a job that writes to a JDBC target, the job might encounter errors in the following scenarios:

- If your job writes to a Microsoft SQL Server table, and the table has columns defined as type `Boolean`, then the table must be predefined in the SQL Server database. When you define the job on the Amazon Glue console using a SQL Server target with the option **Create tables in your data target**, don't map any source columns to a target column with data type `Boolean`. You might encounter an error when the job runs.

You can avoid the error by doing the following:

- Choose an existing table with the **Boolean** column.
- Edit the `ApplyMapping` transform and map the **Boolean** column in the source to a number or string in the target.
- Edit the `ApplyMapping` transform to remove the **Boolean** column from the source.
- If your job writes to an Oracle table, you might need to adjust the length of names of Oracle objects. In some versions of Oracle, the maximum identifier length is limited to 30 bytes or 128 bytes. This limit affects the table names and column names of Oracle target data stores.

You can avoid the error by doing the following:

- Name Oracle target tables within the limit for your version.
- The default column names are generated from the field names in the data. To handle the case when the column names are longer than the limit, use `ApplyMapping` or `RenameField` transforms to change the name of the column to be within the limit.

Error: Amazon S3: The operation is not valid for the object's storage class

If Amazon Glue returns this error, your Amazon Glue job may have been reading data from tables that have partitions across Amazon S3 storage class tiers.

- By using storage class exclusions, you can ensure that your Amazon Glue jobs will work on tables that have partitions across these storage class tiers. Without exclusions, jobs that read data from these tiers fail with the following error: `AmazonS3Exception: The operation is not valid for the object's storage class.`

For more information, see [Excluding Amazon S3 storage classes](#).

Error: Amazon S3 timeout

If Amazon Glue returns a connect timed out error, it might be because it is trying to access an Amazon S3 bucket in another Amazon Region.

- An Amazon S3 VPC endpoint can only route traffic to buckets within an Amazon Region. If you need to connect to buckets in other Regions, a possible workaround is to use a NAT gateway. For more information, see [NAT Gateways](#).

Error: Amazon S3 access denied

If Amazon Glue returns an access denied error to an Amazon S3 bucket or object, it might be because the IAM role provided does not have a policy with permission to your data store.

- An ETL job must have access to an Amazon S3 data store used as a source or target. A crawler must have access to an Amazon S3 data store that it crawls. For more information, see [Step 2: Create an IAM role for Amazon Glue](#).

Error: Amazon S3 access key ID does not exist

If Amazon Glue returns an access key ID does not exist error when running a job, it might be because of one of the following reasons:

- An ETL job uses an IAM role to access data stores, confirm that the IAM role for your job was not deleted before the job started.
- An IAM role contains permissions to access your data stores, confirm that any attached Amazon S3 policy containing `s3:ListBucket` is correct.

Error: Job run fails when accessing Amazon S3 with an `s3a://` URI

If a job run returns an error like *Failed to parse XML document with handler class*, it might be because of a failure trying to list hundreds of files using an `s3a://` URI. Access your data store using an `s3://` URI instead. The following exception trace highlights the errors to look for:

```
1. com.amazonaws.SdkClientException: Failed to parse XML document with handler class

Error: Amazon S3 service token expired

When moving data to and from Amazon Redshift, temporary Amazon S3 credentials, which expire after 1 hour, are used. If you have a long running job, it might fail. For information about how to set up your long running jobs to move data to and from Amazon Redshift, see [aws-glue-programming-etl-connect-redshift-home](#).

Error: No private DNS for network interface found

If a job fails or a development endpoint fails to provision, it might be because of a problem in the network setup.

- If you are using the Amazon provided DNS, the value of `enableDnsHostnames` must be set to `true`. For more information, see [DNS](#).

Error: Development endpoint provisioning failed

If Amazon Glue fails to successfully provision a development endpoint, it might be because of a problem in the network setup.

- When you define a development endpoint, the VPC, subnet, and security groups are validated to confirm that they meet certain requirements.
- If you provided the optional SSH public key, check that it is a valid SSH public key.
- Check in the VPC console that your VPC uses a valid **DHCP option set**. For more information, see [DHCP option sets](#).
- If the cluster remains in the PROVISIONING state, contact Amazon Web Services Support.

Error: Notebook server CREATE_FAILED

If Amazon Glue fails to create the notebook server for a development endpoint, it might be because of one of the following problems:

- Amazon Glue passes an IAM role to Amazon EC2 when it is setting up the notebook server. The IAM role must have a trust relationship to Amazon EC2.
- The IAM role must have an instance profile of the same name. When you create the role for Amazon EC2 with the IAM console, the instance profile with the same name is automatically created. Check for an error in the log regarding the instance profile name `iamInstanceProfile.name` that is not valid. For more information, see [Using Instance Profiles](#).
- Check that your role has permission to access `aws-glue*` buckets in the policy that you pass to create the notebook server.

Error: Local notebook fails to start

If your local notebook fails to start and reports errors that a directory or folder cannot be found, it might be because of one of the following problems:

- If you are running on Microsoft Windows, make sure that the `JAVA_HOME` environment variable points to the correct Java directory. It's possible to update Java without updating this variable, and if it points to a folder that no longer exists, Jupyter notebooks fail to start.

Error: Running crawler failed

If Amazon Glue fails to successfully run a crawler to catalog your data, it might be because of one of the following reasons. First check if an error is listed in the Amazon Glue console crawlers list.

Check if there is an exclamation icon next to the crawler name and hover over the icon to see any associated messages.

- Check the logs for the crawler run in CloudWatch Logs under `/aws-glue/crawlers`.

Error: Partitions were not updated

In case your partitions were not updated in the Data Catalog when you ran an ETL job, these log statements from the `DataSink` class in the CloudWatch logs may be helpful:

- `"Attempting to fast-forward updates to the Catalog - nameSpace:"` — Shows which database, table, and `catalogId` are attempted to be modified by this job. If this statement is not here, check if `enableUpdateCatalog` is set to `true` and properly passed as a `getSink()` parameter or in `additional_options`.
- `"Schema change policy behavior:"` — Shows which schema `updateBehavior` value you passed in.
- `"Schemas qualify (schema compare):"` — Will be `true` or `false`.
- `"Schemas qualify (case-insensitive compare):"` — Will be `true` or `false`.
- If both are `false` and your `updateBehavior` is not set to `UPDATE_IN_DATABASE`, then your `DynamicFrame` schema needs to be identical or contain a subset of the columns seen in the Data Catalog table schema.

For more information on updating partitions, see [Updating the schema, and adding new partitions in the Data Catalog using Amazon Glue ETL jobs](#).

Error: Job bookmark update failed due to version mismatch

You may be trying to parametrize Amazon Glue jobs to apply the same transformation/logic on different datasets in Amazon S3. You want to track processed files on the locations provided. When you run the same job on the same source bucket and write to the same/different destination concurrently (concurrency >1) the job fails with this error:

```
py4j.protocol.Py4JJavaError: An error occurred while
callingz:com.amazonaws.services.glue.util.Job.commit.:com.amazonaws.services.gluejobexecutor.m
Continuation update failed due to version mismatch. Expected version 2 but found
version 3
```

Solution: set concurrency to 1 or don't run the job concurrently.

Currently Amazon Glue bookmarks don't support concurrent job runs and commits will fail.

Error: A job is reprocessing data when job bookmarks are enabled

There might be cases when you have enabled Amazon Glue job bookmarks, but your ETL job is reprocessing data that was already processed in an earlier run. Check for these common causes of this error:

Max Concurrency

Setting the maximum number of concurrent runs for the job greater than the default value of 1 can interfere with job bookmarks. This can occur when job bookmarks check the last modified time of objects to verify which objects need to be reprocessed. For more information, see the discussion of max concurrency in [Configuring job properties for Spark jobs in Amazon Glue](#).

Missing Job Object

Ensure that your job run script ends with the following commit:

```
job.commit()
```

When you include this object, Amazon Glue records the timestamp and path of the job run. If you run the job again with the same path, Amazon Glue processes only the new files. If you don't include this object and job bookmarks are enabled, the job reprocesses the already processed files along with the new files and creates redundancy in the job's target data store.

Missing Transformation Context Parameter

Transformation context is an optional parameter in the `GlueContext` class, but job bookmarks don't work if you don't include it. To resolve this error, add the transformation context parameter when you [create the DynamicFrame](#), as shown following:

```
sample_dynF=create_dynamic_frame_from_catalog(database,  
table_name,transformation_ctx="sample_dynF")
```

Input Source

If you are using a relational database (a JDBC connection) for the input source, job bookmarks work only if the table's primary keys are in sequential order. Job bookmarks work for new rows, but not

for updated rows. That is because job bookmarks look for the primary keys, which already exist. This does not apply if your input source is Amazon Simple Storage Service (Amazon S3).

Last Modified Time

For Amazon S3 input sources, job bookmarks check the last modified time of the objects, rather than the file names, to verify which objects need to be reprocessed. If your input source data has been modified since your last job run, the files are reprocessed when you run the job again.

Error: Failover behavior between VPCs in Amazon Glue

The following process is used for failover for jobs in Amazon Glue 5.1 and previous versions.

Summary: an Amazon Glue connection is selected at the time a job run is submitted. If the job run encounters some issues, (lack of IP addresses, connectivity to source, routing problem), the job run will fail. If retries are configured, Amazon Glue will retry with the same connection.

1. For each run attempt, Amazon Glue will check the connections health in the order listed in the job configuration, given until it finds one it can use. In the case of an Availability Zone (AZ) failure, the connections from that AZ will fail the check and will be skipped.
2. Amazon Glue validates the connection with the following:
 - checks for valid Amazon VPC id and subnet.
 - checks that a NAT gateway or Amazon VPC endpoint exists.
 - checks that the subnet has more than 0 allocated IP addresses.
 - checks that the AZ is healthy.

Amazon Glue cannot verify connectivity at the time of job run submission.

3. For jobs using Amazon VPC, all drivers and executors will be created in the same AZ with the connection selected at the time of job run submission.
4. If retries are configured, Amazon Glue will retry with the same connection. This is because we cannot guarantee problems with this connection are long-running. If an AZ fails, existing job runs (depending on the stage of the job run) in that AZ can fail. A retry should detect an AZ failure and choose another AZ for the new run.

Crawler errors when the crawler is using Lake Formation permissions

Use the information below to diagnose and fix various issues while configuring the crawler using Lake Formation credentials.

Error: The S3 location: s3://examplepath is not registered

For a crawler to run using Lake Formation credentials, you need to first set up Lake Formation permissions. To resolve this error, please register the target Amazon S3 location with Lake Formation. For more information, see [Registering an Amazon S3 location](#).

Error: User/Role is not authorized to perform: lakeformation:GetDataAccess on resource

Please add the `lakeformation:GetDataAccess` permission to the crawler role using the IAM console or Amazon CLI. With this permission, Lake Formation grants the request for temporary credentials to access the data. See the policy below:

JSON

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "lakeformation:GetDataAccess"
      ],
      "Resource": "*"
    }
  ]
}
```

Error: Insufficient Lake Formation permission(s) on (Database name: exampleDatabase, Table Name: exampleTable)

In the Lake Formation console (<https://console.amazonaws.cn/lakeformation/>), grant the crawler role access permissions (`Create`, `Describe`, `Alter`) on the database, which is specified as

the output database. You can grant permissions on the table as well. For more information, see [Granting database permissions using the named resource method](#).

Error: Insufficient Lake Formation permission(s) on s3://examplepath

1. Cross-account crawling

- a. Log in to the Lake Formation console (<https://console.amazonaws.cn/lakeformation/>) using the account where Amazon S3 bucket is registered (account B). Grant data location permissions to the account where the crawler will be run. This will allow the crawler to read data from the target Amazon S3 location.
- b. In the account where the crawler is created (account A), grant data location permissions on the target Amazon S3 location to the IAM role used for the crawler run so that the crawler can read the data from the destination in Lake Formation. For more information, see [Granting data location permissions \(external account\)](#).

2. In-account (crawler and registered Amazon S3 location are in the same account) crawling

- Grant data location permissions to the IAM role used for the crawler run on the Amazon S3 location so that the crawler can read the data from the target in Lake Formation. For more information, see [Granting data location permissions \(same account\)](#).

Frequently asked questions about crawler configuration using Lake Formation credentials

1. How do I configure a crawler to run using Lake Formation credentials using the Amazon console?

In the Amazon Glue console (<https://console.amazonaws.cn/glue/>), while configuring the crawler, select the option **Use Lake Formation credentials for crawling Amazon S3 data source**. For cross-account crawling, specify the Amazon Web Services account ID where the target Amazon S3 location is registered with Lake Formation. For in-account crawling, the **accountId** field is optional.

2. How do I configure a crawler to run using Lake Formation credentials using Amazon CLI?

During `CreateCrawler` API call, add `LakeFormationConfiguration` :

```
"LakeFormationConfiguration": {  
  "UseLakeFormationCredentials": true,
```

```
"AccountId": "111111111111" (AWS account ID where the target Amazon S3 location
is registered with Lake Formation)
}
```

3. What are the supported targets for a crawler using Lake Formation credentials?

A crawler using Lake Formation credentials is only supported for Amazon S3 (in-account and cross-account crawling), in-account Data Catalog targets (where the underlying location is Amazon S3), and Apache Iceberg targets.

4. Can I crawl multiple Amazon S3 buckets as part of a single crawler using Lake Formation credentials?

No, for crawling targets using Lake Formation credential vending, the underlying Amazon S3 locations must belong to the same bucket. For example, customers can use multiple target locations (`s3://bucket1/folder1`, `s3://bucket1/folder2`) if they are under the same bucket (bucket1). Specifying different buckets (`s3://bucket1/folder1`, `s3://bucket2/folder2`) is not supported.

Troubleshooting Amazon Glue for Ray errors from logs

Amazon Glue provides access to logs that are emitted by Ray processes during the job run. If you encounter errors or unexpected behavior in Ray jobs, first gather information from the logs to determine the cause of failure. We also provide similar logs for interactive sessions. Sessions logs are provided with the `/aws-glue/ray/sessions` prefix.

Log lines are sent to CloudWatch in real time, as your job is run. Print statements are appended to the CloudWatch logs after the run completes. Logs are retained for two weeks after a job is run.

Inspecting Ray job logs

When a job fails, gather your job name and job run ID. You can find these in the Amazon Glue console. Navigate to the job page, and then navigate to the **Runs** tab. Ray job logs are stored in the following dedicated CloudWatch log groups.

- `/aws-glue/ray/jobs/script-log/` – Stores logs emitted by your main Ray script.
- `/aws-glue/ray/jobs/ray-monitor-log/` – Stores logs emitted by the Ray autoscaler process. These logs are generated for the head node and not for other worker nodes.

- `/aws-glue/ray/jobs/ray-gcs-logs/` – Stores logs emitted by the GCS (global control store) process. These logs are generated for the head node and not for other worker nodes.
- `/aws-glue/ray/jobs/ray-process-logs/` – Stores logs emitted by other Ray processes (primarily the dashboard agent) running on the head node. These logs are generated for the head node and not for other worker nodes.
- `/aws-glue/ray/jobs/ray-raylet-logs/` – Stores logs emitted by each raylet process. These logs are collected in a single stream for each worker node, including the head node.
- `/aws-glue/ray/jobs/ray-worker-out-logs/` – Stores `stdout` logs for each worker in the cluster. These logs are generated for each worker node, including the head node.
- `/aws-glue/ray/jobs/ray-worker-err-logs/` – Stores `stderr` logs for each worker in the cluster. These logs are generated for each worker node, including the head node.
- `/aws-glue/ray/jobs/ray-runtime-env-log/` – Stores logs about the Ray setup process. These logs are generated for each worker node, including the head node.

Troubleshooting Ray job errors

To understand the organization of Ray log groups, and to find the log groups that will help you troubleshoot your errors, it helps to have background information about Ray architecture.

In Amazon Glue ETL, a worker corresponds to an instance. When you configure workers for an Amazon Glue job, you're setting the type and quantity of instances that are dedicated to the job. Ray uses the term *worker* in different ways.

Ray uses *head node* and *worker node* to distinguish the responsibilities of an instance within a Ray cluster. A Ray worker node can host multiple *actor* processes that perform computations to achieve the result of your distributed computation. Actors that run a replica of a function are called *replicas*. Replica actors can also be called worker processes. Replicas can also run on the head node, which is known as the head because it runs additional processes to coordinate the cluster.

Each actor that contributes to your computation generates its own log stream. This provides us with some insights:

- The number of processes that emit logs might be larger than the number of workers that are allocated to the job. Often, each core on each instance has an actor.
- Ray head nodes emit cluster management and startup logs. In contrast, Ray worker nodes only emit logs for the work performed on them.

For more information about Ray architecture, see [Architecture Whitepapers](#) in the Ray documentation.

Problem area: Amazon S3 access

Check the failure message of the job run. If that doesn't provide enough information, check `/aws-glue/ray/jobs/script-log/`.

Problem area: PIP dependency management

Check `/aws-glue/ray/jobs/ray-runtime-env-log/`.

Problem area: Inspecting intermediate values in main process

Write to `stderr` or `stdout` from your main script, and retrieve logs from `/aws-glue/ray/jobs/script-log/`.

Problem area: Inspecting intermediate values in a child process

Write to `stderr` or `stdout` from your remote function. Then, retrieve logs from `/aws-glue/ray/jobs/ray-worker-out-logs/` or `/aws-glue/ray/jobs/ray-worker-err-logs/`. Your function might have run on any replica, so you might have to examine multiple logs to find your intended output.

Problem area: Interpreting IP addresses in error messages

In certain error situations, your job might emit an error message that contains an IP address. These IP addresses are ephemeral, and are used by the cluster to identify and communicate between nodes. Logs for a node will be published to a log stream with a unique suffix based on the IP address.

In CloudWatch, you can filter down your logs to inspect those specific to this IP address by identifying this suffix. For example, given `FAILED_IP` and `JOB_RUN_ID`, you can identify the suffix with:

```
filter @logStream like /JOB_RUN_ID/
| filter @message like /IP-/
| parse @message "IP-[*]" as ip
| filter ip like /FAILED_IP/
```

```
| fields replace(ip, ":", "_") as uIP  
| stats count_distinct by uIP as logStreamSuffix  
| display logStreamSuffix
```

Amazon Glue machine learning exceptions

This topic describes HTTP error codes and strings for Amazon Glue exceptions related to machine learning. The error codes and error strings are provided for each machine learning activity that may occur when you perform an operation. Also, you can see whether it is possible to retry the operation that resulted in the error.

CancelMLTaskRunActivity

This activity has the following exceptions:

- EntityNotFoundException (400)
 - "Cannot find MLTransform in account [accountId] with handle [transformName]."
 - "No ML Task Run found for [taskRunId]: in account [accountId] for transform [transformName]."

OK to retry: No.

CreateMLTaskRunActivity

This activity has the following exceptions:

- InvalidInputException (400)
 - "Internal service failure due to unexpected input."
 - "An Amazon Glue Table input source should be specified in transform."
 - "Input source column [columnName] has an invalid data type defined in the catalog."
 - "Exactly one input record table must be provided."
 - "Should specify database name."
 - "Should specify table name."
 - "Schema is not defined on the transform."
 - "Schema should contain given primary key: [primaryKey]."

- “Problem fetching the data catalog schema: [message].”
- “Cannot set Max Capacity and Worker Num/Type at the same time.”
- “Both WorkerType and NumberOfWorkers should be set.”
- “MaxCapacity should be >= [maxCapacity].”
- “NumberOfWorkers should be >= [maxCapacity].”
- “Max retries should be non-negative.”
- “Find Matches parameters have not been set.”
- “A primary key must be specified in Find Matches parameters.”

OK to retry: No.

- AlreadyExistsException (400)
 - “Transform with name [transformName] already exists.”

OK to retry: No.

- IdempotentParameterMismatchException (400)
 - “Idempotent create request for transform [transformName] had mismatching parameters.”

OK to retry: No.

- InternalServiceException (500)
 - “Dependency failure.”

OK to retry: Yes.

- ResourceNumberLimitExceededException (400)
 - “ML Transforms count ([count]) has exceeded the limit of [limit] transforms.”

OK to retry: Yes, once you’ve deleted a transform to make room for this new one.

DeleteMLTransformActivity

This activity has the following exceptions:

- EntityNotFoundException (400)
 - “Cannot find MLTransform in account [accountId] with handle [transformName]”

GetMLTaskRunActivity

This activity has the following exceptions:

- EntityNotFoundException (400)
 - “Cannot find MLTransform in account [accountId] with handle [transformName].”
 - “No ML Task Run found for [taskRunId]: in account [accountId] for transform [transformName].”

OK to retry: No.

GetMLTaskRunsActivity

This activity has the following exceptions:

- EntityNotFoundException (400)
 - “Cannot find MLTransform in account [accountId] with handle [transformName].”
 - “No ML Task Run found for [taskRunId]: in account [accountId] for transform [transformName].”

OK to retry: No.

GetMLTransformActivity

This activity has the following exceptions:

- EntityNotFoundException (400)
 - “Cannot find MLTransform in account [accountId] with handle [transformName].”

OK to retry: No.

GetMLTransformsActivity

This activity has the following exceptions:

- EntityNotFoundException (400)
 - “Cannot find MLTransform in account [accountId] with handle [transformName].”

OK to retry: No.

- InvalidInputException (400)
 - "Account ID can't be blank."
 - "Sorting not supported for column [column]."
 - "[column] can't be blank."
 - "Internal service failure due to unexpected input."

OK to retry: No.

GetSaveLocationForTransformArtifactActivity

This activity has the following exceptions:

- EntityNotFoundException (400)
 - "Cannot find MLTransform in account [accountId] with handle [transformName]."

OK to retry: No.

- InvalidInputException (400)
 - "Unsupported artifact type [artifactType]."
 - "Internal service failure due to unexpected input."

OK to retry: No.

GetTaskRunArtifactActivity

This activity has the following exceptions:

- EntityNotFoundException (400)
 - "Cannot find MLTransform in account [accountId] with handle [transformName]."
 - "No ML Task Run found for [taskRunId]: in account [accountId] for transform [transformName]."

OK to retry: No.

- InvalidInputException (400)
 - "File name '[fileName]' is invalid for publish."

- “Cannot retrieve artifact for [taskType] task type.”
- “Cannot retrieve artifact for [artifactType].”
- “Internal service failure due to unexpected input.”

OK to retry: No.

PublishMLTransformModelActivity

This activity has the following exceptions:

- EntityNotFoundException (400)
 - “Cannot find MLTransform in account [accountId] with handle [transformName].”
 - “An existing model with version - [version] cannot be found for account id - [accountId] - and transform id - [transformId].”

OK to retry: No.

- InvalidInputException (400)

- "A primary key must be specified in Find Matches parameters."

OK to retry: No.

- `InternalServiceException` (500)
 - "Dependency failure."

OK to retry: Yes.

- `ConcurrentRunsExceededException` (400)
 - "ML Task Runs count [count] has exceeded the transform limit of [limit] task runs."

OK to retry: Yes, after task runs have completed.

UpdateMLTransformActivity

This activity has the following exceptions:

- `EntityNotFoundException` (400)
 - "Cannot find MLTransform in account [accountId] with handle [transformName]."

OK to retry: No.

- `InvalidInputException` (400)
 - "Another transform with name [transformName] already exists."
 - "[message]."
 - "Transform name cannot be blank."
 - "Cannot set Max Capacity and Worker Num/Type at the same time."
 - "Both WorkerType and NumberOfWorkers should be set."
 - "MaxCapacity should be >= [minMaxCapacity]."
 - "NumberOfWorkers should be >= [minNumWorkers]."
 - "Max retries should be non-negative."
 - "Internal service failure due to unexpected input."
 - "Find Matches parameters have not been set."
 - "A primary key must be specified in Find Matches parameters."

OK to retry: No.

- AlreadyExistsException (400)
 - "Transform with name [transformName] already exists."

OK to retry: No.

- IdempotentParameterMismatchException (400)
 - "Idempotent create request for transform [transformName] had mismatching parameters."

OK to retry: No.

Amazon Glue quotas

You can contact Amazon Web Services Support to [request a quota increase](#) for the service quotas listed in the *Amazon Web Services General Reference*. Unless otherwise noted, each quota is Region-specific. For more information, see [Amazon Glue Endpoints and Quotas](#).

Improving Amazon Glue performance

Baseline strategy for performance tuning

In order to improve Amazon Glue performance, you may consider updating certain performance related Amazon Glue parameters. When preparing to tune parameters, use the following best practices:

- Determine your performance goals before beginning to identify problems.
- Use metrics to identify problems before attempting to change tuning parameters.

For the most consistent results when tuning a job, develop a baseline strategy for your tuning work.

Generally, performance tuning is performed in the following workflow:

1. Determine performance goals.
2. Measure metrics.
3. Identify bottlenecks.
4. Reduce the impact of the bottlenecks.
5. Repeat steps 2-4 until you achieve the intended target.

Tuning strategies for your job type

Spark jobs—follow the guidance in [Best practices for performance tuning Amazon Glue for Apache Spark jobs](#) on Amazon Prescriptive Guidance.

Other jobs—you can tune Amazon Glue for Ray and Amazon Glue Python shell jobs by adapting strategies available in other runtime environments.

Improving performance for Amazon Glue for Apache Spark jobs

In order to improve Amazon Glue for Spark performance, you may consider updating certain performance related Amazon Glue and Spark parameters.

For more information about specific strategies for identifying bottlenecks through metrics and reducing their impact, see [Best practices for performance tuning Amazon Glue for Apache Spark jobs](#) on Amazon Prescriptive Guidance. This guide introduces you to key topics applicable to Apache Spark in all runtime environments, such as Spark architecture and Resilient Distributed Datasets. Using those topics, the guide guides you to implement specific performance tuning strategies, such as optimizing shuffles and parallelizing tasks.

You can identify bottlenecks by configuring Amazon Glue to show the Spark UI. For more information, see [the section called “Monitoring with the Spark UI”](#).

Additionally, Amazon Glue provides performance features that may be applicable to the specific type of data store your job connects to. Reference information about performance parameters for data stores can be found in [the section called “Connection parameters”](#).

Optimizing reads with pushdown in Amazon Glue ETL

Pushdown is an optimization technique that pushes logic about retrieving data closer to the source of your data. The source could be a database or a file system such as Amazon S3. When executing certain operations directly on the source, you can save time and processing power by not bringing all the data over the network to the Spark engine managed by Amazon Glue.

Another way of saying this is that pushdown reduces data scan. For more information about the process of identifying when this technique is appropriate, consult [Reduce the amount of data scan](#) in the *Best practices for performance tuning Amazon Glue for Apache Spark jobs* guide on Amazon Prescriptive Guidance.

Predicate pushdown on files stored on Amazon S3

When working with files on Amazon S3 that have been organized by prefix, you can filter your target Amazon S3 paths by defining a pushdown predicate. Rather than reading the complete dataset and applying filters within a `DynamicFrame`, you can directly apply the filter to the partition metadata stored in the Amazon Glue Data Catalog. This approach allows you to selectively list and read only the necessary data. For more information about this process, including writing to a bucket by partitions, see [the section called “Managing partitions”](#).

You achieve predicate pushdown in Amazon S3 by using the `push_down_predicate` parameter. Consider a bucket in Amazon S3 you've partitioned by year, month and day. If you want to retrieve customer data for June of 2022, you can instruct Amazon Glue to read only relevant Amazon S3

paths. The `push_down_predicate` in this case is `year='2022' and month='06'`. Putting it all together, the read operation can be achieved as below:

Python

```
customer_records = glueContext.create_dynamic_frame.from_catalog(  
    database = "customer_db",  
    table_name = "customer_tbl",  
    push_down_predicate = "year='2022' and month='06'"  
)
```

Scala

```
val customer_records = glueContext.getCatalogSource(  
    database="customer_db",  
    tableName="customer_tbl",  
    pushDownPredicate="year='2022' and month='06'"  
).getDynamicFrame()
```

In the previous scenario, `push_down_predicate` retrieves a list of all partitions from the Amazon Glue Data Catalog and filters them before reading the underlying Amazon S3 files. Though this helps in most cases, when working with datasets that have millions of partitions, the process of listing partitions can be time consuming. To address this issue, server-side pruning of partitions can be used to improve performance. This is done by building a **Partition index** for your data in the Amazon Glue Data Catalog. For more information about partition indices, see [the section called “Creating partition indexes”](#). You can then use the `catalogPartitionPredicate` option to reference the index. For an example retrieving partitions with `catalogPartitionPredicate`, see [the section called “Catalog partition predicates”](#).

Pushdown when working with JDBC sources

The Amazon Glue JDBC reader used in the `GlueContext` supports pushdown on supported databases by providing custom SQL queries that can run directly on the source. This can be achieved by setting the `sampleQuery` parameter. Your sample query can specify which columns to select as well as provide a pushdown predicate to limit the data transferred to the Spark engine.

By default, sample queries operate on a single node, which can result in job failures when dealing with large data volumes. To use this feature to query data at scale, you should configure query

partitioning by setting `enablePartitioningForSampleQuery` to true, which will distribute the query to multiple nodes across a key of your choice. Query partitioning also requires a few other necessary configuration parameters. For more information about query partitioning, see [the section called “Reading from JDBC in parallel”](#).

When setting `enablePartitioningForSampleQuery`, Amazon Glue will combine your pushdown predicate with a partitioning predicate when querying your database. Your `sampleQuery` must end with an AND for Amazon Glue to append partitioning conditions. (If you do not provide a pushdown predicate, `sampleQuery` must end with a WHERE). See an example below, where we push down a predicate to only retrieve rows whose `id` is greater than 1000. This `sampleQuery` will only return the name and location columns for rows where `id` is greater than the specified value:

Python

```
sample_query = "select name, location from customer_tbl WHERE id>=1000 AND"
customer_records = glueContext.create_dynamic_frame.from_catalog(
    database="customer_db",
    table_name="customer_tbl",
    sample_query = "select name, location from customer_tbl WHERE id>=1000 AND",

    additional_options = {
        "hashpartitions": 36 ,
        "hashfield":"id",
        "enablePartitioningForSampleQuery":True,
        "sampleQuery":sample_query
    }
)
```

Scala

```
val additionalOptions = Map(
    "hashpartitions" -> "36",
    "hashfield" -> "id",
    "enablePartitioningForSampleQuery" -> "true",
    "sampleQuery" -> "select name, location from customer_tbl WHERE id >= 1000
AND"
)

val customer_records = glueContext.getCatalogSource(
    database="customer_db",
```

```
tableName="customer_tbl").getDynamicFrame()
```

Note

If `customer_tbl` has a different name in your Data Catalog and underlying data store, you must provide the underlying table name in `sample_query`, since the query is passed to the underlying data store.

You can also query against JDBC tables without integrating with the Amazon Glue Data Catalog. Instead of providing username and password as parameters to the method, you can reuse credentials from a preexisting connection by providing `useConnectionProperties` and `connectionName`. In this example, we retrieve credentials from a connection called `my_postgre_connection`.

Python

```
connection_options_dict = {
    "useConnectionProperties": True,
    "connectionName": "my_postgre_connection",
    "dbtable": "customer_tbl",
    "sampleQuery": "select name, location from customer_tbl WHERE id >= 1000 AND",
    "enablePartitioningForSampleQuery": True,
    "hashfield": "id",
    "hashpartitions": 36
}

customer_records = glueContext.create_dynamic_frame.from_options(
    connection_type="postgresql",
    connection_options=connection_options_dict
)
```

Scala

```
val connectionOptionsJson = """
{
  "useConnectionProperties": true,
  "connectionName": "my_postgre_connection",
  "dbtable": "customer_tbl",

```

```
"sampleQuery": "select name, location from customer_tbl WHERE id>=1000 AND",
"enablePartitioningForSampleQuery" : true,
"hashfield" : "id",
"hashpartitions" : 36
}
"""

val connectionOptions = new JsonOptions(connectionOptionsJson)

val dyf = glueContext.getSource("postgresql",
connectionOptions).getDynamicFrame()
```

Notes and limitations for pushdown in Amazon Glue

Pushdown, as a concept, is applicable when reading from non-streaming sources. Amazon Glue supports a variety of sources - the ability to pushdown depends on the source and connector.

- When connecting to Snowflake, you can use the `query` option. Similar functionality exists in the Redshift connector in Amazon Glue 4.0 and later versions. For more information about reading from Snowflake with `query`, see [the section called "Read from Snowflake"](#).
- The DynamoDB ETL reader does not support filters or pushdown predicates. MongoDB and DocumentDB also do not support this sort of functionality.
- When reading from data stored in Amazon S3 in open table formats, the partitioning method for files in Amazon S3 is no longer sufficient. To read and write from partitions using open table formats, consult documentation for the format.
- `DynamicFrame` methods do not perform Amazon S3 projection pushdown. All columns will be read from files that pass the predicate filter.
- When working with `custom.jdbc` connectors in Amazon Glue, the ability to pushdown depends on the source and connector. Please review the appropriate connector documentation to confirm if and how it supports pushdown in Amazon Glue.

Using auto scaling for Amazon Glue

Auto Scaling is available for your Amazon Glue ETL, interactive sessions, and streaming jobs with Amazon Glue version 3.0 or later.

With Auto Scaling enabled, you will get the following benefits:

- Amazon Glue automatically adds and removes workers from the cluster depending on the parallelism at each stage or microbatch of the job run.
- It reduces the need for you to experiment and decide on the number of workers to assign for your Amazon Glue ETL jobs.
- With the given maximum number of workers, Amazon Glue will choose the right size resources for the workload.
- You can see how the size of the cluster changes during the job run by looking at CloudWatch metrics on the job run details page in Amazon Glue Studio.

Auto Scaling for Amazon Glue ETL and streaming jobs enables on-demand scaling-out and scaling-in of the computing resources of your Amazon Glue jobs. On-demand scale-up helps you to only allocate the required computing resources initially on job run startup, and also to provision the required resources as per demand during the job.

Auto Scaling also supports dynamic scale-in of the Amazon Glue job resources over the course of a job. Over a job run, when more executors are requested by your Spark application, more workers will be added to the cluster. When the executor has been idle without active computation tasks, the executor and the corresponding worker will be removed.

Common scenarios where Auto Scaling helps with cost and utilization for your Spark applications include:

- a Spark driver listing a large number of files in Amazon S3 or performing a load while executors are inactive
- Spark stages running with only a few executors due to over-provisioning
- data skews or uneven computation demand across Spark stages

Requirements

Auto Scaling is only available for Amazon Glue version 3.0 or later. To use Auto Scaling, you can follow the [migration guide](#) to migrate your existing jobs to Amazon Glue version 3.0 or later or create new jobs with Amazon Glue version 3.0 or later.

Auto Scaling is available for Amazon Glue jobs with the G.1X, G.2X, G.4X, G.8X, G.12X, G.16X, R.1X, R.2X, R.4X, R.8X, or G.025X (only for Streaming jobs) worker types. Standard DPUs are not supported for Auto Scaling.

Enabling Auto Scaling in Amazon Glue Studio

On the **Job details** tab in Amazon Glue Studio, choose the type as **Spark** or **Spark Streaming**, and **Glue version** as **Glue 3.0** or later. Then, a check box will appear below **Worker type**.

- Select the **Automatically scale the number of workers** option.
- Set the **Maximum number of workers** to define the maximum number of workers that can be vended to the job run.

The screenshot shows the 'Job details' tab in Amazon Glue Studio. At the top, there are navigation tabs: 'Visual', 'Script', 'Job details' (selected), 'Runs', and 'Schedules'. Below the tabs, the configuration is as follows:

- Type:** A text input field containing 'Spark'. Below it, a note states: 'The type of ETL job. This is set automatically based on the types of data sources you have selected.'
- Glue version:** A dropdown menu with 'Glue 3.0 - Supports spark 3.1, Scala 2, Python 3' selected. A blue 'Info' link is next to the label.
- Language:** A dropdown menu with 'Python 3' selected.
- Worker type:** A dropdown menu with 'G.1X' selected. Below it, a note states: 'Set the type of predefined worker that is allowed when a job runs.'
- Automatically scale the number of workers:** A checked checkbox. Below it, a note states: 'Glue will optimize costs and resource usage by dynamically scaling the number of workers up and down throughout the job run. Requires Glue 3.0 or later.'
- Maximum number of workers:** A text input field containing '10'. Below it, a note states: 'The number of workers you want Glue to allocate to this job. The maximums are 299 for G.1X and 149 for G.2X, and the minimum is 2.'

Enabling Auto Scaling with the Amazon CLI or SDK

To enable Auto Scaling from the Amazon CLI for your job run, run `start-job-run` with the following configuration:

```
{  
  "JobName": "<your job name>",
```

```

"Arguments": {
  "--enable-auto-scaling": "true"
},
"WorkerType": "G.2X", // G.1X, G.2X, G.4X, G.8X, G.12X, G.16X, R.1X, R.2X, R.4X,
and R.8X are supported for Auto Scaling Jobs
"NumberOfWorkers": 20, // represents Maximum number of workers
...other job run configurations...
}

```

Once an ETL job run is finished, you can also call `get-job-run` to check the actual resource usage of the job run in DPU-seconds. Note: the new field **DPUSecods** will only show up for your batch jobs on Amazon Glue 4.0 or later enabled with Auto Scaling. This field is not supported for streaming jobs.

```

$ aws glue get-job-run --job-name your-job-name --run-id jr_xx --endpoint https://
glue.us-east-1.amazonaws.com --region us-east-1
{
  "JobRun": {
    ...
    "GlueVersion": "3.0",
    "DPUSecods": 386.0
  }
}

```

You can also configure job runs with Auto Scaling using the [Amazon Glue SDK](#) with the same configuration.

Enabling Auto Scaling with Interactive sessions

To enable Auto Scaling when building Amazon Glue jobs with interactive sessions, see [Configuring Amazon Glue interactive sessions](#).

Tips and considerations

Tips and the considerations for fine-tuning Amazon Glue Auto Scaling:

- In case you do not have any idea on the initial value of the maximum number of the workers, you can start from the rough calculation explained in [Estimate Amazon Glue DPU](#) . You should not configure extremely large value in the maximum number of workers for very low volume data.
- Amazon Glue Auto Scaling configures `spark.sql.shuffle.partitions` and `spark.default.parallelism` based on the maximum number of DPU (calculated with the

maximum number of workers and the worker type) configured on the job. In case you prefer the fixed value on those configurations, you can overwrite these parameters with the following job parameters:

- **Key:** `--conf`
- **Value:** `spark.sql.shuffle.partitions=200 --conf`
`spark.default.parallelism=200`
- For streaming jobs, by default, Amazon Glue does not auto scale within micro batches and it requires several micro batches to initiate auto scaling. In case you want to enable auto scaling within micro batches, provide `--auto-scale-within-microbatch`. For more information, see [Job parameter reference](#) .

Monitoring Auto Scaling with Amazon CloudWatch metrics

The CloudWatch executor metrics are available for your Amazon Glue 3.0 or later jobs if you enable Auto Scaling. The metrics can be used to monitor the demand and optimized usage of executors in their Spark applications enabled with Auto Scaling. For more information, see [Monitoring Amazon Glue using Amazon CloudWatch metrics](#).

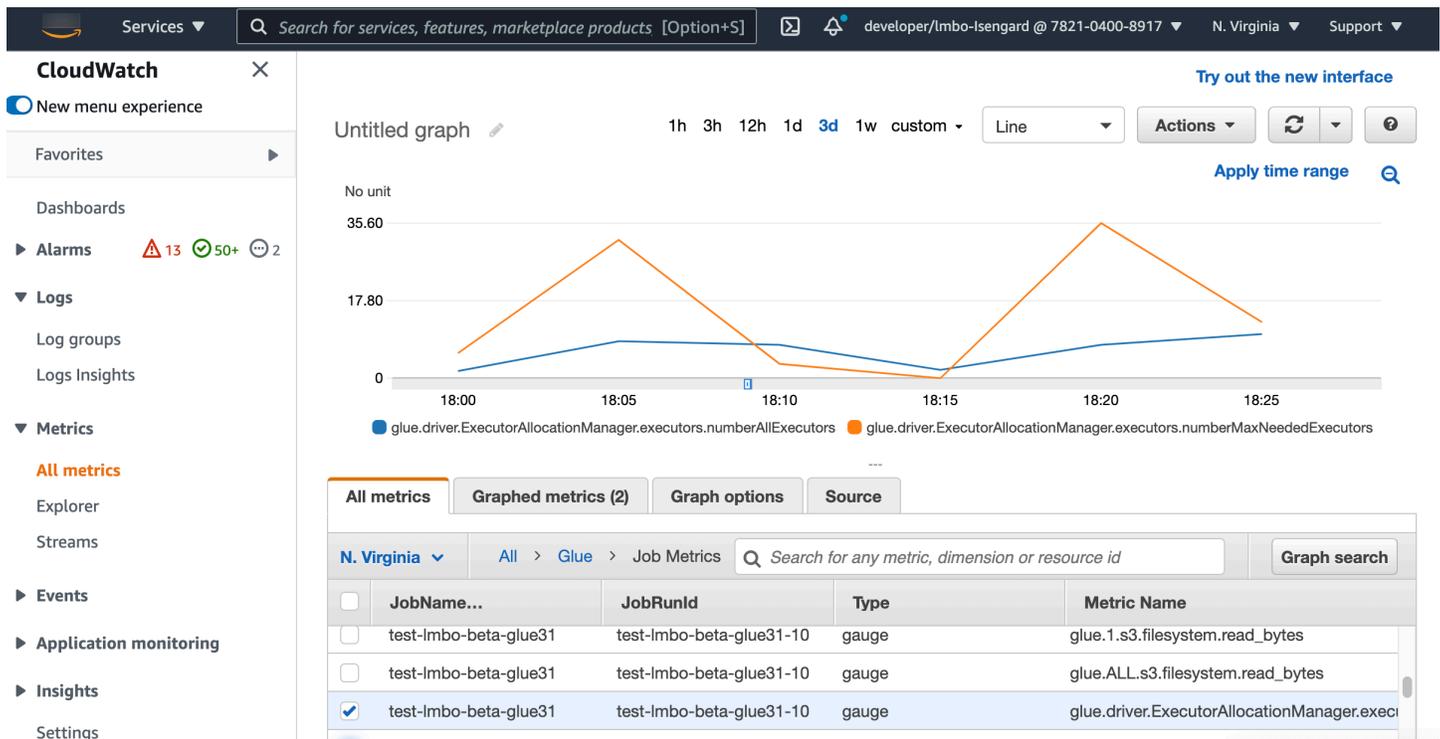

You can also utilize Amazon Glue observability metrics to get insights about resource utilization. For example, by monitoring `glue.driver.workerUtilization`, you can monitor how much resource was actually used with and without auto scaling. For another example, by monitoring `glue.driver.skewness.job` and `glue.driver.skewness.stage`, you can see how the data is skewed. Those insights will help you decide to enable auto scaling and fine tune the configurations. For more information, see Monitoring with [Monitoring with Amazon Glue Observability metrics](#).

- `glue.driver.ExecutorAllocationManager.executors.numberAllExecutors`
- `glue.driver.ExecutorAllocationManager.executors.numberMaxNeededExecutors`

For more details on these metrics, see [Monitoring for DPU capacity planning](#).

Note

CloudWatch executor metrics are not available for interactive sessions.

Monitoring Auto Scaling with Amazon CloudWatch Logs

If you are using interactive sessions, you can monitor the number of executors by enabling continuous Amazon CloudWatch Logs and searching “executor” in the logs, or by using the Spark UI. To do this, use the `%%configure` magic to enable continuous logging along with enable auto scaling.

```
%%configure{
  "--enable-continuous-cloudwatch-log": "true",
  "--enable-auto-scaling": "true"
}
```

In the Amazon CloudWatch Logevents, search "executor" in the logs:

CloudWatch > Log groups > /aws-glue/sessions/error > 2c420420-29b3-42df-9efd-09c31c2f734e

Log events

You can use the filter bar below to search for and match terms, phrases, or values in your log events. [Learn more about filter patterns](#)

Monitoring Auto Scaling with Spark UI

With Auto Scaling enabled, you can also monitor executors being added and removed with dynamic scale-up and scale-down based on the demand in your Amazon Glue jobs using the Glue Spark UI. For more information, see [Enabling the Apache Spark web UI for Amazon Glue jobs](#).

When you use interactive sessions from Jupyter notebook, you can run following magic to enable auto scaling along with Spark UI:

```
%%configure{
  "--enable-auto-scaling": "true",
  "--enable-continuous-cloudwatch-log": "true"
}
```

Monitoring Auto Scaling job run DPU usage

You may use the [Amazon Glue Studio Job run view](#) to check the DPU usage of your Auto Scaling jobs.

1. Choose **Monitoring** from the Amazon Glue Studio navigation pane. The Monitoring page appears.
2. Scroll down to the Job runs chart.
3. Navigate to the job run you are interested and scroll to the DPU hours column to check the usage for the specific job run.

Limitations

Amazon Glue streaming Auto Scaling currently doesn't support a streaming DataFrame join with a static DataFrame created outside of `ForEachBatch`. A static DataFrame created inside the `ForEachBatch` will work as expected.

Workload partitioning with bounded execution

Errors in Spark applications commonly arise from inefficient Spark scripts, distributed in-memory execution of large-scale transformations, and dataset abnormalities. There are many reasons that may cause driver or executor out of memory issues, for example a data skew, listing too many objects, or large data shuffles. These issues often appear when you are processing huge amounts of backlog data with Spark.

Amazon Glue allows you to solve OOM issues and make your ETL processing easier with workload partitioning. With workload partitioning enabled, each ETL job run only picks unprocessed data, with an upper bound on the dataset size or the number of files to be processed with this job run. Future job runs will process the remaining data. For example, if there are 1000 files need to be processed, you can set the number of files to be 500 and separate them into two job runs.

Workload partitioning is supported only for Amazon S3 data sources.

Enabling workload partitioning

You can enable bounded execution by manually setting the options in your script or by adding catalog table properties.

To enable workload partitioning with bounded execution in your script:

1. To avoid reprocessing data, enable job bookmarks in the new job or existing job. For more information, see [Tracking Processed Data Using Job Bookmarks](#).
2. Modify your script and set the bounded limit in the additional options in the Amazon Glue `getSource` API. You should also set the transformation context for the job bookmark to store the state element. For example:

Python

```
glueContext.create_dynamic_frame.from_catalog(  
    database = "database",  
    table_name = "table_name",  
    redshift_tmp_dir = "",  
    transformation_ctx = "datasource0",  
    additional_options = {  
        "boundedFiles" : "500", # need to be string  
        # "boundedSize" : "1000000000" unit is byte  
    }  
)
```

Scala

```
val datasource0 = glueContext.getCatalogSource(  
    database = "database", tableName = "table_name", redshiftTmpDir = "",  
    transformationContext = "datasource0",  
    additionalOptions = JsonOptions(  
        Map("boundedFiles" -> "500") // need to be string  
        //"boundedSize" -> "1000000000" unit is byte  
    )  
)  
.getDynamicFrame()
```

```
val connectionOptions = JsonOptions(  
    Map("paths" -> List(baseLocation), "boundedFiles" -> "30")  
)  
val source = glueContext.getSource("s3", connectionOptions, "datasource0", "")
```

To enable workload partitioning with bounded execution in your Data Catalog table:

1. Set the key-value pairs in the `parameters` field of your table structure in the Data Catalog. For more information, see [Viewing and Editing Table Details](#).
2. Set the upper limit for the dataset size or the number of files processed:
 - Set `boundedSize` to the target size of the dataset in bytes. The job run will stop after reaching the target size from the table.
 - Set `boundedFiles` to the target number of files. The job run will stop after processing the target number of files.

Note

You should only set one of `boundedSize` or `boundedFiles`, as only a single boundary is supported.

Setting up an Amazon Glue trigger to automatically run the job

Once you have enabled bounded execution, you can set up an Amazon Glue trigger to automatically run the job and incrementally load the data in sequential runs. Go to the Amazon Glue Console and create a trigger, setup the schedule time, and attach to your job. Then it will automatically trigger the next job run and process the new batch of data.

You can also use Amazon Glue workflows to orchestrate multiple jobs to process data from different partitions in parallel. For more information, see [Amazon Glue Triggers](#) and [Amazon Glue Workflows](#).

For more information on use cases and options, please refer to the blog [Optimizing Spark applications with workload partitioning in Amazon Glue](#).

Known issues for Amazon Glue

Note the following known issues for Amazon Glue.

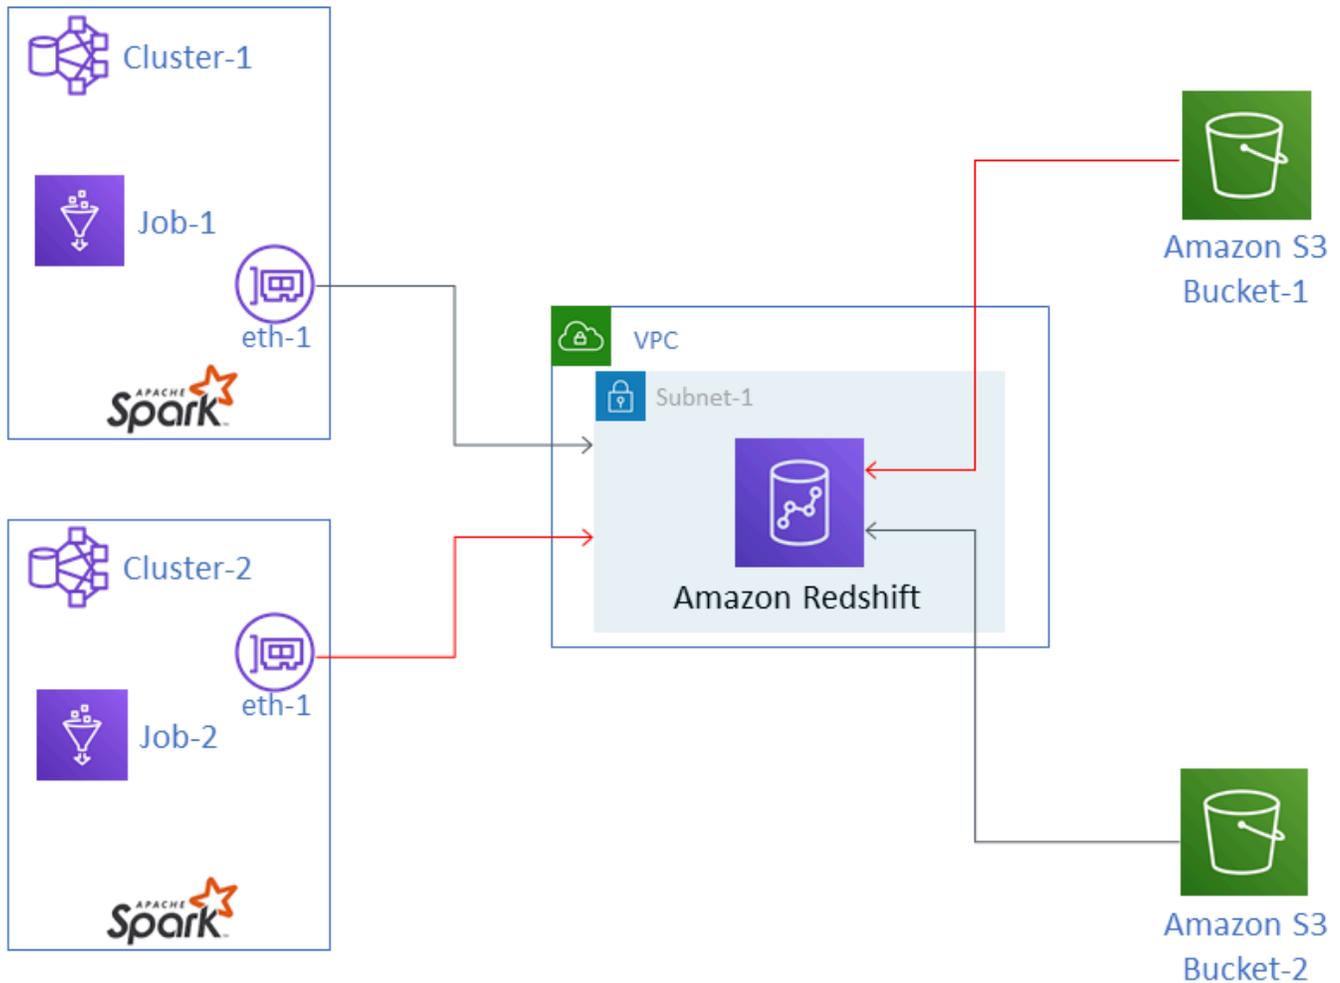

Topics

- [Preventing cross-job data access](#)

Preventing cross-job data access

Consider the situation where you have two Amazon Glue Spark jobs in a single Amazon Web Services Account, each running in a separate Amazon Glue Spark cluster. The jobs are using Amazon Glue connections to access resources in the same virtual private cloud (VPC). In this situation, a job running in one cluster might be able to access the data from the job running in the other cluster.

The following diagram illustrates an example of this situation.

In the diagram, Amazon Glue Job-1 is running in Cluster-1, and Job-2 is running in Cluster-2. Both jobs are working with the same instance of Amazon Redshift, which resides in Subnet-1 of a VPC. Subnet-1 could be a public or private subnet.

Job-1 is transforming data from Amazon Simple Storage Service (Amazon S3) Bucket-1 and writing the data to Amazon Redshift. Job-2 is doing the same with data in Bucket-2. Job-1 uses the Amazon Identity and Access Management (IAM) role Role-1 (not shown), which gives access to Bucket-1. Job-2 uses Role-2 (not shown), which gives access to Bucket-2.

These jobs have network paths that enable them to communicate with each other's clusters and thus access each other's data. For example, Job-2 could access data in Bucket-1. In the diagram, this is shown as the path in red.

To prevent this situation, we recommend that you attach different security configurations to Job-1 and Job-2. By attaching the security configurations, cross-job access to data is blocked by virtue of certificates that Amazon Glue creates. The security configurations can be *dummy* configurations. That is, you can create the security configurations without enabling encryption of Amazon S3 data, Amazon CloudWatch data, or job bookmarks. All three encryption options can be disabled.

For information about security configurations, see [the section called “Encrypting data written by Amazon Glue”](#).

To attach a security configuration to a job

1. Open the Amazon Glue console at <https://console.amazonaws.cn/glue/>.
2. On the **Configure the job properties** page for the job, expand the **Security configuration, script libraries, and job parameters** section.
3. Select a security configuration in the list.

Documentation history for Amazon Glue

| Change | Description | Date |
|--|---|-------------------|
| Support for Amazon Glue version 5.1 | Added information about support for Amazon Glue version 5.1. Features include Apache Spark update to 3.5.6, open table format updates, Iceberg materialized views, Iceberg format version 3, Hudi full table access reads and writes, Spark native fine-grained access control DDL/DML on Hive, Iceberg, and Delta Lake tables, and more. For more information, see Amazon Glue Release Notes and Migrating Amazon Glue jobs to Amazon Glue version 5.1 . | November 26, 2025 |
| Amazon Glue Data Quality now supports rule labeling for enhanced reporting | Amazon Glue Data Quality now supports rule labeling, allowing you to organize and analyze data quality results more effectively. You can query results by specific labels to identify failing rules within particular categories, count rule outcomes by team or domain, and create focused reports for different stakeholders. For more information, see Labels . | November 21, 2025 |

[Amazon Glue Data Quality now supports pre-processing queries](#)

Amazon Glue Data Quality now supports Constants in DQDL, allowing you to define constant values and reference them throughout your script. This helps prevent issues related to query size limits when working with large SQL statements. For more information, see [Constants](#).

November 21, 2025

[Support for new worker types G.12X, G.16X, and memory-optimized R worker types](#)

Added support for new worker types G.12X, G.16X, and memory-optimized R.1X, R.2X, R.4X, R.8X worker types for Amazon Glue jobs. These new worker types provide additional compute and memory options for different workload requirements. For more information, see [Adding jobs in Amazon Glue](#).

January 30, 2025

[Support for 14 more new SaaS native connectors for Amazon Glue](#)

Fourteen more SaaS native connectors were added to Amazon Glue. For more information, see [Adding an Amazon Glue connection](#).

January 30, 2025

[Support for 16 more new SaaS native connectors for Amazon Glue](#)

Sixteen more SaaS native connectors were added to Amazon Glue. For more information, see [Adding an Amazon Glue connection](#).

December 17, 2024

[Automatic column statistics generation](#)

Amazon Glue Data Quality now supports Amazon SageMaker AI LakeHouse tables and Amazon Lake Formation managed Iceberg, Delta and HUDI tables in Data Catalog and ETL. For more information, see [Amazon Glue Data Quality](#).

December 6, 2024

[Support for zero-ETL integrations](#)

Zero-ETL is a set of fully managed integrations by Amazon that minimizes the need to build ETL data pipelines. For more information, see [Zero-ETL integrations](#).

December 3, 2024

[Support for reusable connections](#)

A new Amazon Glue connections schema provides a unified way to manage data connections across Amazon services and applications, such as Amazon Glue, Amazon Athena, and Amazon SageMaker Unified Studio. For more information, see [Connecting to data](#).

December 3, 2024

[Support for Amazon Glue version 5.0.](#)

Added information about support for Amazon Glue version 5.0. Features include an Apache Spark update to 3.52, Java update to 17, open table format updates, Spark native fine-grained access control, Sagemaker Lakehouse and data warehouse abstraction integration, support in Sagemaker Unified Studio, and more. For more information, see [Amazon Glue Release Notes](#) and [Migrating Amazon Glue jobs to Amazon Glue version 5.0.](#)

December 3, 2024

[Connecting to Amazon Glue Data Catalog using Amazon Glue Iceberg REST endpoint](#)

Amazon Glue's Iceberg REST endpoint supports API operations specified in the Apache Iceberg REST specification. Using an Iceberg REST client, you can connect your application running on an analytics engine to the REST catalog hosted in the Data Catalog. For more information, see [Accessing the Data Catalog.](#)

December 3, 2024

[Automatic column statistics generation](#)

Automatically generate column statistics for new tables in the Amazon Glue Data Catalog. For more information, see [Automatic column statistics generation](#).

December 3, 2024

[Support for Generative AI upgrades for Apache Spark in Amazon Glue](#)

Spark Upgrades in Amazon Glue enables data engineers and developers to upgrade and migrate upgrade and migrate their existing Amazon Glue Spark jobs to the latest Spark releases using generative AI. For more information, see [Upgrade analysis with AI](#).

November 22, 2024

[Support for Generative AI troubleshooting for Apache Spark in Amazon Glue](#)

Generative AI Troubleshooting for Apache Spark jobs in Amazon Glue helps data engineers and scientists diagnose and fix issues in their Spark applications with ease. For more information, see [Troubleshooting Spark jobs with AI](#).

November 22, 2024

[Support for Iceberg optimizers to access Amazon S3 buckets in a VPC](#)

Amazon Glue Data Catalog supports Iceberg table optimizers to access Amazon S3 buckets from a specific Virtual Private Cloud (VPC) using Amazon Glue network connection. For more information, see [Optimizing Iceberg tables](#).

November 20, 2024

| | | |
|--|---|-------------------|
| Support for nine more new SaaS native connectors for Amazon Glue | Nine more SaaS native connectors were added to Amazon Glue. For more information, see Adding an Amazon Glue connection . | November 19, 2024 |
| Support for ten new SaaS native connectors for Amazon Glue | Ten SaaS native connectors were added to Amazon Glue. For more information, see Adding an Amazon Glue connection . | November 15, 2024 |
| Support for job run queuing for Amazon Glue ETL jobs | You can turn on job run queuing to run jobs later, when they cannot run immediately due to service quotas. For more information, see Configuring job properties for Spark jobs in Amazon Glue . | September 3, 2024 |
| Updated policy changes | Documented changes to the AwsGlueSessionUserRestrictedNotebookPolicy and AwsGlueSessionUserRestrictedNotebookServiceRole policies, required for supporting on-tag-on-create for sessions with owner tag key. For more information, see Amazon Glue updates to Amazon managed policies . | August 30, 2024 |

[Anomaly Detection and Dynamic Rules are now generally available](#)

Amazon Glue Data Quality utilizes a machine learning algorithm to learn from past trends and then predict future values to detect anomalies. Dynamic Rules allows you to provide dynamic thresholds. For more information, see [Optimizing query performance for Iceberg tables](#).

August 7, 2024

[Updated policy changes](#)

Documented changes to the **AwsGlueSessionUserRestrictedPolicy** and **AwsGlueSessionUserRestrictedServiceRole** policies, required for supporting on tag-on-create for sessions with owner tag key. For more information, see [Amazon Glue updates to Amazon managed policies](#).

August 5, 2024

[Generating column statistics for Iceberg tables is now generally available](#)

Amazon Glue supports calculating and updating number of distinct values (NDVs) for each column in Iceberg tables. For more information, see [Anomaly detection in Amazon Glue Data Quality](#) and [Dynamic rules](#).

July 9, 2024

[Support for Amazon Glue usage profiles](#)

Admins can create Amazon Glue usage profiles for various classes of users within the account, such as developers, testers, and product teams. This flexibility allows administrators to apply different usage and cost controls for each class of users. For more information, see [Setting up Amazon Glue usage profiles](#).

June 18, 2024

[Support for a Salesforce connector for Amazon Glue for Spark](#)

Added information about a new Amazon Glue connector for Salesforce. This feature allows you to use Amazon Glue for Spark to read from and write to Salesforce in Amazon Glue 4.0 and later versions. For more information, see [Connecting to Salesforce](#).

May 22, 2024

[Amazon Q data integration in Amazon Glue \(GA\)](#)

April 30, 2024

Amazon Q data integration in Amazon Glue is a new generative AI capability of Amazon Glue that enables data engineers and ETL developers to build data integration jobs using natural language. Engineers and developers can ask Q to author jobs, troubleshoot issues and answer questions about Amazon Glue and data integration. For more information, see [Amazon Q data integration in Amazon Glue](#). This feature includes an update to the `AwsGlueSessionUserRestrictedPolicy`, `AwsGlueSessionUserRestrictedNotebookServiceRole`, and `AwsGlueSessionUserRestrictedServiceRole` Amazon managed policies. For more information, see [Amazon Glue updates to Amazon managed policies](#).

[Amazon Q data integration in Amazon Glue \(preview\)](#)

Amazon Q data integration in Amazon Glue is a new generative AI capability of Amazon Glue that enables data engineers and ETL developers to build data integration jobs using natural language. Engineers and developers can ask Q to author jobs, troubleshoot issues and answer questions about Amazon Glue and data integration. For more information, see [Amazon Q data integration in Amazon Glue](#). This feature includes an update to the `AwsGlueSessionUserRestrictedNotebookPolicy` Amazon managed policy. For more information, see [Amazon Glue updates to Amazon managed policies](#).

January 30, 2024

[Update to the documentation for Amazon Glue Streaming](#)

Added a new chapter with new and reorganized content for Amazon Glue Streaming . This content describes how streaming works with Amazon Glue, the characteristics of real-time data processing, and how to monitor your streaming jobs. For more information, see [Amazon Glue Streaming](#).

December 27, 2023

[Support for using fine-grained sensitive data detection](#)

The Detect Sensitive Data transform provides the ability to detect, mask, or remove entities that you define, or are pre-defined by Amazon Glue. Fine-grained actions further allows you to apply a specific action per entity. For more information, see [Using fine-grained sensitive data detection](#).

November 26, 2023

[Support for monitoring jobs with Amazon Glue Observability metrics](#)

Use Amazon Glue Observability metrics to generate insights into what is happening inside your Amazon Glue for Apache Spark jobs to improve triaging and analysis of issues. For more information, see [Monitoring with Amazon Glue Observability metrics](#).

November 26, 2023

[Support for anomaly detection in Amazon Glue Data Quality](#)

Amazon Glue Data Quality anomaly detection applies machine learning (ML) algorithms on data statistics over time to detect abnormal patterns and hidden data quality issues that are hard to detect through rules. For more information, see [Anomaly detection in Amazon Glue Data Quality](#).

November 26, 2023

[Update to default Spark UI logging behavior](#)

Spark jobs generating Spark UI logs will now write with a different filename pattern to support Spark UI in the Amazon Glue console. This does not change CloudWatch log behavior. You can revert to the legacy behavior by updating your job configuration. For more information, see [Monitoring jobs using the Apache Spark web UI](#).

November 17, 2023

[Support for new data sources in Amazon Glue for Spark](#)

Connections to Amazon OpenSearch Service, Azure SQL, Azure Cosmos for NoSQL, SAP HANA Teradata Vantage and Vertica are now supported natively within Amazon Glue. Additionally, connections to these data sources, along with MongoDB, are now available for use in the Amazon Glue Studio visual editor. For more information, see [Connection types and options for ETL in Amazon Glue for Spark](#) for information about Amazon Glue for Spark support and [Adding an Amazon Glue connection](#) for information about use in the Amazon Glue Studio visual editor.

November 17, 2023

[Support for generating column statistics](#)

You can compute column-level statistics for Amazon Glue Data Catalog tables in data formats such as Parquet, ORC, JSON, ION, CSV, and XML without setting up additional data pipelines. For more information, see [Working with column statistics](#).

November 16, 2023

[Support for data compaction for Iceberg tables](#)

For better read performance by Amazon analytics services such as Amazon Athena and Amazon EMR, and Amazon Glue ETL jobs, Data Catalog provides managed compaction (a process that compacts small Amazon S3 objects into larger objects) for Iceberg tables in Data Catalog. For more information, see [Optimizing Iceberg tables](#).

November 13, 2023

[Update to job run wait behavior](#)

Standard Spark and Python shell job runs will now transition to WAITING in certain situations, rather than immediately transitioning to FAILED. For more information, see [Amazon Glue job run statuses](#).

November 8, 2023

| | | |
|---|--|------------------|
| Amazon Glue Studio user guide consolidated into Amazon Glue developer guide | The Amazon Glue Studio user guide has been moved into the developer guide to create a single unified user guide for Amazon Glue Studio, the Amazon Glue console, and Amazon Glue Studio programmatic access. | October 25, 2023 |
| Update to the AWSGlueServiceNotebookRole Amazon managed policy | Added information about a minor update to the AWSGlueServiceNotebookRole Amazon managed policy. For more information, see Amazon Glue Updates to Amazon Managed Policies . | October 9, 2023 |
| Amazon Glue Studio supports five new built-in transforms | Amazon Glue Studio supports the following five new built-in transforms: Record matching, Remove null rows, Parse JSON column, Extract JSON path, and Regex extractor. For more information, see Editing Amazon Glue managed data transform nodes . | August 11, 2023 |
| Update to the AWSGlueServiceRole Amazon managed policy | Added information about a minor update to the AWSGlueServiceRole Amazon managed policy. For more information, see Amazon Glue Updates to Amazon Managed Policies . | August 4, 2023 |

[Support for crawling Apache Hudi tables](#)

Added information about using Amazon Glue to crawl Hudi tables in Amazon S3 buckets and registering the Hudi tables to the Amazon Glue Data Catalog. For more information, see [Which data stores can I crawl?](#), and [Crawler properties](#).

July 21, 2023

[Update to the AWSGlueConsoleFullAccess Amazon managed policy](#)

Added information about a minor update to the AWSGlueConsoleFullAccess Amazon managed policy. For more information, see [Amazon Glue Updates to Amazon Managed Policies](#).

July 14, 2023

[Support for crawling Apache Iceberg tables](#)

Added information about using Amazon Glue to crawl Iceberg tables in Amazon S3 buckets and registering the Iceberg tables to the Amazon Glue Data Catalog. For more information, see [Which data stores can I crawl?](#), and [Crawler properties](#).

July 7, 2023

[Support for Amazon Glue with Ray](#)

Added information about Amazon Glue with Ray, a new engine that can back Amazon Glue jobs. Reorganized existing Amazon Glue with Spark content to disambiguate.

May 30, 2023

[Support for Amazon Glue Data Quality \(GA\)](#)

Amazon Glue Data Quality is now generally available. Amazon Glue Data Quality helps you evaluate and monitor the quality of your data. For information about how to use Amazon Glue Data Quality with Data Catalog, see [Amazon Glue Data Quality](#). To learn about Amazon Glue Data Quality for Amazon Glue Studio, see [Evaluating data quality with Amazon Glue Studio](#).

May 24, 2023

[Support for larger worker types for Apache Spark jobs](#)

Support is now available for use of the G.4X and G.8X worker types for Apache Spark jobs. These worker types are appropriate for jobs whose workloads contain your most demanding transforms, aggregations, joins, and queries. For more information, see [Adding jobs in Amazon Glue](#).

May 8, 2023

[Support for creating partition indexes when crawling tables](#)

Added information about how crawlers support the creation of partition indexes for tables that the crawler detects. For more information, see [Setting the partition index crawler configuration option](#).

April 24, 2023

| | | |
|---|--|-------------------|
| Support for resource usage metrics | Added information about viewing the service's resource usage and configuring alarms in Amazon CloudWatch. For more information, see Amazon Glue resource monitoring . | April 7, 2023 |
| Update to the AWSGlueConsoleFullAccess Amazon managed policy | Added information about a minor update to the AWSGlueConsoleFullAccess Amazon managed policy. For more information, see Amazon Glue Updates to Amazon Managed Policies . | March 28, 2023 |
| Added guidance for using Amazon Glue with an Amazon SDK with examples | The Amazon Glue Developer Guide has two new sections that provide information to help you use Amazon Glue with an Amazon SDK. For more information, see Using Amazon Glue with an Amazon SDK and Code examples for Amazon Glue using Amazon SDKs . | February 23, 2023 |
| Update to the documentation for IAM with Amazon Glue | Reorganized and added information on using IAM with Amazon Glue. For more information, see Identity and access management for Amazon Glue . | February 15, 2023 |

[Support for running streaming ETL jobs in Amazon Glue version 4.0](#)

Added information about support for running streaming ETL jobs in Glue version 4.0, and new options for connecting to a Kafka cluster or an Amazon Managed Streaming for Apache Kafka cluster, and Amazon Kinesis Data Streams. For more information, see [Adding Streaming ETL Jobs in Amazon Glue](#) and [Connection types and options for ETL in Amazon Glue](#).

February 8, 2023

[Support for crawling MongoDB Atlas data sources](#)

Added information about using Amazon Glue to crawl MongoDB Atlas data sources. For more information, see [Which data stores can I crawl?](#), [MongoDB and MongoDB Atlas connection properties](#), and [Using a MongoDB or MongoDB Atlas connection](#).

February 6, 2023

[Support for crawling Delta Lake tables using a native Delta Lake connector](#)

Added information about using Amazon Glue to crawl Delta Lake tables using a native Delta Lake connector . This feature allows you to use Amazon query engines to query the Delta transaction log directly and use features such as time travel and ACID guarantees, and to sync your Delta Lake metadata from Amazon S3 transaction files into the Data Catalog to enable column permissions on your queries in Lake Formation. For more information, see [How to specify configuration options for a Delta Lake data store](#), and [Querying Delta Lake tables](#).

December 15, 2022

[Support for Amazon Glue Data Quality \(preview\)](#)

Support is now available for Amazon Glue Data Quality (preview). Amazon Glue Data Quality helps you evaluate and monitor the quality of your data when you use Amazon Glue 3.0. For information about how to use Amazon Glue Data Quality with Data Catalog, see [Amazon Glue Data Quality \(preview\)](#). To learn about Amazon Glue Data Quality for Amazon Glue Studio, see [Evaluating data quality with Amazon Glue Studio](#).

November 30, 2022

[Support for a new Amazon Redshift Spark connector with new features and performance improvements](#)

Support is now available for a new Amazon Redshift Spark connector with a new JDBC driver for use with Amazon Glue ETL jobs to build Apache Spark applications that read from and write to data in Amazon Redshift as part of your data ingestion and transformation pipelines. For more information, see [Moving data to and from Amazon Redshift](#).

November 29, 2022

[Support for Amazon Glue version 4.0.](#)

Added information about support for Amazon Glue version 4.0. Features include native support for open-data lake frameworks with Apache Hudi, Delta Lake, and Apache Iceberg, and native support for the Amazon S3-based Cloud Shuffle Storage Plugin (an Apache Spark plugin) to use Amazon S3 for shuffling and elastic storage capacity. For more information, see [Amazon Glue Release Notes](#) and [Migrating Amazon Glue jobs to Amazon Glue version 4.0.](#)

November 28, 2022

[Amazon Glue Studio now offers custom visual transforms](#)

Custom visual transforms let customers define, reuse, and share business-specific ETL logic among their teams. For more information, see [Custom visual transforms](#) .

November 28, 2022

[Support for using the Amazon Glue crawler to publish metadata for JDBC data stores](#)

Support is now available for using the Amazon Glue crawler to publish metadata such as comments and rawtypes to the Data Catalog for JDBC data stores. For more information, see [Parameters set on Data Catalog tables by crawler](#), [Crawler properties](#), and [JdbcTarget structure](#).

November 18, 2022

[Support for crawling Snowflake data stores](#)

Support is now available for using Amazon Glue to crawl Snowflake tables and views, and to publish the metadata to the Data Catalog as a table entry. For Snowflake external tables in Amazon S3, the crawler also crawls the Amazon S3 location and the file format type of the external table and populates as Table parameters. For more information, see [Which data stores can I crawl?](#), [Amazon Glue connection properties](#), and [Parameters set on Data Catalog tables by crawler](#).

November 18, 2022

[Support for improved shuffle management of your Spark applications](#)

Support is now available for a new Cloud Shuffle Storage Plugin for Apache Spark. For more information, see [Amazon Glue Spark shuffle plugin with Amazon S3](#) and [Cloud Shuffle Storage Plugin for Apache Spark](#).

November 15, 2022

[Added support for Data Catalog targets when accelerating crawls Amazon S3 event notifications](#)

In addition to the existing support for Amazon S3 targets, support is now available for accelerating crawls for Data Catalog targets using Amazon S3 event notifications. For more information, see [Accelerating Crawls Using Amazon S3 Event Notifications](#).

October 13, 2022

[Support for specifying the maximum number of tables a crawler can create](#)

Support is now available for specifying the maximum number of tables the crawler is allowed to create. For more information, see [How to specify the maximum number of tables the crawler is allowed to create](#).

September 6, 2022

[Support for Python 3.9 in Python shell jobs in Amazon Glue](#)

Support is now available for running scripts compatible with Python 3.9 in Python shell jobs in Amazon Glue, and for choosing to use pre-packaged library sets. For more information, see [Python shell jobs in Amazon Glue](#).

August 11, 2022

[Support for running non-urgent or non-time sensitive Amazon Glue jobs on spare capacity](#)

Support is now available for the configuration of flexible job runs for non-urgent jobs such as pre-production jobs, testing, and one-time data loads. For more information, see [Adding jobs in Amazon Glue](#).

August 9, 2022

[Support for a new worker type for streaming jobs](#)

Support is now available for use of the G.025X worker type for low volume streaming jobs. For more information, see [Adding jobs in Amazon Glue](#).

July 14, 2022

[Support for the use of Kafka SASL in Amazon Glue connections](#)

Support is now available for use of Kafka SASL in Amazon Glue connections. For more information, see [Amazon Glue Kafka connection properties for client authentication](#).

July 5, 2022

[Support for Apache kafka connector for protobuf schemas](#)

Support is now available for Apache Kafka Connector for Protobuf schemas. For more information, see [Amazon Glue Schema Registry](#).

June 9, 2022

[Support for Auto Scaling for Amazon Glue jobs \(GA\)](#)

Added information on using Auto Scaling for jobs in Amazon Glue version 3.0 to dynamically scale compute resources. For more information, see [Using Auto Scaling for Amazon Glue](#).

April 14, 2022

[Update to the documentation for Amazon Glue developing and testing Amazon Glue job scripts](#)

Reorganized and added information on the available development and testing methods for Amazon Glue, including instructions for developing with Docker. For more information, see [Developing and testing Amazon Glue job scripts](#).

March 14, 2022

| | | |
|--|---|-------------------|
| Addition of protocol buffers (protobuf) as a supported data format for the Amazon Glue schema registry | Added information about Protobuf as a supported data format (in addition to AVRO and JSON). For more information, see Amazon Glue Schema Registry . | February 25, 2022 |
| Support for crawling Delta Lake tables | Added information about using Amazon Glue to crawl Delta Lake tables. For more information, see How to specify configuration options for a Delta Lake data store . | February 24, 2022 |
| Support for Amazon Glue job insights | Added information about using Amazon Glue job insights to simplify job debugging and optimization for your Amazon Glue jobs. For more information, see Monitoring with Amazon Glue job insights . | February 8, 2022 |
| Support for crawling Amazon S3 backed Data Catalog tables using a VPC endpoint | In addition to Amazon S3 data stores, you can configure your Amazon S3 backed Data Catalog tables to be accessed only by an Amazon Virtual Private Cloud environment (Amazon VPC), for security, auditing, or control purposes. For more information, see Crawling an Amazon S3 Data Store or Amazon S3 backed Data Catalog tables using a VPC Endpoint . | February 3, 2022 |

[Support for Lake Formation governed tables](#)

Added information about Amazon Glue support for Lake Formation governed tables, which support ACID transactions, automatic data compaction, and time-travel queries. For more information, see [Amazon Glue API](#) and the [Amazon Lake Formation developer guide](#).

November 30, 2021

[New Amazon managed policies added for interactive sessions and notebooks](#)

New managed policies for IAM provided enhanced security for using Amazon Glue with interactive sessions and notebooks. For more information, see [Amazon Managed Policies for Amazon Glue](#).

November 30, 2021

[Glue schema registry now supported with streaming jobs](#)

You can create streaming jobs that access tables that are part of the Glue Schema Registry. For more information see [Amazon Glue Schema Registry](#) and [Adding Streaming ETL Jobs in Amazon Glue](#).

November 15, 2021

[Support for new machine learning features](#)

Added information about new features for the Find matches machine learning transform , including incremental matching and match scoring. For more information, see [Finding Incremental Matches](#) and [Estimating the Quality of Matches using Match Confidence Scores](#).

October 31, 2021

[\(Private preview\) Support for Amazon Glue flex jobs](#)

Added information about configuring Amazon Glue Spark jobs with a flexible execution class, appropriate for time-insensitive jobs whose start and completion times may vary. For more information, see [Adding Jobs in Amazon Glue](#).

October 29, 2021

[Support for accelerating crawls using Amazon S3 event notifications](#)

Added information about accelerating crawls using Amazon S3 event notifications. For more information, see [Accelerating Crawls Using Amazon S3 Event Notifications](#).

October 15, 2021

| | | |
|--|---|------------------|
| Additional security configuration options related to access-control and VPCs | Added information about how you can configure new access control permissions on Amazon Glue and configuration of VPCs. For more information, see Amazon Tags in Amazon Glue , Identity-Based Policies (IAM Policies) that Control Settings Using Condition Keys or Context Keys , and Configuring all Amazon calls to go through your VPC . | October 13, 2021 |
| Support for VPC endpoint policies | Added information about support for Virtual Private Cloud (VPC) endpoint policies in Amazon Glue. For more information, see Amazon Glue and interface VPC endpoints (Amazon PrivateLink) . | October 11, 2021 |
| Glue Studio is now available in China | Amazon Glue Studio is now available in the China Beijing and Ningxia regions. | October 11, 2021 |
| Amazon Glue Studio offers notebook authoring, for interactive job editing | Notebooks help you to write and execute code, visualize the results, and share insights. Typically, data scientists use notebooks for experiments and data exploration tasks. For more information, see Using Notebooks . | October 1, 2021 |

[Direct access to streaming sources now available](#)

When adding data sources to your ETL job in the visual editor, you can supply information to access the data stream instead of having to use a Data Catalog database and table.

September 30, 2021

[Documented the Amazon Glue version support policy](#)

Added information about the Amazon Glue version support policy and the end of life phases for certain Amazon Glue versions. For more information, see [Amazon Glue version support policy](#).

September 24, 2021

[Custom connectors can now be used with data previews](#)

When editing data source node using a custom connector, you can preview the dataset by choosing the Dat preview tab. For more information, see [Custom Connectors](#).

September 24, 2021

[Support for Amazon Glue interactive sessions \(private preview\)](#)

(Private preview) Added information about using Amazon Glue interactive sessions to run Spark workloads in the cloud from any Jupyter Notebook. Interactive sessions are the preferred method for developing your Amazon Glue extract, transform, and load (ETL) code when you use Amazon Glue 2.0 or later. For more information, see [Setting Up and Running Amazon Glue interactive sessions for Jupyter Notebook](#).

August 24, 2021

[Support for creating workflows from blueprints \(GA\)](#)

Added information about coding common extract, transform, and load (ETL) use cases in blueprints and then creating workflows from blueprints. Enables data analysts to easily create and run complex ETL processes . For more information, see [Performing Complex ETL Activities Using blueprints and Workflows in Amazon Glue](#).

August 23, 2021

[Support for Amazon Glue version 3.0.](#)

Added information about support for Amazon Glue version 3.0 which supports the Apache Spark 3.0 engine upgrade for running Apache Spark ETL jobs, and other optimizations and upgrades. For more information, see [Amazon Glue Release Notes](#) and [Migrating Amazon Glue jobs to Amazon Glue version 3.0](#). Other features in this release include the Amazon Glue shuffle manager, a SIMD vectorized CSV reader, and catalog partition predicates. For more information see [Amazon Glue Spark shuffle manager with Amazon S3](#), [Format Options for ETL Inputs and Outputs in Amazon Glue](#), and [Server-side filtering using catalog partition predicates](#).

August 18, 2021

[Amazon GovCloud \(US\) Region](#)

Amazon Glue Studio is now available in the Amazon GovCloud (US) Region

August 18, 2021

[Python shell authoring available in Amazon Glue Studio](#)

When creating a new job, you can now choose to create a Python shell job. For more information, see [Start the job creation process](#) and [Editing Python shell jobs in Amazon Glue Studio](#).

August 13, 2021

[Support for starting a workflow with an Amazon EventBridge event](#)

Added information about how Amazon Glue can be an event consumer in an event-driven architecture. For more information, see [Starting an Amazon Glue Workflow with an Amazon EventBridge Event](#) and [Viewing the EventBridge Events That Started a Workflow](#).

July 14, 2021

[Addition of JSON as a supported data format for the Amazon Glue schema registry](#)

Added information about JSON as a supported data format (in addition to AVRO). For more information, see [Amazon Glue Schema Registry](#).

June 30, 2021

[Create Amazon Glue streaming jobs without a Data Catalog table](#)

The `create_data_frame_from_options` Python function or `getSource` for Scala scripts support creating streaming ETL jobs that reference the data streams directly instead of requiring a Data Catalog table.

June 15, 2021

[Amazon Glue machine learning transforms now support Amazon Key Management Service keys](#)

You can specify a security configuration or Amazon KMS key when configuring Amazon Glue Machine Learning transforms with the console, the CLI, or the Amazon Glue APIs. For more information, see [Using Data Encryption with Machine Learning Transforms](#) and [Amazon Glue Machine Learning API](#).

June 15, 2021

[Update to the AWSGlueConsoleFullAccess Amazon managed policy](#)

Added information about a minor update to the AWSGlueConsoleFullAccess Amazon managed policy. For more information, see [Amazon Glue Updates to Amazon Managed Policies](#).

June 10, 2021

[View your job's dataset while creating and editing jobs](#)

You can use the new **Data preview** tab for a node in your job diagram to see a sample of the data processed by that node. For more information, see [Using data previews in the visual job editor](#).

June 7, 2021

[Support for specifying a value that indicates the table location for the crawler output.](#)

Added information about specifying a value that indicates the table location when configuring the crawler's output. For more information, see [How to specify the table location](#).

June 4, 2021

[Support for crawling a sample of files in a dataset when crawling an Amazon S3 data store](#)

Added information about how to crawl a sample of files when crawling Amazon S3. For more information, see [Crawler Properties](#).

May 10, 2021

[Support for the Amazon Glue optimized parquet writer](#)

Added information about using the Amazon Glue optimized parquet writer for DynamicFrames to create or update tables with the parquet classification. For more information, see [Creating Tables, Updating Schema, and Adding New Partitions in the Data Catalog from Amazon Glue ETL Jobs and Format Options for ETL Inputs and Outputs in Amazon Glue](#).

May 4, 2021

[Support for kafka client authentication passwords](#)

Added information about how streaming ETL jobs in Amazon Glue support SSL client certificate authentication with Apache Kafka stream producers. You can now provide a custom certificate while defining an Amazon Glue connection to an Apache Kafka cluster, which Amazon Glue will use when authenticating with it. For more information, see [Amazon Glue Connection Properties](#) and [Connection API](#).

April 28, 2021

[Support for consuming data from Amazon Kinesis Data Streams in another account in streaming ETL jobs](#)

Added information about to create a streaming ETL job to consume data from Amazon Kinesis Data Streams in another account. For more information, see [Adding Streaming ETL Jobs in Amazon Glue](#).

March 30, 2021

[SQL transform available](#)

You can use a **SQL** transform node to write your own transform in the form of a SQL query. For more information, see [Using a SQL query to transform data](#).

March 23, 2021

[Support for creating workflows from blueprints \(public preview\)](#)

(Public preview) Added information about coding common extract, transform, and load (ETL) use cases in blueprints and then creating workflows from blueprints. Enables data analysts to easily create and run complex ETL processes. For more information, see [Performing Complex ETL Activities Using blueprints and Workflows in Amazon Glue](#).

March 22, 2021

[Connectors can be used for data targets](#)

Using a custom or Amazon Web Services Marketplace connector for your data target is now supported. For more information, see [Authoring jobs with custom connectors](#).

March 15, 2021

[Support for column importance metrics for Amazon Glue machine learning transforms](#)

Added information about viewing column importance metrics when working with Amazon Glue machine learning transforms. For more information see [Working with Machine Learning Transforms on the Amazon Glue Console](#)

February 5, 2021

[Job scheduling now available in Amazon Glue Studio](#)

You can define a time-based schedule for your job runs in Amazon Glue Studio. You can use the console to create a basic schedule, or define a more complex schedule using the Unix-like [cron](#) syntax. For more information, see [Schedule job runs](#).

December 21, 2020

[Amazon Glue Custom Connectors released](#)

Amazon Glue Custom Connectors allow you to discover and subscribe to connectors in Amazon Web Services Marketplace. We also released Amazon Glue Spark runtime interfaces to plug in connectors built for Apache Spark Datasource, Athena federated query, and JDBC APIs. For more information, see [Using Connectors and connections with Amazon Glue Studio](#).

December 21, 2020

[Support for running streaming ETL jobs in Amazon Glue version 2.0](#)

Added information about support for running streaming ETL jobs in Glue version 2.0. For more information, see [Adding Streaming ETL Jobs in Amazon Glue](#).

December 18, 2020

[Support for workload partitioning with bounded execution](#)

Added information about enabling workload partitioning to configure the upper bounds on the dataset size, or the number of files processed on ETL job runs. For more information, see [Workload Partitioning with Bounded Execution](#).

November 23, 2020

[Support for enhanced partition management](#)

Added information about how to use new APIs to add or delete a partition index to/from an existing table. For more information, see [Working with Partition Indexes](#).

November 23, 2020

[Support for the Amazon Glue schema registry](#)

Added information about using the Amazon Glue Schema Registry to centrally discover, control, and evolve schemas. For more information, see [Amazon Glue Schema Registry](#).

November 19, 2020

[Support for the grok input format in streaming ETL jobs](#)

Added information about applying Grok patterns to streaming sources such as log files. For more information, see [Applying Grok Patterns to Streaming Sources](#).

November 17, 2020

[Support for adding tags to workflows on the Amazon Glue console](#)

Added information about adding tags when creating a workflow using the Amazon Glue console. For more information, see [Creating and Building Out a Workflow Using the Amazon Glue Console](#).

October 27, 2020

[Support for incremental crawler runs](#)

Added information about support for incremental crawler runs, which crawl only Amazon S3 folders added since the last run. For more information, see [Incremental Crawls](#).

October 21, 2020

[Support for schema detection for streaming ETL data sources. support for Avro streaming ETL data sources and self-managed kafka](#)

Streaming extract, transform, and load (ETL) jobs in Amazon Glue can now automatically detect the schema of incoming records and handle schema changes on a per-record basis. Self-managed Kafka data sources are now supported. Streaming ETL jobs now support the Avro format in data sources. For more information, see [Streaming ETL in Amazon Glue](#), [Defining Job Properties for a Streaming ETL Job](#), and [Notes and Restrictions for Avro Streaming Sources](#).

October 7, 2020

[Support for crawling MongoDB and DocumentDB data sources](#)

Added information about support for crawling MongoDB and Amazon DocumentDB (with MongoDB compatibility) data sources. For more information, see [Defining Crawlers](#).

October 5, 2020

[Support for FIPS compliance](#)

Added information about FIPS endpoints for customers who require FIPS 140-2 validated cryptographic modules when accessing data using Amazon Glue. For more information, see [FIPS Compliance](#).

September 23, 2020

[Amazon Glue Studio provides an easy to use visual interface for creating and monitoring jobs](#)

You can now use a simple graph-based interface to compose jobs that move and transform data and run them on Amazon Glue. You can then use the job run dashboard in Amazon Glue Studio to monitor ETL execution and ensure that your jobs are operating as intended. For more information, see [Amazon Glue Studio User Guide](#).

September 23, 2020

[Support for creating table indexes to improve query performance](#)

Added information about creating table indexes to allow you to retrieve a subset of the partitions from a table. For more information, see [Working with Partition Indexes](#).

September 9, 2020

[Support for reduced startup times when running Apache Spark ETL jobs in Amazon Glue version 2.0.](#)

Added information about support for Amazon Glue version 2.0 which provides an upgraded infrastructure for running Apache Spark ETL jobs with reduced startup times, changes in logging, and support for specifying additional Python modules at the job level. For more information, see [Amazon Glue Release Notes](#) and [Running Spark ETL Jobs with Reduced Startup Times](#).

August 10, 2020

[Support for limiting the number of concurrent workflow runs.](#)

Added information about how to limit the number of concurrent workflow runs for a particular workflow. For more information, see [Creating and Building Out a Workflow Using the Amazon Glue Console](#).

August 10, 2020

[Support for crawling an Amazon S3 data store using a VPC endpoint](#)

Added information about configuring your Amazon S3 data store to be accessed only by an Amazon Virtual Private Cloud environment (Amazon VPC), for security, auditing, or control purposes. For more information, see [Crawling an Amazon S3 Data Store using a VPC Endpoint](#).

August 7, 2020

[Support for resuming workflow runs](#)

Added information about how to resume workflow runs that only partially completed because one or more nodes (jobs or crawlers) did not complete successfully. For more information, see [Repairing and Resuming a Workflow Run](#).

July 27, 2020

[Support for enabling private CA certificates in kafka connections in Amazon Glue.](#)

Added information about new connection options that support enabling private CA certificates for Kafka connections in Amazon Glue. For more information, see [Connection Types and Options for ETL in Amazon Glue](#) and [Special Parameters Used by Amazon Glue](#).

July 20, 2020

[Support for reading DynamoDB data in another account](#)

Added information about Amazon Glue support for reading data from another Amazon account's DynamoDB table. For more information, see [Reading from DynamoDB Data in Another Account](#).

July 17, 2020

[Support for a DynamoDB writer connection in Amazon Glue version 1.0 or later](#)

Added information about support for DynamoDB writer, and new or updated connection options for DynamoDB to read or write. For more information, see [Connection Types and Options for ETL in Amazon Glue](#).

July 17, 2020

[Support for resource links and for cross-account access control using both Amazon Glue and Lake Formation](#)

Added content about new Data Catalog objects called resource links, and about how to manage sharing Data Catalog resources across accounts with both Amazon Glue and Amazon Lake Formation. For more information, see [Granting Cross-Account Access](#) and [Table Resource Links](#).

July 7, 2020

[Support for sampling records when crawling DynamoDB data stores](#)

Added information about new properties that you can configure when crawling a DynamoDB data store. For more information, see [Crawler Properties](#).

June 12, 2020

[Support for stopping a workflow run.](#)

Added information about how to stop a workflow run for a particular workflow. For more information, see [Stopping a Workflow Run](#).

May 14, 2020

[Support for Spark streaming ETL jobs](#)

Added information about creating extract, transform, and load (ETL) jobs with streaming data sources. For more information, see [Adding Streaming ETL Jobs in Amazon Glue](#).

April 27, 2020

[Support for creating tables, updating the schema, and adding new partitions in the Data Catalog after running an ETL job](#)

Added information about how you can enable creating tables, updating the schema, and adding new partitions to see the results of your ETL job in the Data Catalog. For more information, see [Creating Tables, Updating Schema, and Adding New Partitions in the Data Catalog from Amazon Glue ETL Jobs](#).

April 2, 2020

[Support for specifying a version for the Apache Avro data format as an ETL input and output in Amazon Glue](#)

Added information about specifying a version for the Apache Avro data format as an ETL input and output in Amazon Glue. The default version is 1.7. You can use the `version` format option to specify Avro version 1.8 to enable logical reading/writing. For more information, see [Format Options for ETL Inputs and Outputs in Amazon Glue](#).

March 31, 2020

[Support for the EMRFS S3-optimized committer for writing Parquet data into Amazon S3](#)

Added information about how to set a new flag to enable the EMRFS S3-optimized committer for writing Parquet data into Amazon S3 when creating or updating an Amazon Glue job. For more information, see [Special Parameters Used by Amazon Glue](#).

March 30, 2020

[Support for machine learning transforms as a resource managed by Amazon resource tags](#)

Added information about using Amazon resource tags to manage and control access to your machine learning transforms in Amazon Glue. You can assign Amazon resource tags to jobs, triggers, endpoints, crawlers, and machine learning transforms in Amazon Glue. For more information, see [Amazon Tags in Amazon Glue](#).

March 2, 2020

[Support for non-overrideable job arguments](#)

Added information about support for special job parameters that cannot be overridden in triggers or when you run the job. For more information see [Adding Jobs in Amazon Glue](#).

February 12, 2020

[Support for new transforms to work with datasets in Amazon S3](#)

Added information about new transforms (Merge, Purge, and Transition) and Amazon S3 storage class exclusions for Apache Spark applications to work with datasets in Amazon S3. For more information on support for these transforms for Python, see [mergeDynamicFrame](#) and [Working with Datasets in Amazon S3](#). For Scala, see [mergeDynamicFrames](#) and [Amazon Glue Scala GlueContext APIs](#).

January 16, 2020

[Support for updating the Data Catalog with new partition information from an ETL job](#)

Added information about how to code an extract, transform, and load (ETL) script to update the Amazon Glue Data Catalog with new partition information. With this capability, you no longer have to rerun the crawler after job completion to view the new partitions. For more information see [Updating the Data Catalog with New Partitions](#).

January 15, 2020

[New tutorial: Using an SageMaker AI notebook](#)

Added a tutorial that demonstrates how to use an Amazon SageMaker notebook to help develop your ETL and machine learning scripts. See [Tutorial: Use an Amazon SageMaker Notebook with Your Development Endpoint](#).

January 3, 2020

[Support for reading from MongoDB and Amazon DocumentDB \(with MongoDB compatibility\)](#)

Added information about new connection types and connection options for reading from and writing to MongoDB and Amazon DocumentDB (with MongoDB Compatibility). For more information, see [Connection Types and Options for ETL in Amazon Glue](#).

December 17, 2019

[Various corrections and clarifications](#)

Added corrections and clarifications throughout. Removed entries from the Known Issues chapter. Added warnings that Amazon Glue supports only symmetrical customer master keys (CMKs) when specifying Data Catalog encryption settings and creating security configurations. Added a note that Amazon Glue does not support writing to Amazon DynamoDB.

December 9, 2019

[Support for custom JDBC drivers](#)

Added information about connecting to data sources and targets with JDBC drivers that Amazon Glue does not natively support, such as MySQL version 8 and Oracle Database version 18. For more information see [JDBC connectionType Values](#).

November 25, 2019

[Support for connecting SageMaker AI notebooks to different development endpoints](#)

Added information about how you can connect an SageMaker AI notebook to different development endpoints. Updates to describe the new console action for switching to a new development endpoint, and the new SageMaker AI IAM policy. For more information, see [Working with Notebooks on the Amazon Glue Console](#) and [Create an IAM Policy for Amazon SageMaker AI Notebooks](#).

November 21, 2019

[Support for Amazon Glue version in machine learning transforms](#)

Added information about defining the Amazon Glue version in a machine learning transform to indicate the which version of Amazon Glue a machine learning transform is compatible with. For more information see [Working with Machine Learning Transforms on the Amazon Glue Console](#).

November 21, 2019

[Support for rewinding your job bookmarks](#)

Added information about rewinding your job bookmarks to any previous job run, resulting in the subsequent job run reprocessing data only from the bookmarked job run. Described two new sub-options for the `job-bookmark-pause` option that allow you to run a job between two bookmarks. For more information, see [Tracking Processed Data Using Job Bookmarks](#) and [Special Parameters Used by Amazon Glue](#).

October 22, 2019

[Support for custom JDBC certificates for connecting to a data store](#)

Added information about Amazon Glue support of custom JDBC certificates for SSL connections to Amazon Glue data sources or targets. For more information, see [Working with Connections on the Amazon Glue Console](#).

October 10, 2019

[Support for Python wheel](#)

Added information about Amazon Glue support of wheel files (along with egg files) as dependencies for Python shell jobs. For more information, see [Providing Your Own Python Library](#).

September 26, 2019

[Support for versioning of development endpoints in Amazon Glue](#)

Added information about defining the Glue version in development endpoints. Glue version determines the versions of Apache Spark and Python that Amazon Glue supports. For more information, see [Adding a Development Endpoint](#).

September 19, 2019

[Support for monitoring Amazon Glue using Spark UI](#)

Added information about using Apache Spark UI to monitor and debug Amazon Glue ETL jobs running on the Amazon Glue job system, and Spark applications on Amazon Glue development endpoints. For more information, see [Monitoring Amazon Glue Using Spark UI](#).

September 19, 2019

[Enhancement of support for local ETL script development using the public Amazon Glue ETL library](#)

Updated the Amazon Glue ETL library content to reflect that Amazon Glue version 1.0 is now supported. For more information, see [Developing and Testing ETL Scripts Locally Using the Amazon Glue ETL Library](#).

September 18, 2019

| | | |
|---|--|-----------------|
| Support for excluding Amazon S3 storage classes when running jobs | Added information about excluding Amazon S3 storage classes when running Amazon Glue ETL jobs that read files or partitions from Amazon S3. For more information, see Excluding Amazon S3 Storage Classes . | August 29, 2019 |
| Support for local ETL script development using the public Amazon Glue ETL library | Added information about how to develop and test Python and Scala ETL scripts locally without the need for a network connection. For more information, see Developing and Testing ETL Scripts Locally Using the Amazon Glue ETL Library . | August 28, 2019 |
| Known issues | Added information about known issues in Amazon Glue. For more information, see Known Issues for Amazon Glue . | August 28, 2019 |
| Support for machine learning transforms in Amazon Glue | Added information about machine learning capabilities provided by Amazon Glue to create custom transforms. You can create these transforms when you create a job. For more information, see Machine Learning Transforms in Amazon Glue . | August 8, 2019 |

[Support for shared Amazon Virtual Private Cloud](#)

Added information about Amazon Glue support for shared Amazon Virtual Private Cloud. For more information, see [Shared Amazon VPCs](#).

August 6, 2019

[Support for versioning in Amazon Glue](#)

Added information about defining the Glue version in job properties. Amazon Glue version determines the versions of Apache Spark and Python that Amazon Glue supports. For more information, see [Adding Jobs in Amazon Glue](#).

July 24, 2019

[Support for additional configuration options for development endpoints](#)

Added information about configuration options for development endpoints that have memory-intensive workloads. You can choose from two new configurations that provide more memory per executor. For more information, see [Working with Development Endpoints on the Amazon Glue Console](#).

July 24, 2019

[Support for performing extract, transfer, and load \(ETL\) activities using workflows](#)

Added information about using a new construct called a workflow to design a complex multi-job extract, transform, and load (ETL) activity that Amazon Glue can run and track as a single entity. For more information, see [Performing Complex ETL Activities Using Workflows in Amazon Glue](#).

June 20, 2019

[Support for Python 3.6 in Python shell jobs](#)

Added information about support for Python 3.6 in Python shell jobs. You can specify either Python 2.7 or Python 3.6 as a job property. For more information, see [Adding Python Shell Jobs in Amazon Glue](#).

June 5, 2019

[Support for virtual private cloud \(VPC\) endpoints](#)

Added information about connecting directly to Amazon Glue through an interface endpoint in your VPC. When you use a VPC interface endpoint, communication between your VPC and Amazon Glue is conducted entirely and securely within the Amazon network. For more information, see [Using Amazon Glue with VPC Endpoints](#).

June 4, 2019

[Support for real-time, continuous logging for Amazon Glue jobs.](#)

Added information about enabling and viewing real-time Apache Spark job logs in CloudWatch including the driver logs, each of the executor logs, and a Spark job progress bar. For more information, see [Continuous Logging for Amazon Glue Jobs](#).

May 28, 2019

[Support for existing Data Catalog tables as crawler sources](#)

Added information about specifying a list of existing Data Catalog tables as crawler sources. Crawlers can then detect changes to table schemas, update table definitions, and register new partitions as new data becomes available. For more information, see [Crawler Properties](#).

May 10, 2019

[Support for additional configuration options for memory-intensive jobs](#)

Added information about configuration options for Apache Spark jobs with memory-intensive workloads. You can choose from two new configurations that provide more memory per executor. For more information, see [Adding Jobs in Amazon Glue](#).

April 5, 2019

[Support for CSV custom classifiers](#)

Added information about using a custom CSV classifier to infer the schema of various types of CSV data. For more information, see [Writing Custom Classifiers](#).

March 26, 2019

[Support for Amazon resource tags](#)

Added information about using Amazon resource tags to help you manage and control access to your Amazon Glue resources . You can assign Amazon resource tags to jobs, triggers, endpoints, and crawlers in Amazon Glue. For more information, see [Amazon Tags in Amazon Glue](#).

March 20, 2019

[Support of Data Catalog for Spark SQL jobs](#)

Added information about configuring your Amazon Glue jobs and development endpoints to use the Amazon Glue Data Catalog as an external Apache Hive Metastore. This allows jobs and development endpoints to directly run Apache Spark SQL queries against the tables stored in the Amazon Glue Data Catalog. For more information, see [Amazon Glue Data Catalog Support for Spark SQL Jobs](#).

March 14, 2019

| | | |
|--|---|-------------------|
| Support for Python shell jobs | Added information about Python shell jobs and the new field Maximum capacity . For more information, see Adding Python Shell Jobs in Amazon Glue . | January 18, 2019 |
| Support for notifications when there are changes to databases and tables | Added information about events that are generated for changes to database, table, and partition API calls. You can configure actions in CloudWatch Events to respond to these events. For more information, see Automating Amazon Glue with CloudWatch Events . | January 16, 2019 |
| Support for encrypting connection passwords | Added information about encrypting passwords used in connection objects. For more information, see Encrypting Connection Passwords . | December 11, 2018 |
| Support for resource-level permission and resource-based policies | Added information about using resource-level permissions and resource-based policies with Amazon Glue. For more information, see the topics within Security in Amazon Glue . | October 15, 2018 |

[Support for SageMaker AI notebooks](#)

Added information about using SageMaker AI notebooks with Amazon Glue development endpoints. For more information, see [Managing Notebooks](#).

October 5, 2018

[Support for encryption](#)

Added information about using encryption with Amazon Glue. For more information, see [Encryption at Rest](#), [Encryption in Transit](#), and [Setting Up Encryption in Amazon Glue](#).

August 24, 2018

[Support for Apache Spark job metrics](#)

Added information about the use of Apache Spark metrics for better debugging and profiling of ETL jobs. You can easily track runtime metrics such as bytes read and written, memory usage and CPU load of the driver and executors, and data shuffles among executors from the Amazon Glue console. For more information, see [Monitoring Amazon Glue Using CloudWatch Metrics](#), [Job Monitoring and Debugging](#), and [Working with Jobs on the Amazon Glue Console](#).

July 13, 2018

| | | |
|---|---|---------------|
| Support of DynamoDB as a data source | Added information about crawling DynamoDB and using it as a data source of ETL jobs. For more information, see Cataloging Tables with a Crawler and Connection Parameters . | July 10, 2018 |
| Updates to create notebook server procedure | Updated information about how to create a notebook server on an Amazon EC2 instance associated with a development endpoint. For more information, see Creating a Notebook Server Associated with a Development Endpoint . | July 9, 2018 |
| Updates now available over RSS | You can now subscribe to an RSS feed to receive notifications about updates to the <i>Amazon Glue Developer Guide</i> . | June 25, 2018 |
| Support delay notifications for jobs | Added information about configuring a delay threshold when a job runs. For more information, see Adding Jobs in Amazon Glue . | May 25, 2018 |
| Configure a crawler to append new columns | Added information about new configuration option for crawlers, MergeNewColumns. For more information, see Configuring a Crawler . | May 7, 2018 |

[Support timeout of jobs](#)

Added information about setting a timeout threshold when a job runs. For more information, see [Adding Jobs in Amazon Glue](#).

April 10, 2018

[Support Scala ETL script and trigger jobs based on additional run states](#)

Added information about using Scala as the ETL programming language. In addition, the trigger API now supports firing when any conditions are met (in addition to all conditions). Also, jobs can be triggered based on a "failed" or "stopped" job run (in addition to a "succeeded" job run).

January 12, 2018

Earlier updates

The following table describes the important changes in each release of the *Amazon Glue Developer Guide* before January 2018.

| Change | Description | Date |
|---|--|--------------------|
| Support XML data sources and new crawler configuration option | Added information about classifying XML data sources and new crawler option for partition changes. | November 16, 2017 |
| New transforms, support for additional Amazon RDS database engines, and developme | Added information about the map and filter transforms, support for Amazon RDS Microsoft SQL Server, and Amazon RDS Oracle, and new features for development endpoints. | September 29, 2017 |

| Change | Description | Date |
|-----------------------------|---|-----------------|
| nt endpoint enhancements | | |
| Amazon Glue initial release | This is the initial release of the <i>Amazon Glue Developer Guide</i> . | August 14, 2017 |

Amazon Glossary

For the latest Amazon terminology, see the [Amazon glossary](#) in the *Amazon Web Services Glossary Reference*.
