Developer Guide

Amazon SDK for Ruby

Amazon SDK for Ruby: Developer Guide

Table of Contents

What is the Amazon SDK for Ruby?

Welcome to the Amazon SDK for Ruby Developer Guide. The Amazon SDK for Ruby provides support libraries for almost all Amazon Web Services services, including Amazon Simple Storage Service (Amazon S3), Amazon Elastic Compute Cloud (Amazon EC2), and Amazon DynamoDB.

The Amazon SDK for Ruby Developer Guide provides information about how to install, set up, and use the Amazon SDK for Ruby to create Ruby applications that use Amazon Web Services services.

Getting started with the Amazon SDK for Ruby

Additional documentation and resources

For more resources for Amazon SDK for Ruby developers, see the following:

- Amazon SDKs and Tools Reference Guide – Contains settings, features, and other foundational concepts common among Amazon SDKs
- Amazon SDK for Ruby API Reference - Version 3
- Amazon Code Examples Repository on GitHub
- RubyGems.org – Latest version of SDK is modularized into service-specific gems available here
  - Supported Services – Lists all gems that the Amazon SDK for Ruby supports
- Amazon SDK for Ruby source on GitHub:
  - Source and README
  - Change logs under each gem
  - Moving from v2 to v3
  - Issues
  - Core upgrade notes
- Developer blog

Deploying to the Amazon Cloud

You can use Amazon Web Services services such as Amazon Elastic Beanstalk and Amazon CodeDeploy to deploy your application to the Amazon Cloud. For deploying Ruby applications with Elastic Beanstalk, see Deploying Elastic Beanstalk Applications in Ruby Using EB CLI and Git in the

Amazon Elastic Beanstalk Developer Guide. For an overview of Amazon deployment services, see Overview of Deployment Options on Amazon.

Maintenance and support for SDK major versions

For information about maintenance and support for SDK major versions and their underlying dependencies, see the following in the Amazon SDKs and Tools Reference Guide:

- Amazon SDKs and Tools Maintenance Policy
- Amazon SDKs and Tools Version Support Matrix

Getting started with the Amazon SDK for Ruby

Learn how to install, set up, and use the SDK to create a Ruby application to access an Amazon resource programmatically.

Topics

Authenticating with Amazon using Amazon SDK for Ruby

You must establish how your code authenticates with Amazon when developing with Amazon Web Services services. You can configure programmatic access to Amazon resources in different ways depending on the environment and the Amazon access available to you.

To choose your method of authentication and configure it for the SDK, see Authentication and access in the *Amazon SDKs and Tools Reference Guide*.

Using console credentials

For local development, we recommend that new users use their existing Amazon Management Console sign-in credentials for programmatic access to Amazon services. After browser-based authentication, Amazon generates temporary credentials that work with local development tools like the Amazon Command Line Interface (Amazon CLI) and the Amazon SDK for Ruby.

If you choose this method, follow the instructions to Login for Amazon local development using console credentials using the Amazon CLI.

The Amazon SDK for Ruby does not need additional gems (such as `aws-sdk-signin`) to be added to your application to use login with console credentials.

Using IAM Identity Center authentication

If you choose this method, complete the procedure for IAM Identity Center authentication in the *Amazon SDKs and Tools Reference Guide*. Afterwards, your environment should contain the following elements:

- The Amazon CLI, which you use to start an Amazon access portal session before you run your application.
- A shared Amazon`config` file having a `[default]` profile with a set of configuration values that can be referenced from the SDK. To find the location of this file, see Location of the shared files in the *Amazon SDKs and Tools Reference Guide*.
- The shared `config` file sets the `region` setting. This sets the default Amazon Web Services Region that the SDK uses for Amazon requests. This Region is used for SDK service requests that aren't specified with a Region to use.
- The SDK uses the profile's SSO token provider configuration to acquire credentials before sending requests to Amazon. The `sso_role_name` value, which is an IAM role connected to an IAM Identity Center permission set, allows access to the Amazon Web Services services used in your application.

  The following sample `config` file shows a default profile set up with SSO token provider configuration. The profile's `sso_session` setting refers to the named `sso-session` section. The `sso-session` section contains settings to initiate an Amazon access portal session.

```
[default]
sso_session = my-sso
sso_account_id = 111122223333
sso_role_name = SampleRole
region = us-east-1
output = json

[sso-session my-sso]
sso_region = us-east-1
sso_start_url = https://provided-domain.awsapps.com/start
sso_registration_scopes = sso:account:access
```

The Amazon SDK for Ruby does not need additional gems (such as `aws-sdk-sso` and `aws-sdk-ssooidc`) to be added to your application to use IAM Identity Center authentication.

Start an Amazon access portal session

Before running an application that accesses Amazon Web Services services, you need an active Amazon access portal session for the SDK to use IAM Identity Center authentication to resolve credentials. Depending on your configured session lengths, your access will eventually expire and

the SDK will encounter an authentication error. To sign in to the Amazon access portal, run the following command in the Amazon CLI.

```
aws sso login
```

If you followed the guidance and have a default profile setup, you do not need to call the command with a `--profile` option. If your SSO token provider configuration is using a named profile, the command is `aws sso login --profile named-profile`.

To optionally test if you already have an active session, run the following Amazon CLI command.

```
aws sts get-caller-identity
```

If your session is active, the response to this command reports the IAM Identity Center account and permission set configured in the shared `config` file.

> **Note**
>
> If you already have an active Amazon access portal session and run `aws sso login`, you will not be required to provide credentials.
> The sign-in process might prompt you to allow the Amazon CLI access to your data.
> Because the Amazon CLI is built on top of the SDK for Python, permission messages might contain variations of the `botocore` name.

More authentication information

Human users, also known as *human identities*, are the people, administrators, developers, operators, and consumers of your applications. They must have an identity to access your Amazon environments and applications. Human users that are members of your organization - that means you, the developer - are known as *workforce identities*.

Use temporary credentials when accessing Amazon. You can use an identity provider for your human users to provide federated access to Amazon accounts by assuming roles, which provide temporary credentials. For centralized access management, we recommend that you use Amazon IAM Identity Center (IAM Identity Center) to manage access to your accounts and permissions within those accounts. For more alternatives, see the following:

- To learn more about best practices, see Security best practices in IAM in the *IAM User Guide*.
- To create short-term Amazon credentials, see Temporary Security Credentials in the *IAM User Guide*.
- To learn about the Amazon SDK for Ruby credential provider chain, and how different authentication methods are attempted automatically by the SDK in a sequence, see Credential provider chain.
- For Amazon SDK credential provider configuration settings, see Standardized credential providers in the *Amazon SDKs and Tools Reference Guide*.

Installing the Amazon SDK for Ruby

This section includes prerequisites and installation instructions for the Amazon SDK for Ruby.

Prerequisites

Before you use the Amazon SDK for Ruby, you must authenticate with Amazon. For information about setting up authentication, see Authenticating with Amazon using Amazon SDK for Ruby.

Installing the SDK

You can install the Amazon SDK for Ruby as you would any Ruby gem. The gems are available at RubyGems. The Amazon SDK for Ruby is designed to be modular and is separated by Amazon Web Services service. Installing the entire `aws-sdk` gem is large and may take over an hour.

We recommend only installing the gems for the Amazon Web Services services you use. These are named like `aws-sdk-`*`service_abbreviation`* and the complete list is found in the Supported Services table of the Amazon SDK for Ruby README file. For example, the gem for interfacing with the Amazon S3 service is directly available at `aws-sdk-s3`.

Ruby version manager

Instead of using system Ruby, we recommend using a Ruby version manager such as the following:

- RVM
- chruby
- rbenv

For example, if you are using an Amazon Linux 2 operating system, the following commands can be used to update RVM, list the available Ruby versions, then choose the version you want to use for development with the Amazon SDK for Ruby. The minimum required Ruby version is 2.5.

```
$ rvm get head
$ rvm list known
$ rvm install ruby-3.1.3
$ rvm --default use 3.1.3
```

Bundler

If you use Bundler, the following commands install the Amazon SDK for Ruby gem for Amazon S3:

1. Install Bundler and create the `Gemfile`:

   ```
   $ gem install bundler
   $ bundle init
   ```

2. Open the created `Gemfile` and add a `gem` line for each Amazon service gem your code will use. To follow along with the Amazon S3 example, add the following line to the bottom of the file:

   ```
   gem "aws-sdk-s3"
   ```

3. Save the Gemfile.
4. Install the dependencies specified in your `Gemfile`:

   ```
   $ bundle install
   ```

Creating a simple application using the Amazon SDK for Ruby

Say hello to Amazon S3 using the Amazon SDK for Ruby. The following example displays a list of your Amazon S3 buckets.

Writing the code

Copy and paste the following code into a new source file. Name the file `hello-s3.rb`.

```
require 'aws-sdk-s3'
```

```
# Wraps Amazon S3 resource actions.
class BucketListWrapper
  attr_reader :s3_resource

  # @param s3_resource [Aws::S3::Resource] An Amazon S3 resource.
  def initialize(s3_resource)
    @s3_resource = s3_resource
  end

  # Lists buckets for the current account.
  #
  # @param count [Integer] The maximum number of buckets to list.
  def list_buckets(count)
    puts 'Found these buckets:'
    @s3_resource.buckets.each do |bucket|
      puts "\t#{bucket.name}"
      count -= 1
      break if count.zero?
    end
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't list buckets. Here's why: #{e.message}"
    false
  end
end

# Example usage:
def run_demo
  wrapper = BucketListWrapper.new(Aws::S3::Resource.new)
  wrapper.list_buckets(25)
end

run_demo if $PROGRAM_NAME == __FILE__
```

Amazon SDK for Ruby is designed to be modular and is separated by Amazon Web Services service. After the gem is installed, the `require` statement at the top of your Ruby source file imports the Amazon SDK classes and methods for the Amazon S3 service. For a complete list of available Amazon service gems, see the Supported Services table of the Amazon SDK for Ruby README file.

```
require 'aws-sdk-s3'
```

Running the program

Open a command prompt to run your Ruby program. The typical command syntax to run a Ruby program is:

```
ruby [source filename] [arguments...]
```

This sample code uses no arguments. To run this code, enter the following into the command prompt:

```
$ ruby hello-s3.rb
```

Note for Windows users

When you use SSL certificates on Windows and run your Ruby code, you might see an error similar to the following.

```
C:\Ruby>ruby buckets.rb
C:/Ruby200-x64/lib/ruby/2.0.0/net/http.rb:921:in `connect': SSL_connect returned=1
 errno=0 state=SSLv3 read server certificate B: certificate verify failed
 (Seahorse::Client::NetworkingError)
        from C:/Ruby200-x64/lib/ruby/2.0.0/net/http.rb:921:in `block in connect'

        from C:/Ruby200-x64/lib/ruby/2.0.0/timeout.rb:66:in `timeout'
        from C:/Ruby200-x64/lib/ruby/2.0.0/net/http.rb:921:in `connect'
        from C:/Ruby200-x64/lib/ruby/2.0.0/net/http.rb:862:in `do_start'
        from C:/Ruby200-x64/lib/ruby/2.0.0/net/http.rb:857:in `start'
...
```

To fix this issue, add the following line to your Ruby source file, somewhere before your first Amazon call.

```
Aws.use_bundled_cert!
```

If you're using only the `aws-sdk-s3` gem in your Ruby program and you want to use the bundled certificate, you also need to add the `aws-sdk-core` gem.

Next steps

To test out many other Amazon S3 operations, check out the Amazon Code Examples Repository on GitHub.

Configuring service clients in the Amazon SDK for Ruby

To programmatically access Amazon Web Services services, the Amazon SDK for Ruby uses a client class for each Amazon Web Services service. For example, if your application needs to access Amazon EC2, your application creates an Amazon EC2 client object to interface with that service. You then use the service client to make requests to that Amazon Web Services service.

To make a request to an Amazon Web Services service, you must first create a service client. For each Amazon Web Services service your code uses, it has its own gem and its own dedicated type for interacting with it. The client exposes one method for each API operation exposed by the service.

There are many alternative ways to configure SDK behavior, but ultimately everything has to do with the behavior of service clients. Any configuration has no effect until a service client that is created from them is used.

You must establish how your code authenticates with Amazon when you develop with Amazon Web Services services. You must also set the Amazon Web Services Region you want to use.

The Amazon SDKs and Tools Reference Guide also contains settings, features, and other foundational concepts common among many of the Amazon SDKs.

Topics

The Shared `config` and `credentials` files can be used for configuration settings. For all Amazon SDK settings, see the Settings reference in the *Amazon SDKs and Tools Reference Guide*.

Different profiles can be used to store different configurations. To specify the active profile that the SDK loads, you can use the `AWS_PROFILE` environment variable or the `profile` option of `Aws.config`.

Precedence of settings

Global settings configure features, credential providers, and other functionality that are supported by most SDKs and have a broad impact across Amazon Web Services services. All Amazon SDKs have a series of places (or sources) that they check in order to find a value for global settings. Not all settings are available in all sources. The following is the setting lookup precedence:

1. Any explicit setting set in the code or on a service client itself takes precedence over anything else.
   a. Any parameters passed directly into a client constructor take highest precedence.
   b. `Aws.config` is checked for global or service-specific settings.
2. The environment variable is checked.
3. The shared Amazon `credentials` file is checked.
4. The shared Amazon `config` file is checked.
5. Any default value provided by the Amazon SDK for Ruby source code itself is used last.

Configuring Amazon SDK for Ruby service clients externally

Many configuration settings can be handled outside of your code. When configuration is handled externally, the configuration is applied across all of your applications. Most configuration settings can be set as either environment variables or in a separate shared Amazon `config` file. The shared `config` file can maintain separate sets of settings, called profiles, to provide different configurations for different environments or tests.

Environment variables and shared `config` file settings are standardized and shared across Amazon SDKs and tools to support consistent functionality across different programming languages and applications.

See the *Amazon SDKs and Tools Reference Guide* to learn about configuring your application through these methods, plus details on each cross-sdk setting. To see all the all settings that the SDK can resolve from the environment variables or configuration files, see the Settings reference in the *Amazon SDKs and Tools Reference Guide*.

To make a request to an Amazon Web Services service, you first instantiate a client for that service. You can configure common settings for service clients such as timeouts, the HTTP client, and retry configuration.

Each service client requires an Amazon Web Services Region and a credential provider. The SDK uses these values to send requests to the correct Region for your resources and to sign requests with the correct credentials. You can specify these values programmatically in code or have them automatically loaded from the environment.

The SDK has a series of places (or sources) that it checks in order to find a value for configuration settings.

1. Any explicit setting set in the code or on a service client itself takes precedence over anything else.
2. Environment variables
   - For details on setting environment variables, see environment variables in the *Amazon SDKs and Tools Reference Guide*.
   - Note that you can configure environment variables for a shell at different levels of scope: system-wide, user-wide, and for a specific terminal session.
3. Shared `config` and `credentials` files
   - For details on setting up these files, see the Shared `config` and `credentials` files in the *Amazon SDKs and Tools Reference Guide*.
4. Any default value provided by the SDK source code itself is used last.
   - Some properties, such as Region, don't have a default. You must specify them either explicitly in code, in an environment setting, or in the shared `config` file. If the SDK can't resolve required configuration, API requests can fail at runtime.

Amazon SDK for Ruby environment variables

Beyond the cross-sdk environment variables supported across most Amazon SDKs, the Amazon SDK for Ruby supports some unique ones:

`AWS_SDK_CONFIG_OPT_OUT`

If the Amazon SDK for Ruby environment variable `AWS_SDK_CONFIG_OPT_OUT` is set, the shared Amazon `config` file, typically at `~/.aws/config`, won't be used for any configuration values.

`AMAZON_REGION`

An alternative environment variable to `AWS_REGION` for setting the Amazon Web Services Region. This value is only checked if `AWS_REGION` is not used.

Configuring Amazon SDK for Ruby service clients in code

When configuration is handled directly in code, the configuration scope is limited to the application that uses that code. Within that application, there are options for the global configuration of all service clients, the configuration to all clients of a certain Amazon Web Services service type, or the configuration to a specific service client instance.

`Aws.config`

To provide global configuration within your code for all Amazon classes, use `Aws.config` that is available in the `aws-sdk-core` gem.

`Aws.config` supports two syntaxes for different uses. Global settings can either be applied for all Amazon Web Services services or for a specific service. For the complete list of supported settings, see the `Client` `Options` in the *Amazon SDK for Ruby API Reference*.

Global settings through `Aws.config`

To set service-agnostic settings through `Aws.config`, use the following syntax:

```
Aws.config[:<global setting name>] = <value>
```

These settings are merged into any created service clients.

Example of a global setting:

```
Aws.config[:region] = 'us-west-2'
```

If you try to use a setting name that is not globally supported, an error is raised when you attempt to create an instance of a type of service that doesn't support it. If this happens, use service-specific syntax instead.

Service-specific settings through `Aws.config`

To set service-specific settings through `Aws.config`, use the following syntax:

```
Aws.config[:<service identifier>] = { <global setting name>: <value> }
```

These settings are merged into all created service clients of that service type.

Example of a setting that only applies to Amazon S3:

```
Aws.config[:s3] = { force_path_style: true }
```

The *<service identifier>* can be identified by looking at the name of the corresponding Amazon SDK for Ruby gem name, and using the suffix that follows "aws-sdk-". For example:

- For aws-sdk-s3, the service identifier string is "s3".
- For aws-sdk-ecs, the service identifer string is "ecs".

Setting the Amazon Web Services Region for the Amazon SDK for Ruby

You can access Amazon Web Services services that operate in a specific geographic area by using Amazon Web Services Regions. This can be useful both for redundancy and to keep your data and applications running close to where you and your users access them.

> **Important**
>
> Most resources reside in a specific Amazon Web Services Region and you must supply the correct Region for the resource when using the SDK.

You must set a default Amazon Web Services Region for the SDK for Ruby to use for Amazon requests. This default is used for any SDK service method calls that aren't specified with a Region.

For more information on the region setting, see Amazon Web Services Region in the *Amazon SDKs and Tools Reference Guide*. This also includes examples on how to set the default region through the shared Amazon config file or environment variables.

Region search order for resolution

You need to set a Region when using most Amazon Web Services services. The Amazon SDK for Ruby searches for a Region in the following order:

1. Setting the Region in a client or resource object
2. Setting the Region by using `Aws.config`
3. Setting the Region by using environment variables
4. Setting the Region by using the shared `config` file

How to set the Region

This section describes different ways to set a Region, starting with the most common approach.

Setting the Region using the shared `config` file

Set the region by setting the `region` variable in the shared Amazon `config` file. For more information about the shared `config` file, see Shared config and credentials files in the *Amazon SDKs and Tools Reference Guide*.

Example of setting this value in the `config` file:

```
[default]
region = us-west-2
```

The shared `config` file is not checked if the environment variable `AWS_SDK_CONFIG_OPT_OUT` is set.

Setting the Region using environment variables

Set the Region by setting the `AWS_REGION` environment variable.

Use the `export` command to set this variable on Unix-based systems, such as Linux or macOS. The following example sets the Region to `us-west-2`.

```
export AWS_REGION=us-west-2
```

To set this variable on Windows, use the `set` command. The following example sets the Region to `us-west-2`.

```
set AWS_REGION=us-west-2
```

Setting the Region with `Aws.config`

Set the Region by adding a `region` value to the `Aws.config` hash. The following example updates the `Aws.config` hash to use the `us-west-1` Region.

```
Aws.config.update({region: 'us-west-1'})
```

Any clients or resources that you create later are bound to this Region.

Setting the Region in a client or resource object

Set the Region when you create an Amazon client or resource. The following example creates an Amazon S3 resource object in the `us-west-1` Region. Choose the correct Region for your Amazon resources. A service client object is immutable, so you must create a new client for each service to which you make requests and for making requests to the same service using a different configuration.

```
s3 = Aws::S3::Resource.new(region: 'us-west-1')
```

Using Amazon SDK for Ruby credential providers

All requests to Amazon must be cryptographically signed by using credentials issued by Amazon. At runtime, the SDK retrieves configuration values for credentials by checking several locations.

Authentication with Amazon can be handled outside of your codebase. Many authentication methods can be automatically detected, used, and refreshed by the SDK using the credential provider chain.

For guided options for getting started on Amazon authentication for your project, see Authentication and access in the *Amazon SDKs and Tools Reference Guide*.

Credential provider chain

All SDKs have a series of places (or sources) that they check in order to get valid credentials to use to make a request to an Amazon Web Services service. After valid credentials are found, the search is stopped. This systematic search is called the default credential provider chain.

> **Note**
>
> If you followed the recommended approach for new users to get started, you authenticated using login with console credentials during Authenticating with Amazon using Amazon SDK for Ruby. Other authentication methods are useful for different situations. To avoid security risks, we recommend always using short-term credentials. For other authentication method procedures, see Authentication and access in the *Amazon SDKs and Tools Reference Guide*.

For each step in the chain, there are different ways to set the values. Setting values directly in code always takes precedence, followed by setting as environment variables, and then in the shared Amazon `config` file.

The *Amazon SDKs and Tools Reference Guide* has information on SDK configuration settings used by all Amazon SDKs and the Amazon CLI. To learn more about how to configure the SDK through the shared Amazon `config` file, see Shared config and credentials files. To learn more about how to configure the SDK through setting environment variables, see Environment variables support.

To authenticate with Amazon, the Amazon SDK for Ruby checks the credential providers in the order listed in the following table.

Credential provider by precedence	***Amazon SDKs and Tools Reference Guide***	***Amazon SDK for Ruby API Reference***

Amazon access keys (temporary and long-term credentials)	Amazon access keys	`Aws::Credentials`
		
		`Aws::SharedCredentials`

Web identity token from Amazon Security Token Service (Amazon STS)	Assume role credential provider Using `role_arn`, `role_session_name` , and `web_identity_token_file`	`Aws::AssumeRoleWebIdentityCredentials`
Amazon IAM Identity Center. In this guide, see Authentic	IAM Identity Center credential provider	`Aws::SSOCredentials`

Credential provider by precedence	*Amazon SDKs and Tools Reference Guide*	*Amazon SDK for Ruby API Reference*
ating with Amazon using Amazon SDK for Ruby.		
Trusted entity provider (such as `AWS_ROLE_ARN`). In this guide, see Creating an Amazon STS access token.	Assume role credential provider Using `role_arn` and `role_session_name`	`Aws::AssumeRoleCredentials`
Login credential provider	Login credential provider	`Aws::LoginCredentials`
Process credential provider	Process credential provider	`Aws::ProcessCredentials`
Amazon Elastic Container Service (Amazon ECS) credentials	Container credential provider	`Aws::ECSCredentials`
Amazon Elastic Compute Cloud (Amazon EC2) instance profile credentials (IMDS credential provider)	IMDS credential provider	`Aws::InstanceProfileCredentials`

If the Amazon SDK for Ruby environment variable `AWS_SDK_CONFIG_OPT_OUT` is set, the shared Amazon `config` file, typically at `~/.aws/config`, will not be parsed for credentials.

Creating an Amazon STS access token

Assuming a role involves using a set of temporary security credentials that you can use to access Amazon resources that you might not normally have access to. These temporary credentials consist of an access key ID, a secret access key, and a security token. You can use the `Aws::AssumeRoleCredentials` method to create an Amazon Security Token Service (Amazon STS) access token.

The following example uses an access token to create an Amazon S3 client object, where `linked::account::arn` is the Amazon Resource Name (ARN) of the role to assume and `session-name` is an identifier for the assumed role session.

```
role_credentials = Aws::AssumeRoleCredentials.new(
  client: Aws::STS::Client.new,
  role_arn: "linked::account::arn",
  role_session_name: "session-name"
)

s3 = Aws::S3::Client.new(credentials: role_credentials)
```

For more information about setting `role_arn` or `role_session_name`, or about setting these using the shared Amazon `config` file instead, see Assume role credential provider in the *Amazon SDKs and Tools Reference Guide*.

Configuring retries in the Amazon SDK for Ruby

The Amazon SDK for Ruby provides a default retry behavior for service requests and customizable configuration options. Calls to Amazon Web Services services occasionally return unexpected exceptions. Certain types of errors, such as throttling or transient errors, might be successful if the call is retried.

Retry behavior can be configured globally using environment variables or settings in the shared Amazon `config` file. For information on this approach, see Retry behavior in the *Amazon SDKs and Tools Reference Guide*. It also includes detailed information on retry strategy implementations and how to choose one over another.

Alternatively, these options can also be configured in your code, as shown in the following sections.

Specifying client retry behavior in code

By default, the Amazon SDK for Ruby performs up to three retries, with 15 seconds between retries, for a total of up to four attempts. Therefore, an operation could take up to 60 seconds to time out.

The following example creates an Amazon S3 client in the region `us-west-2`, and specifies to wait five seconds between two retries on every client operation. Therefore, Amazon S3 client operations could take up to 15 seconds to time out.

```
 s3 = Aws::S3::Client.new(
   region: region,
   retry_limit: 2,
   retry_backoff: lambda { |c| sleep(5) }
)
```

Any explicit setting set in the code or on a service client itself takes precedence over those set in environment variables or the shared `config` file.

Configuring observability features in the Amazon SDK for Ruby

Observability is the extent to which a system's current state can be inferred from the data it emits. The data emitted is commonly referred to as telemetry. The Amazon SDK for Ruby can provide the traces as a telemetry signal. You can wire up a `TelemetryProvider` to collect and send telemetry data to an observability backend. The SDK currently supports OpenTelemetry (OTel) as a telemetry provider and OpenTelemetry has many ways to export your telemetry data, including using Amazon X-Ray or Amazon CloudWatch. For more information on OpenTelemetry exporters for Ruby, see Exporters on the OpenTelemetry website.

By default, the SDK will not record or emit any telemetry data. This topic explains how to configure and emit telemetry output.

Telemetry can be configured either for a specific service or globally. The SDK for Ruby supplies an OpenTelemetry provider. You can also define a custom telemetry provider of your choice.

Configuring an `OTelProvider` for a service client

The SDK for Ruby provides an OpenTelemetry provider called `OTelProvider`. The following example configures telemetry export using OpenTelemetry for the Amazon Simple Storage Service service client. For this simple example, the `OTEL_TRACES_EXPORTER` environment variable from OpenTelemetry is used to export the traces to the console output when you run the code. To learn more about `OTEL_TRACES_EXPORTER`, see Exporter Selection in the OpenTelemetry documentation.

```
require 'aws-sdk-s3'
require 'opentelemetry-sdk'
require 'opentelemetry-exporter-otlp'

ENV['OTEL_TRACES_EXPORTER'] ||= 'console'
```

```
OpenTelemetry::SDK.configure

otel_provider = Aws::Telemetry::OTelProvider.new
client = Aws::S3::Client.new(telemetry_provider: otel_provider)
client.list_buckets
```

The previous code example shows the steps to configuring trace output for a service client:

1. Require OpenTelemetry dependencies.
   a. `opentelemetry-sdk` for using `Aws::Telemetry::OTelProvider`.
   b. `opentelemetry-exporter-otlp` for exporting telemetry data.
2. Call `OpenTelemetry::SDK.configure` to set up the OpenTelemetry SDK with their configuration defaults.
3. Using SDK for Ruby's OpenTelemetry provider, create an instance of the `OTelProvider` to pass as a configuration option to the service client that you want to trace.

   ```
   otel_provider = Aws::Telemetry::OTelProvider.new
   client = Aws::S3::Client.new(telemetry_provider: otel_provider)
   ```

Using these steps, any methods that are called on that service client will emit trace data.

An example of the trace output generated from the call to Amazon S3's `list_buckets` method is as follows:

Example OpenTelemetry trace output

```
#<struct OpenTelemetry::SDK::Trace::SpanData
 name="Handler.NetHttp",
 kind=:internal,
 status=#<OpenTelemetry::Trace::Status:0x000000011da17bd8 @code=1, @description="">,
 parent_span_id="\xBFb\xC9\xFD\xA6F!\xE1",
 total_recorded_attributes=7,
 total_recorded_events=0,
 total_recorded_links=0,
 start_timestamp=1736190567061767000,
 end_timestamp=1736190567317160000,
 attributes=
  {"http.method"=>"GET",
   "net.protocol.name"=>"http",
   "net.protocol.version"=>"1.1",
```

```
    "net.peer.name"=>"s3.amazonaws.com",

tracestate=#<OpenTelemetry::Trace::Tracestate:0x000000011d990638 @hash={}>>
```

The previous trace output has two spans of data. Each trace entry provides additional metadata about the event in one or more attributes.

Configuring an `OTelProvider` for all service clients

Instead of turning on telemetry for a specific service client like the previous section explained, you have the option to turn on telemetry globally.

To emit telemetry data for **all** Amazon service clients, you can set the telemetry provider on the `Aws.config` prior to creating service clients.

```
otel_provider = Aws::Telemetry::OTelProvider.new
Aws.config[:telemetry_provider] = otel_provider
```

With this configuration, any service clients created afterwards will automatically emit telemetry. To learn more about using `Aws.config` to set global settings, see `Aws.config`.

Configuring a custom telemetry provider

If you don't want to use OpenTelemetry as your telemetry provider, the Amazon SDK for Ruby does support you implementing a custom provider. It might be helpful to use the `OTelProvider` implementation that is available in the Amazon SDK for Ruby GitHub repository as an example. For additional context, refer to the notes in `Module: Aws::Telemetry` in the *Amazon SDK for Ruby API Reference*.

Span Attributes

Traces are the output of telemetry. Traces consist of one or more spans. Spans have attributes that include additional metadata that is automatically included when appropriate for the method call. The following is a list of the attributes supported by the SDK for Ruby, where:

- Attribute Name - the name used to label the data appearing in the trace.
- Type - the data type of the value.
- Description - a description of what the value represents.

Attribute Name	Type	Description
`error`	Boolean	True if the unit of work was unsuccessful. Otherwise, false.
`exception.message`	String	The exception or error message.
`exception.stacktrace`	String	A stacktrace as provided by the language runtime if available.
`exception.type`	String	The type (fully qualified name) of the exception or error.
`rpc.system`	String	The remote system identifier set to '`aws-api`'.
`rpc.method`	String	The name of the operation being invoked.
`rpc.service`	String	The name of the remote service.
`aws.request_id`	String	The Amazon request ID returned in the response

		headers, per HTTP attempt. The latest request ID is used when possible.
`code.function`	String	The method or function name.
`code.namespace`	String	The namespace within which `code.function` is defined.
`http.status_code`	Long	The HTTP response status code.
`http.request_content_length`	Long	The size of the request payload body in bytes.
`http.response_content_length`	Long	The size of the response payload body in bytes.
`http.method`	String	The HTTP request method.
`net.protocol.name`	String	The name of the application layer protocol.
`net.protocol.version`	String	The version of the application layer protocol (e.g. 1.0, 1.1, 2.0).
`net.peer.name`	String	The logical remote hostname.
`net.peer.port`	String	The logical remote port number.

Tip

OpenTelemetry-Ruby has additional implementations that are integrated with SDK for Ruby's existing Telemetry support. For more information, see OpenTelemetry Amazon-SDK Instrumentation in the `open-telemetry` GitHub repository.

Configuring HTTP-level settings within the Amazon SDK for Ruby

Setting a nonstandard endpoint

The region is used to construct an SSL endpoint to use for Amazon requests. If you need to use a nonstandard endpoint in the Region you've selected, add an `endpoint` entry to `Aws.config`. Alternatively, set the `endpoint:` when creating a service client or resource object. The following example creates an Amazon S3 resource object in the `other_endpoint` endpoint.

```
s3 = Aws::S3::Resource.new(endpoint: other_endpoint)
```

To use an endpoint of your choosing for API requests and to have that choice persist, see the Service-specific endpoints configuration option in the *Amazon SDKs and Tools Reference Guide*.

Using the Amazon SDK for Ruby

This section provides information about developing software with the Amazon SDK for Ruby, including how to use some of the SDK's advanced features.

The Amazon SDKs and Tools Reference Guide also contains settings, features, and other foundational concepts common among many of the Amazon SDKs.

Topics

Making Amazon Web Services service requests using the Amazon SDK for Ruby

To programmatically access Amazon Web Services services, SDKs use a client class for each Amazon Web Services service. For example, if your application needs to access Amazon EC2, your application creates an Amazon EC2 client object to interface with that service. You then use the service client to make requests to that Amazon Web Services service.

To make a request to an Amazon Web Services service, you must first create and configure a service client. For each Amazon Web Services service your code uses, it has its own gem and its own dedicated type for interacting with it. The client exposes one method for each API operation exposed by the service.

Each service client requires an Amazon Web Services Region and a credential provider. The SDK uses these values to send requests to the correct Region for your resources and to sign requests with the correct credentials. You can specify these values programmatically in code or have them automatically loaded from the environment.

- When instantiating a client class, Amazon credentials must be supplied. For the order that the SDK checks for authentication providers, see Credential provider chain.

- The SDK has a series of places (or sources) that it checks in order to find a value for configuration settings. For details, see Precedence of settings.

The SDK for Ruby includes client classes that provide interfaces to the Amazon Web Services services. Each client class supports a particular Amazon Web Services service and follows the convention `Aws::<service identifier>::Client`. For example, `Aws::S3::Client` provides an interface to the Amazon Simple Storage Service service, and `Aws::SQS::Client` provides an interface to the Amazon Simple Queue Service service.

All client classes for all Amazon Web Services services are thread-safe.

You can pass configuration options directly to Client and Resource constructors. These options take precedence over the environment and `Aws.config` defaults.

```
# using a credentials object
ec2 = Aws::EC2::Client.new(region: 'us-west-2', credentials: credentials)
```

Using the Amazon SDK for Ruby REPL utility

The `aws-sdk` gem includes a Read-Eval-Print-Loop (REPL) interactive command-line interface where you can test the SDK for Ruby and immediately see the results. SDK for Ruby gems are available at RubyGems.org.

Prerequisites

- Installing the Amazon SDK for Ruby.
- The `aws-v3.rb` is located in the `aws-sdk-resources` gem. The `aws-sdk-resources` gem is also included by the main `aws-sdk` gem.
- You will need an xml library, such as the `rexml` gem.
- Although the program does work with the Interactive Ruby Shell (`irb`), we recommend that you install the `pry` gem, which provides a more powerful REPL environment.

Bundler setup

If you use Bundler, the following updates to your `Gemfile` will address the prerequisite gems:

1. Open your `Gemfile` that you created when you installed the Amazon SDK for Ruby. Add the following lines to the file:

```
gem "aws-sdk"
gem "rexml"
gem "pry"
```

2. Save the Gemfile.
3. Install the dependencies specified in your `Gemfile`:

```
$ bundle install
```

Running REPL

You can access the REPL by running `aws-v3.rb` from the command line.

```
aws-v3.rb
```

Alternatively, you can enable HTTP wire logging by setting the verbose flag. HTTP wire logging provides information about the communication between the Amazon SDK for Ruby and Amazon. Note, the verbose flag also adds overhead that can make your code run slower.

```
aws-v3.rb -v
```

The SDK for Ruby includes client classes that provide interfaces to the Amazon Web Services services. Each client class supports a particular Amazon Web Services service. In the REPL, every service class has a helper that returns a new client object for interacting with that service. The name of the helper will be the name of the service converted to lower case. For example, the names of the Amazon S3 and Amazon EC2 helper objects are `s3` and `ec2`, respectively. To list the Amazon S3 buckets in your account, you can enter `s3.list_buckets` into the prompt.

You can type `quit` into the REPL prompt to exit.

Using the Amazon SDK for Ruby with Ruby on Rails

Ruby on Rails provides a web development framework that makes it easy to create websites with Ruby.

Amazon provides the `aws-sdk-rails` gem to enable easy integration with Rails. You can use Amazon Elastic Beanstalk, Amazon OpsWorks, Amazon CodeDeploy, or the Amazon Rails Provisioner to deploy and run your Rails applications in the Amazon Cloud.

For information on installing and using the `aws-sdk-rails` gem, see the GitHub repository https://github.com/aws/aws-sdk-rails.

Debugging using wire trace information from an Amazon SDK for Ruby client

You can get wire trace information from an Amazon client by setting the `http_wire_trace` Boolean. Wire trace information helps differentiate client changes, service issues, and user errors. When `true`, the setting shows what is being sent on the wire. The following example creates an Amazon S3 client with wire tracing enabled at the time of client creation.

```
s3 = Aws::S3::Client.new(http_wire_trace: true)
```

Given the following code and the argument `bucket_name`, the output displays a message that says whether a bucket with that name exists.

```
require 'aws-sdk-s3'

s3 = Aws::S3::Resource.new(client: Aws::S3::Client.new(http_wire_trace: true))

if s3.bucket(ARGV[0]).exists?
  puts "Bucket #{ARGV[0]} exists"
else
  puts "Bucket #{ARGV[0]} does not exist"
end
```

If the bucket exists, the output is similar to the following. (Returns were added to the HEAD line for readability.)

```
opening connection to bucket_name.s3-us-west-1.amazonaws.com:443...
```

```
opened
starting SSL for bucket_name.s3-us-west-1.amazonaws.com:443...
SSL established, protocol: TLSv1.2, cipher: ECDHE-RSA-AES128-GCM-SHA256
-> "HEAD / HTTP/1.1
    Accept-Encoding:
    User-Agent: aws-sdk-ruby3/3.171.0 ruby/3.2.2 x86_64-linux aws-sdk-s3/1.120.0
    Host: bucket_name.s3-us-west-1.amazonaws.com
    X-Amz-Date: 20230427T143146Z
/* omitted */
Accept: */*\r\n\r\n"
-> "HTTP/1.1 200 OK\r\n"
-> "x-amz-id-2: XxB2J+kpHgTjmMUwpkUI1EjaFSPxAjWRgkn/+z7YwWc/
iAX5E3OXRBzJ37cfc8T4D7ELC1KFELM=\r\n"
-> "x-amz-request-id: 5MD4APQQS815QVBR\r\n"
-> "Date: Thu, 27 Apr 2023 14:31:47 GMT\r\n"
-> "x-amz-bucket-region: us-east-1\r\n"
-> "x-amz-access-point-alias: false\r\n"
-> "Content-Type: application/xml\r\n"
-> "Server: AmazonS3\r\n"
-> "\r\n"
Conn keep-alive
Bucket bucket_name exists
```

You can also turn on wire tracing after client creation.

```
s3 = Aws::S3::Client.new
s3.config.http_wire_trace = true
```

For more information on the fields in the wire trace information reported, see Transfer Family required request headers.

Adding testing with stubbing to your Amazon SDK for Ruby application

Learn how to stub client responses and client errors in an Amazon SDK for Ruby application.

Stubbing client responses

When you stub a response, the Amazon SDK for Ruby disables network traffic and the client returns stubbed (or fake) data. If you don't supply stubbed data, the client returns:

- Lists as empty arrays
- Maps as empty hashes
- Numeric values as zero
- Dates as now

The following example returns stubbed names for the list of Amazon S3 buckets.

```
require 'aws-sdk'

s3 = Aws::S3::Client.new(stub_responses: true)

bucket_data = s3.stub_data(:list_buckets, :buckets => [{name:'aws-sdk'}, {name:'aws-
sdk2'}])
s3.stub_responses(:list_buckets, bucket_data)
bucket_names = s3.list_buckets.buckets.map(&:name)

# List each bucket by name
bucket_names.each do |name|
  puts name
end
```

Running this code displays the following.

```
aws-sdk
aws-sdk2
```

Note

After you supply any stubbed data, the default values no longer apply for any remaining instance attributes. This means that in the previous example, the remaining instance attribute, `creation_date`, is not now but `nil`.

The Amazon SDK for Ruby validates your stubbed data. If you pass in data of the wrong type, it raises an `ArgumentError` exception. For example, if instead of the previous assignment to `bucket_data`, you used the following:

```
bucket_data = s3.stub_data(:list_buckets, buckets:['aws-sdk', 'aws-sdk2'])
```

The Amazon SDK for Ruby raises two `ArgumentError` exceptions.

```
expected params[:buckets][0] to be a hash
expected params[:buckets][1] to be a hash
```

Stubbing client errors

You can also stub errors that the Amazon SDK for Ruby raises for specific methods. The following example displays `Caught Timeout::Error error calling head_bucket on aws-sdk`.

```
require 'aws-sdk'

s3 = Aws::S3::Client.new(stub_responses: true)
s3.stub_responses(:head_bucket, Timeout::Error)

begin
  s3.head_bucket({bucket: 'aws-sdk'})
rescue Exception => ex
  puts "Caught #{ex.class} error calling 'head_bucket' on 'aws-sdk'"
end
```

Using paginated results in the Amazon SDK for Ruby

Many Amazon operations return truncated results when the payload is too large to return in a single response. Instead, the service returns a portion of the data and a token to retrieve the next set of items. This pattern is known as pagination.

Paged responses are enumerable

The simplest way to handle paged response data is to use the built-in enumerator in the response object, as shown in the following example.

```
s3 = Aws::S3::Client.new

s3.list_objects(bucket:'aws-sdk').each do |response|
  puts response.contents.map(&:key)
end
```

This yields one response object per API call made, and enumerates objects in the named bucket. The SDK retrieves additional pages of data to complete the request.

Handling paged responses manually

To handle paging yourself, use the response's `next_page?` method to verify there are more pages to retrieve, or use the `last_page?` method to verify there are no more pages to retrieve.

If there are more pages, use the `next_page` (notice there is no ?) method to retrieve the next page of results, as shown in the following example.

```
s3 = Aws::S3::Client.new

# Get the first page of data
response = s3.list_objects(bucket:'aws-sdk')

# Get additional pages
while response.next_page? do
  response = response.next_page
  # Use the response data here...
end
```

> **Note**
>
> If you call the `next_page` method and there are no more pages to retrieve, the SDK raises an Aws::PageableResponse::LastPageError exception.

Paged data classes

Paged data in the Amazon SDK for Ruby is handled by the Aws::PageableResponse class, which is included with Seahorse::Client::Response to provide access to paged data.

Using waiters in the Amazon SDK for Ruby

Waiters are utility methods that poll for a particular state to occur on a client. Waiters can fail after a number of attempts at a polling interval defined for the service client. For an example of how a waiter is used, see the create_table method of the Amazon DynamoDB Encryption Client in the Amazon Code Examples Repository.

Invoking a waiter

To invoke a waiter, call `wait_until` on a service client. In the following example, a waiter waits until the instance `i-12345678` is running before continuing.

```
ec2 = Aws::EC2::Client.new

begin
  ec2.wait_until(:instance_running, instance_ids:['i-12345678'])
  puts "instance running"
rescue Aws::Waiters::Errors::WaiterFailed => error
  puts "failed waiting for instance running: #{error.message}"
end
```

The first parameter is the waiter name, which is specific to the service client and indicates which operation is being waited for. The second parameter is a hash of parameters that are passed to the client method called by the waiter, which varies according to the waiter name.

For a list of operations that can be waited for and the client methods called for each operation, see the `waiter_names` and `wait_until` field documentation for the client you are using.

Wait failures

Waiters can fail with any of the following exceptions.

Aws::Waiters::Errors::FailureStateError

A failure state was encountered while waiting.

Aws::Waiters::Errors::NoSuchWaiterError

The specified waiter name is not defined for the client being used.

Aws::Waiters::Errors::TooManyAttemptsError

The number of attempts exceeded the waiter's `max_attempts` value.

Aws::Waiters::Errors::UnexpectedError

An unexpected error occurred while waiting.

Aws::Waiters::Errors::WaiterFailed

One of the wait states was exceeded or another failure occurred while waiting.

All of these errors—except `NoSuchWaiterError`—are based on `WaiterFailed`. To catch errors in a waiter, use `WaiterFailed`, as shown in the following example.

```
rescue Aws::Waiters::Errors::WaiterFailed => error
  puts "failed waiting for instance running: #{error.message}"
end
```

Configuring a waiter

Each waiter has a default polling interval and a maximum number of attempts it will make before returning control to your program. To set these values, use the `max_attempts` and `delay:` parameters in your `wait_until` call. The following example waits for up to 25 seconds, polling every five seconds.

```
# Poll for ~25 seconds
client.wait_until(...) do |w|
  w.max_attempts = 5
  w.delay = 5
end
```

To disable wait failures, set the value of either of these parameters to `nil`.

Extending a waiter

To modify the behavior of waiters, you can register callbacks that are triggered before each polling attempt and before waiting.

The following example implements an exponential backoff in a waiter by doubling the amount of time to wait on every attempt.

```
ec2 = Aws::EC2::Client.new

ec2.wait_until(:instance_running, instance_ids:['i-12345678']) do |w|
  w.interval = 0 # disable normal sleep
  w.before_wait do |n, resp|
    sleep(n ** 2)
  end
end
```

The following example disables the maximum number of attempts, and instead waits for one hour (3600 seconds) before failing.

```
started_at = Time.now
client.wait_until(...) do |w|
  # Disable max attempts
  w.max_attempts = nil

  # Poll for one hour, instead of a number of attempts
  w.before_wait do |attempts, response|
    throw :failure if Time.now - started_at > 3600
  end
end
```

SDK for Ruby code examples

The code examples in this topic show you how to use the Amazon SDK for Ruby with Amazon.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other Amazon Web Services services.

Some services contain additional example categories that show how to leverage libraries or functions specific to the service.

Aurora examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Aurora.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Get started

Get started

Hello Aurora

The following code example shows how to get started using Aurora.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-rds'
```

```
# Creates an Amazon RDS client for the AWS Region
rds = Aws::RDS::Client.new

puts 'Listing clusters in this AWS account...'

# Calls the describe_db_clusters method to get information about clusters
resp = rds.describe_db_clusters(max_records: 20)

# Checks if any clusters are found and prints the appropriate message
if resp.db_clusters.empty?
  puts 'No clusters found!'
else
  # Loops through the array of cluster objects and prints the cluster identifier
  resp.db_clusters.each do |cluster|
    puts "Cluster identifier: #{cluster.db_cluster_identifier}"
  end
end
```

- For API details, see DescribeDBClusters in *Amazon SDK for Ruby API Reference*.

Auto Scaling examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Auto Scaling.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Auto Scaling

The following code example shows how to get started using Auto Scaling.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-autoscaling'
require 'logger'

# AutoScalingManager is a class responsible for managing AWS Auto Scaling operations
# such as listing all Auto Scaling groups in the current AWS account.
class AutoScalingManager
  def initialize(client)
    @client = client
    @logger = Logger.new($stdout)
  end

  # Gets and prints a list of Auto Scaling groups for the account.
  def list_auto_scaling_groups
    paginator = @client.describe_auto_scaling_groups
    auto_scaling_groups = []
    paginator.each_page do |page|
      auto_scaling_groups.concat(page.auto_scaling_groups)
    end

    if auto_scaling_groups.empty?
      @logger.info('No Auto Scaling groups found for this account.')
    else
      auto_scaling_groups.each do |group|
        @logger.info("Auto Scaling group name: #{group.auto_scaling_group_name}")
        @logger.info("  Group ARN:             #{group.auto_scaling_group_arn}")
        @logger.info("  Min/max/desired:       #{group.min_size}/#{group.max_size}/
#{group.desired_capacity}")
        @logger.info("\n")
      end
    end
  end
end
```

```
if $PROGRAM_NAME == __FILE__
  autoscaling_client = Aws::AutoScaling::Client.new
  manager = AutoScalingManager.new(autoscaling_client)
  manager.list_auto_scaling_groups
end
```

- For API details, see DescribeAutoScalingGroups in *Amazon SDK for Ruby API Reference*.

CloudTrail examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with CloudTrail.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Amazon Cognito Identity Provider examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Amazon Cognito Identity Provider.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Get started

Hello Amazon Cognito

The following code example shows how to get started using Amazon Cognito.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-cognitoidentityprovider'
require 'logger'

# CognitoManager is a class responsible for managing AWS Cognito operations
# such as listing all user pools in the current AWS account.
class CognitoManager
  def initialize(client)
    @client = client
    @logger = Logger.new($stdout)
  end

  # Lists and prints all user pools associated with the AWS account.
  def list_user_pools
```

```
    paginator = @client.list_user_pools(max_results: 10)
    user_pools = []
    paginator.each_page do |page|
      user_pools.concat(page.user_pools)
    end

    if user_pools.empty?
      @logger.info('No Cognito user pools found.')
    else
      user_pools.each do |user_pool|
        @logger.info("User pool ID: #{user_pool.id}")
        @logger.info("User pool name: #{user_pool.name}")
        @logger.info("User pool status: #{user_pool.status}")
        @logger.info('---')
      end
    end
  end
end

if $PROGRAM_NAME == __FILE__
  cognito_client = Aws::CognitoIdentityProvider::Client.new
  manager = CognitoManager.new(cognito_client)
  manager.list_user_pools
end
```

- For API details, see ListUserPools in *Amazon SDK for Ruby API Reference*.

Amazon Comprehend examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Amazon Comprehend.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other Amazon Web Services services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Scenarios

Scenarios

Create an application to analyze customer feedback

The following code example shows how to create an application that analyzes customer comment cards, translates them from their original language, determines their sentiment, and generates an audio file from the translated text.

SDK for Ruby

This example application analyzes and stores customer feedback cards. Specifically, it fulfills the need of a fictitious hotel in New York City. The hotel receives feedback from guests in various languages in the form of physical comment cards. That feedback is uploaded into the app through a web client. After an image of a comment card is uploaded, the following steps occur:

- Text is extracted from the image using Amazon Textract.
- Amazon Comprehend determines the sentiment of the extracted text and its language.
- The extracted text is translated to English using Amazon Translate.
- Amazon Polly synthesizes an audio file from the extracted text.

The full app can be deployed with the Amazon CDK. For source code and deployment instructions, see the project in GitHub.

Services used in this example

- Amazon Comprehend
- Lambda
- Amazon Polly
- Amazon Textract
- Amazon Translate

Amazon DocumentDB examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Amazon DocumentDB.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Serverless examples

Invoke a Lambda function from a Amazon DocumentDB trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving records from a DocumentDB change stream. The function retrieves the DocumentDB payload and logs the record contents.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming a Amazon DocumentDB event with Lambda using Ruby.

```
require 'json'

def lambda_handler(event:, context:)
  event['events'].each do |record|
    log_document_db_event(record)
  end
  'OK'
end

def log_document_db_event(record)
  event_data = record['event'] || {}
  operation_type = event_data['operationType'] || 'Unknown'
  db = event_data.dig('ns', 'db') || 'Unknown'
  collection = event_data.dig('ns', 'coll') || 'Unknown'
  full_document = event_data['fullDocument'] || {}

  puts "Operation type: #{operation_type}"
  puts "db: #{db}"
  puts "collection: #{collection}"
  puts "Full document: #{JSON.pretty_generate(full_document)}"
```

```
end
```

DynamoDB examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with DynamoDB.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other Amazon Web Services services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Get started

Hello DynamoDB

The following code example shows how to get started using DynamoDB.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-dynamodb'
require 'logger'

# DynamoDBManager is a class responsible for managing DynamoDB operations
# such as listing all tables in the current AWS account.
class DynamoDBManager
  def initialize(client)
    @client = client
    @logger = Logger.new($stdout)
  end

  # Lists and prints all DynamoDB tables in the current AWS account.
  def list_tables
    @logger.info('Here are the DynamoDB tables in your account:')

    paginator = @client.list_tables(limit: 10)
    table_names = []

    paginator.each_page do |page|
      page.table_names.each do |table_name|
        @logger.info("- #{table_name}")
        table_names << table_name
      end
    end

    if table_names.empty?
      @logger.info("You don't have any DynamoDB tables in your account.")
    else
      @logger.info("\nFound #{table_names.length} tables.")
    end
  end
end

if $PROGRAM_NAME == __FILE__
  dynamodb_client = Aws::DynamoDB::Client.new
  manager = DynamoDBManager.new(dynamodb_client)
  manager.list_tables
end
```

- For API details, see ListTables in *Amazon SDK for Ruby API Reference*.

Basics

Learn the basics

The following code example shows how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table, then delete the table.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Create a class that encapsulates a DynamoDB table.

```
# Creates an Amazon DynamoDB table that can be used to store movie data.
# The table uses the release year of the movie as the partition key and the
# title as the sort key.
#
# @param table_name [String] The name of the table to create.
# @return [Aws::DynamoDB::Table] The newly created table.
def create_table(table_name)
  @table = @dynamo_resource.create_table(
    table_name: table_name,
    key_schema: [
      { attribute_name: 'year', key_type: 'HASH' }, # Partition key
      { attribute_name: 'title', key_type: 'RANGE' } # Sort key
    ],
    attribute_definitions: [
      { attribute_name: 'year', attribute_type: 'N' },
      { attribute_name: 'title', attribute_type: 'S' }
```

```
      ],
      billing_mode: 'PAY_PER_REQUEST'
    )
    @dynamo_resource.client.wait_until(:table_exists, table_name: table_name)
    @table
  rescue Aws::DynamoDB::Errors::ServiceError => e
    @logger.error("Failed create table #{table_name}:\n#{e.code}: #{e.message}")
    raise
  end
```

Create a helper function to download and extract the sample JSON file.

```
  # Gets sample movie data, either from a local file or by first downloading it from
  # the Amazon DynamoDB Developer Guide.
  #
  # @param movie_file_name [String] The local file name where the movie data is
 stored in JSON format.
  # @return [Hash] The movie data as a Hash.
  def fetch_movie_data(movie_file_name)
    if !File.file?(movie_file_name)
      @logger.debug("Downloading #{movie_file_name}...")
      movie_content = URI.open(
        'https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/samples/
moviedata.zip'
      )
      movie_json = ''
      Zip::File.open_buffer(movie_content) do |zip|
        zip.each do |entry|
          movie_json = entry.get_input_stream.read
        end
      end
    else
      movie_json = File.read(movie_file_name)
    end
    movie_data = JSON.parse(movie_json)
    # The sample file lists over 4000 movies. This returns only the first 250.
    movie_data.slice(0, 250)
  rescue StandardError => e
    puts("Failure downloading movie data:\n#{e}")
    raise
  end
```

Run an interactive scenario to create the table and perform actions on it.

```
 table_name = "doc-example-table-movies-#{rand(10**4)}"
 scaffold = Scaffold.new(table_name)
 dynamodb_wrapper = DynamoDBBasics.new(table_name)

 new_step(1, 'Create a new DynamoDB table if none already exists.')

Actions

`BatchExecuteStatement`

The following code example shows how to use `BatchExecuteStatement`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Read a batch of items using PartiQL.

```
class DynamoDBPartiQLBatch
  attr_reader :dynamo_resource, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamodb = Aws::DynamoDB::Resource.new(client: client)
    @table = @dynamodb.table(table_name)
  end

  # Selects a batch of items from a table using PartiQL
  #
  # @param batch_titles [Array] Collection of movie titles
  # @return [Aws::DynamoDB::Types::BatchExecuteStatementOutput]
  def batch_execute_select(batch_titles)
    request_items = batch_titles.map do |title, year|
      {
        statement: "SELECT * FROM \"#{@table.name}\" WHERE title=? and year=?",
        parameters: [title, year]
      }
    end
    @dynamodb.client.batch_execute_statement({ statements: request_items })
  end
```

Delete a batch of items using PartiQL.

```
class DynamoDBPartiQLBatch
  attr_reader :dynamo_resource, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamodb = Aws::DynamoDB::Resource.new(client: client)
    @table = @dynamodb.table(table_name)
  end

  # Deletes a batch of items from a table using PartiQL
  #
  # @param batch_titles [Array] Collection of movie titles
  # @return [Aws::DynamoDB::Types::BatchExecuteStatementOutput]
  def batch_execute_write(batch_titles)
    request_items = batch_titles.map do |title, year|
      {
        statement: "DELETE FROM \"#{@table.name}\" WHERE title=? and year=?",
        parameters: [title, year]
      }
    end
    @dynamodb.client.batch_execute_statement({ statements: request_items })
  end
```

- For API details, see BatchExecuteStatement in *Amazon SDK for Ruby API Reference*.

`BatchWriteItem`

The following code example shows how to use `BatchWriteItem`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class DynamoDBBasics
  attr_reader :dynamo_resource, :table
```

```
 def initialize(table_name)
   client = Aws::DynamoDB::Client.new(region: 'us-east-1')
   @dynamo_resource = Aws::DynamoDB::Resource.new(client: client)
   @table = @dynamo_resource.table(table_name)
 end

 # Fills an Amazon DynamoDB table with the specified data. Items are sent in
 # batches of 25 until all items are written.
 #
 # @param movies [Enumerable] The data to put in the table. Each item must contain
at least
 #                            the keys required by the schema that was specified
when the
 #                            table was created.
 def write_batch(movies)
   index = 0
   slice_size = 25
   while index < movies.length
     movie_items = []
     movies[index, slice_size].each do |movie|
       movie_items.append({ put_request: { item: movie } })
     end
     @dynamo_resource.client.batch_write_item({ request_items: { @table.name =>
movie_items } })
     index += slice_size
   end
 rescue Aws::DynamoDB::Errors::ServiceError => e
   puts(
     "Couldn't load data into table #{@table.name}. Here's why:"
   )
   puts("\t#{e.code}: #{e.message}")
   raise
 end
```

- For API details, see BatchWriteItem in *Amazon SDK for Ruby API Reference*.

`CreateTable`

The following code example shows how to use `CreateTable`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
# Encapsulates an Amazon DynamoDB table of movie data.
class Scaffold
  attr_reader :dynamo_resource, :table_name, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamo_resource = Aws::DynamoDB::Resource.new(client: client)
    @table_name = table_name
    @table = nil
    @logger = Logger.new($stdout)
    @logger.level = Logger::DEBUG
  end

  # Creates an Amazon DynamoDB table that can be used to store movie data.
  # The table uses the release year of the movie as the partition key and the
  # title as the sort key.
  #
  # @param table_name [String] The name of the table to create.
  # @return [Aws::DynamoDB::Table] The newly created table.
  def create_table(table_name)
    @table = @dynamo_resource.create_table(
      table_name: table_name,
      key_schema: [
        { attribute_name: 'year', key_type: 'HASH' }, # Partition key
        { attribute_name: 'title', key_type: 'RANGE' } # Sort key
      ],
      attribute_definitions: [
        { attribute_name: 'year', attribute_type: 'N' },
        { attribute_name: 'title', attribute_type: 'S' }
      ],
      billing_mode: 'PAY_PER_REQUEST'
    )
    @dynamo_resource.client.wait_until(:table_exists, table_name: table_name)
    @table
```

```
  rescue Aws::DynamoDB::Errors::ServiceError => e
    @logger.error("Failed create table #{table_name}:\n#{e.code}: #{e.message}")
    raise
  end
```

- For API details, see CreateTable in *Amazon SDK for Ruby API Reference*.

`DeleteItem`

The following code example shows how to use `DeleteItem`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class DynamoDBBasics
  attr_reader :dynamo_resource, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamo_resource = Aws::DynamoDB::Resource.new(client: client)
    @table = @dynamo_resource.table(table_name)
  end

  # Deletes a movie from the table.
  #
  # @param title [String] The title of the movie to delete.
  # @param year [Integer] The release year of the movie to delete.
  def delete_item(title, year)
    @table.delete_item(key: { 'year' => year, 'title' => title })
  rescue Aws::DynamoDB::Errors::ServiceError => e
    puts("Couldn't delete movie #{title}. Here's why:")
    puts("\t#{e.code}: #{e.message}")
    raise
  end
```

- For API details, see DeleteItem in *Amazon SDK for Ruby API Reference*.

`DeleteTable`

The following code example shows how to use `DeleteTable`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
# Encapsulates an Amazon DynamoDB table of movie data.
class Scaffold
  attr_reader :dynamo_resource, :table_name, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamo_resource = Aws::DynamoDB::Resource.new(client: client)
    @table_name = table_name
    @table = nil
    @logger = Logger.new($stdout)
    @logger.level = Logger::DEBUG
  end

  # Deletes the table.
  def delete_table
    @table.delete
    @table = nil
  rescue Aws::DynamoDB::Errors::ServiceError => e
    puts("Couldn't delete table. Here's why:")
    puts("\t#{e.code}: #{e.message}")
    raise
  end
```

- For API details, see DeleteTable in *Amazon SDK for Ruby API Reference*.

`DescribeTable`

The following code example shows how to use `DescribeTable`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
# Encapsulates an Amazon DynamoDB table of movie data.
class Scaffold
  attr_reader :dynamo_resource, :table_name, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamo_resource = Aws::DynamoDB::Resource.new(client: client)
    @table_name = table_name
    @table = nil
    @logger = Logger.new($stdout)
    @logger.level = Logger::DEBUG
  end

  # Determines whether a table exists. As a side effect, stores the table in
  # a member variable.
  #
  # @param table_name [String] The name of the table to check.
  # @return [Boolean] True when the table exists; otherwise, False.
  def exists?(table_name)
    @dynamo_resource.client.describe_table(table_name: table_name)
    @logger.debug("Table #{table_name} exists")
  rescue Aws::DynamoDB::Errors::ResourceNotFoundException
    @logger.debug("Table #{table_name} doesn't exist")
    false
  rescue Aws::DynamoDB::Errors::ServiceError => e
    puts("Couldn't check for existence of #{table_name}:\n")
    puts("\t#{e.code}: #{e.message}")
    raise
  end
```

- For API details, see DescribeTable in *Amazon SDK for Ruby API Reference*.

`ExecuteStatement`

The following code example shows how to use `ExecuteStatement`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Select a single item using PartiQL.

```
class DynamoDBPartiQLSingle
  attr_reader :dynamo_resource, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamodb = Aws::DynamoDB::Resource.new(client: client)
    @table = @dynamodb.table(table_name)
  end

  # Gets a single record from a table using PartiQL.
  # Note: To perform more fine-grained selects,
  # use the Client.query instance method instead.
  #
  # @param title [String] The title of the movie to search.
  # @return [Aws::DynamoDB::Types::ExecuteStatementOutput]
  def select_item_by_title(title)
    request = {
      statement: "SELECT * FROM \"#{@table.name}\" WHERE title=?",
      parameters: [title]
    }
    @dynamodb.client.execute_statement(request)
  end
```

Update a single item using PartiQL.

```
class DynamoDBPartiQLSingle
  attr_reader :dynamo_resource, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamodb = Aws::DynamoDB::Resource.new(client: client)
    @table = @dynamodb.table(table_name)
  end

  # Updates a single record from a table using PartiQL.
  #
  # @param title [String] The title of the movie to update.
  # @param year [Integer] The year the movie was released.
  # @param rating [Float] The new rating to assign the title.
  # @return [Aws::DynamoDB::Types::ExecuteStatementOutput]
  def update_rating_by_title(title, year, rating)
    request = {
      statement: "UPDATE \"#{@table.name}\" SET info.rating=? WHERE title=? and
 year=?",
      parameters: [{ "N": rating }, title, year]
    }
    @dynamodb.client.execute_statement(request)
  end
```

Add a single item using PartiQL.

```
class DynamoDBPartiQLSingle
  attr_reader :dynamo_resource, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamodb = Aws::DynamoDB::Resource.new(client: client)
    @table = @dynamodb.table(table_name)
  end

  # Adds a single record to a table using PartiQL.
  #
  # @param title [String] The title of the movie to update.
  # @param year [Integer] The year the movie was released.
  # @param plot [String] The plot of the movie.
  # @param rating [Float] The new rating to assign the title.
  # @return [Aws::DynamoDB::Types::ExecuteStatementOutput]
```

```
  def insert_item(title, year, plot, rating)
    request = {
      statement: "INSERT INTO \"#{@table.name}\" VALUE {'title': ?, 'year': ?,
 'info': ?}",
      parameters: [title, year, { 'plot': plot, 'rating': rating }]
    }
    @dynamodb.client.execute_statement(request)
  end
```

Delete a single item using PartiQL.

```
class DynamoDBPartiQLSingle
  attr_reader :dynamo_resource, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamodb = Aws::DynamoDB::Resource.new(client: client)
    @table = @dynamodb.table(table_name)
  end

  # Deletes a single record from a table using PartiQL.
  #
  # @param title [String] The title of the movie to update.
  # @param year [Integer] The year the movie was released.
  # @return [Aws::DynamoDB::Types::ExecuteStatementOutput]
  def delete_item_by_title(title, year)
    request = {
      statement: "DELETE FROM \"#{@table.name}\" WHERE title=? and year=?",
      parameters: [title, year]
    }
    @dynamodb.client.execute_statement(request)
  end
```

- For API details, see ExecuteStatement in *Amazon SDK for Ruby API Reference*.

`GetItem`

The following code example shows how to use `GetItem`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class DynamoDBBasics
  attr_reader :dynamo_resource, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamo_resource = Aws::DynamoDB::Resource.new(client: client)
    @table = @dynamo_resource.table(table_name)
  end

  # Gets movie data from the table for a specific movie.
  #
  # @param title [String] The title of the movie.
  # @param year [Integer] The release year of the movie.
  # @return [Hash] The data about the requested movie.
  def get_item(title, year)
    @table.get_item(key: { 'year' => year, 'title' => title })
  rescue Aws::DynamoDB::Errors::ServiceError => e
    puts("Couldn't get movie #{title} (#{year}) from table #{@table.name}:\n")
    puts("\t#{e.code}: #{e.message}")
    raise
  end
```

- For API details, see GetItem in *Amazon SDK for Ruby API Reference*.

`ListTables`

The following code example shows how to use `ListTables`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Determine whether a table exists.

```
# Encapsulates an Amazon DynamoDB table of movie data.
class Scaffold
  attr_reader :dynamo_resource, :table_name, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamo_resource = Aws::DynamoDB::Resource.new(client: client)
    @table_name = table_name
    @table = nil
    @logger = Logger.new($stdout)
    @logger.level = Logger::DEBUG
  end

  # Determines whether a table exists. As a side effect, stores the table in
  # a member variable.
  #
  # @param table_name [String] The name of the table to check.
  # @return [Boolean] True when the table exists; otherwise, False.

`PutItem`

The following code example shows how to use `PutItem`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class DynamoDBBasics
  attr_reader :dynamo_resource, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamo_resource = Aws::DynamoDB::Resource.new(client: client)
    @table = @dynamo_resource.table(table_name)
  end

  # Adds a movie to the table.
  #
  # @param movie [Hash] The title, year, plot, and rating of the movie.
  def add_item(movie)
    @table.put_item(
      item: {
        'year' => movie[:year],
        'title' => movie[:title],
        'info' => { 'plot' => movie[:plot], 'rating' => movie[:rating] }
      }
    )
  rescue Aws::DynamoDB::Errors::ServiceError => e
    puts("Couldn't add movie #{title} to table #{@table.name}. Here's why:")
    puts("\t#{e.code}: #{e.message}")
    raise
  end
```

- For API details, see PutItem in *Amazon SDK for Ruby API Reference*.

`Query`

The following code example shows how to use `Query`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class DynamoDBBasics
  attr_reader :dynamo_resource, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamo_resource = Aws::DynamoDB::Resource.new(client: client)
    @table = @dynamo_resource.table(table_name)
  end

  # Queries for movies that were released in the specified year.
  #
  # @param year [Integer] The year to query.
  # @return [Array] The list of movies that were released in the specified year.
  def query_items(year)
    response = @table.query(
      key_condition_expression: '#yr = :year',
      expression_attribute_names: { '#yr' => 'year' },
      expression_attribute_values: { ':year' => year }
    )
  rescue Aws::DynamoDB::Errors::ServiceError => e
    puts("Couldn't query for movies released in #{year}. Here's why:")
    puts("\t#{e.code}: #{e.message}")
    raise
  else
    response.items
  end
```

- For API details, see Query in *Amazon SDK for Ruby API Reference*.

Scan

The following code example shows how to use Scan.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class DynamoDBBasics
  attr_reader :dynamo_resource, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamo_resource = Aws::DynamoDB::Resource.new(client: client)
    @table = @dynamo_resource.table(table_name)
  end

  # Scans for movies that were released in a range of years.
  # Uses a projection expression to return a subset of data for each movie.
  #
  # @param year_range [Hash] The range of years to retrieve.
  # @return [Array] The list of movies released in the specified years.
  def scan_items(year_range)
    movies = []
    scan_hash = {
      filter_expression: '#yr between :start_yr and :end_yr',
      projection_expression: '#yr, title, info.rating',
      expression_attribute_names: { '#yr' => 'year' },
      expression_attribute_values: {
        ':start_yr' => year_range[:start], ':end_yr' => year_range[:end]
      }
    }

    raise
  else
    movies
  end
```

- For API details, see Scan in *Amazon SDK for Ruby API Reference*.

`UpdateItem`

The following code example shows how to use `UpdateItem`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class DynamoDBBasics
  attr_reader :dynamo_resource, :table

  def initialize(table_name)
    client = Aws::DynamoDB::Client.new(region: 'us-east-1')
    @dynamo_resource = Aws::DynamoDB::Resource.new(client: client)
    @table = @dynamo_resource.table(table_name)
  end

  # Updates rating and plot data for a movie in the table.
  #
  # @param movie [Hash] The title, year, plot, rating of the movie.
  def update_item(movie)
    response = @table.update_item(
      key: { 'year' => movie[:year], 'title' => movie[:title] },
      update_expression: 'set info.rating=:r',
      expression_attribute_values: { ':r' => movie[:rating] },
```

```
      return_values: 'UPDATED_NEW'
    )
  rescue Aws::DynamoDB::Errors::ServiceError => e
    puts("Couldn't update movie #{movie[:title]} (#{movie[:year]}) in table
#{@table.name}\n")
    puts("\t#{e.code}: #{e.message}")
    raise
  else
    response.attributes
  end
```

- For API details, see UpdateItem in *Amazon SDK for Ruby API Reference*.

Scenarios

Query a table by using batches of PartiQL statements

The following code example shows how to:

- Get a batch of items by running multiple SELECT statements.
- Add a batch of items by running multiple INSERT statements.
- Update a batch of items by running multiple UPDATE statements.
- Delete a batch of items by running multiple DELETE statements.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Run a scenario that creates a table and runs batch PartiQL queries.

```
table_name = "doc-example-table-movies-partiql-#{rand(10**4)}"
scaffold = Scaffold.new(table_name)
sdk = DynamoDBPartiQLBatch.new(table_name)
```

```
  new_step(1, 'Create a new DynamoDB table if none already exists.')
  unless scaffold.exists?(table_name)
    puts("\nNo such table: #{table_name}. Creating it...")
    scaffold.create_table(table_name)
    print "Done!\n".green
  end

  new_step(2, 'Populate DynamoDB table with movie data.')
  download_file = 'moviedata.json'
  puts("Downloading movie database to #{download_file}...")
  movie_data = scaffold.fetch_movie_data(download_file)
  puts("Writing movie data from #{download_file} into your table...")
  scaffold.write_batch(movie_data)
  puts("Records added: #{movie_data.length}.")
  print "Done!\n".green

  new_step(3, 'Select a batch of items from the movies table.')
  puts "Let's select some popular movies for side-by-side comparison."
  response = sdk.batch_execute_select([['Mean Girls', 2004], ['Goodfellas', 1977],
 ['The Prancing of the Lambs', 2005]])
  puts("Items selected: #{response['responses'].length}\n")
  print "\nDone!\n".green

  new_step(4, 'Delete a batch of items from the movies table.')
  sdk.batch_execute_write([['Mean Girls', 2004], ['Goodfellas', 1977], ['The
 Prancing of the Lambs', 2005]])
  print "\nDone!\n".green

  new_step(5, 'Delete the table.')
  return unless scaffold.exists?(table_name)

  scaffold.delete_table
end
```

- For API details, see BatchExecuteStatement in *Amazon SDK for Ruby API Reference*.

Query a table using PartiQL

The following code example shows how to:

- Get an item by running a SELECT statement.

- Add an item by running an INSERT statement.
- Update an item by running an UPDATE statement.
- Delete an item by running a DELETE statement.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Run a scenario that creates a table and runs PartiQL queries.

```
table_name = "doc-example-table-movies-partiql-#{rand(10**8)}"
scaffold = Scaffold.new(table_name)
sdk = DynamoDBPartiQLSingle.new(table_name)

new_step(1, 'Create a new DynamoDB table if none already exists.')
unless scaffold.exists?(table_name)
  puts("\nNo such table: #{table_name}. Creating it...")
  scaffold.create_table(table_name)
  print "Done!\n".green
end

new_step(2, 'Populate DynamoDB table with movie data.')
download_file = 'moviedata.json'
puts("Downloading movie database to #{download_file}...")
movie_data = scaffold.fetch_movie_data(download_file)
puts("Writing movie data from #{download_file} into your table...")
scaffold.write_batch(movie_data)
puts("Records added: #{movie_data.length}.")
print "Done!\n".green

new_step(3, 'Select a single item from the movies table.')
response = sdk.select_item_by_title('Star Wars')
puts("Items selected for title 'Star Wars': #{response.items.length}\n")
print response.items.first.to_s.yellow
print "\n\nDone!\n".green

new_step(4, 'Update a single item from the movies table.')
```

```
  puts "Let's correct the rating on The Big Lebowski to 10.0."
  sdk.update_rating_by_title('The Big Lebowski', 1998, 10.0)
  print "\nDone!\n".green

  new_step(5, 'Delete a single item from the movies table.')
  puts "Let's delete The Silence of the Lambs because it's just too scary."
  sdk.delete_item_by_title('The Silence of the Lambs', 1991)
  print "\nDone!\n".green

  new_step(6, 'Insert a new item into the movies table.')
  puts "Let's create a less-scary movie called The Prancing of the Lambs."
  sdk.insert_item('The Prancing of the Lambs', 2005, 'A movie about happy
 livestock.', 5.0)
  print "\nDone!\n".green

  new_step(7, 'Delete the table.')
  return unless scaffold.exists?(table_name)

  scaffold.delete_table
end
```

- For API details, see ExecuteStatement in *Amazon SDK for Ruby API Reference*.

Serverless examples

Invoke a Lambda function from a DynamoDB trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving records from a DynamoDB stream. The function retrieves the DynamoDB payload and logs the record contents.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming a DynamoDB event with Lambda using Ruby.

```
def lambda_handler(event:, context:)
    return 'received empty event' if event['Records'].empty?

    event['Records'].each do |record|
      log_dynamodb_record(record)
    end

    "Records processed: #{event['Records'].length}"
  end

  def log_dynamodb_record(record)
    puts record['eventID']
    puts record['eventName']
    puts "DynamoDB Record: #{JSON.generate(record['dynamodb'])}"
  end
```

Reporting batch item failures for Lambda functions with a DynamoDB trigger

The following code example shows how to implement partial batch response for Lambda functions that receive events from a DynamoDB stream. The function reports the batch item failures in the response, signaling to Lambda to retry those messages later.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Reporting DynamoDB batch item failures with Lambda using Ruby.

```
def lambda_handler(event:, context:)
    records = event["Records"]
    cur_record_sequence_number = ""

    records.each do |record|
      begin
        # Process your record
```

```
        cur_record_sequence_number = record["dynamodb"]["SequenceNumber"]
      rescue StandardError => e
        # Return failed record's sequence number
        return {"batchItemFailures" => [{"itemIdentifier" =>
cur_record_sequence_number}]}
      end
    end

    {"batchItemFailures" => []}
  end
```

Amazon EC2 examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Amazon EC2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Get started

Hello Amazon EC2

The following code example shows how to get started using Amazon EC2.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-ec2'
require 'logger'

# EC2Manager is a class responsible for managing EC2 operations
# such as listing all EC2 instances in the current AWS account.
class EC2Manager
  def initialize(client)
    @client = client
    @logger = Logger.new($stdout)
  end

  # Lists and prints all EC2 instances in the current AWS account.
  def list_instances
    @logger.info('Listing instances')

    instances = fetch_instances

    if instances.empty?
      @logger.info('You have no instances')
    else
      print_instances(instances)
    end
  end

  private

  # Fetches all EC2 instances using pagination.
  #
  # @return [Array<Aws::EC2::Types::Instance>] List of EC2 instances.
  def fetch_instances
    paginator = @client.describe_instances
    instances = []

    paginator.each_page do |page|
      page.reservations.each do |reservation|
        reservation.instances.each do |instance|
          instances << instance
        end
      end
    end

    instances
```

```
  end

  # Prints details of the given EC2 instances.
  #
  # @param instances [Array<Aws::EC2::Types::Instance>] List of EC2 instances to
 print.
  def print_instances(instances)
    instances.each do |instance|
      @logger.info("Instance ID: #{instance.instance_id}")
      @logger.info("Instance Type: #{instance.instance_type}")
      @logger.info("Public IP: #{instance.public_ip_address}")
      @logger.info("Public DNS Name: #{instance.public_dns_name}")
      @logger.info("\n")
    end
  end
end

if $PROGRAM_NAME == __FILE__
  ec2_client = Aws::EC2::Client.new(region: 'us-west-2')
  manager = EC2Manager.new(ec2_client)
  manager.list_instances
end
```

Actions

`AllocateAddress`

The following code example shows how to use `AllocateAddress`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
# Creates an Elastic IP address in Amazon Virtual Private Cloud (Amazon VPC).
#
# @param ec2_client [Aws::EC2::Client] An initialized EC2 client.
# @return [String] The allocation ID corresponding to the Elastic IP address.
# @example
#   puts allocate_elastic_ip_address(Aws::EC2::Client.new(region: 'us-west-2'))
def allocate_elastic_ip_address(ec2_client)
  response = ec2_client.allocate_address(domain: 'vpc')
  response.allocation_id
rescue StandardError => e
  puts "Error allocating Elastic IP address: #{e.message}"
  'Error'
end
```

- For API details, see AllocateAddress in *Amazon SDK for Ruby API Reference*.

`AssociateAddress`

The following code example shows how to use `AssociateAddress`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
# Associates an Elastic IP address with an Amazon Elastic Compute Cloud
# (Amazon EC2) instance.
#
# Prerequisites:
#
# - The allocation ID corresponding to the Elastic IP address.
# - The Amazon EC2 instance.
#
# @param ec2_client [Aws::EC2::Client] An initialized EC2 client.
# @param allocation_id [String] The ID of the allocation corresponding to
#   the Elastic IP address.
# @param instance_id [String] The ID of the instance.
```

```
# @return [String] The assocation ID corresponding to the association of the
#   Elastic IP address to the instance.
# @example
#   puts allocate_elastic_ip_address(
#     Aws::EC2::Client.new(region: 'us-west-2'),
#     'eipalloc-04452e528a66279EX',
#     'i-033c48ef067af3dEX')
def associate_elastic_ip_address_with_instance(
  ec2_client,
  allocation_id,
  instance_id
)
  response = ec2_client.associate_address(
    allocation_id: allocation_id,
    instance_id: instance_id
  )
  response.association_id
rescue StandardError => e
  puts "Error associating Elastic IP address with instance: #{e.message}"
  'Error'
end
```

- For API details, see AssociateAddress in *Amazon SDK for Ruby API Reference*.

`CreateKeyPair`

The following code example shows how to use `CreateKeyPair`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
# This code example does the following:
# 1. Creates a key pair in Amazon Elastic Compute Cloud (Amazon EC2).
# 2. Displays information about available key pairs.
```

```
# 3. Deletes the key pair.

require 'aws-sdk-ec2'

# @param ec2_client [Aws::EC2::Client] An initialized EC2 client.
# @param key_pair_name [String] The name for the key pair and private
#   key file.
# @return [Boolean] true if the key pair and private key file were
#   created; otherwise, false.
# @example
#   exit 1 unless key_pair_created?(
#     Aws::EC2::Client.new(region: 'us-west-2'),
#     'my-key-pair'
#   )

`CreateSecurityGroup`

The following code example shows how to use `CreateSecurityGroup`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
# This code example does the following:
# 1. Creates an Amazon Elastic Compute Cloud (Amazon EC2) security group.
# 2. Adds inbound rules to the security group.
# 3. Displays information about available security groups.
# 4. Deletes the security group.

require 'aws-sdk-ec2'

# Creates an Amazon Elastic Compute Cloud (Amazon EC2) security group.
#
# Prerequisites:
#
```

```
# - A VPC in Amazon Virtual Private Cloud (Amazon VPC).
#
# @param ec2_client [Aws::EC2::Client] An initialized
#   Amazon EC2 client.
# @param group_name [String] A name for the security group.
# @param description [String] A description for the security group.
# @param vpc_id [String] The ID of the VPC for the security group.
# @return [String] The ID of security group that was created.
# @example
#   puts create_security_group(
#     Aws::EC2::Client.new(region: 'us-west-2'),
#     'my-security-group',
#     'This is my security group.',
#     'vpc-6713dfEX'
#   )

Scenarios

Create and trigger a rule

The following code example shows how to create and trigger a rule in Amazon EventBridge.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Call the functions in the correct order.

```
require 'aws-sdk-sns'
require 'aws-sdk-iam'
require 'aws-sdk-cloudwatchevents'
require 'aws-sdk-ec2'
require 'aws-sdk-cloudwatch'
require 'aws-sdk-cloudwatchlogs'
require 'securerandom'
```

Checks whether the specified Amazon Simple Notification Service (Amazon SNS) topic exists among those provided to this function.

```
# Checks whether the specified Amazon SNS
# topic exists among those provided to this function.
# This is a helper function that is called by the topic_exists? function.
#
# @param topics [Array] An array of Aws::SNS::Types::Topic objects.
# @param topic_arn [String] The ARN of the topic to find.
# @return [Boolean] true if the topic ARN was found; otherwise, false.
# @example
#   sns_client = Aws::SNS::Client.new(region: 'us-east-1')
#   response = sns_client.list_topics
#   if topic_found?(
#     response.topics,
#     'arn:aws:sns:us-east-1:111111111111:aws-doc-sdk-examples-topic'
#   )
#     puts 'Topic found.'
#   end
def topic_found?(topics, topic_arn)
  topics.each do |topic|
    return true if topic.topic_arn == topic_arn
  end
  false
end
```

Checks whether the specified topic exists among those available to the caller in Amazon SNS.

```
# Checks whether the specified topic exists among those available to the
# caller in Amazon SNS.
#
# @param sns_client [Aws::SNS::Client] An initialized Amazon SNS client.
# @param topic_arn [String] The ARN of the topic to find.
# @return [Boolean] true if the topic ARN was found; otherwise, false.
# @example
#   exit 1 unless topic_exists?(
#     Aws::SNS::Client.new(region: 'us-east-1'),
#     'arn:aws:sns:us-east-1:111111111111:aws-doc-sdk-examples-topic'
#   )
def topic_exists?(sns_client, topic_arn)
```

```
  puts "Searching for topic with ARN '#{topic_arn}'..."
  response = sns_client.list_topics
  if response.topics.count.positive?
    if topic_found?(response.topics, topic_arn)
      puts 'Topic found.'
      return true
    end
    while response.next_page?
      response = response.next_page
      next unless response.topics.count.positive?

      if topic_found?(response.topics, topic_arn)
        puts 'Topic found.'
        return true
      end
    end
  end
  puts 'Topic not found.'
  false
rescue StandardError => e
  puts "Topic not found: #{e.message}"
  false
end
```

Create a topic in Amazon SNS and then subscribe an email address to receive notifications to that topic.

```
# Creates a topic in Amazon SNS
# and then subscribes an email address to receive notifications to that topic.
#
# @param sns_client [Aws::SNS::Client] An initialized Amazon SNS client.
# @param topic_name [String] The name of the topic to create.
# @param email_address [String] The email address of the recipient to notify.
# @return [String] The ARN of the topic that was created.
# @example
#   puts create_topic(
#     Aws::SNS::Client.new(region: 'us-east-1'),
#     'aws-doc-sdk-examples-topic',
#     'mary@example.com'
#   )
def create_topic(sns_client, topic_name, email_address)
  puts "Creating the topic named '#{topic_name}'..."
```

```
  topic_response = sns_client.create_topic(name: topic_name)
  puts "Topic created with ARN '#{topic_response.topic_arn}'."
  subscription_response = sns_client.subscribe(
    topic_arn: topic_response.topic_arn,
    protocol: 'email',
    endpoint: email_address,
    return_subscription_arn: true
  )
  puts 'Subscription created with ARN ' \
    "'#{subscription_response.subscription_arn}'. Have the owner of the " \
    "email address '#{email_address}' check their inbox in a few minutes " \
    'and confirm the subscription to start receiving notification emails.'
  topic_response.topic_arn
rescue StandardError => e
  puts "Error creating or subscribing to topic: #{e.message}"
  'Error'
end
```

Check whether the specified Amazon Identity and Access Management (IAM) role exists among those provided to this function.

```
# Checks whether the specified AWS Identity and Access Management (IAM)
# role exists among those provided to this function.
# This is a helper function that is called by the role_exists? function.
#
# @param roles [Array] An array of Aws::IAM::Role objects.
# @param role_arn [String] The ARN of the role to find.
# @return [Boolean] true if the role ARN was found; otherwise, false.
# @example
#   iam_client = Aws::IAM::Client.new(region: 'us-east-1')
#   response = iam_client.list_roles
#   if role_found?(
#     response.roles,
#     'arn:aws:iam::111111111111:role/aws-doc-sdk-examples-ec2-state-change'
#   )
#     puts 'Role found.'
#   end
def role_found?(roles, role_arn)
  roles.each do |role|
    return true if role.arn == role_arn
  end
  false
```

```
end
```

Check whether the specified role exists among those available to the caller in IAM.

```

Amazon Glue examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Amazon Glue.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Get started
- Basics
- Actions

Get started

Hello Amazon Glue

The following code example shows how to get started using Amazon Glue.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-glue'
require 'logger'

# GlueManager is a class responsible for managing AWS Glue operations
# such as listing all Glue jobs in the current AWS account.
class GlueManager
  def initialize(client)
    @client = client
    @logger = Logger.new($stdout)
  end

  # Lists and prints all Glue jobs in the current AWS account.
  def list_jobs
    @logger.info('Here are the Glue jobs in your account:')

    paginator = @client.get_jobs(max_results: 10)
    jobs = []

    paginator.each_page do |page|
      jobs.concat(page.jobs)
    end

    if jobs.empty?
      @logger.info("You don't have any Glue jobs.")
    else
      jobs.each do |job|
        @logger.info("- #{job.name}")
      end
    end
  end
end

if $PROGRAM_NAME == __FILE__
  glue_client = Aws::Glue::Client.new
  manager = GlueManager.new(glue_client)
  manager.list_jobs
end
```

- For API details, see ListJobs in *Amazon SDK for Ruby API Reference*.

Basics

Learn the basics

The following code example shows how to:

- Create a crawler that crawls a public Amazon S3 bucket and generates a database of CSV-formatted metadata.
- List information about databases and tables in your Amazon Glue Data Catalog.
- Create a job to extract CSV data from the S3 bucket, transform the data, and load JSON-formatted output into another S3 bucket.
- List information about job runs, view transformed data, and clean up resources.

For more information, see Tutorial: Getting started with Amazon Glue Studio.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Create a class that wraps Amazon Glue functions used in the scenario.

```
# The `GlueWrapper` class serves as a wrapper around the AWS Glue API, providing a
 simplified interface for common operations.
# It encapsulates the functionality of the AWS SDK for Glue and provides methods for
 interacting with Glue crawlers, databases, tables, jobs, and S3 resources.
# The class initializes with a Glue client and a logger, allowing it to make API
 calls and log any errors or informational messages.
class GlueWrapper
  def initialize(glue_client, logger)
    @glue_client = glue_client
    @logger = logger
  end

  # Retrieves information about a specific crawler.
  #
```

```
  # @param name [String] The name of the crawler to retrieve information about.
  # @return [Aws::Glue::Types::Crawler, nil] The crawler object if found, or nil if
not found.
  def get_crawler(name)
    @glue_client.get_crawler(name: name)
  rescue Aws::Glue::Errors::EntityNotFoundException
    @logger.info("Crawler #{name} doesn't exist.")
    false
  rescue Aws::Glue::Errors::GlueException => e
    @logger.error("Glue could not get crawler #{name}: \n#{e.message}")
    raise
  end

  # Creates a new crawler with the specified configuration.
  #
  # @param name [String] The name of the crawler.
  # @param role_arn [String] The ARN of the IAM role to be used by the crawler.
  # @param db_name [String] The name of the database where the crawler stores its
metadata.
  # @param db_prefix [String] The prefix to be added to the names of tables that the
crawler creates.
  # @param s3_target [String] The S3 path that the crawler will crawl.
  # @return [void]
  def create_crawler(name, role_arn, db_name, _db_prefix, s3_target)
    @glue_client.create_crawler(
      name: name,
      role: role_arn,
      database_name: db_name,
      targets: {
        s3_targets: [
          {
            path: s3_target
          }
        ]
      }
    )
  rescue Aws::Glue::Errors::GlueException => e
    @logger.error("Glue could not create crawler: \n#{e.message}")
    raise
  end

  # Starts a crawler with the specified name.
  #
  # @param name [String] The name of the crawler to start.
```

```
  # @return [void]

IAM examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with IAM.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Get started
- Basics
- Actions

Get started

Hello IAM

The following code example shows how to get started using IAM.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-iam'
require 'logger'

# IAMManager is a class responsible for managing IAM operations
# such as listing all IAM policies in the current AWS account.
class IAMManager
  def initialize(client)
    @client = client
    @logger = Logger.new($stdout)
  end

  # Lists and prints all IAM policies in the current AWS account.
  def list_policies
    @logger.info('Here are the IAM policies in your account:')

    paginator = @client.list_policies
    policies = []

    paginator.each_page do |page|
      policies.concat(page.policies)
    end

    if policies.empty?
      @logger.info("You don't have any IAM policies.")
    else
      policies.each do |policy|
        @logger.info("- #{policy.policy_name}")
      end
    end
  end
end

if $PROGRAM_NAME == __FILE__
  iam_client = Aws::IAM::Client.new
  manager = IAMManager.new(iam_client)
  manager.list_policies
end
```

- For API details, see ListPolicies in *Amazon SDK for Ruby API Reference*.

Basics

Learn the basics

The following code example shows how to create a user and assume a role.

> **Warning**
>
> To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as Amazon IAM Identity Center.

- Create a user with no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list S3 buckets using temporary credentials, then clean up resources.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Create an IAM user and a role that grants permission to list Amazon S3 buckets. The user has rights only to assume the role. After assuming the role, use temporary credentials to list buckets for the account.

```
# Wraps the scenario actions.
class ScenarioCreateUserAssumeRole
  attr_reader :iam_client

  # @param [Aws::IAM::Client] iam_client: The AWS IAM client.
  def initialize(iam_client, logger: Logger.new($stdout))
    @iam_client = iam_client
    @logger = logger
  end
```

```
# Waits for the specified number of seconds.
#
# @param duration [Integer] The number of seconds to wait.
def wait(duration)
  puts('Give AWS time to propagate resources...')
  sleep(duration)
end

# Creates a user.
#
# @param user_name [String] The name to give the user.
# @return [Aws::IAM::User] The newly created user.
def create_user(user_name)
  user = @iam_client.create_user(user_name: user_name).user
  @logger.info("Created demo user named #{user.user_name}.")
rescue Aws::Errors::ServiceError => e
  @logger.info('Tried and failed to create demo user.')
  @logger.info("\t#{e.code}: #{e.message}")
  @logger.info("\nCan't continue the demo without a user!")
  raise
else
  user
end

# Creates an access key for a user.
#
# @param user [Aws::IAM::User] The user that owns the key.
# @return [Aws::IAM::AccessKeyPair] The newly created access key.
def create_access_key_pair(user)
  user_key = @iam_client.create_access_key(user_name: user.user_name).access_key

Kinesis examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Kinesis.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Serverless examples

Serverless examples

Invoke a Lambda function from a Kinesis trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving records from a Kinesis stream. The function retrieves the Kinesis payload, decodes from Base64, and logs the record contents.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming an Kinesis event with Lambda using Ruby.

```
# Copyright Amazon.com, Inc. or its affiliates. All Rights Reserved.
# SPDX-License-Identifier: Apache-2.0
require 'aws-sdk'

def lambda_handler(event:, context:)
```

```
  event['Records'].each do |record|
    begin
      puts "Processed Kinesis Event - EventID: #{record['eventID']}"
      record_data = get_record_data_async(record['kinesis'])
      puts "Record Data: #{record_data}"
      # TODO: Do interesting work based on the new data
    rescue => err
      $stderr.puts "An error occurred #{err}"
      raise err
    end
  end
  puts "Successfully processed #{event['Records'].length} records."
end

def get_record_data_async(payload)
  data = Base64.decode64(payload['data']).force_encoding('UTF-8')
  # Placeholder for actual async work
  # You can use Ruby's asynchronous programming tools like async/await or fibers
 here.
  return data
end
```

Reporting batch item failures for Lambda functions with a Kinesis trigger

The following code example shows how to implement partial batch response for Lambda functions that receive events from a Kinesis stream. The function reports the batch item failures in the response, signaling to Lambda to retry those messages later.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Reporting Kinesis batch item failures with Lambda using Ruby.

```
# Copyright Amazon.com, Inc. or its affiliates. All Rights Reserved.
# SPDX-License-Identifier: Apache-2.0
require 'aws-sdk'
```

```
def lambda_handler(event:, context:)
  batch_item_failures = []

  event['Records'].each do |record|
    begin
      puts "Processed Kinesis Event - EventID: #{record['eventID']}"
      record_data = get_record_data_async(record['kinesis'])
      puts "Record Data: #{record_data}"
      # TODO: Do interesting work based on the new data
    rescue StandardError => err
      puts "An error occurred #{err}"
      # Since we are working with streams, we can return the failed item
 immediately.
      # Lambda will immediately begin to retry processing from this failed item
 onwards.
      return { batchItemFailures: [{ itemIdentifier: record['kinesis']
['sequenceNumber'] }] }
    end
  end

  puts "Successfully processed #{event['Records'].length} records."
  { batchItemFailures: batch_item_failures }
end

def get_record_data_async(payload)
  data = Base64.decode64(payload['data']).force_encoding('utf-8')
  # Placeholder for actual async work
  sleep(1)
  data
end
```

Amazon KMS examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Amazon KMS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Actions

`CreateKey`

The following code example shows how to use `CreateKey`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-kms' # v2: require 'aws-sdk'

# Create a AWS KMS key.
# As long we are only encrypting small amounts of data (4 KiB or less) directly,
# a KMS key is fine for our purposes.
# For larger amounts of data,
# use the KMS key to encrypt a data encryption key (DEK).

client = Aws::KMS::Client.new

resp = client.create_key({
                           tags: [
                             {
                               tag_key: 'CreatedBy',
                               tag_value: 'ExampleUser'
                             }
                           ]
                         })

puts resp.key_metadata.key_id
```

- For API details, see CreateKey in *Amazon SDK for Ruby API Reference*.

`Decrypt`

The following code example shows how to use `Decrypt`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-kms' # v2: require 'aws-sdk'

# Decrypted blob

blob =
 '01020200785d68faeec386af1057904926253051eb2919d3c16078badf65b808b26dd057c101747cadf3593596
blob_packed = [blob].pack('H*')

client = Aws::KMS::Client.new(region: 'us-west-2')

resp = client.decrypt({
                        ciphertext_blob: blob_packed
                      })

puts 'Raw text: '
puts resp.plaintext
```

- For API details, see Decrypt in *Amazon SDK for Ruby API Reference*.

`Encrypt`

The following code example shows how to use `Encrypt`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-kms' # v2: require 'aws-sdk'

# ARN of the AWS KMS key.
#
# Replace the fictitious key ARN with a valid key ID

keyId = 'arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab'

text = '1234567890'

client = Aws::KMS::Client.new(region: 'us-west-2')

resp = client.encrypt({
                        key_id: keyId,
                        plaintext: text
                      })

# Display a readable version of the resulting encrypted blob.
puts 'Blob:'
puts resp.ciphertext_blob.unpack('H*')
```

- For API details, see Encrypt in *Amazon SDK for Ruby API Reference*.

`ReEncrypt`

The following code example shows how to use `ReEncrypt`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-kms' # v2: require 'aws-sdk'

# Human-readable version of the ciphertext of the data to reencrypt.

blob =
 '01020200785d68faeec386af1057904926253051eb2919d3c16078badf65b808b26dd057c101747cadf3593596
sourceCiphertextBlob = [blob].pack('H*')

# Replace the fictitious key ARN with a valid key ID

destinationKeyId = 'arn:aws:kms:us-west-2:111122223333:key/0987dcba-09fe-87dc-65ba-
ab0987654321'

client = Aws::KMS::Client.new(region: 'us-west-2')

resp = client.re_encrypt({
                           ciphertext_blob: sourceCiphertextBlob,
                           destination_key_id: destinationKeyId
                         })

# Display a readable version of the resulting re-encrypted blob.
puts 'Blob:'
puts resp.ciphertext_blob.unpack('H*')
```

- For API details, see ReEncrypt in *Amazon SDK for Ruby API Reference*.

Lambda examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Lambda.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other Amazon Web Services services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Get started

Hello Lambda

The following code example shows how to get started using Lambda.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-lambda'

# Creates an AWS Lambda client using the default credentials and configuration
def lambda_client
```

```
  Aws::Lambda::Client.new
end

# Lists the Lambda functions in your AWS account, paginating the results if
 necessary
def list_lambda_functions
  lambda = lambda_client

  # Use a pagination iterator to list all functions
  functions = []
  lambda.list_functions.each_page do |page|
    functions.concat(page.functions)
  end

  # Print the name and ARN of each function
  functions.each do |function|
    puts "Function name: #{function.function_name}"
    puts "Function ARN: #{function.function_arn}"
    puts
  end

  puts "Total functions: #{functions.count}"
end

list_lambda_functions if __FILE__ == $PROGRAM_NAME
```

- For API details, see ListFunctions in *Amazon SDK for Ruby API Reference*.

Basics

Learn the basics

The following code example shows how to:

- Create an IAM role and Lambda function, then upload handler code.
- Invoke the function with a single parameter and get results.
- Update the function code and configure with an environment variable.
- Invoke the function with new parameters and get results. Display the returned execution log.
- List the functions for your account, then clean up resources.

For more information, see Create a Lambda function with the console.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Set up pre-requisite IAM permissions for a Lambda function capable of writing logs.

```
# Get an AWS Identity and Access Management (IAM) role.
#
# @param iam_role_name: The name of the role to retrieve.
# @param action: Whether to create or destroy the IAM apparatus.
# @return: The IAM role.
def manage_iam(iam_role_name, action)
  case action
  when 'create'
    create_iam_role(iam_role_name)
  when 'destroy'
    destroy_iam_role(iam_role_name)
  else
    raise "Incorrect action provided. Must provide 'create' or 'destroy'"
  end
end

Define a Lambda handler that increments a number provided as an invocation parameter.

```
require 'logger'

# A function that increments a whole number by one (1) and logs the result.
# Requires a manually-provided runtime parameter, 'number', which must be Int
#
# @param event [Hash] Parameters sent when the function is invoked
```

```
# @param context [Hash] Methods and properties that provide information
# about the invocation, function, and execution environment.
# @return incremented_number [String] The incremented number.
def lambda_handler(event:, context:)
  logger = Logger.new($stdout)
  log_level = ENV['LOG_LEVEL']
  logger.level = case log_level
                 when 'debug'
                   Logger::DEBUG
                 when 'info'
                   Logger::INFO
                 else
                   Logger::ERROR
                 end
  logger.debug('This is a debug log message.')
  logger.info('This is an info log message. Code executed successfully!')
  number = event['number'].to_i
  incremented_number = number + 1
  logger.info("You provided #{number.round} and it was incremented to
 #{incremented_number.round}")
  incremented_number.round.to_s
end
```

Zip your Lambda function into a deployment package.

```
  # Creates a Lambda deployment package in .zip format.
  #
  # @param source_file: The name of the object, without suffix, for the Lambda file
 and zip.
  # @return: The deployment package.
  def create_deployment_package(source_file)
    Dir.chdir(File.dirname(__FILE__))

do |w|
      w.max_attempts = 5
      w.delay = 5
    end
    response
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error creating #{function_name}:\n #{e.message}")
  rescue Aws::Waiters::Errors::WaiterFailed => e
    @logger.error("Failed waiting for #{function_name} to activate:\n #{e.message}")
  end
```

Invoke your Lambda function with optional runtime parameters.

```
  # Invokes a Lambda function.
  # @param function_name [String] The name of the function to invoke.
  # @param payload [nil] Payload containing runtime parameters.
  # @return [Object] The response from the function invocation.
  def invoke_function(function_name, payload = nil)
    params = { function_name: function_name }
    params[:payload] = payload unless payload.nil?
    @lambda_client.invoke(params)
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error executing #{function_name}:\n #{e.message}")
  end
```

Update your Lambda function's configuration to inject a new environment variable.

```
  # Updates the environment variables for a Lambda function.
  # @param function_name: The name of the function to update.
  # @param log_level: The log level of the function.
  # @return: Data about the update, including the status.
  def update_function_configuration(function_name, log_level)
    @lambda_client.update_function_configuration({
                                                   function_name: function_name,
                                                   environment: {
                                                     variables: {
                                                       'LOG_LEVEL' => log_level
                                                     }
                                                   }
                                                 })
    @lambda_client.wait_until(:function_updated_v2, { function_name:
 function_name }) do |w|
      w.max_attempts = 5
      w.delay = 5
    end
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error updating configurations for #{function_name}:
\n #{e.message}")
  rescue Aws::Waiters::Errors::WaiterFailed => e
    @logger.error("Failed waiting for #{function_name} to activate:\n #{e.message}")
  end
```

Update your Lambda function's code with a different deployment package containing different code.

```
  # Updates the code for a Lambda function by submitting a .zip archive that
 contains
  # the code for the function.
  #
  # @param function_name: The name of the function to update.
  # @param deployment_package: The function code to update, packaged as bytes in
  #                           .zip format.
  # @return: Data about the update, including the status.
  def update_function_code(function_name, deployment_package)
    @lambda_client.update_function_code(
      function_name: function_name,
      zip_file: deployment_package
    )
    @lambda_client.wait_until(:function_updated_v2, { function_name:
 function_name }) do |w|
      w.max_attempts = 5
      w.delay = 5
    end
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error updating function code for: #{function_name}:
\n #{e.message}")
    nil
  rescue Aws::Waiters::Errors::WaiterFailed => e
    @logger.error("Failed waiting for #{function_name} to update:\n #{e.message}")
  end
```

List all existing Lambda functions using the built-in paginator.

```
  # Lists the Lambda functions for the current account.
  def list_functions
    functions = []
    @lambda_client.list_functions.each do |response|
      response['functions'].each do |function|
        functions.append(function['function_name'])
      end
    end
    functions
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error listing functions:\n #{e.message}")
```

```
end
```

Delete a specific Lambda function.

```
# Deletes a Lambda function.
# @param function_name: The name of the function to delete.
def delete_function(function_name)
  print "Deleting function: #{function_name}..."
  @lambda_client.delete_function(
    function_name: function_name
  )
  print 'Done!'.green
rescue Aws::Lambda::Errors::ServiceException => e
  @logger.error("There was an error deleting #{function_name}:\n #{e.message}")
end
```

Actions

`CreateFunction`

The following code example shows how to use `CreateFunction`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class LambdaWrapper
  attr_accessor :lambda_client, :cloudwatch_client, :iam_client

  def initialize
    @lambda_client = Aws::Lambda::Client.new
    @cloudwatch_client = Aws::CloudWatchLogs::Client.new(region: 'us-east-1')
    @iam_client = Aws::IAM::Client.new(region: 'us-east-1')
    @logger = Logger.new($stdout)
    @logger.level = Logger::WARN
  end

  # Deploys a Lambda function.
  #
  # @param function_name: The name of the Lambda function.
  # @param handler_name: The fully qualified name of the handler function.
  # @param role_arn: The IAM role to use for the function.
  # @param deployment_package: The deployment package that contains the function
 code in .zip format.
  # @return: The Amazon Resource Name (ARN) of the newly created function.
  def create_function(function_name, handler_name, role_arn, deployment_package)
    response = @lambda_client.create_function({
                                                role: role_arn.to_s,
                                                function_name: function_name,
                                                handler: handler_name,
                                                runtime: 'ruby2.7',
                                                code: {
                                                  zip_file: deployment_package
                                                },
                                                environment: {
                                                  variables: {
                                                    'LOG_LEVEL' => 'info'
                                                  }
                                                }
                                              })
```

```
    @lambda_client.wait_until(:function_active_v2, { function_name: function_name })
 do |w|
      w.max_attempts = 5
      w.delay = 5
    end
    response
  rescue Aws::Lambda::Errors::ServiceException => e

  rescue Aws::Waiters::Errors::WaiterFailed => e
    @logger.error("Failed waiting for #{function_name} to activate:\n #{e.message}")
  end
```

- For API details, see CreateFunction in *Amazon SDK for Ruby API Reference*.

`DeleteFunction`

The following code example shows how to use `DeleteFunction`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class LambdaWrapper
  attr_accessor :lambda_client, :cloudwatch_client, :iam_client

  def initialize
    @lambda_client = Aws::Lambda::Client.new
    @cloudwatch_client = Aws::CloudWatchLogs::Client.new(region: 'us-east-1')
    @iam_client = Aws::IAM::Client.new(region: 'us-east-1')
    @logger = Logger.new($stdout)
    @logger.level = Logger::WARN
  end

  # Deletes a Lambda function.
  # @param function_name: The name of the function to delete.
  def delete_function(function_name)
```

```
    print "Deleting function: #{function_name}..."
    @lambda_client.delete_function(
      function_name: function_name
    )
    print 'Done!'.green
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error deleting #{function_name}:\n #{e.message}")
  end
```

- For API details, see DeleteFunction in *Amazon SDK for Ruby API Reference*.

`GetFunction`

The following code example shows how to use `GetFunction`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class LambdaWrapper
  attr_accessor :lambda_client, :cloudwatch_client, :iam_client

  def initialize
    @lambda_client = Aws::Lambda::Client.new
    @cloudwatch_client = Aws::CloudWatchLogs::Client.new(region: 'us-east-1')
    @iam_client = Aws::IAM::Client.new(region: 'us-east-1')
    @logger = Logger.new($stdout)
    @logger.level = Logger::WARN
  end

  # Gets data about a Lambda function.
  #
  # @param function_name: The name of the function.
  # @return response: The function data, or nil if no such function exists.
  def get_function(function_name)
    @lambda_client.get_function(
      {
```

```
        function_name: function_name
      }
    )
  rescue Aws::Lambda::Errors::ResourceNotFoundException => e
    @logger.debug("Could not find function: #{function_name}:\n #{e.message}")
    nil
  end
```

- For API details, see GetFunction in *Amazon SDK for Ruby API Reference*.

Invoke

The following code example shows how to use `Invoke`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class LambdaWrapper
  attr_accessor :lambda_client, :cloudwatch_client, :iam_client

  def initialize
    @lambda_client = Aws::Lambda::Client.new
    @cloudwatch_client = Aws::CloudWatchLogs::Client.new(region: 'us-east-1')
    @iam_client = Aws::IAM::Client.new(region: 'us-east-1')
    @logger = Logger.new($stdout)
    @logger.level = Logger::WARN
  end

  # Invokes a Lambda function.
  # @param function_name [String] The name of the function to invoke.
  # @param payload [nil] Payload containing runtime parameters.
  # @return [Object] The response from the function invocation.
  def invoke_function(function_name, payload = nil)
    params = { function_name: function_name }
    params[:payload] = payload unless payload.nil?
    @lambda_client.invoke(params)
```

```
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error executing #{function_name}:\n #{e.message}")
  end
```

- For API details, see Invoke in *Amazon SDK for Ruby API Reference*.

`ListFunctions`

The following code example shows how to use `ListFunctions`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class LambdaWrapper
  attr_accessor :lambda_client, :cloudwatch_client, :iam_client

  def initialize
    @lambda_client = Aws::Lambda::Client.new
    @cloudwatch_client = Aws::CloudWatchLogs::Client.new(region: 'us-east-1')
    @iam_client = Aws::IAM::Client.new(region: 'us-east-1')
    @logger = Logger.new($stdout)
    @logger.level = Logger::WARN
  end

  # Lists the Lambda functions for the current account.
  def list_functions
    functions = []
    @lambda_client.list_functions.each do |response|
      response['functions'].each do |function|
        functions.append(function['function_name'])
      end
    end
    functions
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error listing functions:\n #{e.message}")
  end
```

- For API details, see ListFunctions in *Amazon SDK for Ruby API Reference*.

`UpdateFunctionCode`

The following code example shows how to use `UpdateFunctionCode`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class LambdaWrapper
  attr_accessor :lambda_client, :cloudwatch_client, :iam_client

  def initialize
    @lambda_client = Aws::Lambda::Client.new
    @cloudwatch_client = Aws::CloudWatchLogs::Client.new(region: 'us-east-1')
    @iam_client = Aws::IAM::Client.new(region: 'us-east-1')
    @logger = Logger.new($stdout)
    @logger.level = Logger::WARN
  end

  # Updates the code for a Lambda function by submitting a .zip archive that
 contains
  # the code for the function.
  #
  # @param function_name: The name of the function to update.
  # @param deployment_package: The function code to update, packaged as bytes in
  #                            .zip format.
  # @return: Data about the update, including the status.
  def update_function_code(function_name, deployment_package)
    @lambda_client.update_function_code(
      function_name: function_name,
      zip_file: deployment_package
    )
    @lambda_client.wait_until(:function_updated_v2, { function_name:
 function_name }) do |w|
```

```
      w.max_attempts = 5
      w.delay = 5
    end
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error updating function code for: #{function_name}:
\n #{e.message}")
    nil
  rescue Aws::Waiters::Errors::WaiterFailed => e
    @logger.error("Failed waiting for #{function_name} to update:\n #{e.message}")
  end
```

- For API details, see UpdateFunctionCode in *Amazon SDK for Ruby API Reference*.

`UpdateFunctionConfiguration`

The following code example shows how to use `UpdateFunctionConfiguration`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
class LambdaWrapper
  attr_accessor :lambda_client, :cloudwatch_client, :iam_client

  def initialize
    @lambda_client = Aws::Lambda::Client.new
    @cloudwatch_client = Aws::CloudWatchLogs::Client.new(region: 'us-east-1')
    @iam_client = Aws::IAM::Client.new(region: 'us-east-1')
    @logger = Logger.new($stdout)
    @logger.level = Logger::WARN
  end

  # Updates the environment variables for a Lambda function.
  # @param function_name: The name of the function to update.
  # @param log_level: The log level of the function.
  # @return: Data about the update, including the status.
  def update_function_configuration(function_name, log_level)
```

```
    @lambda_client.update_function_configuration({
                                                    function_name: function_name,
                                                    environment: {
                                                      variables: {
                                                        'LOG_LEVEL' => log_level
                                                      }
                                                    }
                                                  })
    @lambda_client.wait_until(:function_updated_v2, { function_name:
 function_name }) do |w|
      w.max_attempts = 5
      w.delay = 5
    end
  rescue Aws::Lambda::Errors::ServiceException => e
    @logger.error("There was an error updating configurations for #{function_name}:
\n #{e.message}")
  rescue Aws::Waiters::Errors::WaiterFailed => e
    @logger.error("Failed waiting for #{function_name} to activate:\n #{e.message}")
  end
```

- For API details, see UpdateFunctionConfiguration in *Amazon SDK for Ruby API Reference*.

Scenarios

Create an application to analyze customer feedback

The following code example shows how to create an application that analyzes customer comment cards, translates them from their original language, determines their sentiment, and generates an audio file from the translated text.

SDK for Ruby

This example application analyzes and stores customer feedback cards. Specifically, it fulfills the need of a fictitious hotel in New York City. The hotel receives feedback from guests in various languages in the form of physical comment cards. That feedback is uploaded into the app through a web client. After an image of a comment card is uploaded, the following steps occur:

- Text is extracted from the image using Amazon Textract.
- Amazon Comprehend determines the sentiment of the extracted text and its language.
- The extracted text is translated to English using Amazon Translate.

- Amazon Polly synthesizes an audio file from the extracted text.

The full app can be deployed with the Amazon CDK. For source code and deployment instructions, see the project in GitHub.

Services used in this example

- Amazon Comprehend
- Lambda
- Amazon Polly
- Amazon Textract
- Amazon Translate

Serverless examples

Connecting to an Amazon RDS database in a Lambda function

The following code example shows how to implement a Lambda function that connects to an RDS database. The function makes a simple database request and returns the result.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Connecting to an Amazon RDS database in a Lambda function using Ruby.

```
# Ruby code here.

require 'aws-sdk-rds'
require 'json'
require 'mysql2'

def lambda_handler(event:, context:)
  endpoint = ENV['DBEndpoint'] # Add the endpoint without https"
  port = ENV['Port']           # 3306
  user = ENV['DBUser']
```

```
  region = ENV['DBRegion']     # 'us-east-1'
  db_name = ENV['DBName']

  credentials = Aws::Credentials.new(
    ENV['AWS_ACCESS_KEY_ID'],
    ENV['AWS_SECRET_ACCESS_KEY'],
    ENV['AWS_SESSION_TOKEN']
  )
  rds_client = Aws::RDS::AuthTokenGenerator.new(
    region: region,
    credentials: credentials
  )

  token = rds_client.auth_token(
    endpoint: endpoint+ ':' + port,
    user_name: user,
    region: region
  )

  begin
    conn = Mysql2::Client.new(
      host: endpoint,
      username: user,
      password: token,
      port: port,
      database: db_name,
      sslca: '/var/task/global-bundle.pem',
      sslverify: true,
      enable_cleartext_plugin: true
    )
    a = 3
    b = 2
    result = conn.query("SELECT #{a} + #{b} AS sum").first['sum']
    puts result
    conn.close
    {
      statusCode: 200,
      body: result.to_json
    }
  rescue => e
    puts "Database connection failed due to #{e}"
  end
end
```

Invoke a Lambda function from a Kinesis trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving records from a Kinesis stream. The function retrieves the Kinesis payload, decodes from Base64, and logs the record contents.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming an Kinesis event with Lambda using Ruby.

```
# Copyright Amazon.com, Inc. or its affiliates. All Rights Reserved.
# SPDX-License-Identifier: Apache-2.0
require 'aws-sdk'

def lambda_handler(event:, context:)
  event['Records'].each do |record|
    begin
      puts "Processed Kinesis Event - EventID: #{record['eventID']}"
      record_data = get_record_data_async(record['kinesis'])
      puts "Record Data: #{record_data}"
      # TODO: Do interesting work based on the new data
    rescue => err
      $stderr.puts "An error occurred #{err}"
      raise err
    end
  end
  puts "Successfully processed #{event['Records'].length} records."
end

def get_record_data_async(payload)
  data = Base64.decode64(payload['data']).force_encoding('UTF-8')
  # Placeholder for actual async work
  # You can use Ruby's asynchronous programming tools like async/await or fibers
 here.
  return data
end
```

Invoke a Lambda function from a DynamoDB trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving records from a DynamoDB stream. The function retrieves the DynamoDB payload and logs the record contents.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming a DynamoDB event with Lambda using Ruby.

```
def lambda_handler(event:, context:)
    return 'received empty event' if event['Records'].empty?

    event['Records'].each do |record|
      log_dynamodb_record(record)
    end

    "Records processed: #{event['Records'].length}"
  end

  def log_dynamodb_record(record)
    puts record['eventID']
    puts record['eventName']
    puts "DynamoDB Record: #{JSON.generate(record['dynamodb'])}"
  end
```

Invoke a Lambda function from a Amazon DocumentDB trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving records from a DocumentDB change stream. The function retrieves the DocumentDB payload and logs the record contents.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming a Amazon DocumentDB event with Lambda using Ruby.

```
require 'json'

def lambda_handler(event:, context:)
  event['events'].each do |record|
    log_document_db_event(record)
  end
  'OK'
end

def log_document_db_event(record)
  event_data = record['event'] || {}
  operation_type = event_data['operationType'] || 'Unknown'
  db = event_data.dig('ns', 'db') || 'Unknown'
  collection = event_data.dig('ns', 'coll') || 'Unknown'
  full_document = event_data['fullDocument'] || {}

  puts "Operation type: #{operation_type}"
  puts "db: #{db}"
  puts "collection: #{collection}"
  puts "Full document: #{JSON.pretty_generate(full_document)}"
end
```

Invoke a Lambda function from an Amazon MSK trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving records from an Amazon MSK cluster. The function retrieves the MSK payload and logs the record contents.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming an Amazon MSK event with Lambda using Ruby.

```
require 'base64'

def lambda_handler(event:, context:)
  # Iterate through keys
  event['records'].each do |key, records|
    puts "Key: #{key}"

    # Iterate through records
    records.each do |record|
      puts "Record: #{record}"

      # Decode base64
      msg = Base64.decode64(record['value'])
      puts "Message: #{msg}"
    end
  end
end
```

Invoke a Lambda function from an Amazon S3 trigger

The following code example shows how to implement a Lambda function that receives an event triggered by uploading an object to an S3 bucket. The function retrieves the S3 bucket name and object key from the event parameter and calls the Amazon S3 API to retrieve and log the content type of the object.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming an S3 event with Lambda using Ruby.

```
require 'json'
require 'uri'
require 'aws-sdk'

puts 'Loading function'

def lambda_handler(event:, context:)
  s3 = Aws::S3::Client.new(region: 'region') # Your AWS region
  # puts "Received event: #{JSON.dump(event)}"

  # Get the object from the event and show its content type
  bucket = event['Records'][0]['s3']['bucket']['name']
  key = URI.decode_www_form_component(event['Records'][0]['s3']['object']['key'],
 Encoding::UTF_8)
  begin
    response = s3.get_object(bucket: bucket, key: key)
    puts "CONTENT TYPE: #{response.content_type}"
    return response.content_type
  rescue StandardError => e
    puts e.message
    puts "Error getting object #{key} from bucket #{bucket}. Make sure they exist
 and your bucket is in the same region as this function."
    raise e
  end
end
```

Invoke a Lambda function from an Amazon SNS trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving messages from an SNS topic. The function retrieves the messages from the event parameter and logs the content of each message.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming an SNS event with Lambda using Ruby.

```
# Copyright Amazon.com, Inc. or its affiliates. All Rights Reserved.
# SPDX-License-Identifier: Apache-2.0
def lambda_handler(event:, context:)
  event['Records'].map { |record| process_message(record) }
end

def process_message(record)
  message = record['Sns']['Message']
  puts("Processing message: #{message}")
rescue StandardError => e
  puts("Error processing message: #{e}")
  raise
end
```

Invoke a Lambda function from an Amazon SQS trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving messages from an SQS queue. The function retrieves the messages from the event parameter and logs the content of each message.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming an SQS event with Lambda using Ruby.

```
# Copyright Amazon.com, Inc. or its affiliates. All Rights Reserved.
# SPDX-License-Identifier: Apache-2.0
def lambda_handler(event:, context:)
  event['Records'].each do |message|

`DescribeDBSnapshots`

The following code example shows how to use `DescribeDBSnapshots`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-rds' # v2: require 'aws-sdk'

# List all Amazon Relational Database Service (Amazon RDS) DB instance
# snapshots.
#
# @param rds_resource [Aws::RDS::Resource] An SDK for Ruby Amazon RDS resource.
# @return instance_snapshots [Array, nil] All instance snapshots, or nil if error.
def list_instance_snapshots(rds_resource)
  instance_snapshots = []
  rds_resource.db_snapshots.each do |s|
    instance_snapshots.append({
                                "id": s.snapshot_id,
                                "status": s.status
                              })
  end
  instance_snapshots
rescue Aws::Errors::ServiceError => e
  puts "Couldn't list instance snapshots:\n #{e.message}"
end
```

- For API details, see DescribeDBSnapshots in *Amazon SDK for Ruby API Reference*.

Serverless examples

Connecting to an Amazon RDS database in a Lambda function

The following code example shows how to implement a Lambda function that connects to an RDS database. The function makes a simple database request and returns the result.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Connecting to an Amazon RDS database in a Lambda function using Ruby.

```
# Ruby code here.

require 'aws-sdk-rds'
require 'json'
require 'mysql2'

def lambda_handler(event:, context:)
  endpoint = ENV['DBEndpoint'] # Add the endpoint without https"
  port = ENV['Port']           # 3306
  user = ENV['DBUser']
  region = ENV['DBRegion']     # 'us-east-1'
  db_name = ENV['DBName']

  credentials = Aws::Credentials.new(
    ENV['AWS_ACCESS_KEY_ID'],
    ENV['AWS_SECRET_ACCESS_KEY'],
    ENV['AWS_SESSION_TOKEN']
  )
  rds_client = Aws::RDS::AuthTokenGenerator.new(
    region: region,
    credentials: credentials
  )
```

```
  token = rds_client.auth_token(
    endpoint: endpoint+ ':' + port,
    user_name: user,
    region: region
  )

  begin
    conn = Mysql2::Client.new(
      host: endpoint,
      username: user,
      password: token,
      port: port,
      database: db_name,
      sslca: '/var/task/global-bundle.pem',
      sslverify: true,
      enable_cleartext_plugin: true
    )
    a = 3
    b = 2
    result = conn.query("SELECT #{a} + #{b} AS sum").first['sum']
    puts result
    conn.close
    {
      statusCode: 200,
      body: result.to_json
    }
  rescue => e
    puts "Database connection failed due to #{e}"
  end
end
```

Amazon S3 examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Amazon S3.

Basics are code examples that show you how to perform the essential operations within a service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other Amazon Web Services services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Get started

Hello Amazon S3

The following code example shows how to get started using Amazon S3.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
# frozen_string_literal: true

# S3Manager is a class responsible for managing S3 operations
# such as listing all S3 buckets in the current AWS account.
class S3Manager
  def initialize(client)
    @client = client
    @logger = Logger.new($stdout)
  end
```

```
  # Lists and prints all S3 buckets in the current AWS account.
  def list_buckets
    @logger.info('Here are the buckets in your account:')

    response = @client.list_buckets

    if response.buckets.empty?
      @logger.info("You don't have any S3 buckets yet.")
    else
      response.buckets.each do |bucket|
        @logger.info("- #{bucket.name}")
      end
    end
  rescue Aws::Errors::ServiceError => e
    @logger.error("Encountered an error while listing buckets: #{e.message}")
  end
end

if $PROGRAM_NAME == __FILE__
  s3_client = Aws::S3::Client.new
  manager = S3Manager.new(s3_client)
  manager.list_buckets
end
```

- For API details, see ListBuckets in *Amazon SDK for Ruby API Reference*.

Basics

Learn the basics

The following code example shows how to:

- Create a bucket and upload a file to it.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the bucket objects and the bucket.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-s3'

# Wraps the getting started scenario actions.
class ScenarioGettingStarted
  attr_reader :s3_resource

  # @param s3_resource [Aws::S3::Resource] An Amazon S3 resource.
  def initialize(s3_resource)
    @s3_resource = s3_resource
  end

  # Creates a bucket with a random name in the currently configured account and
  # AWS Region.
  #
  # @return [Aws::S3::Bucket] The newly created bucket.
  def create_bucket
    bucket = @s3_resource.create_bucket(
      bucket: "amzn-s3-demo-bucket-#{Random.uuid}",

Actions

`CopyObject`

The following code example shows how to use `CopyObject`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Copy an object.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectCopyWrapper
  attr_reader :source_object

  # @param source_object [Aws::S3::Object] An existing Amazon S3 object. This is
 used as the source object for
  #                                        copy actions.
  def initialize(source_object)
    @source_object = source_object
  end

  # Copy the source object to the specified target bucket and rename it with the
 target key.
  #
  # @param target_bucket [Aws::S3::Bucket] An existing Amazon S3 bucket where the
 object is copied.
  # @param target_object_key [String] The key to give the copy of the object.
  # @return [Aws::S3::Object, nil] The copied object when successful; otherwise,
 nil.
  def copy_object(target_bucket, target_object_key)
    @source_object.copy_to(bucket: target_bucket.name, key: target_object_key)
    target_bucket.object(target_object_key)
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't copy #{@source_object.key} to #{target_object_key}. Here's why:
 #{e.message}"
```

```
  end
end

# Example usage:
def run_demo
  source_bucket_name = "amzn-s3-demo-bucket1"
  source_key = "my-source-file.txt"
  target_bucket_name = "amzn-s3-demo-bucket2"
  target_key = "my-target-file.txt"

  source_bucket = Aws::S3::Bucket.new(source_bucket_name)
  wrapper = ObjectCopyWrapper.new(source_bucket.object(source_key))
  target_bucket = Aws::S3::Bucket.new(target_bucket_name)
  target_object = wrapper.copy_object(target_bucket, target_key)
  return unless target_object

  puts "Copied #{source_key} from #{source_bucket_name} to
 #{target_object.bucket_name}:#{target_object.key}."
end

run_demo if $PROGRAM_NAME == __FILE__
```

Copy an object and add server-side encryption to the destination object.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectCopyEncryptWrapper
  attr_reader :source_object

  # @param source_object [Aws::S3::Object] An existing Amazon S3 object. This is
 used as the source object for
  #                                        copy actions.
  def initialize(source_object)
    @source_object = source_object
  end

  # Copy the source object to the specified target bucket, rename it with the target
 key, and encrypt it.
  #
  # @param target_bucket [Aws::S3::Bucket] An existing Amazon S3 bucket where the
 object is copied.
```

```
  # @param target_object_key [String] The key to give the copy of the object.
  # @return [Aws::S3::Object, nil] The copied object when successful; otherwise,
 nil.
  def copy_object(target_bucket, target_object_key, encryption)
    @source_object.copy_to(bucket: target_bucket.name, key: target_object_key,
 server_side_encryption: encryption)
    target_bucket.object(target_object_key)
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't copy #{@source_object.key} to #{target_object_key}. Here's why:
 #{e.message}"
  end
end

# Example usage:
def run_demo
  source_bucket_name = "amzn-s3-demo-bucket1"
  source_key = "my-source-file.txt"
  target_bucket_name = "amzn-s3-demo-bucket2"
  target_key = "my-target-file.txt"
  target_encryption = "AES256"

  source_bucket = Aws::S3::Bucket.new(source_bucket_name)
  wrapper = ObjectCopyEncryptWrapper.new(source_bucket.object(source_key))
  target_bucket = Aws::S3::Bucket.new(target_bucket_name)
  target_object = wrapper.copy_object(target_bucket, target_key, target_encryption)
  return unless target_object

  puts "Copied #{source_key} from #{source_bucket_name} to
 #{target_object.bucket_name}:#{target_object.key} and "\
       "encrypted the target with #{target_object.server_side_encryption}
 encryption."
end

run_demo if $PROGRAM_NAME == __FILE__
```

- For API details, see CopyObject in *Amazon SDK for Ruby API Reference*.

`CreateBucket`

The following code example shows how to use `CreateBucket`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 bucket actions.
class BucketCreateWrapper
  attr_reader :bucket

  # @param bucket [Aws::S3::Bucket] An Amazon S3 bucket initialized with a name.
 This is a client-side object until
  #                                 create is called.
  def initialize(bucket)
    @bucket = bucket
  end

  # Creates an Amazon S3 bucket in the specified AWS Region.
  #
  # @param region [String] The Region where the bucket is created.
  # @return [Boolean] True when the bucket is created; otherwise, false.
  def create?(region)
    @bucket.create(create_bucket_configuration: { location_constraint: region })
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't create bucket. Here's why: #{e.message}"
    false
  end

  # Gets the Region where the bucket is located.
  #
  # @return [String] The location of the bucket.
  def location
    if @bucket.nil?
      'None. You must create a bucket before you can get its location!'
    else
      @bucket.client.get_bucket_location(bucket: @bucket.name).location_constraint
    end
```

```
  rescue Aws::Errors::ServiceError => e
    "Couldn't get the location of #{@bucket.name}. Here's why: #{e.message}"
  end
end

# Example usage:
def run_demo
  region = "us-west-2"
  wrapper = BucketCreateWrapper.new(Aws::S3::Bucket.new("amzn-s3-demo-bucket-
#{Random.uuid}"))
  return unless wrapper.create?(region)

  puts "Created bucket #{wrapper.bucket.name}."
  puts "Your bucket's region is: #{wrapper.location}"
end

run_demo if $PROGRAM_NAME == __FILE__
```

- For API details, see CreateBucket in *Amazon SDK for Ruby API Reference*.

`DeleteBucket`

The following code example shows how to use `DeleteBucket`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
  # Deletes the objects in an Amazon S3 bucket and deletes the bucket.
  #
  # @param bucket [Aws::S3::Bucket] The bucket to empty and delete.
  def delete_bucket(bucket)
    puts("\nDo you want to delete all of the objects as well as the bucket (y/n)? ")
    answer = gets.chomp.downcase
    if answer == 'y'

    puts("\t#{e.code}: #{e.message}")
    raise
  end
```

- For API details, see DeleteBucket in *Amazon SDK for Ruby API Reference*.

`DeleteBucketCors`

The following code example shows how to use `DeleteBucketCors`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 bucket CORS configuration.
class BucketCorsWrapper
  attr_reader :bucket_cors

  # @param bucket_cors [Aws::S3::BucketCors] A bucket CORS object configured with an
 existing bucket.
  def initialize(bucket_cors)
    @bucket_cors = bucket_cors
  end

  # Deletes the CORS configuration of a bucket.
  #
  # @return [Boolean] True if the CORS rules were deleted; otherwise, false.
  def delete_cors
    @bucket_cors.delete
    true
```

```
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't delete CORS rules for #{@bucket_cors.bucket.name}. Here's why:
 #{e.message}"
    false
  end

end
```

- For API details, see DeleteBucketCors in *Amazon SDK for Ruby API Reference*.

`DeleteBucketPolicy`

The following code example shows how to use `DeleteBucketPolicy`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
# Wraps an Amazon S3 bucket policy.
class BucketPolicyWrapper
  attr_reader :bucket_policy

  # @param bucket_policy [Aws::S3::BucketPolicy] A bucket policy object configured
 with an existing bucket.
  def initialize(bucket_policy)
    @bucket_policy = bucket_policy
  end

  def delete_policy
    @bucket_policy.delete
    true
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't delete the policy from #{@bucket_policy.bucket.name}. Here's why:
 #{e.message}"
    false
  end
```

```
end
```

- For API details, see DeleteBucketPolicy in *Amazon SDK for Ruby API Reference*.

`DeleteObjects`

The following code example shows how to use `DeleteObjects`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
# Deletes the objects in an Amazon S3 bucket and deletes the bucket.
#
# @param bucket [Aws::S3::Bucket] The bucket to empty and delete.
def delete_bucket(bucket)
  puts("\nDo you want to delete all of the objects as well as the bucket (y/n)? ")
  answer = gets.chomp.downcase
  if answer == 'y'
    bucket.objects.batch_delete!
    bucket.delete
    puts("Emptied and deleted bucket #{bucket.name}.\n")
  end
rescue Aws::Errors::ServiceError => e
  puts("Couldn't empty and delete bucket #{bucket.name}.")
  puts("\t#{e.code}: #{e.message}")
  raise
end
```

- For API details, see DeleteObjects in *Amazon SDK for Ruby API Reference*.

`GetBucketCors`

The following code example shows how to use `GetBucketCors`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 bucket CORS configuration.
class BucketCorsWrapper
  attr_reader :bucket_cors

  # @param bucket_cors [Aws::S3::BucketCors] A bucket CORS object configured with an
 existing bucket.
  def initialize(bucket_cors)
    @bucket_cors = bucket_cors
  end

  # Gets the CORS configuration of a bucket.
  #
  # @return [Aws::S3::Type::GetBucketCorsOutput, nil] The current CORS configuration
 for the bucket.
  def cors
    @bucket_cors.data
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't get CORS configuration for #{@bucket_cors.bucket.name}. Here's
 why: #{e.message}"
    nil
  end

end
```

- For API details, see GetBucketCors in *Amazon SDK for Ruby API Reference*.

`GetBucketPolicy`

The following code example shows how to use `GetBucketPolicy`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
# Wraps an Amazon S3 bucket policy.
class BucketPolicyWrapper
  attr_reader :bucket_policy

  # @param bucket_policy [Aws::S3::BucketPolicy] A bucket policy object configured
 with an existing bucket.
  def initialize(bucket_policy)
    @bucket_policy = bucket_policy
  end

  # Gets the policy of a bucket.
  #
  # @return [Aws::S3::GetBucketPolicyOutput, nil] The current bucket policy.
  def policy
    policy = @bucket_policy.data.policy
    policy.respond_to?(:read) ? policy.read : policy
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't get the policy for #{@bucket_policy.bucket.name}. Here's why:
 #{e.message}"
    nil
  end

end
```

- For API details, see GetBucketPolicy in *Amazon SDK for Ruby API Reference*.

`GetObject`

The following code example shows how to use `GetObject`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Get an object.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectGetWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  # Gets the object directly to a file.
  #
  # @param target_path [String] The path to the file where the object is downloaded.
  # @return [Aws::S3::Types::GetObjectOutput, nil] The retrieved object data if
 successful; otherwise nil.
  def get_object(target_path)
    @object.get(response_target: target_path)
  rescue Aws::Errors::ServiceError => e
    puts "Couldn't get object #{@object.key}. Here's why: #{e.message}"
  end
end

# Example usage:
def run_demo
  bucket_name = "amzn-s3-demo-bucket"
  object_key = "my-object.txt"
  target_path = "my-object-as-file.txt"

  wrapper = ObjectGetWrapper.new(Aws::S3::Object.new(bucket_name, object_key))
  obj_data = wrapper.get_object(target_path)
  return unless obj_data
```

```
  puts "Object #{object_key} (#{obj_data.content_length} bytes} downloaded to
 #{target_path}."
end

run_demo if $PROGRAM_NAME == __FILE__
```

Get an object and report its server-side encryption state.

```
require 'aws-sdk-s3'

# Wraps Amazon S3 object actions.
class ObjectGetEncryptionWrapper
  attr_reader :object

  # @param object [Aws::S3::Object] An existing Amazon S3 object.
  def initialize(object)
    @object = object
  end

  return unless wrapper.put_object_encrypted(object_content, encryption)

  puts "Put your content into #{bucket_name}:#{object_key} and encrypted it with
 #{encryption}."
end

run_demo if $PROGRAM_NAME == __FILE__
```

- For API details, see PutObject in *Amazon SDK for Ruby API Reference*.

Scenarios

Create a presigned URL

The following code example shows how to create a presigned URL for Amazon S3 and upload an object.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-s3'
require 'net/http'

# Creates a presigned URL that can be used to upload content to an object.
#
# @param bucket [Aws::S3::Bucket] An existing Amazon S3 bucket.
# @param object_key [String] The key to give the uploaded object.
# @return [URI, nil] The parsed URI if successful; otherwise nil.
def get_presigned_url(bucket, object_key)
  url = bucket.object(object_key).presigned_url(:put)
  puts "Created presigned URL: #{url}"
  URI(url)
rescue Aws::Errors::ServiceError => e
  puts "Couldn't create presigned URL for #{bucket.name}:#{object_key}. Here's why:
 #{e.message}"
end

# Example usage:
def run_demo
  bucket_name = "amzn-s3-demo-bucket"
  object_key = "my-file.txt"
  object_content = "This is the content of my-file.txt."

  bucket = Aws::S3::Bucket.new(bucket_name)
  presigned_url = get_presigned_url(bucket, object_key)
  return unless presigned_url

  response = Net::HTTP.start(presigned_url.host) do |http|
    http.send_request('PUT', presigned_url.request_uri, object_content,
 'content_type' => '')
  end

  case response
  when Net::HTTPSuccess
```

```
    puts 'Content uploaded!'
  else
    puts response.value
  end
end

run_demo if $PROGRAM_NAME == __FILE__
```

Serverless examples

Invoke a Lambda function from an Amazon S3 trigger

The following code example shows how to implement a Lambda function that receives an event triggered by uploading an object to an S3 bucket. The function retrieves the S3 bucket name and object key from the event parameter and calls the Amazon S3 API to retrieve and log the content type of the object.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming an S3 event with Lambda using Ruby.

```
require 'json'
require 'uri'
require 'aws-sdk'

puts 'Loading function'

def lambda_handler(event:, context:)
  s3 = Aws::S3::Client.new(region: 'region') # Your AWS region
  # puts "Received event: #{JSON.dump(event)}"

  # Get the object from the event and show its content type
  bucket = event['Records'][0]['s3']['bucket']['name']
```

```
  key = URI.decode_www_form_component(event['Records'][0]['s3']['object']['key'],
 Encoding::UTF_8)
  begin
    response = s3.get_object(bucket: bucket, key: key)
    puts "CONTENT TYPE: #{response.content_type}"
    return response.content_type
  rescue StandardError => e
    puts e.message
    puts "Error getting object #{key} from bucket #{bucket}. Make sure they exist
 and your bucket is in the same region as this function."
    raise e
  end
end
```

Amazon SES examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Amazon SES.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

`Subscribe`

The following code example shows how to use `Subscribe`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

Subscribe an email address to a topic.

```
require 'aws-sdk-sns'
require 'logger'

# Represents a service for creating subscriptions in Amazon Simple Notification
 Service (SNS)
class SubscriptionService
  # Initializes the SubscriptionService with an SNS client
  #
  # @param sns_client [Aws::SNS::Client] The SNS client
  def initialize(sns_client)
    @sns_client = sns_client
    @logger = Logger.new($stdout)
  end

  # Attempts to create a subscription to a topic
  #
  # @param topic_arn [String] The ARN of the SNS topic
  # @param protocol [String] The subscription protocol (e.g., email)
  # @param endpoint [String] The endpoint that receives the notifications (email
 address)
  # @return [Boolean] true if subscription was successfully created, false otherwise
  def create_subscription(topic_arn, protocol, endpoint)
    @sns_client.subscribe(topic_arn: topic_arn, protocol: protocol, endpoint:
 endpoint)
    @logger.info('Subscription created successfully.')
    true
  rescue Aws::SNS::Errors::ServiceError => e
    @logger.error("Error while creating the subscription: #{e.message}")
    false
```

```
  end
end

# Main execution if the script is run directly
if $PROGRAM_NAME == __FILE__
  protocol = 'email'
  endpoint = 'EMAIL_ADDRESS' # Should be replaced with a real email address
  topic_arn = 'TOPIC_ARN'    # Should be replaced with a real topic ARN

  sns_client = Aws::SNS::Client.new
  subscription_service = SubscriptionService.new(sns_client)

  @logger.info('Creating the subscription.')
  unless subscription_service.create_subscription(topic_arn, protocol, endpoint)
    @logger.error('Subscription creation failed. Stopping program.')
    exit 1
  end
end
```

- For more information, see Amazon SDK for Ruby Developer Guide.
- For API details, see Subscribe in *Amazon SDK for Ruby API Reference*.

Serverless examples

Invoke a Lambda function from an Amazon SNS trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving messages from an SNS topic. The function retrieves the messages from the event parameter and logs the content of each message.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming an SNS event with Lambda using Ruby.

```
# Copyright Amazon.com, Inc. or its affiliates. All Rights Reserved.
# SPDX-License-Identifier: Apache-2.0
def lambda_handler(event:, context:)
  event['Records'].map { |record| process_message(record) }
end

def process_message(record)
  message = record['Sns']['Message']
  puts("Processing message: #{message}")
rescue StandardError => e
  puts("Error processing message: #{e}")
  raise
end
```

Amazon SQS examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Amazon SQS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

- Actions
- Serverless examples

Actions

`ChangeMessageVisibility`

The following code example shows how to use `ChangeMessageVisibility`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-sqs' # v2: require 'aws-sdk'
# Replace us-west-2 with the AWS Region you're using for Amazon SQS.
sqs = Aws::SQS::Client.new(region: 'us-west-2')

begin
  queue_name = 'my-queue'
  queue_url = sqs.get_queue_url(queue_name: queue_name).queue_url

  # Receive up to 10 messages
  receive_message_result_before = sqs.receive_message({
                                                        queue_url: queue_url,
                                                        max_number_of_messages: 10
                                                      })

  puts "Before attempting to change message visibility timeout: received
 #{receive_message_result_before.messages.count} message(s)."

  receive_message_result_before.messages.each do |message|
    sqs.change_message_visibility({
                                    queue_url: queue_url,
                                    receipt_handle: message.receipt_handle,
                                    visibility_timeout: 30 # This message will not
 be visible for 30 seconds after first receipt.
                                  })
  end

  # Try to retrieve the original messages after setting their visibility timeout.
  receive_message_result_after = sqs.receive_message({
                                                       queue_url: queue_url,
                                                       max_number_of_messages: 10
                                                     })
```

```
  puts "\nAfter attempting to change message visibility timeout: received
 #{receive_message_result_after.messages.count} message(s)."
rescue Aws::SQS::Errors::NonExistentQueue
  puts "Cannot receive messages for a queue named '#{queue_name}', as it does not
 exist."
end
```

- For API details, see ChangeMessageVisibility in *Amazon SDK for Ruby API Reference*.

`CreateQueue`

The following code example shows how to use `CreateQueue`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
# This code example demonstrates how to create a queue in Amazon Simple Queue
 Service (Amazon SQS).

require 'aws-sdk-sqs'

# @param sqs_client [Aws::SQS::Client] An initialized Amazon SQS client.
# @param queue_name [String] The name of the queue.
# @return [Boolean] true if the queue was created; otherwise, false.
# @example
#   exit 1 unless queue_created?(
#     Aws::SQS::Client.new(region: 'us-west-2'),
#     'my-queue'
#   )
def queue_created?(sqs_client, queue_name)
  sqs_client.create_queue(queue_name: queue_name)
  true
rescue StandardError => e
  puts "Error creating queue: #{e.message}"
  false
```

```
end

# Full example call:
# Replace us-west-2 with the AWS Region you're using for Amazon SQS.
def run_me
  region = 'us-west-2'
  queue_name = 'my-queue'
  sqs_client = Aws::SQS::Client.new(region: region)

  puts "Creating the queue named '#{queue_name}'..."

  if queue_created?(sqs_client, queue_name)
    puts 'Queue created.'
  else
    puts 'Queue not created.'
  end
end

# Example usage:
run_me if $PROGRAM_NAME == __FILE__
```

- For API details, see CreateQueue in *Amazon SDK for Ruby API Reference*.

`DeleteQueue`

The following code example shows how to use `DeleteQueue`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-sqs' # v2: require 'aws-sdk'
# Replace us-west-2 with the AWS Region you're using for Amazon SQS.
sqs = Aws::SQS::Client.new(region: 'us-west-2')

sqs.delete_queue(queue_url: URL)
```

- For API details, see DeleteQueue in *Amazon SDK for Ruby API Reference*.

`ListQueues`

The following code example shows how to use `ListQueues`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
require 'aws-sdk-sqs'
require 'aws-sdk-sts'

# @param sqs_client [Aws::SQS::Client] An initialized Amazon SQS client.
# @example
#   list_queue_urls(Aws::SQS::Client.new(region: 'us-west-2'))
def list_queue_urls(sqs_client)
  queues = sqs_client.list_queues

  queues.queue_urls.each do |url|
    puts url
  end
rescue StandardError => e
  puts "Error listing queue URLs: #{e.message}"
end

# Lists the attributes of a queue in Amazon Simple Queue Service (Amazon SQS).
#
# @param sqs_client [Aws::SQS::Client] An initialized Amazon SQS client.
# @param queue_url [String] The URL of the queue.
# @example
#   list_queue_attributes(
#     Aws::SQS::Client.new(region: 'us-west-2'),
#     'https://sqs.us-west-2.amazonaws.com/111111111111/my-queue'
```

```
#   )

      id: 'Message1',
      message_body: 'This is the first message.'
    },
    {
      id: 'Message2',
      message_body: 'This is the second message.'
    }
  ]
```

```
  sts_client = Aws::STS::Client.new(region: region)

  # For example:
  # 'https://sqs.us-west-2.amazonaws.com/111111111111/my-queue'
  queue_url = "https://sqs.#{region}.amazonaws.com/
#{sts_client.get_caller_identity.account}/#{queue_name}"

  sqs_client = Aws::SQS::Client.new(region: region)

  puts "Sending messages to the queue named '#{queue_name}'..."

  if messages_sent?(sqs_client, queue_url, entries)
    puts 'Messages sent.'
  else
    puts 'Messages not sent.'
  end
end
```

- For API details, see SendMessageBatch in *Amazon SDK for Ruby API Reference*.

Serverless examples

Invoke a Lambda function from an Amazon SQS trigger

The following code example shows how to implement a Lambda function that receives an event triggered by receiving messages from an SQS queue. The function retrieves the messages from the event parameter and logs the content of each message.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Consuming an SQS event with Lambda using Ruby.

```
# Copyright Amazon.com, Inc. or its affiliates. All Rights Reserved.
```

```
# SPDX-License-Identifier: Apache-2.0
def lambda_handler(event:, context:)
  event['Records'].each do |message|
    process_message(message)
  end
  puts "done"
end

def process_message(message)
  begin
    puts "Processed message #{message['body']}"
    # TODO: Do interesting work based on the new message
  rescue StandardError => err
    puts "An error occurred"
    raise err
  end
end
```

Reporting batch item failures for Lambda functions with an Amazon SQS trigger

The following code example shows how to implement partial batch response for Lambda functions that receive events from an SQS queue. The function reports the batch item failures in the response, signaling to Lambda to retry those messages later.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Serverless examples repository.

Reporting SQS batch item failures with Lambda using Ruby.

```
# Copyright Amazon.com, Inc. or its affiliates. All Rights Reserved.
# SPDX-License-Identifier: Apache-2.0
require 'json'

def lambda_handler(event:, context:)
  if event
    batch_item_failures = []
```

```
    sqs_batch_response = {}

    event["Records"].each do |record|
      begin
        # process message
      rescue StandardError => e
        batch_item_failures << {"itemIdentifier" => record['messageId']}
      end
    end

    sqs_batch_response["batchItemFailures"] = batch_item_failures
    return sqs_batch_response
  end
end
```

Amazon STS examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Amazon STS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

`AssumeRole`

The following code example shows how to use `AssumeRole`.

SDK for Ruby

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the Amazon Code Examples Repository.

```
 # Creates an AWS Security Token Service (AWS STS) client with specified
credentials.
 # This is separated into a factory function so that it can be mocked for unit
testing.
 #
 # @param key_id [String] The ID of the access key used by the STS client.
 # @param key_secret [String] The secret part of the access key used by the STS
client.
 def create_sts_client(key_id, key_secret)
   Aws::STS::Client.new(access_key_id: key_id, secret_access_key: key_secret)
 end

 # Gets temporary credentials that can be used to assume a role.
 #
 # @param role_arn [String] The ARN of the role that is assumed when these
credentials
 #                          are used.
 # @param sts_client [AWS::STS::Client] An AWS STS client.
 # @return [Aws::AssumeRoleCredentials] The credentials that can be used to assume
the role.
 def assume_role(role_arn, sts_client)
   credentials = Aws::AssumeRoleCredentials.new(
     client: sts_client,
     role_arn: role_arn,
     role_session_name: 'create-use-assume-role-scenario'
   )
   @logger.info("Assumed role '#{role_arn}', got temporary credentials.")
   credentials
 end
```

- For API details, see AssumeRole in *Amazon SDK for Ruby API Reference*.

Amazon Textract examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Amazon Textract.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other Amazon Web Services services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Topics

Scenarios

Create an application to analyze customer feedback

The following code example shows how to create an application that analyzes customer comment cards, translates them from their original language, determines their sentiment, and generates an audio file from the translated text.

SDK for Ruby

This example application analyzes and stores customer feedback cards. Specifically, it fulfills the need of a fictitious hotel in New York City. The hotel receives feedback from guests in various languages in the form of physical comment cards. That feedback is uploaded into the app through a web client. After an image of a comment card is uploaded, the following steps occur:

- Text is extracted from the image using Amazon Textract.
- Amazon Comprehend determines the sentiment of the extracted text and its language.
- The extracted text is translated to English using Amazon Translate.
- Amazon Polly synthesizes an audio file from the extracted text.

The full app can be deployed with the Amazon CDK. For source code and deployment instructions, see the project in GitHub.

Services used in this example

- Amazon Comprehend

- Lambda
- Amazon Polly
- Amazon Textract
- Amazon Translate

Amazon Translate examples using SDK for Ruby

The following code examples show you how to perform actions and implement common scenarios by using the Amazon SDK for Ruby with Amazon Translate.

Scenarios are code examples that show you how to accomplish specific tasks by calling multiple functions within a service or combined with other Amazon Web Services services.

Each example includes a link to the complete source code, where you can find instructions on how to set up and run the code in context.

Migrating from Amazon SDK for Ruby version 1 or 2 to Amazon SDK for Ruby version 3

This topic includes details to help you migrate from version 1 or 2 of the Amazon SDK for Ruby to version 3.

Side-by-side usage

It isn't necessary to replace the version 1 or 2 of the Amazon SDK for Ruby with version 3. You can use them together in the same application. See this blog post for more information.

A quick example follows.

```
require 'aws-sdk-v1' # version 1
require 'aws-sdk'    # version 2
require 'aws-sdk-s3' # version 3

s3 = AWS::S3::Client.new # version 1
s3 = Aws::S3::Client.new # version 2 or 3
```

You don't need to rewrite existing working version 1 or 2 code to start using the version 3 SDK. A valid migration strategy is to only write new code against the version 3 SDK.

General differences

Version 3 differs from version 2 in one important way.

- Each service is available as a separate gem.

Version 2 differs from version 1 in several important ways.

- Different root namespace –`Aws` versus `Amazon`. This enables side-by-side usage.
- `Aws.config`– Now a vanilla Ruby hash, instead of a method.
- Strict constructor options - When constructing a client or resource object in the version 1 SDK, unknown constructor options are ignored. In version 2, unknown constructor options trigger an `ArgumentError`. For example:

```
# version 1
AWS::S3::Client.new(http_reed_timeout: 10)
# oops, typo'd option is ignored

# version 2
Aws::S3::Client.new(http_reed_timeout: 10)
# => raises ArgumentError
```

Client differences

There are no differences between the client classes in version 2 and version 3.

Between version 1 and version 2, the client classes have the fewest external differences. Many service clients will have compatible interfaces after client construction. Some important differences:

- `Aws::S3::Client` - The version 1 Amazon S3 client class was hand-coded. Version 2 is generated from a service model. Method names and inputs are very different in version 2.
- `Aws::EC2::Client`- Version 2 uses plural names for output lists, version 1 uses the suffix `_set`. For example:

```
# version 1
resp = AWS::EC2::Client.new.describe_security_groups
resp.security_group_set
#=> [...]

# version 2
resp = Aws::EC2::Client.new.describe_security_groups
resp.security_groups
#=> [...]
```

- `Aws::SWF::Client`– Version 2 uses structured responses, where version 1 uses vanilla Ruby hashes.
- Service class renames – Version 2 uses a different name for multiple services:
  - `Amazon::SimpleWorkflow` has become `Aws::SWF`
  - `Amazon::ELB` has become `Aws::ElasticLoadBalancing`
  - `Amazon::SimpleEmailService` has become `Aws::SES`

- Client configuration options – Some of the version 1 configuration options are renamed in version 2. Others are removed or replaced. Here are the primary changes:
  - `:use_ssl` has been removed. Version 2 uses SSL everywhere. To disable SSL you must configure an `:endpoint` that uses `http://`.
  - `:ssl_ca_file` is now `:ssl_ca_bundle`
  - `:ssl_ca_path` is now `:ssl_ca_directory`
  - Added `:ssl_ca_store`.
  - `:endpoint` must now be a fully qualified HTTP or HTTPS URI instead of a hostname.
  - Removed `:*_port` options for each service, now replaced by `:endpoint`.
  - `:user_agent_prefix` is now `:user_agent_suffix`

Resource differences

There are no differences between the resource interfaces in version 2 and version 3.

There are significant differences between the resource interfaces in version 1 and version 2. Version 1 was entirely hand-coded, where as version 2 resource interfaces are generated from a model. Version 2 resource interfaces are significantly more consistent. Some of the systemic differences include:

- Separate resource class – In version 2, the service name is a module, not a class. In this module, it is the resource interface:

```
# version 1
s3 = AWS::S3.new

# version 2
s3 = Aws::S3::Resource.new
```

- Referencing resources – The version 2 SDK separates collections and individual resource getters into two different methods:

```
# version 1
s3.buckets['bucket-name'].objects['key'].delete

# version 2
s3.bucket('bucket-name').object('key').delete
```

- Batch operations – In version 1, all batch operations were hand-coded utilities. In version 2, many batch operations are autogenerated batching operations over the API. **Version 2 batching interfaces are very different from version 1.**

Security for Amazon SDK for Ruby

Cloud security at Amazon Web Services (Amazon) is the highest priority. As an Amazon customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations. Security is a shared responsibility between Amazon and you. The Shared Responsibility Model describes this as Security of the Cloud and Security in the Cloud.

Security of the Cloud– Amazon is responsible for protecting the infrastructure that runs all of the services offered in the Amazon Cloud and providing you with services that you can use securely. Our security responsibility is the highest priority at Amazon, and the effectiveness of our security is regularly tested and verified by third-party auditors as part of the Amazon Compliance Programs.

Security in the Cloud– Your responsibility is determined by the Amazon Web Services service you are using, and other factors including the sensitivity of your data, your organization's requirements, and applicable laws and regulations.

Topics

Data Protection in Amazon SDK for Ruby

The Amazon shared responsibility model applies to data protection in . As described in this model, Amazon is responsible for protecting the global infrastructure that runs all of the Amazon Web Services Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the Amazon Web Services services that you use. For more information about data privacy, see the Data Privacy FAQ.

For data protection purposes, we recommend that you protect Amazon Web Services account credentials and set up individual users with Amazon IAM Identity Center or Amazon Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with Amazon resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with Amazon CloudTrail. For information about using CloudTrail trails to capture Amazon activities, see Working with CloudTrail trails in the *Amazon CloudTrail User Guide*.
- Use Amazon encryption solutions, along with all default security controls within Amazon Web Services services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-3 validated cryptographic modules when accessing Amazon through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-3.

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field. This includes when you work with or other Amazon Web Services services using the console, API, Amazon CLI, or Amazon SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Identity and Access Management for Amazon SDK for Ruby

Amazon Identity and Access Management (IAM) is an Amazon Web Services (Amazon) service that helps an administrator securely control access to Amazon resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use resources Amazon Web Services services. IAM is an Amazon Web Services service that you can use with no additional charge.

To use Amazon SDK for Ruby to access Amazon, you need an Amazon account and Amazon credentials. To increase the security of your Amazon account, we recommend that you use an *IAM user* to provide access credentials instead of using your Amazon account credentials.

For details about working with IAM, see IAM.

For an overview of IAM users and why they are important for the security of your account, see Amazon Security Credentials in the Amazon Web Services General Reference.

Amazon SDK for Ruby follows the shared responsibility model through the specific Amazon Web Services (Amazon) services it supports. For Amazon Web Services service security information, see the Amazon Web Services service security documentation page and Amazon Web Services services that are in scope of Amazon compliance efforts by compliance program.

Compliance Validation for Amazon SDK for Ruby

Amazon SDK for Ruby follows the shared responsibility model through the specific Amazon Web Services (Amazon) services it supports. For Amazon Web Services service security information, see the Amazon Web Services service security documentation page and Amazon Web Services services that are in scope of Amazon compliance efforts by compliance program.

The security and compliance of Amazon Web Services (Amazon) services is assessed by third-party auditors as part of multiple Amazon compliance programs. These include SOC, PCI, FedRAMP, HIPAA, and others. Amazon provides a frequently updated list of Amazon Web Services services in scope of specific compliance programs at Amazon Services in Scope by Compliance Program.

Third-party audit reports are available for you to download using Amazon Artifact. For more information, see Downloading Reports in Amazon Artifact.

For more information about Amazon compliance programs, see Amazon Compliance Programs.

Your compliance responsibility when using Amazon SDK for Ruby to access an Amazon Web Services service is determined by the sensitivity of your data, your organization's compliance objectives, and applicable laws and regulations. If your use of an Amazon Web Services service is subject to compliance with standards such as HIPAA, PCI, or FedRAMP, Amazon provides resources to help:

- Security and Compliance Quick Start Guides– Deployment guides that discuss architectural considerations and provide steps for deploying security-focused and compliance-focused baseline environments on Amazon.

- HIPAA Eligible Services Reference – Lists HIPAA eligible services. Not all Amazon Web Services services are HIPAA eligible.
- Amazon Compliance Resources– A collection of workbooks and guides that might apply to your industry and location.
- Amazon Config– A service that assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- Amazon Security Hub– A comprehensive view of your security state within Amazon that helps you check your compliance with security industry standards and best practices.

Resilience for Amazon SDK for Ruby

The Amazon Web Services (Amazon) global infrastructure is built around Amazon Web Services Regions and Availability Zones.

Amazon Web Services Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking.

With Availability Zones, you can design and operate applications and databases that automatically fail over between Availability Zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about Amazon Web Services Regions and Availability Zones, see Amazon Global Infrastructure.

Amazon SDK for Ruby follows the shared responsibility model through the specific Amazon Web Services (Amazon) services it supports. For Amazon Web Services service security information, see the Amazon Web Services service security documentation page and Amazon Web Services services that are in scope of Amazon compliance efforts by compliance program.

Infrastructure Security for Amazon SDK for Ruby

Amazon SDK for Ruby follows the shared responsibility model through the specific Amazon Web Services (Amazon) services it supports. For Amazon Web Services service security information, see the Amazon Web Services service security documentation page and Amazon Web Services services that are in scope of Amazon compliance efforts by compliance program.

For information about Amazon security processes, see the Amazon: Overview of Security Processes whitepaper.

Enforcing a minimum TLS version in the Amazon SDK for Ruby

Communication between the Amazon SDK for Ruby and Amazon is secured using Secure Sockets Layer (SSL) or Transport Layer Security (TLS). All versions of SSL, and versions of TLS earlier than 1.2, have vulnerabilities that can compromise the security of your communication with Amazon. For this reason, you should make sure that you're using the Amazon SDK for Ruby with a version of Ruby that supports TLS version 1.2 or later.

Ruby uses the OpenSSL library to secure HTTP connections. Supported versions of Ruby (1.9.3 and later) installed through system package managers (`yum`, `apt`, and others), an official installer, or Ruby managers (rbenv, RVM, and others) typically incorporate OpenSSL 1.0.1 or later, which supports TLS 1.2.

When used with a supported version of Ruby with OpenSSL 1.0.1 or later, the Amazon SDK for Ruby prefers TLS 1.2, and uses the latest version of SSL or TLS supported by both the client and server. This is always at least TLS 1.2 for Amazon Web Services services. (The SDK uses the Ruby `Net::HTTP` class with `use_ssl=true`.)

Checking the OpenSSL version

To make sure your installation of Ruby is using OpenSSL 1.0.1 or later, enter the following command.

```
ruby -r openssl -e 'puts OpenSSL::OPENSSL_VERSION'
```

An alternative way to get the OpenSSL version is to query the `openssl` executable directly. First, locate the appropriate executable using the following command.

```
ruby -r rbconfig -e 'puts RbConfig::CONFIG["configure_args"]'
```

The output should have `--with-openssl-dir=/path/to/openssl` indicating the location of the OpenSSL installation. Make a note of this path. To check the version of OpenSSL, enter the following commands.

```
cd /path/to/openssl
bin/openssl version
```

This latter method might not work with all installations of Ruby.

Upgrading TLS support

If the version of OpenSSL used by your Ruby installation is earlier than 1.0.1, upgrade your Ruby or OpenSSL installation using your system package manager, Ruby installer, or Ruby manager, as described in Ruby's installation guide. If you're installing Ruby from source, install the latest OpenSSL first, and then pass `--with-openssl-dir=/path/to/upgraded/openssl` when running `./configure`.

Amazon S3 Encryption Client Migration (V1 to V2)

> **Note**
>
> If you are using V2 of the S3 encryption client and want to migrate to V3, see Amazon S3 Encryption Client Migration (V2 to V3).

This topic shows how to migrate your applications from Version 1 (V1) of the Amazon Simple Storage Service (Amazon S3) encryption client to Version 2 (V2), and ensure application availability throughout the migration process.

Migration Overview

This migration happens in two phases:

1. **Update existing clients to read new formats.** First, deploy an updated version of the Amazon SDK for Ruby to your application. This will allow existing V1 encryption clients to decrypt objects written by the new V2 clients. If your application uses multiple Amazon SDKs, you must upgrade each SDK separately.

2. **Migrate encryption and decryption clients to V2.** Once all of your V1 encryption clients can read new formats, you can migrate your existing encryption and decryption clients to their respective V2 versions.

Update Existing Clients to Read New Formats

The V2 encryption client uses encryption algorithms that older versions of the client don't support. The first step in the migration is to update your V1 decryption clients to the latest SDK release. After completing this step, your application's V1 clients will be able to decrypt objects encrypted by V2 encryption clients. See details below for each major version of the Amazon SDK for Ruby.

Update Amazon SDK for Ruby Version 3

Version 3 is the latest version of the Amazon SDK For Ruby. To complete this migration, you need to use version 1.76.0 or later of the `aws-sdk-s3` gem.

Installing from the Command Line

For projects that install the `aws-sdk-s3` gem, use the version option to verify that the minimum version of 1.76.0 is installed.

```
gem install aws-sdk-s3 -v '>= 1.76.0'
```

Using Gemfiles

For projects that use a Gemfile to manage dependencies, set the minimum version of the `aws-sdk-s3` gem to 1.76.0. For example:

```
gem 'aws-sdk-s3', '>= 1.76.0'
```

1. Modify your Gemfile.
2. Run `bundle update aws-sdk-s3`. To verify your version, run `bundle info aws-sdk-s3`.

Upgrade Amazon SDK for Ruby Version 2

Version 2 of the Amazon SDK for Ruby will enter maintenance mode on November 21st, 2021. To complete this migration, you need to use version 2.11.562 or later of the aws-sdk gem.

Installing from the Command Line

For projects that install the `aws-sdk` gem, from the command line, use the version option to verify that the minimum version of 2.11.562 is installed.

```
gem install aws-sdk -v '>= 2.11.562'
```

Using Gemfiles

For projects that use a Gemfile to manage dependencies, set the minimum version of the `aws-sdk` gem to 2.11.562. For example:

```
gem 'aws-sdk', '>= 2.11.562'
```

1. Modify your Gemfile. If you have a Gemfile.lock file, delete or update it.
2. Run `bundle update aws-sdk`. To verify your version, run `bundle info aws-sdk`.

Migrate Encryption and Decryption Clients to V2

After updating your clients to read the new encryption formats, you can update your applications to the V2 encryption and decryption clients. The following steps show you how to successfully migrate your code from V1 to V2.

Before updating your code to use the V2 encryption client, ensure that you have followed the preceding steps and are using the `aws-sdk-s3` gem version 2.11.562 or later.

> **Note**
>
> When decrypting with AES-GCM, read the entire object to the end before you start using the decrypted data. This is to verify that the object has not been modified since it was encrypted.

Configuring V2 Encryption Clients

The *EncryptionV2::Client* requires additional configuration. For detailed configuration information, see the EncryptionV2::Client documentation or the examples provided later in this topic.

1. **The key wrap method and content encryption algorithm must be specified on client construction.** When creating a new `EncryptionV2::Client`, you need to provide values for `key_wrap_schema` and `content_encryption_schema`.

`key_wrap_schema` - If you are using Amazon KMS, this must be set to `:kms_context`. If you are using a symmetric (AES) key, it must be set to `:aes_gcm`. If you are using an asymmetric (RSA) key, it must be set to `:rsa_oaep_sha1`.

`content_encryption_schema` - This must be set to *:aes_gcm_no_padding*.

2. **security_profile must be specified on client construction.** When creating a new `EncryptionV2::Client`, you need to provide a value for `security_profile`. The *security_profile* parameter determines the support for reading objects written using the older V1 `Encryption::Client`. There are two values: *:v2* and *:v2_and_legacy*. To support migration, set the `security_profile` to *:v2_and_legacy*. Use *:v2* only for new application development.

3. **Amazon KMS key ID is enforced by default.** In V1, `Encryption::Client`, the `kms_key_id` used to create the client was not provided to the Amazon KMS `Decrypt call`. Amazon KMS can get this information from metadata and add it to the symmetric ciphertext blob. In V2, E`ncryptionV2::Client`, the *kms_key_id* is passed to the Amazon KMS Decrypt call, and the call fails if it does not match the key used to encrypt the object. If your code previously relied on not setting a specific `kms_key_id`, either set `kms_key_id: :kms_allow_decrypt_with_any_cmk` on client creation or set `kms_allow_decrypt_with_any_cmk: true` on `get_object` calls.

Example: Using a Symmetric (AES) Key

Pre-migration

```
client = Aws::S3::Encryption::Client.new(encryption_key: aes_key)
client.put_object(bucket: bucket, key: key, body: secret_data)
resp = client.get_object(bucket: bucket, key: key)
```

Post-migration

```
client = Aws::S3::EncryptionV2::Client.new(
  encryption_key: rsa_key,
  key_wrap_schema: :rsa_oaep_sha1, # the key_wrap_schema must be rsa_oaep_sha1 for
 asymmetric keys
  content_encryption_schema: :aes_gcm_no_padding,
  security_profile: :v2_and_legacy # to allow reading/decrypting objects encrypted by
 the V1 encryption client
 )
client.put_object(bucket: bucket, key: key, body: secret_data)  # No changes
resp = client.get_object(bucket: bucket, key: key) # No changes
```

Example: Using Amazon KMS with kms_key_id

Pre-migration

```
client = Aws::S3::Encryption::Client.new(kms_key_id: kms_key_id)
client.put_object(bucket: bucket, key: key, body: secret_data)
resp = client.get_object(bucket: bucket, key: key)
```

Post-migration

```
client = Aws::S3::EncryptionV2::Client.new(
```

```
  kms_key_id: kms_key_id,
  key_wrap_schema: :kms_context, # the key_wrap_schema must be kms_context for KMS keys
  content_encryption_schema: :aes_gcm_no_padding,
  security_profile: :v2_and_legacy # to allow reading/decrypting objects encrypted by
 the V1 encryption client
)
client.put_object(bucket: bucket, key: key, body: secret_data)  # No changes
resp = client.get_object(bucket: bucket, key: key) # No change
```

Example: Using Amazon KMS without kms_key_id

Pre-migration

```
client = Aws::S3::Encryption::Client.new(kms_key_id: kms_key_id)
client.put_object(bucket: bucket, key: key, body: secret_data)
resp = client.get_object(bucket: bucket, key: key)
```

Post-migration

```
client = Aws::S3::EncryptionV2::Client.new(
  kms_key_id: kms_key_id,
  key_wrap_schema: :kms_context, # the key_wrap_schema must be kms_context for KMS keys
  content_encryption_schema: :aes_gcm_no_padding,
  security_profile: :v2_and_legacy # to allow reading/decrypting objects encrypted by
 the V1 encryption client
)
client.put_object(bucket: bucket, key: key, body: secret_data)  # No changes
resp = client.get_object(bucket: bucket, key: key, kms_allow_decrypt_with_any_cmk:
 true) # To allow decrypting with any cmk
```

Post-Migration Alternative

If you only read and decrypt (never write and encrypt) objects using the S2 encryption client, use this code.

```
client = Aws::S3::EncryptionV2::Client.new(
  kms_key_id: :kms_allow_decrypt_with_any_cmk, # set kms_key_id to allow all get_object
 requests to use any cmk
  key_wrap_schema: :kms_context, # the key_wrap_schema must be kms_context for KMS keys
  content_encryption_schema: :aes_gcm_no_padding,
  security_profile: :v2_and_legacy # to allow reading/decrypting objects encrypted by
 the V1 encryption client
```

```
)
resp = client.get_object(bucket: bucket, key: key) # No change
```

Amazon S3 Encryption Client Migration (V2 to V3)

> **Note**
>
> If you are using V1 of the S3 encryption client, you must first migrate to V2 before migrating to V3. See Amazon S3 Encryption Client Migration (V1 to V2) for instructions on migrating from V1 to V2.

This topic shows how to migrate your applications from Version 2 (V2) of the Amazon Simple Storage Service (Amazon S3) encryption client to Version 3 (V3), and ensure application availability throughout the migration process. V3 introduces AES GCM with Key Commitment and Commitment Policies to enhance security and protect against data key tampering.

Migration Overview

Version 3 of the Amazon S3 encryption client introduces AES GCM with Key Commitment for enhanced security. This new encryption algorithm provides protection against data key tampering and ensures the integrity of encrypted data. The migration to V3 requires careful planning to maintain application availability and data accessibility throughout the process.

This migration happens in two phases:

1. **Update existing clients to read new formats.** First, deploy an updated version of the Amazon SDK for Ruby to your application. This will allow existing V2 encryption clients to decrypt objects written by the new V3 clients. If your application uses multiple Amazon SDKs, you must upgrade each SDK separately.

2. **Migrate encryption and decryption clients to V3.** Once all of your V2 encryption clients can read new formats, you can migrate your existing encryption and decryption clients to their respective V3 versions. This includes configuring Commitment Policies and updating your code to use the new client configuration options.

If you have not yet migrated from V1 to V2, you must complete that migration first. See Amazon S3 Encryption Client Migration (V1 to V2) for detailed instructions on migrating from V1 to V2.

Understanding V3 Features

Version 3 of the Amazon S3 encryption client introduces two key security features: Commitment Policies and AES GCM with Key Commitment. Understanding these features is essential for planning your migration strategy and ensuring the security of your encrypted data.

Commitment Policies

Commitment Policies control how the encryption client handles key commitment during encryption and decryption operations. Key commitment ensures that encrypted data can only be decrypted with the exact key that was used to encrypt it, protecting against certain types of cryptographic attacks.

The V3 encryption client supports three Commitment Policy options:

`FORBID_ENCRYPT_ALLOW_DECRYPT`

This policy encrypts objects without key commitment and allows decryption of both objects with and without key commitment.

- **Encryption behavior:** Objects are encrypted without key commitment, using the same algorithm suite as V2.
- **Decryption behavior:** Can decrypt objects encrypted with or without key commitment.
- **Security implications:** This policy does not enforce key commitment and may allow tampering. Objects encrypted with this policy do not benefit from the enhanced security protections of key commitment. Use this policy only during migration when you need to maintain compatibility with V2 encryption behavior.
- **Version compatibility:** Objects encrypted with this policy can be read by all V2 and V3 implementations of the S3 encryption client.

`REQUIRE_ENCRYPT_ALLOW_DECRYPT`

This policy encrypts objects with key commitment and allows decryption of both objects with and without key commitment.

- **Encryption behavior:** Objects are encrypted with key commitment using AES GCM with Key Commitment.
- **Decryption behavior:** Can decrypt objects encrypted with or without key commitment, providing backward compatibility.

- **Security implications:** New objects benefit from key commitment protection, while existing objects without key commitment can still be read. This provides a balance between security and backward compatibility during migration.
- **Version compatibility:** Objects encrypted with this policy can only be read by the V3 and the latest V2 implementations of the S3 encryption client.

`REQUIRE_ENCRYPT_REQUIRE_DECRYPT`

This policy encrypts objects with key commitment and only allows decryption of objects that were encrypted with key commitment.

- **Encryption behavior:** Objects are encrypted with key commitment using AES GCM with Key Commitment.
- **Decryption behavior:** Can only decrypt objects that were encrypted with key commitment. Attempts to decrypt objects without key commitment will fail.
- **Security implications:** This policy provides the highest level of security by enforcing key commitment for all operations. Use this policy only after all objects have been re-encrypted with key commitment and all clients have been upgraded to V3.
- **Version compatibility:** Objects encrypted with this policy can only be read by the V3 and the latest V2 implementations of the S3 encryption client. This policy also prevents reading objects encrypted by V2 or V1 clients.

> **Note**
>
> When planning your migration, start with `REQUIRE_ENCRYPT_ALLOW_DECRYPT` to maintain backward compatibility while gaining the security benefits of key commitment for new objects. Only move to `REQUIRE_ENCRYPT_REQUIRE_DECRYPT` after all objects have been re-encrypted and all clients have been upgraded to V3.

AES GCM with Key Commitment

AES GCM with Key Commitment (`ALG_AES_256_GCM_HKDF_SHA512_COMMIT_KEY`) is a new encryption algorithm introduced in V3 that provides enhanced security by protecting against data key tampering. Understanding how this algorithm works and when it applies is important for planning your migration.

How ALG_AES_256_GCM_HKDF_SHA512_COMMIT_KEY Differs from Previous Algorithms

Previous versions of the S3 encryption client used AES CBC or AES GCM without key commitment to encrypt the data key in Instruction Files. ALG_AES_256_GCM_HKDF_SHA512_COMMIT_KEY adds a cryptographic commitment to the encryption process, which binds the encrypted data to a specific key. This prevents an attacker from tampering with the encrypted data key in the Instruction File and causing the client to decrypt data with an incorrect key.

Without key commitment, it may be possible for an attacker to modify the encrypted data key in an Instruction File such that it decrypts to a different key, potentially allowing unauthorized access or data corruption. ALG_AES_256_GCM_HKDF_SHA512_COMMIT_KEY prevents this attack by ensuring that the encrypted data key can only decrypt to the original key that was used during encryption.

Version Compatibility

Objects encrypted with ALG_AES_256_GCM_HKDF_SHA512_COMMIT_KEY can only be decrypted by V3 implementations of the S3 encryption client and certain transition versions of V2 that include support for reading V3 formats. V2 clients without this transition support cannot decrypt Instruction Files encrypted with ALG_AES_256_GCM_HKDF_SHA512_COMMIT_KEY.

> **⚠ Warning**
>
> Before enabling encryption with ALG_AES_256_GCM_HKDF_SHA512_COMMIT_KEY (by using REQUIRE_ENCRYPT_ALLOW_DECRYPT or REQUIRE_ENCRYPT_REQUIRE_DECRYPT commitment policies), ensure that all clients that need to read your encrypted objects have been upgraded to V3 or a transition version that supports V3 formats. If any V2 clients without transition support attempt to read objects encrypted with ALG_AES_256_GCM_HKDF_SHA512_COMMIT_KEY, decryption will fail.

During migration, you can use the FORBID_ENCRYPT_ALLOW_DECRYPT commitment policy to continue encrypting without ALG_AES_256_GCM_HKDF_SHA512_COMMIT_KEY while still allowing your V3 clients to read objects encrypted with key commitment. This provides a safe migration path where you first upgrade all readers, then switch to encrypting with key commitment.

Update Existing Clients to Read New Formats

The V3 encryption client uses encryption algorithms and key commitment features that V2 clients don't support by default. The first step in the migration is to update your V2 decryption clients to a version of the Amazon SDK for Ruby that can read V3 encrypted objects. After completing this step, your application's V2 clients will be able to decrypt objects encrypted by V3 encryption clients.

To read objects encrypted by V3 clients (those using `REQUIRE_ENCRYPT_ALLOW_DECRYPT` or `REQUIRE_ENCRYPT_REQUIRE_DECRYPT` commitment policies), you need to use version 1.93.0 or later of the `aws-sdk-s3` gem. This version includes support for decrypting objects encrypted with AES GCM with Key Commitment.

Installing from the Command Line

For projects that install the `aws-sdk-s3` gem from the command line, use the version option to verify that the minimum version of 1.208.0 is installed.

```
gem install aws-sdk-s3 -v '>= 1.208.0'
```

Using Gemfiles

For projects that use a Gemfile to manage dependencies, set the minimum version of the `aws-sdk-s3` gem to 1.208.0. For example:

```
gem 'aws-sdk-s3', '>= 1.208.0'
```

1. Modify your Gemfile to specify the minimum version.
2. Run `bundle update aws-sdk-s3` to update the gem.
3. To verify your version, run `bundle info aws-sdk-s3`.

> **Note**
>
> After updating to the latest version, your existing V2 encryption clients will be able to decrypt objects encrypted by V3 clients. However, they will continue to encrypt new objects using V2 algorithms until you migrate them to V3 as described in the next section.

Migrate Encryption and Decryption Clients to V3

After updating your clients to read the new encryption formats, you can update your applications to the V3 encryption and decryption clients. The following steps show you how to successfully migrate your code from V2 to V3.

Before updating your code to use the V3 encryption client, ensure that you have followed the preceding steps and are using the `aws-sdk-s3` gem version 1.93.0 or later.

> **Note**
>
> When decrypting with AES-GCM, read the entire object to the end before you start using the decrypted data. This is to verify that the object has not been modified since it was encrypted.

Configuring V3 Clients

The V3 encryption client introduces new configuration options that control key commitment behavior and backward compatibility. Understanding these options is essential for a successful migration.

commitment_policy

The `commitment_policy` parameter controls how the encryption client handles key commitment during encryption and decryption operations. This is the most important configuration option for V3 clients.

- `:require_encrypt_allow_decrypt` - Encrypts new objects with key commitment and allows decryption of objects with or without key commitment. This is the recommended setting for migration, as it provides enhanced security for new objects while maintaining backward compatibility with existing V2 objects.
- `:forbid_encrypt_allow_decrypt` - Encrypts new objects without key commitment (using V2 algorithms) and allows decryption of objects with or without key commitment. Use this setting only if you need to maintain V2 encryption behavior during migration, such as when some clients cannot yet read V3 encrypted objects.
- `:require_encrypt_require_decrypt` - Encrypts new objects with key commitment and only allows decryption of objects that were encrypted with key commitment. Use this setting

only after all objects have been re-encrypted with key commitment and all clients have been upgraded to V3.

security_profile

The `security_profile` parameter determines support for reading objects written by older encryption client versions. This parameter is essential for maintaining backward compatibility during migration.

- `:v3_and_legacy` - Allows the V3 client to decrypt objects encrypted by V1 and V2 encryption clients. Use this setting during migration to ensure your V3 clients can read all existing encrypted objects.
- `:v3` - Allows the V3 client to decrypt objects encrypted by V2 encryption clients only. Use this setting if you have already migrated all V1 objects to V2 format.
- If not specified, the client will only decrypt objects encrypted by V3 clients. Use this only for new application development where no legacy objects exist.

envelope_location

The `envelope_location` parameter determines where encryption metadata (including the encrypted data key) is stored. This parameter affects which objects are protected by AES GCM with Key Commitment.

- `:metadata` (Default) - Stores encryption metadata in the S3 object's metadata headers. This is the default behavior and is recommended for most use cases. When using metadata storage, AES GCM with Key Commitment does not apply.
- `:instruction_file` - Stores encryption metadata in a separate S3 object (Instruction File) with a configurable suffix. When using Instruction Files, AES GCM with Key Commitment protects the encrypted data key from tampering. Use this setting if you require the additional security provided by key commitment for the data key itself.

When using `:instruction_file`, you can optionally specify the `instruction_file_suffix` parameter to customize the suffix used for Instruction File objects. The default suffix is `.instruction`.

When to Use Each Configuration Option

During migration, follow this recommended configuration strategy:

1. **Initial Migration:** Set `commitment_policy: :require_encrypt_allow_decrypt` and `security_profile: :v3_and_legacy`. This allows your V3 clients to encrypt new objects with key commitment while still being able to decrypt all existing V1 and V2 objects.
2. **After All Clients Are Upgraded:** Continue using `commitment_policy: :require_encrypt_allow_decrypt` and `security_profile: :v3_and_legacy` until you have re-encrypted all objects that need key commitment protection.
3. **Full V3 Enforcement:** Only after all objects have been re-encrypted with key commitment and you no longer need to read V1/V2 objects, you can optionally switch to `commitment_policy: :require_encrypt_require_decrypt` and remove the `security_profile` parameter (or set it to `:v2` if V2 objects still exist).

For `envelope_location`, continue using your existing storage method (`:metadata` or `:instruction_file`) unless you have a specific reason to change it. If you are currently using metadata storage and want the additional security of AES GCM with Key Commitment for the data key, you can switch to `:instruction_file`, but note that this will require updating all clients that read these objects.

Migrate Encryption and Decryption clients to V3

After updating your clients to read the new encryption formats, you can update your applications to the V3 encryption and decryption clients. The following examples show you how to successfully migrate your code from V2 to V3.

Using V3 Encryption Clients

Pre-migration (V2)

```
require 'aws-sdk-s3'

# Create V2 encryption client with KMS
client = Aws::S3::EncryptionV2::Client.new(
  kms_key_id: kms_key_id,
  key_wrap_schema: :kms_context,
  content_encryption_schema: :aes_gcm_no_padding,
  security_profile: :v2_and_legacy,
  commitment_policy: :forbid_encrypt_allow_decrypt
```

```
)

# Encrypt and upload object
client.put_object(bucket: 'my-bucket', key: 'my-object', body: 'secret data')

# Download and decrypt object
resp = client.get_object(bucket: 'my-bucket', key: 'my-object')
decrypted_data = resp.body.read
```

During migration (V3 with backward compatibility)

```
require 'aws-sdk-s3'

# Create V3 encryption client with KMS
client = Aws::S3::EncryptionV3::Client.new(
  kms_key_id: kms_key_id,
  key_wrap_schema: :kms_context,
  content_encryption_schema: :aes_gcm_no_padding,
  security_profile: :v3_and_legacy,
  commitment_policy: :require_encrypt_allow_decrypt
)

# Encrypt and upload object
client.put_object(bucket: 'my-bucket', key: 'my-object', body: 'secret data')

# Download and decrypt object
resp = client.get_object(bucket: 'my-bucket', key: 'my-object')
decrypted_data = resp.body.read
```

Post-migration (V3)

```
require 'aws-sdk-s3'

# Create V3 encryption client with KMS
client = Aws::S3::EncryptionV3::Client.new(
  kms_key_id: kms_key_id,
  key_wrap_schema: :kms_context,
  content_encryption_schema: :aes_gcm_no_padding,
  security_profile: :v3,
  # Use the commitment policy (REQUIRE_ENCRYPT_REQUIRE_DECRYPT)
  # This encrypts with key commitment and does not decrypt V2 objects
  commitment_policy: :require_encrypt_require_decrypt
)
```

```
# Encrypt and upload object
client.put_object(bucket: 'my-bucket', key: 'my-object', body: 'secret data')

# Download and decrypt object
resp = client.get_object(bucket: 'my-bucket', key: 'my-object')
decrypted_data = resp.body.read
```

The key difference in V3 is the addition of the `commitment_policy` parameter. Setting it to `:require_encrypt_require_decrypt` ensures that new objects are encrypted with key commitment and that the client is only decrypting object encrypted with key commitment, providing enhanced security against data key tampering.

The `put_object` call itself remains unchanged. All the security enhancements are configured at the client level.

Additional Examples

This section provides additional examples for specific migration scenarios and configuration options that may be useful during your V2 to V3 migration.

Instruction File vs Metadata Storage

The S3 encryption client can store encryption metadata (including the encrypted data key) in two different locations: in the S3 object's metadata headers or in a separate Instruction File. The choice of storage method affects which objects benefit from AES GCM with Key Commitment protection.

Metadata Storage (Default)

By default, the encryption client stores encryption metadata in the S3 object's metadata headers. This is the recommended approach for most use cases because it keeps the encryption metadata with the object and doesn't require managing separate Instruction File objects.

```
require 'aws-sdk-s3'

# Create V3 encryption client with metadata storage (default)
client = Aws::S3::EncryptionV3::Client.new(
  kms_key_id: kms_key_id,
  key_wrap_schema: :kms_context,
  content_encryption_schema: :aes_gcm_no_padding,
  security_profile: :v3_and_legacy,
```

```
  commitment_policy: :require_encrypt_allow_decrypt,
  envelope_location: :metadata # Explicitly set to metadata (this is the default)
)

# Encrypt and upload object
# Encryption metadata is stored in the object's metadata headers
client.put_object(bucket: 'my-bucket', key: 'my-object',body: 'secret data')
```

When using metadata storage, AES GCM with Key Commitment does not apply to the encrypted data key. However, the content encryption still benefits from key commitment when using `commitment_policy: :require_encrypt_allow_decrypt` or `:require_encrypt_require_decrypt`.

Instruction File Storage

Alternatively, you can configure the encryption client to store encryption metadata in a separate S3 object called an Instruction File. When using Instruction Files with V3, the encrypted data key is protected by AES GCM with Key Commitment, providing additional security against data key tampering.

```
require 'aws-sdk-s3'

# Create V3 encryption client with instruction file storage
client = Aws::S3::EncryptionV3::Client.new(
  kms_key_id: kms_key_id,
  key_wrap_schema: :kms_context,
  content_encryption_schema: :aes_gcm_no_padding,
  security_profile: :v3_and_legacy,
  commitment_policy: :require_encrypt_allow_decrypt,
  envelope_location: :instruction_file, # Store metadata in separate instruction file
  instruction_file_suffix: '.instruction' # Optional: customize the suffix (default is
 '.instruction')
)

# Encrypt and upload object
# Encryption metadata is stored in a separate object: 'my-object.instruction'
client.put_object(bucket: 'my-bucket', key: 'my-object', body: 'secret data')

# When retrieving the object, the client automatically reads the instruction file
resp = client.get_object(bucket: 'my-bucket', key: 'my-object')
decrypted_data = resp.body.read
```

When using `envelope_location: :instruction_file`, the encryption client creates two S3 objects:

1. The encrypted data object (e.g., `my-object`)
2. The Instruction File containing encryption metadata (e.g., `my-object.instruction`)

The `instruction_file_suffix` parameter allows you to customize the suffix used for Instruction Files. The default value is `.instruction`.

When to Use Each Storage Method

- **Use Metadata Storage** for most scenarios. It simplifies object management since encryption metadata travels with the object.
- **Use Instruction File Storage** when object metadata size is a concern or when you need to separate encryption metadata from the encrypted object. Note that using Instruction Files requires managing two S3 objects (the encrypted object and its instruction file) instead of one.

> **⚠ Warning**
>
> If you change from metadata storage to instruction file storage (or vice versa), existing objects encrypted with the old storage method will not be readable by clients configured with the new storage method. Plan your storage method carefully and maintain consistency across your application.

Document History

The following table describes important changes in this guide. For notification about updates to this documentation, you can subscribe to an RSS feed.

Change	Description	Date
Content reorganization	Updating the table of contents and content organization to better align with other Amazon SDKs.	March 29, 2025
Observability	Added information regarding Ruby Observability.	January 24, 2025
General updates	Updated minimum required Ruby version to v2.5. Updated resource links.	November 13, 2024
Table of contents and guided examples	Removed guided examples to defer to the more comprehen sive Code Examples Repositor y.	July 10, 2024
Table of contents	Updated table of contents to make code examples more accessible.	June 1, 2023
IAM best practices updates	Updated guide to align with the IAM best practices . For more information, see Security best practices in IAM. Updates to Getting started.	May 8, 2023
General updates	Updating welcome page for relevant external resources . Also updated minimum required Ruby version for	August 8, 2022

	v2.3. Updated Amazon Key Management Service sections to reflect terminology updates. Updated usage information on REPL utility for clarity.	
Correcting broken links	Fixed broken examples links. Removed redundant Tips and Tricks page; redirecting to Amazon EC2 example content. Included lists of the code examples that are available on GitHub in the Code Examples repository.	August 3, 2022
SDK Metrics	Removed information about enabling SDK Metrics for Enterprise Support, which has been deprecated.	January 28, 2022
