What is Amazon Server Migration Service?

Amazon Server Migration Service (Amazon SMS) automates the migration of your on-premises VMware vSphere, Microsoft Hyper-V/SCVMM, and Azure virtual machines to the Amazon Cloud. Amazon SMS incrementally replicates your server VMs as cloud-hosted Amazon Machine Images (AMIs) ready for deployment on Amazon EC2. Working with AMIs, you can easily test and update your cloud-based images before deploying them in production.

By using Amazon SMS to manage your server migrations, you can:

- **Simplify the cloud migration process.** You can begin by migrating a group of servers using the Amazon CLI. After the migration has initiated, Amazon SMS manages all the complexities of the migration process, including automatically replicating volumes of live servers to Amazon and creating new AMIs periodically. You can quickly launch EC2 instances from AMIs in the console.
- **Orchestrate multi-server migrations.** Amazon SMS orchestrates server migrations by allowing you to schedule replications and track progress of a group of servers that constitutes an *application*. You can schedule initial replications, configure replication intervals, and track progress for each server using the Amazon CLI. When you launch a migrated application, you can apply customized configuration scripts that run during startup.
- **Test server migrations incrementally:** With support for incremental replication, Amazon SMS allows fast, scalable testing of migrated servers. Because Amazon SMS utilizes incremental replication, it transfers only the changes to the cloud. Therefore, you can test small changes iteratively and save on network bandwidth.
- **Support the most widely used operating systems.** Amazon SMS supports the replication of operating system images containing Windows, as well as several major Linux distributions.
- **Minimize downtime.** Incremental Amazon SMS replication minimizes the business impact associated with application downtime during the final cutover.

Use of Amazon SMS is limited as follows:

- 50 concurrent VM migrations per account, unless a customer requests a limit increase.
- 90 days of service usage per VM (not per account), beginning with the initial replication of a VM. We terminate an ongoing replication after 90 days unless a customer requests a limit increase.
- 50 concurrent application migrations per account, with a limit of 10 groups and 50 servers in each application.

Note

Amazon Server Migration Service requires TCP ports 80, 8080, and 443 to be open on your Amazon accounts. Contact your account manager or log a case with Amazon Support to authorize access to these ports. For more information see [ICP in China](#).

Pricing

There is no additional fee to use Server Migration Service. You pay the standard fees for the S3 buckets, EBS volumes, and data transfer used during the migration process, and for the EC2 instances that you run. For more information, see [Amazon Server Migration Service pricing](#).

Requirements for Amazon Server Migration Service

Your VMware vSphere, Microsoft Hyper-V/SCVMM, or Microsoft Azure environment must meet the following requirements for you to use the Server Migration Service to migrate your on-premises virtualized servers to Amazon EC2.

Requirements

- [General requirements \(p. 2\)](#)
- [Operating systems \(p. 4\)](#)
- [Volume types and file systems \(p. 5\)](#)
- [Configure an IAM user for Server Migration Connector \(p. 5\)](#)
- [Limitations \(p. 5\)](#)
- [Licensing options for Amazon SMS \(p. 7\)](#)
- [Other requirements \(p. 8\)](#)

General requirements

Before setting up Amazon SMS, take action as needed to meet all of the following requirements.

All VMs

- Disable any antivirus or intrusion detection software on the VM you are migrating. These services can be re-enabled after the migration process is complete.
- Disconnect any CD-ROM drives (virtual or physical) connected to the VM.

Windows VMs

- Enable Remote Desktop (RDP) for remote access.
- Install the appropriate version of .NET Framework on the VM. Note that .NET Framework 4.5 or later will be installed automatically on your VM if required.

Windows Version	.NET Framework Version
Windows Server 2008 or earlier	3.5 or later
Windows Server 2008 R2 or later	4.5 or later
Windows 8 or earlier	3.5 or later
Windows 8.1 or later	4.5 or later

- When preparing a Microsoft Windows VM for migration, configure a fixed pagefile size and ensure that at least 6 GiB of free space is available on the root volume. This is necessary for successful installation of the drivers.

- Make sure that your host firewall (such as Windows firewall) allows access to RDP. Otherwise, you will not be able to access your instance after the migration is complete.
- Apply the following hotfixes:
 - [You cannot change system time if RealTimeIsUniversal registry entry is enabled in Windows](#)
 - [High CPU usage during DST changeover in Windows Server 2008, Windows 7, or Windows Server 2008 R2](#)
- The following instance types are the only instance types that support 32-bit AMIs: `t2.nano`, `t2.micro`, `t2.small`, `t2.medium`, `c3.large`, `t1.micro`, `m1.small`, `m1.medium`, and `c1.medium`. If you are migrating a 32-bit instance, you are limited to these instance types and the Regions that support them.

Linux VMs

- Enable Secure Shell (SSH) for remote access.
- Make sure that your host firewall (such as iptables) allows access to SSH. Otherwise, you won't be able to access your instance after the migration is complete.
- Make sure that you have configured a non-root user to use public key-based SSH to access your instance after it is imported. The use of password-based SSH and root login over SSH are both possible, but we do not recommend it. We recommend the use of public keys and a non-root user because it is more secure. Your Linux VM won't have an `ec2-user` account created as part of the migration process.
- Make sure that your Linux VM uses GRUB (GRUB legacy) or GRUB 2 as its bootloader.
- Make sure that the root volume of your Linux VM uses one of the following file systems:
 - EXT2
 - EXT3
 - EXT4
 - Btrfs
 - JFS
 - XFS
- Migrated Linux VMs must use 64-bit images. Migrating 32-bit Linux images is not supported.
- Migrated Linux VMs should use default kernels for best results. VMs that use custom Linux kernels might not migrate successfully.
- When preparing Amazon EC2 Linux VMs for migration, make sure that at least 250 MiB of disk space is available on the root volume for installing drivers and other software.

Programmatic modifications to VMs

When importing a VM, Amazon modifies the file system to make the imported VM accessible to the customer. The following actions may occur:

- [Linux] Installing Citrix PV drivers either directly in OS or modify `initrd/initramfs` to contain them.
- [Linux] Modifying network scripts to replace static IP addresses with dynamic IP addresses.
- [Linux] Modifying `/etc/fstab`, commenting out invalid entries and replacing device names with UUIDs. If no matching UUID can be found for a device, the `nofail` option is added to the device description. You will need to correct the device naming and remove `nofail` after import. As a best practice when preparing your VMs for import, we recommend that you specify your VM disk devices by UUID rather than device name.

Entries in `/etc/fstab` that contain distributed file system types (`nfs`, `cifs`, `smbfs`, `vboxsf`, `sshfs`, etc.) will be disabled.

- [Linux] Modifying grub bootloader settings such as the default entry and timeout.

- [Windows] Modifying registry settings to make the VM bootable.

When writing a modified file, Amazon retains the original file at the same location under a new name.

Operating systems

The following operating systems can be migrated to EC2 using SMS:

Windows (32- and 64-bit)

- Microsoft Windows Server 2003 (Standard, Datacenter, Enterprise) with Service Pack 1 (SP1) or later (32- and 64-bit)
- Microsoft Windows Server 2003 R2 (Standard, Datacenter, Enterprise) (32- and 64-bit)
- Microsoft Windows Server 2008 (Standard, Datacenter, Enterprise) (32- and 64-bit)
- Microsoft Windows Server 2008 R2 (Standard, Web Server, Datacenter, Enterprise) (64-bit only)
- Microsoft Windows Server 2012 (Standard, Datacenter) (64-bit only)
- Microsoft Windows Server 2012 R2 (Standard, Datacenter) (64-bit only) (Nano Server installation not supported)
- Microsoft Windows Server 2016 (Standard, Datacenter) (64-bit only)
- Microsoft Windows Server 1709 (Standard, Datacenter) (64-bit only)
- Microsoft Windows Server 1803 (Standard, Datacenter) (64-bit only)
- Microsoft Windows Server 2019 (Standard, Datacenter) (64-bit only)
- Microsoft Windows 7 (Home, Professional, Enterprise, Ultimate) (US English) (32- and 64-bit)
- Microsoft Windows 8 (Home, Professional, Enterprise) (US English) (32- and 64-bit)
- Microsoft Windows 8.1 (Professional, Enterprise) (US English) (64-bit only)
- Microsoft Windows 10 (Home, Professional, Enterprise, Education) (US English) (64-bit only)

Linux/Unix (64-bit)

- Ubuntu 12.04, 12.10, 13.04, 13.10, 14.04, 14.10, 15.04, 16.04, 16.10, 17.04, 18.04
- Red Hat Enterprise Linux (RHEL) 5.1-5.11, 6.1-6.9, 7.0-7.6 (6.0 lacks required drivers)
- SUSE Linux Enterprise Server 11 with Service Pack 1 and kernel 2.6.32.12-0.7
- SUSE Linux Enterprise Server 11 with Service Pack 2 and kernel 3.0.13-0.27
- SUSE Linux Enterprise Server 11 with Service Pack 3 and kernel 3.0.76-0.11, 3.0.101-0.8, or 3.0.101-0.15
- SUSE Linux Enterprise Server 11 with Service Pack 4 and kernel 3.0.101-63
- SUSE Linux Enterprise Server 12 with kernel 3.12.28-4
- SUSE Linux Enterprise Server 12 with Service Pack 1 and kernel 3.12.49-11
- SUSE Linux Enterprise Server 12 with Service Pack 2 and kernel 4.4
- SUSE Linux Enterprise Server 12 with Service Pack 3 and kernel 4.4
- CentOS 5.1-5.11, 6.1-6.6, 7.0-7.6 (6.0 lacks required drivers)
- Debian 6.0.0-6.0.8, 7.0.0-7.8.0, 8.0.0
- Oracle Linux 5.10-5.11 with el5uek kernel suffix
- Oracle Linux 6.1-6.10 using RHEL-compatible kernel 2.6.32 or UEK kernels 3.8.13, 4.1.12
- Oracle Linux 7.0-7.6 using RHEL compatible kernel 3.10.0 or UEK kernels 3.8.13, 4.1.12, 4.14.35

- Fedora Server 19-21

Volume types and file systems

Amazon Server Migration Service supports migrating Windows and Linux instances with the following file systems:

Operating System	File System	Architecture	Partition Table	Data Volumes Supported	Boot Volumes Supported
Windows	NTFS	32-bit	MBR	✓	✓
			GPT	✓	
		64-bit	MBR	✓	✓
			GPT	✓	✓ (VHDX only)
	ReFS	32-bit	MBR		
			GPT		
		64-bit	MBR	✓	
			GPT	✓	
Linux/Unix	ext2, ext3, ext4, Btrfs, JFS, XFS	64-bit	MBR	✓	✓
			GPT	✓	

AMIs with volumes using EBS encryption are not supported. When migrating servers using Amazon SMS, do not turn on encryption by default. If encryption by default is already on and you are experiencing delta replication failures, turn off this feature.

Configure an IAM user for Server Migration Connector

To create an IAM user for Server Migration Connector in your Amazon account

1. Create a new IAM user for your connector to communicate with Amazon. Save the generated access key and secret key for use during the initial connector setup. For information about managing IAM users and permissions, see [Creating an IAM User in Your Amazon Account](#).
2. Attach the managed IAM policy **ServerMigrationConnector** to the IAM user. For more information, see [Managed Policies and Inline Policies](#).

Limitations

The following limitations apply.

Limitations

- [Image format \(p. 6\)](#)

- [Booting \(p. 6\)](#)
- [Networking \(p. 6\)](#)
- [Application import from Migration Hub \(p. 6\)](#)
- [Miscellaneous \(p. 7\)](#)

Image format

- When migrating VMs managed by Hyper-V/SCVMM, SMS supports both Generation 1 VMs (using either VHD or VHDX disk format) and Generation 2 VMs (VHDX only).
- Amazon SMS does not support VMs on Hyper-V running any version of RHEL 5 if backed by a VHDX disk. We recommend converting disks in this format to VHD for migration.
- Amazon SMS does not support VMs that have a mix of VHD and VHDX disk files.
- On VMware, Amazon SMS does not support VMs that use Raw Device Mapping (RDM). Only VMDK disk images are supported.

Booting

- UEFI/EFI boot partitions are supported only for Windows boot volumes with VHDX as the image format. Otherwise, a VM's boot volume must use Master Boot Record (MBR) partitions. In either case, boot volume cannot exceed 2 TiB (uncompressed) due to MBR limitations.

Note

When Amazon detects a Windows GPT boot volume with an UEFI boot partition, it converts it on-the-fly to an MBR boot volume with a BIOS boot partition. This is because EC2 does not directly support GPT boot volumes.

- An imported VM might fail to boot if the root partition is not on the same virtual hard drive as the MBR.
- A migrated VM might fail to boot if the root partition is not on the same virtual hard disk as the MBR.
- Migrating VMs with dual-boot configurations is not supported.

Networking

- Multiple network interfaces are not currently supported. After migration, your VM will have a single virtual network interface that uses DHCP to assign addresses. Your instance receives a private IP address.
- A VM migrated into a VPC does not receive a public IP address, regardless of the auto-assign public IP setting for the subnet. Instead, you can allocate an Elastic IP address to your account and associate it with your instance.
- Internet Protocol version 6 (IPv6) IP addresses are not supported.

Application import from Migration Hub

- SMS imports application-related servers from Amazon Migration Hub only if they exist in the SMS Server Catalog. As a result, some applications may only be partially migrated.
- If none of the servers in a Migration Hub application exist in the SMS Server Catalog, the import will fail silently and the application will not be visible in SMS.
- Imported applications can be migrated but cannot be edited in SMS. They can, however, be edited in Migration Hub.

Miscellaneous

- An SMS replication job will fail for VMs with more than 22 volumes attached.
- AMIs with volumes using EBS encryption are not supported. When migrating servers using Amazon SMS, do not turn on encryption by default. If encryption by default is already on and you are experiencing delta replication failures, turn off this feature.
- Amazon SMS creates AMIs that use Hardware Virtual Machine (HVM) virtualization. It can't create AMIs that use Paravirtual (PV) virtualization. Linux PVHVM drivers are supported within migrated VMs.
- VMs that are created as the result of a P2V conversion are not supported. A P2V conversion occurs when a disk image is created by performing a Linux or Windows installation process on a physical machine and then importing a copy of that Linux or Windows installation to a VM.
- Amazon SMS does not install the single root I/O virtualization (SR-IOV) drivers except with imports of Microsoft Windows Server 2012 R2 VMs. These drivers are not required unless you plan to use enhanced networking, which provides higher performance (packets per second), lower latency, and lower jitter. For Microsoft Windows Server 2012 R2 VMs, SR-IOV drivers are automatically installed as a part of the migration process.
- Because independent disks are unaffected by snapshots, Amazon SMS does not support interval replication for VMDKs in independent mode.
- Windows language packs that use UTF-16 (or non-ASCII) characters are not supported for import. We recommend using the English language pack when importing Windows Server 2003, Windows Server 2008, and Windows Server 2012 R1 VMs.
- For Windows Server 2003, disable Windows driver-signing checks before migrating.

Licensing options for Amazon SMS

When you create a new replication job, the Amazon Server Migration Service API and Amazon CLI include a license type option. If you choose a license type that is incompatible with your VM, the replication job fails with an error message. The possible values are:

- **Auto** (default)

Detects the source-system operating system (OS) and applies the appropriate license to the migrated virtual machine (VM).

- **Amazon**

Replaces the source-system license with an Amazon license, if appropriate, on the migrated VM.

- **BYOL**

Retains the source-system license, if appropriate, on the migrated VM.

Amazon CLI example:

```
aws sms create-replication-job --license-type value
```

The value of the `--license-type` parameter can be `AWS` or `BYOL`. The default value is `Auto`.

Licensing for Linux

Linux operating systems support only BYOL licenses. Choosing **Auto** (the default) means that SMS uses a BYOL license.

Migrated Red Hat Enterprise Linux (RHEL) VMs must use Cloud Access (BYOL) licenses. For more information, see [Red Hat Cloud Access](#) on the Red Hat website.

Migrated SUSE Linux Enterprise Server VMs must use SUSE Public Cloud Program (BYOS) licenses. For more information, see [SUSE Public Cloud Program—Bring Your Own Subscription](#).

Licensing for Windows

Windows server operating systems support either BYOL or Amazon licenses. Windows client operating systems (such as Windows 10) support only BYOL licenses.

If you choose **Auto** (the default), Amazon SMS uses the Amazon license if the VM has a server OS. If the VM has a client OS, the BYOL license is used.

The following rules apply when you use your BYOL Microsoft license, either through MSDN or [Windows Software Assurance Per User](#):

- Your BYOL instances are priced at the prevailing Amazon EC2 Linux instance pricing, provided that you meet the following conditions:
 - Run on a Dedicated Host ([Dedicated Hosts](#))
 - Launch from VMs sourced from software binaries provided by you using Amazon SMS, which are subject to the current terms and abilities of Amazon SMS
 - Designate the instances as BYOL instances
 - Run the instances within your designated Amazon Regions, and where Amazon offers the BYOL model
 - Activate using Microsoft keys that you provide or are used in your key management system
- You must account for the fact that when you start an Amazon EC2 instance, it can run on any one of many servers within an Availability Zone. This means that each time you start an Amazon EC2 instance (including a stop/start), it might run on a different server within an Availability Zone. You must account for this fact in light of the limitations on license reassignment as described in Microsoft Volume Licensing Product Terms, available at [Licensing Terms](#), or consult your specific use rights to determine if your rights are consistent with this usage.
- You must be eligible to use the BYOL program for the applicable Microsoft software under your agreements with Microsoft, for example, under your MSDN user rights or under your Windows Software Assurance Per User Rights. You are solely responsible for obtaining all required licenses and for complying with all applicable Microsoft licensing requirements, including the PUR/PT. Further, you must have accepted Microsoft's End User License Agreement (Microsoft EULA), and by using the Microsoft Software under the BYOL program, you agree to the Microsoft EULA.
- Amazon recommends that you consult with your own legal and other advisers to understand and comply with the applicable Microsoft licensing requirements. Usage of the Services (including usage of the **licenseType** parameter and **BYOL** flag) in violation of your agreements with Microsoft is not authorized or permitted.

Other requirements

Support for VMware vMotion

Amazon Server Migration Service partially supports vMotion, Storage vMotion, and other features based on virtual machine migration (such as DRS and Storage DRS) subject to the following limitations:

- Migrating a virtual machine to a new ESXi host or datastore after one replication run ends, and before the next replication run begins, is supported as long as the Server Migration Connector's vCenter service account has sufficient permissions on the destination ESXi host, datastores, and datacenter, and on the virtual machine itself at the new location.

- Migrating a virtual machine to a new ESXi host, datastore, and/or datacenter while a replication run is active—that is, while a virtual machine upload is in progress—is not supported.
- Cross vCenter vMotion is not supported for use with Amazon SMS.

Support for VMware vSAN

VMs on vSAN datastores are only supported when **Replication job type** on the **Configure replication jobs settings** page is set to **One-time migration**.

Support for VMware Virtual Volumes (VVOL)

Amazon does not provide support for migrating VMware Virtual Volumes. Some implementations may work, however.

VMware VMs with snapshots

Amazon SMS supports only one-time migration on VMs where snapshot-based backup software is used. Also, avoid creating snapshots on VMs replicated through Amazon SMS.

Hyper-V checkpoints

Amazon SMS does not support VMs with existing checkpoints.

Hyper-V differencing disk

Amazon SMS does not support VMs with differencing disks.

Install the Server Migration Connector

The Server Migration Connector is a FreeBSD VM that you install in your on-premises virtualization environment. The supported platforms are VMware vSphere, Microsoft Hyper-V/SCVMM, and Microsoft Azure.

Contents

- [Install the Server Migration Connector on VMware \(p. 10\)](#)
- [Install the Server Migration Connector on Hyper-V \(p. 13\)](#)
- [Install the Server Migration Connector on Azure \(p. 20\)](#)

Install the Server Migration Connector on VMware

Use the following information to install the Server Migration Connector, so that you can use Amazon SMS to migrate VMs from a VMware environment to Amazon EC2.

This information applies only to VMs in an on-premises VMware environment. For information about installing the connector on other environments, see [Install the Server Migration Connector \(p. 10\)](#).

Requirements for VMware connector

- vCenter version 5.1 or higher (validated up to 6.7)
- ESXi 5.1 or higher (validated up to 6.7)
- Minimum 8 GiB RAM
- Minimum available disk storage of 20 GiB (thin-provisioned) or 250 GiB (thick-provisioned)
- Support for the following network services. Note that you might need to reconfigure your firewall to permit stateful outbound connections from the connector to these services.
 - DNS—Allow the connector to initiate connections to port 53 for name resolution.
 - HTTPS on vCenter—Allow the connector to initiate secure web connections to port 443 of vCenter. You can also configure a non-default port at your discretion. If your vCenter Server is configured to use a non-default port, specify both the vCenter's hostname and port, separated by a colon (for example, HOSTNAME : PORT or IP : PORT) in the vCenter Service Account page in **Connector setup**.
 - HTTPS on ESXi—Allow the connector to initiate secure web connections to port 443 of the ESXi hosts containing the VMs you intend to migrate.
 - NTP—Optionally allow the connector outbound access to port 123 for time synchronization. If the connector synchronizes its clock with the ESXi host, this is unnecessary.

To set up the connector for a VMware environment

1. Download the connector for VMware environments using the following link: <https://s3.amazonaws.com/sms-connector/AWS-SMS-Connector.ova>. The connector is a preconfigured FreeBSD VM in OVA format that is ready for deployment in your vCenter.

Integrity checksum

- **MD5** — <https://s3.amazonaws.com/sms-connector/AWS-SMS-Connector.ova.md5>
 - **SHA256** — <https://s3.amazonaws.com/sms-connector/AWS-SMS-Connector.ova.sha256>
2. Set up your vCenter service account. Create a vCenter user with permissions necessary to create and delete snapshots on VMs that need be migrated to Amazon and download their delta disks.

Note

As a best practice, we recommend that you limit vCenter permissions for the connector service account to only those vCenter data centers that contain the VMs that you intend to migrate. We also recommend that you lock down your vCenter service account permissions by assigning this user the NoAccess role in vCenter on the hosts, folders, and datastores that do not have any VMs for migration.

3. Create a role in vCenter with the following privileges:
 - **Datastore > Browse datastore and Low level file operations** (Datastore.Browse and Datastore.FileManagement)
 - **Host > Configuration > System Management** (Host.Config.SystemManagement)
 - **vApp > Export** (VApp.Export)
 - **Virtual Machine > Snapshot management > Create snapshot and Remove Snapshot** (VirtualMachine.State.CreateSnapshot and VirtualMachine.State.RemoveSnapshot)
4. Assign the role as follows:
 - a. Assign this vCenter role to the service account for the connector to use to log in to vCenter.
 - b. Assign this role with propagating permissions to the data centers that contain the VMs to migrate.
5. To manually verify your vCenter service account's permissions, verify that you can log in to vSphere Client with your connector service account credentials. Then, export your VMs as OVF templates, use the datastore browser to download files off the datastores that contain your VMs, and view the properties on the **Summary** tab of the ESXi hosts of your VMs.

To configure the connector

1. Deploy the connector OVA downloaded in the previous procedure to your VMware environment using vSphere Client.
2. Open the connector's virtual machine console and log in as `ec2-user` with the password `ec2pass`. Supply a new password if prompted.
3. Obtain the IP address of the connector as follows:
 - a. Run the command **`sudo setup.rb`**. This displays a configuration menu:

```
Choose one of the following options:
 1. Reset password
 2. Reconfigure network settings
 3. Restart services
 4. Factory reset
 5. Delete unused upgrade-related files
 6. Enable/disable SSL certificate validation
 7. Display connector's SSL certificate
 8. Generate log bundle
 0. Exit
Please enter your option [1-9]:
```

- b. Enter option 2. This displays current network information and a submenu for making changes to the network settings. The output should resemble the following:

```
Current network configuration: DHCP
IP: 192.0.2.100
Netmask: 255.255.254.0
Gateway: 192.0.2.1
DNS server 1: 192.0.2.200
DNS server 2: 192.0.2.201
DNS suffix search list: subdomain.example.com
Web proxy: not configured

Reconfigure your network:
  1. Renew or acquire a DHCP lease
  2. Set up a static IP
  3. Set up a web proxy for Amazon communication
  4. Set up a DNS suffix search list
  5. Exit
Please enter your option [1-5]:
```

You need to enter this IP address in later procedures.

4. [Optional] Configure a static IP address for the connector. This prevents you from having to reconfigure the trusted hosts lists on your LAN each time DHCP assigns a new address to the connector.

In the **Reconfigure your network** menu, enter option **2**. This displays a form to supply network settings:

For each field, provide an appropriate value and press Enter. You should see output similar to the following:

```
Setting up static IP:
  1. Enter IP address: 192.0.2.50
  2. Enter netmask: 255.255.254.0
  3. Enter gateway: 192.0.2.1
  4. Enter DNS 1: 192.0.2.200
  5. Enter DNS 2: 192.0.2.201

Static IP address configured.
```

5. In the connector's network configuration menu, configure domain suffix values for the DNS suffix search list.
6. If your environment uses a web proxy to reach the internet, configure that now.
7. Before leaving the connector console, use **ping** to verify network access to the following targets inside and outside your LAN:
 - Inside your LAN, to your ESXi hosts and vCenter by hostname, FQDN, and IP address
 - Outside your LAN, to Amazon
8. In a web browser, access the connector VM at its IP address (<https://ip-address-of-connector/>) to open the setup wizard, and choose **Get started now**.
9. Review the license agreement, select the check box, and choose **Next**.
10. Create a password for the connector.
11. Choose **Upload logs automatically** and **Server Migration Connector auto-upgrade**.
12. For **Amazon Region**, choose your Region from the list. For **Amazon Credentials**, enter the IAM credentials that you created in [Configure an IAM user for Server Migration Connector \(p. 5\)](#). Choose **Next**.
13. For **vCenter Service Account**, enter the vCenter hostname, user name, and password from step 3. Choose **Next**.

14. After accepting the vCenter certificate, complete registration and then view the connector configuration dashboard.
15. Verify that the connector you registered shows up on the **Connectors** page. If you encounter an issue registering the connector, contact sms-service@amazon.com.

Install the Server Migration Connector on Hyper-V

Amazon SMS supports migration in either of two modes: from standalone Hyper-V servers, or from Hyper-V servers managed by System Center Virtual Machine Manager (SCVMM). Use the following information to install the Server Migration Connector on Hyper-V so that you can use Amazon SMS to migrate VMs from Hyper-V to Amazon EC2.

This information applies only to VMs in an on-premises Hyper-V environment. For information about installing the connector on other environments, see [Install the Server Migration Connector \(p. 10\)](#).

Considerations for migration scenarios

- The installation procedures for standalone Hyper-V and for SCVMM environments are not interchangeable.
- When configured in SCVMM mode, one Server Migration Connector appliance supports migration from one SCVMM (which may manage multiple Hyper-V servers).
- When configured in standalone Hyper-V mode, one Server Migration Connector appliance supports migration from multiple Hyper-V servers.
- Amazon SMS supports deploying any number of connector appliances to support migration from multiple SCVMMs and multiple standalone Hyper-V servers in parallel.

Requirements for Hyper-V connector

- Hyper-V role on Windows Server 2012 R2 or Windows Server 2016
- Active Directory 2012 or above
- [Optional] SCVMM 2012 SP1 or SCVMM 2016
- Minimum 8 GiB RAM
- Minimum available disk storage of 300 GiB
- Support for the following network services. Note that you might need to reconfigure your firewall to permit stateful outbound connections from the connector to these services.
 - DNS—Allow the connector to initiate connections to port 53 for name resolution.
 - HTTPS on WinRM port 5986 on your SCVMM or standalone Hyper-V host
 - Inbound HTTPS on port 443 of the connector—Allow the connector to receive secure web connections on port 443 from Hyper-V hosts containing the VMs you intend to migrate.
 - NTP—Optionally allow the connector outbound access to port 123 for time synchronization. If the connector synchronizes its clock with the Hyper-V host, this is unnecessary.

- [Step 3: Download and install the Hyper-V/SCVMM configuration script \(p. 16\)](#)
- [Step 4: Validate the integrity and cryptographic signature of the script file \(p. 17\)](#)
- [Step 5: Run the script \(p. 18\)](#)

- [Step 6: Configure the connector \(p. 19\)](#)

About the Server Migration Connector installation script

The Amazon SMS configuration script automates creation of appropriate permissions and network connections that allow Amazon SMS to execute tasks on your Hyper-V environment. You must run the script as administrator on each Hyper-V and SCVMM host that you plan to use in migrating VMs. When you run the script, it performs the following actions:

1. **[All systems]** Checks whether the Windows Remote Management (WinRM) service is enabled on SCVMM and all Hyper-V hosts, enables it if necessary, and sets it to start automatically on boot.
2. **[All systems]** Enables PowerShell remoting, which allows the connector to execute PowerShell commands on that host over a WinRM connection.
3. **[All systems]** Creates a self-signed X.509 certificate, creates a WinRM HTTPS listener, and binds the certificate to the listener.
4. **[All systems]** Creates a firewall rule to accept incoming connections to the WinRM listener.
5. **[All systems]** Adds the IP address or domain name of the connector to the list of trusted hosts in the WinRM configuration. You must have this IP address or domain name configured before running the script so that you can provide it interactively.
6. **[All systems]** Enables Credential Security Support Provider (CredSSP) authentication with WinRM.
7. **[All systems]** Grants read and execute permissions to a pre-configured Active Directory user on WinRM configSDDL. This user is the same as the service account described below in [Step 1: Create a service account for Server Migration Connector in Active Directory \(p. 14\)](#).
8. **[Standalone Hyper-V only]** Adds the Active Directory user to the groups Hyper-V Administrators and Remote Management Users on your Hyper-V host.
9. **[Standalone Hyper-V only]** Gives read-only permissions to all VM data folders managed by this Hyper-V.
10. **[SCVMM only]** Grants "Execute Methods," "Enable Account," and "Remote Enable" permissions to the Active Directory user on two WMI objects, CIMV2 and SCVMM.
11. **[SCVMM only]** Creates a Delegated Administrator role in SCVMM with permissions to access all Hyper-V hosts. It assigns the role to the Active Directory user. You can selectively remove access to hosts by editing this role in SCVMM.
12. **[SCVMM only]** Checks whether a secure (HTTPS) network path exists between SCVMM and the Hyper-V hosts. If the script does not detect a secure channel, it returns an error and generates instructions for the administrator to secure the channel.
13. **[SCVMM only]** Iterates through all the Hyper-V hosts managed by SCVMM and grants the Active Directory user read-only permissions on all VM folders on each Hyper-V host.

Step 1: Create a service account for Server Migration Connector in Active Directory

The Server Migration Connector requires a service account in Active Directory. As the connector configuration script is run on each SCVMM and Hyper-V host, it grants permissions on those hosts to this account.

Note

When configured in SCVMM mode, the SCVMM host and all the Hyper-V hosts that it manages must be located in a single Active Directory domain. If you have multiple Active Directory domains, configure a connector for each.

To create the Active Directory user

1. Using the Active Directory Administrative Center on the Windows computer where your Active Directory forest is installed, create a new user and assign a password to it.
2. Add the new user to the **Remote Management Users** group.

Step 2: Download and deploy the Server Migration Connector

Download the [Server Migration Connector for Hyper-V and SCVMM](#) to your on-premises environment and install it on a Hyper-V host.

To set up the connector for a Hyper-V environment

1. Download the connector for Hyper-V using the following link: <https://s3.amazonaws.com/sms-connector/AWS-SMS-Connector-for-SCVMM-HyperV.zip>.

Integrity checksum

- **MD5** — <https://s3.amazonaws.com/sms-connector/AWS-SMS-Connector-for-SCVMM-HyperV.zip.md5>
 - **SHA256** — <https://s3.amazonaws.com/sms-connector/AWS-SMS-Connector-for-SCVMM-HyperV.zip.sha256>
2. Transfer the downloaded connector file to your Hyper-V host, unzip it, and import the connector as a VM.
 3. Open the connector's virtual machine console and log in as `ec2-user` with the password `ec2pass`. Supply a new password if prompted.
 4. Obtain the IP address of the connector as follows:
 - a. Run the command `sudo setup.rb`. This displays a configuration menu:

```
Choose one of the following options:
 1. Reset password
 2. Reconfigure network settings
 3. Restart services
 4. Factory reset
 5. Delete unused upgrade-related files
 6. Enable/disable SSL certificate validation
 7. Display connector's SSL certificate
 8. Generate log bundle
 0. Exit
Please enter your option [1-9]:
```

- b. Enter option 2. This displays current network information and a submenu for making changes to the network settings. The output should resemble the following:

```
Current network configuration: DHCP
IP: 192.0.2.100
Netmask: 255.255.254.0
Gateway: 192.0.2.1
DNS server 1: 192.0.2.200
DNS server 2: 192.0.2.201
DNS suffix search list: subdomain.example.com
Web proxy: not configured

Reconfigure your network:
```

Amazon Server Migration Service User Guide
Step 3: Download and install the
Hyper-V/SCVMM configuration script

```
1. Renew or acquire a DHCP lease
2. Set up a static IP
3. Set up a web proxy for Amazon communication
4. Set up a DNS suffix search list
5. Exit
Please enter your option [1-5]:
```

You need to enter this IP address in later procedures.

5. [Optional] Configure a static IP address for the connector. This prevents you from having to reconfigure the trusted hosts lists on your LAN each time DHCP assigns a new address to the connector.

In the **Reconfigure your network** menu, enter option **2**. This displays a form to supply network settings:

For each field, provide an appropriate value and press Enter. You should see output similar to the following:

```
Setting up static IP:
1. Enter IP address: 192.0.2.50
2. Enter netmask: 255.255.254.0
3. Enter gateway: 192.0.2.1
4. Enter DNS 1: 192.0.2.200
5. Enter DNS 2: 192.0.2.201

Static IP address configured.
```

6. In the connector's network configuration menu, configure domain suffix values for the DNS suffix search list.
7. If your environment uses a web proxy to reach the internet, configure that now.
8. Before leaving the connector console, use **ping** to verify network access to the following targets inside and outside your LAN:
 - Inside your LAN, to your Hyper-V hosts and SCVMM by hostname, FQDN, and IP address
 - Outside your LAN, to Amazon

Step 3: Download and install the Hyper-V/SCVMM configuration script

Amazon SMS provides a downloadable PowerShell script to configure the Windows environment to support communications with the Server Migration Connector. The same script is used for configuring either standalone Hyper-V or SCVMM. The script is cryptographically signed by Amazon.

Download the script and hash files from the following URLs:

File	URL
Installation script	https://s3.amazonaws.com/sms-connector/aws-sms-hyperv-setup.ps1
MD5 hash	https://s3.amazonaws.com/sms-connector/aws-sms-hyperv-setup.ps1.md5
SHA256 hash	https://s3.amazonaws.com/sms-connector/aws-sms-hyperv-setup.ps1.sha256

After download, transfer the downloaded files to the computer or computers where you plan to run the script.

Step 4: Validate the integrity and cryptographic signature of the script file

Before running the script, we recommend that you validate its integrity and signature. These procedures assume that you have downloaded the script and the hash files, that they are installed on the desktop of the computer where you plan to run the script, and that you are signed in as the administrator. You may need to modify the procedures to match your setup.

To validate script integrity using cryptographic hashes (PowerShell)

1. Use one or both of the downloaded hash files to validate the integrity of the script file, ensuring that it has not changed in transit to your computer.

- a. To validate with the MD5 hash, run the following command in a PowerShell window:

```
PS C:\Users\Administrator> Get-FileHash aws-sms-hyperv-setup.ps1 -Algorithm MD5
```

This should return information similar to the following:

Algorithm	Hash
-----	----
MD5	1AABAC6D068EEF6EXAMPLEDF50A05CC8

- b. To validate with the SHA256 hash, run the following command in a PowerShell window:

```
PS C:\Users\Administrator> Get-FileHash aws-sms-hyperv-setup.ps1 -Algorithm SHA256
```

This should return information similar to the following:

Algorithm	Hash
-----	----
SHA256	6B86B273FF34FCE19D6B804EFF5A3F574EXAMPLE22F1D49C01E52DDB7875B4B

2. Compare the returned hash values with the values provided in the downloaded files, `aws-sms-hyperv-setup.ps1.md5` and `aws-sms-hyperv-setup.ps1.sha256`.

Next, use either the Windows user interface or PowerShell to check that the script file includes a valid signature from Amazon.

To check the script file for a valid cryptographic signature (Windows GUI)

1. In Windows Explorer, open the context (right-click) menu on the script file and choose **Properties**, **Digital Signatures**, **Amazon Web Services**, and **Details**.
2. Verify that the displayed information contains "This digital signature is OK" and that "Amazon Web Services, Inc." is the signer.

To check the script file for a valid cryptographic signature (PowerShell)

- In a PowerShell window, run the following command:

```
PS C:\Users\Administrator> Get-AuthenticodeSignature aws-sms-hyperv-setup.ps1 | Select *
```

A correctly signed script file should return information similar to the following:

```
SignerCertificate      : [Subject]
                       CN="Amazon Web Services, Inc." ...
                       [Issuer]
                       CN=DigiCert EV Code Signing CA (SHA2), OU=www.digicert.com,
0=DigiCert Inc, C=US
...
TimeStamperCertificate :
Status                 : Valid
StatusMessage         : Signature verified.
Path                  : C:\Users\Administrator\Desktop\aws-sms-hyperv-setup.ps1
...
```

Step 5: Run the script

This procedure assumes that you have downloaded the script onto the desktop of the computer where you plan to run the script, and that you are signed in as the administrator. You may need to modify the procedure shown to match your setup.

Note

If you are using SCVMM, you must first run this script on each Hyper-V host you plan to migrate from, and then run it on SCVMM.

To run the script on each host

- Using RDP, log in to your SCVMM system or standalone Hyper-V host as administrator.
- Run the script using the following PowerShell command:

```
PS C:\Users\Administrator> .\aws-sms-hyperv-setup.ps1
```

Note

If your PowerShell execution policy is set to verify signed scripts, you are prompted for an authorization when you run the connector configuration script. Verify that the script is published by "Amazon Web Services, Inc." and choose "R" to run one time. You can view this setting using **Get-ExecutionPolicy** and modify it using **Set-ExecutionPolicy**.

- As the script runs, it prompts you for several pieces of information. Be prepared to respond to the following prompts:

Script action	Customer prompt	Customer action
Prompts for an option based on the connector's mode of operation (migrate from standalone Hyper-V vs. migrate using SCVMM), which determines what changes must be made to your Windows environment.	0. Exit 1. Reconfigure standalone Hyper-V... 2. Reconfigure Hyper-V managed by SCVMM... 3. Reconfigure SCVMM...	Choose 0 to exit the script. Choose 1 to reconfigure a standalone Hyper-V host to allow migration of its guest VMs. Choose 2 to reconfigure a Hyper-V host allow SCVMM

Script action	Customer prompt	Customer action
	4. Help/Support	to manage migration its guest VMs. Choose 3 to reconfigure SCVMM to allow migration of guest VMs on all Hyper-V hosts it manages. Option 4 links to this document and to information about Amazon Support.
Prompts for the Active Directory user that the connector uses when communicating with SCVMM and Hyper-V.	Enter the AD user that the connector will use (DOMAIN \user)	Provide the Active Directory user that you previously configured. For more information, see Step 1: Create a service account for Server Migration Connector in Active Directory (p. 14) .
Prompts for the IP address or hostname of the connector.	Enter the IP Address or Hostname of the connector appliance	Provide the IP address or host name that you configured on the connector.
Prompts for confirmation before modifying your Windows environment.	Make changes to Windows system configuration? (Enter "yes" or "no")	Enter "yes" and press Enter to start the reconfiguration. Entering "no" causes the script to exit.

Step 6: Configure the connector

When the connector configuration has been successfully run, browse to the connector's web interface:

```
https://ip-address-of-connector/
```

Complete the following steps to set up the new connector.

To configure the connector

1. On the connector landing page, choose **Get started now**.
2. Review the license agreement, select the check box, and choose **Next**.
3. Create a password for the connector. The password must meet the displayed criteria. Choose **Next**.
4. On the **Network Info** page, you can (among other tasks) assign a static IP address to the connector if you have not already done so. Choose **Next**.
5. On the **Log Uploads and Upgrades** page, select **Upload logs automatically** and **Server Migration Connector auto-upgrade**, and choose **Next**.
6. On the **Server Migration Service** page, provide the following information:
 - For **Amazon Region**, choose your Region from the list.
 - For **Amazon Credentials**, enter the IAM credentials that you created in [Configure an IAM user for Server Migration Connector \(p. 5\)](#). Choose **Next**.
7. On the **Choose your VM manager type** page, choose either **Microsoft® System Center Virtual Manager (SCVMM)** or **Microsoft® Hyper-V** depending on your environment. Selecting **VMware® vCenter** results in an error if you have installed the Hyper-V connector. Choose **Next**.

8. On the **Hyper-V: Host and Service Account Setup** or **SCVMM: Host and Service Account Setup** page, provide the account information for the Active Directory user that you created in [Step 1: Create a service account for Server Migration Connector in Active Directory \(p. 14\)](#), including **Username** and **Password**.
9.
 - [SCVMM only] Provide the SCVMM hostname to be served by this connector and choose **Next**. Inspect the certificate for the host and choose **Trust** if the certificate is valid.
 - [Stand-alone Hyper-V only] Provide the Hyper-V hostname for each host to be served by this connector. To add additional hosts, use the plus symbol. To inspect the certificate for each host, choose **Verify Certificate** and choose **Trust** if the certificate is valid. Choose **Next**.

Alternatively, you can select the host-specific option to **Ignore hostname mismatch and expiration errors...** for either SCVMM or Hyper-V host certificates. We do not recommend overriding security in production, but it may be useful during testing.

Note

If you have Hyper-V hosts located in multiple Active Directory domains, we recommend configuring a separate connector for each domain.

10. If you successfully authenticated with the connector, you should see the **Congratulations** page. To view the connector's health status, choose **Go to connector dashboard**.
11. To verify that the connector that you registered is now listed, open the **Connectors** page on the Amazon Server Migration Service console. If you encounter an issue registering the connector, contact sms-service@amazon.com.

Install the Server Migration Connector on Azure

Use the following information to install the Server Migration Connector on Azure so that you can use Amazon SMS to migrate VMs from Azure to Amazon EC2.

This information applies only to VMs hosted by Azure. For information about installing the connector on other environments, see [Install the Server Migration Connector \(p. 10\)](#).

Considerations for migration scenarios

- A single Server Migration Connector appliance can only migrate VMs under one subscription and one Azure region.
- After a Server Migration Connector appliance is deployed, you cannot change its subscription or region unless you deploy another connector in the new subscription and region.
- Amazon SMS supports deploying any number of Server Migration Connector appliance VMs to support migration from multiple Azure subscriptions and regions in parallel.
- Server Migration Connector does not support the Azure Government regions.

Requirements for Azure connector

- The recommended VM size of Azure connector is F4s – 4 vCPUs and 8 GB RAM. Ensure that you have a sufficient Azure CPU quota in the region where you are deploying the connector.
- A Standard Storage Account (cannot be Premium) under which the connector can be deployed.
- A virtual network where the connector can be deployed.
- Inbound access on port 443 (HTTPS), either from within the connector's virtual network (recommended) or open to the public (not recommended), for connector registration and viewing the connector dashboard.
- Outbound Internet access to access Amazon services, Azure services, to perform connector OS updates, and so on.

Contents

- [Step 1: Download the connector installation script \(p. 21\)](#)
- [Step 2: Validate the integrity and cryptographic signature of the script file \(p. 21\)](#)
- [Step 3: Run the script \(p. 22\)](#)
- [Step 4: Configure the connector \(p. 23\)](#)
- [\(Alternative\) Deploy the Server Migration Connector manually \(p. 24\)](#)

Step 1: Download the connector installation script

Amazon SMS provides a downloadable PowerShell script to deploy the connector in your Azure environment. The script is cryptographically signed by Amazon. Complete this procedure to run the PowerShell script and install the connector automatically in your Azure environment. The script requires PowerShell 5.1 or later.

Note

Amazon recommends using the scripted installation, but you can alternatively install the connector manually. For more information, see [\(Alternative\) Deploy the Server Migration Connector manually \(p. 24\)](#).

To download the script and hash files

1. Download the PowerShell script and hash files from the following URLs:

File	URL
Installation script	https://s3.amazonaws.com/sms-connector/aws-sms-azure-setup.ps1
MD5 hash	https://s3.amazonaws.com/sms-connector/aws-sms-azure-setup.ps1.md5
SHA256 hash	https://s3.amazonaws.com/sms-connector/aws-sms-azure-setup.ps1.sha256

2. After download, transfer the files to the computer or computers where you plan to run the script.

Step 2: Validate the integrity and cryptographic signature of the script file

Before running the script, we recommend that you validate its integrity and signature, ensuring that it has not changed in transit to your computer. These procedures assume that you have downloaded the script and the hash files, that they are installed on the desktop of the computer where you plan to run the script, and that you are signed in as administrator. You may need to modify the procedures to match your setup.

To validate script integrity using cryptographic hashes (PowerShell)

1. Use one or both of the downloaded hash files to validate the integrity of the script file.
 - a. To validate with the MD5 hash, run the following command in a PowerShell window:

```
PS C:\Users\Administrator> Get-FileHash aws-sms-azure-setup.ps1 -Algorithm MD5
```

This should return information similar to the following:

```
Algorithm      Hash
-----
MD5            1AABAC6D068EEF6EXAMPLEDF50A05CC8
```

- b. To validate with the SHA256 hash, run the following command in a PowerShell window:

```
PS C:\Users\Administrator> Get-FileHash aws-sms-azure-setup.ps1 -Algorithm SHA256
```

This should return information similar to the following:

```
Algorithm      Hash
-----
SHA256        6B86B273FF34FCE19D6B804EFF5A3F574EXAMPLE22F1D49C01E52DDB7875B4B
```

2. Compare the returned hash values with the values provided in the downloaded files, `aws-sms-azure-setup.ps1.md5` and `aws-sms-azure-setup.ps1.sha256`.

Next, use either PowerShell or the Windows user interface to check that the script file includes a valid signature from Amazon.

To check the script file for a valid cryptographic signature (PowerShell)

- In a PowerShell window, run the following command:

```
PS C:\Users\Administrator> Get-AuthenticodeSignature aws-sms-azure-setup.ps1 | Select *
```

A correctly signed script file should return information similar to the following:

```
SignerCertificate      : [Subject]
                        CN="Amazon Web Services, Inc." ...
                        [Issuer]
                        CN=DigiCert EV Code Signing CA (SHA2), OU=www.digicert.com,
                        O=DigiCert Inc, C=US
                        ...
TimeStamperCertificate :
Status                 : Valid
StatusMessage          : Signature verified.
Path                   : C:\Users\Administrator\Desktop\aws-sms-azure-setup.ps1
                        ...
```

To check the script file for a valid cryptographic signature (Windows GUI)

- In Windows Explorer, open the context (right-click) menu on the script file and choose **Properties**, **Digital Signatures**, **Amazon Web Services**, and **Details**.
- Verify that the displayed information contains "This digital signature is OK" and that "Amazon Web Services, Inc." is the signer.

Step 3: Run the script

Run this script from any computer with PowerShell 5.1 or later installed.

Note

If your PowerShell execution policy is set to verify signed scripts, you are prompted for an authorization when you run the connector configuration script. Verify that the script is published by "Amazon Web Services, Inc." and choose "R" to run one time. You can view this setting using **Get-ExecutionPolicy** and modify it using **Set-ExecutionPolicy**.

```
PS C:\Users\Administrator> .\aws-sms-azure-setup.ps1 -StorageAccountName name -  
ExistingVNetName name -SubscriptionId id -SubnetName name
```

StorageAccountName

The name of the storage account where you want to deploy the connector.

ExistingVNetName

The name of the virtual network where you want to deploy the connector.

SubscriptionId

(Optional) The ID of the subscription to use. If you do not specify this parameter, the default subscription for the account is used.

SubnetName

(Optional) The name of the subnet in the virtual network. If you do not specify this parameter, the subnet named "default" is used.

When the script prompts for an Azure login, use a login that has administrator permissions for the subscription under which you are deploying the connector.

When the script completes, the connector is deployed in your account. The script prints out the connector's private IP address and the Object ID of the System Assigned Identity of the connector VM. You need both of these to complete the next step.

Step 4: Configure the connector

From another VM on the same virtual network where you deployed the connector, browse to the connector's web interface using the following URL, which includes the private IP address of the connector that you obtained in the previous step:

```
https://ip-address-of-connector
```

To configure the connector

1. On the connector landing page, choose **Get started now**.
2. Review the license agreement, select the check box, and choose **Next**.
3. Create a password for the connector. The password must meet the displayed criteria. Choose **Next**.
4. On the **Network Info** page, you can find instructions to perform network-related tasks, such as setting up Amazon proxy for the connector. Choose **Next**.
5. On the **Log Uploads** page, select **Upload logs automatically** and choose **Next**.
6. On the **Server Migration Service** page, provide the following information:
 - For **Amazon Region**, choose your Region from the list.
 - For **Amazon Credentials**, enter the IAM credentials that you created in [Configure an IAM user for Server Migration Connector \(p. 5\)](#). Choose **Next**.
7. On the **Azure Account Verification** page, verify that your Azure subscription ID and location are correct. This connector can migrate VMs under this subscription and location. Provide the object

ID of the System Assigned Identity of the connector VM, which was provided as output from the deployment script.

8. If you successfully set up the connector, the **Congratulations** page is displayed. To view the health status of the connector, choose **Go to connector dashboard**.
9. To verify that the connector that you registered is listed, open the **Connectors** page on the Systems Manager console.

(Alternative) Deploy the Server Migration Connector manually

Complete this procedure to install the connector manually in your Azure environment.

To install the connector manually

1. Log into the Azure Portal as a user with administrator permissions for the subscription under which you are deploying this connector.
2. Make sure that you are ready to supply a Storage Account, its Resource Group, a Virtual Network, and the Azure region as described in [Requirements for Azure connector \(p. 20\)](#).
3. Download the connector VHD and associated files from the URLs in the following table.

File	URL
Connector VHD	https://awssmsconnector.blob.core.windows.net/release/AWS-SMS-Connector-for-Azure.vhd
MD5 hash	https://s3.amazonaws.com/sms-connector/AWS-SMS-Connector-for-Azure.vhd.md5
SHA256 hash	https://s3.amazonaws.com/sms-connector/AWS-SMS-Connector-for-Azure.vhd.sha256

4. Verify the cryptographic integrity of the connector VHD using procedures similar to those described in [Step 2: Validate the integrity and cryptographic signature of the script file \(p. 21\)](#).
5. Upload the connector VHD and associated files to your Storage Account.
6. Create a new managed disk with the following parameter values:
 - **Resource Group:** Select your resource group
 - **Name:** Any name - for example, sms-connector-disk-westus
 - **Region:** Select your Azure region
 - **Availability Zone:** None
 - **Source Type:** Storage Blob (Choose the VHD blob you uploaded from step 3.c.)
 - **OSType:** Linux
 - **Size:** 60 GB/Standard HDD
7. Choose **Create VM** to create a new virtual machine from the managed disk that you created. Assign the following parameter values.

Under the **Basics** tab:

- **Resource Group:** Enter in your resource group
- **Virtual Machine Name:** Any name, for example sms-connector-vm-westus
- **Region:** Select your Azure region
- **Size:** F4s

- **Public Inbound Ports:** None

Under the **Disks** tab:

- **OS Disk Type:** Standard HDD

Under the **Networking** tab:

- **Virtual Network:** Enter in your Virtual Network name
- **Subnet:** Leave as default or choose a particular subnet
- **Public IP:** Leave as new
- **NIC Network Security Group:** Basic
- **Public Inbound Ports:** None
- Accept defaults for the remaining fields.

Under the **Management** tab:

- **Boot Diagnostics:** On
 - **OS Guest Diagnostics:** Off
 - **Diagnostics Storage account:** Storage Account
 - **System Assigned Managed Identity:** On
 - **Enable auto-shutdown:** Off
8. Review and create the VM. This will be your connector VM.
 9. Download the two role documents:
 - <https://s3.amazonaws.com/sms-connector/SMSConnectorRole.json>
 - <https://s3.amazonaws.com/sms-connector/SMSConnectorRoleSA.json>
 10. **(Important)** Customize the role documents.

Edit `SMSConnectorRole.json`. Change the name field to `sms-connector-role-subscription_id`. Then change the `AssignableScopes` field to match your subscription ID.

Edit `SMSConnectorRoleSA.json`. Change the name field to `sms-connector-role-storage_account`. For example, if your account is `testStorage`, then the name field must be `sms-connector-role-testStorage`. Then change the `AssignableScopes` field to match your Subscription, Resource Group, and Storage Account values.
 11. Create a role definition. Currently, there is no way to create a role definition from the Azure Portal. You must use Az CLI or Az PowerShell for this step. Use the [New-AzRoleDefinition](#) (Az PowerShell) or [az role definition create](#) (Az CLI) command to create these custom roles in your subscription, using the JSON files that you created in the previous step.
 12. Assign roles to the connector VM. In Azure Portal, choose **Storage Account, Access Control, Roles, Add, Add Role Assignment**. Choose the role `sms-connector-role`, assign access to *Virtual Machine*, and select the connector VM's System Assigned Identity from the list. Repeat this for the role `sms-connector-role-storage_account`.
 13. Restart the connector VM to activate the role assignments.
 14. Continue to [Step 4: Configure the connector \(p. 23\)](#).

Replicate VMs using Amazon CLI commands for Amazon SMS

You can use the Amazon Command Line Interface (Amazon CLI) to inventory and migrate your on-premises servers to Amazon EC2.

Prerequisites

- Install the Server Migration Connector as described in [Install the Server Migration Connector \(p. 10\)](#).
- You must use the following [create-service-linked-role](#) command to create the required service-linked role.

```
aws iam create-service-linked-role --aws-service-name sms.amazonaws.com
```

For more information, see [Service-linked roles for Amazon SMS \(p. 41\)](#).

Considerations

- You can replicate your on-premises servers to Amazon for up to 90 days per server. Usage time is calculated from the time a server replication begins until you terminate the replication job. After 90 days, your replication job is automatically terminated. You can request an extension from Amazon Web Services Support.
- If you have enabled integration between Amazon SMS and Amazon Migration Hub, your SMS server catalog is also visible on Migration Hub. For more information, see [Import applications from Migration Hub \(p. 33\)](#).
- During the replication process, Amazon SMS creates an Amazon S3 bucket in the Region on your behalf, with server-side encryption enabled and a bucket policy to delete any items in the bucket after seven days. Amazon SMS replicates server volumes from your environment to this bucket and then creates EBS snapshots from the volumes. If you do not delete this bucket, Amazon SMS uses it for all replication jobs in this Region.
- During the AMI creation process, Amazon SMS sets the `DeleteOnTermination` attribute for the root volume to false, overriding the default. You can delete the root volume manually after you terminate the instance, or you can set the attribute to true so that Amazon EC2 deletes the root volume on instance termination. For more information, see [Preserving Amazon EBS volumes on instance termination](#) in the *Amazon EC2 User Guide*.

To replicate a server using the CLI

1. Use the [get-connectors](#) command to obtain a list of connectors that are registered to you.

```
aws sms get-connectors
```

2. After a connector has been installed and registered, use the [import-server-catalog](#) command to create an inventory of your servers. This process can take up to a minute.

```
aws sms import-server-catalog
```

3. Use the [get-servers](#) command to display a list of servers available for import to Amazon EC2.

```
aws sms get-servers
```

The output should be similar to the following:

```
{
  "serverList": [
    {
      "serverId": "s-12345678",
      "serverType": "VIRTUAL_MACHINE",
      "vmServer": {
        "vmManagerName": "vcenter.yourcompany.com",
        "vmServerAddress": {
          "vmManagerId": "your-vcenter-instance-uuid",
          "vmId": "vm-123"
        },
        "vmName": "your-linux-vm",
        "vmPath": "/Datacenters/DC1/vm/VM Folder Path/your-linux-vm",
        "vmManagerType": "vSphere"
      }
    },
    {
      "replicationJobTerminated": false,
      "serverId": "s-23456789",
      "serverType": "VIRTUAL_MACHINE",
      "replicationJobId": "sms-job-12345678",
      "vmServer": {
        "vmManagerName": "vcenter.yourcompany.com",
        "vmServerAddress": {
          "vmManagerId": "your-vcenter-instance-uuid",
          "vmId": "vm-234"
        },
        "vmName": "Your Windows VM",
        "vmPath": "/Datacenters/DC1/vm/VM Folder Path/Your Windows VM",
        "vmManagerType": "vSphere"
      }
    }
  ]
}
```

If you have not yet imported a server catalog, you see output similar to the following:

```
{
  "lastModifiedOn": 1477006131.856,
  "serverCatalogStatus": "NOT_IMPORTED",
  "serverList": []
}
```

A catalog status of DELETED or EXPIRED also shows that no servers exist in the catalog.

4. Select a server to replicate, note the server ID, and specify the ID in the [create-replication-job](#) command.

```
aws sms create-replication-job --server-id s-12345678 \
  --frequency 12 \
  --seed-replication-time 2016-10-24T15:30:00-07:00 \
  --role-name AWSServiceRoleForSMS
```

After the replication job is set up, it starts replicating automatically at the time specified with the `--seed-replication-time` parameter, expressed in seconds of the Unix epoch or according to ISO 8601. For more information, see [Specifying Parameter Values for the Amazon Command Line Interface](#). Thereafter, the replication repeats with an interval specified by the `--frequency` parameter, expressed in hours.

- You can view details of all running replication jobs using the [get-replication-jobs](#) command. If you do not specify any parameters, the command lists all your replication jobs.

This command returns output similar to the following:

```
{
  "replicationJobList": [
    {
      "vmServer": {
        "vmManagerName": "vcenter.yourcompany.com",
        "vmServerAddress": {
          "vmManagerId": "your-vcenter-instance-uuid",
          "vmId": "vm-1234"
        },
        "vmName": "VM name in vCenter",
        "vmPath": "/Datacenters/DC1/vm/VM Folder Path/VM name in vCenter"
      },
      "replicationRunList": [
        {
          "scheduledStartTime": 1487007010.0,
          "state": "Deleted",
          "type": "Automatic",
          "statusMessage": "Uploading",
          "replicationRunId": "sms-run-12345678"
        }
      ],
      "replicationJobId": "sms-job-98765432",
      "state": "Deleted",
      "frequency": 12,
      "seedReplicationTime": 1477007049.0,
      "roleName": "sms"
    },
    {
      "vmServer": {
        "vmManagerName": "vcenter.yourcompany.com",
        "vmServerAddress": {
          "vmManagerId": "your-vcenter-instance-uuid",
          "vmId": "vm-2345"
        },
        "vmName": "win2k12",
        "vmPath": "/Datacenters/DC1/vm/VM Folder Path/win2k12"
      },
      "replicationRunList": [
        {
          "scheduledStartTime": 1477008789.0,
          "state": "Active",
          "type": "Automatic",
          "statusMessage": "Converting",
          "replicationRunId": "sms-run-12345679"
        }
      ],
      "replicationJobId": "sms-job-23456789",
      "state": "Active",
      "frequency": 24,
      "seedReplicationTime": 1477008789.0,
      "roleName": "sms"
    }
  ]
}
```

- You can also use the [get-replication-runs](#) command to retrieve information about all replication runs for a specific replication job. To do this, specify a replication job ID as follows:

```
aws sms get-replication-runs --replication-job-id sms-job-12345678
```

This command returns a list of all replication runs for the specified replication job, as well as details for that replication job, similar to the following:

```
{
  "replicationRunList": [
    {
      "scheduledStartTime": 1477310423.0,
      "state": "Active",
      "type": "Automatic",
      "statusMessage": "Converting",
      "replicationRunId": "sms-run-23456789"
    },
    {
      "amiId": "ami-abcdefab",
      "state": "Completed",
      "completedTime": 1477227683.652,
      "scheduledStartTime": 1477224023.0,
      "replicationRunId": "sms-run-34567890",
      "type": "Automatic",
      "statusMessage": "Completed"
    },
    {
      "amiId": "ami-efababcd",
      "state": "Completed",
      "completedTime": 1477144823.486,
      "scheduledStartTime": 1477137623.0,
      "replicationRunId": "sms-run-45678903",
      "type": "Automatic",
      "statusMessage": "Completed"
    }
  ]
}
```

- To change any of the parameters of a replication job after you have created it, use the [update-replication-job](#) command, by providing the replication job ID and any parameters to change.

```
aws sms update-replication-job --replication-job-id sms-job-12345678 --frequency 24 --next-replication-run-start-time 2016-10-24T15:30:00-07:00
```

- In addition to your scheduled replication runs, you may also start up to two on-demand replication runs per 24-hour period. To do this, use the [start-on-demand-replication-run](#) command, which starts a replication run immediately. If another replication run is currently active, an on-demand replication run cannot be started.

```
aws sms start-on-demand-replication-run --replication-job-id sms-job-12345678
```

If a scheduled replication run is expected to start while an on-demand replication run is ongoing, then the scheduled run is skipped and rescheduled for the next interval.

- After you are finished replicating a server, you may stop the replication job using the [delete-replication-job](#) command. This stops the replication job and cleans up any artifacts created by the service (for example, the job's S3 bucket). This does not delete any AMIs created by runs of the stopped job.

```
aws sms delete-replication-job --replication-job-id sms-job-12345678
```

10. When you no longer need to maintain your catalog of servers, use the [delete-server-catalog](#) command to clear the catalog of servers maintained by the service.

```
aws sms delete-server-catalog
```

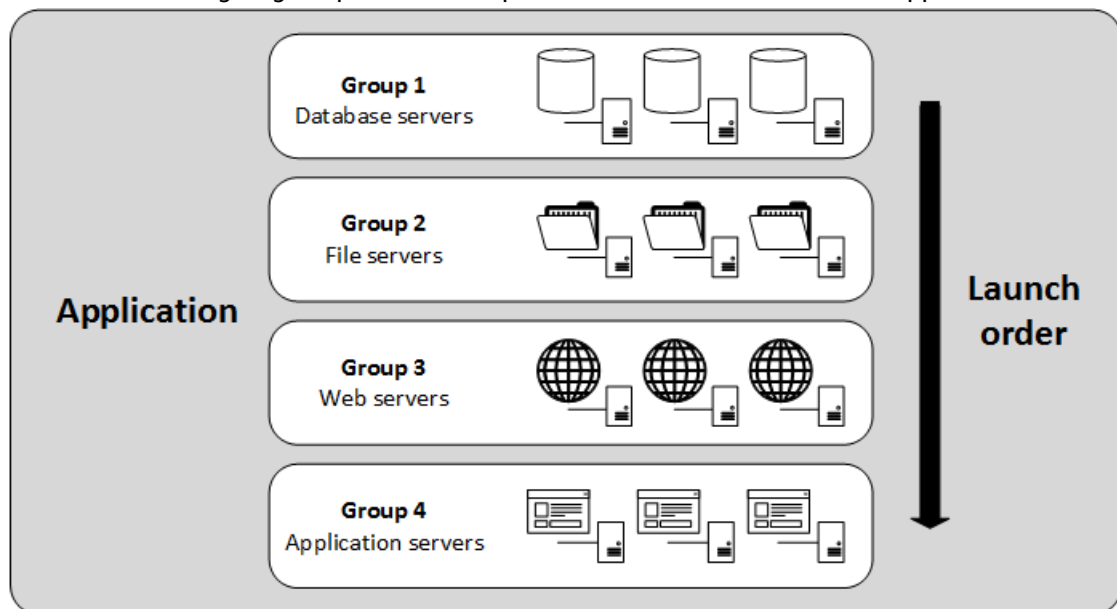

11. When you are done using a connector, use the [disassociate-connector](#) command to deregister the connector from Amazon SMS. Call this command only after all replications using that connector are complete.

```
aws sms disassociate-connector --connector-id c-12345678901234567
```

Migrate applications using Amazon SMS

Amazon Server Migration Service supports the automated migration of multi-server application stacks from your on-premises data center to Amazon EC2. Where server migration is accomplished by replicating a single server as an Amazon Machine Image (AMI), application migration replicates all of the servers in an application as AMIs and generates an Amazon CloudFormation template to launch them in a coordinated fashion.

Applications can be further subdivided into groups that allow you to launch tiers of servers in a defined order. The following diagram provides a sample case of a database-backed web application:

In this example, the application is divided into four groups, each with three servers. The Amazon CloudFormation template starts the servers in the following order: databases, file servers, web servers, and application servers.

After your servers are organized into applications and launch groups, you can specify a replication frequency, provide configuration scripts, and configure a target VPC in which to launch them. When you launch an application, Amazon SMS configures it based on the generated template.

Application migration relies on the procedures for discovering on-premises resources described in [Install the Server Migration Connector \(p. 10\)](#). After you have imported a server catalog into Amazon SMS using the Server Migration Connector, you can configure settings for applications, replication, and launch, as well as monitor migration status using the resources for Amazon SMS in the Amazon SMS API, Amazon CLI, or Amazon SDKs.

Considerations

- You can replicate your on-premises servers to Amazon for up to 90 days per server. Usage time is calculated from the time a server replication begins until you terminate the replication job. After 90

days, your replication job is automatically terminated. You can request an extension from Amazon Web Services Support.

- During the AMI creation process, Amazon SMS sets the `DeleteOnTermination` attribute for the root volume to `false`, overriding the default. You can delete the root volume manually after you terminate the instance, or you can set the attribute to `true` so that Amazon EC2 deletes the root volume on instance termination. For more information, see [Preserving Amazon EBS volumes on instance termination](#) in the *Amazon EC2 User Guide*.
- Application migration from Microsoft Azure environments is supported, but the Server Migration Connector for Azure does not currently guarantee the closeness of the server snapshots in the application.

Use application migration

You can perform the following tasks.

Tasks

- [Create an application \(p. 32\)](#)
- [Configure replication settings \(p. 32\)](#)
- [Configure launch settings \(p. 32\)](#)
- [Start replication \(p. 32\)](#)
- [Launch an application \(p. 32\)](#)
- [Generate a CloudFormation template \(p. 33\)](#)

Create an application

To create an application, see the Amazon SMS [create-app](#) command in the *Amazon CLI Command Reference*.

Configure replication settings

To configure replication settings for an application, see the Amazon SMS [update-replication-job](#) command in the *Amazon CLI Command Reference*.

Configure launch settings

Before you can configure network settings, you must set up a virtual private cloud, subnet, and security group, as described for the [RunInstances](#) Amazon EC2 API action.

To configure launch settings for an application, see the Amazon SMS [put-app-launch-configuration](#) command in the *Amazon CLI Command Reference*.

Start replication

To start replicating an application, see the Amazon SMS [start-app-replication](#) command in the *Amazon CLI Command Reference*.

Launch an application

To launch an application, see the Amazon SMS [launch-app](#) command in the *Amazon CLI Command Reference*.

Generate a CloudFormation template

To examine the Amazon CloudFormation template that is auto-generated when you launch the application, see the Amazon SMS [generate-template](#) command in the *Amazon CLI Command Reference*.

Import applications from Migration Hub

Application Migration supports the import and migration of applications discovered by Amazon Migration Hub.

To import applications from Migration Hub, see the Amazon SMS [import-app-catalog](#) command in the *Amazon CLI Command Reference*.

Note

SMS imports application-related servers from Migration Hub only if they exist in the SMS Server Catalog and are not part of an existing SMS application. As a result, some applications may be only partially imported. An application cannot be re-imported if it is being actively replicated or launched by SMS. If this conflict occurs, stop the replication or launch and re-import.

Using Amazon CloudWatch Events and Amazon Lambda with Amazon SMS

You can use Amazon CloudWatch Events with Amazon Server Migration Service to automate actions based on your migration workflow. This requires you to create an IAM policy for Lambda to assume, a Lambda function to handle the event, and a CloudWatch Events rule that matches incoming events and routes them to the Lambda function.

Handling CloudWatch Events rules for Amazon SMS

The following procedure uses an Amazon Lambda function to monitor Amazon SMS job state changes and launches an Amazon EC2 instance whenever an AMI ID has been created.

To create a Lambda function that monitors job state changes

1. Open the IAM console at <https://console.amazonaws.cn/iam/>.
2. Create an IAM policy to provide permissions to execute an action (called by Lambda) and to write to the CloudWatch log when invoked by CloudWatch Events. The following example provides permissions to execute a RunInstances action. Assign the policy to the IAM role of the user that will handle the CloudWatch event.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "logs:CreateLogGroup",
        "logs:CreateLogStream",
        "logs:PutLogEvents"
      ],
      "Resource": "arn:aws:logs:*:*:*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "ec2:RunInstances"
      ],
      "Resource": "*"
    }
  ]
}
```

3. Open the Amazon Lambda console at <https://console.amazonaws.cn/lambda/>.
4. Choose **Create function**.

5. To ensure that your Lambda function is available from the CloudWatch console, create it in the region where the CloudWatch event will occur. For more information, see the [Amazon Lambda Developer Guide](#). Name the function `LaunchInstanceFromAMI` and select **Python 2.7** as the runtime.
6. For **Role**, select **Choose an existing role**. Under **Existing role**, in the list of available roles, choose the role to which you added your policy.
7. Choose **Create function** and define a Lambda function similar to the one below. This sample function, written in Python 2.7, is invoked by CloudWatch Events when an Amazon SMS job completion sends an event with an AMI ID. When invoked, it launches a `t2.micro` instance in the region of the event.

```
# Sample Lambda function to launch an EC2 instance from all AMI ID's created from a
# Server Migration Service replication job

import boto3

# main function
def lambda_handler(event, context):

    # create an ec2 client
    ec2 = boto3.client('ec2', region_name=event['region'])

    # match any event that returns an ami-id
    if 'ami-id' in event['detail']:
        imageId = event['detail']['ami-id']

        # launch instance from the AMI ID
        ec2.run_instances(
            ImageId=imageId,
            MaxCount=123,
            MinCount=1,
            InstanceType='t2.micro'
        )
        print 'launched instance with ami id: ' + imageId
    else:
        print 'did not launch instance'
```

8. Open the CloudWatch console at <https://console.amazonaws.cn/cloudwatch/>.
9. Choose **Events, Create rule**. For **Service Name**, choose **Server Migration Service (SMS)**. For **Event Type**, choose **Server Migration Job State Change**.
10. Choose **Target, Add Target**.
11. For **Lambda function**, select the Lambda function that you previously created and choose **Configure details**.
12. On the **Configure rule details** page, type values for **Name** and **Description**. Select the **State** check box to activate the function (setting it to **Enabled**).
13. Choose **Create rule**.

Your rule should now appear on the **Rules** tab. In the example shown, the configured event should launch an EC2 instance each time that you receive an AMI ID.

Logging Amazon Server Migration Service API calls using Amazon CloudTrail

Amazon Server Migration Service is integrated with Amazon CloudTrail, a service that provides a record of actions taken by a user, role, or an Amazon service in Amazon SMS. CloudTrail captures all API calls for Amazon SMS as events. The calls captured include code calls to the Amazon SMS API operations. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for Amazon SMS. If you don't configure a trail, you can still view the most recent events in the CloudTrail console in **Event history**. Using the information collected by CloudTrail, you can determine the request that was made to Amazon SMS, the IP address from which the request was made, who made the request, when it was made, and additional details.

For more information, see the [Amazon CloudTrail User Guide](#).

Amazon SMS information in CloudTrail

CloudTrail is enabled on your Amazon account when you create the account. When activity occurs in Amazon SMS, that activity is recorded in a CloudTrail event along with other Amazon service events in **Event history**. You can view, search, and download recent events in your Amazon account. For more information, see [Viewing Events with CloudTrail Event History](#).

For an ongoing record of events in your Amazon account, including events for Amazon SMS, create a trail. A *trail* enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the CloudTrail console, the trail applies to all Amazon Regions. The trail logs events from all Regions in the Amazon partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other Amazon services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see the following:

- [Overview for Creating a Trail](#)
- [CloudTrail Supported Services and Integrations](#)
- [Configuring Amazon SNS Notifications for CloudTrail](#)
- [Receiving CloudTrail Log Files from Multiple Regions and Receiving CloudTrail Log Files from Multiple Accounts](#)

All Amazon SMS actions are logged by CloudTrail and are documented in the [Amazon SMS API Reference](#). For example, calls to the [CreateReplicationJob](#), [GetConnectors](#), and [ImportServerCatalog](#) actions generate entries in the CloudTrail log files.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or Amazon Identity and Access Management (IAM) user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another Amazon service.

For more information, see the [CloudTrail userIdentity Element](#).

Understanding Amazon SMS log file entries

A trail is a configuration that enables delivery of events as log files to an Amazon S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files aren't an ordered stack trace of the public API calls, so they don't appear in any specific order.

The following example shows a CloudTrail log entry that demonstrates the `CreateReplicationJob` action.

```
{
  "eventVersion": "1.05",
  "userIdentity": {
    "type": "IAMUser",
    "principalId": "0123456789abcdef01234",
    "arn": "arn:aws:iam::0123456789ab:user/sms-user",
    "accountId": "0123456789ab",
    "accessKeyId": "0123456789abcdef0123",
    "userName": "sms-user"
  },
  "eventTime": "2018-09-04T16:34:49Z",
  "eventSource": "sms.amazonaws.com",
  "eventName": "CreateReplicationJob",
  "awsRegion": "us-east-1",
  "sourceIPAddress": "1.2.3.4",
  "userAgent": "aws-sdk-java/example-sdk-version Linux/example-kernel-version ...",
  "requestParameters": {
    "roleName": "sms",
    "serverId": "s-01234567",
    "runOnce": true,
    "seedReplicationTime": "Sep 4, 2018 4:36:48 PM"
  },
  "responseElements": {
    "replicationJobId": "sms-job-012345677"
  },
  "requestID": "00000000-1111-2222-3333-444444444444",
  "eventID": "55555555-6666-7777-8888-999999999999",
  "eventType": "AwsApiCall",
  "recipientAccountId": "0123456789ab"
}
```

Security in Amazon Server Migration Service

Cloud security at Amazon is the highest priority. As an Amazon customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between Amazon and you. The [shared responsibility model](#) describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – Amazon is responsible for protecting the infrastructure that runs Amazon services in the Amazon Cloud. Amazon also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the [Amazon Compliance Programs](#). To learn about the compliance programs that apply to Amazon Server Migration Service (Amazon SMS), see [Amazon Services in Scope by Compliance Program](#).
- **Security in the cloud** – Your responsibility is determined by the Amazon service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations

This documentation helps you understand how to apply the shared responsibility model when using Amazon SMS. It shows you how to configure Amazon SMS to meet your security and compliance objectives. You also learn how to use other Amazon services that help you to monitor and secure your Amazon SMS resources.

Contents

- [Data protection in Amazon Server Migration Service \(p. 38\)](#)
- [Identity and access management for Amazon Server Migration Service \(p. 39\)](#)
- [Service-linked roles for Amazon SMS \(p. 41\)](#)

Data protection in Amazon Server Migration Service

The Amazon [shared responsibility model](#) applies to data protection in Amazon Server Migration Service. As described in this model, Amazon is responsible for protecting the global infrastructure that runs all of the Amazon Web Services Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. This content includes the security configuration and management tasks for the Amazon Web Services that you use. For more information about data privacy, see the [Data Privacy FAQ](#).

For data protection purposes, we recommend that you protect Amazon Web Services account credentials and set up individual user accounts with Amazon Identity and Access Management (IAM). That way each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with Amazon resources. We recommend TLS 1.2 or later.
- Set up API and user activity logging with Amazon CloudTrail.
- Use Amazon encryption solutions, along with all default security controls within Amazon services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing personal data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing Amazon through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see [Federal Information Processing Standard \(FIPS\) 140-2](#).

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form fields such as a **Name** field. This includes when you work with Amazon SMS or other Amazon services using the console, API, Amazon CLI, or Amazon SDKs. Any data that you enter into tags or free-form fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Encryption at rest

When replicating server volumes from your on-premises environment, Amazon SMS stores data temporarily in an intermediate S3 bucket. After replication is complete, Amazon SMS deletes this data stored Amazon S3. Otherwise, Amazon SMS does not store your data at rest.

Encryption in transit

Data in transit is encrypted using TLS. This includes traffic from the Server Migration Connector to Amazon S3 and the Server Migration Connector to Amazon SMS.

Identity and access management for Amazon Server Migration Service

Amazon Identity and Access Management (IAM) is an Amazon service that helps an administrator securely control access to Amazon resources. IAM administrators control who can be authenticated (signed in) and authorized (have permissions) to use Amazon resources. IAM enables you to create users and groups under your Amazon account. You control the permissions that users have to perform tasks using Amazon resources. You can use IAM for no additional charge.

By default, IAM users don't have permissions for Amazon Server Migration Service (Amazon SMS) resources and operations. To allow IAM users to manage Amazon SMS resources, you must create an IAM policy that explicitly grants them permissions, and attach the policy to the IAM users or groups that require those permissions.

When you attach a policy to a user or group of users, it allows or denies the users permission to perform the specified tasks on the specified resources. For more information, see [Policies and Permissions](#) in the *IAM User Guide* guide.

Policy structure

An IAM policy is a JSON document that consists of one or more statements. Each statement is structured as follows.

```
{
  "Statement": [
    {
      "Effect": "effect",
      "Action": "action",
      "Resource": "arn",
      "Condition": {
        "condition": {
          "key": "value"
        }
      }
    }
  ]
}
```

There are various elements that make up a statement:

- **Effect:** The effect can be Allow or Deny. By default, IAM users don't have permission to use resources and API actions, so all requests are denied. An explicit allow overrides the default. An explicit deny overrides any allows.
- **Action:** The action is the specific Amazon SMS API action for which you are granting or denying permission.
- **Resource:** The resource that's affected by the action. For Amazon SMS, you must specify "*" as the resource.
- **Condition:** Conditions are optional. They can be used to control when your policy is in effect.

Example policies

In an IAM policy statement, you can specify any API action from any service that supports IAM. For Amazon SMS, use the following prefix with the name of the API action: sms : as follows.

```
"Action": "sms:UpdateReplicationJob"
```

To specify multiple actions in a single statement, separate them with commas as follows.

```
{
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["sms:action1", "sms:action2"],
      "Resource": "*"
    }
  ]
}
```

You can also specify multiple actions using wildcards. For example, you can specify all Amazon SMS API actions whose name begins with the word "Get" as follows.

```
{
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "sms:Get*",
      "Resource": "*"
    }
  ]
}
```

```
}
```

To specify all Amazon SMS API actions, use the * wildcard as follows.

```
{  
  "Statement": [  
    {  
      "Effect": "Allow",  
      "Action": "sms:*",  
      "Resource": "*"  
    }  
  ]  
}
```

To prevent users from enabling automatic launch after replication, use the following statement. It is not sufficient to omit `sms:LaunchApp` from the list of allowed actions, because with automatic launch, users do not call `LaunchApp` directly.

```
{  
  "Statement": [  
    {  
      "Effect": "Deny",  
      "Action": "sms:LaunchApp",  
      "Resource": "*"  
    }  
  ]  
}
```

Predefined Amazon managed policies

The managed policies created by Amazon grant the required permissions for common use cases. You can attach these policies to your IAM users, based on the access to Amazon that they require.

Service-linked roles for Amazon SMS

Amazon SMS uses a service-linked role for the permissions that it requires to call other Amazon services on your behalf. For more information, see [Using Service-Linked Roles](#) in the *IAM User Guide*.

Before the introduction of a service-linked role for Amazon SMS, you were required to create two IAM roles to grant Amazon SMS the permissions that it needs. These roles are no longer required to use Amazon SMS. However, they are documented here for completeness. For more information, see [Legacy IAM roles for Amazon SMS](#) (p. 42).

Permissions granted by the service-linked role

Amazon SMS uses the service-linked role named **AWSServiceRoleForSMS** to enable Amazon SMS to manage your replication jobs.

AWSServiceRoleForSMS trusts the `sms.amazonaws.com` service principal to assume the role.

The role permissions policy allows Amazon SMS to complete the following actions on the specified resources:

- Use specific Amazon SMS actions to create and manage replication jobs
- Use specific Amazon CloudFormation actions to create and manage `arn:aws:cloudformation:*:*:stack/sms-app-*/*`

- Use specific Amazon EC2 actions to manage snapshots and images, launch instances, and manage instances that meet the following tag condition: `ec2:ResourceTag/aws:cloudformation:stack-id": "arn:aws:cloudformation:*:*:stack/sms-app-*/"`
- Use specific Amazon Systems Manager actions to run scripts on your instances
- Use `iam:GetRole` on all resources and `iam:PassRole` on `arn:aws:cloudformation:*:*:stack/sms-app-*/`
- Use specific Amazon S3 actions to create and manage `arn:aws:s3:::sms-app-*`

Create the service-linked role

You can create this service-linked role manually by using the following Amazon CLI [create-service-linked-role](#) command to create **AWSServiceRoleForSMS**.

```
aws iam create-service-linked-role --aws-service-name sms.amazonaws.com
```

Edit the service-linked role

You can edit the description of **AWSServiceRoleForSMS** using IAM. For more information, see [Editing a Service-Linked Role](#) in the *IAM User Guide*.

Delete the service-linked role

If you no longer need to use Amazon SMS, we recommend that you delete the **AWSServiceRoleForSMS** role. The service-linked role can only be deleted in the following conditions:

- The service-linked role is not being used by an active replication job
- The service-linked role is not being used by an application that has an associated active replication job
- The service-linked role is not being used by an application that has an associated Amazon CloudFormation stack

You can use the IAM console, the IAM CLI, or the IAM API to delete service-linked roles. For more information, see [Deleting a Service-Linked Role](#) in the *IAM User Guide*.

After you delete the **AWSServiceRoleForSMS** role, Amazon SMS creates the role again if you start a replication job.

Legacy IAM roles for Amazon SMS

Before the introduction of **AWSServiceRoleForSMS**, you would have been required to create a service role and a launch role to grant Amazon SMS the permissions that it needs. It is no longer necessary for you to create these roles.

Configure a service role for Amazon SMS

Use the following procedure to create an IAM role that grants permissions to Amazon SMS to place migrated resources into your Amazon EC2 account.

To create the IAM role for Amazon SMS

1. Open the IAM console at <https://console.amazonaws.cn/iam/>.
2. In the navigation pane, choose **Roles**, **Create role**.

3. Under **Choose the service that will use this role**, choose **SMS, Next: Permissions**.
4. Under **Attached permissions policies**, confirm that the policy **ServerMigrationServiceRole** is visible and choose **Next: Review**.
5. Under **Review**, for **Role name**, enter **sms**.

Note

Alternatively, you can apply a different name. However, you must then specify the role name explicitly each time that you create a replication job or an application.

6. Choose **Create role**. You should now see the **sms** role in the list of available roles.
7. For additional security controls, context keys such as `aws:SourceAccount` and `aws:SourceArn` can be added to the trust policy for this newly created role. SMS will publish the `sourceAccount` and `sourceArn` keys as specified in the example below to assume this role.

```
{
  "Version": "2012-10-17",
  "Statement": {
    "Effect": "Allow",
    "Principal": { "Service": "sms.amazonaws.com" },
    "Action": "sts:AssumeRole",
    "Condition": {
      "StringEquals": {
        "aws:SourceAccount": "<YOUR_AWS_ACCOUNT_ID>"
      },
      "ArnLike": {
        "aws:SourceArn": "arn:aws:sms:*:<YOUR_AWS_ACCOUNT_ID>:*"
      }
    }
  }
}
```

Configure a launch role for Amazon SMS

If you plan to launch applications, you need an Amazon SMS launch role. You assign this role using the `PutAppLaunchConfiguration` API. When the `LaunchApp` API is called, the role is used by Amazon CloudFormation.

To create a launch role for Amazon SMS

1. Open the IAM console at <https://console.amazonaws.cn/iam/>.
2. In the navigation pane, choose **Roles, Create role**.
3. Under **Choose the service that will use this role**, choose **CloudFormation, Next: Permissions**.
4. Under **Attached permissions policies**, confirm that the policy **ServerMigrationServiceLaunchRole** is visible and choose **Next: Review**.
5. Under **Review**, for **Role name**, enter **sms-launch**.

Note

Alternatively, you can apply a different name. However, you must then specify the role name explicitly each time that you create a launch configuration for an application.

6. Choose **Create role**. You should now see the **sms-launch** role in the list of available roles.

Resilience in Amazon Server Migration Service

The Amazon global infrastructure is built around Amazon Regions and Availability Zones. Regions provide multiple physically separated and isolated Availability Zones, which are connected through low-

latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about Amazon Regions and Availability Zones, see [Amazon Global Infrastructure](#).

Infrastructure security in Amazon Server Migration Service

As a managed service, Amazon SMS is protected by the Amazon global network security procedures that are described in the [Amazon Web Services: Overview of Security Processes](#) whitepaper.

You use Amazon published API calls to access Amazon SMS through the network. Clients must support Transport Layer Security (TLS) 1.0 or later. We recommend TLS 1.2 or later. Clients must also support cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the [Amazon Security Token Service](#) (Amazon STS) to generate temporary security credentials to sign requests.

Compliance validation for Amazon Server Migration Service

Third-party auditors assess the security and compliance of Amazon Web Services as part of multiple Amazon compliance programs, such as SOC, PCI, FedRAMP, and HIPAA.

To learn whether an Amazon Web Service is within the scope of specific compliance programs, see [Amazon Web Services in Scope by Compliance Program](#) and choose the compliance program that you are interested in. For general information, see [Amazon Web Services Compliance Programs](#).

You can download third-party audit reports using Amazon Artifact. For more information, see [Downloading Reports in Amazon Artifact](#).

Your compliance responsibility when using Amazon Web Services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. Amazon provides the following resources to help with compliance:

- [Security and Compliance Quick Start Guides](#) – These deployment guides discuss architectural considerations and provide steps for deploying baseline environments on Amazon that are security and compliance focused.
- [Amazon Compliance Resources](#) – This collection of workbooks and guides might apply to your industry and location.
- [Evaluating Resources with Rules](#) in the *Amazon Config Developer Guide* – The Amazon Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- [Amazon Security Hub](#) – This Amazon Web Service provides a comprehensive view of your security state within Amazon that helps you check your compliance with security industry standards and best practices.

Troubleshooting Amazon SMS

The following information can help you troubleshoot issues with errors that you might encounter when using Amazon SMS. Before using these procedures, confirm that your SMS setup and the server you are trying to migrate meet the requirements in [Requirements for Amazon Server Migration Service](#) (p. 2).

Contents

- [Log files for the connector](#) (p. 45)
- [Failure when registering the connector](#) (p. 46)
- [Certificate error when uploading a VM to Amazon S3](#) (p. 46)
- [Server Migration Connector fails to connect to Amazon with error "PKIX path building failed"](#) (p. 47)
- [This CA Root certificate is not trusted](#) (p. 47)
- [Replication run fails during the preparing stage](#) (p. 48)
- [Replicated AMI doesn't support some instance types for launch](#) (p. 48)
- [ServerError: Failure to upload base disk\(s\) to Amazon S3](#) (p. 48)
- [ServerError: Failed to validate replication job](#) (p. 49)
- [An internal error occurred. Confirm that your Amazon credentials and VM Manager credentials are correct.](#) (p. 49)
- [Snapshot-related errors \(VMware\)](#) (p. 49)
- [Checkpoint errors \(Hyper-V\)](#) (p. 49)
- [Incremental replication delta exceeds 1 TB](#) (p. 50)

Log files for the connector

The Server Migration Connector provides log files that you can use to troubleshoot replication jobs that fail prior to completing the upload to Amazon S3. Use the following procedure to download the connector log files.

To download the connector log files

1. In a web browser, enter the IP address of the connector VM.
2. Log in to the connector.
3. Verify that the connector passes all checks.
4. Under **Support Links**, choose **Download Log Bundle**.
5. Extract the files in the log bundle.

The following connector log files are included in the log bundle:

- `connector.log` – Check for connector configuration issues.
- `connectorsetup.log` – Check for detailed information about the initial configuration.
- `frontend.log` – Check for issues with connectivity to Amazon endpoints.
- `metrics.log` – Check the throughput statistics and upload speeds (see `UploadStats`).
- `netstat.log` – Check for network packet errors.
- `poller.log` – Confirm database polling activity.

- `sms-replication-poller-log` – Review activity from validation of the replication job through the disk is uploaded to Amazon S3. For example, you can verify upload progress as a percentage and review the start and end of each phase of the replication job.

Failure when registering the connector

If you encounter an issue registering the connector, contact sms-service@amazon.com.

Certificate error when uploading a VM to Amazon S3

The connector may fail to replicate your VM because the VM is on an ESXi host with an SSL certificate problem. If this occurs, you see the following error message displayed in the **Latest run's status message** section: "ServerError: Failed to upload base disk(s) to S3. Please try again. If this problem persists, please contact Amazon Support: vSphere certificate hostname mismatch: Certificate for <*somehost.somedomain.com*> doesn't match any of the subject alternative names: [*localhost.localdomain*]."

You can override this ESXi host certificate problem by completing the following tasks:

Tasks

- [Upgrade your connector \(p. 46\)](#)
- [Re-register your connector \(p. 46\)](#)

Upgrade your connector

This section is for customers who are manually upgrading the connector. If you have previously configured automatic upgrades, skip these steps and continue to [Re-register your connector \(p. 46\)](#).

To upgrade your connector

1. Open the connector console.
2. Log in to the connector.
3. Choose **Upgrade**.
4. Wait for the connector to finish upgrading to version 1.0.11.13 or later.

Re-register your connector

This section applies to all customers encountering the certificate mismatch problem.

To re-register your connector

1. Open the connector console.
2. Log in to the connector.
3. In the **General Health** section, check that the connector version is 1.0.11.13 or later.
4. Choose **Edit Amazon Server Migration Service Settings**.
5. On the **Setup** page, for **Amazon Region**, select the desired region from the list. For **Amazon Credentials**, enter the IAM access key and secret key that you created in Step 2 of the [setup guide \(p. 10\)](#). Choose **Next**.

6. On the **vCenter Service Account** page, enter the vCenter hostname, user name, and password that you created in Step 3 of the [setup guide](#) (p. 10).
7. Select the **Ignore hostname mismatch and expiration errors for vCenter and ESXi certificates** check box. Choose **Next**.
8. Complete registration and view the connector configuration dashboard.
9. Use the Amazon SMS CLI or API to delete and restart your stuck replication jobs.

Server Migration Connector fails to connect to Amazon with error "PKIX path building failed"

In some customer environments, secure network traffic is proxied through a certificate re-signing mechanism for auditing and management purposes. This can cause your Amazon credentials to fail when the connector attempts to contact Amazon SMS. The error message contains "PKIX path building failed," indicating that an invalid certificate was presented.

For the connector to work in such an environment, the re-signing certificate (a user certificate that your organization trusts and uses to sign outbound packets) must be added to the connector's trust store, as described in the following steps.

To add the re-signing certificate to the connector trust store

1. On your connector system, disable the FreeBSD packet filter and enable SSH with the following commands:

```
sudo service pf stop
sudo service sshd onestart
```

2. Copy your user certificate to the connector by a method such as the following:

```
scp userCertFile ec2-user@10.0.0.100:/tmp/
```

3. Add the user certificate to the trust store:

```
keytool -importcert -keystore /usr/local/amazon/connector/config/jetty/trustStore -
storepass AwSc0nNeCt0r -file /tmp/userCertFileName -alias userCertName
```

4. Restart services using the following command (part of Amazon Management Portal for vCenter):

```
sudo setup.rb
```

Select option **3** and type "yes".

5. Re-enable the packet filter:

```
sudo service pf start
```

This CA Root certificate is not trusted

When you access the IP address of a virtual machine that you installed on-premises, you may receive the following message:

```
This CA Root certificate is not trusted. To enable trust,
install this certificate in the Trusted Root Certifications
Authorities store.
```

You can safely ignore this message.

Replication run fails during the preparing stage

In some cases, Amazon SMS allows a replication job to continue scheduling incremental replication runs even when the latest replication run has failed. When the maximum allowed number of consecutive failures is reached, the default behavior for a replication job is to be paused. The job can be resumed within four days, after which it is deleted. In such cases, the Amazon EBS snapshots from the latest replication run are shared with the customer account, and a status message for the failed replication run is sent. The message contains the snapshot IDs and states the reason for the failure. A typical status message resembles the following:

```
EBS snapshot(s) created with snapshot ID(s): snap-12345678abcdefgh. Another run
has been scheduled after the last run failed due to an import failure. 2 re-try run(s)
remaining before the job will be failed.
```

The reason for replication-run failures (including first-boot failures) often correlates closely with failures observed when Amazon EC2 VM Import/Export is used for VM migrations. For more information, see [Troubleshooting VM Import/Export](#).

If you need further help with resolving a problem, contact Amazon Web Services Support. EBS snapshots generated during a failed migration are shared with your account, and the snapshot IDs are included in the status message for the replication job. Be sure to have these details available when you contact Amazon Support.

Replicated AMI doesn't support some instance types for launch

Some instances require ENA support. If the migration does not enable ENA support, then the replicated AMI does not allow you to launch instances that require ENA support.

Verify that ENA is enabled. For more information, see [Enabling Enhanced Networking on Windows](#) or [Enabling Enhanced Networking on Linux](#) in the Amazon EC2 documentation.

ServerError: Failure to upload base disk(s) to Amazon S3

Possible causes

- The VMDK is not snapshottable or the VM has mounted ISOs.
- The connection to the hypervisor (Hyper-V or ESXi host) timed out while the connector uploads buffered data to Amazon S3.
- Maintenance is being performed while the replication job uploads disks to Amazon S3.
- There is a compression issue with the virtual disk.

- There is a validation error with the hypervisor certificate.
- The status of the connector is Unhealthy.
- The connector cannot reach Amazon endpoints.

ServerError: Failed to validate replication job

Possible causes

- There is a change in the virtual machine path.
- There is a change in IAM permissions.
- There is a change in user or account permissions for the virtual environment.
- There is a configuration issue with WinRM (Hyper-V).
- There is a DNS resolution failure.
- There is an NTP configuration error on the connector VM.

An internal error occurred. Confirm that your Amazon credentials and VM Manager credentials are correct.

Possible causes

- The IAM permissions are not sufficient to complete the connector setup.
- The user or account permissions for the virtual environment are not sufficient.
- There are issues with the IAM roles for Amazon SMS.
- There are missing prerequisites.
- The VM environment is not prepared.
- Special characters were used when setting up the connector (Hyper-V).

Snapshot-related errors (VMware)

Possible causes

- The VMDK is configured as an independent disk.
- The ESXi host cannot take a snapshot.
- The VMDK is locked.
- The snapshot chain is broken. Ensure that no snapshots are taken between replication runs, either manually or by third-party software.
- A previous replication run did not consolidate snapshots.

Checkpoint errors (Hyper-V)

Possible causes

- The VM has existing checkpoints.

- There are checkpoints created manually or by third-party software.
- The VHD or VHDX is locked.
- The Hyper-V host is unable to create a checkpoint.

Incremental replication delta exceeds 1 TB

The connector is designed to handle frequent replication with small deltas. The connector does not support deltas larger than 1 TB. If you do not replicate on a regular basis, the delta can exceed this limit and the replication run fails.

To prevent this issue, set up frequent incremental replication runs. If you cannot replicate frequently, you can increase the delta upload limit. For example, run the following commands on the connector to increase the part size of S3 uploads from 25 MB to 100 MB. When prompted, select option 3.

```
sudo sms-connector-config -set slotSizeMB 100  
sudo setup.rb
```

Increasing the upload limit impacts the performance and memory usages of the connector. Do not increase the upload limit while the connector is uploading multiple deltas.

Release notes for Server Migration Connector

The following tables describe the release history of the Server Migration Connector.

Releases

- [Releases for vCenter environments \(p. 51\)](#)
- [Releases for Hyper-V/SCVMM environments \(p. 53\)](#)
- [Releases for Azure environments \(p. 54\)](#)

Releases for vCenter environments

December 16, 2021	1.2.0.2038	<ul style="list-style-type: none"> This version includes minor bug fixes and the patch for Apache Log4j2 Code Execution 0-day vulnerability (CVE-2021-44228).
February 27, 2020	1.2.0.350	<ul style="list-style-type: none"> Minor bug fixes
May 31, 2019	1.2.0.286	<ul style="list-style-type: none"> Deployment script supports nondefault subscriptions Minor bug fixes and performance improvements
April 18, 2019	1.2.0.269	<ul style="list-style-type: none"> Added support for Microsoft's Azure environment

Document history for Amazon SMS

The following table describes the releases of Amazon SMS.

Change	Description	Date
Console deprecation (p. 55)	Removed documentation support for Amazon SMS console in line with Amazon SMS console deprecation. The Amazon SMS APIs will be supported through March 31, 2023.	April 1, 2022
Application validation (p. 55)	Added support for validating applications before launching them. With application validation, you run validation scripts on your EC2 instances using Amazon Systems Manager. With instance validation, you can run a configuration script when your EC2 instance first boots using Amazon EC2 user data.	August 10, 2020
Azure support (p. 55)	Added support for Microsoft Azure.	April 18, 2019
Integration with Amazon Migration Hub (p. 55)	Added support for importing and migrating applications discovered by Migration Hub.	February 22, 2019
Application migration (p. 55)	Added support for migrating groups of servers organized as applications, and or automated application launching using CloudFormation.	December 5, 2018
Larger disk size support (p. 55)	Added support for VMs with disk-size larger than 4 TB using the S3 Manifest functionality.	June 11, 2018
Migrate multiple servers with single connector (p. 55)	Added support for migrating VMs from multiple Hyper-V servers using a single connector.	April 25, 2018
Hyper-V support (p. 55)	Added support for Microsoft's Hyper-V environment.	December 14, 2017
Upload resilience (p. 55)	Improved resilience in disk uploads.	November 8, 2017
Enhanced upload speeds (p. 55)	Improved VM disk upload speeds.	August 29, 2017

[vCenter 5.1; one-time migration; error messages; security \(p. 55\)](#)

Added support for vCenter 5.1. Support for one-time migration. Improved error messages and security-related bug fixes.

May 5, 2017

[Initial release \(p. 55\)](#)

Server Migration Connector virtual appliance for VMware environments. Amazon Server Migration Service console to manage VM migrations and SMS replication tasks using a graphical interface. Amazon Server Migration Service CLI to manage VM migrations and SMS replication tasks using the command line.
